## F O R E W O R D

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to fresh water lakes and reservoirs.

### OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

### ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

### LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Georgia Department of Natural Resources for professional involvement and to the Georgia National Guard for conducting the tributary sampling phase of the Survey.

Joe D. Tanner, Commissioner of the Department of Natural Resources; J. Leonard Ledbetter, Director of the Environmental Protection Division; Ralph S. Howard, Jr., Environmental Affairs Coordinator; Gene B. Welsh, Chief of the Water Protection Branch; Edward T. Hall, Jr., Unit Coordinator; and Broughton A. Caldwell, R. Marshall Gaddis, William D. Kennedy, and Kenneth W. Martin, Environmental Specialists, provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary lake reports, and provided critiques most useful in the preparation of this Working Paper series.

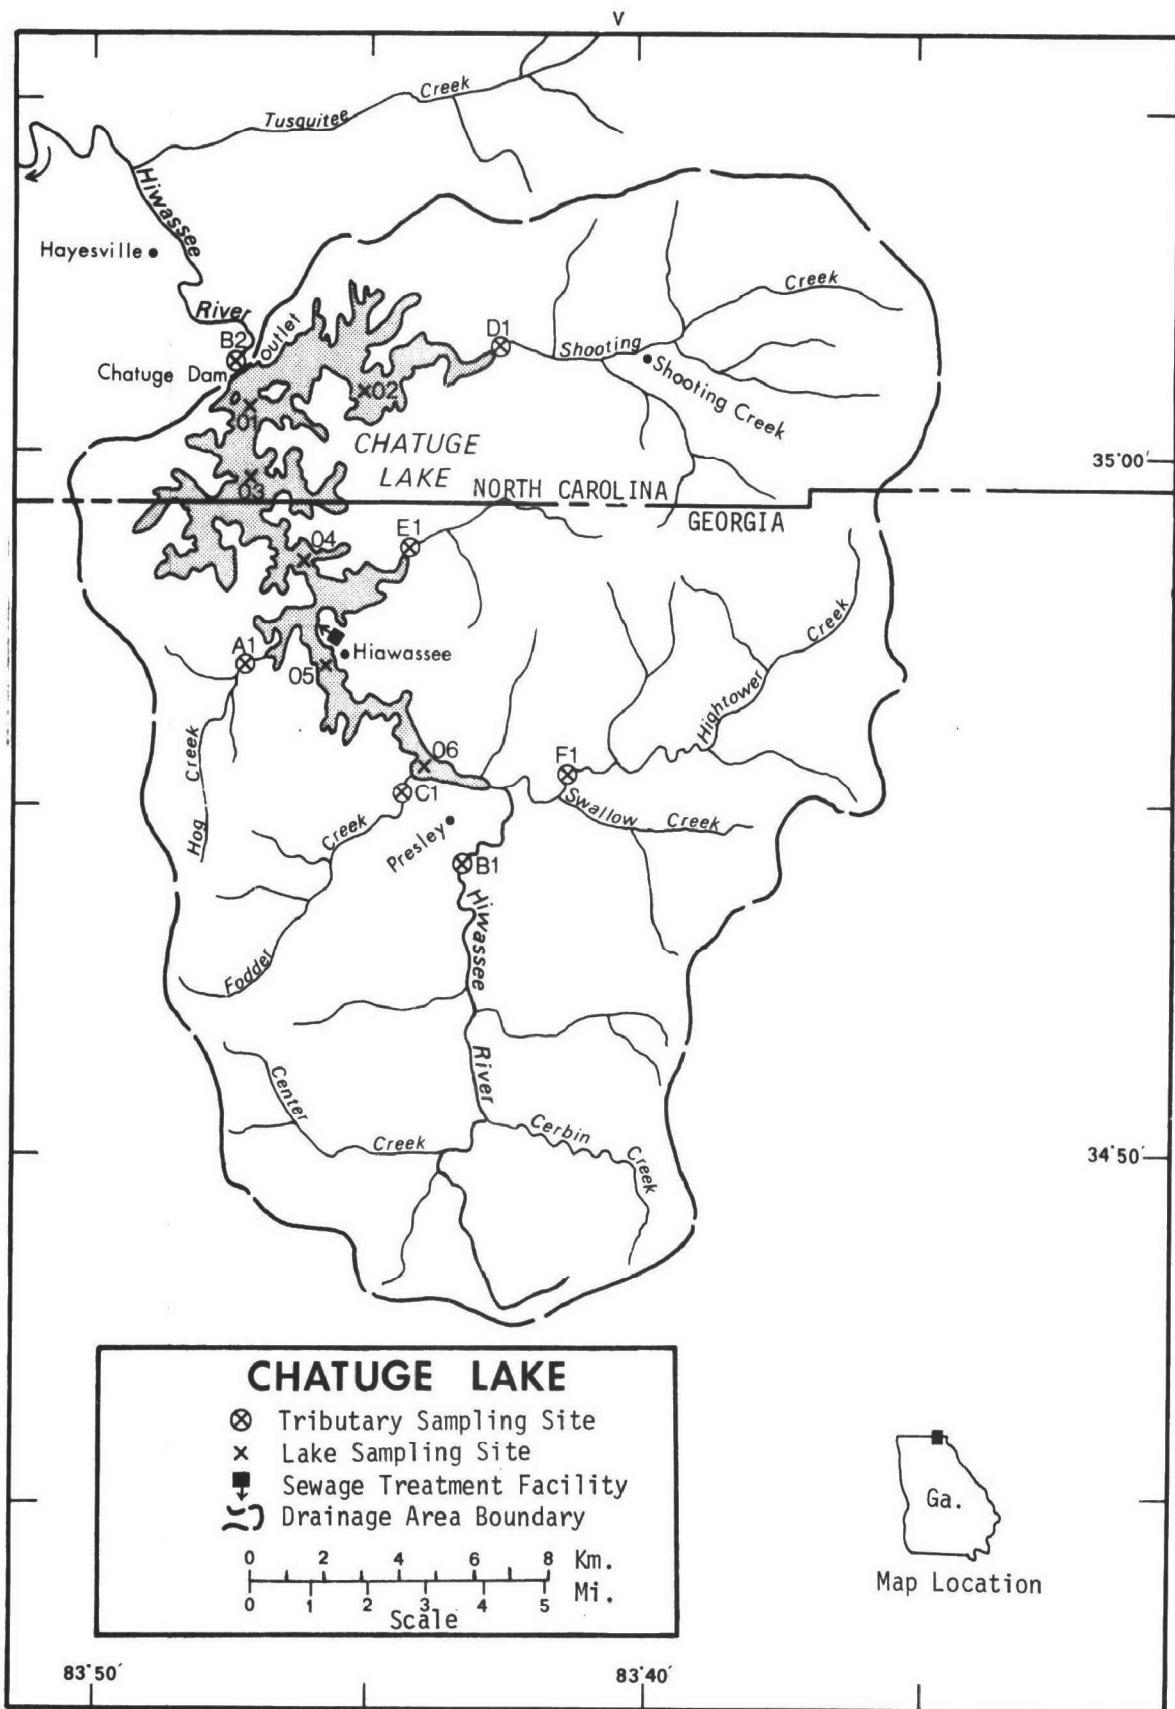

Major General Joel B. Paris, III, then the Adjutant General of Georgia, and Project Officer Lt. Colonel John R. Ranier, who directed the volunteer efforts of the Georgia National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

CHATUGE LAKE\*

STORET NO. 1303

I. CONCLUSIONS

A. Trophic Condition:

Survey data show that Chatuge Lake is mesotrophic. Of the 14 lakes and reservoirs sampled in Georgia, Chatuge Lake ranked third using a combination of six parameters as an index to overall quality\*\*. Two of the lakes had less median total phosphorus, four had less and two had the same median dissolved phosphorus, two had less median inorganic nitrogen, four had less mean chlorophyll a, and only one had a greater mean Secchi disc transparency.

During their visits to the lake, Survey limnologists did not observe any nuisance conditions. However, dissolved oxygen was depressed with depth (at and below 5 to 6 meters) at all sampling stations in June and was essentially depleted below 9 meters at stations 1, 2, 3, and 4 in September.

B. Rate-Limiting Nutrient:

The algal assay results indicate Chatuge Lake was phosphorus limited at the time the assay sample was collected. Lake data also indicate phosphorus limitation for the June, 1973, sampling as well as the September, 1973, sampling (i.e., the mean N/P ratios were 19/1 and greater, and phosphorus limitation would be expected). However, the November, 1973, lake sampling data

---

\* Table of metric conversions--Appendix A.

\*\* See Appendix B.

indicate a nitrogen limited condition (i.e., the mean N/P ratio was 8/1, and nitrogen limitation would be expected).

#### C. Nutrient Controllability:

1. Point sources--The phosphorus load from the only known point source was 4.2% of the total reaching the lake during the sampling year. Phosphorus reduction at the Hiwassee wastewater treatment plant would not appreciably change the loading rate of 0.39 g/m<sup>2</sup>/yr (see page 15). However, any future increase in point-source loading should be carefully evaluated due to the existing high quality of Chatuge Lake.

2. Non-point sources--The phosphorus loads from non-point sources accounted for 95.8% of the total reaching the lake during the sampling year. The gaged tributaries contributed a total of 74.8% and ranged from 24.6% (Hiwassee River) to 3.6% (Fodder Creek). The ungaged tributaries were estimated to have contributed 16.4% of the total.

The phosphorus export rates of the sampled tributaries ranged from 15 to 25 kg/km<sup>2</sup>/yr with a mean of 22 kg/km<sup>2</sup>/yr (see page 15). These rates compare well with the export rates of tributaries to nearby Blue Ridge Lake\* (mean of 18 kg/km<sup>2</sup>/yr) and Nottely Reservoir\*\* (mean of 20 kg/km<sup>2</sup>/yr).

---

\* Working Paper No. 284.

\*\* Working Paper NO. 291.

In a recent Georgia Department of Natural Resources report (Anonymous, 1973), the Hiwassee River was classified as "healthy" at a station two miles upstream from Chatuge Lake; nutrient concentrations at that time (08/10/72) were very low ( $\text{NO}_2 + \text{NO}_3 = 0.050 \text{ mg/l}$ ,  $\text{NH}_3 = <0.020 \text{ mg/l}$ , and  $\text{P} = <0.020 \text{ mg/l}$ ). On 08/05/73, Survey concentrations at the same place were quite comparable ( $\text{NO}_2 + \text{NO}_3 = 0.115 \text{ mg/l}$ ,  $\text{NH}_3 = 0.013 \text{ mg/l}$ , and total  $\text{P} = 0.015 \text{ mg/l}$ ).

## II. LAKE AND DRAINAGE BASIN CHARACTERISTICS

### A. Lake Morphometry<sup>†</sup>:

1. Surface area: 28.94 kilometers<sup>2</sup>.
2. Mean depth: 10.6 meters.
3. Maximum depth: 36.9 meters.
4. Volume:  $306.764 \times 10^6 \text{ m}^3$ .
5. Mean hydraulic retention time: 296 days.

### B. Tributary and Outlet:

(See Appendix C for flow data)

### III. LAKE WATER QUALITY SUMMARY

Chatuge Lake was sampled three times during the open-water season of 1973 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from six stations on the lake and from a number of depths at each station (see map, page v). During each visit, a single depth-integrated (4.6 meters or near bottom to surface) sample was composited from the six stations for phytoplankton identification and enumeration; and during the first visit (June, 1973), two 18.9-liter depth-integrated samples were composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 31.7 meters at station 1, 20.1 meters at station 2, 30.5 meters at station 3, 24.4 meters at station 4, 13.7 meters at station 5, and 5.2 meters at station 6.

The results obtained are presented in full in Appendix D, and are summarized in the following table.

### 3. Discussion -

The control yields of the assay alga, Selenastrum capricornutum, indicate that the potential primary productivity of Chatuge Lake was low at the time of sample collection.

Both assays, filtered only and autoclaved-filtered, demonstrated increasing yields with increasing concentrations of orthophosphorus indicating that this lake was limited by phosphorus at that time. Note that the addition of only nitrogen resulted in yields not significantly different from those of the controls.

The lake data also indicate Chatuge Lake was phosphorus limited at the time the algal assay sample was collected (June, 1973); the mean ratio of inorganic nitrogen to dissolved phosphorus was greater than 50/1. Lake data also indicate a phosphorus limited condition during the September, 1973, sampling. However, the lake data indicate nitrogen limitation during the November, 1973, sampling; the mean N/P ratio was 8/1, and nitrogen limitation would be expected.

IV. NUTRIENT LOADINGS  
(See Appendix E for data)

For the determination of nutrient loadings, the Georgia National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page v), except for the high runoff months of January and February when two samples were collected. Sampling was begun in March, 1973, and was completed in February, 1974.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Georgia District Office of the U.S. Geological Survey for the tributary sites nearest the lake.

In this report, nutrient loads for sampled tributaries were calculated from mean annual concentrations and mean annual flows. Nutrient loadings for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the mean concentrations at stations A-1, B-1, C-1, D-1, E-1, and F-1 and the mean annual ZZ flow.

The City of Hiawassee did not participate in the Survey, and nutrient loads were estimated at 1.134 kg P and 3.401 kg N/capita/year.

| Total  | 264,545             | 100.0                 |

## 2. Outputs -

Lake outlet - Hiwassee River 188,910

3. Net annual N accumulation - 75,635 kg.

\* Estimate based on 250 lakeshore dwellings; see Working Paper No. 175.

\*\* See Working Paper No. 175.

## D. Mean Annual Non-point Nutrient Export by Subdrainage Area:

| <u>Tributary</u> | <u>kg P/km<sup>2</sup>/yr</u> | <u>kg N/km<sup>2</sup>/yr</u> |
|------------------|-------------------------------|-------------------------------|
| Hiwassee River   | 23                            | 569                           |
| Hog Creek        | 21                            | 340                           |
| Fodder Creek     | 15                            | 336                           |
| Shooting Creek   | 24                            | 600                           |
| Bell Creek       | 24                            | 492                           |
| Hightower Creek  | 25                            | 457                           |

## E. Yearly Loading Rates:

In the following table, the existing phosphorus loading rates are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" rate is the rate at which the receiving water would become eutrophic or remain eutrophic; his "permissible" rate is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic rate would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

|                          | Total Phosphorus |             | Total Nitrogen |             |
|--------------------------|------------------|-------------|----------------|-------------|
|                          | Total            | Accumulated | Total          | Accumulated |
| grams/m <sup>2</sup> /yr | 0.39             | 0.11        | 9.1            | 2.6         |

Vollenweider loading rates for phosphorus (g/m<sup>2</sup>/yr) based on mean depth and mean hydraulic retention time of Chatuge Lake:

|                                   |      |
|-----------------------------------|------|
| "Dangerous" (eutrophic rate)      | 0.70 |
| "Permissible" (oligotrophic rate) | 0.35 |
