MERCURY SOURCES AND REGULATIONS

BACKGROUND INFORMATION FOR THE VIRTUAL **ELIMINATION PILOT PROJECT**

Prepared for

U.S. EPA GREAT LAKES NATIONAL PROGRAM OFFICE CONTRACT #68-C8-0066

Prepared by

ROSS & ASSOCIATES

ENVIRONMENTAL CONSULTING, LTD.

Under Contract to

Science Applications International Corporation

SEPTEMBER 12, 1994

ACKNOWLEDGEMENTS

Ross & Associates would like to thank the many reviewers and other participants who contributed information and insights to this background material. Discussions with EPA staff, including GLNPO, Region 5, and headquarters, as well as representatives from each of the Great Lakes states helped shape many of the ideas included here.

Special thanks are due to the following individuals who reviewed earlier drafts of this material.

Raymond Balfour, Vice President, Rayovac Corporation

(for the Dry Battery Section of the National Electrical Manufacturers Association)

Angela Bandemehr, U.S. EPA Region 5 (Air)

Pat Carey, Minnesota Pollution Control Agency

Lloyd Eagan, Air Management Supervisor, Wisconsin Department of Natural Resources

Tim Eder, National Wildlife Federation

Gary Gulezian, Chief, Air Toxics and Radiation Branch, U.S. EPA Region 5

Steve Jasinski, Mercury Commodity Specialist, U.S. Dept. of Interior Bureau of Mines

Martha Keating, U.S. EPA Office of Air Quality Planning and Standards

Carrie Lohse-Hanson, Minnesota Pollution Control Agency

Barbara McLeod, U.S. EPA Region 5 (Water)

Edward Swain, Minnesota Pollution Control Agency

Background Information on Mercury Sources and Regulations

I. Introduction

Mercury enters our lives more frequently than we may imagine. It may be in the fluorescent lights in our office, in old cans of latex paint, in our batteries, in our dental fillings, and numerous other sources. Within the United States alone, manufacturers use 500 - 600 metric tons of mercury annually as part of their manufacturing processes or to create products that rely on mercury's diverse properties.

A naturally-occurring, inorganic element, mercury's value in numerous industrial processes was discovered centuries ago. In very small quantities, it conducts electricity, measures temperature and pressure, acts as a biocide, and functions a catalyst. Over time, however, we have discovered that mercury is a potent neurotoxin, capable of impairing neurological development in fetuses and young children and damaging the central nervous system of adults. Mercury does not degrade and is not destroyed by combustion. When released to the environment, even in small quantities, it bioaccumulates, reaching dangerous levels in fish at the top of the aquatic food chain. Fish consumption advisories throughout Great Lakes waterbodies are testament to the health risks caused by mercury present in the Great Lakes ecosystem. Thirty-seven states have issued fish consumption advisories due to mercury contamination.

Scientists believe that atmospheric deposition contributes a large portion of the mercury found in the lakes and soil. Mercury emitted into the air by combustion, incineration, or manufacturing processes may later be deposited in lakes. Mercury emissions also come from natural sources including marine and aquatic environments, as well as volcanic and geothermal activity. However, recent studies suggest that anthropogenic sources contribute the majority of mercury releases.

At both federal and state levels, numerous efforts are underway to curtail mercury releases into the environment. To understand what options are available to reduce mercury use and release we must first answer four basic questions:

- (1) What are the sources of the mercury (supplying mercury and releasing mercury) into the environment?
- (2) What products contain mercury?
- (3) What regulations and non-regulatory measures currently influence mercury use and release?

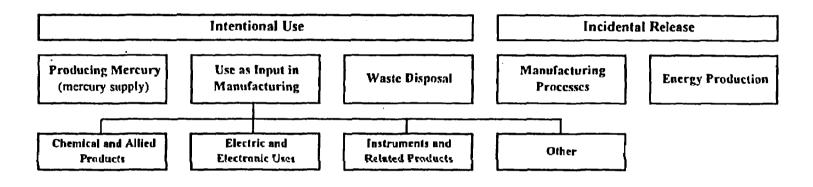

The objective of this background information is to provide a context for understanding the full range of mercury sources and existing regulations that affect mercury use and release. From this information, we will be able to understand the extent to which existing regulations encourage a reduction in mercury use and release, and identify other opportunities--including regulatory and non-regulatory programs--that might hasten the pace of reductions.

Table 1 provides an overview of the material covered in this background section.

TABLE 1: Overview

What are the Sources of Mercury?

Describes five categories of anthropogenic mercury sources and the individual sources covered in this analysis.

How is Mercury Regulated?

Characterizes the different types of mercury regulations.

Describes how mercury use and release is regulated by the relevant statutes in each category:

Procuring/Using Mercury

Releasing Mercury Environmental Management Standards

Links regulations to specific mercury sources.

Identifies mercury products regulated at a federal and state level.

II. WHAT ARE THE SOURCES OF MERCURY?

Mercury is released into the environment from natural and anthropogenic sources. This report focuses on anthropogenic sources of mercury. Because mercury use is widespread throughout multiple industries as a process or product ingredient, its releases cannot be traced to one industrial sector. As a naturally occurring metallic element, mercury is also present as a trace contaminant in ores and fuels. It may be released into the environment when raw materials containing mercury are heated, even though the mercury itself plays no role in these processes. Thus, mercury releases occur as a result of decisions to intentionally use mercury in consumer products or manufacturing processes, and as a result of incidental releases.

Through a separate analysis, EPA is estimating the relative air emissions of different mercury sources. In the "Mercury Study," mandated by the Clean Air Act amendments of 1990 (§112(n)(1)(B); see discussion in Section III of this report), anthropogenic mercury sources are divided into the following broad groups, based on their emission properties: (1) combustion point sources; (2) manufacturing point sources; (3) miscellaneous point sources; and (4) area sources. Note that the individual source categories in the mercury study are similar to the ones used in this report.

Using emissions factors to estimate mercury releases, preliminary analysis indicates that, in the United States, anthropogenic sources emit 263 tons of mercury annually to the atmosphere. Of this total, combustion point sources, which include utility, commercial, industrial and other boilers, as well as municipal waste combustors and other incinerators, account for 85% of anthropogenic mercury emissions. Four specific combustion source categories account for the majority of anthropogenic emissions: municipal and medical waste incineration (25% each); utility boilers (21%); and commercial/industrial boilers (12%). In addition, manufacturing sources, which include chlor-alkali production, smelting, secondary mercury production, equipment manufacture, and other processes, account for 12% of total anthropogenic mercury emissions.

For the Virtual Elimination project, we have divided mercury sources into two broad groups, based on these two different roles of mercury: is mercury intentionally used or is it incidentally released? Table 2A shows the categories of mercury sources used in this report.

TABLE 2A: Categories of Mercury Sources

Mercury releases occur as a result of intentional use or incidental release. This table shows the categories of anthropogenic mercury sources discussed in this report. For each category, the issues involving the origin and release of mercury are different. Therefore, the options for obtaining additional mercury reductions differ. Table 2B lists the specific mercury sources for each category shown in this table.

Intentional Use

Mercury is used as a product or process ingredient. Mercury release is a result of intentional mercury use.

Producing or Supplying Mercury

Use in Manufacturing

(products contain mercury or processes rely on mercury)

Waste Disposal

(mercury-containing products or waste streams)

Incidental Release

Mercury is released incidentally as a result of using raw materials that contain traces of mercury. Mercury is not used intentionally in these sources.

Manufacturing **Processes**

(raw materials contain mercury)

Energy Production

(fuel sources contain mercury)

<u>INTENTIONAL USE</u>: When mercury is used intentionally as an input in production processes or consumer products, three distinct but inter-related types of sources contribute to mercury releases. Sources in this category include:

- (1) Produce or supply mercury;
- (2) Use mercury as an input to manufacture products containing mercury or as part of a manufacturing process; and
- (3) Receive mercury-containing wastes for disposal.

All of these sources supply, use, or release intentionally used mercury into the environment. Because the quantity of mercury used in the manufacturing sector directly influences a significant amount of the mercury ultimately released into the environment, several leverage points are potentially available to reduce mercury releases. The price and supply of mercury, the feasibility of recycling, the availability of alternative inputs or processes, and the structure of existing regulations all contribute to a company's decision to use mercury in their production processes or products.

INCIDENTAL RELEASE: Incidentally released mercury comes from two categories of sources:

- (1) Manufacturing processes where the raw materials contain trace amounts of mercury; and
- (2) Energy Production where the fuel source (primarily coal) contains mercury.

These sources, particularly coal combustion, and copper, lead and zinc smelting, may contribute a large portion of overall mercury air emissions. However, because their processes or products do not rely on mercury, their mercury emissions are not influenced by the costs associated with using mercury. They are affected only by regulatory costs associated with releasing mercury. Therefore, the menu of opportunities for reducing mercury releases from these sources will differ from sources that rely on mercury for some aspect of their business.

The source categories used throughout this report are, for the most part, consistent with sources identified in recently released reports that track mercury use and emissions, specifically the Bureau of Mines Mineral Industry Surveys, and the EPA Mercury Study Report to Congress mandated under the Clean Air Act Amendments of 1990 (§112(n)(1)(B)) (in preparation). By using similar source categories, we can combine information on mercury use and emissions trends at a national level with an overview of existing regulations. Table 2B lists the specific source categories of mercury that are covered in this analysis.

^{*} See Table 5 for a list of the main mercury-containing products

For this analysis, we have focused only on the largest uses and releases of mercury. Part D of this section discusses the reporting data available to track mercury sources. Data on mercury releases available through different reporting programs illustrates the industrial sectors where mercury release occurs most frequently in the Great Lakes states (based on the reporting requirements of each program). Because mercury has thousands of applications, these data may cover a much broader list of sources than the categories covered in this report. Appendix A includes a detailed "use tree" of mercury sources.

A. INTENTIONAL USE

This section provides a brief overview of the three source categories that contribute to mercury releases as a result of intentional mercury use: 1) production; 2) use; and 3) disposal.

1) Producing or Supplying Mercury

The mercury available for use in the United States comes from five main sources: (1) Primary mercury production; (2) Secondary mercury production (mercury recovery); (3) Mercury compound production; (4) Government stocks; and (5) Imports. Table 3 (and the accompanying figure) illustrates the relative contributions of these sources to the United States mercury supply.

(1) PRIMARY MERCURY PRODUCTION. Virgin mercury is mined from mercury ore or produced as a by-product of gold mining. In the United States, mercury is produced only as a by-product of gold mining. The last mercury ore mine, the McDermitt Mine in Nevada, closed in 1990. No by-product mercury mines are located in the Great Lakes States.

Byproduct Mercury-Producing Mines in the United States (1992)

<u>Mine</u>	<u>Location</u>	<u>Operator</u>
Alligator Ridge	White Pine, NV	USMX Inc
Carlin Mines Complex	Eureka, NV	Newmont Gold Co.
Hog Ranch	Washoe, NV	Western Hog Ranch Co.
Enfield Bell	Elko, NV	Independence Mining Co., Inc.
Getchell	Humboldt, NV	FMC Gold Co.
McGlaughlin	Napa, CA	Homestake Mining Co.
Mercur	Tooele, UT	Barrick Mercur Gold Mines Inc.
Paradise Peak	Nye, NV	FMC Gold Co
Pinson	Humboldt, NV	Pinson Mining Co

*U.S. Department of the Interior Bureau of Mines, Mineral Industry Surveys, July 1994. (2) SECONDARY MERCURY PRODUCTION. Mercury is also recovered from discarded products and wastes such as chlor-alkali wastes, dental amalgams, fluorescent light tubes, electronic devices, and others. The mercury is vaporized in a retort and collected by condensation. Condensed mercury is then distilled to remove impurities. Triple-distilling yields the highest purity mercury. Secondary production almost doubled in 1993, expanding to 63% of U.S. total mercury consumption from 30% in 1991. The table below shows the trends in U.S. mercury consumption and secondary mercury production.

Secondary Mercury Production in the I

	1950	1960	1970	1980	1990	1991	1993
Industrial demand (consumption)	1697	1764	2120	2033	720	554	558
Secondary production (industrial)	69	184	253	234	108	165	350
Secondary production as a percent of consumption	4%	10%	12%	12%	15%	30%	63%

U.S. Department of Interior Bureau of Mines, Recycled Metals in the U.S., October 1993, and Mineral Industry Surveys: Mercury in 1993, July 1994.

Three facilities, all located in Great Lakes states, produce the bulk of secondary mercury in the United States. D.F. Goldsmith Chemical and Metal in (Evanston, IL) specializes in distilling 99% or greater flowable mercury, and Bethlehem Apparatus (Hellertown, PA) and Mercury Refining Company (Albany, NY) retort and distill a wide variety of mercury wastes and scrap material. However, they do not accept certain types of RCRA wastes. At the end of 1993, eleven plants in the U.S. recycled mercury from fluorescent lights, using physical separation to recover mercury. Six of these facilities opened in 1993.

(3) MERCURY COMPOUND PRODUCTION. Mercury compounds are used in a wide variety of pharmaceutical and other uses. Commonly used mercury compounds include mercuric oxide (cathode material in batteries), mercuric chloride (pharmaceuticals), phenylmercuric acetate (used in paints and pharmaceuticals), mercuric sulfide (used in red pigment and other pharmaceuticals), and thimerosal (contact lens solution). Several mercury compound manufacturers are located in Great Lakes states:

Mercury Compound Producers in Great Lakes States*

Company	Location	Compound(s)
AAKASH Chemicals & Dye Stuffs, Inc.	Addison, IL	Hg acetate, HgBr2, HgI2, Hg(NO3)2, HgO (red & yellow), HgSO4, Mercurous Nitrate, Hg(ammoniated), Hg salts
Atomergic Chemetals Corp.	Farmingdale, NY	Hg cyanide, HgO (black), Mercurous Iodide, Mercurous Sulfate, Thimerosal
GFS Chemicals, Inc.	Powell, OH	Hg acetate, Hgl2,Hg(NO3)2, HgSO4
R.S.A. Corp.	Ardsley, NY	Hg(SCN)2 - thiocyanate

Chemical Buyers Directory, 81st Annual Edition, 1994.

(4) GOVERNMENT STOCKS. The United States government maintains a supply of mercury as part of the National Defense Stockpile, established at the end of World War I to maintain adequate supplies of materials deemed critical to national defense. The Defense Logistics Agency (DLA), a unit of the Department of Defense, manages the stockpile. DLA periodically evaluates the quantity of mercury and other materials needed in the stockpile, and may sell any "excess" material on the open market. Mercury is stored and sold in flasks, which contain 34.5 kg of mercury. Regulations governing the sale of excess mercury are described in Section III ("Regulations").

At the end of April 1994, DLA held 127,000 flasks (4,381 metric tons) of mercury in the stockpile. With a current stockpile goal of zero for mercury, all of this material is considered excess. DLA suspended stockpile mercury sales in January after selling its entire 1994 mercury allocation (10,000 flasks). However, DLA received Congressional approval to increase the total amount of mercury available for sale in fiscal year 1994 to 50,000 flasks (1,725 metric tons), leaving 40,000 flasks (1,380 metric tons) available to sell by September 30, the end of the fiscal year. For comparison, DLA sold only 8,250 of the 10,000 (345 metric tons) flasks authorized for sale during fiscal year 1993. In July 1994, however, DLA suspended future mercury sales until the environmental implications of these sales are addressed.

In past years, DLA also sold mercury for the Department of Energy (DOE), at monthly auctions. DOE holds secondary mercury (scrap mercury) at its facility in Oak Ridge, TN, leftover from mercury accumulated by the Atomic Energy Commission (DOE's predecessor) for use in nuclear reactors. All of this mercury is also considered excess to government needs. DLA suspended these mercury sales in July 1993, and plans to continue the suspension through 1994 in order to concentrate on selling its own material.

(5) IMPORTS. The United States imported 92 metric tons of mercury in 1992, the most recent year for which data are available. Of this total, 70% (64 metric tons) came from Canada and 29% came from Germany. The remainder (one percent) came from Spain and the United Kingdom. Mercury compounds are also imported. Section III ("Regulations") discusses mercury imports and relevant tariffs in more detail.

2) Using Mercury as an Input

Mercury is used throughout the worldwide industrial base as a result of its diverse properties. In very small quantities, it conducts electricity, measures temperature and pressure, and forms alloys with almost all other metals. With these and other unique properties, mercury plays an important role as a process or product ingredient in several industrial sectors.

a) Industrial Categories

For this report we have used the industrial categories reflected in the Bureau of Mines Minerals Commodities Summaries to illustrate the quantities of mercury used in different industrial sectors. Table 4 shows the trends in domestic mercury use since 1988, and the relative amounts of mercury used in the following industrial categories:

- ▶ Chemical and Allied Products:
- ▶ Electrical and Electronic Uses: and
- ▶ Instruments and Related Products.

Mercury use in the United States has declined 63% since 1988, to 558 metric tons per year in 1993 from 1,503 metric tons in 1988. In many cases, manufacturers appear to be moving away from mercury except those uses for which mercury is currently considered essential. However, the rate of decline has slowed since 1990.

Public pressure has also driven manufacturers to seek alternatives to non-essential mercury in their products. For instance, recent public outcry against mercury switches contained in children's light-up sneakers caused the manufacturer to change to a non-mercury switch that accomplishes the same purpose. The manufacturer now provides a toll-free number for customers to request a postage-paid mailer and return the shoes for proper mercury disposal.

TABLE 3: UNITED STATES MERCURY SUPPLY AND DEMAND

(Metric tons)

⁽¹⁾ Comprises only the mercury produced at the McDermitt Mine, as reported in Placer Dome Inc. annual and 10-K reports. The mine was closed in November 1990.

Source: United States Bureau of Mines, Mineral Industry Surveys, July 22, 1994.

⁽²⁾ Mercury by-product from nine gold mining operations.

⁽³⁾ Secondary mercury shipped from U.S. Department of Energy stocks.

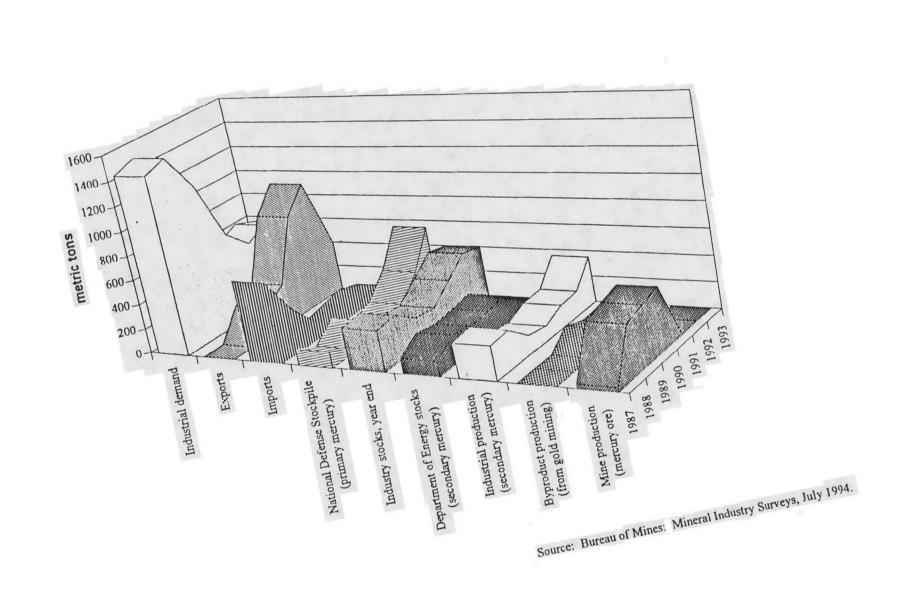

⁽⁴⁾ Stocks at consumers and dealers only. Mine stocks withheld to avoid disclosing company proprietary data.

⁽⁵⁾ Primary mercury. This quantity represents shipments during the 1993 calendar year. Congressional authorization for stockpile sales is based on a fiscal year (October-September) which bridges 2 calendar years.

w = withheld to avoid disclosing proprietary information

^{*} Note: See Table 4 for a breakdown of mercury consumption by industrial category.

U.S. Mercury Supply and Demand

CHEMICAL AND ALLIED PRODUCTS: Chemical and allied products are responsible for the largest quantity of mercury used in the United States. This is due to the fact that a single industrial process--chlorine and caustic soda manufacture--alone uses more mercury than any of the other industrial sectors that use mercury. One chlor-alkali process, known as the mercury-cell process, relies on a mercury cathode to produce hydrogen gas and caustic soda. Caustic soda produced from this process may contain mercury, which in turn may contaminate other products.

At a national level, the chlor-alkali industry is regulated more directly for mercury than any other industry, with national air emissions limits, water discharge limits, and waste disposal restrictions. Although most mercury-cell chlor-alkali plants in the United States have closed, two still exist in the Great Lakes. Fourteen facilities remain in the United States. The chloralkali facility in Wisconsin is the second largest source of mercury emissions in that state.

Until the early 1990s, paint manufacturing used large quantities of mercury. The mercury compound phenylmercuric acetate was used as a biocide to control mildew in latex paints. However, EPA curtailed this use, eliminating mercury in interior latex paints in 1990 and exterior paints in 1991. Mercury emissions from volatized paint and demolition waste may continue from paints manufactured before the ban.

ELECTRIC AND ELECTRONIC USES: In the electrical industry, mercury is used in electric lighting devices such as fluorescent lamps, wiring devices and switches, and several different kinds of batteries. In 1992, electrical manufacturing accounted for approximately 25% of the mercury used in the United States. As recently as 1988, battery manufacturing alone consumed almost 25% of the total mercury use in the United States. As manufacturers have found alternatives to mercury in alkaline batteries, and states began limiting mercury content in batteries, the volume of mercury used in batteries declined by over 95%. Mercury substitutes are not as readily available in fluorescent and other lamps. Mercury use in lamps appears to be rising especially as fluorescent lamps are promoted for energy conservation. Some manufacturers are developing fluorescent lamps that rely on smaller quantities of mercury.

INSTRUMENTS AND RELATED PRODUCTS: Mercury is also used in navigational devices, instruments that measure temperature and pressure, and other related uses. It is also used frequently in dental amalgam tooth fillings, although substitutes are available. Mercury use in this area has declined.

The input of refined liquid mercury to domestic manufacturing establishments.

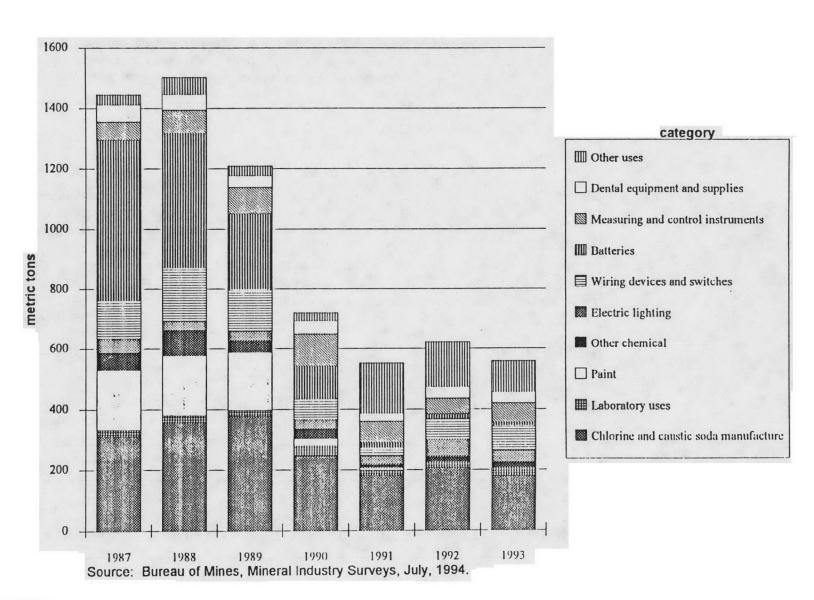

Source: United States Bureau of Mines, Mineral Industry Surveys, July 1994.

¹ Includes agricultural chemicals, pigments, and miscellaneous catalysts.

² Includes other electrical and electronic uses, other instruments and related products, and unclassified uses. In 1991 and 1992, a large amount of mercury that was not reported by end use was included in this category.

Data may not add to totals shown because of independent rounding.

U.S. Consumption of Refined Mercury Metal, by Use

b) Specific Uses of Mercury

In each of the industrial categories listed above, mercury plays a unique role in a manufacturing process or in a product. Table 5 lists the primary products that contain mercury in each of the source categories discussed in this section. These products, which may not pose mercury-related health risks during regular use, contribute mercury to the environment upon disposal. In addition, Appendix A includes a detailed mercury use tree.

Several states regulate mercury-containing products directly by limiting or prohibiting mercury content in certain products, and restricting disposal options. These regulations, which have had a direct impact on the quantity of mercury consumed in industrial activities, are discussed in more detail in Section III ("Regulations"). Many mercury products are used as components in widely used products. Mercury may be released when products are discarded. For example, Honeywell, Inc. a thermostat manufacturer, has developed a thermostat collection program in Minnesota to recycle the mercury switches.

Mercury is also used in numerous industrial processes for amalgamation, wood processing, as a solvent for reactive and precious metals, in nuclear reactors, and as a catalyst. Any facility that uses mercury in its process is a potential source of mercury emissions. Available reporting data may help locate and identify these sources. However, many sources that use or release mercury may fall below existing reporting thresholds.

3) Waste Disposal

Mercury-containing waste streams and products sent offsite for disposal contribute mercury to waste disposal facilities, which then release mercury into the environment. Industrial facilities, hospitals, and dental offices that divert their wastewater to Publicly Owned Treatment Works (POTWs) contribute to mercury in POTW effluent. Batteries, electric lamps, old paint, and other mercury-containing products contribute to the mercury emissions at municipal, hazardous waste, and medical waste incinerators, and may leach or vent mercury from landfills. As long as mercury is used in industrial processes, facilities will generate wastes that contain mercury, and consumer products will contribute mercury upon disposal. Table 6 shows the trends in mercury products contained in municipal solid waste.

Table 2B lists the different types of waste disposal sources. Appendix B provides details on the mercury-specific regulations for waste disposal sources. Note that cement kilns are not listed as a waste disposal source. However, cement kilns, used frequently as a waste disposal option, may burn hazardous wastes as a fuel source. Mercury may accumulate in the cement kiln dust. Metals emissions from cement kilns, which are regulated under EPA's interim standards for boilers and industrial furnaces (BIFs), are currently under review.

TABLE 5: Products That May Contain Mercury

This table lists the primary products that may contain mercury. It is not an exhaustive list of all mercury products. Rather, it illustrates the types of products where mercury may be used. In several cases, manufacturers are moving away from mercury use. See Table 4 for the relative amounts of mercury used in each industrial category. See Appendix A for a detailed mercury use tree.

Chemical and Allied Products

Paint (existing stocks only)

- latex paint
- maritime paint

Other

- agricultural products
- catalysts
- cosmetics
- explosives
- fircworks
- livestock and poultry remedies
- packaging
- pharmaceuticals
- pigments/dyes
- poisons
- preservatives
- special paper coatings
- turf products (existing stocks only)

Electrical and Electronic Uses

Electric Lighting

- fluorescent lights
- high intensity lamps
- incandescent lamp filaments
- mercury vapor lamps
- metal halide lighting
- UV disinfectant lamps

Wiring Devices and Switches

- electric wall switches
- shoes
- thermostats
- toys
- white goods (appliances)

Batteries

- alkaline batteries (no longer used)
- carbon zinc batteries (no longer used)
- mercuric oxide batteries
- zinc air

Instruments and Related Products

Measure and Control Instruments

- barometers
- medical and scientific instruments
- thermometers

Dental Equipment and Supplies

• dental amalgam

Other Uses

Electrical Components

- high purity copper foil
- mercury arc rectifiers
- relays
- tilt switches

TABLE 6 Discards* of Mercury in Products in the Municipal Solid Waste Stream, 1970 to 2000 (in short tons**)

Products	1970	1975	1980	1985	1989	1995	2000

Source: EPA, Characterization of Products Containing Mercury in Municipal Solid Waste in the United States, 1970 to 2000, April 1992

Discards before recovery.

^{**} Weights in this report are converted to short tons of 2000 pounds, and refer to the <u>weight of mercury</u> in the products, not the weight of the entire product.

^{***} NOTE: These numbers may not reflect recent state, federal, and battery manufacturer efforts to reduce mercury content in batteries. Since this report was released, several states have restricted mercury content in alkaline batteries, and/or banned the sale of mercuric oxide batteries. Federal legislation to restrict mercury use in batteries is pending. The battery industry has eliminated mercury as an intentional additive in alkaline batteries, except button cells and reusable alkaline batteries.

B. INCIDENTAL RELEASE

1) Manufacturing Processes

As a natural element, mercury is found in many raw materials that form the backbone of the industrial base. Mercury is emitted from numerous manufacturing processes that use raw materials containing mercury as a trace element. A list of these sources is included in Table 2B, and Appendices A and B describe these sources in greater detail.

Smelting processes, such as copper, lead, and zinc smelting, may contribute a large percentage of overall mercury releases. For example, the Copper Range Smelter in White Pine, Michigan, releases over 1000 pounds of mercury annually. In 1992, Zinc Corporation of America contributed 90% of total mercury releases reported in Toxic Chemical Release Inventory (TRI) for the Great Lakes states. This high level of mercury release, which was sent off site for recycling, reflected periodic cleaning of the sulfuric acid plants, not ongoing releases. Mercury is also present in zinc concentrates and is removed as an impurity during sulfuric acid production.

Because these sources are not dependent on mercury as a component of their business, they are not influenced by the costs associated with using mercury. In some cases, they may be more amenable to control technology or to incentives that are not tied directly to mercury.

2) Energy Production

Utility boilers, particularly coal-fired utilities, may contribute a large portion of the overall atmospheric mercury emissions due to the presence of mercury in fuel sources. Although currently unregulated for mercury emissions, they are the subject of intensive study under a separate Utility Study mandated by the 1990 Clean Air Act amendments (§112(n)(1)(A)). The report, scheduled for completion in 1995, is evaluating the extent to which coal combustion contributes to overall mercury releases, as well as the need for specific mercury emissions regulations for the utility industry. Given this in-depth report on the full range of utility emissions, we will not focus on utility mercury emissions in this report, beyond identifying any relevant existing regulations.

C. DATA SOURCES FOR THE GREAT LAKES STATES

Mercury releases are reported under several different federal and state programs, each with a different set of regulatory requirements, and each covering a different subset of the regulated community. Mercury information is available from three federal reporting programs: (1) the Toxic Chemical Release Inventory (TRI), (2) RCRA Biennial Report System (BRS) data, and (3) the Permit Compliance System (PCS) data for water releases. In addition to these federal reporting programs, some Great Lakes states maintain other reporting systems that provide additional information on mercury releases. Data is included for Wisconsin air point sources, Michigan's Critical Materials Wastewater Report, and Indiana's Aerometric Information Retrieval System (AIRS).

Information from each of these sources is summarized below, and included in detail in Appendix F. With the exception of TRI data, all information is shown by SIC code to illustrate the distribution of mercury releases across different industrial sectors. Appendix F1 provides a summary of the number of facilities that report mercury releases under each of these programs, and shows how the number of facilities varies by reporting program as a result of differing reporting requirements. For instance, 572 facilities in the Great Lakes states report mercury-bearing wastestreams under RCRA biennial reporting requirements, while only 14 facilities report mercury releases under TRI.

Toxic Chemical Release Inventory (TRI). Appendix F2 shows TRI mercury releases for the Great Lakes states. The Toxic Chemical Release Inventory contains chemical release and transfer information from manufacturing facilities (SIC codes 20 - 39) that meet reporting thresholds (manufacture or process 25,000 pounds of a listed chemical or otherwise use 10,000 pounds of a listed chemical. Appendix F2a includes 1992 data for the eight Great Lakes states, including any source reduction activities implemented by each facility. Appendix F2b contains similar data for the 1991 reporting year.

In 1992, 14 facilities in the Great Lakes States reported mercury releases, down from 20 facilities that reported in 1991. Tables 7A shows the trends in mercury releases from 1987-1992, and Table 7B shows the industrial sectors that reported mercury releases in 1992. The majority of mercury releases reported in 1992 came from Zinc Corporation of America. Because zinc concentrates contain mercury that is released during the sulfuric acid production process, mercury builds up in the sulfuric acid plants. Periodically, these plants must be cleaned, which generates a higher then normal volume of waste for that year.

Appendices F2c and F2d show nationwide mercury releases reported in TRI for 1992 and 1991, respectively. Great Lakes states reported 60.65% of the mercury releases and transfers reported nationwide in TRI for 1992. This number was skewed by the large volume of waste generated by Zinc Corporation of America, as described above. In 1991, Great Lakes states reported 18.13% of total mercury releases and transfers nationwide.

Source: Toxic Chemical Release Inventory
Data downloaded June 21, 1994

RCRA Biennial Report data. Approvidix F3 includes 1991 data from the RCRA Biennial Report System (BRS). BRS data tracks information on hazardous waste generated and managed by large quantity generators and permitted Treatment, Storage, and Disposal (TSD) facilities. RCRA wastes are identified by waste code, several of which indicate the presence of mercury in a wastestream or discarded product (see RCRA discussion in section III).

Appendix F3a shows the number of facilities, by SIC code, that report mercury-bearing wastestreams. The data reflects only recurrent waste generation, and does not include one-time waste or remediation wastes. A total of 572 facilities reported mercury-bearing wastestreams. Mercury-bearing wastestreams showed up most frequently in the following industrial sectors: colleges and universities 6.5 facilities), pharmaceutical preparations (28 facilities), electric services (22 facilities), plastics materials and resins (21 facilities), and industrial organic chemicals (20 facilities). Because most of the mercury-bearing wastes are characteristic for mercury (i.e., they exceed the regulatory concentration limit for mercury), and include other substances, it is difficult to gauge the quantity of mercury in the wastestreams.

Biennial report data also indicates the source processes that generated a given waste stream. Appendix F3b lists the sources processes in each SIC code that generated mercury-bearing waste streams. A summary table at the end of the appendix shows the frequency with which each process occurred. A total of 39 different sources processes contributed to mercury-bearing wastestreams. Laboratory wastes was reported most frequently (168 facilities), followed by discarded out of data products or chemicals (76 facilities).

PCS data. Appendix F4 contains data from EPA's Permit Compliance System (PCS) for water discharges. PCS data approximates point source loads from municipal and industrial dischargers. The information is based on monitoring data supplied by regulated facilities. EPA uses PCS data as the basis for its enforcement program. In 1993, the top 10 mercury dischargers in Region 5 were:

Detroit WWTP	108kg
Lake County - Mentor	54kg
City of Fostoria	27kg
Gary Wastewater Treatment Plant	17kg
Hammond Municipal STP	16kg
Milwaukee MSO - South Shore	13kg
Fort Wayne Municipal STP	12kg
Watertown(C) WPCP	11kg
Ashta Chemicals	10kg
Milwaukee MSD - Jones Island	8kg

Wisconsin Air Point Source Emissions Data. Appendix F5 contains air emissions data for Wisconsin facilities (1992 data). As part of its Clean Air Act Title V Operating Permit Program, Wisconsin collected emissions data from facilities that reported releases greater than one pound of hazardous air pollutants, including mercury. Sixty one facilities reported mercury emissions under this program. This total includes 13 utilities and nine paper mills. A utility reported the largest emissions (1272 pounds), followed by a chlor-alkali facility (1071 pounds).

Michigan Critical Materials Registry. Appendix F6 includes data from Michigan's Critical Materials Wastewater Report (1991 data). As part of its water quality program, Michigan collects information on chemical use and release from facilities that use any substance, including mercury, on the "Critical Materials Registry." It is the only program that requires facilities to report information about chemical use. Under this program, "use" means the presence of the chemical on site. A total of 270 facilities reported mercury use, including 19 hospitals, 18 motor vehicle parts facilities, 16 plastics products facilities, and 16 utilities. The total mercury use was between 288,174 - 308,510 pounds. Of this total, 121 facilities reported discharges ranging in total between 271 and 1740 pounds. 160 facilities reported residuals ranging in total between 2720 and 10,420 pounds.

Indiana Aerometric Information Retrieval System (AIRS): Appendix F7 includes data from Indiana's 1991 AIRS database. Mercury emissions quantities in this database are estimates derived by the Indiana Department of Environmental Management, based on data reported for criteria pollutant emissions. As such, the quantities do not represent measured data, nor data supplied directly by individual facilities.

III. HOW IS MERCURY REGULATED?

Mercury regulations span multiple federal and state statutes, as well as multiple agency jurisdictions. For example, the Environmental Protection Agency (EPA) regulates mercury in pesticides, and mercury releases into the environment through air, water, and land disposal limits. The Food and Drug Administration (FDA) regulates mercury in cosmetics, food, and dental products. The Occupational Safety and Health Administration (OSHA) regulates mercury air exposures in the workplace.

Unlike the separate regulatory structure created for PCBs under the Toxic Substances Control Act (TSCA), no statute, at a federal level, has strategically identified mercury as a sole source of concern. Instead, mercury is one of several substances covered under the overarching structure of numerous statutes. In some cases, mercury receives more attention than other substances covered in the same statute. Mercury regulations do not apply uniformly to all source categories. Thus, the nature and completeness of mercury regulation varies by statute. Furthermore, aspects of mercury regulation extend beyond the traditional realm of environmental statutes. Federal and state agencies are exploring efforts to curtail the use of mercury, not just its release, in order to focus on prevention opportunities.

Individually, no single regulation appears to motivate substantial change in mercury use and release. Collectively, however, the existing set of regulations has caused a dramatic decline in mercury use. Whether or not these regulations have caused a similar drop in mercury releases is not readily known. However, mercury is beginning to command more widespread public recognition, and public concern is becoming a powerful leveraging tool to change manufacturing practices. It is important to recognize that the face of mercury regulations is changing rapidly.

This section describes the regulations that affect mercury use and release. We have provided tables that describe how existing mercury regulations apply to mercury-containing products and sources that use and/or release mercury. From this information, we can identify the extent to which individual mercury sources are covered--or not covered--by existing regulations, and the opportunities that might exist to encourage additional reductions mercury use and release.

Table 8 illustrates the different categories of mercury regulations used in this report, and the applicable statutes or regulations for each category. Table 9 shows the federal environmental management standards for mercury. Tables 10 and 11 summarize mercury product regulations. Table 12 summarizes the potential changes in mercury regulation. At the end of the report, Appendix B provides a detailed description of mercury sources and specific release regulations; Appendix C describes the regulations affecting mercury products; and Appendix D describes the main provisions of Great Lakes states' mercury-specific statutes.

A) Types of Mercury Regulations

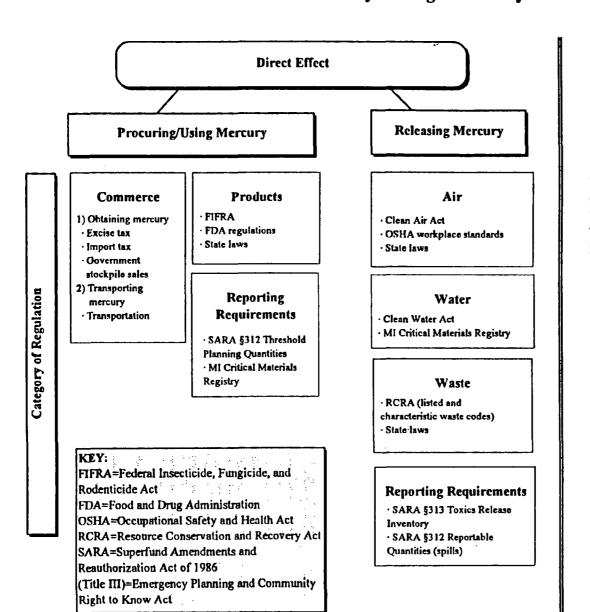

To understand how existing mercury regulations influence the full spectrum of economic activities that involve mercury, it is helpful to first distinguish between regulations that have a direct effect on sources from those that have an indirect effect on sources.

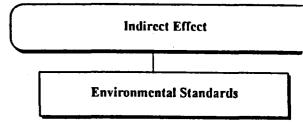

<u>Use- or release-related</u> regulations have a direct effect on sources that use mercury or release mercury into the environment. These regulations specify, for individual mercury sources, the costs and/or conditions associated with using and releasing mercury during production or disposal. This project is concerned primarily with the structure of use- and release-related regulations and the extent to which existing regulations encourage pollution prevention.

Environmental management standards, on the other hand, have an indirect effect on individual sources. Environmental standards are numeric criteria that specify a maximum acceptable mercury concentration for different media, based on scientific or risk-based criteria. For instance, mercury standards exist for water, sludge, fish tissue, drinking water, and several other media. These standards provide a yardstick against which to measure the effectiveness of mercury release regulations.

In contrast to use- and release-related regulations which apply directly to individual sources, environmental standards remain independent of specific sources. However, environmental standards exert an important effect on sources that release mercury to any media. For instance, sewage treatment plants must ensure that the mercury content of their sludge remains below the mercury concentration specified for land application. Even absent a specific mercury effluent limit, the POTW must still work with its dischargers to minimize mercury content in their discharges to the treatment plant.

TABLE 8: Mercury: Regulatory Overview

Fish Water
Groundwater Drinking Water
Bottled Water OSHA standards
Water (level of detect) Sludge
Hazardous Waste Compost

Table Explanation

Mercury regulations include (1) use- and release-related regulations that specify the requirements associated with using or releasing mercury, and (2) environmental standards, which specify a maximum acceptable mercury concentration in different media, and thus may indirectly influence mercury release levels.

Specific statutes regulate mercury in each of these difference tegories.

The charts above illustrate the different types of use and release regulations, and the different media that have mercury limits.

Table 9: Environmental Standards for Mercury

Media	Mercury Standard	Explanation
Ambient Water	 0.144 u/l for ingestion of both water and aquatic organisms; 0.146 u/l for ingestion of only aquatic organism. 2.4 u/l for freshwater acute exposure; 0.012 u/l for freshwater chronic exposure; 2.1 u/l for marine acute exposure; 0.025 u/l for marine chronic exposure. (50 FR 30791) 	 Established under Clean Water Act §304(a) Ambient water criteria varies by state (may change with GLI)
Drinking Water	Maximum contaminant level = .002 mg/l (40 CFR 141.62)	Maximum contaminant level for mercury established under the Safe Drinking Water Act.
Air	No ambient standard.	
Sludge	Limits: 17 mg/kg (dry wt) and 17 kg/hectare cumulative loading for sludge applied on agricultural, forest and publicly accessible lands. 17 mg/kg (dry wt) and .85 kg/hectare annual loading rate for sludge sold or distributed for application to a lawn or home garden. 57 mg/kg (dry wt) for sludge sold or distributed for other types of land disposal 100 g/kg (dry wt) for sludge disposed in lined or unlined facilities (40 CFR 503).	
Compost	No federal standards.	Minnesota sets mercury concentration limits in compost.
Fish	• 1 ug/g (1 mg/kg or 1 ppm)	 FDA action level for methyl mercury. ug/g (1 mg/kg or 1 ppm)
Groundwater	• 2 ug/l	
Bottled Water	• .002 mg/1 (21 CFR 103.35)	
Water-level of detect	• .2 ug/l (200 mg/l) = recommended method	 EPA-approved method to detect Hg in water. Lower detection methods are available, but not yet approved by EPA.
Hazardous Waste	• TCLP = .2 mg/l or .2 ppm (40 CFR 261.24, 264)	 Land disposal (Subtitle D, nonhazardous landfills) prohibited unless leachate contains less than 2 mg/l.

B) Mercury Use Regulations

Regulations associated with mercury use in commerce impose costs, conditions, and/or restrictions associated with obtaining, selling, using, or transporting mercury. We have used the following categories to describe mercury use regulations: (1) <u>commerce</u>-related regulations such as taxes and transportation requirements; (2) <u>product</u>-related restrictions; and (3) <u>reporting</u> requirements.

Mercury use regulations affect only those facilities that use mercury as an input. They do not affect those sources that release mercury incidentally as a by-product. For each statute, we describe the mercury-specific information, the type of regulatory mechanism used, and any potential changes to the current regulatory status.

1) Mercury in Commerce

Provisions of several statutes regulate different aspects of mercury in commerce. Excise taxes and import taxes directly affect the cost of using mercury as an input in manufacturing processes; regulations governing mercury sales from the National Defense Stockpile influence the amount of mercury available for purchase; and transportation requirements impose restrictions on mercury transport.

a) Obtaining Mercury

EXCISE TAX: Internal Revenue Code of 1986 (26 USCA §4661)

Mercury Information: The Internal Revenue Code imposes taxes on 40 chemicals, including mercury, that are sold by the manufacturer, producer, or importer. The tax rate for mercury is \$4.45/ton, the second highest tax rate listed (10 substances have the highest tax rate of \$4.87/ton).

Regulatory Mechanism: Input/sales tax

Potential changes: None identified

IMPORT TAX: Harmonized Tariff Schedule of the United States

Mercury Information: Mercury and several mercury compounds are subject to import taxes under the Harmonized Tariff Schedule of the United States, which identifies import taxes on all goods imported into the United States from most-favored-nation (MFN) countries, as well as from special treaty nations and non-most-favored-nation (non-MFN) countries.

For 1994, the tax rate for mercury imports from MFN countries is 16.5 ¢/kg, compared to a 55.1 ¢/kg tax on imports from non-MFN countries (item 2805.40). Due to special treaty agreements, no duty is imposed on mercury imports from Canada, Israel, Bolivia, Colombia, Ecuador, and Caribbean Basin countries.

Regulatory Mechanism: tax

Potential Changes: Under GATT, mercuric oxide, a mercury compound used frequently in medical and military batteries, will be exempt from all U.S. import duties, effective July 1, 1995. Until the end of 1992, facilities that imported mercuric oxide enjoyed duty-free imports, as a result of a special line-item tariff exemption heading (9902.28.25). This duty-waiver lapsed at the end of December 1992. In January 1993, Iowa representatives introduced bills into both houses of Congress designed to extend the waiver for several more years (S.397 (Grassley), HB2522 (Grandy)). Neither bill emerged from committee, and, thus, the import duty on mercuric oxide has remained in effect since January 1993. The GATT duty-waiver will replace the need to amend the Harmonized Tariff Schedule with specific legislation.

Mercury recycling equipment is also subject to import taxes. A bill introduced by Minnesota Senator Durenberger (S.1308) would suspend the duty on equipment used to recycle mercury and other parts of fluorescent light bulbs (adding sections 9902.87.17 and .18 to amend sections 8419.40.00 and 8479.82.00). A Swedish company manufactures the only equipment capable of separating each part of a fluorescent bulb and distilling mercury pure enough for industrial reuse. A duty-waiver would lower the cost of recycling mercury from fluorescent lamps.

GOVERNMENT MERCURY STOCKPILE SALES: Strategic and Critical Materials Stockpile Act (50 USCA §98)

Mercury Information: The Strategic and Critical Materials Stockpile Act regulates mercury that the Defense Logistics Agency (DLA) sells from the National Defense Stockpile. The amount of mercury sold from the stockpile has the potential to affect the mercury market, although DLA considers its impact on the market when requesting Congressional authorization for sales. DLA accepts daily bids for mercury. Over the last year, the price of DLA mercury has ranged from \$57 - 82 per flask.

DLA must submit an Annual Materials Plan to Congress that includes its requests for selling materials deemed excess to stockpile needs for each fiscal year, including projections for the following four years. For fiscal year 1994, DLA initially received authorization to sell 10,000 flasks of mercury, but reached that limit by early 1994. In April, DLA received Congressional authorization to increase fiscal year 1994 mercury sales to 50,000 flasks, a five-fold increase that is more than three times the estimated

total US consumption of mercury for 1993. By comparison, DLA had authority to sell 10,000 flasks of mercury (345 metric tons) in fiscal year 1993, but by year's end, sold only 8,250 flasks (284.6 metric tons).

Until fiscal year 1994, funds received from stockpile sales were used only for stockpile-related activities. However, the Defense Appropriation Act for fiscal year 1994 (PL 103-160, §305) changed the allowable uses of stockpile revenues, specifying that up to \$500 million be transferred to Department of Defense operations and maintenance accounts. This change, combined with favorable market conditions and increasing interest in stockpile materials, motivated DLA to seek approval to sell additional quantities of several stockpile materials, including mercury.

Potential changes: In July, 1994, DLA suspended future mercury sales until a number of potential environmental implications can be addressed. EPA will be represented on the market impact committee that reviews stockpile sales. DLA has submitted its 1995 Annual Materials Plan to Congress, requesting authorization to sell 20,000 flasks of mercury for fiscal year 1995. The House Armed Services subcommittee, chaired by Rep. Earl Hutto (D-FL), handles strategic material issues. DLA is also considering offering long-term contracts for mercury purchases.

b) Transporting Mercury

TRANSPORTATION: The Hazardous Materials Transportation Act

Mercury Information: The Department of Transportation regulates hazardous materials transport under the Hazardous Materials Transportation Act (HMTA). Mercury and mercury compounds are hazardous substances subject to packaging, shipping and transportation rules for hazardous materials. RCRA regulations for hazardous waste transporters incorporate HMTA rules.

Regulatory mechanism: operating requirements, labeling

Potential changes: None identified

c) Using Mercury

Mercury Information: Currently, only Minnesota has a use-restriction law providing that mercury sold in the state will be used only for medical, dental, instructional, research, or manufacturing purposes. Sellers must provide buyers with a material safety data sheet and have the buyer sign a statement of proper use and disposal.

2) Mercury in Products

Mercury-containing products are regulated in several different ways. At a federal level, mercury product regulation has generally centered around health-based reasons to eliminate mercury from products, using the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Federal Food, Drug, and Cosmetic Act (FFDCA) regulations.

In recent years, many states have taken a different approach. Restrictions on mercury-containing products, once used sparingly by the federal government, are increasing rapidly at the state level. States are beginning to move beyond strictly health-based concerns associated with particular products, and are looking instead to the waste disposal problems associated with mercury containing products. Many Great Lakes states, most notably Minnesota, are beginning to ban the sale of certain products that contain mercury (e.g., toys and shoes), limit the content of mercury in other products (e.g., batteries and packaging), and impose recycling requirements and disposal restrictions on mercury-containing products.

At present, mercury product laws represent a patchwork of regulations that vary by state. Table 10 compares characteristics of the most common mercury product regulations in each of the Great Lakes states. Table 11 summarizes the regulations that affect mercury-containing products at a national level and in each of the Great Lakes states. Appendices C and D describe each of these regulations in more detail. Appendix E shows the different types of mercury battery legislation in place nationwide.

At a federal level, two statutes have been used to limit mercury content or curtail mercury use in specific products.

Statute: FEDERAL INSECTICIDE, FUNGICIDE AND ROBENTICIDE ACT (FIFRA)

Mercury Information: FIFRA covers the sale and use of pesticides, including registration of chemicals that meet health and safety tests. Until recently, several mercury compounds were registered as pesticides, bactericides, and fungicides. By 1991, however, all registrations for mercury compounds in paints had been canceled by EPA or voluntarily withdrawn by the manufacturer. Registrations for calo-chlor and calo-gran, the last mercury-based pesticides registered for use in the United States (to control pink and grey snow mold) were voluntarily canceled by the manufacturer in November 1993. Existing stocks may be sold until depleted.

Regulatory Mechanism: ban, cancellation

Potential changes: None identified

Statute: FEDERAL FOOD, DRUG, AND COSMETIC ACT (FFDCA)

Mercury Information: The Food and Drug Administration is responsible for mercury in food, drugs, and cosmetics. Mercury use as a preservative or antimicrobial is limited to eye-area cosmetics or ointments in concentrations below 60ppm. Yellow mercuric oxide is not recognized as a safe and effective ophthalmic anti-infective ingredient. The FDA also regulates dental amalgam under FFDCA. Dental mercury is classified as a Class I medical device, with extensive safety regulations on its use. Dental amalgam alloy is classified as a Class II device, subject to additional special controls.

Regulatory Mechanism: content restriction, use conditions, labeling

Potential Changes: None identified. However, California may require warnings on dental amalgam above and beyond FFDCA rules, under its Safe Drinking Water and Toxic Enforcement Act (Proposition 65), which requires businesses to warn employees and the public if business activities result in emissions of listed chemicals.

Federal regulations may soon take a different approach to mercury product regulation. Two bills introduced recently into Congress would impose restrictions on the mercury content in packaging and batteries ("Mercury-Containing and Rechargeable Battery Management Act," S1949 (passed the Senate in May 1994); and HB4528 (same language). Similar language ins included in the "Lead Exposure Reduction Act," which will be considered by Congressman John Dingell's Energy and Commerce Committee). A bill to limit mercury content in packaging materials was introduced in 1993. If passed, these bills would establish national standards for allowable mercury content in batteries and packaging. Currently, over a dozen states independently limit mercury content in batteries and packaging.

FEDERAL REGULATIONS:

- * Batteries: Bills introduced recently to the U.S. House and Senate are designed to phase out mercury in batteries by imposing limitations on the sale of (1) alkaline- manganese and zinc carbon batteries containing mercury; and (2) mercury button cell and other mercuric-oxide batteries. (S. 1949, Lautenberg (D-NJ), "Mercury-Containing and Rechargeable Battery Management Act", passed the Senate on 5/25/94; HB 4528, Richardson (D-NM) contains same language.) Mercury battery provisions of HB4528 were added to HB4882 (Lead Exposure Reduction Act of 1994; Swift, 8/11/94) and will be considered by Congressman Dingell's (MI) Energy and Commerce Committee after Labor Day.
- ** Packaging: A bill introduced into the U.S. Senate would prohibit intentionally introduced mercury in packaging. (S.966, Lautenberg (D-NJ) introduced May 13, 1993. "Reduction of Metals in Packaging Act")
- *** Electric lamps: EPA is considering two options to modify RCRA disposal restrictions for mercury-containing lamps: (1) inclusion in universal waste rule; and (2) conditional exemption.

3) Reporting Requirements

Mercury use reporting is seldom required under the existing regulatory framework. Most reporting requirements track mercury releases, and are discussed separately in the "Mercury Release" section that follows.

At a federal level, only facilities that exceed threshold planning quantities for mercury under SARA Title III regulations must report that quantity to their local emergency planning commission. This program is included under "Releases," because it is geared toward spill prevention, rather than use. EPA is currently considering a chemical use inventory, which would track the quantities of chemicals used at individual facilities.

Currently, only Michigan has regulations that specifically require facilities to report the quantities of chemicals used. Under the Part 9 rules of Act 245, Michigan's water pollution control act, businesses that use any substance listed on the "Critical Materials Registry" must report the quantities of each substance used and released. Mercury is included the Critical Materials Registry. The state uses this information to assist in permit development and compliance in its water program.

C) MERCURY RELEASE REGULATIONS

This section describes regulations that affect mercury release into air and water, as well as waste disposal, and requirements for public disclosure of releases (e.g., TRI reporting). Specific statutes—at a federal and/or state level—regulate mercury in each of these different categories. Appendix B shows the specific mercury release regulations that apply to each mercury source.

The Clean Air Act, Clean Water Act, and the Resource Recovery and Conservation Act (RCRA) all operate differently, and impose different thresholds that influence the extent to which mercury releases are covered. In addition, states have the flexibility to impose site-specific mercury regulations on individual sources. With the exception of the Toxic Chemical Release Inventory (TRI), which specifically requires facilities to report chemical releases into all media, programs that require mercury release reporting are incorporated into broader regulatory programs.

The following information is provided for each statute discussed: the principal provisions that affect mercury releases; the specific sources regulated; the threshold that triggers coverage; the regulatory mechanism(s) used; environmental standards included in the statute; potential changes to existing regulations; and other relevant statutes that may provide similar information.

1) Mercury Air Emissions

Statute: CLEAN AIR ACT

Principal Provisions that affect mercury releases:

Mercury and mercury compounds are considered Hazardous Air Pollutants (HAPs) under the Clean Air Act. To date, EPA has established National Emission Standards for Hazardous Air Pollutants (NESHAPs) for mercury emissions from three source categories: ore processing facilities, mercury cell chlor-alkali plants, and sewage sludge driers.

EPA will also be promulgating a new category of regulation, known as maximum achievable control technology (MACT standards) for "major source" in any listed source category. Major sources are defined as those sources that release 10 tons per year of any HAP, or 25 tons per year in total HAP emissions. Mercury releases alone are unlikely to trigger the major source definition. For instance, Wisconsin's air point source inventory showed the highest mercury release at 1000 pounds, well below a 10 ton (20,000 pound) threshold for major sources.

It is too early to tell the extent to which MACT standards will influence mercury release levels. MACT standards will be defined based on an analysis of existing control technology for a given source category. Thus, if mercury controls are not currently in use, they may not be part of a defined MACT standard. EPA may set lesser quantity cutoffs, which would redefine the level at which a facility would be defined as a major source.

Under the Title V Operating Permits program, states may impose emissions fees up to \$25/ton of emissions for all chemicals. Facilities releasing mercury are subject to this fee for their mercury emissions. Without a differential fee structure, the fee alone is not likely to be high enough to spur reductions in mercury emissions. For instance, Wisconsin's largest source of mercury air emissions, an electric utility, would only pay \$15.90 for its mercury releases (.63 ton @ \$25/ton).

Specific Sources covered: Only three source categories have NESHAPs for mercury emissions: (1) mercury cell chlor alkali plants (2) sewage sludge incinerators and driers (3) mercury ore processing facilities.

Individual states may impose specific mercury emissions limits on individual facilities. For instance, many states impose mercury emissions limits on municipal and hazardous waste incinerators.

Threshold that triggers coverage: Listed source category for NESHAPs (no numeric thresholds); MACT threshold not yet defined, but will probably be specific to source categories.

Regulatory mechanism(s): emissions limits, emissions fees, permits, monitoring, operating requirements (which may include pollution prevention), reporting.

Environmental Standards: No federal ambient air mercury standards

Potential Changes: The 1990 Clean Air Act amendments single out mercury for additional study--and potential future regulations--more than any other substance. The following studies may potentially alter significantly the manner in which mercury air emissions are regulated:

Mercury Study (§112(n)(1)(B): The 1990 Clean Air Act amendments mandated a special study of mercury emissions to the environment. The study, which will be finalized in early 1995, is estimating the relative contribution of mercury emissions from source categories, the public health and environmental effect of such emissions and evaluating available control technologies and their costs.

EPA must also list (by 1995) the source categories that account for at least 90% of aggregate emissions for seven pollutants, including mercury (§112(c)(6)). Information developed for the mercury study will contribute to this evaluation. Sources identified in the §112(c)(6) strategy will be subject to MACT standards within ten years.

<u>Utility Study (§112(n)(1)(A))</u>: Closely tied to the mercury study is the Utility Emissions Study, mandated by Section 112(n)(1)(A) of the 1990 Clean Air Act amendments. This study, scheduled for completion in November 1995, will describe in detail the contribution of utilities to mercury emissions and other HAPs. The CAA exempted utilities from the categories of sources potentially subject to MACT standards until the study is completed. The study may recommend specific controls, including controls for utility boilers, which are currently unregulated for mercury emissions.

Municipal Waste Incinerator Limits (§129): EPA has begun a rulemaking for mercury emissions from municipal and medical waste incinerators.

Great Waters Program: Section 112(m) required EPA to study atmospheric deposition of mercury and other substances into several large water bodies, including the Great Lakes. The program is geared toward building an improved atmospheric monitoring network that will enable EPA and other agencies to study the relative contributions of different HAPs and the extent to which atmospheric deposition causes human health or environmental problems. If necessary, EPA may require additional controls on certain

sources as a result of this study. Under §112(m)(5), EPA is required to assess the contribution of atmospheric deposition to pollutant loadings, the environmental and public health effects of atmospheric deposition and the extent to which atmospheric deposition contributes to water quality standard exceedances. The Great Waters report recommends that EPA promulgate Lesser-Quantity Emissions Rates for mercury.

Other relevant statutes: Mercury air releases are listed in a facility's TRI report, provided the facility meets the TRI threshold reporting requirements. RCRA regulations cover emissions from hazardous waste combustion, and boilers and industrial furnaces. Existing regulations do not include specific mercury standards.

Statute: OCCUPATIONAL SAFETY AND HEALTH ACT

Mercury Information: The Occupational Safety and Health Administration has responsibility for maintaining safe workplace conditions. OSHA sets permissible exposure levels for mercury in workplace settings. Mercury is listed as a neurotoxin capable of causing behavioral changes, decreased motor function and other effects on the nervous system (29CFR1926.59). OSHA mercury standards also recommend that skin contact should be avoided.

Workplace standards may influence the types of processes used at a facility. For instance, OSHA standards for cadmium were tightened recently. Stricter OSHA limits for cadmium will force many cadmium users to modify their processes or eliminate cadmium entirely in order to meet these new standards.

Regulatory Mechanism(s): operating requirements, inspections

Environmental Standards: workplace air concentration levels

Specific Sources covered: Facilities that use mercury are subject to mercury standard

Potential Changes: None identified. However, the Agency for Toxic Substances and Disease Registry (ATSDR), which evaluates exposure levels for hazardous substances at superfund sites under CERCLA, recently revised its toxicological profile for mercury. Although these levels have no direct regulatory effect, they may cause other agencies that evaluate mercury exposure levels to re-evaluate existing standards.

2) Mercury Discharges to Water

Statute: CLEAN WATER ACT

Principal Provisions that affect mercury releases:

Mercury is listed as a toxic pollutant under §307(a) of the Clean Water Act. For mercury discharge, Clean Water Act regulations specify technology-based effluent limits for classes and categories of industries, and describes the circumstances in which states may require effluent limits or monitoring requirements more stringent than technology-based standards. States may also set water quality standards for pollutants including mercury. The Clean Water Act relies on a permit system, known as the National Pollutant Discharge Elimination System (NPDES) to regulate water discharges. Facilities may be assigned a specific mercury discharge limit, or may only be required to monitor their discharge for mercury. Facilities report actual discharge levels in Discharge Monitoring Reports (DMRs), which serve as the basis for determining compliance.

Pretreatment standards regulate industries that discharge into a publicly owned treatment plant (POTW) instead of discharging directly into a receiving water body. Regulations list industrial categories subject to national categorical pretreatment standards for new and existing facilities that discharge into treatment plants. POTWs with approved pretreatment programs may set permit limits and conduct inspections of industrial users. Facilities that do not have specific pretreatment standards for mercury (or other hazardous substances), are supposed to notify the POTW of any hazardous waste discharge that exceeds 100kg per month. Wastestreams from certain manufacturing processes that may involve mercury, such as fluorescent lamps and switchgear, are excluded from categorical pretreatment standards because they are considered dilute.

Mercury is included in the list of chemicals eligible for removal credits at a POTW. That is, a POTW may allow a facility to discharge a higher quantity of mercury provided that the POTW meets the applicable mercury standard in its sludge without additional costs.

EPA Region 5 Water Division recently revised its enforcement program for certain chemicals to trigger enforcement investigations earlier than the previous program. Under the Great Lakes Enforcement Strategy, EPA will target violations of daily maximum permit limits. This screening criteria is more stringent than the national definition of significant noncompliance, which targets violations of monthly average limits.

Specific Sources covered: The Clean Water Act lists technology-based standards for the following industry source categories: Inorganic Chemicals Manufacturing, chloralkali subcategory (mercury cell process)(40CFR415.60); Nonferrous Metals category including, primary antimony subcategory (40CFR421.140), secondary mercury subcategory (40CFR421.200), primary precious metals and mercury subcategory (40CFR250); Steam electric power generation (40CFR423--mercury is an Appendix A priority pollutant); Ore Mining and Dressing Category including, mercury ore subcategory (40CFR440.40), copper, lead, zinc subcategory (40CFR440.100), platinum ores subcategory; Pesticide Manufacturing category, metallo organic pesticide chemicals subcategory (40CFR455); Battery Manufacturing category, LeClanche and zinc subcategories (40CFR461.40).

However, this list does not limit the types of dischargers that may have mercury effluent limits or monitoring requirements in their NPDES permits. Individual states may impose specific mercury discharge limits and/or monitoring requirements on individual facilities that discharge into water quality-limited waterbodies. The current EPA-approved level of detect for mercury is 200 ng/L, which may be higher than water quality based effluent limits, and higher than some states' water quality standards for mercury.

Threshold that triggers coverage: No volume or quantity threshold

Regulatory Mechanism(s): effluent limits, effluent fees (WI), permits, operating requirements, control requirements, monitoring/reporting

Environmental Standards: surface water, sludge

Potential Changes:

Great Lakes Water Quality Initiative (GLI): In recognition of the vulnerability of the Great Lakes to bioaccumulative pollutants, including mercury, EPA proposed water quality criteria designed to protect aquatic life, wildlife, and human health on a long term basis. The GLI is designed to remedy the differences in water quality standards of the Great Lakes states and protect lakes from chemicals that bioaccumulate in the food chain. Released in draft form, the GLI proposes several major changes to water quality programs in the Great Lakes states, including water quality standards for mercury designed to protect wildlife.

<u>Clean Water Act Reauthorization</u>: Several bills introduced into Congress as part of the Clean Water Act reauthorization process may change the current regulations governing mercury water discharges. Proposed changes include a ban and/or discharge tax on all mercury discharges.

Other relevant statutes: Mercury water releases are listed in a facilities Toxic Release Inventory, provided the facility meets the TRI threshold reporting requirements (see discussion under Mercury Reporting Requirement). Michigan also collects information on use and release in its Critical Materials Registry.

3) Mercury Waste Disposal

Statute: Resource Conservation and Recovery Act (RCRA) (see also 40 CFR 261)

Principal Provisions that affect mercury disposal:

RCRA regulations outline specific classification and disposal requirements for products and wastes that contain mercury. In general, RCRA regulations are waste-specific. not source-specific, and thus may apply to any facility that generates mercury-containing wastes.

Waste code identification: RCRA regulations assign specific waste codes to five types of wastes that are either "characteristic" wastes or "listed" wastes. Mercury is both a characteristic and a listed waste under RCRA.

Wastes are considered "characteristic" hazardous wastes if they exhibit any of four specified characteristics: ignitability, corrosivity, reactivity, or toxicity. Ignitability, corrosivity, and reactivity describe general properties of the waste, whereas the toxicity characteristic identifies wastes likely to leach specific toxic constituents into groundwater if managed improperly. Wastes that exhibit concentrations above a specific regulatory level for any of 40 substances, including mercury, are considered hazardous.

A specific "D" waste code identifies the contaminant(s) for which a waste exhibits the toxicity characteristic. The regulatory level for mercury is 0.2 mg/l (or 0.2ppm), and the waste code **D009**, identifies wastes that exceed the toxicity characteristic for mercury (40CFR261.24). Regulations outline the required toxicity characteristic leaching procedure (TCLP) test necessary to determine the concentration of each substance (40CFR261 AppII).

"Listed" wastes are specifically identified wastestreams or products that appear on one of three hazardous waste lists in RCRA. Each listed waste is assigned a different waste code. Wastes from non-specific sources such as spent solvents, are assigned an "F" code. Wastes from specific sources are assigned a "K" code. Each of these wastes are listed for a specific substance (40CFR 261.30). Appendix VII of the regulations lists the constituents that caused specific wastestreams to be listed.

Commercial chemical products such as manufacturing chemical intermediates, off-specification species, container residues, and spill residues may also be considered hazardous wastes when discarded. Two sublists identify waste codes for commercial chemical products. Chemicals assigned a "P" code are considered acute hazardous wastes when discarded (40CFR261.33 (e)); chemicals assigned a "U" code are toxic chemicals considered hazardous when discarded and are regulated like other listed hazardous wastes (40CFR261.33(f)). The P and U lists are triggered only when the P or U chemical is the sole active ingredient, a commercial product is discarded, or a listed chemical is spilled. These lists do not apply to manufacturing process wastestreams that contain listed chemicals.

In addition to the D009 waste code, the following waste codes identify mercury-containing wastes or discarded chemical products:

F039: Leachate (liquids that have percolated through land disposed wastes) resulting from the disposal of more than one restricted waste classified as hazardous. F039 is listed for multiple substances and may not be a reliable indicator of mercury in the wastestream.

K071: Brine purification muds from the mercury cell process in chlorine production, where separately prepurified brine is not used. K071 is listed only for mercury.

K106: wastewater treatment sludge from the mercury cell process in chlorine production. K106 is listed only for mercury.

P065 identifies mercury fulminate (mercury compound used in explosives) as an acute hazardous waste;

P092 identifies phenylmercuric acetate (mercury compound used in paints) as an acute hazardous waste; and

U151 identifies mercury as a toxic waste.

Disposal Requirements, including prohibitions on land disposal: RCRA regulations describe specific disposal requirements for individual waste codes. All mercury-bearing wastes (wastewaters and nonwastewaters) are subject to land disposal restrictions. That is, the mercury concentration in these wastes must be below the regulatory concentration level before the wastes may be land-disposed. For some types of waste, the regulations require a specific treatment, such as incineration or thermal treatment. In other cases, only a maximum mercury concentration is required, and any treatment method may be used. As a result of recently imposed land disposal restrictions on chlor

alkali wastes (K071 and K106), some facilities are building their own mercury recovery facilities, whereas others are shipping their wastes to Canada or elsewhere for disposal.

RCRA regulations also influence product disposal and recycling options for mercury containing products. Discarded products considered hazardous wastes are subject to storage, transportation, and permitting requirements under RCRA subtitle C (hazardous wastes). Currently, batteries are included in a "universal waste rule" that eases RCRA restrictions on hazardous waste management and enables states to set up special collection programs. Fluorescent lamps, however, are considered hazardous waste because levels of mercury exceed the toxicity characteristic for mercury. EPA is considering two options to ease disposal restrictions: (1) including mercury-lamps in the universal waste rule to facilitate recycling, or (2) a conditional exemption which would allow disposal in solid waste landfills.

Requirements for owners and operators of hazardous waste land treatment facilities: Landfill owners must determine the mercury concentrations in any wastes if food chain crops are grown at the facility. Food chain crops cannot be grown on the treated area of a hazardous waste land treatment facility unless the owner or operator can demonstrate, based on field testing that any mercury and other specified constituent will not impair the quality of the food grown there (40CFR 265.273 and .276).

Hazardous waste combustion: RCRA regulates air emissions from hazardous waste combustion and boiler and industrial furnaces (BIFs). Cement kilns, regulated under interim BIF standards, frequently burn hazardous waste as a fuel source. Federal regulations for hazardous waste incinerators do not currently set metals limits. A potential for regulatory overlap exists between RCRA hazardous waste combustion rules and Clean Air Act municipal waste combustion rules.

Specific Sources covered: Any facility that uses mercury may generate waste that exceeds the toxicity characteristic for mercury. Facility operators use best professional judgment to determine whether or not to test their waste specifically for mercury. Mercury-cell chlor-alkali facilities are the only mercury sources that have specifically listed wastestreams (K071, K106).

Threshold that triggers coverage: Facilities must meet RCRA hazardous waste quantity thresholds before they are required to report information on their hazardous waste generation and management. Thresholds are based on the *total amount* of hazardous waste generated at a facility, not on the amount of any one kind of waste (e.g., facilities that generate more than 2,200 pounds per month of hazardous waste are considered large quantity generators; facilities that generates 220 - 2,200 pounds of hazardous waste per month are considered small quantity generators). Therefore, levels

of mercury waste alone are not likely to determine whether or not an individual facility it subject to RCRA requirements.

Regulatory Mechanisms: disposal restrictions, labeling, control requirements, inspections, planning requirements, operating requirements, permits, reporting

Environmental Standards: hazardous waste concentration, groundwater standards

Potential Changes: EPA is revising the hazardous waste combustion rules, the interim standards that regulate boilers and industrial furnaces, and fluorescent lamp disposal requirements. The "universal waste rule" for batteries, and possibly thermostats, is scheduled to be finalized in the fall of 1994.

4) Mercury Reporting Requirements

Several sections of the Superfund Amendments and Reauthorization Act of 1986 (SARA), which amended CERCLA to address ongoing activities that result in releases of hazardous substances, impose reporting requirements on mercury use, release, and spills. Title III, known as the "Emergency Planning and Community Right-to-Know Act" establishes emergency release, inventory, and release reporting requirements. The most well known requirement is the Toxics Release Inventory (TRI), which requires facilities in the manufacturing sector (SIC codes 20-39) to report releases to air, water, and land for all listed chemicals, including mercury. Other sections require facilities to report spills of listed substances above a threshold reporting quantity (reportable quantities), and the quantities of chemicals stored above a specified threshold planning quantity. Each of these sections is discussed separately below.

Statute: (SARA TITLE III, §313) TOXIC CHEMICAL RELEASE INVENTORY (TRI)

Principal Provisions that affect mercury reporting: All facilities in the manufacturing sector (SIC codes 20 - 39) that meet the threshold reporting requirements must report their releases of mercury to all media. TRI thresholds are based on the quantity of each substance used, processed, manufactured, or imported at any of these facilities.

Mercury is one of 17 priority chemicals target by EPA's 33/50 program, a voluntary pollution prevention initiative that established an interim goal of achieving a 33% reduction in releases of targeted chemicals by 1992 and a 50% reduction by 1995, using 1988 TRI reporting data as a baseline. The 33/50 program is one of EPA's primary voluntary reduction programs designed to augment traditional command and control regulations. Releases and transfers of the 33/50 chemicals declined four times faster than non-33/50 chemicals between 1991 and 1992.

Specific Sources covered: Any manufacturing facility that uses quantities of mercury above the reporting threshold.

Threshold that triggers coverage: Facilities that manufacture, process, or import 25,000 pounds of mercury and/or otherwise use 10,000 pounds of mercury must report releases to all media. These thresholds are generally too high to capture the vast majority of sources that use mercury.

Regulatory Mechanism: public disclosure, reporting

Potential Changes: EPA is considering two proposals that would affect the number and types of facilities required to report under TRI. One proposal would lower the TRI reporting threshold, and perhaps include multiple thresholds. Given the low number of sources captured under the current reporting threshold, it is conceivable that, depending on the level of a new threshold, many new facilities would be captured under TRI. Another proposal would expand the reporting universe beyond the manufacturing sector. At present, mining operations, waste disposal sources, and other facilities not included in SIC codes 20 - 39, are not required to report releases under TRI. Again, depending on how this expansion is structured, different types of facilities would likely be captured under TRI.

Other relevant statutes: Clean Air Act, Clean Water Act, RCRA. Courts are currently reviewing whether or not a facility that reports mercury releases to water in its TRI report but does not have a Clean Water Act NPDES permit for those discharges is in violation of its NPDES permit.

Statute: SARA TITLE III §302, §304, §311 and §312 (threshold planning quantities and reportable quantities)

Principal Provisions that affect mercury reporting: SARA reportable quantities are linked closely to CERCLA §102 reporting requirements. Under SARA §302, any facility that produces, uses, or stores "extremely hazardous" substances must notify the State Emergency Response Commission. Mercuric acetate, mercuric chloride, and mercuric oxide (mercury compounds) are considered extremely hazardous substances (40CFR355). Under §304, a facility must notify the state emergency response commission and a local emergency planning committee of releases that exceed reportable quantities for hazardous substances. Facilities must also notify the National Response Center (1-800-424-8802). The reportable quantity for mercury spills is one pound (40CFR302).

Under §311 and §312, facilities that keep hazardous substances on-site in quantities greater than threshold levels must submit a chemical inventory to the state emergency response commission, the local emergency planning commission, and the local fire department (40CFR370). The threshold for mercury (a hazardous substance) is 10,000 pounds, and the threshold for listed mercury compounds is 500 pounds (extremely hazardous substances).

Specific Sources covered: Any facility that uses mercury may be potentially subject to these regulations.

Threshold that triggers coverage: Hazardous substances in quantities greater than 10,000 pounds, and extremely hazardous substances in quantities greater than 500 pounds must be reported. The reporting threshold for mercury spills is one pound (40CFR355.40).

Regulatory Mechanism(s): reporting, public disclosure

Environmental Standards: n/a

Potential Changes: None identified.

Other relevant statutes: Clean Air Act, Clean Water Act, CERCLA. Ohio imposes an annual chemical inventory filing fee of \$100.00 base fee, plus \$10 for each additional hazardous substance over 5 substances and \$50 per extremely hazardous substance reported. The facility filing fee cap is \$2,500.

	Fungicide	Prohibits use of mercury in fungicides	MN	retailers may sell products until stocks exhausted; users may use products until stocks depleted.
Paint	Mercury compounds used as biocide to control microbial growth in paint	Registrations for mercury compounds in indoor and outdoor latex paint banned or cancelled (1990, 1991)	Federal	Manufacturers may use up existing stocks
	cans and prevent mildew on painted surfaces	Anti-fouling paints for marine use banned in 1972	Federal	Cancellation of biocide registrations has reduced Hg consumption in paint, and paint residue in municipal solid waste; paint cans w/mercury
		No Hg deliberately introduced into paint intended for use in MN (except in art supplies)	MN	residue are still disearded
Pigment, Dyes	Coloring (maroon, red, orange) primarily for plastics	Cadmium-mercury pigments no longer manufactured in U.S. (domestic production ceased in 1988); may still be imported	Federal	Many states have laws that phase out metals in pigments
	,	No Hg deliberately introduced into pigments and dyes intended for use in MN (except in art supplies)	MN	
Cosmetics	Preservative, antimicrobial	Limited to eye area cosmetics or ointments with concentration <65 ppm (21CFR700.13)	Federal	

Product/Use	Role of Mercury	Regulations/Programs on Mercury Products	Fed/State Regulation	Comments
Pharmaceuticals	Used in antiseptics, continents, diuretics	Mishranded drug laws - list quantity of mercury in product	IL, IN, NY, OH, PA	
		Yellow mercuric oxide is not generally recognized as safe and effective, or is misbranded for over the counter use	Federal	
Poisons		Restrictions on sale of mercury and mercury compounds	OII	
		Levels established for Hg products to be considered poisons	PΛ	
Catalysts	Hg used as catalysts for production of vinyl chloride monomers and urethine frams, as well as other products			
Packaging		Restrictions on mercury content in packaging and packaging components; no products may be sold in packaging that contains intentionally introduced Hg	IL, MN, NY, WI	Implementation dates vary by state, and include general exceptions if no feasible alternatives exist; Pennsylvania is considering bill to regulate toxic materials in packaging
Special Paper Cuatings	Mercury bromide and mercury acetic acid used in specialized paper and film with cathode my tubes			Manufacturers plan to phase out use of mercury in coating
Explosives	Mercury fulminate is detonator	Explosives containing mercury are Class A, maximum hazards	MN, WI	In the last 20 years, only the military has used mercury explosives
Fireworks	Catalyst/explosive	Permits required for fireworks with mercury	MI	
Livestock and Poultry Remedies		List percentage of mercury on remedy	МІ	

Product/Usc	Role of Mercury	Regulations/Programs on Mercury Products	Fed/State Regulation	Comments
Electrical and Ele	ctronic Uses			
Electric Lighting				Electric lighting products are second largest component of municipal solid waste (after batteries)
Fluorescent Lumps (low pressure)	Mercury vapor fluoresces at UV wavelength	Encouraged as replacement for incandescent bulbs for energy conservation (see 10CFR450.31 - energy conservation measures)	Federal	Fluorescent lights are largest component of electric lighting diseards in municipal solid waste; used bulbs considered hazardous waste because high levels of mercury exceed RCRA toxicity
		Lumps in state-owned buildings must be recycled	MN	characteristic limit (.2 mg/l in leachate)
		Viewed as by-product that can be recycled, and exempt from RCRA	OII	EPA considering two options to ease RCRA disposal restrictions: (1) inclusion in universal waste
		Lamps sold to managers of industrial, commercial, office, or multiunit buildings must be labeled; building contractors must specify mercury management plans for removed lamps	MN	rule to facilitate recycling; (2) conditional exemption which would allow disposal in solid waste landfills
Mercury Vapor Lamps	Facilitates light production by electric are	Encouraged for energy conservation (see 10CFR450.31 - energy conservation measures)	Federal	
		Lamps must be self-extinguishing or have protective shield; efficiency standards in public areas (theaters, gyms)	NY	
		Mercury must be removed before disposal; lamp sellers and contractors responsible for public education about mercury management requirements; limits on production and distribution of lamps	MN	
Iligh Intensity Lamps		Lamps sold to managers of industrial, commercial, offices, or multiunit buildings must be labeled; building contractors must specify mercury management plans for removed lamps	MN	Used for outdoor lighting; mercury lamps are more efficient and brighter than other outdoor lights

Product/Usc	Role of Mercury	Regulations/Programs on Mercury Products	Fed/State Regulation	Comments
Metal Halide Lamps			Federal	Encouraged for energy conservation (see 10CFR-energy conservation measures)
Incandescent Lamp Filaments	Hg used as continuous electrical contact in tungsten bar sintering			
Wiring Devices and	l Switches			
Thermostats	Temperature measurement	Mercury must be removed for recycling or recovery before disposal; manufacturers must provide information and incentives to ensure recycling or proper management; heating, ventilating and	MN	Digital thermostats are replacing mercury thermostats; long lag time before old Hg thermostats discarded
		air-conditioning (HVAC) dealers required to properly manage or recycle used mercury thermostats (MN St 115A.93, 115A.9561, 115.932)		MN just began pilot program for HVAC dealers to recycle mercury containing thermostats by returni them to HVAC wholesaler who, in turn, returns them to Honeywell for recycling/reclaiming
		Products containing Hg must be labeled, including disposal restrictions	MN	
White Goods	Mercury components (e.g., switches) may be included in large appliances (e.g., refrigerators, air	Mercury components must be removed prior to disposal	MN, IL	
	conditioners, etc.)	Hg in repaired or replaced items must be reused or recycled	MN	
Toys		Ban on toys with Hg; fines imposed for retail sales	MN, WI	
Electric Wall Switches		Products containing Hg must be labeled, including disposal restrictions	ми	

Product/Use	Role of Mercury	Regulations/Programs on Mercury Products	Fed/State Regulation	Comments
Electrical Components	May be included in any electrical machinery (e.g., mining, automotive,	Limits on mercury use in mining equipment	PΛ	
• • • • • • • • • • • • • • • • • • • •	and industrial equipment, smoke detectors, etc.)	Products containing mercury must be labelled, including disposal restrictions	МИ	
Batteries				
General Mercury Containing Batteries		Butteries included in universal waste rule to ease RCRA restrictions on hazardous waste management and divert waste from MSW landfills; states may set up special collection programs not subject to storage, transportation, and permitting requirements of RCRA		Butteries were largest source of Hg in municipal solid waste. Many states have banned mercury in batteries; manufacturers have reduced mercury use by over 90% since 1988.
		Deposit/refund system will begin in 1998; purchasers return used mercury batteries to retailer or approved collection facility	Мі	EPA is requesting comments on labeling batteries to nid in collection, sorting, and recycling; denied a petition filed under §TSCA to require deposit on mercury-containing batteries.
		Task force on storage, transport, disposal, recycling	IL	Industry groups have developed uniform voluntary industry labeling standards for lead and cadmium batteries
Alkaline Batteries	Prevents corrosion and hydrogen release, extends shelf life; improves	11g concentrations <.025% by weight	MN, NY	Battery manufacturers have eliminated mercury in alkaline batteries, except button cells and reusable
	performance over temperature range (hatteries used in flashlights, rudios,	Hg banned in alkaline batteries in 1996	MN, WI	butteries.
	and other electronics)		MN	

Product/Usc	Role of Mercury	Regulations/Programs on Mercury Products	Fed/State Regulation	Comments
Mercuric Oxide Batteries (also button cell, mercury-zinc button cell)	Mercury used as cuthode material and is integral component (button cell hatteries contain -40% mercury)	Sale of dry cell batteries with mercuric oxide, electrode batteries prohibited without exemption; button cell nonrechargeable batteries restricted to <25mg Hg; labeling requirements; disposal prohibited; manufacturers responsible for collection system	MN	Primarily used in hearing aids; also used in culculators, watches, cameras, photographic equipment, electronic games, health/hospital equipment, airplane underwater locator beacons NY is exploring recycling options for these batter
		Hg content of alkuline button cell butteries must be <25 mg by weight	Υ	Some mercuric oxide cells used in military and medical operations (e.g., night vision devices, EK machines, etc.) are disposed of as hazardous wast Proposed federal legislation may ban mercuric os batteries.
Carbon Zinc (LeClanche)	Contain ~1% Hg; Hg controls chemical reactions between zinc and other battery components	Sale prohibited if Hg concentration > 1ppm Sale of butteries with Hg banned after 1994	NY WI	Curbon zinc cells have shorter life than alkaline batteries. Mercury is no longer used in certain zin battery products.
Zinc Air	Hg content ~ 1%	Button cells restricted to <25 mg mercury, labelling	MN	Used in pagers, hearing aids
Instruments and I	Related Products			
Measure and Contro	of Instruments		· · · · · · · · · · · · · · · · · · ·	
Thermometers	Elemental mercury indicates temperature	Limits on distribution of Hg thermometers; mercury must be removed before disposal; no routine distribution of Hg thermometers by medical facilities	MN	Digital thermometers are replacing mercury thermometers
Burometers	Indicates pressure			
Medical, Scientific Instruments	Temperature and pressure measuring devices	Products w/llg must be labeled, including disposal restrictions	MN	

Dental Equipment an	d Supplies			
Dental Equipment/Supplies	Forms alloys; chemically binds compounds to form restorative material	FDA regulates dental mercury and amalgam alloys separately as class I and class II devices under Federal Food, Drug, and Cosmetic Act	Federul	One of nation's largest manufacturers of mercury amalgam dental fillings will place warnings on amalgam containers shipped to California and provide warning signs for dental patient waiting
		Disposal banned unless mercury reused, recycled or managed to ensure compliance	МИ	rooms under California's Proposition 65 (Safe Drinking Water and Toxic Enforcement Act).
		Purchaser must sign agreement of use for medical or dental uses	MN	The Act requires businesses that use or distribute toxics to label or otherwise notify the public about possible exposure to chemicals.
Discontinued Uses				
embalming Iluid film pack batterics	Preservative	Use discontinued as of 1988		
maritime paints photographic developme soap wood preservatives	Antifouling agent	Registrations suspended in 1972	Federal	

Appendix D: Summary of Mercury-Specific Statutes in Great Lakes States

		NOTE: This table summarizes provisions of statutes that specifically regulate mercury in the Great Lakes States. At this time, not all states have specific mercury statutes. This table does not include state regulations for implementing federal environmental programs.
State	Item(s)	Provisions
IL	Batteries	Task force studied storage, transport, disposal, and recycling
	Packaging	After 7/1/94, no package or packaging component may be sold if it contains mercury above 600ppm; levels decrease to 250ppm (7/1/95), 100ppm (7/1/96)
	White Goods	Mercury must be removed before disposal (landfill operators may have permits to remove Hg components at landfill)
MI	Batteries	After 1/1/98, deposit refund system to facilitate return of used mercury batteries to distributor or recycling/disposal contractor
	Fireworks	Permits required for fireworks containing mercury
	Use/relense	Water Pollution Control Act- businesses must report use and discharge information for chemicals on "critical materials registry", which includes mercury
	Pending: Toys, Shoes, Clothes	No sale of toys w/Hg
MN	Batteries	No batteries > .025% Hg by weight may be sold or distributed; after 1/1/96, alkaline manganese batteries must have no added Hg Button cell nonrechargeable batteries must have <25mg Hg and must be labeled Exemption required to sell batteries containing mercuric oxide electrodes
	Lamps	Mercury must be removed before disposal; lamp sellers and contractors responsible for informing buyer/generator of mercury management requirements

Page 1 of 3

Appendix D: Summary of Mercury-Specific Statutes in Great Lakes States

		NOTE: This table summarizes provisions of statutes that specifically regulate mercury in the Great Lakes States. At this time, not all states have specific mercury statutes. This table does not include state regulations for implementing federal environmental programs.
State	Item(s)	Provisions
MN cont'd	Product Disposal	Disposal banned unless mercury removed (reused or recycled) from items such as thermometers, thermostats, etc.
	Product Servicing	Repair person must ensure proper Hg management when Hg items removed from service
	Product Labeling	Thermostats, thermometers, switches, appliances, and medical and scientific instruments must be labeled to inform purchaser/consumer that mercury must be removed before disposal
	Inks, Dyes Paints, Fungicides	No mercury after 7/1/94
	Páckaging	No mercury in packaging after 8/1/93 (threshold 600ppm); allowable concentration decreases to 100ppm in 8/1/95
	Toys, Shoes, Clothes	No sale of toys, clothes, or shoes w/Hg
	Thermometers	No routine distribution of Hg thermometers in medical facilities
	Thermostats	Manufacturers must provide incentives for proper management (Honeywell, a thermostat manufacturer, implemented a thermostat take-back and recycling program)
NY	Batteries	After 1/1/92, alkaline manganese. batteries must have <0.25mg Hg by weight; alkaline button
		batteries must have <25mg Hg; zinc carbon batteries <1ppm Hg
	Packaging	No mercury in packaging after 7/1/94 (threshold 600ppm), allowable concentration decreases to 100ppm 7/1/96

Appendix D: Summary of Mercury-Specific Statutes in Great Lakes States

		NOTE: This table summarizes provisions of statutes that specifically regulate mercury in the Great Lakes States. At this time, not all states have specific mercury statutes. This table does not include state regulations for implementing federal environmental programs.
State	Item(s)	Provisions
PA	Packaging: (pending)	No intentionally introduced mercury in packaging
WI	Batteries	After 1/1/96, alkaline manganese batteries cannot contain intentionally introduced mercury; button-shaped alkaline manganese batteries <25mg Hg; after 1/1/94 zinc carbon batteries cannot contain Hg
	Packaging	No mercury in packaging after 6/1/92 (threshold 600ppm), allowable concentration decreases to 100ppm 6/1/94
	Medical Waste Incinerators	Incinerators with >5 tons/day capacity must be tested once for mercury
	Toys	No sale of toys containing Hg

MERCURY BATTERIES (except Button Cells) Information as of July 31, 1994

VERMONT	Passed	1-1-93	3(a,b,c,e), 4(a)
WISCONSIN	Passed	7-1-94	1(c), 2(b[ii]), 3(b,c,g), 4(a)

i: BAN ON SALE OF PRODUCT

- (a) Absolute ban (no exemptions possible).
- (b) Banned generally, but state agency authorized to grant exemptions (conditioned on: showing of need; collection requirements; manufacturers responsibilities; etc.)
- (c) Banned only if manufacturer fails to meet collection and other responsibilities.

2: STATE REGULATORY AGENCIES

- (a) State agency authorized or required to issued regulations defining collection procedures, responsibilities, etc.
- (b) State statute generally defines collection procedures, responsibilities, etc.
 - [i] Manufacturers must get approval of collection plans from state agency prior to implementation.
 - [ii] Prior approval of implementation plans not required, but manufacturer must notify state agency of plans.

3: MANUFACTURER RESPONSIBILITIES

- (a) Accept used batteries.
- (b) Identify collection site having necessary treatment and disposal permits.
- (c) Inform purchasers about:
 - [i] Prohibition against disposal in solid, medical waste.
 - [ii] Collection site available to user.
 - [iii] Telephone number user can call for more information.
- (d) Pay for consumer (user) education efforts.
- (e) Pay for transportation and disposal of used batteries.
- (f) Get approval of collection plans, etc. from state agency prior to implementation.
- (g) Notify state agency of collection plans, etc. (approval not required).
- (h) Manufacturer must submit periodic reports to state agency.

4: USER RESPONSIBILITIES

- (a) Don't dispose of batteries in solid or medical waste.
- (b) Pay for proper disposal.

5: DEPOSITS

(a) \$2/battery required at time of sale, unless trade-ins of used batteries made at that time.

6: OTHER

- (a) Legislation does not distinguish between button cells and larger sizes of mercury batteries.
- (b) "Retailer," "wholesaler," "supplier," "all participants in the stream of commerce," etc. mentioned in legislation, may have responsibilities.

APPENDIX E ALKALINE BATTERIES

STATE	EFFECTIVE DATE, 250 PPM (0.025%) MERCURY	EFFECTIVE DATE, NO-MERCURY FORMULA
Federal (pending)		1-1-96 (mfg. date)
Arkansas		1-1-96 (mfg. date)
California	1-1-94 (mfg. date)	1-1-96 (mfg. date)
Connecticut	1-1-92 (mfg. date)	
Florida	7-1-93 (sale date)	1-1-96 (sale date, rtl.)
Iowa	7-1-93 (sale date)	1-1-96 (sale date, rtl.)
Maine	1-1-94 (sale date)	1-1-96 (mfg. date)
Massachusetts (pending)		1-1-95 (sale date, rtl.)
Michigan (pending)		7-1-95 (sale date, mfg.)
Minnesota	2-1-92 (sale date, mfg.)	1-1-96 (sale date, mfg.)
New Hampshire	1-1-93 (mfg. date)	1-1-96 (sale date, mfg.)

New York	1-1-92 (mfg. date)	
Oregon	1-1-92 (mfg. date)	
Rhode Island	1-1-92 (mfg. date)	
Vermont	2-1-92 (mfg. date)	1-1-96 (sale date, rtl.)
Wisconsin		1-1-96 (mfg. date)

NOTES:

- 1. Information as of August 18, 1994.
- 2. State laws banning the sale of alkaline batteries containing more than allowable mercury content may be either of two types:
 - Effective date refers to manufacture. Batteries made prior to the effective date may be sold after the effective date, even if they exceed allowable mercury content. ("Mfg. date")
 - Effective date refers to sale. Batteries containing more than allowable mercury content may not be sold, regardless of when manufactured. But the legislation may refer either to the date of sale by the battery manufacturer ("sale date, mfg.") or by the retailer ("sale date, rtl.").
- 3. Mercury limitations do not apply to alkaline button cells.

STATE	EFFECTIVE DATE, NO-MERCURY FORMULA
Federal (pending)	1-1-95 (mfg. date)
Arkansas	1-1-94 (mfg. date)
California	1-1-94 (mfg. date)
Connecticut	1-1-93 (mfg. date)

New Hampshire	1-1-93 (mfg. date)
New Jersey	1-1-92 (mfg. date)
New York	1-1-93 (mfg. date)
Wisconsin	7-1-94 (mfg. date)

NOTES:

- 1. Information as of August 18, 1994.
- 2. State laws banning the sale of zinc carbon batteries containing more than allowable mercury content may be either of two types:
 - Effective date refers to manufacture. Batteries made prior to the effective date may be sold after the effective date, even if they exceed allowable mercury content. ("Mfg. date")
 - Effective date refers to retail sales. Batteries containing more than allowable mercury content may not be sold at retail, regardless of when manufactured. ("Sale date")

APPENDIX E CONSUMER MERCURY BUTTON CELL BATTERIES Information as of July 31, 1994

		EFFECT	IVE DATE	
JURIBDICTION	STATUS OF LEGISLATION	BAN	COLLECTION	NOTE (B)
FEDERAL	Pending	1-1-95		
ARKANSAS	Passed	1-1-94		
CALIFORNIA	Passed	1-1-94		
CONNECTICUT	Passed		1-1-92	2(a), (b)
FLORIDA	Passed	10-1-93		
IOWA	Passed		7-1-96	1, 2(a)
MAINE	Passed	1-1-93		
MARYLAND	Passed		7-1-94	1
MASSACHUSETTS	Pending	??		
MICHIGAN	Passed		1-1-98	3
	Pending	7-1-95		
MINNESOTA	Passed	2-1-92		
NEW HAMPSHIRE	Passed		1-1-93	2 (b)
NEW JERSEY	Passed	1-1-94		
RHODE ISLAND	Passed	1-1-93		
VERMONT	Passed	1-1-93		

Note 1: Battery manufacturers financially responsible for collection, transportation, disposal, consumer education, etc. Failure to meet these requirements results in a sales ban for the manufacturer's mercury button cells.

Note 2: Battery manufacturer not expressly responsible, but:

- (a) Retailer required to collect;
- (b) State regulatory agency to issue regulations.

Note 3: \$2/battery required at time of sale, unless trade-ins of used batteries made at that time.

APPENDIX F: DATA ON MERCURY RELEASES

Appendix F contains information on mercury releases available from several federal and state reporting systems. Federal and state agencies collect information on mercury releases as part of broader programs designed to meet reporting requirements for multiple substances. It is important to keep in mind that each data set must be interpreted separately due to differences in reporting requirements and the types of information collected.

All data is organized by Standard Industrial Classification codes (SIC codes). This structure offers a uniform method to identify industrial sectors. The first two digits of an SIC code identify major industrial sectors. The full four digit code allows more specific identification of industry type. Even with this detailed breakdown, variation exists within a given SIC code. For a complete list and description of SIC codes, as well as the specific industrial processes covered by each code, refer to the <u>Standard Industrial Classification Manual</u>.

By using SIC codes, it is possible, on a broad scale, to identify the types of industrial sectors where mercury releases occur most frequently. However, particularly for air emissions data, the link to SIC code may be misleading. For example, any facility that maintains a coal-fired boiler on site may generate mercury releases that are independent of a specific industrial process that uses mercury.

Appendix F includes mercury release information from six specific data sources. The list below indicates the specific components of Appendix F. The first page of each set of data includes an explanation of the reporting program and the data reviewed.

- App. F1 Summary of Reporting Information: The table shows, by SIC code, the frequency with which mercury releases appear in each data set reviewed for this analysis. It is organized by SIC code and by state.
- App. F2 Toxic Chemical Release Inventory (TRI) data: TRI data for 1992 and 1991.

F2a = 1992 data for Great Lakes states only

F2b = 1991 data for Great Lakes states only

F2c = 1992 national mercury data

F2d = 1991 national mercury data

App. F3 RCRA Biennial Report System (BRS) data: 1991 BRS data for mercury-bearing waste codes.

F3a = Summary of facilities reporting mercury-bearing wastes in each SIC code

F3b = Summary of source processes that generate mercury-bearing wastes

App. F4 Permit Compliance System (PCS) data: PCS data for the Great Lakes basin (facilities located in the Great Lakes basin only; not necessarily statewide)

F4a = July 1992 - June 1993 data F4b = July 1991 - June 1992 data

- App. F5 Wisconsin Air Point Source data: Mercury air emissions data collected for Wisconsin's Clean Air Act Title V Operating Permit Program (reported data).
- App. F6 Michigan Critical Materials Registry: 1991 data collected under Michigan's wastewater reporting program. Data indicates the number of facilities reporting mercury use.
- App. F7 Indiana AIRs data: Air emissions <u>derived</u> from data reported on criteria pollutants. This is <u>not</u> measured data. Instead, it represents estimated mercury releases based on emissions factor calculations.

NOTE: This table compares the number of facilities in each SIC code that report mercury releases under the different federal reporting programs discussed in this report.

In addition, three Great Lakes states collect state-specific information on mercury releases, which is also captured in this table. The data is the most current available for each program.

This table illustrates how the number of Incilities reporting mercury releases varies based on the reporting requirements and thresholds of each reporting program.

More detailed data sets for each program are provided following this summary table.

BRS data for New York and Wisconsin are not included in this total due to technical difficulties in obtaining the data. Additional information may be provided at the September meeting. Ohio data did not include waste origin codes, and therefore may include remediation wastes as well as ongoing process wastes.

KEY: TRI = Toxic Chemical Release Inventory, 1992 data

BRS = RCRA Biennial Report System, 1991 data

PCS = Permit Compliance System, July 1992 - June 1993 data

IN = AIRS Inventory, 1990 data

MI = Michigan Critical Materials Wastewater Report, 1991 data

WI = Wisconsin Title V Operating Permits Program, 1991 data

ROLE OF MERCURY AND ITS USES AT THE FACILITY

A = Produce	D = For sale/distribution
8 = import	E = As a byproduct
C. = For on-site use/processing	F = As an impurity
Z = Process the toxic chemical	
A s le e reectent	C m Am am article component

D = Repackaging

3 - Otherwise use the toxic chemical

B = As a formulation component

- A = As a chemical processing aid
- B = As a menufacturing aid

1 = Manufacture the toxic chemical

C = Ancillary or other use

SOURCE REDUCTION ACTIVITIES

W13 =	improved maintenance scheduling,
	recordkeeping, or procedures

- W19 = Other changes in operating practices
- W36 * Implemented inspection or monitoring program of potential spill or leak sources
- W42 = Substituted raw materials
- W52 Modified equipment, layout or piping
- W58 = Other process modifications
- W82 = Modified design or composition of product

METHODS USED TO ID SOURCE REDUCTION ACTIVITIES

- 101 = Internal Pollution Prev. Opportunity Audi
- TO2 = External Pollution Prev. Opportunity Audi
- 103 = Materials Balance Audits
- 104 = Participative Team Management
- 105 = Employee Recommendation (independent of # formal company program)
- 110 = Vendor Assistance
- 111 = Other

ROLE OF MERCURY AND ITS USES AT THE FACILITY

1 = Manufacture the toxic chemical

A = Produce

B = Import

C = for on-site use/processing

D = For sale/distribution

E = As a byproduct

F = As an impurity

3 = Otherwise use the toxic chemical

A = As a chemical processing aid

B = As a manufacturing aid

C = Ancillary or other use

2 = Process the toxic chemical

A = As a reactant

C = As an article component

B = As a formulation component

D = Repackaging

18.13 % (35,795 kg/yr) of Total Releases and Transfers of Mercury came from Great Lakes States

*TRI information may be edited after it is originally reported. The 1991 reporting year data shown in this table reflect a TRI download performed nearly concurrently with the TRI information published in April 1993, with one exception. One Great Lakes facility that had reported mercury releases in this version of TRI was no longer included in a later version of TRI. To maintain consistency with 1991 TRI mercury data pulled specifically for the Great Lakes states (downloaded 6/21/94), that facility was removed from this table.

ROLE OF MERCURY AND ITS USES AT THE FACILITY

1 = Manufacture the toxic chemical

A = Produce D = For sale/distribution

NOTE: This table shows, by the SIC code of the generating facility, the number of generators that reported hazardous mercury-bearing waste streams for the 1991 reporting year, the most recent year for which data is widely available. Large Quantity Generators (LQGs) and permitted Treatment. Storage, and Disposal facilities (TSDs) are required to report on waste generation and management activities biannually, although some states require more frequent reporting or have lower generation thresholds that trigger reporting requirements. Most states manage this data through the Biennial Reporting System (BRS) or Biennial-Report compatible data systems. Mercury-bearing wastes include the following waste codes: D009 (characteristic for mercury). U151 (discarded product). K071 (chlor alkali process waste), K106 (chlor-alkali process waste), P092 (phenylmercuric acetate), and P065 (mercury fulminate). This table includes only data for waste of recurrent origin; that is, waste generated as a result of ongoing production or services processes. Data for waste streams of other waste origins (remediation-derived waste hazardous residuals resulting from the treatment of other waste streams, and waste not generated originally at the reporting facility) are not included. Ohio does not collect waste origin information, and as a result, any hazardous mercury-bearing remediation waste, treatment residuals, or wastes passing through Transfer/Storage facilities may be included in Ohio data. Wisconsin and New York data are not included due to technical delays in obtaining the data.

NOTE: This table, organized by facility SIC Code, shows the specific processes responsible for generating mercury-bearing waste streams, as reported in 1991 BRS data. Facilities supply a source code, describing the specific process or activity that created the waste, for each waste stream generated. Ohio data did not include source code information, and therefore, Ohio facilities are not included in the totals. Wisconsin and New York data are not included at present due to technical delays in obtaining the data. Facilities are counted once for each source code they report in connection with mercury-bearing waste streams, regardless of the number of mercury-bearing waste streams associated with the source process.

A summary page of source codes and total number of facilities reporting each source code is included at the end of this section.

Note: This table shows the facilities (by SIC code) that reported mercury emissions under Wisconsin's Clean Air Act Title V Operating Permits Program. Under the Title V Program, states may impose fees up to \$25/ton of emissions of all eligible substances. In Wisconsin, facilities report emissions that exceed 1 pound.

In some cases, mercury emissions may be linked to processes such as fuel combusion that are independent of SIC codes.

Kev

Number of Facilities = # of facilities reporting emissions equal or greater than 1 lb.

Total Emissions= total Hg emissions from all sources reporting in each SIC Code.

Range = range of reported releases from all sources reporting in each SIC Code.

NOTE: This table shows the facilities (by SIC code) that may generate mercury emissions in Indiana. The information is included in Indiana's Aerometric Information Retrieval System (AIRS) 1990 emissions inventory, which contains data on criteria pollutant emissions. Mercury emissions quantities are estimates derived by the Indiana Department of Environmental Management, based on reported data. As such, the quantities do not represent measured data, nor data supplied directly by individual facilities. The quality of this data may be suspect based on uncertainty of specific emissions factors used and its completeness.

In some cases, mercury emissions may be linked to processes such as coal-burning boilers that are independent of SIC codes and specific industrial processes.
