## FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

### OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point source discharge reduction and nonpoint source pollution abatement in lake watersheds.

### ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

### LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's freshwater lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by the U.S. Environmental Protection Agency and to augment plans implementation by the states.

#### ACKNOWLEDGEMENTS

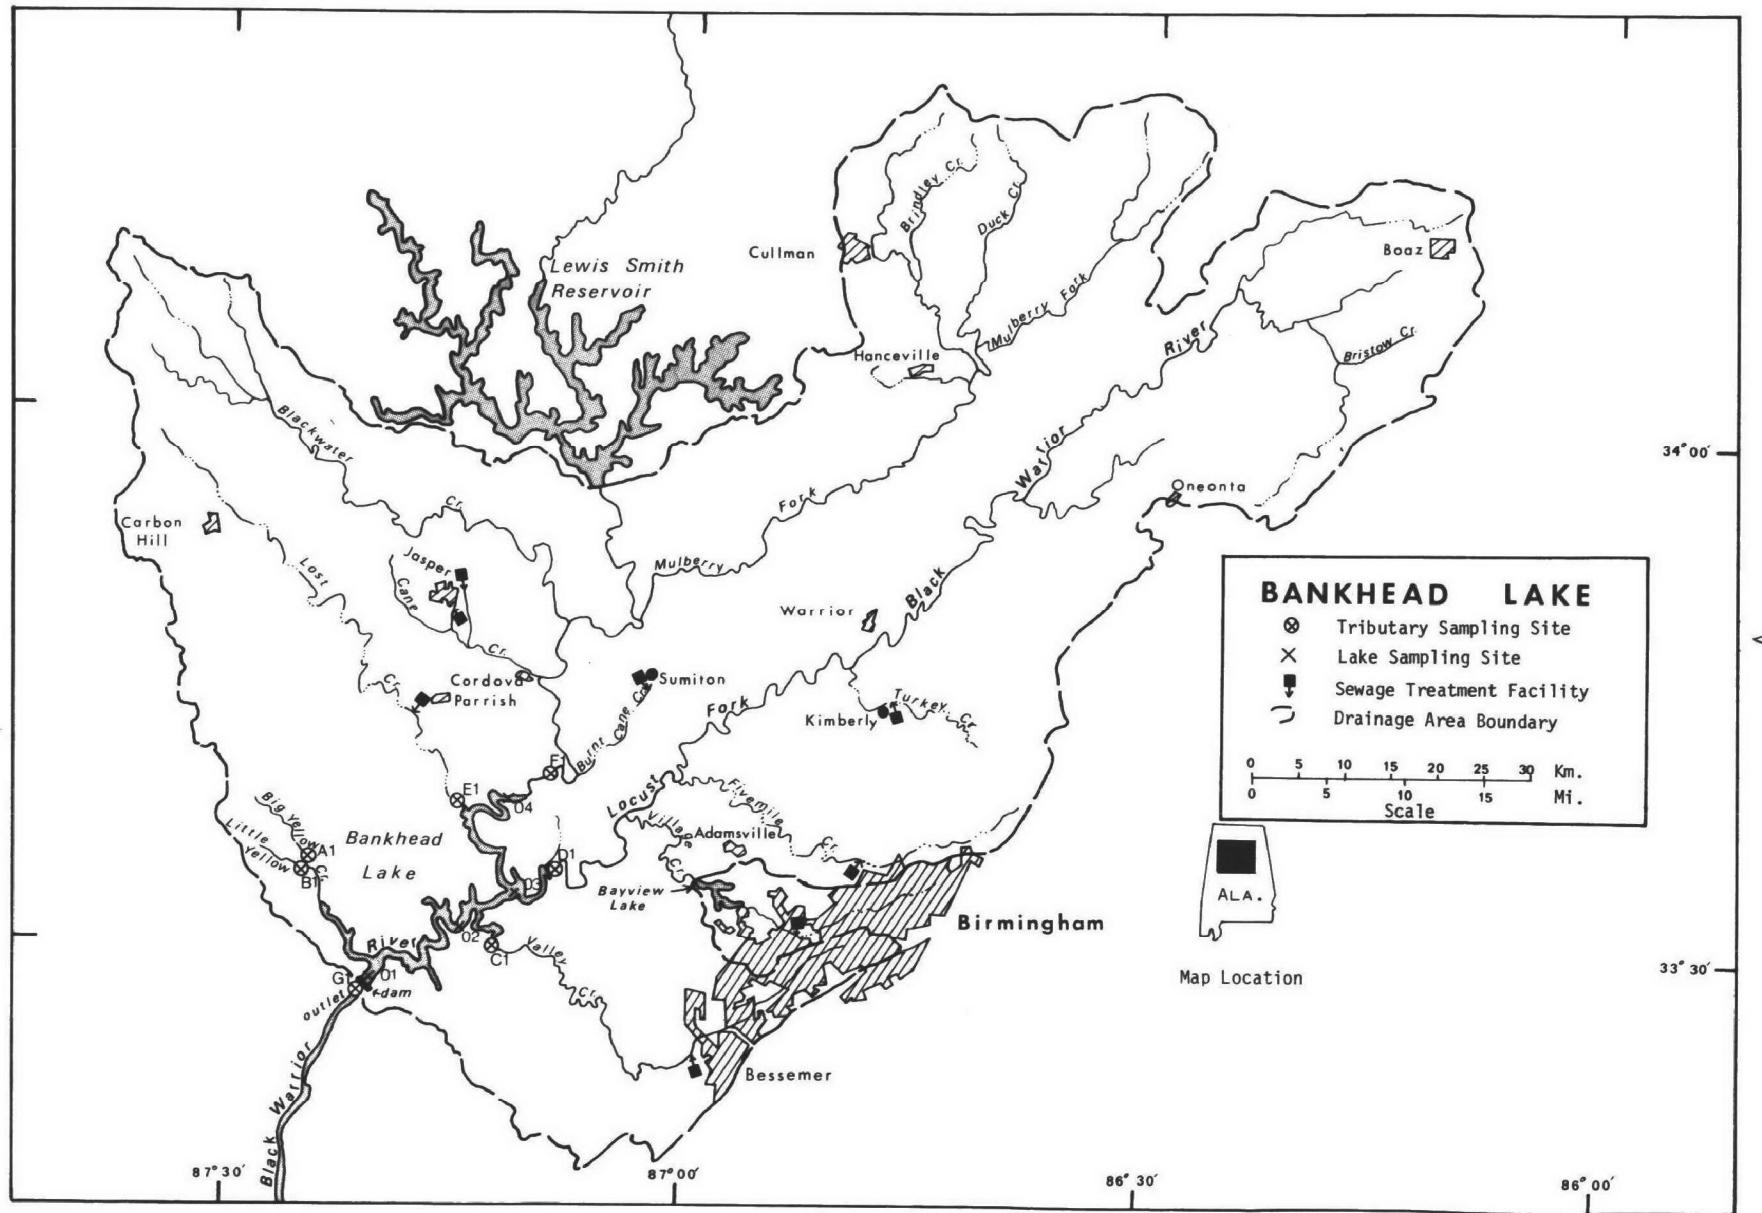

The staff of the National Eutrophication Survey (Office of Research and Development, U.S. Environmental Protection Agency) expresses sincere appreciation to the Alabama Water Improvement Commission for professional involvement and to the Alabama National Guard for conducting the tributary sampling phase of the Survey.

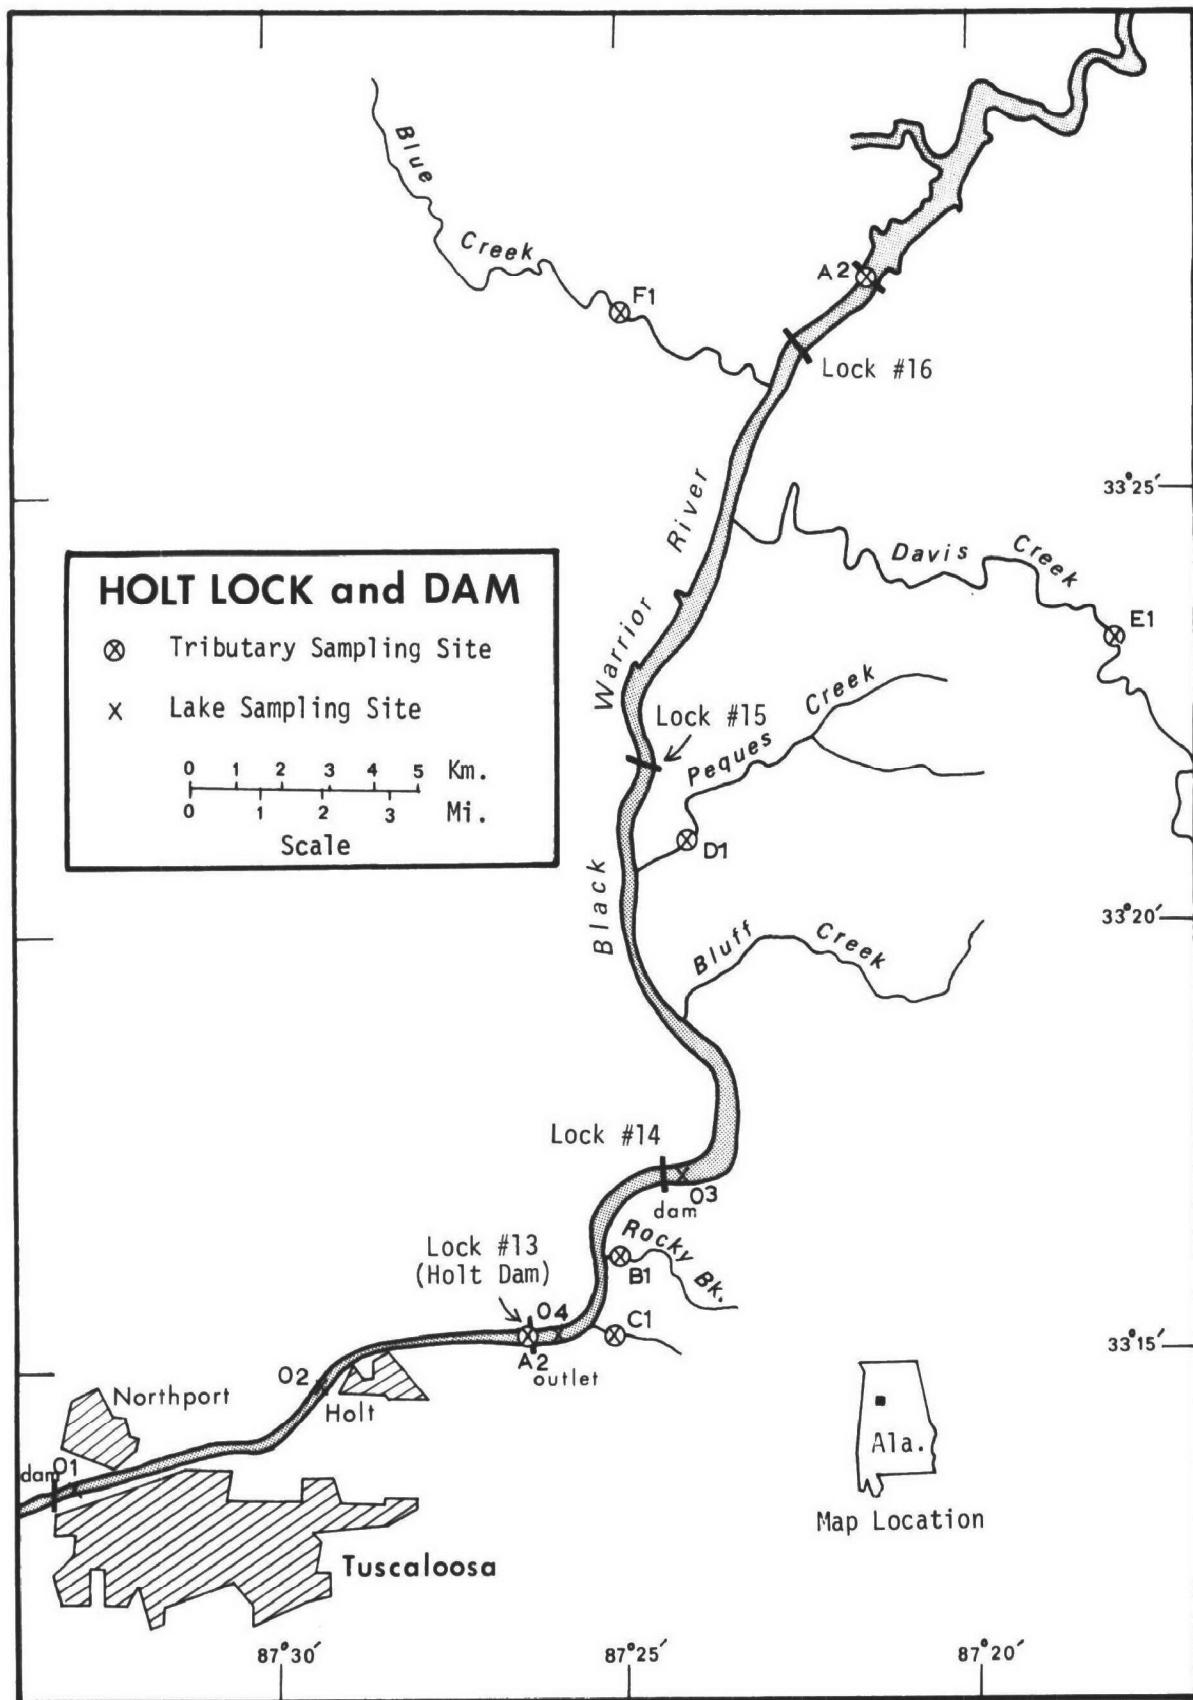

E. John Williford, Chief, Surveillance and Monitoring Section; and John C. Chitwood, Biologist, Surveillance and Monitoring Section; and Sam L. Coleman, Water Quality Planning Section; and M. H. Floyd, Engineer, Surveillance and Monitoring Section; and Truman Green, Engineer, Municipal Waste Control Section; and Tim McCartha, Biologist, Surveillance and Monitoring Section; and James E. McIndoe, Engineer, Water Quality Planning Section; and Richard T. Maddox, Engineer, Industrial Waste Control Section; and James T. White, Engineer, Municipal Waste Control Section provided invaluable lake documentation and counsel during the course of the Survey.

Major General Charles A. Rollo, Adjutant General of Alabama, and Project Officer Lt. Col. Wash B. Ray, who directed the volunteer efforts of the Alabama National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

REPORT ON BANKHEAD LAKE AND HOLT LOCK AND DAM

STORET NUMBERS 0101 AND 0105

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Bankhead Lake and Holt Lock and Dam are eutrophic (i.e., nutrient rich and highly productive). Whether such nutrient enrichment is to be considered beneficial or deleterious is determined by its actual or potential impact upon designated beneficial water uses of each lake.

Of the 11 Alabama lakes sampled in 1973, only Holt Lock and Dam had higher median inorganic nitrogen levels than Bankhead Lake (Appendix E). In both impoundments, dissolved oxygen concentrations were depressed and Secchi disc transparencies were low. Pollution tolerant genera were predominant among the phytoplankton identified, although in low concentrations probably due to toxic substances in the water and short reservoir retention times (EPA, 1975). Survey limnologists reported a continuous surface oil film at Holt Lock and Dam, apparently generated by coal barges and barge loading sites along the reservoir.

Other studies (EPA, 1975) indicate that there are 18 municipal and 73 industrial waste sources discharging into the Black Warrior River and its tributaries upstream from Bankhead Lake. Excessive surface coal mining operations in the Bankhead watershed contribute high concentrations of zinc and manganese and lower the pH levels in both reservoirs. The EPA report recommended the reduction of both industrial and municipal waste loads into Bankhead Reservoir to improve water quality and reduce potential for algal blooms.

B. Rate-Limiting Nutrient:

Algal assay results indicate that both Bankhead Lake and Holt Lock and Dam were limited by available phosphorus levels. Spikes of phosphorus, and nitrogen and phosphorus simultaneously resulted in increases in assay yield. Additions of nitrogen alone did not stimulate a growth response. The ratios of inorganic nitrogen to orthophosphorus (N/P) in sampled waters further suggest primary limitation by phosphorus in the reservoir.

C. Nutrient Controllability:

1. Point sources -

Nutrient loading to both Black Warrior River reservoirs was far higher than the eutrophic levels proposed by Vollenweider (1975) for lakes with such volumes and retention times. Loading to Bankhead Lake was approximately seven times the eutrophic loading, while the

impoundment at Holt Lock and Dam was four times the eutrophic level. However, Vollenweider's model probably does not apply to water bodies with short hydraulic retention times, and the mean hydraulic retention times of Bankhead Lake and Holt Lock and Dam are only seven and six days, respectively.

The mean annual phosphorus load from known point sources was estimated to be 70.4% of the total reaching Bankhead Lake. Of the point source load, the city of Birmingham contributed a total of 50.4% from two wastewater plants, and the city of Bessemer contributed 16.5%. While elimination of point source loading to the lake would substantially reduce the overall load, nutrient input would still exceed Vollenweider's eutrophic rate. Concurrent control of nonpoint sources, through application of proper land use practices and reduction of presently unmeasured point sources (EPA, 1975) would be required to upgrade water quality.

There are no known point sources directly impacting Holt Lock and Dam. However, elimination of the point sources impacting Bankhead Lake would be expected to substantially improve water quality of Holt Lock and Dam.

2. Nonpoint sources -

The Locust and Mulberry Forks of the Black Warrior River were estimated to contribute 27.2% of the total phosphorus load to Bankhead Lake, and the Black Warrior River contributed 96.7% of the total to Holt Lock and Dam. Additional sampling is needed to determine to what degree these nonpoint background loads are overestimated due to unmeasured point sources, particularly industrial, which impact the Black Warrior River.

## II. LAKE AND DRAINAGE BASIN CHARACTERISTICS

Lake and drainage basin characteristics are itemized below.

Lake surface areas and mean depths were provided by the Alabama Water Improvement Commission; maximum depths were estimated on the basis of National Eutrophication Survey (NES) sampling data; tributary data were provided by the Alabama District Office of the U.S. Geological Survey (USGS) (outlet drainage areas include the lake surface area). Mean hydraulic retention times were obtained by dividing the lake volumes by mean flows of the outlets. Precipitation values are estimated by methods as outlined in NES Working Paper No. 175. A table of metric/English conversions is included as Appendix A.

A. Lake Morphometry:	<u>Bankhead Lake</u>	<u>Holt Lock and Dam</u>
1. Surface area:	37.23	13.36 km <sup>2</sup> .
2. Mean depth:	3.1	7.9 meters.
3. Maximum depth:	21.3	23.8 meters.
4. Volume:	115.413	105.544 x 10 <sup>6</sup> m <sup>3</sup> .
5. Mean hydraulic retention time:	7	6 days

B. Tributary and Outlet (See Appendix B for flow data):

1. Tributaries -

## C. Precipitation:

	<u>Bankhead Lake</u>	<u>Holt Lock and Dam</u>	
1. Year of sampling:	167.9	170.8	cm.
2. Mean annual:	135.2	126.8	cm.

### III. LAKE WATER QUALITY SUMMARY

Bankhead Lake and Holt Lock and Dam were sampled three times during the open-water season of 1973 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from four stations on each lake and from a number of depths at each station (see maps, pages v-vi). During each visit, depth-integrated samples were collected from each station for chlorophyll a analysis and phytoplankton identification and enumeration. During the first visit, 18.9-liter depth-integrated samples were composited for algal assays. Maximum depths sampled, expressed in meters, were:

<u>Station</u>	<u>Bankhead Lake</u>	<u>Holt Lock and Dam</u>
1	17.7	11.0
2	20.1	7.6
3	10.7	18.0
4	9.8	22.6

For a more detailed explanation of NES methods, see NES Working Paper No. 175.

The results obtained are presented in full in Appendix C and are summarized in III-A for waters at the surface and at the maximum depth for each site. Results of the phytoplankton counts and chlorophyll a determinations are included in III-B. Results of the limiting nutrient study are presented in III-C.

## 2. Discussion -

The control yields of the assay alga, Selenastrum capricornutum, indicate that the potentials for primary production in Bankhead Lake and Holt Lock and Dam were moderate to high at the time of sample analyses. In both assays, increases in yield with the addition of phosphorus as well as the lack of response when only nitrogen was added indicate phosphorus limitation. Maximum growth potential was achieved with the simultaneous addition of both phosphorus and nitrogen.

The spring N/P ratios in the field were about 56/1 in Bankhead Lake, and 76/1 in Holt Lock and Dam, indicating primary limitation by phosphorus at the time of assay sample collection. N/P ratios for the entire sampling year in Bankhead and Holt Lock and Dam were 93/1 and 104/1, respectively, also indicating phosphorus limitation (an N/P ratio of 14/1 or greater generally reflects phosphorus limitation).

IV. NUTRIENT LOADINGS  
(See Appendix D for data)

For the determination of nutrient loadings, the Alabama National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the maps (pages v-vi), except for the high runoff months of January and February when two samples were collected. Sampling was begun in March 1973, and was completed in February 1974.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Alabama District Office of the USGS for the tributary sites nearest the lake.

In this report, nutrient loads for sampled tributaries, except Valley Creek and the Locust Fork of the Black Warrior River (Bankhead Reservoir), were determined by using a modification of the USGS computer program for calculating stream loadings. Nutrient loads indicated for tributaries are those measured minus known point source loads, if any.

Nutrient loadings for unsampled "minor tributaries and immediate drainage" ("ZZ" of USGS) and Valley Creek and Locust Fork were estimated by using the mean annual nutrient loads for Big Yellow, Little Yellow Creek, Pequesa Creek, Davis Creek, and Blue Creek at Stations 0101A1 and B1, and 0105D1, E1, and F1 and multiplying the means by the appropriate drainage area in km<sup>2</sup>.

The operators of the Bessemer, Kimberly, Birmingham (Five Mile Creek and Valley Creek) and Jasper wastewater treatment plants provided monthly effluent samples and corresponding flow data. Nutrient loads for the cities of Parrish and Sumiton wastewater treatment plants were estimated at 1.134 kg P and 3.401 kg N/Capita/year.

A. Waste Sources: Bankhead Lake only

1. Known municipal -

<u>Name</u>	<u>Population Served</u>	<u>Treatment</u>	<u>Mean Flow (m<sup>3</sup>/d x 10<sup>3</sup>)</u>	<u>Receiving Water</u>
Valley Creek (Bessemer)	100,000	Primary clarification	56.529	Valley Creek
Turkey Creek (Kimberly)	1,500	Activated sludge	1.156	Turkey Creek/ Locust Fork/ Black Warrior River
Five Mile Creek (Birmingham)	10,000	Primary clarification	22.713	Five Mile Creek

## D. Mean Annual Nonpoint Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km<sup>2</sup>/yr</u>	<u>kg N/km<sup>2</sup>/yr</u>
Big Yellow Creek	4	138
Little Yellow Creek	5	109
Valley Creek	9	435
Locust Fork (Black Warrior River)	9	435
Lost Creek	5	193
Mulberry Fork (Black Warrior River)	29	676
Black Warrior River	21	916
Rocky Branch	11	665
Unnamed Stream	11	697
Peques Creek	6	479
Davis Creek	12	628
Blue Creek	19	819

F. Yearly Loadings:

In the following table, the existing phosphorus annual loading is compared to the relationship proposed by Vollenweider (1975). Essentially, his eutrophic loading is that at which the receiving waters would become eutrophic or remain eutrophic; his oligotrophic loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between eutrophic and oligotrophic.

Note that Vollenweider's model may not apply to lakes with short hydraulic retention times or in which light penetration is severely restricted by high concentrations of suspended solids in the surface waters.

---

<u>Total Yearly Phosphorus Loading (g/m<sup>2</sup>/yr)</u>	<u>Bankhead</u>	<u>Holt Lock</u>
Estimated loading for	17.49	16.94
Vollenweider's eutrophic loading	2.40	4.18
Vollenweider's oligotrophic loading	1.20	2.09
