EPA's proposed approach for both treatment standards and applying a dilution prohibition for characteristic wastes received many comments. Most commenters expressed concern about the regulatory impact of these rules on land disposal facilities regulated under RCRA subtitle D. There was particular concern over the impact of the proposed rules on existing wastewater treatment trains regulated under the Pretreatment and National Pollutant Discharge Elimination System (NPDES) programs, pursuant to sections 307(b) and 402 of the CWA, which use surface impoundments not regulated under RCRA subtitle C. In addition, there were many comments concerning the impact of the proposed rules on the SDWA program for nonhazardous injection wells.

As discussed below, Congress has given apparently conflicting guidance on how the Agency should address land disposal prohibitions for characteristic wastes. EPA believes it has authority to reconcile these potential conflicts and to harmonize statutory provisions to forge a coherent regulatory system. (See RCRA Section 1006(b)—"The Administrator shall integrate all provisions of (RCRA) for the purposes of administration and enforcement and shall avoid duplication to the maximum extent practicable, with the appropriate provisions of the (CWA and SDWA)".) Within this authority EPA seeks to further the policy of section 3004(m) to treat hazardous waste prior to land disposal. However, EPA may also take

steps to address problems that could arise from integration of LDR prohibitions in the context of the RCRA Subtitle D, CWA and SDWA programs. A more detailed discussion of the legal authority for this approach is provided below.

b. *General Standard for Agency Construction of Statutes.* *Chevron U.S.A. Inc. v. NRDC*, 467 U.S. 837 (1984) sets forth a two-step process for determining whether to sustain an agency's statutory interpretations. First, a court determines whether Congress has spoken directly to the precise question at issue. If the intent of Congress is clear, then the agency construction must be consistent with the Congressional directive. If, however, the statute is silent or ambiguous with respect to the specific issue, the agency choice must be based on a permissible construction of the statute. The construction may reflect a reasonable accommodation of policies that are committed to the agency by statute.

For the reasons stated below, EPA believes that Congress has not spoken to the precise question of the point at which LDR prohibitions apply and, thus, the Agency may develop a reasonable interpretation of the statute considering the goals and objectives of the LDR program and RCRA in general.

c. *Scope of Agency Authority for Treatment Requirements.* Several industry commenters argue that EPA must determine the applicability of LDR requirements at the point of land disposal based on the language of RCRA section 3004(g), which authorizes EPA to prohibit "the land disposal of hazardous waste." Commenters argue that this language indicates a Congressional decision to apply LDR requirements only to waste which is listed or exhibits a characteristic at the point of land disposal.

The Agency agrees that this is one permissible construction of the language in section 3004(g). Clearly a waste must be "hazardous" to fall under the mandate of 3004(g). EPA could assess whether or not a waste is hazardous at the point of land disposal to determine whether the prohibition in 3004(g) applies. The Agency, however, does not believe this is the only permissible construction. Although section 3004(g) clearly authorizes EPA to prohibit the land disposal of characteristic waste, it does not specify that the status of the waste for purposes of the prohibition can only be evaluated at the point of land disposal. Rather, the evaluation of whether a hazardous waste is subject to the prohibitions can apply at the point of generation or at the point of disposal (and possibly at some other point or

combination of the two). Indeed, section 3004(g)(5) requires EPA to consider " * * * the goal of managing hazardous waste in an appropriate manner *in the first instance*," (emphasis added) when determining the scope of the land disposal prohibitions. See reference to section 3004(d)(1)(B) in section 3004(g)(5). This language can be read to refer to a point of generation approach. Moreover, the statutory structure provides for treatment of hazardous waste under section 3004(m) treatment standards *before* land disposal and not necessarily at the physical point of land disposal. Commenters further argue that the Congressional policy is to limit the scope of the LDR provisions to facilities currently regulated under subtitle C of RCRA.

As discussed below, the Agency has concluded that applying LDR requirements at the point of generation is not only a permissible construction of the statute, but one which may better serve the goals and objectives of the LDR program.⁶ Specifically, EPA believes that applying LDR requirements at the point of generation may, in some cases, be necessary to effectuate the requirement that the Agency set treatment standards or methods for characteristic wastes under section 3004(m). As the Agency noted in the proposal at 54 FR 48490, the point of disposal approach could undermine the Congressional goals of the land disposal restrictions in critical ways when applied to characteristic wastes.

First, the Agency would not effectively be able to set a particular method of treatment or limit dilution for a characteristic waste. A point of disposal approach might permit dilution of characteristic wastes, since waste diluted below a characteristic level prior to land disposal would not be regulated by LDR provisions. Such dilution could be in lieu of treatment or a specified method and would not fulfill the goals of

section 3004(m). In many cases, dilution simply increases the volume of a waste without reducing or immobilizing the mass of hazardous constituents in the waste.

Second, the point of disposal approach could be construed to limit treatment standards both in terms of treatment levels and the range of hazardous constituents affected by the treatment standard. For characteristic wastes, a point of disposal approach would, in effect, preclude a requirement to treat below the characteristic level. In some cases, characteristic levels are not levels below which there may be no significant risks to human health and the environment. Rather, the EP (and TC) limits are levels at which wastes clearly are hazardous. 45 FR 33084 (May 19, 1980); 51 FR 21648 (June 13, 1986); 55 FR 11798 (March 29, 1990).⁷

Characteristic wastes also may exhibit both a specific characteristic and contain significant concentrations of other hazardous constituents. (This is true, for example, of the high TOC ignitable wastes and reactive cyanide wastes regulated under today's rule.) Simply treating the one specific characteristic which is an indicator that the waste is a hazardous waste would not necessarily fulfill the goal of section 3004(m), *i.e.*, to "substantially diminish the toxicity of the waste or substantially reduce the likelihood of migration of hazardous constituents from the waste so that short-term and long-term threats to human health and the environment are minimized" (emphasis added). The statutory focus on hazardous constituents beyond the specific characteristic constituent is also enunciated in sections 3004(d)-(g) of RCRA. These provisions authorize EPA to take into account " * * * the persistence, toxicity, mobility, and propensity to bioaccumulate of such hazardous wastes and their hazardous constituents" in establishing hazardous

⁶ The Agency has previously adopted the point of generation approach with respect to identification of waste subject to the California list prohibitions set out in RCRA section 3004(d)(1) and (2). 52 FR 25760 (July 8, 1987). Like characteristic wastes, California list wastes must contain constituents or exhibit a property above a certain level. Moreover, as a general matter, to ensure the proper management of waste in the first instance, EPA has required application of several 40 CFR part 268 requirements at the point of generation. See § 268.30(a)(3) and 52 FR 21072 (June 4, 1987) (initial generator must determine whether solvent wastes are prohibited); 53 FR 31146-47 (August 17, 1988) and 54 FR 28605 (June 23, 1989) (waste code carry-through principle applies at the point of generation and determines both the prohibition and the treatment standard for listed wastes). All land disposal restriction tracking requirements likewise attach at the point of generation. (268.7(a) and 54 FR 36968 (Sept. 6, 1989).

⁷ In *Hazardous Waste Treatment Council v. EPA* (HWTC III), 886 F.2d 355 (D.C. Cir. 1989) the court noted that it would be inappropriate under section 3004(m) to require treatment below levels which there are no longer threats to human health and the environment. *Id.* at 383. However, the court noted that the inquiry under section 3004(m) concerning the extent of treatment is different than levels established for other regulatory purposes, and specifically noted that EPA need not construe characteristic levels as levels below which no further minimization of threats can occur. *Id.* at 362. The Agency has recently discussed its rationale for a technology-based approach to treatment standards under section 3004(m) which does not cap the treatment requirements at delisting levels. (See 55 FR 6640, (February 28, 1990).) EPA recognizes that HWTC III is not dispositive on the issue we address today whether characteristic levels at the point of disposal serve as a jurisdictional bar to application of section 3004(m) treatment standards.

waste prohibitions. Section 3004(d)(1)(C) (emphasis added). Thus, EPA believes it has statutory authority to take into account all aspects of a waste stream in determining appropriate treatment and is not limited to considering merely one specific "characteristic" that indicates that the waste is hazardous in the first instance.

EPA also has general authority under RCRA section 3004 (a)(3) to establish different criteria for determining when wastes will enter and exit the hazardous waste management system—*i.e.*, when they will initially be designated as hazardous waste and when they no longer require RCRA subtitle C management controls. For example, the clean-closure standards for regulated units that hold characteristic wastes require removal of hazardous constituents even if the waste no longer exhibits a hazardous characteristic. See 53 FR 8705 (March 19, 1987). EPA also has previously promulgated regulations requiring that incinerators treating hazardous waste be operated to a certain efficiency even if a characteristic waste in the waste feed ceases to exhibit a characteristic somewhere in the combustion process.

EPA believes that under the first test in *Chevron*, Congress has neither mandated nor precluded a point of generation approach. In this case the "meaning or reach of a statute involve[s] reconciling conflicting policies." *Chevron*, 467 U.S. at 846 (citation omitted). Moreover, "a full understanding of the force of the statutory policy in the given situation has depended upon more than ordinary knowledge respecting the subject matters subjected to agency regulations." *Id.* Accordingly, EPA should make choices which represent "a reasonable accommodation of conflicting policies that were committed to the agency's care by statute." *Id.*

In this regard, section 1006(b) of RCRA provides EPA authority to integrate provisions of RCRA and other acts it administers, including the CWA and SDWA, for purposes of administration and enforcement. Such integration must be consistent with the goals and policies of these acts. Under this framework, EPA can analyze potential overlaps between regulatory programs in its decision-making. Where the goals are consistent, and uniform administration or enforcement is preferable, EPA may rely on one regulatory framework instead of applying potentially duplicative or inconsistent regulations. Accordingly, the Agency believes that it can harmonize potentially conflicting

policies by considering both the benefits of a given approach and any regulatory problems (including regulatory overlap) that would be engendered by the approach. The balancing may thus result in different application of LDR requirements for certain classes of facilities.

d. *Agency Framework for Addressing Treatment Standards for Characteristic Wastes and Integrating them With Other Regulatory Programs.* The Agency believes that it has authority to apply LDR requirements at the point of waste generation for characteristic wastes and that such an approach will generally better achieve the goals of the LDR program. Specifically, EPA believes it has the authority to set treatment levels below the characteristic levels, to specify methods of treatment, and to prohibit dilution for characteristic wastes where necessary and appropriate to further the goals of the statute. EPA recognizes, however, that there are many far-reaching policy considerations respecting the actual implementation of this approach. For example, a point of generation approach could apply to management of waste prior to RCRA subtitle D land disposal.*

LDR standards which require waste to be treated to below characteristic levels would apply to wastes currently destined for RCRA subtitle D facilities. Application of the LDR provisions would be a very significant change in the regulatory scheme for these facilities, and could cause major administration and enforcement problems for both EPA and these facilities. For example, EPA currently has no authority to enforce subtitle D criteria against subtitle D facilities, and hence has no enforcement program for these facilities. In order to ensure that these facilities met the subtitle C requirements, the Agency would have to implement an enforcement scheme that addressed thousands of subtitle D facilities. In addition, owners and operators of subtitle D facilities would need to meet complex LDR tracking requirements. Many may decide not to accept partially treated characteristic wastes rather than comply, thus, diverting potentially large volumes of non-hazardous waste to subtitle C facilities and potentially aggravating capacity problems at subtitle C

* Waste disposed into such units would need to meet the treatment requirements unless disposal is (1) into a "no migration" unit approved under 40 CFR part 148 or 268, or (2) into a surface impoundment which meets the requirements of RCRA section 3005(j)(11).

facilities.⁹ As noted in the proposal at 54 FR 48491, some of these problems may be addressed by future regulatory revisions. EPA will continue to evaluate this issue as it addresses standards for the wastes identified by the new Toxicity Characteristic (TC).

In addition, many of these potentially affected subtitle D units contain wastes that are regulated, in part, under the National Pollutant Discharge Elimination System (NPDES) and pretreatment programs under sections 301, 304, 307, and 402 of the CWA, and the Underground Injection Control (UIC) program under the SDWA. Requiring treatment below characteristic levels or imposing a dilution prohibition would require significant changes to the operations of these facilities and create problems of regulatory integration.

This is not to say that the section 3004(m) objectives carry little weight with respect to characteristic wastes. On the contrary, particularly with respect to toxic wastes, these policies are of critical importance. Moreover, many of these potential implementation problems may be addressed by future rulemakings.

Section 1006(b) of RCRA requires the Agency to integrate "for the purposes of administration and enforcement" RCRA subtitle C with the goals and policies of other portions of RCRA, as well as other statutes administered by EPA. In light of this requirement and the absence of any clear Congressional directive to apply LDR requirements directly to subtitle D facilities, the Agency must ask itself whether the benefits of treating below characteristic levels warrant the serious implementation problems such as those discussed above. This is particularly true where the administrative record contains inadequate data to set levels below the characteristic level for the many waste matrices represented by a single characteristic waste code. However, where the data is adequate, EPA believes it can successfully implement treatment requirements beyond removal of the characteristic, on a case-by-case basis, without significant disruptions to other regulatory programs to further the goals of section 3004(m) by requiring treatment beyond removal of the characteristic. EPA is prepared to reevaluate these issues in future rulemakings based on further information and experience with implementing the LDR program.

The extent to which the treatment goals of section 3004(m) are furthered by

⁹ As noted below, EPA has provided a regulatory structure to enforce dilution rules which does not impact subtitle D facilities.

treatment beyond removal of the specific characteristic and by application of LDR dilution rules is discussed below for certain classes of wastes and certain classes of waste management practices. EPA also will consider section 3004(g) and the Congressional directive under section 1003(b) of RCRA to integrate regulatory programs. Accordingly, EPA's approach is to balance both the extent of additional treatment provided from treatment beyond removal of a characteristic and regulatory integration concerns for LDR standards relating to characteristic wastes.¹⁰

Below, EPA addresses three separate LDR requirements: treatment levels, methods of treatment, and dilution prohibitions. In addition, EPA discusses exclusions for some of these requirements for certain practices regulated under the CWA and SDWA.

3. Treatment Levels

a. Environmental Considerations.

Section 3004(m) states that treatment standards should substantially diminish the toxicity or mobility and minimize short-term and long-term threats. The legislative history of this provision also states that regulation under RCRA should complement and reciprocally re-enforce regulations under the CWA. S. Rept. at 18. EPA's framework for developing best demonstrated available technologies helps to ensure that toxicity and mobility are minimized. Additionally, the methods or levels derived through the BDAT process also minimize short and long-term threats to human health and the environment. Thus, in establishing BDAT, EPA seeks to achieve substantial reductions in toxicity and mobility, not merely incidental or small reductions. Available data and objectives of the land disposal

¹⁰ In determining that some balancing of competing section 3004(m) and 1006(b)/3004(g) interests is necessary in establishing prohibitions for characteristic wastes, the Agency is further determining that the framework outlined in the court's opinion in *HWTC III*, 886 F. 2d 355 (D.C. Cir. 1989) and the Agency's response to that opinion (55 FR 6640 (Feb. 28, 1990)) is not dispositive in the differing context of characteristic wastes. Both the opinion and the Agency's response dealt with situations where listed hazardous wastes were being disposed so there were no competing interests to balance against the Section 3004(m) mandate. Consequently, the Agency determined that until it could develop *de minimis* concentration levels which establish when threats from prohibited wastes are minimized, it would opt for the certainty of technology-based treatment standards to remove as much of the uncertainty associated with land disposal of hazardous wastes. 55 FR at 6642. Characteristic wastes present a different situation, however, due to the potential disruption of other programs, see *supra*, and possible minimal benefits to treatment below the characteristic levels in some cases.

restrictions program are both relevant for determining the appropriate level of minimization in individual cases.

Treatment to a characteristic level will result in a substantial reduction in the toxicity or mobility of the characteristic waste matrices EPA has evaluated in this rulemaking. For example, EPA's stabilization data for arsenic demonstrated untreated EP toxicity from 41 to 6450 mg/l. Treatment of these wastes to the characteristic level of 5 mg/l results in a reduction of 88 to 99.9%. The Agency also believes that further treatment may, in some cases, continue to minimize threats to human health and the environment. However, for other waste treatability groups addressed in this rulemaking, EPA believes it only has sufficient data, at this time, to establish treatment levels at the characteristic level. See section III A above.

This section sets forth EPA's approach for developing treatment standards for each category of characteristic wastes. The Agency based its decisions on the data available at the time of this rulemaking. See RCRA section 3004(d)(1). EPA plans to re-examine these standards as new information becomes available. In addition, EPA will develop additional standards for the newly-identified wastes in the toxicity characteristic rule.

Today's rule reflects a decision to take limited, but nonetheless significant, steps within the point of generation framework. As a general matter, the Agency believes that the goals of section 3004(m) may require application of standards which go beyond the characteristic level (subject to harmonization with section 3004(g) policies) in some future cases. EPA intends in the rulemaking for TC wastes to evaluate more stringent treatment levels for more treatability groups. This would potentially require lower levels for characteristic constituents and treatment of other hazardous constituents in a given characteristic waste matrix. The phased approach in today's rule is consistent with the principle that an agency is entitled to the highest deference in deciding the sequence and grouping in which it addresses issues. *Hazardous Waste Treatment Council v. EPA*, 861 F.2d 277, 287 (D.C. Cir. 1988) (upholding EPA's construction of HSWA statutory provisions in a way that allowed the Agency to take one step at a time in implementing the provisions under HSWA); *Associated Gas Distributors v. FERC*, 824 F. 2d 981, 1039 (D.C. Cir. 1987).

(1) *Toxic Wastewaters*. EP toxic inorganic wastewaters are primarily destined for NPDES wastewater treatment systems, pretreatment systems and UIC injection wells. Given current data EPA could set treatment levels about an order of magnitude below the characteristic levels for some of the EP toxic metal wastewaters. Imposing treatment standards below the characteristic level, however, could have the effect of invalidating legitimate methods of treatment involving surface impoundments that are part of CWA wastewater treatment trains (equalization basins used to equalize flows to centralized chemical precipitation and sedimentation treatment, for example). A treatment standard below characteristic levels would need to be met prior to placement in a subtitle D treatment impoundment. This would be so even though the impoundment might treat the waste for purposes of CWA requirements. In effect, this could move BAT/PSES standards from end-of-pipe to in-process, requiring facilities to change their existing wastewater treatment systems or comply with internal waste stream requirements that would overlap with CWA requirements. Imposing such standards on Class I non-hazardous UIC disposal could interfere with protective disposal practices with no corresponding environmental benefit (see discussion on dilution below).

As a result, EPA is not imposing treatment standards below characteristic levels for such wastewaters. Based on the information in the rulemaking record virtually all wastewaters are managed in the context of CWA treatment impoundments or UIC wells.¹¹

(2) *Toxic nonwastewaters*. With respect to nonwastewaters exhibiting the EP characteristic for metals, EPA determined that BDAT is based on vitrification of stabilization. These technologies are matrix-dependent types of treatment. When considering characteristic wastes, the amount of diversity within a single waste code is typically extensive. This is because, unlike listed wastes, the characteristics do not identify wastes from single processes, single industries, or single chemical species, but rather can come from virtually any process or industry.

¹¹ If EPA should receive information in the future indicating that significant volumes of wastewater is land disposed in another context EPA will reevaluate the issue of setting treatment levels lower than the characteristic level for EP toxic metals. Again EPA is utilizing its considerable discretion to address issues one at a time. See *HWTCIII*, *supra*, 861 F. 2d at 287.

Using available data, it is not possible in this rulemaking, due to lack of time and data on this diverse universe, to subcategorize each characteristic waste into treatability groups designed specifically for certain industries or processes. Thus, in considering what treatment standards are achievable for EP toxic metal nonwastewaters, the Agency had to develop uniform standards based on BDAT technology that constitute all or most of the wastes identified by the characteristic.

As discussed in section IIIA. of the preamble, the Agency is confident that these wastes can be treated at least to characteristic levels. However, the Agency is unable to treatment standards below the characteristic level are achievable for all of such wastes. Certainly, as shown by data submitted by the waste treatment industry and other commenters, some samples in these waste categories can be treated to levels below the characteristic, and some to levels well below (an order of magnitude or more, in some cases). The Agency does not believe that these data are sufficiently representative, however, to warrant extrapolation to all waste matrices under a given waste code.¹² See discussion in section IIIA.

In reviewing the additional data submitted by commenters, the Agency was struck by the amount of diversity often present in the treatment data for a particular characteristic, not only confirming the matrix-dependent nature of the technology, but the difficulty of finding a single numerical standard that would be generally achievable for all wastes in that particular metal waste code. Another problem confirmed by data is that many wastes exhibit characteristics for more than one metal, and optimized treatment for one metal can preclude optimized treatment for another. Yet virtually all of the metal treatability data in this record is for treating only one metal.

Even if the Agency had enough data to require treatment below the characteristic levels for these wastes, it would likely have to establish specific treatability groups within the individual codes (as done today to a limited extent). Many of the difficulties in assessing data noted briefly above, and discussed in detail in the sections on each characteristic metal, appear to be industry or process specific. It should be noted that the Agency expects that treatment will result in levels slightly

¹² The treatment industry data, for example, was often deficient in such information as to whether and how concentrated characteristic wastes are mixed and back calculations for dilution effects resulting from pretreatment mixing. See section IIIA.

below the characteristic levels in any case. This is because most treatment technologies cannot easily be "turned off" at precisely the characteristic level and, thus, EPA believes the requirement to treat to the characteristic level will often result in further treatment.

For EP toxic pesticide nonwastewaters, treatment is based on a non-matrix dependent technology that can reduce hazardous constituent levels to orders of magnitude below the characteristic level. Thus, the types of difficulties posed for EP metals—assessing treatment achievability for a wide variety of wastes treated by a matrix-dependent technology—are not presented for pesticide wastes. Moreover, the pesticide wastes are potent carcinogens, so that removing the uncertainties of the threats they pose when land disposed is highly desirable. The Agency, thus, is establishing treatment standards for these wastes based on performance of optimized destruction technology. EPA does not believe the general regulatory difficulties in implementing this requirement to treat below characteristic levels are significant in the context of subtitle D facilities as there is a limited amount of this waste in existence and the destruction of the toxic constituents is a clear benefit over other treatment approaches.

(3) *Other Characteristic wastes.* As discussed in section IIIA., for most corrosive, reactive, and ignitable characteristic wastes, the Agency has determined that the appropriate treatment for these wastes is to remove the characteristic. The environmental concerns from the properties of ignitability, corrosivity, and reactivity are different from the environmental concern from EP toxic wastes. Toxic constituents can pose a cumulative impact on land disposal even where waste is below the characteristic level. Where wastes pose an ascertainable toxicity concern, as with high TOC ignitable wastes, and cyanide-bearing and sulfide-bearing reactive wastes, the Agency has developed treatment standards that address the toxicity concern and (in-effect) require treatment below the characteristic level. As discussed in section IIIA., this approach is important to address toxic constituents in this waste. EPA does not believe the regulatory problems in implementing standards for this limited number of streams will be significant. Otherwise, treatment that removes the properties of ignitability, corrosivity, and reactivity, fully addresses the environmental concern from the properties themselves. Further

discussion is contained in the preamble dealing with each specific characteristic.

b. *Regulatory Problems.* In reaching the approach set forth in today's rule, EPA has considered the advantages of additional treatment, with the difficulties in (1) implementing a requirement to treat below characteristic levels and (2) the effect of such a rule on overlapping federal environmental programs.

The characteristic level evaluated at the point of disposal serves to distinguish certain disposal practices and facilities from other permitting and regulatory requirements under Subtitle C of RCRA. Many commenters argued that there are significant advantages to providing a clear regulatory boundary which serves, in most cases, to separate the jurisdiction of different environmental programs. As discussed above, LDR provisions that apply to require treatment beyond removal of the characteristic might require complicated tracking and enforcement provisions that would apply at many subtitle D disposal facilities which are currently not subject to any subtitle C requirements. The most complicated of such requirements would involve enforcing levels below the characteristic levels. To enforce and implement such requirements, EPA would potentially need to expand the universe of disposal facilities covered by the LDR provisions to perhaps thousands of facilities.

Requiring levels of treatment below the characteristic level would also have specific disruptive impact on practices regulated, in part, under the CWA. In effect, a treatment standard below characteristic levels would need to be met prior to placement in a surface impoundment used in the treatment process. EPA estimates that up to 2000 nonhazardous treatment impoundments could be affected by a requirement for treatment below characteristic levels. There are other difficulties in applying treatment standards below characteristic levels to injection wells regulated under the SDWA which are described in detail below.

EPA does not believe that the current technical data in the record justifies treatment levels below characteristic levels for the nonwastewater EP toxic metals. Thus, EPA has not engaged in an extensive balancing of regulatory integration problems for the wastes in this rule. For the EP toxic pesticides, EPA believes treatment to the levels provided for in the BDAT incineration technology is important to destroy these particularly dangerous pesticides. Because there is a limited amount of these pesticides, EPA believes the

environmental considerations outweigh any difficulties in implementing the LDR requirement to treat below the characteristic level. For wastewaters, EPA believes the regulatory difficulties in integrating the CWA and SDWA programs outweigh the limited benefit from additional treatment based on the current information. Finally, EPA has set requirements to remove certain toxic constituents from certain ignitable and reactive wastes. Some of these treatment requirements are in the form of methods which are discussed below. Again, EPA believes the environmental benefit in terms of treatment outweighs the regulatory problems in providing such standards for these wastes because of the limited circumstances involving such wastes.

4. Methods of treatment

a. Environmental Considerations. EPA has express authority to specify methods of treatment as the treatment standard. As discussed above, this necessarily entails a point of generation approach. Imposition of these treatment methods normally results in more than the removal of the characteristic and further minimizes threats to human health and the environment.

EPA proposed methods of treatment for certain classes of characteristic wastes. There are several advantages to specifying a method of treatment. First, EPA may not have enough data to set a level of treatment. In such cases, a method can still fulfill the purposes of 3004(m) by providing for treatment. Second, analytic methods may not exist to measure key constituents in a prohibited waste, in which case designation of a method is the only way to ensure treatment. Third, a method may treat other constituents beyond those addressed by the specific characteristic. Finally, specifying a method may preclude other treatment alternatives which the Agency believes create other risks to the environment. For example, some wastewater treatment systems remove volatile organics from the wastestreams simply by venting these volatiles to the atmosphere. However, there are two disadvantages to specifying methods of treatment: (1) It may preclude the use of alternative methods or development of alternatives that are cost-effective and consistent with Agency objectives; and (2) it establish a national requirement that may not be appropriate for a variety of case-specific applications. For these reasons, EPA must consider carefully a decision to rely on methods of treatment.

In today's rulemaking, EPA is specifying incineration or fuel

substitution for ignitable characteristic wastes with high levels of total organic carbon (TOC). The TOC content of these wastes serves as an indicator of high concentrations of hazardous constituents which incineration will destroy. See, e.g., Senator Chaffee's floor statement introducing the amendment that became section 3004(m): "for wastes with a high organic content, incineration should be required in lieu of land disposal." 130 Cong. Rec. S9179 (July 25, 1984).

b. Regulatory Problems. To have any practical effect, methods of treatment must generally attach at the point of generation. EPA does not believe, however, that this requirement will be difficult to implement in this rule because a limited number of characteristic wastes are affected. EPA is also somewhat limiting the circumstances under which the methods would apply to avoid certain regulatory integration problems with the SDWA program regulating underground injection wells. However, as discussed below, the requirement to incinerate these wastes is entirely consistent with and promoting of the objectives of the CWA. Accordingly, EPA believes the benefits of incineration of certain categories of characteristic waste outweigh any limited regulatory problems under the CWA.

5. General Dilution Prohibition

a. Environmental Considerations. Dilution rules are intended to prohibit dilution in lieu of treatment and to ensure that wastes are treated in appropriate ways. As discussed in the preamble sections on treatment of characteristic wastes, EPA believes the mixing of waste streams to eliminate certain characteristic is appropriate treatment for most wastes which are purely corrosive, or in some cases, reactive or ignitable. As a general matter, these are properties which can effectively be removed by mixing. On the other hand, simple dilution is not effective treatment for toxic constituents. Dilution does not itself remove or treat any toxic constituent from the waste. Accordingly, EPA believes that a dilution prohibition for characteristic wastes is important for purposes of the treatment requirements and carries a significant benefit.

The dilution rules will help minimize hazardous constituents that are currently disposed under both the RCRA subtitle C and D programs. Although few data on specific health and environmental impacts resulting from subtitle D facilities are available, the large volume of waste and number of facilities involved present concerns

about actual and potential threats. Based on a 1984 study, EPA estimated that there were 7.6 billion tons of industrial nonhazardous waste disposed in approximately 28,000 industrial solid waste and disposal facilities. More than half of these facilities were surface impoundments, which create concerns because of the mobility and physical driving force of liquids in impoundments and the current limited use of design controls. Study results indicated only sporadic use of design and operating controls at industrial solid waste landfills and surface impoundments, with only 12 percent and 22 percent, respectively, employing any type of liner system. (53 FR 33320, August 30, 1988). Study findings also reveal that few of these facilities have monitoring systems, and only 35 percent were inspected by States in 1984, the latest year for which data are available. The present inspection status is unknown. Limited data on violations of State requirements, coupled with these statistics on design and operating controls, suggest that releases may be occurring (53 FR 33320, August 30, 1988). As discussed below, EPA believes this is an area where the environmental benefits imposing a prohibition on characteristic wastes at the point of generation outweigh the problems in integrating other regulatory programs.

b. Regulatory Problems. As discussed below, the LDS dilution prohibition could have a significant disruptive effect on practices regulated, in part, by programs under the CWA and SDWA. EPA generally agrees with the many comments regarding impacts on these programs. In harmonizing or reconciling the general need for a dilution prohibition with the need to avoid these disruptive impacts, EPA believes it is appropriate to exempt certain practices from the dilution prohibition. These practices and the rationale for the exemptions are described in the sections that follow.

EPA does not believe these same regulatory problems apply to the program for disposal of other waste under subtitle D of RCRA. Subtitle D establishes a framework for Federal, State, and local government cooperation in controlling the management of nonhazardous solid waste. The Federal role in this arrangement is to establish the overall regulatory direction, to provide minimum standards for protecting human health and the environment, and to provide technical assistance to States for planning and developing environmentally sound waste management practices. The actual planning and direct implementation of

solid waste programs under subtitle D, however, remain State and local functions. Most States impose some set of overall facility performance standards; however, among the States, specific design and operating standards vary greatly.

Under the authority of sections 1008(a)(3) and 4004(a) of RCRA, EPA promulgated the "Criteria for Classification of Solid Waste Disposal Facilities and Practices" (40 CFR part 257), and subsequently issued minor modifications to these Criteria. These Subtitle D Criteria establish minimum national performance standards necessary to ensure that "no reasonable probability of adverse effects on health or the environment" will result from solid waste disposal facilities or practices. The existing Part 257 Criteria include general environmental performance standards addressing eight major topics: floodplains, endangered species, surface water, ground water, land application, disease, air, and safety. Currently, EPA does not have the authority to enforce these criteria directly.

EPA does not believe this regulatory framework is at all similar to those under the CWA and SDWA which, as discussed below, the Agency is excluding from the LDR dilution rules. Specifically, there are limited federal regulatory, implementation or enforcement provisions that would require integration. (This is not the case, incidentally if treatment standards are established below characteristic levels.) In that case, the subtitle D facility would necessarily be involved in the implementation and enforcement of the prohibitions. Accordingly, EPA is codifying the general dilution prohibition for characteristic wastes with certain exceptions.

6. Exemption to Dilution Prohibition for Characteristic Wastes Treated for Purposes of Certain CWA Programs

a. Introduction. For listed wastes, there are generally no overlapping CWA and RCRA treatment requirements for wastewater ultimately discharged to a water of the United States or POTW.¹³

¹³ Wastewater which contains a listed hazardous waste and is ultimately discharged to waters of the United States under an NPDES permit pursuant to section 402 of the CWA or to a Publicly Owned Treatment Works (POTW) pursuant to section 307 of the CWA is not ordinarily subject to the land disposal prohibitions for several reasons. First, in many situations, the wastewater is managed in tanks prior to discharge and, thus, there is no placement in a land disposal unit. Second, even where a surface impoundment is used to treat hazardous waste prior to discharge such surface impoundments may satisfy the requirements of section 3005(j)(11) of RCRA in lieu of meeting

(Of course, sludges or other residues from NPDES treatment trains which are subsequently land disposed are subject to the land disposal restriction provisions.) Some of these facilities, however, generate waste which exhibits a hazardous characteristic but after mixing with other waste streams ceases to exhibit that characteristic prior to placement in a subtitle D surface impoundment which is part of the wastewater treatment train. These surface impoundments are land disposal units for purposes of LDR prohibitions. The practice of mixing could thus trigger LDR dilution rules. EPA received many comments that the proposed RCRA dilution prohibition for wastewater going into these impoundments could undermine the ability of these operators to use nonhazardous waste surface impoundments as part of their NPDES treatment train.¹⁴ This impact would occur despite the fact that further treatment would occur in the impoundment to remove constituents from the wastewater prior to discharge to waters of the United States or to a POTW. These commenters further argued that application of such RCRA rules to wastewaters already required to be treated under CWA requirements would be unduly confusing and duplicative.

b. Environmental Considerations. As discussed below, the NPDES program has a series of technology-based requirements for the treatment of wastewater prior to discharge to waters of the United States. See 33 U.S.C. 1314 and 40 CFR Parts 400-471. These requirements provide for treatment of wastewaters prior to discharge. Indeed, many of the LDR treatment standards are based on data used to set the CWA standards. Thus, EPA believes the overlap of an LDR dilution prohibition where an NPDES treatment train includes a nonhazardous treatment impoundment would not substantially further the treatment goals of the land disposal restrictions.

c. Regulatory Problems. The regulatory overlap of similar but not identical dilution rules would create significant regulatory disruption. Section 1006(b) of RCRA provides EPA the

section 3004(m) treatment standards. See § 268.4. Section 3005(j)(11) requires an impoundment to meet certain design requirements set out in section 3004(o)(1) of RCRA and be dredged annually to remove residues.

¹⁴ As noted above, applying LDR requirements at a point of generation would require a facility either to (1) treat the waste prior to placement in the surface impoundment (2) obtain a "no migration variance, (3) comply with section 3005(j)(11); or (4) install tank treatment instead of using surface impoundments.

authority to consider these integration problems and set requirements that are consistent with the goals and policies of the CWA and RCRA. Many of the effluent limitations guidelines and standards, including all of those reflecting mass-based limits and standards, have factored in controls on dilution. In addition, NPDES permit writers can set requirements which reflect the nature of the treatment process, including best management practices, mass limitations in lieu of concentration based limitations, adjustments to reflect pollutants in intake water, and conditions on internal waste streams. 40 CFR 122.44(k); 122.45 (f), (g) and (h). Indirect dischargers are also subject to specific CWA dilution rules in both the general pretreatment rules and the Combined Wastestream Formula (as well as though many the categorical standards). 40 CFR 403.6 (d) and (e).

In this case, the general treatment requirements and associated dilution rules under the CWA are generally consistent with the similar requirements under RCRA. Relying on the existing CWA provisions is, thus, consistent with the goals of both Acts and avoids unnecessary duplication and potentially conflicting requirements.

EPA also believes, however, that where the Agency has established a method of treatment, and where application of that method is consistent with and promotes the objectives of the CWA program, then the dilution prohibition should apply to make it impermissible to dilute these wastes to avoid treating them by the designated treatment method. This group includes the ignitable nonwastewaters containing greater than 10% total organic carbon (TOC). The treatment methods for these wastes is incineration or, in the case of the ignitable waste, fuel substitution. Prohibiting dilution to require the specified method is entirely consistent with the regulatory framework for the CWA programs. The high TOC ignitable wastes, in particular, are inappropriate for wastewater treatment systems as the high TOC levels would overwhelm the capacity for most biological treatment systems. In addition, EPA believes there are few remaining pesticide wastes designated as D012-17. Thus, this requirement should have minimum impact on CWA systems. Accordingly, the exemption from the dilution prohibition for CWA systems is not an exemption for the requirement to follow specific methods of treatment.

7. Exemption from LDR Prohibitions for Characteristic Wastes Disposed Below Characteristic Levels in Wells Regulated under the SDWA

a. *Introduction.* EPA has set out a regulatory program under sections 1421, 1422, and 1425 of the SDWA which contains "minimum requirements for effective programs to prevent underground injection which endangers drinking water sources." 42 U.S.C. 300h(b)(1). Class I deep wells inject below the lowermost geologic formation containing an underground source of drinking water (USDW). 40 CFR 144.6(a).¹⁵ These wells are subject to location, construction, and operating requirements set out at 40 CFR parts 144 and 146. In addition, EPA may authorize states to administer the UIC program. 40 CFR parts 145 and 147. There are approximately 400 such wells currently injecting only nonhazardous waste.

The large facilities that have these wells often mix waste streams and through this mixing remove the characteristic prior to disposal. A dilution prohibition would require restructuring of these facilities. Alternatively, the facilities could apply for a "no migration" variance under 40 CFR part 148.

b. *Environmental Considerations.* LDR dilution rules for wastes currently disposed of below the characteristic levels in UIC wells would be limited to toxic wastes. As discussed below, EPA is generally providing that treatment of ignitable, corrosive or reactive wastewater may be accomplished simply by removing the characteristic. This could be accomplished by mixing. (There are a few exceptions discussed in the specific discussion on treatment standards.) These general standards are based on EPA's technical evaluation of appropriate treatment for purposes of 3004(m) regardless of the disposal scenario. Thus, for these particular characteristic wastes, the application of the part 268 dilution prohibition to operators of nonhazardous waste injection wells would not require any additional treatment beyond what is already occurring. Moreover, there is a very limited amount of the pesticide wastes D012-17, and EPA is unaware of deepwell injection practices for these wastes. Thus, the characteristic wastes of concern for UIC wells in this rule are those that exhibit the characteristic of EP toxicity for metals at the point of generation.

¹⁵ A USDW is defined to include aquifers containing waters with up to 10,000 milligrams per liter ("mg/l") of total dissolved solids ("TDS"). 40 CFR 144.3.

EPA believes that the application of dilution rules to these wastes would not further minimize threats to human health and the environment.

Specifically, EPA believes that disposal of these metals by underground injection at the characteristic level is as sound as the treatment option. Native formation fluids in injection zones already contain substantial concentrations of these metals. The addition of more metal-bearing fluid below characteristic levels would not appreciably alter these concentrations. Moreover, the propensity of such metals to adhere to and, thereby, generally stay contained in the injection zones makes the practice of deep well disposal of such constituents an environmentally sound one. The example of immobilizing heavy metals in a unit is also noted in the legislative history.¹⁶ In addition, as discussed below, there is a significant body of information that EPA has received from the petition process under 40 CFR part 148 concerning the containment properties of injection zones for dilute levels of the wider range of toxic constituents. This data supports the containment properties of these injection zones.

c. *Regulatory Problems.* There would be significant regulatory problems from application of a dilution prohibition to this category of facilities. If such a prohibition were to apply, many well operators would seek a "no migration" variance for their wells. EPA considers such wells likely candidates to be granted variances. Currently, however, EPA is processing variances for hazardous waste injection wells and is not processing variances for nonhazardous wells.

Hazardous waste injection is specifically subject to RCRA's land disposal restrictions. RCRA section 3004 (f), (g) and (k). Approximately 65 of these facilities have submitted petitions to obtain "no migration" variances from the LDR treatment requirements as provided for in 40 CFR part 148. EPA has proposed to grant 15 such variances, has granted 12, and anticipates that many other petitions will be both proposed and granted for underground injection. Thus, as a general matter, EPA believes the practice of deep well injection can be a protective practice within the framework of the land disposal restrictions rule. The petition process, however, has been very time consuming

and resource intensive. In addition, the process has involved a high degree of coordination with states that are authorized to administer the UIC permit program.

EPA experience with the "no migration" petition process indicates that many nonhazardous deep wells could probably qualify for a "no migration" variance under 40 CFR part 148. However, operators of nonhazardous waste wells have not had reason to believe that their operations would be subject to the land disposal restrictions and have not submitted variance petitions. Moreover, EPA is not convinced that the Part 148 regulations would be appropriate for nonhazardous waste wells. The goal of the SDWA regulations for deep well injection is containment of the wastes in an injection zone. This goal is consistent with the protectiveness goals behind the "no migration" variance under RCRA. There are no documented problems with the effectiveness of the UIC regulations.

Moreover, even where the practice involved disposal of hazardous waste, Congress fashioned statutory provisions in RCRA which reflect the view that there is more certainty concerning the safety of the deep well disposal practice than surface disposal practices. For example, RCRA sections 3004(c) and 3019(b) ban both landfilling of liquid hazardous waste and underground injection of hazardous waste into or above USDWs. RCRA provisions regarding deep well injection of hazardous waste, however, provided for further EPA review of this method of land disposal and allow for variances from the statutory prohibition. RCRA section 3004 (f) and (g). The legislative history of the 1984 Amendments also state that "underground injection of hazardous waste can be safe environmental technology." Statement of Senator Bentsen, 129 Cong. Rec. S9153 (daily ed. July 25, 1983), and envisioned that compliance with the then-existing underground injection control regulations could be sufficient to justify continued operation. *Id.* Through the Part 148 petitions, EPA has gained further knowledge concerning the critical issues determining the safety of the practice. In general, where the SDWA regulations are followed, injection of dilute amounts of toxic constituents is safe. Where injection is of waste below the characteristic level the injection zone will appropriately contain these hazardous constituents in a properly operating injection well.

Accordingly, if EPA were to apply a dilution prohibition to nonhazardous wells at this time, there would be

¹⁶ "Another example of a potentially acceptable land treatment situation involves wastes containing heavy metals. Although land treatment does not render the waste nonhazardous, a prohibition would not be necessary if there is long-term certainty that the hazardous constituents would be immobilized" H. Rep. No. 198 at 34.

considerable disruption at facilities that EPA generally considers safe. On balance, EPA believes it is appropriate to exempt from the LDR prohibitions characteristic waste disposed below the characteristic level in these wells.

E. Implementation of Requirements for Characteristic Wastes

In today's final rule, the Agency is promulgating several new provisions concerning implementation of the land disposal restrictions for characteristic wastes. Specifically, the Agency is amending 40 CFR 268.7 and adding 40 CFR 268.9 to incorporate recordkeeping requirements and special rules for characteristic wastes, and is revising the current regulations in parts 261 and 262 regarding the identification and management of wastes that exhibit a characteristic. In addition, the Agency is clarifying which requirements apply during the period of a national capacity variance both to wastes that are prohibited on the basis of exhibiting a characteristic only, and to wastes that have applicable treatment standards as both listed and characteristic wastes. Finally, the Agency is clarifying whether to apply the TCLP or EP analytical methods to verify compliance with the treatment standards.

1. Overlap of Treatment Standards for Listed Wastes that also Exhibit a Characteristic

The Agency is today promulgating its proposed approach with respect to determining applicable treatment standards for wastes that carry more than one waste code.

(1) For wastes that carry more than one characteristic waste code, the waste must be treated to meet the treatment standard for each characteristic.

(2) If a listed waste also exhibits one or more hazardous characteristics, the waste must be treated to meet the treatment standard for each of the waste codes with one exception. Under that exception, if the relevant constituents or narrative characteristics are specifically addressed in the treatment standard for the listed waste, then the standard for the listed waste operates in lieu of the standard for the relevant characteristic(s).

One commenter suggested that EPA should require treatment in compliance with the most stringent treatment standard rather than the most waste-specific treatment standard. The Agency disagrees, and EPA is following the general principle set out in previous rulemakings that the more specific treatment standard takes precedence. This is the principle EPA adopted with respect to California list wastes that are

covered by another treatment standard, an analogous situation. See 52 FR 25773 and 25776 (July 8, 1987). At the same time, when a listed waste exhibits a characteristic that is not addressed by the listed waste's treatment standard, EPA believes it is necessary for that characteristic to be treated to meet the characteristic treatment standard.

The Agency received several comments indicating that subjecting listed wastes to treatment standards for characteristics is a major shift in the current regulatory program. As stated in the proposed rule, the Agency believes that to ignore the characteristic would mean that the Third Third prohibition for that characteristic is being ignored, and that with respect to that constituent, the waste's toxicity or mobility is either not being reduced or not being minimized. Since this outcome would satisfy neither the statutory language nor its policy, EPA is requiring treatment. As with the California list wastes, EPA is applying this principle at the point of generation, since otherwise the treatment standard for the characteristic constituent could be ignored by removing the characteristic. EPA is consequently promulgating new requirements in § 268.9 (b) and (c) as proposed.

EPA is further promulgating provisions specifying that disposal of a waste which at the point of disposal exhibits a characteristic is prohibited unless the treatment standard for that characteristic component is above the characteristic level. This approach is again essentially the same as that which EPA adopted for the analogous situation involving California list wastes (see 52 FR 25767), and is needed to ensure that the statutory prohibition against disposal of characteristic hazardous wastes is not violated.

2. Revisions to Waste Identification Requirements

A consequence of the Agency's interpretation that the prohibition for characteristic wastes can apply concurrently to wastes that also are listed is a change in the initial determination that a generator must make pursuant to § 262.11. That section presently sets out an either/or scheme where if the generator determines that a waste is listed, the generator does not need to determine whether the waste exhibits a characteristic (40 CFR 262.11 (b) and (c)). For purposes of compliance with part 268, however, the generator would need to know if the waste exhibits a characteristic, even if the waste is listed, because further treatment of the waste is required if the treatment standard for the listed waste

does not address the characteristic property. Consequently, EPA is amending section 262.11 to indicate that generators must determine whether listed wastes also exhibit characteristics of hazardous waste for purposes of compliance with part 268.

In addition, §§ 261.21—261.24 indicate that wastes that exhibit the respective characteristics and are not listed have the designations D001—D017. However, as discussed above, generators (and other handlers) will need to know both the listed waste code and the characteristic waste code in the event a listed waste also exhibits a characteristic which is not addressed by the treatment standard for the listed waste. EPA is consequently amending the language in these sections to indicate that wastes that carry characteristic waste codes may also be listed wastes.

3. Wastes Subject to a Capacity Variance

RCRA section 3004(h)(4) states that during periods of national capacity variances and case-by-case extensions, hazardous wastes subject to those extensions that are disposed in landfills and surface impoundments may only be disposed of if the landfill or surface impoundment is in compliance with the minimum technological requirements of section 3004(o). EPA has interpreted this language to mean that the landfill or impoundment unit receiving such wastes must be in compliance with the minimum technological requirements, § 268.5(h)(2), and this interpretation was sustained in *Mobil Oil v. EPA*, 871 F. 2d 149 (D.C. Cir. 1989).

Under the present rule, it is possible for prohibited characteristic wastes subject to a national capacity variance to become nonhazardous. For example, certain D009 mercury wastes are subject to a two-year national capacity variance. If, during the period of the variance, such a waste was treated to be nonhazardous by a means other than retorting and was disposed of in a landfill or surface impoundment, arguably the landfill or impoundment unit would have to meet the minimum technological requirements.

EPA does not read the statute or the rules this way. Rather, section 3004(h)(4) only requires compliance "with the requirements of subsection (o)." Section 3004(o), in turn, only applies to units subject to Subtitle C. See also § 268.5(h)(2), which likewise imposes minimum technological requirements only on landfill and impoundment units that are permitted or that have interim status. Consequently, EPA does not

interpret these provisions as requiring subtitle D landfill and surface impoundment units receiving prohibited wastes during a national capacity variance to have to satisfy the minimum technological requirements.

Finally, for wastes that are subject to more than one treatment standard, the Agency is clarifying that during the period of a national capacity variance for one of the wastes, the treatment standards for any other waste codes that have not received such a variance must be met. For example, if a K048 nonwastewater also exhibits the characteristic for chromium, the waste has a six-month capacity extension as a K048 listed waste, but no capacity extension as a D007 characteristic waste. Therefore, at a minimum, the waste must be treated to meet the treatment standard for D007 (and any other applicable characteristic treatment standard) prior to land disposal. This requirement is consistent with the Agency's approach in previous rulemakings in which it stated that in setting the treatment standard, the Agency is making a more waste-specific determination; however, this determination is not effective until the capacity variance ends. Because capacity exists to treat the characteristic waste, the characteristic treatment standards still apply, and the K048 waste must meet the prohibitions for characteristic wastes. The K048 treatment standard would then become applicable when the national capacity variance expires. See 53 FR 31158. Furthermore, if such listed/characteristic wastes have been treated so that they no longer exhibit any characteristic and are to be disposed of on a surface impoundment or landfill, the unit must meet the minimum technology requirements set out in section 3004(o); as required for listed wastes during the period of a national capacity variance.

4. Use of TCLP v. EP Analytical Methods for Compliance

The Agency proposed two alternatives in the proposed rule, that treatment standards for characteristic wastes either be a numerical standard (typically lower than the characteristic level) or be established at "the characteristic level." See, e.g., 54 FR 48430/3. If the latter alternative were adopted, the Agency did not specify whether the characteristic level would be measured by the EP test or by the TCLP. The Agency did indicate in a somewhat different context, however, that it strongly prefers to use the TCLP to measure compliance wherever possible. *Id.* at 48432/3.

As stated in section III.D of today's preamble, EPA is establishing treatment standards for most characteristic wastes at the characteristic level. The Agency has determined that this level should be measured by the TCLP. This is the protocol that large quantity generators will use to assess the toxicity of their wastes starting on September 25, 1990 and small quantity generators will begin using on March 29, 1991. It is also the protocol used to measure the efficacy of stabilization or other immobilization treatment in most of the BDAT standards. Most of the data submitted in response to the Agency's proposal were based on the TCLP to measure treatment performance, and these data indicate (with a few exceptions) that treatment to the characteristic level, as measured by the TCLP, is achievable. (These data, incidentally, were available for reply comments, and the Agency received dozens of reply comments on the data.)

Furthermore, if EPA were to establish the EP as the protocol to measure compliance with metal standards, then regulated entities would have to subject many wastes to both the EP (for purposes of land disposal restriction compliance) and the TCLP (for waste identification purposes). The Agency prefers not to impose this type of duplicative burden. Accordingly, the Agency is adopting the TCLP as the means of measuring compliance with the metal standards for toxic characteristic Third Third wastes in this rule, with two exceptions. For lead characteristic nonwastewaters and all nonwastewaters containing arsenic as the primary hazardous constituent (*i.e.*, D004, K031, K084, K101, K102, P010, P011, P012, P038, P038, and U136), the Agency is specifying that if a waste does not achieve the nonwastewater standard based on analysis of a TCLP extract but does achieve the standard based on analysis of an EP extract, the waste is in compliance with the standard. The Agency is taking this action because the performance data used to develop the treatment standards for these wastes were based on EP toxicity leachate data. A more detailed discussion is provided in section III.A of today's preamble.

5. Newly Identified TC Wastes

There is one final interpretive point dealing with the interplay of the EP and the new TCLP. EPA interprets the statute such that wastes that exhibit the toxicity characteristic by the TCLP but not the EP are not presently prohibited, even if the constituent causing the waste to exhibit the TCLP is also a constituent controlled by the EP. This is because such wastes are newly identified

pursuant to RCRA section 3004(g)(4); they were identified as hazardous after November 7, 1984.

6. Further Principles Governing Applicability

a. *Other Statutory Exemptions or Exclusions.* The issues in this rulemaking concerning when hazardous wastes become prohibited from land disposal does not change the status of other regulatory or statutory inclusions or exclusions to the definition of solid or hazardous waste found at 40 CFR 261.2-.6. These provisions can override the LDR point of generation evaluation to keep wastes from being prohibited and subject to a dilution prohibition or treatment standard. This result is consistent with EPA's existing regulation at 40 CFR 268.1.

EPA believes that different legal and policy considerations under exclusions from the statutory and regulatory definitions of solid waste and hazardous waste require an evaluation of the status of the waste at the point of disposal. Generally, these exclusions address the status of the waste without regard to a particular constituent concentration, and thus do not involve issues of treatment levels or dilution. EPA has not fully analyzed these exclusions and, in the absence of specific justification, will continue to provide exclusions from the land disposal restrictions for waste excluded from the definition of hazardous or solid waste under 40 CFR 261.2-.6.

For example, solid waste does not include solid or dissolved material in domestic sewage. RCRA section 1004(27). EPA regulations further provide that any mixture of domestic sewage and other waste that passes through a sewer system to a Publicly Owned Treatment Works (POTW) for treatment is not solid waste. 40 CFR 261.4(a)(1). Thus, even if a waste is hazardous at the point of generation, the domestic sewage exclusion would allow land disposal of the solid waste at the POTW without meeting treatment standards under section 3004(m) (assuming that there is no land disposal of the waste before it becomes subject to the domestic sewage exclusion).

b. *Restricted Wastes Versus Prohibited Wastes.* Consistent with the cradle-to-grave mandate of RCRA's land disposal restrictions, those who manage hazardous waste will need to assess what LDR prohibitions apply at different points in the waste management process. First, generators of restricted wastes must assess whether the waste is prohibited under the LDR. Restricted waste is defined by several conditions.

See 51 FR at 40619—40632 (November 7, 1986); 54 FR 36967, 36968 (Sept. 8, 1989).

As discussed above, however, certain statutory exemptions that would be evaluated at the point of land disposal may apply to restricted wastes. Moreover, during either a national capacity variance under section 3004(h)(2) or a case-by-case variance under section 3004(h)(3), disposal of certain restricted wastes into certain units would not be prohibited. Also, placement of waste in a "no migration" unit is not prohibited land disposal, nor is placement in an impoundment in compliance with 40 CFR 268.4. In addition, there are situations where waste is managed in a way which results in no land disposal. EPA outlined which LDR prohibitions attach to wastes managed under each one of the above scenarios in 54 FR 36967, 36968 (September 6, 1989).

c. Changes in Treatability Groups.

The question of whether a given waste is going to prohibited land disposal is complicated by the fact that wastes may change form or treatability groups after undergoing treatment. For example, treatment of a wastewater often generates a nonwastewater sludge as well as a treated wastewater. Also, incineration of a nonwastewater can generate a nonwastewater (ash) as well as a wastewater (scrubber water). (A treatability group is defined both in terms of the applicable waste code and the form the waste is in.) The specific problem addressed here, which occurs most often with respect to characteristic wastes, is the effect that changes in treatability groups have on the initial status of a waste as prohibited or non-prohibited.

First, by way of background, the part 148 and 268 regulations generally divide the universe of wastes potentially subject to land disposal prohibitions into two broad categories: wastewaters and nonwastewaters. For purposes of the LDR program, "wastewaters" are generally defined to have less than 1% total organic carbon (TOC) and less than 1% total suspended solids. Any other waste stream is deemed a nonwastewater. (There are certain enumerated exceptions from certain wastes such as F001-F005 solvents, and K011, K013, and K014 acrylonitrile wastes. See generally § 268.2 in today's rule, incorporating the various regulatory definitions.) Part 268 provides for different treatment standards for these two broad categories of waste. The standards may also have different effective dates because of national capacity variances. Treatment standards for listed wastes apply to the

waste as generated as well as to all of the residual wastes that are generated in treating the original prohibited waste. See 53 FR 31138, 31145 (August 17, 1988). However, when EPA specifies a treatment method as the treatment standard, residues resulting from the required treatment method are no longer prohibited from land disposal (unless EPA should specify other requirements). 54 FR 26594, 26624, 26630 (June 23, 1989).¹⁷

A change in treatability group during the waste management process can affect whether the waste prior to the change in treatability groups is subject to certain LDR requirements. The following rules are important to understand this point. First, if a treatability group, and treatment residues in the same treatability group, is not going to prohibited land disposal, then neither the original waste nor the residue is subject to the treatment standards or to the dilution prohibition. As a corollary, waste *is* prohibited if the treatability group, or residues from the same treatability group is land disposed. This interpretation provides a clear line of demarcation, avoids the enormous difficulties of determining new points of generation every time a hazardous waste is altered in some respect, and avoids having an initial waste's status as prohibited determined in all cases by some later management of a residue derived from the initial waste.

d. Examples. Several examples will be useful to help clarify this point.

Example 1. Listed wastewater A is treated in a tank that yields two residue streams: nonwastewater residue B and wastewater residue C. The nonwastewater residue is land disposed and the wastewater residue is discharged pursuant to an NPDES permit without being land disposed.

Only nonwastewater residue B is going to prohibited land disposal. Moreover, residue B is a newly generated hazardous waste belonging to a different treatability group than the original waste. See 53 FR 31209; 52 FR 25667 col. 1 (July 8, 1987). The original hazardous wastewater A is a restricted waste, but not prohibited, and so is not subject to the dilution prohibition in 40 CFR 268.3 or any treatment standard under part 268. Wastewater residue C

also is a restricted waste (due to the "derived from rule" it carries the same hazardous waste code under 40 CFR part 261 as the original waste A), but it is not a prohibited waste because the wastewater treatability group is not going to prohibited land disposal.

Example 2. Listed nonwastewater D is treated to yield two nonwastewater residues E and F (which carry the same waste code as D based on the derived from rule). Residue E is incinerated and the ash is land disposed; residue F is directly reused as a substitute for a commercial chemical product. In this case, nonwastewaters D and E are subject to treatment standards and the dilution prohibition. EPA does not want impermissible dilution of nonwastewater D to be the reason that the nonwastewater residue E meets the BDAT level. Thus, since there is no change in treatability group between the original point of generation and land disposal for one residue of the original waste D the part 268 prohibitions apply. However, residue F is not a prohibited waste because the definition of solid waste excludes secondary materials that are directly reused as substitutes for commercial chemical products.

As illustrated by the above examples, a unit treatment operation can be a point of generation for certain treatability groups. To assess what prohibitions apply, one must first determine whether any residues of the listed waste go to prohibited land disposal. If no residues are land disposed then part 268 treatment requirements do not apply. If one or more residues are placed in prohibited land disposal, the dilution prohibition applies between the point of land disposal and the point that a given treatability group first exists. In example 1, that point is immediately after the tank treatment operation. In example 2, that point is the original point of generation for nonwastewater D.

The rules regarding treatability groups apply similarly to characteristic wastes. The fact that a waste loses its hazardous characteristic at some point prior to land disposal does not constitute a change in treatability group. The fact that the derived from rule does not apply to characteristic wastes is irrelevant because the derived from rule only affects hazardous waste status, not treatability group determination (which is a function of physical form). To determine if a characteristic waste is prohibited, the decision is still made based on whether the waste or any residue in the same treatability group is destined for land disposal. This approach is necessary to assure that this

¹⁷ A facility is not allowed to dilute or perform partial treatment on a waste in order to switch the applicability of a nonwastewater standard to a wastewater standard or vice versa. See 52 FR 21012 (June 4, 1987); but see 52 FR 25767 (June 8, 1987) noting special circumstances when California list wastes are involved. Dewatering technologies (such as filtration and centrifugation) that are designed to separate wastewater from nonwastewater are not prohibited.

level was met by treatment and not by dilution. The following example helps illustrate this decision rule.

Example 3. Wastewater J is EP toxic for lead. It is treated in a tank and generates a sludge K, that is non-hazardous. The treated wastewater L, which no longer exhibits a characteristic, is then sent to a surface impoundment for further treatment, after which it is discharged under an NPDES permit. The sludge is sent to a landfill.

The sludge K is not a restricted hazardous waste, notwithstanding that it derives from treatment of a characteristic hazardous waste. This is because it is a new treatability group which is not hazardous at point of generation. The status of wastewaters J and L is determined by the special rules for characteristic wastes managed in CWA systems; therefore, they are prohibited wastes but are not subject to a dilution prohibition. Since wastewater L meets the treatment standard when it is land disposed, the disposal is legal.

Example 4. Electroplating wastewater M which exhibits a hazardous characteristic, is treated in a tank to yield a treated wastewater N and a nonwastewater sludge O. The treated wastewater N, which no longer exhibits a hazardous characteristic, is discharged into a Class I injection well and the sludge is sent to a landfill.

In this example, neither wastewater M nor N is a prohibited waste due to the special rules for wastes managed in Class I injection wells subject to the SDWA. Sludge O is a newly generated waste that meets the listing description for EPA Hazardous Waste No. F006. Sludge O is a prohibited waste because this nonwastewater is destined for placement in a land disposal unit.

Example 5. An EP toxic wastewater sludge P is dewatered to yield a nonwastewater sludge Q which is EP toxic and now exceeds the California list level for lead. Also, a wastewater R is generated which exhibits a hazardous characteristic. The sludge Q is sent to a landfill and the wastewater R is mixed with domestic sewage and sent through a sewer system to a POTW.

Both sludges P and Q are prohibited wastes because Q is sent to land disposal and P is in the same treatability group as Q. Note that during a (hypothetical) national capacity variance for the lead characteristic treatment standard, Q must comply with the California list standard for lead. Wastewater R is a restricted waste, but not a prohibited waste because it is covered by a § 261.4 exclusion from the definition of solid waste.

In conclusion, it should be noted that the previous discussion applies in

determining when prohibitions attach. The issue of what administrative requirements apply by virtue of a waste being restricted is discussed elsewhere in this preamble.

F. Amended Tracking System for Characteristic Prohibited Wastes

EPA's decisions concerning characteristic wastes necessitate certain modifications of the tracking provisions contained in § 268.7. See 54 FR 48491 and 48492 (requesting comment on this point). This section of the preamble outlines the modifications the Agency is making to the existing rules, and clarifies certain points regarding the rules' applicability to listed wastes as well as to characteristic wastes. The Agency is also amending one of the certification provisions that presently fails to mention compliance with the prohibition on impermissible dilution.

A. Applicability of Tracking Requirements

1. Clarification of and Changes to Generally Applicable Recordkeeping Requirements. Section 268.7 applies to generators, treaters, storers, and disposers of restricted wastes. Most of the provisions contemplate that restricted wastes are being shipped off-site for treatment or disposal (see § 268.7 (a)(2) and (a)(3), and § 268.7 (b)(4) and (b)(5)). The first point the Agency wishes to address is the existing requirements that apply when restricted wastes are managed on-site. At a minimum, certain recordkeeping requirements are triggered. Section 268.7(a) states that generators must first determine whether their waste is restricted. Section 268.7(a)(6) indicates that generators must retain a copy of all demonstrations and other waste analysis or documentation for all wastes sent to either on-site or off-site treatment, storage, or disposal. The Agency interprets these two provisions to mean that ordinarily generators managing hazardous wastes on-site must determine if the waste is restricted, and keep some documentation of that determination plus some documentation of where the restricted waste was treated, stored or disposed—whether treatment, storage, or disposal occurs on-site or off-site. These recordkeeping requirements for on-site management are needed to implement the various prohibitions or to account for those restricted wastes that for some reason are not also prohibited. The Agency notes briefly that certain wastes are not subject to recordkeeping requirements at all by virtue of the exemptions from all of part 268 that are contained in sections 268.1 (b) and (e). (See 54 FR

38968 (September 8, 1989) discussing what a "restricted" waste is.)

The Agency is applying the existing § 268.7 (a) and (a)(6) requirements to characteristic wastes that are restricted under today's final rule. These requirements apply even when the hazardous characteristic is removed prior to disposal, or when the waste is excluded from the definition of hazardous or solid waste under § 261.2-.6 subsequent to the point of generation. For example, if a characteristic waste is not prohibited because it is discharged pursuant to a NPDES permit without land disposal, some record must still be kept indicating why the waste is not prohibited. (For example, a statement that there is no land disposal in the system prior to the § 261.4 exclusion should be kept in the facility's operating record.) The rationale for this is that the § 261.4(a)(1) exclusion for domestic sewage does not attach until the mixture passes through the sewer system to a POTW; in the interim, the waste is restricted. (See also section III.E.6 of today's final rule.) Finally, this information should already exist in any case, to justify the absence of subtitle C regulation.

B. Tracking (i.e. Notification/Certification) Provisions Applicable to Generators Shipping Wastes Off-Site

Under existing § 268.7(a), generators managing restricted wastes must determine whether the wastes meet applicable treatment standards on the point of generation, or are otherwise exempt from those standards. Separate tracking provisions apply to each of these situations. Section 268.7(a) (1), (2), and (3). In all cases, however, the generator must prepare a notice for each off-site shipment setting out the hazardous waste identification number, applicable treatment standard or prohibition level, manifest number, and available waste analysis data. If a generator's waste meets the treatment standard, the generator must prepare a certification to this effect. (EPA is thus using the terms "tracking document" and "notification and certification" synonymously in the discussion that follows.)

If a generator's characteristic waste has been treated to meet the treatment standard before it is sent off-site, EPA believes that the existing tracking scheme requires some modification. There are two principal reasons to make changes. Characteristic wastes that meet treatment standards will be sent (almost invariably) to subtitle D facilities. EPA is concerned that sending part 268 notifications and certifications

to subtitle D facilities could be counterproductive. These facilities are not familiar with subtitle C paperwork and could easily mistake the tracking forms (i.e. the notifications and certifications) for manifests and refuse to accept the shipment. Even if the forms are not mistaken for manifests, the subtitle D facilities could view the forms as describing hazardous wastes and refuse to accept the wastes. This could result in a situation where scarce subtitle C management capacity is used for non-hazardous wastes because subtitle D facilities are refusing the non-hazardous wastes.

These potential misunderstandings are probably solvable as subtitle D operators become more sophisticated and as EPA further implements its land disposal restriction training and guidance efforts. The Agency believes further, however, that under today's rule no important interest would be vindicated by requiring notifications and certifications to be sent to subtitle D facilities. When listed wastes are involved, the tracking document tells disposal facilities what standard the waste must meet before it can be land disposed. Treatment standards for most characteristic wastes are established at characteristic levels, however. Thus, these wastes can be land disposed in a subtitle D facility when they no longer exhibit a characteristic. Having a generator certify to an off-site subtitle D facility that the waste no longer exhibits a characteristic adds little or nothing to the information the disposal facility needs to know to dispose of the waste. That is, the disposal facility already must determine that the waste no longer exhibits a characteristic. Since under the present rule, sending the tracking forms to subtitle D facilities could normally have only the counterproductive effects discussed in the previous paragraph, EPA has determined that the tracking forms should not accompany shipments from generators to subtitle D facilities. (As noted below, the Agency is adopting the same approach for any shipments to subtitle D facilities, so that a treatment facility that has treated a characteristic waste to meet a treatment standard also would not send tracking documents to a subtitle D disposal facility.) EPA realizes that some of the treatment standards in today's rule, notably those for reactive cyanides and pesticides, and the standards for characteristic wastes that are treatment methods, would generally result in treatment below characteristic levels. In these cases, the tracking documents would add information useful to a subtitle D facility. EPA is concerned enough about

potential confusion and disruption of subtitle D disposal practices, however, that at this time the Agency believes it the better decision not to require tracking documents for this set of wastes to go to subtitle D facilities.

By deciding that tracking documents for prohibited characteristic wastes that no longer exhibit a characteristic should not go to subtitle D facilities, the Agency is not deciding that notifications and certifications should not be prepared for such wastes. The Agency's concern is where those notifications and certifications are sent. EPA believes, and is requiring, that the notifications and certifications be sent to the appropriate EPA Regional Administrator or his delegated representative, or to a state authorized to implement the land disposal restrictions. The person preparing the notification and certification must also include the identity and address of the facility where the treated waste is sent, including the address. This is the approach the Agency adopted in an analogous circumstance where sending notifications and certifications to the ultimate disposer would be counterproductive or otherwise be ill-advised. See § 268.7(b)(8) and 53 FR 31198 (Aug. 17, 1988) (notifications and certifications of persons treating hazardous wastes to produce hazardous waste-derived products that are to be used in a manner constituting disposal are to send the notifications and certifications to EPA or to an authorized state, not to the ultimate user of the hazardous waste-derived product). By requiring notifications and certifications to be prepared, EPA is also assuring that a record is kept that the characteristic waste has been treated to meet the standard and not impermissibly diluted. Generators (or treatment facilities, see below) would also have to certify that these requirements were satisfied. Thus, the key objectives of the notification and certification provisions are satisfied.

EPA is making some slight modifications in the notification form that would be sent to EPA (or to an authorized state). This is because the existing notification form refers to the waste's ID number and manifest number when shipped. Since wastes no longer exhibiting a characteristic have neither an ID number nor a manifest number, some small modifications are necessary. While the notification form would not contain hazardous waste codes, it must contain a complete and accurate description of the waste, including its former hazardous waste classification. In addition, although a manifest number

would not be included, the notifications must clearly identify the facility receiving the waste.

EPA is not amending the tracking requirements for those characteristic wastes that still exhibit a characteristic when they are sent off-site. All of the normal § 268.7(a)(1) notice requirements fit this situation (i.e. the waste has an ID number; it does have to have a manifest, etc.) and do not require any change. The tracking document also would be going to a subtitle C facility so that none of the counterproductive effects discussed above with respect to subtitle D facilities would occur. Thus, no changes to existing rules are required.

The following examples illustrate how the revised tracking requirements would apply to generators of characteristic wastes:

1. Generator A generates a D008 nonwastewater that is sent off-site to a treatment facility.

The generator would prepare a § 268.7(a)(1) notice which would set out the EPA hazardous waste number, treatment standards, manifest number, and any waste analysis data. Because the waste is still hazardous, no revised notice is necessary.

2. Generator B generates a D008 nonwastewater that is not a spent lead acid battery. The generator treats the waste on-site to meet the treatment standard and then sends it off-site for disposal in a subtitle D landfill.

Generator B would have to prepare a notice and certification to document that the waste has met the treatment standard and has not been diluted impermissibly. Rather than send the notification and certification to a subtitle D facility, the generator would send it instead to the EPA Regional Office or to an authorized state. Included on the notification would be the identity and location of the subtitle D facility where the waste has been sent.

C. Tracking Provisions Applicable to Treaters

EPA is adopting the same approach for treaters of characteristic wastes as it is for generators. Thus, tracking documents for shipments of characteristic wastes that meet a treatment standard, and therefore no longer exhibit a characteristic of hazardous waste, would be sent to EPA or an authorized state (along with information documenting the receiving facility's location), not to a subtitle D facility. The reasons are the same as those for generators discussed above. EPA is also making the same slight

adjustments in the notification requirement.

The following examples illustrate how the amended rules would apply to treaters:

1. Treater A receives a D007 nonwastewater that it treats to meet the treatment standard and sends to a subtitle D landfill. The treater also generates a wastewater in the course of treatment that does not exhibit a characteristic.

The treater must prepare a notice and certification which it would send to the EPA Regional Office or to an authorized state. The wastewater generated during treatment is not a prohibited waste because it is a new treatability group whose status as a non-prohibited waste is determined when it (i.e. the new treatability group) is generated. Therefore, part 268 does not apply to the wastewater.

2. Treater B receives a high TOC ignitable waste that it incinerates. The ash, which no longer exhibits a characteristic, is sent to a Subtitle D landfill.

The treater would prepare a notification and certification and send them to EPA or to an authorized state, as in the previous example. At least at this time, the Agency is not requiring that tracking documents be sent to subtitle D facilities, even when the treatment standard is a designated method.

D. Land Disposal Facilities

Under existing rules, subtitle C disposal facilities receiving prohibited wastes must keep copies of the notice and certification prepared by the generator and/or the treater, must test wastes (or waste extracts) at a frequency specified in their waste analysis plan (as modified in today's rule), and must dispose of certain types of wastes in minimum technology units. Section 268.7(c) (1), (2), and (3). These requirements do not fit well for the characteristic wastes prohibited in today's rule. The requirement of disposal in minimum technology units does not have any applicability at all. Moreover, if a land disposal facility is a subtitle D facility receiving non-hazardous waste, EPA does not believe that testing requirements are appropriate to implement today's rule. These facilities are already barred from accepting hazardous waste and so must ascertain if the wastes they are receiving exhibit a characteristic. Thus, since few of the treatment standards adopted today require treatment to levels below the characteristic, the Agency believes that existing controls to ensure against receipt of hazardous

waste will constitute sufficient corroborative testing by a disposal facility. The Agency is thus indicating that the requirements of § 268.7(c) do not apply to Subtitle D disposal facilities receiving wastes that no longer exhibit a characteristic.

E. Changes in Certification to Reflect Dilution Prohibition

EPA is also amending the certifications of compliance required of treaters and generators to state that the treatment standard was not achieved by a form of impermissible dilution. This requirement, of course, is already contained in § 268.3 and today's amendment simply includes a reference to this requirement in the certification. (The existing certification for treatment facilities in fact refers to the dilution prohibition, but does so in an overbroad manner by referring to all dilution, rather than only impermissible dilution. EPA is thus modifying this reference in today's rule.)

G. The Dilution Prohibition as it Applies to Centralized Treatment

1. Background

EPA discussed the issue of permissible and impermissible dilution of prohibited wastes at length in previous rulemakings. EPA's existing rules state that prohibited wastes cannot be diluted in order to circumvent a statutory or regulatory prohibition or effective date. 40 CFR 268.3.¹⁸ The rules also generally discourage aggregation of wastes not amenable to cotreatment by providing that when wastes with different standards for a common constituent are combined for purposes of treatment, the treatment residue must meet the lowest applicable treatment standard. 40 CFR 268.41(b).

In interpretive preamble discussions, the Agency explained that these rules are not intended to discourage legitimate centralized treatment, and that aggregation of wastes preceding legitimate centralized treatment is not considered to be impermissible dilution. See *e.g.*, 52 FR 25766 (July 8, 1987) and other notices there cited. However, the Agency noted that centralized treatment of incompatible wastestreams was not legitimate treatment and constitutes impermissible dilution. *Id.* For example, it is impermissible dilution to aggregate a heavily concentrated organic solvent for which incineration is the appropriate treatment technology with less

concentrated solvent streams for which biological treatment is appropriate.¹⁹

In this rulemaking, EPA believes that it is a necessary and responsible action on the Agency's part to indicate how these existing rules apply when prohibited characteristic wastes are involved. Contrary to the views of some of the commenters, this is not a new issue unrelated to the general substance of the Third Third rulemaking. Absent discussion, the existing rules would still apply to prohibited characteristic wastes, but the regulated community would be unaware of how the Agency interpreted their application and would be potentially unable to determine how to conduct their operations in order to comply with the dilution prohibition. EPA also believes that further clarification of the dilution rules with respect to prohibited listed wastes is warranted.

2. Summary of Proposal

EPA's proposal dealt with two particular issues. The first was the question of what constitutes legitimate treatment as opposed to impermissible dilution. The Agency indicated that any dilution that failed to meet the section 3004(m) standard of substantially reducing the prohibited waste's toxicity or mobility would be impermissible, and further proposed to quantify this statutory standard by indicating that there must be some actual reduction in the prohibited waste's toxicity or mobility as a result of treatment. 54 FR 48494. To satisfy this test, the Agency indicated at a minimum that there would need to be actual reduction through treatment of at least one BDAT constituent for each prohibited waste that is treated. *Id.* EPA further proposed that any dilution of a prohibited waste to render it non-hazardous, in lieu of treating, would be considered impermissible. *Id.* at 48495. The Agency solicited comment, however, on whether dilution could be considered a legitimate form of treatment for certain prohibited characteristic wastes. *Id.* at 48496.

These proposals were the focus of many of the comments, most dealing with the implications for wastewater

¹⁸ EPA notes that its authority to promulgate a dilution prohibition rests not only on the land disposal restriction statutory provisions and Congressional directives (see in particular section 3004(m) and related statutory requirements for EPA to establish pretreatment standards as a condition to land disposal; see also H. Rep. No. 198, 98th Cong. 1st Sess. 38 (1983) and S. Rep. No. 284, 98th Cong. 1st Sess. 17), but in addition, the more general authority in section 3004(a)(3) to establish treatment standards "as may be satisfactory to the Administrator" and "as may be necessary to protect human health and the environment".

¹⁹ Although section 268.3 is written in terms of "restricted" hazardous wastes, it applies equally to the narrower class of prohibited hazardous wastes. See 54 FR 38968 (Sept. 6, 1989) explaining the applicability of the dilution prohibition.

treatment systems that include land-based treatment (often biological treatment ponds) or storage (for example, holding ponds for corrosive wastes that have been neutralized by dilution). Commenters also correctly viewed this issue as being intertwined (at proposal) with the implications of requiring treatment of characteristic wastes below the characteristic levels. More broadly still, the issue presents another aspect of the question of whether to determine if wastes are prohibited at the point of generation or at the point of disposal.

3. Today's Action

The existing rules on dilution and EPA's interpretive statements regarding those rules indicate that the dilution prohibition has a two-fold objective: (1) To ensure that prohibited wastes are actually treated; and (2) to ensure that prohibited wastes are treated by methods that are appropriate for that type of waste. EPA has acknowledged that prohibited wastes which are aggregated are not diluted impermissibly if they are treated legitimately in centralized treatment systems, irrespective of the dilution inherent in such a system. Thus, if "dilution" is a legitimate type of treatment, or a necessary pretreatment step in a legitimate treatment system, such dilution is permissible. Conversely, prohibited wastes that are "treated" by inappropriate methods, or sent to treatment systems that do not treat the wastes, are diluted impermissibly.

In applying these principles to characteristic wastes, EPA encountered two major difficulties: first, the interface with regulatory systems established pursuant to the Clean Water Act and Safe Drinking Water Act, and second, difficulties in being able to quantify the proposal in a meaningful way. In section ILLD above, we have already discussed the potential difficulties of integrating a full-scale dilution prohibition with the Clean Water Act's NPDES and pretreatment regulations, and the Safe Drinking Water Act's UIC program. We explain below the attempts EPA made to quantify the proposed standard, and the obstacles the Agency encountered.

The Agency's proposal to require reduction of a BDAT constituent as a means of evaluating if impermissible dilution has occurred did not indicate how much reduction would be deemed adequate, and thus without further elaboration not only fails to provide clear guidance but also potentially fails to achieve the objective of assuring that wastes are treated by an appropriate treatment method. More importantly, quantifying the extent of removal

necessary to be considered legitimate treatment leads to a very complicated system given the number of prohibited wastes, treatability groups, treatment methods and treatment train configurations.

Given these problems and complications, EPA has decided that the most constructive course is to provide additional interpretive guidance on the existing dilution prohibition contained in § 258.3, and to explain more fully how those rules would apply in specific situations. We also explain again how we have determined to deal with the interface between RCRA and other wastewater regulatory programs.

a. *The existing dilution prohibition ordinarily would not apply to prohibited characteristic wastes generated and managed in treatment systems regulated by the CWA or SDWA.* As explained in a previous section, EPA has determined in most cases not to apply a dilution prohibition to characteristic wastes that are generated and managed in treatment systems regulated under the CWA or SDWA. EPA believes, however, that where the Agency has established a method as the treatment standard for a characteristic waste, and that where application of that method is consistent with and promoting of the objectives of the Clean Water Act or the Safe Drinking Water Act programs, then the method of treatment attaches to the waste at the point of generation, and dilution to change the treatability group to avoid application of the method is impermissible. For example, in this rule, this is true of the ignitable nonwastewaters containing greater than 10% TOC and the EP toxic pesticide wastewaters (DO12-17) if these wastes are managed in wastewater treatment systems regulated under the Clean Water Act. The treatment method for these wastes is incineration, fuel substitution, or some type of wastewater treatment technology that destroys organics. Not only are these wastes amenable to combustion treatment (or other treatment that destroys organics), but they typically contain high concentrations of toxic organic constituents whose destruction furthers the RCRA goal of decreasing waste toxicity and minimizing threats from land disposal.

Prohibiting dilution of these wastes (*i.e.*, requiring application of a specified treatment method) is entirely consistent with the existing regulatory framework of CWA's NPDES/pretreatment programs. For example, the 10% TOC ignitable wastes are inappropriate for wastewater treatment as they would overwhelm the capacity of most

biological treatment systems. (As noted in the preamble section describing the DO01 treatment standards, EPA in fact developed the 10% TOC cutoff for ignitable wastes based on the outer limit of design capacity for biological treatment systems.) The Clean Water Act effluent limitations guidelines and the standards addressing these types of wastes already contemplate that these wastes will not be diluted, but rather will be treated in the appropriate manner.

The logic that forces this decision for these wastes in a NPDES/pretreatment Clean Water Act system is not equally persuasive in the case of wastes disposed of by injection. As noted in section ILLD, Class I deep wells inject below the lowermost geological formation containing an underground source of drinking water. Deep wells are not currently injecting wastes that contain any of the pesticide constituents found in DO12-17 characteristic wastes. Additionally, there is not a design concern of overwhelming the biological treatment system in the deep well scenario. In this instance, it is illogical to force deep wells to utilize a specified method as there is little concomitant environmental or technical benefit through its utilization. Therefore, in today's final rule, the Agency is exempting deep wells from specified methods and the dilution prohibition as long as the characteristic is removed before disposal.

b. *Dilution is considered to be an acceptable method of treatment for non-toxic characteristic wastes.* Although EPA proposed that the dilution prohibition would cover all characteristic wastes, the Agency specifically noted that dilution might be an acceptable type of treatment for non-toxic characteristic wastes and solicited comment on the issue. 54 FR 48496. After considering the comments, the Agency has determined that for non-toxic hazardous characteristic wastes (*i.e.*, wastes that exhibit a hazardous physical or chemical property), it should not matter how the non-toxic characteristic property is removed so long as it is removed. Thus, dilution is an acceptable treatment method for such wastes. (This issue is discussed in more detail in the sections on each particular characteristic waste.) The Agency realizes that this approach does not fully address the potential problem of toxic constituents that may be present in such wastes, nor encourages minimization or recovery of non-toxic characteristic hazardous wastes. EPA has determined that these potential problems should be addressed, if at all,

in other rulemakings (or potentially in a reauthorized statute) and are too difficult to resolve in this proceeding, given the extraordinary pressures and limited review time imposed by the May 8 statutory deadline.

EPA also notes that it considers high TOC ignitable nonwastewaters, reactive cyanide wastes, and reactive sulfide wastes to be toxic characteristic wastes. As noted above, the high TOC ignitables have been shown to frequently contain high concentrations of organic toxicants. Reactive cyanide and sulfide wastes obviously contain toxic constituents. Thus, dilution would not be an appropriate method of treatment for any of these.

c. Determining when types of treatment (including centralized treatment) involving dilution are permissible. The Agency is able to provide limited additional guidance today on the issue of when treatment methods involving dilution are permissible. The issue frequently arises when prohibited wastes are aggregated for purposes of treatment. First, if the wastes are all legitimately amenable to the same type of treatment, and this method of treatment is utilized for the aggregated wastes, the aggregation step is not impermissible dilution. Thus, it is permissible (and normally desirable) for prohibited organic-containing wastes that are suitable for combustion to be aggregated before combustion even though the concentration of organics in some of the wastes decreases. (See, for example, the discussion for wastes K048-52.) On the other hand, as noted above, aggregation of high TOC ignitable wastes with ignitable wastewaters for centralized biological treatment is not permissible. Biological treatment is inappropriate for the high TOC ignitable wastes, and the aggregation step merely dilutes the high TOC stream.

As noted above, EPA is unable to quantify across-the-board what types of treatment are appropriate for particular prohibited hazardous wastes (both listed and characteristic). Clearly, as stated at proposal, units would have to be doing some treatment (*i.e.*, removing toxicity or mobility of BDAT constituents). In addition, treatment units would have to be treating wastes that are amenable to treatment in that type of unit or by that type of treatment, or, in the case of centralized treatment units treating aggregated wastes, appropriately combining wastes for common treatment. An example of type of treatment that is inappropriate for treatment of certain prohibited wastes would be biological treatment systems

used to treat prohibited wastes having treatment standards for metals. In these systems, metal removal is incidental and nowhere as efficient as systems designed to treat metals; biological treatment systems are designed solely for organic treatment. (EPA notes, however, that since it is not applying dilution rules for most characteristic wastewaters, the above example would only apply in cases when a listed prohibited metal-bearing wastewater—a wastewater with treatment standards for metals—was being treated in a biological treatment unit. If this hypothetical biological treatment were a surface impoundment, EPA would not view it as satisfying the requirement of section 3005(j)(11) and § 268.4 that it be conducting "treatment." See discussion at 52 FR 25778-79 (July 8, 1987) where EPA determined in an analogous circumstance that impoundments which primarily evaporate hazardous constituents do not qualify as section 268.4 impoundments which may receive wastes that have not met the treatment standard.) The clearest objective indication that proper treatment for a prohibited waste is being conducted is if the treatment is the same type as that on which the treatment standard is based. Thus, any aggregation before such treatment would ordinarily not be considered to be impermissible dilution. However, other forms of treatment may also be appropriate. Such determinations will be made on a case-by-case basis.

d. Dilution to remove a characteristic. EPA proposed that prohibited hazardous wastes could not be diluted by impermissible means to render them non-hazardous, even though the waste resulting from dilution would not have to be managed in a subtitle C unit. 54 FR 48495. Although this possibility exists for all prohibited wastes—both those that are listed (*i.e.*, dilution to achieve delisting levels) and those that exhibit characteristics—the issue arises most often with respect to characteristic prohibited wastes.

EPA is finalizing this approach in the final rule, modified, however, by a number of principles discussed above. Thus, since it is permissible to dilute prohibited non-toxic ignitable, reactive, and corrosive wastes, it is permissible to remove the characteristic from such wastes by this means. Second, dilution of prohibited characteristic wastewaters is normally permissible because the Agency does not wish to disrupt existing regulatory programs developed under other statutes for such wastewaters. These two modifications address the

concerns raised by many of the commenters.

For other situations, however, dilution to remove a prohibited waste's characteristic (or to render it delistable) is used "as a substitute for adequate treatment to achieve compliance with [a treatment standard]", and so falls within the express terms of the § 268.3 dilution prohibition. Furthermore, as the Agency explained in detail in the proposal, if the dilution prohibition were not to apply in such circumstances, the authority Congress granted the Agency to establish treatment standards for characteristic wastes would be essentially meaningless. Thus, EPA adheres to the position that the act of impermissibly diluting a prohibited waste so that it no longer exhibits a characteristic (or is rendered delistable) is illegal.

5. Examples

a. Facility A generates an EP toxic wastewater that it mixes in tanks with other wastewater so that the characteristic is removed. After mixing, the aggregated wastewaters are discharged to waters of the United States.

The dilution prohibition does not apply because the wastewater is not a prohibited waste; it is not being land disposed. In addition, the Agency has determined not to apply the dilution prohibition rules to characteristic wastewaters (with the exception of those subject to certain treatment methods that are managed in Clean Water Act facilities).

b. Facility B generates a wastewater that is corrosive and EP toxic for a pesticide. It is mixed in tanks with other wastewaters generated at the same facility so that both characteristics are removed. The aggregated mixture is then injected into a Class I UIC well. While a restricted waste at the point of generation, these wastes are not prohibited because they are injected below the characteristic level in a Class I injection well. See § 268.1(c)(3).

c. Facility C generates a wastewater that is a listed hazardous waste that contains metals for which EPA has established treatment standards. It aggregates this waste with organic wastewaters that are generated on-site so that the metal levels in the aggregated wastewaters are below the treatment standard. The aggregated mixture is then sent to a surface impoundment for biological treatment and then discharged to waters of the United States.

The dilution prohibition would be violated. EPA does not consider

biological treatment to be an appropriate mode of treating metal-bearing toxic wastes (*i.e.*, wastes for which there are treatment standards for inorganic hazardous constituents). Any metal removal is incidental because the treatment technology is not designed to remove metals. In addition, removals are at a rate that is considerably less efficient than could be achieved by chemical precipitation or other forms of wastewater treatment. Thus, in the example, dilution would be used as a substitute for treatment of the listed waste and would therefore be illegal dilution and not treatment. (See 54 FR 38938 (Sept. 6, 1989) (dilution prohibition applies to wastes managed in section 258.4 impoundments).)

d. Facility D generates an EP toxic nonwastewater that it stabilizes to meet the treatment standard. The waste's volume increases 400 per cent as a result of stabilization.

Although there are too few facts in this example to give a definitive answer, normally this large an increase in waste volume would indicate that the treatment standard is being achieved as a result of dilution rather than treatment, and therefore would be impermissible.

H. Applicability of Today's Final Rule to Mineral Processing Wastes

Section 3001(b)(3)(A)(ii) of RCRA excludes from the hazardous waste regulations (pending completion of studies by the Agency) solid wastes from the extraction, beneficiation and processing of ores and minerals. On September 1, 1989, EPA published a final rule (54 FR 36592) that narrowed the scope of this exclusion for 25 enumerated wastes that meet the exclusion criteria of "high volume/low hazard," as specified in the September 1 rule. EPA determined that five specific mineral processing wastes clearly remain within the scope of the exclusion, and 20 additional specified mineral processing wastes remain within the exclusion pending collection of further volume and hazard data. All previously excluded mineral processing wastes, other than these 25 specified wastes, that exhibit one or more of the characteristics of hazardous waste will no longer be excluded from the hazardous waste regulations when the final rule became effective on March 1, 1990. On January 23, 1990 (see 55 FR 2322-2354), EPA published another final rule removing an additional five of these wastes from the exclusion based on additional volume and/or hazard data. This final rule becomes effective on July 23, 1990.

EPA believes that these previously excluded wastes are "newly identified" for the purpose of determining applicability of the land disposal prohibitions. Although technically the wastes are not being identified by a new characteristic, they are being brought into the Subtitle C system after the November 8, 1984 enactment of HSWA. A permissible interpretation of RCRA section 3004(g)(4), which is ambiguous as to whether it applies to wastes first brought into the Subtitle C system after 1984 due to regulatory re-interpretation, is that wastes brought into the system after the 1984 RCRA amendments may be prohibited from land disposal under a different schedule than those wastes that were hazardous on the date of enactment of HSWA, and also are not subject to the statutory hard hammer. The policy reasons for preferring this interpretation are those that prompted Congress to establish a separate prohibition schedule for other newly identified and listed wastes: the need to study such wastes separately, and prioritization of hammer dates. Consequently, because these wastes are considered to be newly identified, the Agency must develop treatment standards for them within six months of their being identified as hazardous wastes (RCRA section 3004(g)(4)(C)).

However, as stated above, these wastes are hazardous because they exhibit one or more of the characteristics of hazardous waste. Today's rule promulgates treatment standards for characteristic wastes. A question, therefore, is whether the treatment standards for characteristics should apply to these mineral processing wastes recently determined not to fall within the Bevill exclusion. Put another way, although as newly identified wastes they are not subject to the hard hammer, EPA has the choice of whether to apply the treatment standards for characteristic wastes to them at this time.

The Agency has not yet performed the technical analyses necessary to determine if the treatment standards promulgated today as BDAT for EP toxic hazardous wastes or other characteristic hazardous wastes can be achieved in treating the various mineral processing wastes. Therefore, EPA has determined that these newly identified mineral processing wastes are *not* subject to the BDAT standards promulgated today for characteristic hazardous wastes. The Agency plans to study the mineral processing wastes in the future to determine BDAT for these newly identified hazardous wastes.

There are circumstances when newly identified mineral processing wastes can, however, be subject to existing hazardous waste prohibitions. In particular, if the mineral processing waste is mixed with other prohibited wastes (*i.e.*, any prohibited solvent, dioxin, First or Second Third hazardous waste), it becomes subject to the prohibition for the prohibited waste with which it is mixed. EPA also solicited comment on applicability of California list prohibitions, but has determined that these prohibitions will not apply. See section III.F for a discussion of this issue.

Whether any of these prohibitions would have immediate regulatory effect would be determined by the authorization status of the State in which the waste is managed. Because the final rules removing wastes from the scope of the Bevill exclusion are not being adopted pursuant to HSWA, they do not take effect immediately in authorized States. Thus, in these States, these mineral processing wastes would only be hazardous wastes if they are included within the scope of the State's authorized program. If they are not, they would not be hazardous wastes until an amended State's program including them is authorized. Only after authorization would the land disposal prohibitions apply in that State. These mineral processing wastes would be hazardous wastes in unauthorized States as soon as the rule removing them from the exclusion becomes effective. At that time, any land disposal prohibitions that apply to them also would take effect.

The Agency, in the proposed rule, solicited comment on whether the BDAT treatment standards proposed for the EP toxic metals are appropriate for the newly identified mineral processing wastes. Of the comments received, almost all supported EPA's position that the mineral processing wastes are sufficiently different from other characteristic wastes to warrant additional analysis, and that the statutory hammer and the California list prohibitions apply only to those wastes regulated as hazardous at the time of the HSWA enactment.

Several commenters argued against the Agency's position on mineral processing wastes. One commenter stated that since EPA has extensive information available from the listing process, that should be sufficient to develop BDAT treatment standards. However, data collected and analyzed for the purpose of listing a waste as hazardous are different from those required to perform BDAT analyses. In addition, most of the analyses

performed have been to determine if the mineral processing wastes fall within the scope of the Bevill Amendment (*i.e.*, high volume/low hazard). Thus, the Agency does not agree that it has sufficient data to determine BDAT standards for mineral processing wastes.

Another commenter argued that these wastes were improperly excluded from regulation in the first place by an illegal interpretation of the Bevill Amendment in 1990, so should not be considered newly identified at this time. The Agency disagrees with the commenter that mineral processing wastes cannot be considered newly identified wastes. These wastes have become subject to the subtitle C regulations subsequent to the enactment of HSWA, and thus need not be subject to the hard hammer, nor must treatment standards for characteristic hazardous wastes be applied to them in this rulemaking. Certainly, there is no indication in either the statute or the legislative history that in creating a 66-month deadline for characteristic wastes, Congress expected the Agency to address wastes within the scope of the Bevill Amendment at the time of HSWA's promulgation.

I. Generator Notification Requirements

The generator notification requirements set forth in 40 CFR 268.7 specify that when the generator has determined, either through testing or through knowledge of the waste, that the waste is restricted and does not meet the applicable treatment standards, the generator must, with each shipment of waste, notify the treatment facility in writing of the applicable treatment standards and prohibition levels. This notice must include the EPA Hazardous Waste Number, the corresponding treatment standards and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA section 3004(d), the manifest number associated with the shipment of waste, and waste analysis data, where available (40 CFR 268.7(a)(1)). If the generator has determined that the waste being shipped is restricted, but can be land disposed without further treatment, the generator must submit to the land disposal facility the same information, as well as a certification stating that the waste meets the applicable treatment standards (40 CFR 268.7(a)(2)). (EPA reiterates that such determination must, of course, be accurate. Thus, failure to accurately determine a waste's status as restricted is a violation of § 268.7 (a)(1) or (a)(2), as well as a potential violation of other provisions.)

The Agency had received, prior to the Third Third proposed rule, a number of

questions on whether the actual treatment standards (*i.e.*, the actual number or method) must be placed on the generator notification form, or if it is sufficient to reference the appropriate treatment standards by citation of the applicable part of 40 CFR 268.41, .42, or .43. EPA's interpretation has been that all applicable treatment standards must be listed completely on the generator notification form sent to the treatment, storage or disposal facility. A number of these pre-proposal commenters had indicated that they believe the current regulations can be interpreted to allow referencing, rather than listing the specific treatment standards as part of the generator notification. The commenters argued that referencing the standards serves the same purpose as listing the specific treatment standards. Furthermore, they stated that the notification forms are becoming longer, more complicated, and unwieldy as new wastes and corresponding treatment standards are added to the list of wastes restricted from land disposal, and thus listing each treatment standard on the notification form imposes an unnecessary burden on generators.

As proposed in the Third Third notice on November 22, 1989 (54 FR 48496), the Agency today is amending 40 CFR 268.7 to allow referencing the Code of Federal Regulations (CFR) rather than listing each treatment standard. EPA solicited comment in the Third Third proposed rule on this action to determine if the regulated community anticipated any problems with referencing of the CFR, and to determine the effect this action would have on hazardous waste generators. The comments EPA received on the proposal were overwhelmingly in favor of allowing referencing the CFR. Commenters stated that this action will significantly reduce the paperwork involved in handling the waste shipments, reduce transcription errors, and in no way cause harm to the environment.

Although EPA today is allowing such references to the CFR, the following information also must be included in the reference: the EPA Hazardous Waste No., the subcategory of the waste code (*e.g.*, D003, reactive cyanide subcategory), the treatability group(s) of the waste(s) (*e.g.*, wastewater or non-wastewater), and the CFR sections and paragraphs where the applicable treatment standards appear. In addition, where treatment standards are expressed as specified technologies in § 268.42, the 5-letter treatment code found in Table I of § 268.42 (*e.g.*, INCIN, WETOX) must be listed. Omissions or inaccuracies in listing any of these items

will be considered a violation. In addition, the Agency emphasizes that the change to 40 CFR 268.7 allows referencing of the CFR in lieu of only the individual treatment standards; all other § 268.7 information is still required in the notification.

EPA notes that these revised notification requirements also apply to treatment and storage facilities, with the following exceptions. These changes do not apply to generators, or treatment or storage facilities that ship spent solvents (F001-F005), multi-source leachate (F039) or California list wastes off-site to a disposal facility. These waste categories each contain a number of individual constituents or waste groups (*e.g.*, the waste code for multi-source leachate (F039) contains 230 constituents). Therefore, referencing only the CFR section in lieu of the treatment standards would not provide the disposal facility with meaningful information regarding which constituents might reasonably be expected to be present in the waste. The same is true for California list wastes and spent solvents. For each of these wastes, therefore, all applicable waste groups and individual constituents actually must be listed on the notification.

In addition, some pre-proposal commenters raised concerns about notification requirements with regard to shipments subject to the March 24, 1986 small quantity generator (SQG) rule. This rule, specifically 40 CFR 262.20(e), exempts SQGs (100-1000 kg/mo.) with recycling tolling agreements (as defined in 40 CFR 262.20(e)) from the full Part 262 manifesting requirements. EPA received a number of comments supporting the proposed approach, and today is amending § 268.7 to allow a one-time notification and certification for SQG shipments subject to tolling agreements. Such agreements, as well as the one-time notifications and certifications, must be maintained by the generator for three years after termination or expiration of the agreement in keeping with the provisions of 40 CFR 262.20(e)(2).

The Agency is promulgating this amendment because it believes the subsequent handler of the waste under the contractual tolling arrangement has sufficient notification and knowledge of the nature of the wastes being handled. Tolling agreements provide for the collection and reclamation of a specified waste and for redelivery of regenerated material at a specified frequency. The Agency believes that since the same waste is picked up at regular intervals, one notice will suffice for the duration of

the agreement to apprise the subsequent handler of the land disposal restrictions applicable to the waste.

J. Waste Analysis Plans and Treatment/Disposal Facility Testing Requirements

In the proposed rule, EPA noted that §§ 268.7 (b) and (c) currently require treatment and disposal facilities to test their wastes in order to ensure that they are in compliance with applicable treatment standards and prohibition levels. EPA also noted that these provisions require such testing to be performed according to the frequency specified in the facility's § 264.13 or § 265.13 Waste Analysis Plan (WAP). Although §§ 264.13 and 265.13 require that waste analyses contain enough information to allow the owner/operator to comply with the 40 CFR 268 requirements, the Agency noted that a comment found in both of these sections has created implementation problems. The comment states, "the owner or operator of an off-site (treatment, storage, or disposal) facility may arrange for the generator of the hazardous waste to supply part or all of the (waste analysis) information." This language has been construed erroneously as precluding EPA (or an authorized State) from requiring the owner/operator to conduct a detailed chemical and physical analysis of the waste where the generator has supplied the owner/operator with such waste analysis information. Although EPA stated in the proposal that it has authority to require owner/operators to test their wastes in such cases, the Agency stated its preference for removing any ambiguities and modifying the regulations in order to clarify EPA's intent.

The Agency noted in the proposal its belief that ordinarily, treatment and disposal facilities should do some corroborative testing to ensure compliance with LDR treatment standards and prohibitions. Although there are certainly situations where test data submitted by the generator, or the knowledge of the generator, may constitute an essential part of the necessary information, EPA's proposal was premised on a need to ensure that the LDR requirements are met *prior* to disposal. The Agency also noted that such corroborative testing provides records that may be useful in ascertaining compliance with LDR requirements. Thus, EPA stated that treatment and disposal facilities normally should do periodic independent corroborative testing of prohibited wastes, even if the generator also tests the waste or otherwise

certifies that it is eligible for land disposal.

Given this context, the Agency proposed two approaches for specifying the circumstances under which EPA could require corroborative testing. The first approach would allow off-site facilities to arrange for the generator and/or treater of wastes to supply all or part of the waste analysis information only if an EPA-approved WAP affirmatively allows the generator and/or treater to supply this information. Since interim status facilities do not have their WAPs approved until their permit applications are reviewed by EPA (or the authorized State), such facilities would no longer be able to rely upon generator data under this approach. Under the second approach, the Regional Administrator or his designate would determine the owner/operator's testing frequency, but such facilities would be required to conduct waste analyses at least once a year. Since such an approach would be self-implementing, no revisions to existing permits would be necessary.

Numerous commenters pointed out the advantages and disadvantages of both approaches. The primary issues raised by commenters related to the flexibility and resources associated with the proposed approaches. Several commenters supported the flexibility that the first approach would provide. Individual facility circumstances can be considered, which the commenter, believed would result in appropriate testing frequencies. The Agency agrees with the commenters and continues to believe that the frequency of testing is best determined on a case-by-case basis by the permit writer. This is because the range of variables (*e.g.*, variety of wastes managed, different types of waste matrices, number of processes involved) is too broad to justify a single national testing frequency. However, evaluating the appropriate testing frequencies for every treatment and disposal facility can be very resource-intensive, a task that likely would take several years to complete. Some commenters expressed a preference for specific minimum testing frequencies, in part to establish a baseline level from which to depart. As stated above, a required testing frequency is difficult to specify for all facilities, and would be excessive and redundant in some situations while not being protective enough in others. To address this problem, the Agency is developing guidance to help identify what testing frequency, based on site-specific considerations, is reasonable and

appropriate for treatment and disposal facilities.

Several commenters stated that corroborative testing by treatment and disposal facilities is unnecessary where generators supply such waste analysis data. Some of these commenters felt that testing should be required only where the generator does not supply testing data (*i.e.*, where the generator supplies waste characterization data based only on his knowledge of the waste or waste generation process). EPA disagrees with the commenters, and notes that the D.C. Circuit, in upholding EPA's § 268.7 testing framework, has expressed its support for treatment and disposal facility corroborative testing requirements:

[I]t is the treatment facility's job to transform waste otherwise deemed too dangerous to permit into landfills into acceptable form. It is therefore not irrational for the EPA to introduce a backup, arguably "redundant" testing stage for these wastes requiring treatment and even to consider this a "critical" stage in the process.

886 F.2d at 370.

The court also noted that such corroborative testing is necessary for disposal facilities:

[J]ust prior to land disposal, waste must be vigorously tested to confirm that it is what others have represented it to be and that it may permissibly be land disposed.

Id.

Given these concerns, the Agency today is promulgating an approach that combines elements of both the proposed approaches. EPA is revising the comment in §§ 264.13 and 265.13 to implement this approach.

Under the final approach, treatment and disposal facilities may generally rely on information provided to them by generators or treaters of the waste. However, treatment and disposal facilities must conduct periodic detailed physical and chemical analysis on their waste streams to assure that the appropriate part 268 treatment standards are being met. Specifically, today's final rule amends the comment in §§ 264.13 and 265.13 to make it clear that the restricted waste testing requirement (or other frequency approved by the Agency) is not superseded by the ability of the facility to rely on information supplied by the generator or treater. Also, with today's change, § 264.13 more clearly specifies that EPA may, through the permit, require the owner or generator of a treatment or disposal facility to conduct periodic chemical and physical analysis prior to treatment or other management of wastes.

Interim status facilities are subject to the testing requirement for restricted wastes. Interim status waste analysis plans are developed by the facility and maintained on-site, in accordance with self-implementing procedures of § 265.13. Therefore, interim status facility owners or operators should ensure that their plan conforms with today's new requirement. For example, if the facility's plan specifies total reliance on generator or treater-provided information, then the plan will likely need to change to require appropriate testing (See discussion below regarding general Agency waste testing considerations). Also, interim status facilities should update their pending permit applications promptly to ensure that the applications reflect the most current information and today's revised regulatory requirements.

If a permitted facility wants to amend its WAP to better address restricted waste testing requirements, then it would follow the permit modification procedures in § 270.42. Under those modification procedures, a change to indicate a different testing frequency would most likely be a Class 2 modification (see appendix I to § 270.42, item B(1)).

EPA believes that there will be sufficient time to incorporate appropriate waste analysis requirements into the development of permits for the approximately 1000 interim status treatment and storage facilities expected to receive RCRA permits in the next several years. WAPs for permitted storage and treatment facilities (including incinerators) will be examined no later than at permit reissuance. Reevaluation of land disposal facility permits will occur no later than the five year permit review required by § 270.50(d), so WAP changes can be accomplished at that time. It should also be noted that for permitted facilities, EPA may address selected WAPs earlier than the above timeframes by using its general authority to reopen permits when new standards or regulations have been promulgated (§ 270.41(a)(3)).

For both permitted and interim status facilities, the Agency retains its authority (particularly where a revised WAP has not been Agency-approved) to determine that, based on an inspection or other information, the testing frequencies and/or protocols are inadequate at a particular facility. In such cases, EPA (or an authorized State) may take a number of actions, including, but not limited to, terminating or modifying a facility's permit or pursuing an enforcement action.

In order to aid permit writers and the regulated community in determining the appropriate testing frequencies at both stages in time, the Agency expects to issue guidance soon which will further address these issues.

K. Testing of Wastes Treated in 90-Day Tanks or Containers

As noted in the November 22, 1989 proposal, treatment of prohibited wastes conducted in so-called 90-day tanks (or containers) regulated under § 262.34 is not presently subject to a waste analysis plan requirement. 54 FR 48497. Thus, there is no regulatory vehicle for determining testing frequency in such circumstances. In contrast, under § 268.7(b), treatment facilities treating prohibited hazardous wastes must test the treatment residues that they generate at a frequency determined by their waste analysis plan in order to ascertain compliance with the applicable treatment standards. All treatment facilities operating pursuant to interim status or a full permit must have a waste analysis plan.

Therefore, in order to close this regulatory gap, EPA proposed that generators treating prohibited wastes in § 262.34 tanks and containers must prepare a plan justifying the frequency of testing they choose to adopt (54 FR 48497). EPA disagrees with several commenters who contended that sufficient regulatory mechanisms are already in place for these units. Most importantly, there is no regulation at all addressing testing frequency. Since a substantial volume of hazardous waste is treated in these units, the issue of testing frequency is viewed by the Agency as important for ensuring the integrity of the section 3004(m) treatment standards. Furthermore, today's imposition of a waste analysis plan requirement—addressing, among other issues, testing frequency—on persons treating in 90-day tanks is consistent with the Agency's determination in the Solvents and Dioxins final rule that generators who also treat must assume the same responsibilities as off-site treaters. See 51 FR 40597. Put another way, EPA believes that persons treating prohibited wastes should ordinarily have the same recordkeeping and documentation responsibilities whether the treatment occurs off-site or in 90-day tanks.

Therefore, in today's final rule, the Agency is promulgating the proposed action with several modifications in § 268.7(a)(4). In addition to the modifications (and in accordance with majority of comments), the Agency is clarifying that only generators treating wastes to comply with the applicable

BDAT treatment standards (as opposed to wastes treated partially but receiving further off-site treatment before meeting the treatment standard) are subject to the new requirement to prepare a waste analysis plan. Specifically, generators treating prohibited wastes in § 262.34 tanks and containers to meet the applicable EDAT treatment standard must prepare a plan detailing the frequency of testing that is to be conducted. The plan is to be justified on detailed chemical and physical analysis of a representative sample of the prohibited waste(s) being treated, and must contain all information necessary to treat the waste(s) in accordance with requirements of part 268 (see §§ 264.13 and 265.13, from which these substantive requirements are drawn), including the selected testing frequency. Examples of factors EPA would expect to be included in the plan are: discussion of the number of prohibited wastes treated, their variability, and the variability of the treatment process. See section III.J of today's preamble for more detailed information on factors to include in the plan.

EPA does not believe however, that it needs to require waste analysis plans from 90-day generators who treat partially, but do not treat to achieve the treatment standard. Such a requirement would duplicate waste analysis plans of the ultimate treatment facility. The requirement that EPA is adopting today is meant to close an outright regulatory gap which exists only when the 90-day generator is the sole treater.

The plan will be self-implementing in the sense that there is no requirement of prior approval from any regulatory entity. There is, however, a requirement that the plan be retained as a facility record, where it serves as the means of justifying to enforcement officials why the frequency of testing selected by the facility is reasonable. Furthermore, as suggested by several commenters, this plan should be filed with the EPA Regional office or State within 30 days prior to the activity by some mechanism that can verify delivery (e.g., return receipt requested, Federal Express, or messenger). This provision will allow the Agency or State an opportunity to review the testing plan established. EPA notes, however, that it reserves the right at any subsequent time to disapprove of the testing plan. This review mechanism should ease one commenter's concerns about these plans being self-implementing and not subject to regulatory review.

L. Clarification of "P" and "U" Solid Wastes

1. Residues Remaining in Containers or Inner Liners

In the November 22, 1989 proposal, EPA proposed several amendments to clarify the existing language of 40 CFR 261.33. The first amendment involved 40 CFR 261.33(c), a provision that lists residues remaining in containers or in an inner liner that have held commercial chemical products listed in 40 CFR 261.33(e). EPA believes that this language was partially in error as it does not include residues remaining in containers or in an inner liner contaminated with the 40 CFR 261.33(f) materials. All of the other provisions in 40 CFR 261.33 refer to both 40 CFR 261.33 (e) and (f) wastes, and there is no reason that 40 CFR 261.33(c) should not as well. The omission results in fact from an oversight, and is not based on any choice by the Agency.

Many commenters misunderstood the Agency's intent by this clarification. It was not our intent to subject "U" wastes (i.e., non-acute hazardous wastes) to the triple-rinsing requirements of 40 CFR 261.7(b)(3) as this section applies solely to acute hazardous wastes. In 40 CFR 261.33(c), there is not a corresponding reference, however, that residues remaining in containers or in an inner liner contaminated with "U" wastes are subject to regulation, unless empty as defined in 40 CFR 261.7(b)(1). This omission could be read as allowing the disposal of full containers of "U" listed wastes. While this would clearly be an incorrect reading, today's final action corrects this omission.

2. Spill Residues

In addition, EPA proposed a clarifying amendment to 40 CFR 261.33(d) to be codified in 40 CFR 261.2 (b) and (c) to state that residues of spills of commercial chemical products listed in 40 CFR 261.33 (e) and (f) will be considered solid wastes if they are not recycled within 90 days of the spill. 54 FR 43493-94. The Agency's rationale was that although such spilled materials may be considered to be "abandoned" under the existing regulatory language, it might be more appropriate to establish a specific time period after which such spills became solid wastes. The Agency noted further that it ordinarily views spilled commercial chemicals as solid wastes because the nature of a spill constitutes disposal, and because of the difficulty of recycling spill residues in such matrices as soil or groundwater. *Id.* In these instances, not only are spill residues of commercial chemical products unlike other 40 CFR 261.33

material (e.g., off-specification products), but the Agency believes that marginal claims of recyclability could be asserted to avoid proper cleanup of spills. *Id.*

While comments on this issue were mixed, a number of commenters made the point that this issue was inappropriate for determination in the Third Third rulemaking because it is not directly related to the Land Disposal Restrictions program. Given that these comments have merit and considering the number of issues that must be decided under the pressing timetable imposed by the statute, the Agency will not go forward with the quantified standard that it proposed.

Furthermore, the Agency believes that this issue can be addressed by interpretation of existing regulations. Under 40 CFR 261.33, mere assertion of intent to recycle a spill residue of a commercial chemical product does not automatically immunize the spill area from RCRA subtitle C jurisdiction. The generator has the burden of proving that the spilled material is not a solid waste, and a generalized assertion does not satisfy the burden. See 40 CFR 261.2(f). Objective considerations that could be pointed to to satisfy this burden include whether the generator has begun to recycle the spill residue, the length of time the spill residue has existed, the value of the spilled material, whether it is technically feasible or technically practical to recycle the spill residue, and whether there is any past history of the company recycling this type of residue. EPA repeats that assertion of intent to recycle does not satisfy the generator's burden of proof. Rather, there must be objective indicators of intent, and the indicators must be strong given that a spill of hazardous material to soil or groundwater is normally a simple act of disposal.

3. De Minimis Exception to the Mixture Rule

In the context of the Third Third proposal, several commenters requested clarification of the scope of the mixture rule exemption to the definition of hazardous waste under 40 CFR 261.3(a)(2)(iv). This provision exempts mixtures which contain small amounts of listed spent solvents ("F-listed solvents") or other *de minimis* losses of commercial chemical wastes ("P and U wastes") from manufacturing operations when these listed wastes are mixed with other wastewater "the discharge of which is subject to regulation under either section 402 or section 307(b) of the Clean Water Act (including wastewater at facilities that have eliminated the

discharge of wastewater)." ²⁰

Commenters raised the issue of whether disposal of such mixtures via Class I UIC wells allows the facility to claim this exemption. In particular, commenters expressed concern that recent EPA statements regarding the scope of this exemption imply that large volumes of wastewater will require treatment of the P and U wastes within the wastewater stream before injection of a Class I well, and that capacity for treatment of such wastestreams is not currently available.

Before responding to these comments, some background information is in order. RCRA subtitle C generally regulates as hazardous all mixtures of listed hazardous wastes and other solid wastes. One exception from this rule is for mixtures that "consist[] of wastewater the discharge of which is subject to regulation under either section 402 or 307(b) of the Clean Water Act (including wastewater at facilities which have eliminated the discharge of wastewater) and: [contain specific amounts of listed solvents or *de minimis* losses of discarded chemical products]." 40 CFR 261.3(a)(2)(iv). This exception to the mixture rule was established by regulation on November 17, 1981. See 46 FR 56582. A specific level for spent solvents is established by the regulation (either 1 ppm or 25 ppm). The regulation sets a worst-case maximum concentration of solvent within the wastewater stream; the actual concentration will almost certainly be less. Conversely, there is no set regulatory concentration for *de minimis* loss levels of P and U wastes that are listed in 40 CFR 261.33(e) and (f).

In the 1981 interim final rule, EPA did not exempt all *de minimis* mixtures generated at all facilities. Rather, EPA limited the exemption as follows: "[The exemption] applies only to wastewater mixtures managed in wastewater treatment systems whose discharge is subject to regulation under * * * the [CWA]. This requirement will help to prevent indiscriminate discharge of wastes into wastewater treatment systems because to do so would jeopardize the generator's ability to comply with its [CWA] discharge requirements. * * * (T)he Agency

²⁰ The exemption also covers mixtures of small amounts of listed hazardous wastes in wastewaters resulting from laboratory operations. 40 CFR 261.3(a)(2)(iv)(E). Also, there is similar, but not identical, language contained in a final rule that provided interpretations of certain terms and provisions of standards for hazardous waste tank systems (53 FR 34079, September 2, 1988). Today's notice is not changing the applicability of the September 2, 1988 final rule with respect to hazardous waste tank systems.

means to include all facilities which generate wastewater which is discharged into surface water or into a POTW(.) The Agency also means to include those facilities (known as 'zero dischargers') that have eliminated the discharge of wastewater as a result of, or by exceeding (*i.e.*, doing better than), NPDES or pretreatment program requirements.' 46 FR 56584 (Nov. 17, 1981).

Furthermore, the applicability of the mixture rule exemption for P and U wastes was limited to the introduction of these wastes into wastewaters "in the normal handling of these materials, either as raw products used in the manufacturing process or as intermediate or chemical products used in or produced by the manufacturing process." [emphasis added] 46 FR 56586.

Certain commenters assert that the mixture rule exemption currently applies to wastewater disposed of in a UIC well. Specifically, these commenters argue first that all injection wells dispose of wastewater "the discharge of which is subject to regulation [under the CWA]." Second, commenters argue that UIC wells *per se* constitute a method for facilities to "eliminate * * * the discharge of wastewater." Commenters further suggest that wastewater disposal via UIC wells should be exempted as consistent with the purposes for the exemption expressed by EPA, *i.e.*, that such wastewater mixed with *de minimis* levels of listed wastes are adequately regulated by another statute. These commenters express their belief that disposal of such mixtures down UIC wells would be adequately controlled under the UIC regulations, and that injection was the environmentally sound method of disposal for these wastewaters.

EPA does not agree completely with the commenters' analysis of the scope of the mixture rule exemption. First, injection of a fluid in a UIC well is not a "discharge" within the meaning of the CWA. Injection wells can, in appropriate instances, constitute a practice which has "eliminated the discharge of wastewater," but these instances must be evaluated on a case-by-case basis. As the regulation states, the issue is whether the "discharge" is subject to section 402 or 307(b) of the CWA, not whether the facility is "subject to regulation" under section 402. A UIC well, whether or not the state adopts its regulations under 402(d) addressing such a well, is not a CWA discharge point. Thus, facilities with wells for injection of wastewater do not fall within the mixture rule exemption

simply because they have an injection well on site.

UIC wells may, however, be "zero discharge" facilities, *i.e.*, those which have eliminated their discharge. To qualify as such a facility, it must satisfy the definition of a "zero discharge" facility outlined in the November 17, 1981 regulation. To repeat the language from the 1981 preamble discussing that provision, "(t)he Agency * * * means to include those facilities (known as 'zero dischargers') that have eliminated the discharge of wastewater *as a result of, or by exceeding, NPDES or pretreatment program requirements.*" 46 FR 56584 (Nov. 17, 1981) [emphasis added]. Thus, a UIC well will certainly qualify as a zero discharge facility if the facility injects the wastewater to comply with NPDES permit conditions or an applicable CWA effluent guideline. A well at a facility which is not "subject to (CWA) regulation" under an NPDES permit or an effluent guideline is not within the scope of the language of the mixture rule exemption. EPA notes that this interpretation is fully consistent with its 1981 preamble, and thus does not constitute a "change" in interpretation, as suggested by certain commenters.

EPA notes, that, as a practical matter, the facilities concerned about the scope of the mixture rule exemption are likely unaffected by today's clarification. Most of these facilities are, in fact, in an industry category (organic chemicals) whose facilities are "subject to regulation" under section 402 by virtue of the effluent guideline for that category. See 40 CFR part 414 (1989). Thus, EPA does not believe that there will be a problem with treatment capacity for P and U wastes, because most wastewaters containing *de minimis* amounts of P and U wastes now being injected are not hazardous waste now being injected are not hazardous waste and will be unaffected by today's rule. Nonetheless, EPA wishes to caution such facilities that the mixture rule exemption does not constitute a license to mix collected volumes of E, P, or U wastes into a treated wastewater stream and then inject such a stream. As EPA clearly stated in 1981, the exemption is designed to cover situations where "various spills or incidental losses" of solvents or commercial chemicals are "reasonably and efficiently managed by being discharged into a plant's wastewater treatment system." 46 FR 56584. EPA clearly did not assume that facilities would attempt to avoid treatment of such wastes.

M. Storage Prohibition

In the proposed rule, EPA recognized that there are concerns with its existing interpretation of the statutory storage prohibition set out in section 3004(j) of RCRA. Section 3004(j) provides that storage of prohibited hazardous waste is itself prohibited "unless such storage is solely for the purpose of the accumulation of such quantities of hazardous waste as are necessary to facilitate proper recovery, treatment, or disposal." Principal concerns are that some storage may be prohibited even where it is not being used with the intent to circumvent the land disposal prohibitions, and whether the storage prohibition should only apply if storage is used as surrogate disposal.

To fully evaluate these concerns, the Agency requested comment on an alternative interpretation of 40 CFR 268.50. Under the alternative approach, storage of prohibited wastes in tanks or containers pending the utilization of proper treatment, recovery or disposal capacity would not be prohibited. EPA provided two examples of allowable storage under this alternative approach:

- (1) Where a generator is storing wastes in tanks for six weeks because of a backup at an incinerator which the generator has a contract to use; and
- (2) Where a treatment facility treats a prohibited waste to a level that does not meet the treatment standard and then stores the waste before treating it again to meet the standard.

EPA recognized in the proposal that under the alternative approach, the phrase "utilization of *proper* treatment, recovery or disposal capacity" needed to be further defined. The Agency also sought further comment on how a temporal element might be added to the phrase "pending the utilization * * *" in order to define the limits of the proposed approach. Commenters were also asked to address other potential situations where they believed that an overly literal reading of 3004(j) may have consequences they believe Congress did not intend.

Many of the commenters supported the proposed broadening of the allowable bases for storing prohibited wastes. However, the commenters did not offer specific workable suggestions for defining terms such as "pending" and "proper", as EPA noted was necessary. Without objective criteria for defining the limits of allowable storage, EPA believes that the proposed reinterpretation will be very difficult to implement and enforce. For example, does it matter how far in the future—five years, two years, six months—

proper treatment might be utilized? Must there be a contract with a treatment company? What if it is contingent, or contains option provisions? Thus, the Agency is instead retaining its longstanding interpretation of the storage prohibition and is not finalizing the proposed alternative approach.

Under the existing approach, both RCRA 3004(j) and 40 CFR 268.50 provide that storage of prohibited hazardous wastes is itself prohibited "unless such storage is solely for the purpose of the accumulation of such quantities of hazardous waste as are necessary to facilitate proper recovery, treatment or disposal." Storage of prohibited wastes is only allowed in non-land based storage units (*i.e.*, tanks and containers), since land-based storage is a type of land disposal.

Two major principles underlie the storage prohibition: (1) the need to reduce the risks created by long-term storage; and (2) the goal of the Land Disposal Restrictions, and HSWA generally, to encourage the expeditious use of alternative treatment technologies. *Cf. Hazardous Waste Treatment Council v. EPA*, 886 F.2d. 355 (D.C. Cir. Sept. 15, 1989) ("*HWTC III*") where the court said:

Congress believed that permitting storage of large quantities of waste as a means of forestalling treatment would involve health threats equally serious to those posed by land disposal, and therefore opted in large part for a "treat as you go" regulatory regime. 886 F.2d. at 357.

Mechanisms such as national capacity variances and case-by-case extensions are intended to address situations where there is a lack of treatment capacity.

No firm time limit is established pursuant to § 268.50. Generators and owners or operators can store as long as necessary. The legislative history makes it clear that the intent of RCRA 3004(j) and § 268.50 is to prohibit use of long-term storage to circumvent treatment requirements imposed by the Land Disposal Restrictions. 129 Cong. Rec. H8139 (daily ed. October 6, 1983). However, if prohibited wastes are stored beyond one year, the owner/operator has the burden of proving (in the event of an enforcement action) that such storage is for the allowable reason: prior to one year, EPA maintains the burden of proving that storage has occurred for the wrong reason.

Finally, EPA reemphasizes that intent is not a critical factor in determining liability. In order to successfully enforce this provision, the Agency need not demonstrate that those storing prohibited wastes have a particular state of mind. Rather, objective factors

such as the type and amount of waste in storage and the time in storage still may be relied upon as the key factors in interpreting this provision. In determining whether storage is lawful, the Agency will continue to evaluate these factors in light of its "treat as you go" approach noted in *HWTC III*. EPA notes, however, that the intent of these storing prohibited wastes may be relevant in the Agency's determination regarding what type of relief, if any, to seek in a civil or criminal enforcement action.

1. Storage of Radioactive Mixed Waste

Several commenters urged the Agency to modify its existing interpretation of the section 3004(j) storage prohibition as it relates to radioactive mixed waste. Mixed waste contains both a hazardous waste component subject to RCRA hazardous waste management standards and a radioactive waste component regulated under the Atomic Energy Act (AEA). The commenters asserted that there is little or no available permitted treatment or disposal capacity for commercially generated mixed waste, and that many of these mixed wastes contain spent solvents or California list wastes that are not eligible for the national capacity variance which EPA is granting for mixed waste containing first, second, and third-third wastes. The commenters emphasized that generators have no practical option but to store their prohibited mixed waste on-site, pending the availability of treatment and disposal capacity. The commenters stated that the Agency should not interpret such storage as "surrogate disposal" that violates section 3004(j), since this interpretation would result in a requirement allowing no possibility of compliance by generators. The commenters further asserted that interpreting section 3004(j) in this manner could give rise to an inconsistency with the AEA, within the meaning of RCRA section 1005(a).

EPA is aware of the difficulties posed by the applicability of the section 3004(j) storage prohibition to mixed wastes under circumstances where there is no treatment or disposal capacity. These issues and their effects on certain low-level waste generators (e.g., hospitals, research institutions, universities), were also discussed at length in a recent report developed by the Office of Technology Assessment (OTA). (See "Partnerships Under Pressure, Managing Commercial Low-level Radioactive Waste," OTA, November 1989).

EPA acknowledges that the current shortage of treatment or disposal capacity, and the requirements and

deadlines under other statutory programs, are factors which are affecting the management of mixed waste. EPA will further evaluate the legal, policy, and factual issues relevant to this matter. Since this issue is not material to the requirements which EPA must promulgate in order to meet the May 8, 1990 Third Rule statutory deadline, EPA will resolve this matter separately from this rulemaking. The Agency expects to issue its policy on the mixed waste storage issue during the next 90 days.

N. Case-by-Case Extensions

Under RCRA Section 3004(h)(3), EPA can grant case-by-case extensions of the prohibition effective dates for up to one year beyond the applicable deadlines; extensions are renewable once for up to one additional year. On November 7, 1986, EPA published a final rule (51 FR 40572) establishing the regulatory framework to implement the land disposal restrictions program, including the procedures for submitting case-by-case petitions.

To obtain a case-by-case extension, the statute requires that the applicant make the following demonstrations:

(1) A binding contractual commitment has been made to construct or otherwise provide alternative treatment, recovery, or disposal capacity that protects human health and the environment.²¹

(2) Due to circumstances beyond his or her control, such alternative capacity cannot reasonably be made available by the applicable effective date.

(3) If a surface impoundment or landfill is used by the applicant to manage the waste during the extension period, the unit must meet the requirements of section 3004(o). EPA has interpreted these statutory provisions to also require the following (see 40 CFR 268.5(a)):

(1) A good-faith effort must be made to locate and contract with treatment, recovery, or disposal facilities nationwide to manage the waste in accordance with restrictions by the applicable effective date.

(2) The capacity being constructed or otherwise provided will be sufficient to manage the entire quantity of waste that is the subject of the petition.

²¹ Section 3004(h)(3) refers to "such alternative capacity," referring back to Section 3004(h)(2), which speaks of "alternative treatment, recovery, or disposal capacity which protects human health and the environment." For disposal capacity, EPA interprets this language to mean a no-migration unit. See Sections 3004 (d)(1), (e)(1), and (g)(5). For treatment and recovery capacity, the reference refers to capacity that satisfies the Section 3004(m) standard.

(3) A detailed schedule for obtaining required operating and constructing permits, or an outline of how and when alternative capacity will be available.

(4) Adequate capacity is available to manage the waste during the extension period, documenting in the petition the location of all sites at which the waste will be managed.

After an applicant has been granted a case-by-case extension, the applicant must notify the Administrator as soon as he or she has knowledge of any change in the demonstrations made in the petition. In addition, the applicant must submit progress reports, at specified intervals, that describe the progress being made towards obtaining adequate alternative capacity, identify any delay or possible delay in developing the capacity, and describe the mitigating actions being taken in response to the event. See 40 CFR 268.5 (f) and (g).

The Agency has received a number of inquiries on whether a proposed no-migration petition or proposed treatability variance would satisfy the first statutory requirement. That is, could a proposed no-migration variance or a proposed treatability variance constitute the "alternative treatment, recovery, or disposal capacity." If so, and if the Agency were to grant a case-by-case extension, this could provide petitioners with additional time while their no-migration petition or treatability variance is being considered for final approval.

First, it should be noted that the amount of time required to process no-migration and treatability variances (for other than injected wastes) is expected to be 12-18 months due to the complexity of the technical demonstrations that must be made, and their subsequent evaluation. On the other hand, the case-by-case petitions generally can be processed in about 6-8 months because the required demonstrations are more straightforward. This could give the petitioner about 6 months of relief. Some petitioners believe that there are a number of legitimate circumstances where the few extra months gained would make the difference between closing a facility which ultimately will be granted a valid variance request, and keeping it in operation.

In response to these inquiries, EPA is taking this opportunity to clarify that the statutory requirement to obtain a "binding contractual commitment to construct or otherwise provide alternative treatment, recovery, or disposal capacity" may be satisfied by a Federal Register notice wherein the Agency proposes to grant either a no-migration extension or a treatability

variance. The Agency believes that EPA's proposing to grant either a treatability variance petition or a no-migration petition is sufficient demonstration that the petitioner has made a good faith effort to commit to obtaining alternative protective disposal capacity; any further commitment is solely contingent on EPA's action at this point. In addition, the Agency's action in proposing to grant the variance petition serves as a partial imprimatur that the alternative capacity under consideration will prove to be protective. However, the mere filing of a variance petition provides no such guarantee (most of the no-migration petitions for surface units filed to date, for example, have proven technically deficient), and thus cannot be deemed to satisfy the statutory requirement.

Of course, should EPA then grant a case-by-case extension, that grant would be conditional: if EPA denies the no-migration petition or the treatability variance, then the basis for the case-by-case extension may no longer exist, and the variance will be terminated unless there is additional basis for the variance. In addition, when the no-migration or treatability variance is granted, the case-by-case extension automatically expires (since it is no longer needed).

Because significant time and resources would have been expended on the case-by-case petition review unnecessarily if the no-migration petition or treatability variance is ultimately denied, EPA will begin review of a case-by-case extension petition *only* after receiving a clear indication that the Agency has the intention of proposing to grant the no-migration petition or treatability variance (and will not propose to grant a case-by-case extension unless the Agency has actually proposed to grant the variance). Conversely, when the clear indication is that the no-migration petition or treatability variance will be denied, EPA will not review the case-by-case petition, and the petitioner will be notified at the same time he or she is notified of the status of the other petition.

O. Applicability of California List Prohibitions after May 8, 1990

In the November 22, 1989 proposal, EPA discussed two issues relating to California list wastes. 54 FR 48498. The first issue is the question of continued applicability of California list prohibitions to wastes which are granted a national capacity variance in today's rulemaking. The second issue is whether California list prohibitions apply to wastes that are first identified

and listed after the date of the HSWA amendments. 54 FR 48498-99.

EPA discussed the relationship of California list prohibitions to scheduled wastes subject to a capacity variance (either national or case-by-case) in the preamble to the First Third rule. 53 FR 31188. The Agency established in the First Third rule that although specific prohibitions and treatment standards take precedence over California list prohibitions, during the period of a capacity variance the California list prohibitions continue to apply. EPA included this discussion in the Third Third proposal not to reopen the issue but to put persons on notice that the same reading applies to Third Third wastes, including characteristic wastes. In fact, the few commenters on the issue indicated that they agreed with and were aware of the Agency's position.

The Agency did solicit comment, however, on whether it would be permissible to reevaluate whether the California list prohibitions for acid corrosive wastes would apply during the period of a national capacity variance for Third Third acid corrosive wastes (which are identical substances). Several commenters suggested that the prohibition for California list corrosives should not apply to Third Third corrosives that are granted national capacity variances in today's rulemaking. The Agency disagrees with this assertion and believes that not applying the more generally applicable California list prohibitions as an interim prohibition is contrary to the literal statutory language and enunciations of Congressional intent in the legislative history. See S. Rep. No. 284, 98th Cong. 1st Sess. 17. Also, given the fact that these wastes have been restricted since July 8, 1987, it is illogical that the Agency would grant these wastes a capacity extension in today's rulemaking. Therefore, a corrosive waste that is injected underground is at a minimum subject to the California list prohibitions on August 8, 1990.

The other issue on which EPA solicited comment is whether newly identified or listed wastes could be covered by California list prohibitions. Most of the comments supported the Agency's tentative conclusion that the statutory language does not compel a reading that California list prohibitions apply, and further supported the view that California list prohibitions should not apply. EPA is adopting that reading in today's rule. As the Agency noted at proposal, there would be massive dislocations in the regulated community if California list prohibitions were to apply to newly identified and listed

wastes. For example, if wastes identified by the new Toxicity Characteristic were HOCs, thus triggering immediate California list prohibitions, there would be immediate prohibitions of these wastes rather than the more phased schedule specified in section 3004(g)(4). EPA does not believe this result is desirable. In addition, the Agency believes that the better reading of the statute is that the California list prohibitions were not meant to apply to wastes that are newly identified or listed. Consequently, EPA is determining today that wastes that are newly identified and listed²² are prohibited only when the Agency takes specific action with regard to them pursuant to section 3004(g)(4).

Since the California list prohibitions are superseded by more specific treatment standards (with the caveat that the prohibitions continue to apply during capacity variance periods as discussed above) with the promulgation of the Third Third final rule, almost all of the California list prohibitions will be superseded by more specific prohibitions and treatment standards.²³ The California list prohibitions remain applicable for (1) liquid hazardous wastes that contain over 50 ppm PCBs; (2) HOC-containing wastes identified as hazardous by a characteristic property that does not involve HOCs, as, for example, an ignitable waste that also contains greater than 1000 ppm HOCs (but not an EP toxic waste that exhibits the characteristic because it contains one of the six chlorinated organic pesticides covered by the EP toxicity characteristic); and (3) liquid hazardous wastes that exhibit a characteristic and also contain over 134 mg/l of nickel and/or 130 mg/l of thallium.

Finally, EPA proposed that it would delete the provision specifying burning in boilers and furnaces as a specified method of treatment for California list HOCs (existing § 268.42(a)(2)) because there are virtually no situations to which the provision could apply. 54 FR 48499. There was virtually no comment on this point, and EPA is finalizing this action as proposed for the reasons stated at proposal.

²² Newly identified means either newly subject to an existing characteristic (e.g., such as those wastes removed from the Bevill exclusion) or subject to a new characteristic. Newly listed wastes may still be subject to any preexisting applicable characteristic standards or California list prohibitions stemming from the characteristic.

²³ See 52 FR 29993 (August 12, 1987) and 52 FR 25773 (July 8, 1987); see also 40 CFR 268.32(h) (HOC prohibition superseded by treatment standard and effective date for a particular HOC).

IV. State Authority

A. Applicability of Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. Following authorization, EPA retains enforcement authority under sections 3008, 3013, and 7003 of RCRA, although authorized States have primary enforcement responsibility. The standards and requirements for authorization are found in 40 CFR part 271.

Prior to HSWA, a State with final authorization administered its hazardous waste program in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified time frames. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

In contrast, under RCRA section 3006(g) (42 U.S.C. 6926(g)), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in nonauthorized States. EPA is directed to carry out these requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as State law to retain final authorization, HSWA applies in authorized States in the interim.

With one exception, today's final rule is promulgated pursuant to sections 3004 (d) through (k), and (m), of RCRA (42 U.S.C. 6924 (d) through (k), and (m)). Therefore, it will be added to Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to HSWA and take effect in all States, regardless of their authorization status. States may apply for either interim or final authorization for the HSWA provisions in Table 1, as discussed in the following section. Table 2 in 40 CFR 271.1(j) will also be modified to indicate that this rule is a self-implementing provision of HSWA.

The exception is the clarifying amendment to § 261.33(c). This clarification is not effective in authorized States since the requirements are not imposed pursuant to HSWA.

Thus, these requirements will be applicable only in those States that do not have interim or final authorization. In authorized States, the requirements will not be applicable until the State revises its program to adopt equivalent requirements under State law.

B. Effect on State Authorizations

As noted above, EPA will implement today's final rule in authorized States until their programs are modified to adopt these rules and the modification is approved by EPA. Because the rule is promulgated pursuant to HSWA, a State submitting a program modification may apply to receive either interim or final authorization under RCRA section 3006(g)(2) or 3006(b), respectively, on the basis of requirements that are substantially equivalent or equivalent to EPA's. The procedures and schedule for State program modifications for either interim or final authorization are described in 40 CFR 271.21. It should be noted that HSWA interim authorization will expire on January 1, 1993 (see 40 CFR 271.24(c)).

Section 271.21(e)(2) requires that States that have final authorization must modify their programs to reflect Federal program changes and must subsequently submit the modification to EPA for approval. The deadline by which the State must modify its program to adopt these regulations is July 1, 1991, in accordance with section 271.21(e). These deadlines can be extended in certain cases (see section 271.21(e)(3)). Once EPA approves the modification, the State requirements become subtitle C RCRA requirements.

States with authorized RCRA programs may already have requirements similar to those in today's rule. These State regulations have not been assessed against the Federal regulations being promulgated today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements in lieu of EPA until the State program modification is approved. Of course, States with existing standards may continue to administer and enforce their standards as a matter of State law. In implementing the Federal program, EPA will work with States under agreements to minimize duplication of efforts. In many cases, EPA will be able to defer to the States in their efforts to implement their programs rather than take separate actions under Federal authority.

States that submit official applications for final authorization less than 12 months after the effective date of these regulations are not required to include

standards equivalent to these regulations in their application. However, the State must modify its program by the deadline set forth in § 271.21(e). States that submit official applications for final authorization 12 months after the effective date of these regulations must include standards equivalent to these regulations in their application. The requirements a state must meet when submitting its final authorization application are set forth in 40 CFR 271.3.

The regulations being promulgated today need not affect the State's Underground Injection Control (UIC) primacy status. A State currently authorized to administer the UIC program under the Safe Drinking Water Act (SDWA) could continue to do so without seeking authority to administer these amendments. However, a State which wished to implement Part 148 and receive authorization to grant exemptions from the land disposal restrictions would have to demonstrate that it had the requisite authority to administer sections 3004(f) and (g) of RCRA. The conditions under which such an authorization may take place are summarized below and are discussed in a July 15, 1985 final rule (50 FR 28728).

C. State Implementation

The following four aspects of the framework established in the November 7, 1986, rule (51 FR 40572) affect State implementation of today's rule and impact State actions on the regulated community:

1. Under part 268, subpart C, EPA is promulgating land disposal restrictions for all generators, treaters, storers, and disposers of certain types of hazardous waste. In order to retain authorization, States must adopt the regulations under this Subpart since State requirements can be no less stringent than Federal requirements.

2. Also under part 268, EPA is granting two-year national variances from the effective dates of the land disposal restrictions based on an analysis of available alternative treatment, recovery, or disposal capacity. Under § 268.5, case-by-case extensions of up to one year (renewable for one additional year) may be granted for specific applicants lacking adequate capacity.

The Administrator of EPA is solely responsible for granting variances to the effective dates because these determinations must be made on a national basis. In addition, it is clear that RCRA section 3004(h)(3) intends for the Administrator to grant case-by-case extensions after consulting the affected States, on the basis of national concerns which only the Administrator can

evaluate. Therefore, States cannot be authorized for this aspect of the program.

3. Under § 268.44, the Agency may grant waste-specific variances from treatment standards in cases where it can be demonstrated that the physical and/or chemical properties of the wastes differ significantly from wastes analyzed in developing the treatment standards, and the wastes cannot be treated to specified levels or treated by specified methods.

The Agency is solely responsible for granting such variances since the result of such an action may be the establishment of a new waste treatability group. All wastes meeting the criteria of these new waste treatability groups may also be subject to the treatment standard established by the variance. Granting such variances may have national impacts; therefore, this aspect of the program is not delegated to the States at this time.

4. Under § 268.6, EPA may grant petitions of specific duration to allow land disposal of certain hazardous wastes where it can be demonstrated that there will be no migration of hazardous constituents for as long as the waste remains hazardous. States which have the authority to impose restrictions may be authorized under RCRA section 3006 to grant petitions for exemptions from the restrictions. Decisions on site-specific petitions do not require the national perspective required to restrict wastes or grant extensions. EPA will be handling "no migration" petitions for surface disposal facilities at Headquarters, though the States may be authorized to grant these petitions in the future. The Agency expects to gain valuable experience and information from review of "no migration" petitions which may affect future land disposal restrictions rulemakings. In accordance with RCRA section 3004(i), EPA will publish notice of the Agency's final decision on petitions in the Federal Register.

V. Effect Of the Land Disposal Restrictions Program on Other Environmental Programs

A. Discharges Regulated Under the Clean Water Act

As a result of the land disposal restrictions program, some generators might switch from land disposal of restricted Third Third wastes to discharge to publicly-owned treatment works (POTWs) in order to avoid incurring the costs of alternative treatment. In shifting from land disposal to discharge to POTWs, an increase in human and environmental risks could

occur. Also as a result of the land disposal restrictions, hazardous waste generators might illegally discharge their wastes to surface waters without treatment, which could cause damage to the local ecosystem and potentially pose health risks from direct exposure or bioaccumulation.

Some generators might treat their wastes prior to discharging to a POTW, but the treatment step itself could increase risks to the environment. For example, if incineration were the pretreatment step, metals and other hazardous constituents present in air scrubber waters could be discharged to surface waters. However, the amount of Third Third waste shifted to POTWs would be limited by such factors as the physical form of the waste, the degree of pretreatment required prior to discharge, and State and local regulations.

B. Discharges Regulated Under the Marine Protection, Research, and Sanctuaries Act

There could be a potential demand for some of the hazardous wastes included in today's rulemaking to be shifted from land disposal to ocean dumping and ocean-based incineration. If the cost of ocean-based disposal plus transportation were lower than the cost of land-based treatment, disposal, and transportation, this option could seem to be an attractive alternative. In addition, ocean-based disposal could seem attractive to the regulated community if land-based treatment were not available.

However, the Ocean Dumping Ban Act of 1988 has restricted ocean dumping of sewage sludge and industrial wastes to existing, authorized dumpers until December 31, 1991, after which "... it shall be unlawful for any person to dump (sewage sludge or industrial wastes) into ocean waters...". Therefore, the Ocean Dumping Ban Act has made moot any economic or other incentive to ocean dump industrial hazardous wastes, including the wastes subject to this regulation.

C. Wellhead Protection Regulated under the Safe Drinking Water Act (SDWA)

Section 1428 of the SDWA contains requirements for the development and implementation of state Wellhead Protection (WHP) Programs to protect wells and wellfields which are used, or may be used to provide drinking water to public water systems. Under section 1428, each state must adopt and submit to EPA for approval a WHP program that, at a minimum:

- (1) Specifies the duties of state agencies, local governments, and public water systems

in the development and implementation of the WHP program:

(2) For each wellhead, determines the wellhead protection area (WHPA), as defined in section 1428(e) of SDWA, based on all reasonably available hydrogeologic information on ground-water flow, recharge, and discharge and other information the state deems necessary to adequately determine the WHPA;

(3) Identifies within each WHPA all potential human sources of contaminants which may have any adverse health effects;

(4) Describes provisions for technical assistance, financial assistance, implementation of control measures, and education, training, and demonstration projects to protect the water supply within WHPAs from such contaminants;

(5) Includes contingency plans for the location and provision of alternate drinking water supplies for each public water system in the event of well or wellfield contamination by such contaminants;

(6) Requires that state and local governments and public water systems consider all potential sources of human contamination within the expected wellhead area of a new water well which serves a public water system; and

(7) Requires public participation in developing the WHP program.

SDWA required all states to submit a WHP program to EPA by June 19, 1989, for EPA review and approval. EPA has received 29 state submittals for review. SDWA requires that all Federal agencies having jurisdiction over any potential source of contaminants identified by a state program under this section shall comply with all the requirements of the state program.

Any private or public entity subject to the land disposal restrictions regulations must also be in compliance with the appropriate state's wellhead protection program. The Agency reiterates that the land disposal of hazardous wastes must comply not only with the land disposal restrictions and other RCRA regulations, but with other environmental programs, such as the Wellhead Protection Program under the Safe Drinking Water Act.

D. Air Emissions Regulated Under the Clean Air Act (CAA)

There are two air emission concerns with respect to the land disposal restrictions. The first is a cross-media concern about air emissions that occur as a result of waste treatment such as incineration of metal-bearing wastes causing metal emissions to the atmosphere. Another concern is with air emissions from the land disposal of the treatment residue. Air emissions control programs are under development using both the CAA and RCRA to address these concerns as discussed below.

Specific cross-media air emission concerns have been identified for

treatment technologies applicable to Third Third wastes, but EPA believes that existing Clean Air Act controls adequately address the potential problems. Retorting of mercury sulfide wastes can result in air emissions of both elemental mercury and sulfur dioxide (SO₂). The Agency has promulgated a National Emission Standard for Hazardous Air Pollutants (NESHAP) for mercury emissions under section 112 of the CAA (40 CFR part 61, subpart E). There are no industry-specific national CAA control standards for SO₂ emissions from retorting mercury sulfide wastes. There are, however, regulations for the prevention of significant deterioration (PSD) of air quality that would address not only these SO₂ emissions but also any mercury emissions that are not regulated by the NESHAP.

The NESHAP limits mercury emissions to the atmosphere from mercury processing facilities, mercury cell chlor-alkali plants, and plants that incinerate and/or dry wastewater treatment plant sludges. In all these cases, the NESHAP limits mercury emissions across the entire processing facility to the extent necessary to protect human health. The NESHAP would not apply to a dedicated mercury sulfide waste retorting facility that is not located in an ore processing or a mercury cell chlor-alkali plant. EPA is addressing problems of potential mercury emissions by requiring that retorters either be subject to the NESHAP or operate with the PSDs on which the NESHAP was based.

Under section 165(a) of the CAA, all new major stationary sources and major modifications to existing sources of air pollution must obtain a PSD permit. If the mercury or SO₂ emissions from the retorting process were to come from a major stationary source or a major modification subject to the PSD regulations and would be emitted in significant amounts (greater than 0.1 tons per year of mercury or 40 tons per year of SO₂), then such emissions would be subject to best available control technology (BACT) requirements. An air quality analysis for mercury and SO₂ would also be required under PSD. Moreover, an air quality analysis must be conducted to demonstrate that the SO₂ emissions would neither cause nor contribute to violations of any national ambient air quality standard (NAAQS) or PSD increment for SO₂. Facilities that are located in areas that have failed to meet any NAAQS for SO₂ (i.e., designated nonattachment areas) and emit more than 100 tons per year of SO₂, must not only apply emission controls that meet the lowest achievable

emission rate but also offset their remaining SO₂ emissions by acquiring federally enforceable emission reductions from other nearby SO₂ emissions sources.

The Agency is also concerned whether incineration of wastes containing brominated organics or organo-nitrogen compounds may adversely affect air quality. The presence of bromine complicates the evaluation of incineration of these wastes. A detailed discussion of the Agency's approach for brominated organics is contained in section III.A.5.b of today's preamble. A discussion of potential nitrogen oxide emissions from organo-nitrogen wastes is contained in section III.A.5.c.

There are several general regulatory development programs under RCRA that address treatment technology air emissions. The Agency has initiated a three-phased program under § 3004(n) of RCRA to address air emissions from hazardous waste management units other than incinerators. The first phase addresses organic air emissions as a class from two types of emission sources. The first source category is process equipment (pumps, valves, etc.) that contact hazardous waste that contain greater than 10 percent organic compounds, including such as distillation units and incinerators. The second source category is certain vents on various treatment technologies, such as air or steam strippers. These standards were proposed in the Federal Register on February 5, 1987 (52 FR 3748) and are expected to be promulgated this spring.

The second phase of standards development under section 3004(n) of RCRA addresses organic air emissions as a class from tanks, containers, and surface impoundments. Treatment technologies that occur in tanks or containers that are not controlled by the Phase I standards would be controlled by these standards. Wastes that would be prohibited from land disposal may continue to be managed in a surface impoundment as long as the treatment residuals that do not meet the applicable treatment standards are removed from the impoundment within one year of entry into the impoundment. These standards will control air emissions from the management of wastes in the surface impoundment. These standards are expected to be proposed in the Federal Register this spring.

In the third phase of the section 3004(n) standards development, the Agency will develop additional standards for the sources addressed in

the first two phases as necessary to address residual risks.

In addition to the section 3004(n) standards, general standards to control both organic and metal emissions from the combustion of hazardous waste in incinerators and other types of combustion devices are under various stages of development.

In certain cases, waste treatment may occur in treatment technologies that are not required to obtain RCRA permits. Guidance for the control of air emissions from these sources, such as exempt biological treatment tanks and recycling units, is being developed under the CAA.

None of the regulatory efforts discussed above address air emissions from the land disposal of treatment residue in landfills, land treatment units, or waste piles because the Agency presently presumes that these units will only receive wastes that have been treated to meet the BDAT requirements. The Agency is considering whether to propose regulations in a separate rulemaking to limit air emissions from land disposal units seeking to land dispose of wastes under a no migration variance.

E. Clean Up Actions Under the Comprehensive Environmental Response, Compensation, and Liability Act

The land disposal restrictions may have significant effects on the selection and implementation of response actions that are taken under the Comprehensive Environmental Response,

Compensation, and Liability Act (CERCLA). There are three primary areas in which these effects may occur.

One area that may be affected by the land disposal restrictions is in the selection of treatment standards at the remedial action site. The cleanup standards set at CERCLA sites are risk-based, while treatment standards developed under the land disposal restrictions program are technology-based. Therefore, the technology-based treatment standards may be more stringent than the risk-based cleanup standards developed based on the CERCLA selection of remedy criteria, and vice versa. Another matter that may be affected is the treatment of soil and debris contaminated with wastes restricted from land disposal. Contaminated soil and debris are a primary type of waste that must be remediated at most CERCLA sites. In many cases, the soil matrix is different from that of the industrial wastes for which treatment standards are set. CERCLA site managers must either comply with the treatment standards or

request and be granted a variance from the treatment standard (§ 268.44) or a "no-migration" variance (§ 268.6).

Finally, even though the hazardous substances at a CERCLA remediation site may have been disposed prior to the effective date of RCRA, if the action involves removal of restricted wastes after the prohibition effective date, the land disposal restrictions are legally applicable (51 FR 40577, November 7, 1986). See also *Chemical Waste Management v. EPA*, 869 F.2d at 1535-37 (D.C. Cir. 1989). For example, if a waste is excavated from a unit, treated, and redispersed, EPA has indicated that "placement" (see RCRA section 3004(k)) of the waste in a land disposal unit has occurred, and the applicable treatment standards must be met (see 53 FR 51444 and 51445, December 21, 1988). However, if the waste is capped in place, removal or "placement" has not occurred, and the treatment standards are not legally applicable.

F. Applicability of Treatment Standards to Wastes from Pesticides Regulated Under the Federal Insecticide, Fungicide, and Rodenticide Act

A number of generators of pesticide waste that have heretofore been comparatively unaware of the land disposal restrictions may be regulated under today's rulemaking. This will require that the Agency develop guidance materials and provide training on how to comply with the requirements of the land disposal restrictions.

Generators of significant quantities of pesticide P and U wastes are farmers and commercial pesticide applicators. The provisions of 40 CFR 262.70 and 268.1 exempt farmers from regulation under the land disposal restrictions program; however, no such exemption exists for commercial applicators. Such generators of hazardous wastes have traditionally land disposed their pesticide wastes. With promulgation of today's final rule, these generators must comply with the requirements of the land disposal restrictions if they dispose a restricted hazardous waste.

G. Regulatory Overlap of Polychlorinated Biphenyls (PCBs) Under the Toxic Substance Control Act (TSCA) and RCRA.

Certain P and U listed wastes contain PCBs. The PCB component of such a waste mixture is regulated primarily under TSCA (although it may also be a California list waste, and subject to RCRA regulation (both substantive and administrative as well)), while the listed P or U component of the waste is regulated under RCRA. Such a mixture of listed/PCB waste must meet the

applicable requirements under both statutes. Such a waste must go to an incinerator permitted under both TSCA and RCRA. Any ash residual from incineration must meet the treatment standard for the listed waste component prior to land disposal.

VI. Regulatory Requirements

A. Regulatory Impact Analysis—Surface Disposed Wastes

In accordance with Executive Order No. 12291, the Agency has reviewed the costs and benefits of today's final rule and has determined that today's final rule constitutes a "major regulation" because it results in an annual cost to the economy in excess of \$100 million. As a result of this determination, the Agency has conducted a regulatory impact analysis (RIA) in support of today's final rule. The complete RIA document, Regulatory Impact Analysis of the Land Disposal Restrictions for Third Third Scheduled Wastes Final Rule (April 24, 1990), is available for review in the public docket for today's final rule. The complete document was also submitted to the Office of Management and Budget for review, as required by Executive Order No. 12291.

This section of the preamble summarizes the results of the regulatory impact analysis of the final rule, as detailed in the RIA document, as well as comments received on the regulatory impact analysis for the proposed rule. Section VI.A.1 below describes the universe of wastes and facilities affected by today's rule. Section VI.A.2 below summarizes the analysis of human health and environmental benefits attributable to today's rule. Section VI.A.3 summarizes the economic cost and impact analysis performed for today's rule.

The Agency analyzed benefits, costs, and economic impacts using the same approach and methodology that was used for the August 17, 1988, First Third final rule (53 FR 31138).²⁴ The effects of the final rule were estimated by comparing post-regulatory management practices and conditions with those occurring under baseline conditions. Two post-regulatory scenarios were examined. Under the first scenario, the "subtitle C" scenario, all treatment residuals would be disposed of in subtitle C units. For the second, "subtitle D," scenario, all characteristic waste treatment residuals would be disposed of in Subtitle D units. The baseline was

²⁴ For detailed information on the cost methodology, see *Regulatory Impact Analysis of the Land Disposal Restrictions on First Third Wastes: Final Report*, August 1988, ICF Incorporated.

defined as continued land disposal of wastes in units meeting minimum technological requirements.

The Agency adjusted reported waste management practices to reflect compliance with the land disposal restriction rules covering solvents and dioxins, California list wastes, and First and Second Third scheduled wastes. In making these adjustments, EPA assumed that facilities would comply with these other rules by the least costly methods allowable. However, though First Third soft hammer wastes were examined under the First Third rule Second Third soft hammer wastes are included in today's analysis. Thus, all First Third, Second Third, and Third Third wastes have been addressed in the land disposal restrictions rules collectively.

1. Overview of Affected Wastes, Facilities, and Management

The universe of waste and facilities examined for the RIA was developed from EPA's "National Survey of Hazardous Waste Treatment, Storage, Disposal, and Recycling Facilities" (hereafter, the TSDR survey) and EPA's 1984 "National Survey of Hazardous Waste Generators and Treatment, Storage, and Disposal Facilities Regulated under RCRA in 1981" (hereafter, the RIA Mail survey). Data from these surveys have been updated as part of the capacity analysis accompanying this rulemaking (see discussion in Section 3B). The data used for the final regulatory analysis reflect this updated data base and are consistent with the data used for the capacity analysis accompanying the proposed rule.

As with past land disposal restrictions RIAs, the TSDR and RIA Mail surveys provide an overview of the number of facilities treating, storing, and disposing of waste; the quantities and types of waste (by RCRA waste code) managed at each facility; and the current practice or method of treatment. The adjusted information contained in the two surveys is accepted as the baseline (i.e., pre-Third Third rule) practice for this RIA.

Several commenters noted that the quantities of waste estimated do not include non-hazardous waste that may have been affected by the Agency's proposed dilution prohibition. In today's rule, however, the Agency is allowing facilities that discharge their characteristic wastes under a NPDES permit or dispose of it in a UIC well to dilute. The Agency is also allowing facilities that generate non-toxic characteristic wastes (with the exception of high TOC ignitable

nonwastewaters, reactive cyanide wastes, and reactive sulfide wastes) to dilute their wastes in order to achieve treatment standards. However, characteristic wastes discharged pursuant to an NPDES permit, with a specified method, cannot be rendered nonhazardous through dilution alone. The Agency believes, therefore, that it has accurately analyzed the impact of today's rule.

Quantity of Affected Waste. Today's rule affects approximately 277 million gallons of waste per year as shown in Table VI-1. An additional 44 million gallons (per year) of multisource leachate may also be affected by today's rule.

TABLE VI-1.—THIRD THIRD RULE QUANTITY BY WASTE TYPE

(in million gallons per year)

	Vol.	Per-cent
Ignitable (D001), corrosive (D002), and reactive wastes (D003).....	42	15
EP toxic wastes (D004-D016) and mixtures.....	122	44
Listed wastes.....	2	1
Mixtures of wastes.....	32	12
CBI wastes.....	79	29
Total.....	277	100

Characteristic wastes constitute the largest volume of wastes covered by the final rule. In addition to the 59 percent identified as D001-D016, the waste mixtures category is dominated by characteristic wastes. Table VI-2 gives the volumes of the most affected characteristic wastes.

TABLE VI-2.—PREDOMINANT CHARACTERISTIC WASTES BY VOLUME

(in million gallons per year)

D008 (EP Toxic for lead).....	53
D007 (EP Toxic for chromium).....	41
D002 (Corrosive).....	17
D001 (Ignitable).....	17
Mixtures of D006 and D008.....	9
D006 (Cadmium).....	8
D003 (Reactive).....	7

Affected Facilities. A total of 110 waste management facilities and nearly 1,700 waste generators are affected by today's final rule. Table VI-3 provides a breakdown of affected facilities and their volumes managed.

TABLE VI-3.—THIRD THIRD RULE VOLUMES BY FACILITY TYPE

(in million gallons per year)

Facilities	Volume	Per-cent	No. of facilities
Commercial Facilities.....	212	77	37
Non-Commercial Facilities.....	65	23	73
Generators.....	NA	NA	1,686
Total.....	277	100	1,796

The affected facilities represent a wide variety of industries in 22 major industrial groups. A further examination of the TSDR survey data reveals the following information about the range of industries with large volumes of Third Third wastes.

The volume of commercial process waste, which accounts for 77 percent of the total waste volume, is distributed across the following SIC groups:

- Electric, Gas, & Sanitary Services (SIC 49)..... 43 percent
- Services Not Elsewhere Classified (SIC 89)..... 8 percent
- Chemicals & Allied Products (SIC 28)..... 7 percent
- CBI Facilities..... 32 percent

The volume of noncommercial process waste, which accounts for 23 percent of the total waste volume, is distributed across the following Standard Industrial Code (SIC) groups:

- Non-classifiable Establishments (SIC 99)..... 52 percent
- Primary Metals Industries (SIC 33)..... 13 percent
- Petroleum Refining & Related Industries (SIC 29)..... 10 percent
- Chemicals & Allied Products (SIC 28)..... 6 percent
- CBI Facilities..... 16 percent

Waste Management Practices. Based on the TSDR survey, the RIA examined five land disposal baseline management practices: disposal in landfills, disposal by land treatment, disposal in surface impoundments, treatment in waste piles, and storage in waste piles. Table VI-4 provides a breakdown of these baseline management practices by volume and number of facilities. As shown, approximately half of the waste volume covered by the final rule is currently managed in landfills. Landfills are also the most prevalent baseline practice, occurring at just over one half of the affected facilities.

TABLE VI-4.—THIRD THIRD RULE
BASELINE MANAGEMENT PRACTICES

(in million gallons per year)

Baseline practice	Volume	Percent
Facilities:		
Landfill.....	212	77
Land treatment.....	6	2
Storage waste piles.....	28	10
Treatment waste piles.....	27	10
Disposal surface impoundments.....	3	1
Total *	277	100

* Excludes estimated 44 million gallons of multi-source leachate.

The quantity of multisource leachate is not well characterized at present. However, the RIA estimates that over 150 million gallons of leachate are generated (annually) creating up to 44 million gallons of leachate residue subject to the land disposal restrictions.

Treatment practices in compliance with today's final rule significantly redistribute the quantities of waste among management practices. Most important, while 277 million gallons of waste per year are land disposed under baseline management practices (of which 212 million gallons are landfilled), 206 million gallons of waste per year would be disposed of in landfills under the subtitle C scenario as a result of today's final rule and 208 million gallons of waste per year under the subtitle D scenario. Thus, the final rule results in a 26 percent reduction in the volume of Third Third wastes being land disposed under the Subtitle C scenario, and a 25 percent reduction under the subtitle D scenario. Many of the wastes covered by the final rule are treated by chemical precipitation or stabilization.

2. Benefits of the Final Rule

The final rule would result in several benefits including reduced human health risks, improved safety at facilities, and reduced ecological effects. As with previous land disposal restrictions, the Agency quantified the human health benefits and conducted a qualitative analysis of the other benefits.

Human Health Benefits. The quantitative benefits analysis estimated that over a 70-year lifetime, the final rule reduces cancer cases by 316 and reduces the number of people exposed to at least one noncarcinogen above health based criteria by about 5,400. These results are the same for both scenarios.

In general, the majority of cancer cases averted is due to reduced inhalation exposure to benzene, acrylonitrile, phenanthrene, fluoroanthene, dichloromethane and

other carcinogenic constituents in D001 ignitable wastes and mixtures of ignitable and reactive wastes. The majority noncarcinogenic benefits is due to reduced ingestion of cadmium (D006), chromium (D007), lead (D008), as well as mixtures with these metals or mercury and D001 ignitable waste containing pentachlorobenzene and methanol.

It is important to note that these human health benefits are highly sensitive to the facility (and population) and waste characterizations used for the analysis. In fact, the majority of human health benefits is due to a limited number of waste streams at a few facilities. For example, over 4,000 of the non-cancer "benefits" result from the reduction of a highly concentrated chromium waste that leaches to ground water used as a drinking water source for a populous Northeastern community. And nearly 1,000 non-cancer "benefits" are attributable to reducing high concentration air releases of pentachlorobenzene and methanol in a land application and a landfill unit. Similarly, over 200 of the cancer cases averted result from reducing air releases of phenanthrene and fluoroanthene in land application units at two facilities.

What these examples reveal is the relationship between human health benefits and the attributes of a facility. Given any data base, the facilities with highly concentrated waste in densely populated areas will significantly drive the human health benefits results. Therefore, we believe that the data gives a true representation of reality by the inclusion of these few driving facilities.

The Agency has not estimated benefits attributable to treating multisource leachate residue because of a lack of characterization and facility data. However, the Agency, by way of a screening analysis, developed a hypothetical characterization of multisource leachate residue and simulated releases at several well-defined facilities. While the results are extremely sensitive to the assumptions and hypothetical characterization, they showed the possibility of roughly 200 cancer and 200 non-cancer cases avoided. Again, these results are highly uncertain because of the lack of sufficient data, but they do suggest that the benefits associated with the treatment of multisource leachate residues may be significant.

The Agency believes that the overall benefit estimates are uncertain and may overstate or underestimate the human health benefits of the proposed rule. The RCRA Risk-Cost Analysis model does not contain enough data to model all of

the constituents found in the Third Third wastes. As a result, benefits of regulating wastes with one or more of these missing constituents may be underestimated. This underestimate is most likely to occur for wastes containing pesticides, the sole hazardous constituent of D012-D017, and about 16 "P" wastes.

Human health benefits may also be underestimated because the benefits model only includes exposure via drinking water or air. Not estimated are the deleterious effects from consuming of contaminated food, such as fish caught downstream of releases, recreation exposure, due to contact with polluted rivers, lakes, or streams, and the averting of public benefits due to the destruction of these recreational areas.

At the same time, benefits may be overestimated due to conservative exposure assumptions. Exposure scenarios are based on drinking 2 liters/day for seventy years of contaminated water or inhalation of 20 cubic meters/day of air for seventy years.

Safety Benefits. In addition to adverse human health effects, ignitable (D001) and reactive (D003) wastes may pose a general safety hazard. In the past, land disposal of these wastes has only been allowed if the waste either is deactivated or precautions are taken to prevent accidental ignition or reaction. Until the ignitable or reactive wastes are deactivated, there is some continuing risk that the precautions may fail, resulting in fires, explosions, or release of toxic gases. The final rule requires deactivation of the approximately 24 million gallons of D001 and D003 being land disposed, thereby eliminating the safety risk. However, this benefit is not significant due to the popular practice of deactivation currently employed by facilities.

Environmental Benefits. The final rule results in an overall reduction in toxic releases to the environment, thereby reducing adverse effects to ecosystems. The resulting improvement in ecological health is extremely difficult to quantify due to uncertainty in estimating exposure levels and species populations. However, the sensitivity of certain species to hazardous constituents of wastes covered by the final rule suggests a very high potential for ecological effects.

As an example, aquatic species are at least two orders of magnitude more sensitive than humans to arsenic (D004), mercury (D009), silver (D011), lindane (D013), methoxychlor (D014), and toxaphene (D015). Therefore, aquatic ecosystems may be at some risk even when there is no human health risk.

Another way to look at the potential for ecological effects is to consider the proximity of land disposal facilities to waterbodies. A recent Agency study on ecological risks showed that for a sample of 52 National Priorities List sites, almost 90 percent of the sites posed a threat to freshwater ecosystems due to their proximity to waterbodies.²⁵ Wastes removed from some of these sites may be subject to the treatment standards promulgated in this rule. Thus, the final rule reduces ecological risk associated with Third Third wastes managed at these sites.

3. Costs

The final rule results in an annual incremental cost of approximately \$353 million under the Subtitle D scenario and \$440 million under the Subtitle C scenario, and affects over 1,700 facilities in 22 industrial sectors. Table VI-5 summarizes the estimated incremental costs associated with today's final rule by waste type.

TABLE VI-5.—THIRD THIRD RULE VOLUMES AND INCREMENTAL COST
(Million gallons/yr and million \$/yr)

Waste type	Volume	Cost (in dollars)	
		Subtitle D	Subtitle C
D001, D002, D003	42	\$61	\$67
D004-D016	122	123	166
Listed waste	2	15	15
Mixtures	32	93	102
CBI facilities	79	61	90
Total	277	\$353	\$440

As expected, based on volumes, the largest incremental cost is attributed to the management of D008 (lead) waste. Although the listed wastes are a small volume and have the lowest total cost, expensive treatment technologies such as incineration result in a much higher cost per volume treated. Conversely, the corrosive wastes and mixtures with corrosive wastes are relatively inexpensive to neutralize, resulting in a low cost per volume treated.

Five characteristic wastes contribute about 45 percent of the incremental cost of the rule as shown in table VI-6. EP toxic wastes for lead (D008) and ignitable wastes (D001) are the two single wastes that incur the most incremental cost.

²⁵ Summary of Ecological Risks, Assessment Methods, and Risk Management Decision in Superfund and RCRA (EPA-270-03-89-048) June 1989

TABLE VI-6.—WASTES INCURRING THE MOST INCREMENTAL COST

(In million dollars/year)

Waste stream	Costs	
	Subtitle D	Subtitle C
D003	57	85
D001	46	47
D007	34	38
D009	16	17
D004/D006/D007/D008	16	16
D003	9	12
D007/D008	12	12
D001/D002/D007/D008	11	11
D002	6	9

The cost of treating D002 corrosive wastes attributed to the final rule may be overestimated by as much as \$5 million because some of these wastes may be treated due to the California List Land Disposal Restrictions rule (52 FR 25760). That rule established a performance standard prohibiting land disposal of wastes with a pH less than 2, while the final rule establishes a technology-based standard of deactivation (i.e., neutralization). The Agency does not have data on how facilities are meeting the California List standard. Without specific data about the post-California List practices, the entire cost of neutralizing D002 acidic wastes were attributed to this final rule.

4. Economic Impacts

Tables VI-7 and VI-8 summarize the cost and economic impact of the final rule under subtitle D and subtitle C, respectively. Compliance costs are the tax-adjusted revenue requirements needed to fund the incremental costs discussed above. Significantly affected facilities are those that either need to increase costs by more than 5 percent or their compliance costs exceed 5 percent of their cash from operations.

TABLE VI-7.—SUMMARY OF ECONOMIC IMPACT BY TYPE OF FACILITY—SUBTITLE D

Economic impact	Noncommercial	Com	Generator	Total
Compliance cost (\$Mil)	24	329	235	259
Affected facs.	73	37	1,686	1,796
Significantly affected	3	NA	429	432
Estimated closures	0	NA	14	14
Affected industry groups	12	9	16	22

TABLE VI-8.—SUMMARY OF ECONOMIC IMPACT BY TYPE OF FACILITY—SUBTITLE C

Economic impact	Noncommercial	Com	Generator	Total
Compliance cost (\$Mil)	30	410	299	329
Affected facs.	73	37	1,686	1,796
Significantly affected	4	NA	552	556
Estimated closures	0	NA	14	14
Affected industry groups	12	9	16	22

The economic analysis estimates that the final rule does not have a significant effect on industry. The effects of the final rule are distributed over a wide range of industries in 22 major industrial groups rather than concentrated in a few industries.

Generators are the type of facilities that incur the largest economic impact. The analysis estimates that 91 percent of the compliance cost are borne by generators under both subtitle C and subtitle D scenarios. Also, 33 percent of the affected generators are significantly affected under subtitle C scenario, and 25 percent are significantly affected under subtitle D scenario.

The analysis estimates that 14 facilities would close as a result of the final rule. By comparison, the First Third rule was estimated to result in almost 200 closures. These 14 potential closures represent less than 4 percent of the 429 significantly affected generators under subtitle D scenario and less than 3 percent of the 552 significantly affected generators under subtitle C scenario.

The TSDR survey identified only 2 small businesses that currently land dispose Third Third waste. Neither is significantly affected under the final rule.

B. Regulatory Flexibility Analysis—Surface Disposed Waste

Pursuant to the Regulatory Flexibility Act, 5 U.S.C. 601 *et seq.*, whenever an Agency is required to publish a notice of rulemaking, it must prepare and make available for public comment a Regulatory Flexibility Analysis (RFA) that describes the effect of the rule on small entities (i.e., small businesses, small organizations, and small governmental jurisdictions). This analysis is unnecessary, however, if the Agency's Administrator certifies that the rule will not have a significant economic effect on a substantial number of small entities.

EPA evaluated the economic effect of the final rule on small entities, here defined as firms employing fewer than 50 persons. Because of data limitations, the Agency was unable to include generators of large quantities of Third Third wastes. The small business population therefore included only two groups: all noncommercial TSDFs employing fewer than 50 persons and all small quantity generators (SQGs) that were also small businesses. As a result, the effect of the final rule on small businesses is underestimated. However, the Agency would not expect the conclusions of the small business analysis to change significantly if the generator data were available.

According to EPA's guidelines for conducting an RFA, if over 20 percent of the population of small businesses, small organizations, or small government jurisdictions is likely to experience financial distress based on the costs of the rule, then the Agency is required to consider that the rule will have a significant effect on a substantial number of small entities and to perform a formal RFA. EPA has examined the final rule's effects on small entities as required by the Regulatory Flexibility Act.

The economic analysis identified only 2 small businesses affected by the final rule. Neither of the 2 would be significantly affected. The Administrator therefore certifies that part 268 does not have significant economic effects on a substantial number of small entities. As a result of this finding, the Agency has not prepared a formal RFA.

C. Regulatory Impact Analysis— Underground Injected Wastes

The Agency has completed a separate regulatory impact analysis for underground injected wastes affected by today's final rule. The completed RIA document, Regulatory Impact Analysis of Proposed Hazardous Waste Disposal Restrictions For Class I Injection of Third Thirds List Wastes, is available in the public docket for the final rule.

There are 85 injection facilities, of the total number of Class I injection facilities, injecting approximately 6 billion gallons of Third Third wastes annually, including over 4.7 billion gallons of characteristic wastes. These Class I hazardous injection facilities are required to either treat wastes, or file "no migration" petitions as outlined in 40 CFR part 148 (See 53 FR 28118 preamble for a more thorough discussion of the no migration petition review process). The additional facilities affected by today's rulemaking substantially contribute to overall compliance costs already incurred by

Class I injection well owners and operators managing hazardous wastes regulated by previous rulemaking.

The Agency analyzed costs and benefits for today's rule by using the same approach and methodology developed in the Regulatory Impact Analysis of the Underground Injection Control Program: Proposed Hazardous Waste Disposal Injection Restrictions used for the July 26, 1988 final rule (53 FR 28118) and subsequent rulemaking. An analysis was performed to assess the economic effect of associated compliance costs for the additional volumes of injected wastes attributable to today's final rule.

Total compliance costs for injected wastes are estimated at \$54 million annually. Alternative treatment costs are estimated at \$53.7 million annually, and no migration petition costs are annualized at \$0.3 million. The RIA estimates that 17 facilities will eventually treat their wastes, and therefore be significantly affected economically by today's final rule. All of these costs will be incurred by Class I hazardous injection well owners and operators.

The benefits to human health and the environment in the RIA are generally defined as the reduced human health risk resulting from fewer instances of ground-water contamination. In general, potential health risks from Class I hazardous waste injection wells are extremely low. However, the RIA references a few isolated cases where risks to human health and the environment may be greater, but are still too low to quantify. These cases involve possible grout seal failure around the protective casing of an injection well, and the occurrence of unplugged bore holes around the injection well site. Of studies conducted to describe Class I well problems, only six wells, or less than two percent of all Class I wells, were reported to have experienced malfunctions that contributed to any contamination of the surface or an underground source of drinking water. No health-related problems attributed to Class I injection were reported.

D. Regulatory Flexibility Analysis— Underground Injection Wastes

Owners and operators of hazardous waste injection wells are generally major chemical, petrochemical, and other manufacturing companies. The Agency is not aware of any small entities of injection wells that would be affected by part 148 of today's final rule. The Administrator therefore certifies that part 148 and part 268 will not have significant economic effects on a substantial number of small entities. As

a result of this finding, the Agency has not prepared a formal RFA.

E. Paperwork Reduction Act

All information collection requirements in this final rule were promulgated in previous land disposal restrictions rulemakings (including those for the Underground Injection Control Program) and approved by the Office of Management and Budget (OMB) at that time. Since there are no new information collection requirements being promulgated today, an Information Collection Request has not been prepared.

F. Review of Supporting Documents

The primary source of information on current land disposal practices and industries affected by this rule was EPA's 1986 "National Survey of Hazardous Waste Treatment, Storage, Disposal, and Recycling Facilities" (the TSDR Survey). The average quantity of waste contributed by generator facilities was obtained from EPA's "National Survey of Hazardous Waste Generators and Treatment, Storage, and Disposal Facilities Regulated under RCRA in 1981" (April 1984).

Waste stream characterization data and engineering costs of waste management were based on the following EPA documents:

- "Characterization of Waste Streams Listed in 40 CFR Section 261 Waste Profiles," Vols. I and II (August 1985);
 - "Characterization of Constituents from Selected Waste Streams Listed in 40 CFR Section 261," Vols. I and II (August 1985);
 - RCRA background and listing documents for 40 CFR Section 261;
 - RCRA Section 3007 industry studies;
 - "RCRA Risk-Cost Analysis Model, Appendix A: Waste Stream Data Base" (March 1984);
 - Source assessment documents for various industries; and
 - "1986-1987 Survey of Selected Firms in the Commercial Hazardous Waste Management Industry: Final Report" (March 1988).
- Financial information for the economic impact analysis was obtained from the 1982 Census of Manufacturers and 1984 Annual Survey of Manufacturers. Producer price indices were used to restate 1984 dollars in 1990 terms.

List of Subjects in 40 CFR Parts 148, 261, 262, 264, 265, 268, 270, 271, and 302

Administrative practice and procedure, Confidential business information, Designated facility, Environmental protection, Hazardous

materials, Hazardous materials transportation, Hazardous waste, Intergovernmental relations, Labeling, Manifests, Packaging and containers, Penalties, Recycling, Reportable Quantities, Reporting and recordkeeping requirements, Waste treatment and disposal, Water pollution control, Water supply.

Dated: May 8, 1990.

F. Henry Habicht,

Acting Administrator.

For the reasons set out in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 148—HAZARDOUS WASTE INJECTION RESTRICTIONS

1. The authority citation for part 148 continues to read as follows:

Authority: Section 3004, Resource Conservation and Recovery Act, 42 U.S.C. 6901 et seq.

2. Section 148.1 is amended by adding paragraph (d) to read as follows:

§ 148.1 Purpose, scope, and applicability.

(d) Wastes that are hazardous only because they exhibit a hazardous characteristic, and which are otherwise prohibited under this part, are not prohibited if the wastes:

(1) Are disposed into a nonhazardous or hazardous injection well defined under 40 CFR 144.6(a); and

(2) Do not exhibit any prohibited characteristic of hazardous waste identified in subpart C of part 261 at the point of injection.

3. Section 148.14 is amended by redesignating paragraphs (d), (e), (f), and (g) as paragraphs (e), (g), (h), and (j); by revising the introductory text of newly redesignated paragraph (j); and by adding new paragraphs (d), (f), and (i) to read as follows:

§ 148.14 Waste specific prohibitions—first third wastes.

(d) Effective August 8, 1990, the wastes specified in 40 CFR 261.31 as EPA Hazardous Waste Number F006 (wastewaters) and F019; the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste Numbers K004, K008, K015 (nonwastewaters), K017, K021 (wastewaters), K022 (wastewaters), K031, K035, K046 (reactive nonwastewaters and all wastewaters), K060 (wastewaters), K061 (wastewaters), K069 (calcium sulfate nonwastewaters and all wastewaters), K073, K083, K084, K085, K086 (all but solvent washes), K101 (high arsenic nonwastewaters), K102 (high arsenic

nonwastewaters), and K106; and the wastes specified in 40 CFR part 261.33 as EPA Hazardous Waste Numbers P001, P004, P005, P010, P011, P012, P015, P016, P018, P020, P036, P037, P048, P050, P058, P059, P068, P069, P070, P081, P082, P084, P087, P092, P102, P105, P108, P110, P115, P120, P122, P123, U007, U009, U010, U012, U016, U018, U019, U022, U029, U031, U036, U037, U041, U043, U044, U046, U050, U051, U053, U061, U063, U064, U066, U067, U074, U077, U078, U086, U089, U103, U105, U108, U115, U122, U124, U129, U130, U133, U134, U137, U151, U154, U155, U157, U158, U159, U171, U177, U180, U185, U188, U192, U200, U209, U210, U211, U219, U220, U228, U227, U228, U237, U238, U248, and U249 are prohibited from underground injection at off-site injection facilities.

(f) Effective November 8, 1990, the wastes specified in paragraph (d) of this section are prohibited from underground injection at on-site injection facilities.

(i) Effective May 8, 1992, the wastes specified in 40 CFR 261.32 and 261.33 as EPA Hazardous Waste Numbers K011 (wastewaters), K013 (wastewaters), and K014 are prohibited from underground injection.

(j) The requirements of paragraphs (a) through (i) of this section do not apply:

4. Section 148.15 is amended by redesignating paragraphs (d) and (e) as paragraphs (e) and (g); by revising the introductory text of newly redesignated paragraph (g); and by adding new paragraphs (d) and (f) to read as follows:

§ 148.15 Waste specific prohibitions—second third wastes.

(d) Effective August 8, 1990, the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste Number K025 (wastewaters), K029 (wastewaters), K041, K042, K095 (wastewaters), K096 (wastewaters), K097, K098, and K105; and the wastes specified in 40 CFR part 261.33 as P002, P003, P007, P008, P014, P026, P027, P049, P054, P057, P060, P066, P067, P072, P107, P112, P113, P114, U002, U003, U005, U008, U011, U014, U015, U020, U021, U023, U025, U026, U032, U035, U047, U049, U057, U059, U060, U062, U070, U073, U080, U083, U092, U093, U094, U095, U097, U098, U099, U101, U106, U109, U110, U111, U114, U116, U119, U127, U128, U131, U135, U138, U140, U142, U143, U144, U146, U147, U149, U150, U161, U162, U163, U164, U165, U168, U169, U170, U172, U173, U174, U176, U178, U179, U189,

U193, U196, U203, U205, U206, U208, U213, U214, U215, U216, U217, U218, U239, and U244 are prohibited from underground injection at off-site injection facilities.

(f) Effective November 8, 1990, the wastes specified in paragraph (d) of this section are prohibited from underground injection at on-site injection facilities.

(g) The requirements of paragraphs (a) through (f) of this section do not apply:

5. Section 148.16 is amended by redesignating paragraph (c) as paragraph (g); by revising the introductory text of newly redesignated paragraph (g); and by adding new paragraphs (c), (d), (e), and (f) to read as follows:

§ 148.16 Waste specific prohibitions—third third wastes.

(c) Effective August 8, 1990, the wastes identified in 40 CFR 261.31 as EPA Hazardous Waste Number FC39 (multi-source leachate); the wastes specified in 40 CFR 261.32 EPA Hazardous Waste Numbers K002, K003, K005 (wastewaters), K006, K007 (wastewaters), K023, K026, K032, K033, K034, K093, K094 and K100 (wastewaters); the wastes specified in 40 CFR 261.33 as P006, P009, P017, P022, P023, P024, P028, P031, P033, P034, P038, P042, P045, P046, P047, P051, P056, P064, P065, P073, P075, P076, P077, P078, P088, P093, P095, P096, P099, P101, P103, P109, P116, P118, P119, U001, U004, U006, U017, U024, U027, U030, U033, U038, U034, U038, U039, U042, U045, U048, U052, U055, U056, U068, U071, U072, U075, U076, U079, U081, U082, U084, U085, U087, U088, U090, U091, U096, U112, U113, U117, U118, U120, U121, U123, U125, U126, U132, U136, U139, U141, U145, U148, U152, U153, U156, U160, U168, U167, U181, U182, U183, U184, U186, U187, U191, U194, U197, U201, U202, U204, U207, U222, U225, U234, U236, U240, U243, and U247; and the wastes identified in 40 CFR 261.21, 261.23 or 261.24 as hazardous based on a characteristic alone, designated as D001, D004, D005, D006, D008, D009 (wastewaters), D010, D011, D012, D013, D014, D015, D016, D017 are prohibited from underground injection at off-site injection facilities.

(d) Effective August 8, 1990, mixed radioactive/hazardous waste in 40 CFR 268.10, 268.11, and 268.12, that are mixed radioactive and hazardous wastes, are prohibited from underground injection.

(e) Effective November 8, 1990, the wastes specified in paragraph (c) of this section are prohibited from underground

injection at on-site injection facilities. These effective dates do not apply to the wastes listed in 40 CFR 148.12(b) which are prohibited from underground injection on August 8, 1990.

(f) Effective May 8, 1992, the wastes identified in 40 CFR 261.22, 261.23 or 261.24 as hazardous based on a characteristic alone, designated as D002 (wastewaters and nonwastewaters), D003 (wastewaters and nonwastewaters), D007 (wastewaters and nonwastewaters), and D009 (nonwastewaters) are prohibited from underground injection. These effective dates do not apply to the wastes listed in 40 CFR 148.12(b) which are prohibited from underground injection on August 8, 1990.

(g) The requirements of paragraphs (a) through (f) of this section do not apply:

PART 261—IDENTIFICATION AND LISTING OF HAZARDOUS WASTES

1. The authority citation for part 261 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, 6922, and 6938.

Subpart C—Characteristics of Hazardous Waste

2. In § 261.20, paragraph (b) is revised to read as follows:

§ 261.20 General.

(b) A hazardous waste which is identified by a characteristic in this subpart is assigned every EPA Hazardous Waste Number that is applicable as set forth in this subpart. This number must be in complying with the notification requirements of section 3010 of the Act and all applicable recordkeeping and reporting requirements under parts 262 through 265, 268, and 270 of this chapter.

3. In § 261.21, paragraph (b) is revised to read as follows:

§ 261.21 Characteristic of Ignitability.

(b) A solid waste that exhibits the characteristic of ignitability has the EPA Hazardous Waste Number of D001.

4. In § 261.22, paragraph (b) is revised to read as follows:

§ 261.22 Characteristic of corrosivity.

(b) A solid waste that exhibits the characteristic of corrosivity has the EPA Hazardous Waste Number of D002.

5. In § 261.23, paragraph (b) is revised to read as follows:

§ 261.23 Characteristic of reactivity.

(b) A solid waste that exhibits the characteristic of reactivity has the EPA Hazardous Waste Number of D003.

6. In § 261.24, paragraph (b) introductory text is revised to read as follows:

§ 261.24 Toxicity characteristic.

(b) A solid waste that exhibits the characteristic of toxicity has the EPA Hazardous Waste Number specified in Table I which corresponds to the toxic contaminant causing it to be hazardous.

Subpart D—Lists of Hazardous Wastes

7. Section 261.31 is amended by adding the following waste code in alphanumeric order.

§ 261.31 Hazardous wastes from non-specific sources.

Industry and EPA hazardous waste No.	Hazardous waste	Hazard code
F039.....	Leachate resulting from the treatment, storage, or disposal of wastes classified by more than one waste code under Subpart D, or from a mixture of wastes classified under Subparts C and D of this part. (Leachate resulting from the management of one or more of the following EPA Hazardous Wastes and no other hazardous wastes retains its hazardous waste code(s): F020, F021, F022, F023, F026, F027, and/or F028.)	(T)

8. Paragraph (c) of § 261.33 is revised to read as follows: (the comment paragraph remains):

§ 261.33 Discarded commercial chemical products, off-specification species, container residues, and spill residues thereof.

(c) Any residue remaining in a container or in an inner liner removed from a container that has held any commercial chemical product or manufacturing chemical intermediate having the generic name listed in paragraphs (e) or (f) of this section, unless the container is empty as defined in § 261.7(b) of this chapter.

9. Appendix VII is amended by adding the following waste stream in alphanumeric order to read as follows:

Appendix VII—Basis for Listing Hazardous Waste

EPA hazardous waste No.	Hazardous constituents for which listed
F039.....	All constituents for which treatment standards are specified for multi-source leachate (wastewaters and nonwastewaters) under 40 CFR 268.43(a), Table CCW.

PART 262—STANDARDS APPLICABLE TO GENERATORS OF HAZARDOUS WASTE

1. The authority citation for part 262 continues to read as follows:

Authority: 42 U.S.C. 6906, 6912, 6922, 6923, 6924, 6925, and 6937.

Subpart A—General

2. Paragraph (c) introductory text of § 262.11 is revised to read as follows:

§ 262.11 Hazardous waste determination.

(c) For purposes of compliance with 40 CFR part 268, or if the waste is not listed in subpart D of this part, the generator must then determine whether the waste is identified in subpart C of 40 CFR part 261 by either:

Subpart C—Pre-Transport Requirements

3. Paragraph (a)(4) of § 262.34 is revised to read as follows:

§ 262.34 Accumulation time.

(a) * * * (4) The generator complies with the requirements for owners or operators in subparts C and D in 40 CFR part 265, with § 265.16, and with 40 CFR 268.7(a)(4).

PART 264—STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

Subpart B—General Facility Standards

2. In § 264.13, the comment following Paragraph (a)(2) is revised to read as follows:

§ 264.13 General waste analysis.

- (a) * * *
(2) * * *

[Comment: For example, the facility's records of analyses performed on the waste before the effective date of these regulations, or studies conducted on hazardous waste generated from processes similar to that which generated the waste to be managed at the facility, may be included in the data base required to comply with paragraph (a)(1) of this section. The owner or operator of an off-site facility may arrange for the generator of the hazardous waste to supply part of the information required by paragraph (a)(1) of this section, except as otherwise specified in 40 CFR 268.7 (b) and (c). If the generator does not supply the information, and the owner or operator chooses to accept a hazardous waste, the owner or operator is responsible for obtaining the information required to comply with this section.]

Subpart K—Surface Impoundments

3. The introductory text of § 264.229 is revised to read as follows:

§ 264.229 Special requirements for ignitable or reactive waste.

Ignitable or reactive waste must not be placed in a surface impoundment, unless the waste and impoundment satisfy all applicable requirements of 40 CFR part 268, and:

Subpart L—Waste Piles

4. The introductory text of § 264.256 is revised to read as follows:

§ 264.256 Special requirements for ignitable or reactive waste.

Ignitable or reactive waste must not be placed in a waste pile unless the waste and waste pile satisfy all applicable requirements of 40 CFR part 268, and:

Subpart M—Land Treatment

5. The introductory text of § 264.281 is revised to read as follows:

§ 264.281 Special requirements for ignitable or reactive waste.

The owner or operator must not apply ignitable or reactive waste to the treatment zone unless the waste and the treatment zone meet all applicable requirements of 40 CFR part 268, and:

Subpart N—Landfills

6. In § 264.312, paragraphs (a) introductory text and (b) are revised to read as follows:

§ 264.312 Special requirements for ignitable or reactive waste.

(a) Except as provided in paragraph (b) of this section, and in § 264.316, ignitable or reactive waste must not be placed in a landfill, unless the waste and landfill meet all applicable requirements of part 268, and:

(b) Except for prohibited wastes which remain subject to treatment standards in subpart D of part 268, ignitable wastes in containers may be landfilled without meeting the requirements of paragraph (a) of this section, provided that the wastes are disposed of in such a way that they are protected from any material or conditions which may cause them to ignite. At a minimum, ignitable wastes must be disposed of in non-leaking containers which are carefully handled and placed so as to avoid heat, sparks, rupture, or any other condition that might cause ignition of the wastes; must be covered daily with soil or other non-combustible material to minimize the potential for ignition of the wastes; and must not be disposed of in cells that contain or will contain other wastes which may generate heat sufficient to cause ignition of the waste.

7. In § 264.316, paragraph (f) is added to read as follows:

§ 264.316 Disposal of small containers of hazardous waste in overpacked drums (lab packs).

(f) Such disposal is in compliance with the requirements of Part 268. Persons who incinerate lab packs according to the requirements in 40 CFR 268.42(c)(1) may use fiber drums in place of metal outer containers. Such fiber drums must meet the DOT specifications in 49 CFR 173.12 and be overpacked according to the requirements in paragraph (b) of this section.

PART 265—INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

1. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, 6925, and 6935.

Subpart A—General

2. Section 265.1(e) is revised to read as follows:

§ 265.1 Purpose, scope, and applicability.

(e) The requirements of this part apply to owners or operators of all facilities which treat, store or dispose of hazardous waste referred to in 40 CFR part 268, and the 40 CFR part 268 standards are considered material conditions or requirements of the part 265 interim status standards.

Subpart B—General Facility Standards

3. The comment at the end of paragraph (a) of § 265.13 is revised to read as follows:

§ 265.13 General waste analysis.

- (a) * * *
(2) * * *

Comment: for example, the facility's records of analyses performed on the waste before the effective date of these regulations, or studies conducted on hazardous waste generated from processes similar to that which generated the waste to be managed at the facility, may be included in the data base required to comply with paragraph (a)(1) of this section. The owner or operator of an off-site facility may arrange for the generator of the hazardous waste to supply part of the information required by paragraph (a)(1) of this section, except as otherwise specified in 40 CFR 268.7 (b) and (c). If the generator does not supply the information, and the owner or operator chooses to accept a hazardous waste, the owner or operator is responsible for obtaining the information required to comply with this section.]

Subpart K—Surface Impoundments

4. The introductory text of § 265.229 is revised to read as follows:

§ 265.229 Special requirements for ignitable or reactive waste.

Ignitable or reactive waste must not be placed in a surface impoundment, unless the waste and impoundment satisfy all applicable requirements of 40 CFR part 268, and:

Subpart L—Waste Piles

5. Paragraph (a) introductory text of § 265.256 is revised to read as follows:

§ 265.256 Special requirements for ignitable or reactive waste.

(a) Ignitable or reactive waste must not be placed in a pile unless the waste and pile satisfy all applicable requirements of 40 CFR part 268, and:

Subpart M—Land Treatment

6. The introductory text of § 265.281 is revised to read as follows:

§ 265.281 Special requirements for ignitable or reactive waste.

The owner or operator must not apply ignitable or reactive waste to the treatment zone unless the waste and treatment zone meet all applicable requirements of 40 CFR part 268, and:

Subpart N—Landfills

7. Paragraphs (a) introductory text and (b) of § 265.312 are revised to read as follows:

§ 265.312 Special requirements for ignitable or reactive waste.

(a) Except as provided in paragraph (b) of this section, and in § 265.316, ignitable or reactive waste must not be placed in a landfill, unless the waste and landfill meets all applicable requirements of 40 CFR part 268, and:

(b) Except for prohibited wastes which remain subject to treatment standards in subpart D of part 268, ignitable wastes in containers may be landfilled without meeting the requirements of paragraph (a) of this section, provided that the wastes are disposed of in such a way that they are protected from any material or conditions which may cause them to ignite. At a minimum, ignitable wastes must be disposed of in non-leaking containers which are carefully handled and placed so as to avoid heat, sparks, rupture, or any other condition that might cause ignition of the wastes; must be covered daily with soil or other non-combustible material to minimize the potential for ignition of the wastes; and must not be disposed of in cells that contain or will contain other wastes which may generate heat sufficient to cause ignition of the waste.

8. In § 265.316, paragraph (f) is added to read as follows:

§ 265.316 Disposal of small containers of hazardous waste in overpacked drums (lab packs).

(f) Such disposal is in compliance with the requirements of 40 CFR part 268. Persons who incinerate lab packs according to the requirements in 40 CFR 268.42(c)(1) may use fiber drums in place of metal outer containers. Such fiber drums must meet the DOT specifications in 49 CFR 173.12 and be overpacked according to the requirements in paragraph (b) of this section.

PART 268—LAND DISPOSAL RESTRICTIONS

1. The authority citation for part 268 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921, and 6924.

Subpart A—General

2. In § 268.1, paragraph (c)(3) is added, and paragraph (c)(5) is removed, to read as follows:

§ 268.1 Purpose, scope, and applicability.

(c) * * *

(3) Wastes that are hazardous only because they exhibit a hazardous characteristic, and which are otherwise prohibited from land disposal under this part, are not prohibited from land disposal if the wastes:

- (i) Are disposed into a nonhazardous or hazardous injection well as defined in 40 CFR 144.6(a); and
- (ii) Do not exhibit any prohibited characteristic of hazardous waste at the point of injection.

3. Section 268.2 is revised to read as follows:

§ 268.2 Definitions applicable in this part.

When used in this part the following terms have the meanings given below:

(a) *Halogenated organic compounds* or *HOCs* means those compounds having a carbon-halogen bond which are listed under appendix III to this part.

(b) *Hazardous constituent or constituents* means those constituents listed in appendix VIII to part 261 of this chapter.

(c) *Land disposal* means placement in or on the land and includes, but is not limited to, placement in a landfill, surface impoundment, waste pile, injection well, land treatment facility, salt dome formation, salt bed formation, underground mine or cave, or placement in a concrete vault or bunker intended for disposal purposes.

(d) *Nonwastewaters* are wastes that do not meet the criteria for wastewaters in paragraph (g)(8) of this section.

(e) *Polychlorinated biphenyls* or *PCBs* are halogenated organic compounds defined in accordance with 40 CFR 761.3.

(f) *Wastewaters* are wastes that contain less than 1% by weight total organic carbon (TOC) and less than 1% by weight total suspended solids (TSS), with the following exceptions:

(1) *F001, F002, F003, F004, F005 solvent-water mixtures* that contain less than 1% by weight TOC or less than 1% by weight total F001, F002, F003, F004, F005 solvent constituents listed in § 268.41, Table CCWE.

(2) *K011, K013, K014 wastewaters* (as generated) that contain less than 5% by weight TOC and less than 1% by weight TSS.

(3) *K103 and K104 wastewaters* contain less than 4% by weight TOC and less than 1% by weight TSS.

(g) *Inorganic Solid Debris* are nonfriable inorganic solids that are incapable of passing through a 9.5 mm standard sieve that require cutting, or crushing and grinding in mechanical sizing equipment prior to stabilization, limited to the following inorganic or metal materials:

- (1) Metal slags (either dross or scoria).
- (2) Classified slag.
- (3) Glass.
- (4) Concrete (excluding cementitious or pozzolanic stabilized hazardous wastes).
- (5) Masonry and refractory bricks.
- (6) Metal cans, containers, drums, or tanks.
- (7) Metal nuts, bolts, pipes, pumps, valves, appliances, or industrial equipment.

(8) Scrap metal as defined in 40 CFR 261.1(c)(6).

4. Section 268.3 is revised to read as follows:

§ 268.3 Dilution prohibited as a substitute for treatment.

(a) Except as provided in paragraph (b) of this section, no generator, transporter, handler, or owner or operator of a treatment, storage, or disposal facility shall in any way dilute a restricted waste or the residual from treatment of a restricted waste as a substitute for adequate treatment to achieve compliance with subpart D of this part, to circumvent the effective date of a prohibition in subpart C of this part, to otherwise avoid a prohibition in subpart C of this part, or to circumvent a land disposal prohibition imposed by RCRA section 3004.

(b) Dilution of wastes that are hazardous only because they exhibit a characteristic in a treatment system which treats wastes subsequently discharged to a water of the United States pursuant to a permit issued under section 402 of the Clean Water Act (CWA) or which treats wastes for purposes of pretreatment requirements under section 307 of the CWA is not impermissible dilution for purposes of this section unless a method has been specified as the treatment standard in § 268.42.

5. In § 268.7, paragraphs (a)(1)(ii), (a)(2)(i)(B), (a)(3)(ii), and (a)(4) are revised; new paragraphs (a)(7), (a)(8), and (a)(9) are added; paragraph (b)(4)(ii) is revised; the certification in paragraph (b)(5)(i) is revised; new paragraph (b)(5)(iii) is added; paragraph (b)(7) is removed and paragraph (b)(8) is redesignated as paragraph (b)(7); the

introductory text to paragraph (c) is revised; and paragraphs (c)(3) and (c)(4) are removed, to read as follows:

§ 268.7 Waste analysis and recordkeeping.

(a) * * *

(1) * * *

(ii) The corresponding treatment standards for wastes F001-F005, F039, and wastes prohibited pursuant to § 268.32 or RCRA Section 3004(d). Treatment standards for all other restricted wastes may be referenced by including on the notification the subcategory of the waste, the treatability group(s) of the waste(s), and the CFR section(s) and paragraphs where the treatment standards appear. Where the applicable treatment standards are expressed as specified technologies in § 268.42, the applicable five-letter treatment code found in Table 1 of § 268.42 (e.g., INCIN, WETOX) also must be listed on the notification.

(2) * * *

(i) * * *

(B) The corresponding treatment standards for wastes F001-F005, F039, and wastes prohibited pursuant to § 268.32 or RCRA Section 3004(d). Treatment standards for all other restricted wastes may be referenced by including on the notification the subcategory of the waste, the treatability group(s) of the waste(s), and the CFR section(s) and paragraphs where the treatment standards appear. Where the applicable treatment standards are expressed as specified technologies in § 268.42, the applicable five-letter treatment code found in Table 1 of § 268.42 (e.g., INCIN, WETOX) also must be listed on the notification.

(3) * * *

(ii) The corresponding treatment standards for wastes F001-F005, F039, and wastes prohibited pursuant to § 268.32 or RCRA section 3004(d). Treatment standards for all other restricted wastes may be referenced by including on the notification the subcategory of the waste, the treatability group(s) of the waste(s), and the CFR section(s) and paragraphs where the treatment standards appear. Where the applicable treatment standards are expressed as specified technologies in § 268.42, the applicable five-letter treatment code found in Table 1 of § 268.42 (e.g., INCIN, WETOX) also must be listed on the notification.

(4) If a generator is managing a prohibited waste in tanks or containers regulated under 40 CFR 262.34, and is treating such waste in such tanks or containers to meet applicable treatment

standards under Subpart D of this part, the generator must develop and follow a written waste analysis plan which describes the procedures the generator will carry out to comply with the treatment standards. The plan must be kept on-site in the generator's records, and the following requirements must be met:

(i) The waste analysis plan must be based on a detailed chemical and physical analysis of a representative sample of the prohibited waste(s) being treated, and contain all information necessary to treat the waste(s) in accordance with the requirements of this Part, including the selected testing frequency.

(ii) Such plan must be filed with the EPA Regional Administrator (or his designated representative) or State authorized to implement Part 268 requirements a minimum of 30 days prior to the treatment activity, with delivery verified.

(iii) Wastes shipped off-site pursuant to this paragraph must comply with the notification requirements of § 268.7(a)(2).

(7) If a generator is managing a lab pack that contains wastes identified in Appendix IV of this part and wishes to use the alternative treatment standard under § 268.42, with each shipment of waste the generator must submit a notice to the treatment facility in accordance with paragraph (a)(1) of this section. The generator must also comply with the requirements in paragraphs (a)(5) and (a)(6) of this section, and must submit the following certification, which must be signed by an authorized representative:

I certify under penalty of law that I personally have examined and am familiar with the waste and that the lab pack contains only the wastes specified in appendix IV to part 268 or solid wastes not subject to regulation under 40 CFR part 261. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine or imprisonment.

(8) If a generator is managing a lab pack that contains organic wastes specified in Appendix V of this Part and wishes to use the alternate treatment standards under § 268.42, with each shipment of waste the generator must submit a notice to the treatment facility in accordance with paragraph (a)(1) of this section. The generator also must comply with the requirements in paragraphs (a)(5) and (a)(6) of this section, and must submit the following certification which must be signed by an authorized representative:

I certify under penalty of law that I personally have examined and am familiar

with the waste through analysis and testing or through knowledge of the waste and that the lab pack contains only organic waste specified in Appendix V to Part 268 or solid wastes not subject to regulation under 40 CFR Part 261. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine or imprisonment.

(9) Small quantity generators with tolling agreements pursuant to 40 CFR 262.20(e) must comply with the applicable notification and certification requirements of paragraph (a) of this section for the initial shipment of the waste subject to the agreement. Such generators must retain on-site a copy of the notification and certification, together with the tolling agreement, for at least three years after termination or expiration of the agreement. The three-year record retention period is automatically extended during the course of any unresolved enforcement action regarding the regulated activity or as requested by the Administrator.

(b) * * *

(4) * * *

(ii) The corresponding treatment standards for wastes F001-F005, F039, and wastes prohibited pursuant to § 268.32 or RCRA Section 3004(d). Treatment standards for all other restricted wastes may be referenced by including on the notification the subcategory of the waste, the treatability group(s) of the waste(s), and the CFR section(s) and paragraphs where the treatment standards appear. Where the applicable treatment standards are expressed as specified technologies in § 268.42, the applicable five-letter treatment code found in Table 1 of § 268.42 (e.g., INCIN, WETOX) also must be listed on the notification.

(5) * * *

(i) * * *

I certify under penalty of law that I have personally examined and am familiar with the treatment technology and operation of the treatment process used to support this certification and that, based on my inquiry of those individuals immediately responsible for obtaining this information, I believe that the treatment process has been operated and maintained properly so as to comply with the performance levels specified in 40 CFR part 268, subpart D, and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA section 3004(d) without impermissible dilution of the prohibited waste. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment.

(iii) For wastes with treatment standards expressed as concentrations in the waste pursuant to § 268.43, if compliance with the treatment standards in subpart D of this part is

based in part or in whole on the analytical detection limit alternative specified in § 268.43(c), the certification also must state the following:

I certify under penalty of law that I have personally examined and am familiar with the treatment technology and operation of the treatment process used to support this certification and that, based on my inquiry of those individuals immediately responsible for obtaining this information, I believe that the nonwastewater organic constituents have been treated by incineration in units operated in accordance with 40 CFR part 264, subpart O) or 40 CFR part 265, subpart O, or by combustion in fuel substitution units operating in accordance with applicable technical requirements, and I have been unable to detect the nonwastewater organic constituents despite having used best good faith efforts to analyze for such constituents. I am aware that there are significant penalties for submitting a false certification, including the possibility of fine and imprisonment.

(c) Except where the owner or operator is disposing of any waste that is a recyclable material used in a manner constituting disposal pursuant to 40 CFR 266.20(b), the owner or operator of any land disposal facility disposing any waste subject to restrictions under this part must:

6. Paragraph (a) of § 268.8 is revised to read as follows:

§ 268.8 Landfill and surface impoundment disposal restrictions.

(a) Prior to May 8, 1990, wastes which are otherwise prohibited from land disposal under § 268.33(f) of this part may be disposed in a landfill or surface impoundment which is in compliance with the requirements of § 268.5(h)(2) provided that the requirements of this section are met. As of May 8, 1990, this section is no longer in effect.

7. Section 268.9 is added to subpart A to read as follows:

§ 268.9 Special rules regarding wastes that exhibit a characteristic.

(a) The initial generator of a solid waste must determine each waste code applicable to the waste in order to determine the applicable treatment standards under subpart D of this part. For purposes of part 268, the waste will carry a waste code designation for any applicable listing under 40 CFR part 261, subpart D, and also one or more waste code designations under 40 CFR part 261, subpart C where the waste exhibits the relevant characteristic.

(b) Where a prohibited waste is both listed under 40 CFR part 261, subpart D and exhibits a characteristic under 40

CFR part 261, subpart C, the treatment standard for the waste code listed in 40 CFR part 261, subpart D will operate in lieu of the standard for the waste code under 40 CFR part 261, subpart C, provided that the treatment standard for the listed waste includes a treatment standard for the constituent that causes the waste to exhibit the characteristic. Otherwise, the waste must meet the treatment standards for all applicable listed and characteristic waste codes.

(c) In addition to any applicable standards determined from the initial point of generation, no prohibited waste which exhibits a characteristic under 40 CFR part 261, subpart C may be land disposed unless the waste complies with the treatment standards under subpart D of this part.

(d) Wastes that exhibit a characteristic are also subject to § 268.7 requirements, except that once the waste is no longer hazardous, for each shipment of such wastes to a subtitle D facility the initial generator or the treatment facility need not send a § 268.7 notification to such facility. In such circumstances, a notification and certification must be sent to the appropriate EPA Regional Administrator (or his delegated representative) or State authorized to implement part 268 requirements.

(1) The notification must include the following information:

(i) The name and address of the subtitle D facility receiving the waste shipment;

(ii) A description of the waste as initially generated, including the applicable EPA Hazardous Waste Number(s) and treatability group(s);

(iii) The treatment standards applicable to the waste at the initial point of generation.

(2) The certification must be signed by an authorized representative and must state the language found in § 268.7(b)(5)(i).

Subpart C—Prohibitions on Land Disposal

8. Section 268.35 is added to read as follows:

§ 268.35 Waste specific prohibitions—Third Third wastes.

(a) Effective August 8, 1990, the following wastes specified in 40 CFR 261.31 as EPA Hazardous Waste Numbers F006 (wastewaters), F019, and F039 (wastewaters); the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste Numbers K002; K003; K004 (wastewaters); K005 (wastewaters); K006; K008 (wastewaters); K011 (wastewaters); K013 (wastewaters), K014

(wastewaters); K017; K021 (wastewaters); K022 (wastewaters); K025 (wastewaters); K026; K029 (wastewaters); K031 (wastewaters); K032; K033; K034; K035; K041; K042; K046 (wastewaters); K048 (wastewaters); K049 (wastewaters); K050 (wastewaters); K051 (wastewaters); K052 (wastewaters); K060 (wastewaters); K061 (wastewaters); K069 (wastewaters); K073; K083 (wastewaters); K084 (wastewaters); K085; K095 (wastewaters); K096 (wastewaters); K097; K098; K100 (wastewaters); K101 (wastewaters); K102 (wastewaters); K105; and K106 (wastewaters); the wastes specified in 40 CFR 261.33(e) as EPA Hazardous Waste Numbers P001; P002; P003; P004; P005; P006; P007; P008; P009; P010 (wastewaters); P011 (wastewaters); P012 (wastewaters); P014; P015; P016; P017; P018 (wastewaters); P020; P022; P023; P024; P027; P028; P031; P033; P034; P036 (wastewaters); P037; P038 (wastewaters); P042; P045; P046; P047; P048; P049; P050; P051; P054; P056; P057; P058; P059; P060; P064; P065 (wastewaters); P066; P067; P068; P069; P070; P072; P073; P075; P076; P077; P078; P081; P082; P084; P088; P092 (wastewaters); P093; P095; P096; P101; P102; P103; P105; P108; P109; P110; P112; P113; P114; P115; P116; P118; P119; P120; P122; and P123; and the wastes specified in 40 CFR 261.33(f) as EPA Hazardous Waste Numbers U001; U002; U003; U004; U005; U006; U007; U008; U009; U010; U011; U012; U014; U015; U016; U017; U018; U019; U020; U021; U022; U023; U024; U025; U026; U027; U029; U030; U031; U032; U033; U034; U035; U036; U037; U038; U039; U041; U042; U043; U044; U045; U046; U047; U048; U049; U050; U051; U052; U053; U055; U056; U057; U059; U060; U061; U062; U063; U064; U066; U067; U068; U070; U071; U072; U073; U074; U075; U076; U077; U078; U079; U080; U081; U082; U083; U084; U085; U086; U089; U090; U091; U092; U093; U094; U095; U096; U097; U098; U099; U101; U103; U105; U106; U108; U109; U110; U111; U112; U113; U114; U115; U116; U117; U118; U119; U120 (wastewaters); U121; U122; U123; U124; U125; U126; U127; U128; U129; U130; U131; U132; U133; U134; U135; U136 (wastewaters); U137; U138; U140; U141; U142; U143; U144; U145; U146; U147; U148; U149; U150; U151 (wastewaters); U152; U153; U154; U155; U156; U157; U158; U159; U160; U161; U162; U163; U164; U165; U166; U167; U168; U169; U170; U171; U172; U173; U174; U176; U177; U178; U179; U180; U181; U182; U183; U184; U185; U186; U187; U188; U189; U191; U192; U193;

U194; U196; U197; U200; U201; U202; U203; U204; U205; U206; U207; U209; U209; U210; U211; U213; U214; U215; U216; U217; U218; U219; U220; U222; U225; U226; U227; U228; U234; U236; U237; U238; U239; U240; U243; U244; U246; U247; U248; U249; and the following wastes identified as hazardous based on a characteristic alone: D001; D002, D003, D004 (wastewaters), D005, D006; D007; D008 (except for lead materials stored before secondary smelting), D009 (wastewaters), D010, D011, D012, D013, D014, D015, D016, and D017 are prohibited from land disposal.

(b) Effective November 8, 1990, the following wastes specified in 40 CFR 261.32 as EPA Hazardous Waste Numbers K048 (nonwastewaters), K049 (nonwastewaters), K050 (nonwastewaters), K051 (nonwastewaters), and K052 (nonwastewaters) are prohibited from land disposal.

(c) Effective May 8, 1992, the following waste specified in 40 CFR 261.31 as EPA Hazardous Waste Numbers F039 (nonwastewaters); the wastes specified in 40 CFR 261.32 as EPA Hazardous Waste Numbers K031 (nonwastewaters); K084 (nonwastewaters); K101 (nonwastewaters); K102 (nonwastewaters); K108 (nonwastewaters); the wastes specified in 40 CFR 261.33(e) as EPA Hazardous Waste Numbers P010 (nonwastewaters); P011 (nonwastewaters); P012 (nonwastewaters); P036 (nonwastewaters); P038 (nonwastewaters); P065 (nonwastewaters); P087 (nonwastewaters); and P092 (nonwastewaters); the wastes specified in 40 CFR 261.33(f) as EPA Hazardous Waste Numbers U136 (nonwastewaters); and U151 (nonwastewaters); and the following wastes identified as hazardous based on a characteristic alone: D004 (nonwastewaters); D008 (lead materials stored before secondary smelting); and D009 (nonwastewaters); inorganic solids debris as defined in 40 CFR 268.2(a)(7) (which also applies to chromium refractory bricks carrying the EPA Hazardous Waste Numbers K048-K052); and RCRA hazardous wastes that contain naturally occurring radioactive materials are prohibited from land disposal.

(d) Effective May 8, 1992, hazardous wastes listed in 40 CFR 268.12 that are mixed radioactive/hazardous wastes are prohibited from land disposal.

(e) Effective May 8, 1992, the wastes specified in this section having a treatment standard in subpart D of this part based on incineration, mercury

retorting, or vitrification, and which are contaminated soil or debris, are prohibited from land disposal.

(f) Between May 8, 1990 and August 8, 1990, the wastes included in paragraph (a) may be disposed of in a landfill or surface impoundment only if such unit is in compliance with the requirements specified in § 268.5(h)(2).

(g) Between May 8, 1990 and November 8, 1990, wastes included in paragraph (b) of this section may be disposed of in a landfill or surface impoundment only if such unit is in compliance with the requirements specified in § 268.5(h)(2).

(h) Between May 8, 1990, and May 8, 1992, wastes included in paragraphs (c), (d), and (e) of this section may be disposed of in a landfill or surface impoundment only if such unit is in compliance with the requirements specified in § 268.5(h)(2).

(i) The requirements of paragraphs (a), (b), (c), (d), and (e) of this section do not apply if:

(1) The wastes meet the applicable standards specified in subpart D of this part;

(2) Persons have been granted an exemption from a prohibition pursuant to a petition under § 268.8, with respect to those wastes and units covered by the petition;

(3) The wastes meet the applicable alternate standards established pursuant to a petition granted under § 268.44;

(4) Persons have been granted an extension to the effective date of a prohibition pursuant to § 268.5, with respect to these wastes covered by the extension.

(j) To determine whether a hazardous waste listed in § 268.10, 268.11, and 268.12 exceeds the applicable treatment standards specified in §§ 268.41 and 268.43, the initial generator must test a representative sample of the waste extract or the entire waste, depending on whether the treatment standards are expressed as concentrations in the waste extract or the waste, or the generator may use knowledge of the waste. If the waste contains constituents in excess of the applicable subpart D levels, the waste is prohibited from land disposal, and all requirements of part 268 are applicable, except as otherwise specified.

9. Section 268.40 is amended by revising paragraphs (a) and (c) to read as follows:

§ 268.40 Applicability of treatment standards.

(a) A restricted waste identified in § 268.41 may be land disposed only if an extract of the waste or of the treatment

residue of the waste developed using the test method in appendix I of this part does not exceed the value shown in Table CCWE of § 268.41 for any hazardous constituent listed in Table CCWE for that waste, with the following exceptions: D004, D008, K031, K084, K101, K102, P010, P011, P012, P036, P038, and U136. Wastes D004, D008, K031, K034, K101, K102, P010, P011, P012, P036, P038, and U136 may be land disposed only if an extract of the waste or of the treatment residue of the waste developed using either the test method in Appendix I of this part or the test method in appendix II of part 261 does not exceed the value shown in Table CCW of § 268.41 for any hazardous constituent listed in Table CCWE for that waste.

(c) Except as otherwise specified in § 268.43(c), a restricted waste identified in § 268.43 may be land disposed only if the constituent concentrations in the waste or treatment residue of the waste do not exceed the value shown in Table CCW of § 268.43 for any hazardous constituents listed in Table CCW for that waste.

10. Section 268.41 is amended by revising paragraph (a) and Table CCWE—Constituent Concentrations in Waste Extract, to read as follows:

§ 268.41 Treatment standards expressed as concentrations in waste extract.

(a) Table CCWE identifies the restricted wastes and the concentrations of their associated constituents which may not be exceeded by the extract of a waste or waste treatment residual developed using the test method in Appendix I of this part for the allowable land disposal of such wastes, with the exception of wastes D004, D008, K031, K084, K101, K102, P010, P011, P012, P036, P038, and U136. Table CCWE identifies the restricted wastes D004, D008, K031, K084, K101, K102, P010, P011, P012, P036, P038, and U136 and the concentrations of their associated constituents which may not be exceeded by the extract of a waste or waste treatment residual developed using the test method in Appendix I of this part or appendix II of 40 CFR part 261 for the allowable land disposal of such wastes. (Appendix II of this part provides Agency guidance on treatment methods that have been shown to achieve the Table CCWE levels for the respective wastes. Appendix II of this part is not a regulatory requirement but is provided to assist generators and owners/operators in their selection of appropriate treatment methods.) Compliance with these concentrations is required based upon grab samples.

TABLE CCWE.—CONSTITUENT CONCENTRATIONS IN WASTE EXTRACT

Waste code	See also	Regulated hazardous constituent	CAS number for regulated hazardous constituent	Wastewaters concentration (mg/l)	Non-wastewaters concentration (mg/l)

—These treatment standards have been based on EP Leachate analysis but this does not preclude the use of TCLP analysis.
 *—These waste codes are not subcategorized into wastewaters and nonwastewaters.
 NA—Not Applicable.

Section 268.42 is amended by revising paragraphs (a) introductory text and (a)(2), by removing paragraphs (a)(3) and (a)(4), by revising paragraph (b), and by adding paragraphs (c), (d), and (e) to read as follows:

§ 268.42 Treatment standards expressed as specified technologies.

(a) The following wastes in paragraphs (a)(1) and (a)(2) of this section and in Table 2 and Table 3 of this section must be treated using the technology or technologies specified in

paragraphs (a)(1) and (a)(2) and Table 1 of this section.

(2) Nonliquid hazardous wastes containing halogenated organic compounds (HOCs) in total concentration greater than or equal to 1,000 mg/kg and liquid HOC-containing

wastes that are prohibited under § 268.32(e)(1) of this part must be incinerated in accordance with the requirements of 40 CFR part 264, subpart

O or 40 CFR part 265, subpart O. These treatment standards do not apply where the waste is subject to a part 268, subpart C treatment standard for

specific HOC (such as a hazardous waste chlorinated solvent for which a treatment standard is established under § 268.41(a)).

TABLE 1.—TECHNOLOGY CODES AND DESCRIPTION OF TECHNOLOGY-BASED STANDARDS

Technology code	Description of technology-based standard
ADGAS	Venting of compressed gases into an absorbing or reacting media (i.e., solid or liquid)—venting can be accomplished through physical release utilizing valves/piping; physical penetration of the container; and/or penetration through detonation.
AMLGM	Amalgamation of liquid, elemental mercury contaminated with radioactive materials utilizing inorganic reagents such as copper, zinc, nickel, gold, and sulfur that result in a nonliquid, semi-solid amalgam and thereby reducing potential emissions of elemental mercury vapors to the air.
BIODG	Biodegradation of organics or non-metallic inorganics (i.e., degradable inorganics that contain the elements of phosphorus, nitrogen, and sulfur) in units operated under either aerobic or anaerobic conditions such that a surrogate compound or indicator parameter has been substantially reduced in concentration in the residuals (e.g., Total Organic Carbon can often be used as an indicator parameter for the biodegradation of many organic constituents that cannot be directly analyzed in wastewater residues).
CAREN	Carbon adsorption (granulated or powdered) of non-metallic inorganics, organo-metallics, and/or organic constituents, operated such that a surrogate compound or indicator parameter has not undergone breakthrough (e.g., Total Organic Carbon can often be used as an indicator parameter for the adsorption of many organic constituents that cannot be directly analyzed in wastewater residues). Breakthrough occurs when the carbon has become saturated with the constituent (or indicator parameter) and substantial change in adsorption rate associated with that constituent occurs.
CHOXD	Chemical or electrolytic oxidation utilizing the following oxidation reagents (or waste reagents) or combinations of reagents: (1) Hypochlorite (e.g. bleach); (2) chlorine; (3) chlorine dioxide; (4) ozone or UV (ultraviolet light) assisted ozone; (5) peroxides; (6) persulfates; (7) perchlorates; (8) permanganates; and/or (9) other oxidizing reagents of equivalent efficiency, performed in units operated such that a surrogate compound or indicator parameter has been substantially reduced in concentration in the residuals (e.g., Total Organic Carbon can often be used as an indicator parameter for the oxidation of many organic constituents that cannot be directly analyzed in wastewater residues). Chemical oxidation specifically includes what is commonly referred to as alkaline chlorination.
CHRED	Chemical reduction utilizing the following reducing reagents (or waste reagents) or combinations of reagents: (1) Sulfur dioxide; (2) sodium, potassium, or alkali salts of sulfites, bisulfites, metabisulfites, and polyethylene glycols (e.g., NaPEG and KPEG); (3) sodium hydrosulfide; (4) ferrous salts; and/or (5) other reducing reagents of equivalent efficiency, performed in units operated such that a surrogate compound or indicator parameter has been substantially reduced in concentration in the residuals (e.g., Total Organic Halogens can often be used as an indicator parameter for the reduction of many halogenated organic constituents that cannot be directly analyzed in wastewater residues). Chemical reduction is commonly used for the reduction of hexavalent chromium to the trivalent state.
DEACT	Deactivation to remove the hazardous characteristics of a waste due to its ignitability, corrosivity, and/or reactivity.
FSUBS	Fuel substitution in units operated in accordance with applicable technical operating requirements.
HLVIT	Vitrification of high level mixed radioactive wastes in units in compliance with all applicable radioactive protection requirements under control of the Nuclear Regulatory Commission.
IMERC:	Incineration of wastes containing organics and mercury in units operated in accordance with the technical operating requirements of 40 CFR part 264, subpart O and 40 CFR part 265, subpart O. All wastewater and nonwastewater residues derived from this process must then comply with the corresponding treatment standards per waste code with consideration of any applicable subcategories (e.g., High or Low Mercury Subcategories).
INCIN	Incineration in units operated in accordance with the technical operating requirements of 40 CFR part 264, subpart O and 40 CFR part 265, subpart O.
LLEXT	Liquid-liquid extraction (often referred to as solvent extraction) of organics from liquid wastes into an immiscible solvent for which the hazardous constituents have a greater solvent affinity, resulting in an extract high in organics that must undergo either incineration, reuse as a fuel, or other recovery/reuse and a raffinate (extracted liquid waste) proportionately low in organics that must undergo further treatment as specified in the standard.
MACRO	Macroencapsulation with surface coating materials such as polymeric organics (e.g. resins and plastics) or with a jacket of inert inorganic materials to substantially reduce surface exposure to potential leaching media. Macroencapsulation specifically does not include any material that would be classified as a tank or container according to 40 CFR 260.10.
NEUTR	Neutralization with the following reagents (or waste reagents) or combinations of reagents: (1) Acids; (2) bases; or (3) water (including wastewaters) resulting in a pH greater than 2 but less than 12.5 as measured in the aqueous residuals.
NLDBR	No land disposal based on recycling.
PRECP	Chemical precipitation of metals and other inorganics as insoluble precipitates of oxides, hydroxides, carbonates, sulfides, sulfates, chlorides, fluorides, or phosphates. The following reagents (or waste reagents) are typically used alone or in combination: (1) Lime (i.e., containing oxides and/or hydroxides of calcium and/or magnesium); (2) caustic (i.e., sodium and/or potassium hydroxides); (3) soda ash (i.e., sodium carbonate); (4) sodium sulfide; (5) ferric sulfate or ferric chloride; (6) alum; or (7) sodium sulfate. Additional flocculating, coagulation, or similar reagents/processes that enhance sludge dewatering characteristics are not precluded from use.
RBERY	Thermal recovery of Beryllium.
RCGAS	Recovery/reuse of compressed gases including techniques such as reprocessing of the gases for reuse/resale; filtering/adsorption of impurities; reusing for direct reuse of resale; and use of the gas as a fuel source.
RCORR	Recovery of acids or bases utilizing one or more of the following recovery technologies: (1) Distillation (i.e., thermal concentration); (2) ion exchange; (3) resin or solid adsorption; (4) reverse osmosis; and/or (5) incineration for the recovery of acid—Note: this does not preclude the use of other physical phase separation or concentration techniques such as decantation, filtration (including ultrafiltration), and centrifugation, when used in conjunction with the above listed recovery technologies.
RLEAD	Thermal recovery of lead in secondary lead smelters.
RMERC	Retorting or roasting in a thermal processing unit capable of volatilizing mercury and subsequently condensing the volatilized mercury for recovery. The retorting or roasting unit (or facility) must be subject to one or more of the following: (a) A National Emissions Standard for Hazardous Air Pollutants (NESHAP) for mercury; (b) a Best Available Control Technology (BACT) or a Lowest Achievable Emission Rate (LAER) standard for mercury imposed pursuant to a Prevention of Significant Deterioration (PSD) permit; or (c) a state permit that establishes emission limitations (within meaning of Section 302 of the Clean Air Act) for mercury. All wastewater and nonwastewater residues derived from this process must then comply with the corresponding treatment standards per waste code with consideration of any applicable subcategories (e.g., High or Low Mercury Subcategories).
RMETL	Recovery of metals or inorganics utilizing one or more of the following direct physical/removal technologies: (1) ion exchange; (2) resin or solid (i.e., zeolites) adsorption; (3) reverse osmosis; (4) chelation/solvent extraction; (5) freeze crystallization; (6) ultrafiltration; and/or (6) simple precipitation (i.e., crystallization)—Note: this does not preclude the use of other physical phase separation or concentration techniques such as decantation, filtration (including ultrafiltration), and centrifugation, when used in conjunction with the above listed recovery technologies.
ROORG	Recovery of organics utilizing one or more of the following technologies: (1) Distillation; (2) thin film evaporation; (3) steam stripping; (4) carbon adsorption; (5) critical fluid extraction; (6) liquid-liquid extraction; (7) precipitation/crystallization (including freeze crystallization); or (8) chemical phase separation techniques (i.e., addition of acids, bases, demulsifiers, or similar chemicals); Note: This does not preclude the use of other physical phase separation techniques such as decantation, filtration (including ultrafiltration), and centrifugation, when used in conjunction with the above listed recovery technologies.
RTHPA	Thermal recovery of metals or inorganics from nonwastewaters in units defined in 40 CFR 260.10, paragraphs (1), (6), (7), (11), and (12), under the definition of "industrial furnaces".

TABLE 1.—TECHNOLOGY CODES AND DESCRIPTION OF TECHNOLOGY-BASED STANDARDS—Continued

Technology code	Description of technology-based standard
RZINC	Resmelting in for the purpose of recovery of zinc high temperature metal recovery units.
STABL	Stabilization with the following reagents (or waste reagents) or combinations of reagents: (1) Portland cement; or (2) lime/pozzolans (e.g., fly ash and cement kiln dust)—this does not preclude the addition of reagents (e.g., iron salts, silicates, and clays) designed to enhance the set/cure time and/or compressive strength, or to overall reduce the leachability of the metal or inorganic.
SSTRP	Steam stripping of organics from liquid wastes utilizing direct application of steam to the wastes operated such that liquid and vapor flow rates, as well as, temperature and pressure ranges have been optimized, monitored, and maintained. These operating parameters are dependent upon the design parameters of the unit such as, the number of separation stages and the internal column design. Thus, resulting in a condensed extract high in organics that must undergo either incineration, reuse as a fuel, or other recovery/reuse and an extracted wastewater that must undergo further treatment as specified in the standard.
WETOX	Wet air oxidation performed in units operated such that a surrogate compound or indicator parameter has been substantially reduced in concentration in the residuals (e.g., Total Organic Carbon can often be used as an indicator parameter for the oxidation of many organic constituents that cannot be directly analyzed in wastewater residues).
WTRRX	Controlled reaction with water for highly reactive inorganic or organic chemicals with precautionary controls for protection of workers from potential violent reactions as well as precautionary controls for potential emissions of toxic/ignitable levels of gases released during the reaction.

NOTE 1: When a combination of these technologies (i.e., a treatment train) is specified as a single treatment standard, the order of application is specified in § 268.42, Table 2 by indicating the five letter technology code that must be applied first, then the designation "fb." (an abbreviation for "followed by"), then the five letter technology code for the technology that must be applied next, and so on.

NOTE 2: When more than one technology (or treatment train) are specified as *alternative* treatment standards, the five letter technology codes (or the treatment trains) are separated by a semicolon (;) with the last technology preceded by the word "OR". This indicates that any one of these BAT technologies or treatment trains can be used for compliance with the standard.

(b) Any person may submit an application to the Administrator demonstrating that an alternative treatment method can achieve a measure of performance equivalent to that achievable by methods specified in paragraphs (a), (c), and (d) of this section. The applicant must submit information demonstrating that his treatment method is in compliance with federal, state, and local requirements and is protective of human health and the environment. On the basis of such information and any other available information, the Administrator may approve the use of the alternative treatment method if he finds that the alternative treatment method provides a measure of performance equivalent to that achieved by methods specified in

paragraphs (a), (c), and (d) of this section. Any approval must be stated in writing and may contain such provisions and conditions as the Administrator deems appropriate. The person to whom such approval is issued must comply with all limitations contained in such a determination.

(c) As an alternative to the otherwise applicable subpart D treatment standards, lab packs are eligible for land disposal provided the following requirements are met:

(1) The lab packs comply with the applicable provisions of 40 CFR 264.316 and 40 CFR 265.316;

(2) All hazardous wastes contained in such lab packs are specified in appendix IV or appendix V to part 268;

(3) The lab packs are incinerated in accordance with the requirements of 40 CFR part 264, subpart O or 40 CFR part 265, subpart O; and

(4) Any incinerator residues from lab packs containing D004, D005, D006, D007, D008, D010, and D011 are treated in compliance with the applicable treatment standards specified for such wastes in subpart D of this part.

(d) Radioactive hazardous mixed wastes with treatment standards specified in Table 3 of this section are not subject to any treatment standards specified in § 268.41, § 268.43, or Table 2 of this section. Radioactive hazardous mixed wastes not subject to treatment standards in Table 3 of this section remain subject to all applicable treatment standards specified in

§ 268.41, § 268.43, and Table 2 of this section.

12. Section 268.43 is amended by revising paragraph (a) and Table CCW—Constituent Concentrations in Wastes, and by adding paragraph (c) to read as follows:

§ 268.43 Treatment standards expressed as waste concentrations.

(a) Table CCW identifies the restricted wastes and the concentrations of their associated hazardous constituents which may not be exceeded by the waste or treatment residual (not

an extract of such waste or residual) for the allowable land disposal of such waste or residual. Compliance with these concentrations is required based upon grab samples, unless otherwise noted in the following Table CCW.

* Treatment standards for this organic constituent were established based upon incineration in units operated in accordance with the technical requirements of 40 CFR Part 264 Subpart O or Part 265 Subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may certify compliance with these treatment standards according to provisions in 40 CFR Section 268.7.

• Based on analysis of composite samples.

* As analyzed using SW-846 Method 9010; sample size: 0.5-10; distillation time: one hour to one hour and fifteen minutes.

NA—Not Applicable.

¹ Treatment standards for this organic constituent were established based upon incineration in units operated in accordance with the technical requirements of 40 CFR Part 264 Subpart O or Part 265 Subpart O, or based upon combustion in fuel substitution units operating in accordance with applicable technical requirements. A facility may certify compliance with these treatment standards according to provisions in 40 CFR Section 268.7.

* Based on analysis of composite samples.

² As analyzed using SW-846 Method 9010; sample size: 0.5-10; distillation time: one hour to one hour fifteen minutes.

NA—Not Applicable.

(c) Notwithstanding the prohibitions specified in paragraph (a) of this section, treatment and disposal facilities may demonstrate (and certify pursuant to § 268.7(b)(5)) compliance with the treatment standards for organic constituents specified in this section provided the following conditions are satisfied:

(1) The treatment for the organic constituents were established based on incineration in units operated in accordance with the technical requirements of 40 CFR part 264, subpart O or 40 CFR part 265, subpart O, or based on combustion in fuel substitution units operating in accordance with applicable technical requirements;

(2) The organic constituents have been treated using the methods referenced in paragraph (c)(1) of this section; and

(3) The treatment or disposal facility has been unable to detect the organic constituents despite using its best good-faith efforts as defined by applicable Agency guidance or standards. Until such guidance or standards are developed, such good-faith efforts may be demonstrated where the treatment or disposal facility has detected the organic constituents at levels within an order of magnitude of the treatment standard specified in this section.

13. Appendix IV is added to part 268 to read as follows:

Appendix IV—Organometallic Lab Packs

Hazardous waste with the following EPA waste codes may be placed in an "organometallic" or "Appendix IV lab pack:"

P001, P002, P003, P004, P005, P006, P007, P008, P009, P013, P014, P015, P016, P017, P018, P020, P022, P023, P024, P025, P026, P027, P028, P031, P034, P036, P037, P038, P039, P040, P041, P042, P043, P044, P045, P047, P048, P049, P050, P051, P054, P056, P057, P058, P059, P060, P062, P063, P064,

P065, P066, P067, P068, P069, P070, P071, P072, P073, P074, P075, P077, P081, P082, P084, P085, P087, P088, P089, P092, P093, P094, P095, P096, P097, P098, P099, P101, P102, P103, P104, P105, P108, P109, P110, P112, P113, P114, P115, P116, P118, P119, P120, P122, P123
 U001, U002, U003, U004, U005, U006, U007, U008, U009, U010, U011, U012, U014, U015, U016, U017, U018, U019, U020, U021, U022, U023, U024, U025, U026, U027, U028, U029, U030, U031, U032, U033, U034, U035, U036, U037, U038, U039, U041, U042, U043, U044, U045, U046, U047, U048, U049, U050, U051, U052, U053, U055, U056, U057, U058, U059, U060, U061, U062, U063, U064, U066, U067, U068, U069, U070, U071, U072, U073, U074, U075, U076, U077, U078, U079, U080, U081, U082, U083, U084, U085, U086, U087, U088, U089, U090, U091, U092, U093, U094, U095, U096, U097, U098, U099, U101, U102, U103, U105, U106, U107, U108, U109, U110, U111, U112, U113, U114, U115, U116, U117, U118, U119, U120, U121, U122, U123, U124, U125, U126, U127, U128, U129, U130, U131, U132, U133, U134, U135, U136, U137, U138, U139, U140, U141, U142, U143, U144, U145, U146, U147, U148, U149, U150, U152, U154, U153, U154, U155, U156, U157, U158, U159, U160, U161, U162, U164, U165, U166, U167, U168, U169, U170, U171, U172, U173, U174, U176, U177, U178, U179, U180, U181, U182, U183, U184, U185, U186, U187, U188, U189, U190, U191, U192, U193, U194, U196, U197, U200, U201, U202, U203, U204, U205, U206, U207, U208, U209, U210, U211, U213, U214, U215, U216, U217, U218, U219, U220, U221, U222, U223, U225, U226, U227, U228, U234, U235, U236, U237, U238, U239, U240, U243, U244, U246, U247, U248, U249, U328, U353, U359
 F001, F002, F003, F004, F005, F006, F010, F020, F021, F023, F024, F026, F027, F028

K001, K002, K008, K009, K010, K011, K013, K014, K015, K016, K017, K013, K019, K020, K021, K022, K023, K024, K025, K026, K027, K028, K029, K030, K031, K032, K033, K034, K035, K036, K037, K038, K039, K040, K041, K042, K043, K044, K045, K046, K047, K048, K049, K050, K051, K052, K054, K060, K061, K064, K065, K066, K069, K071, K073, K083, K084, K085, K086, K087, K093, K094, K095, K096, K097, K098, K099, K101, K102, K103, K104, K105, K111, K112, K113, K114, K115, K116, K117, K118, K123, K124, K125, K126, K136

D001, D002, D003, D004, D005, D006, D007, D008, D010, D011, D012, D013, D014, D015, D018, D017

U032, U136, U144, U145, U146, U133, U214, U215, U216, U217

14. Appendix V is added to part 268 to read as follows:

Appendix V—Organic Lab Packs

Hazardous wastes with the following EPA Hazardous Waste Code No. may be placed in an "organic" or "Appendix V:"

P001, P002, P003, P004, P005, P006, P007, P008, P009, P013, P014, P015, P016, P017, P018, P020, P022, P023, P025, P024, P026, P027, P028, P031, P034, P036, P037, P038, P039, P040, P041, P042, P043, P044, P045, P046, P047, P048, P049, P050, P051, P054, P057, P058, P059, P060, P062, P063, P064, P064, P065, P066, P067, P068, P069, P070, P071, P072, P073, P074, P075, P077, P081, P082, P084, P085, P087, P088, P089, P092, P093, P094, P095, P096, P097, P098, P099, P101, P102, P103, P104, P105, P108, P109, P110, P111, P112, P113, P114, P115, P116, P119, P119, P120, P122, P123
 U001, U002, U003, U004, U005, U006, U007, U008, U009, U010, U011, U012, U014, U015, U016, U017, U018, U019, U020, U021, U022, U023, U024, U025, U026, U027, U028, U029, U030, U031, U033, U034, U035, U036, U037, U038,

U039, U041, U042, U043, U044, U045, U046, U047, U048, U049, U050, U051, U052, U053, U055, U056, U057, U058, U059, U060, U061, U062, U063, U064, U066, U067, U068, U069, U070, U071, U072, U073, U074, U075, U076, U077, U078, U079, U080, U081, U082, U083, U084, U085, U086, U087, U088, U089, U090, U091, U092, U093, U094, U095, U096, U097, U098, U099, U101, U102, U103, U105, U106, U107, U108, U109, U110, U111, U112, U113, U114, U115, U116, U117, U118, U119, U120, U121, U122, U123, U124, U125, U126, U127, U128, U129, U130, U131, U132, U133, U135, U137, U138, U139, U140, U141, U142, U143, U147, U148, U149, U150, U153, U154, U155, U156, U157, U158, U159, U160, U161, U162, U163, U164, U165, U166, U167, U168, U169, U170, U171, U172, U173, U174, U176, U177, U178, U179, U180, U181, U182, U183, U184, U185, U186, U187, U188, U189, U190, U191, U192, U193, U194, U196, U197, U200, U201, U202, U203, U205, U206, U207, U208, U209, U210, U211.

U213, U214, U218, U219, U220, U221, U222, U223, U225, U226, U227, U228, U234, U235, U236, U237, U238, U239, U240, U243, U244, U246, U247, U248, U249, U328, U353, U359
 F001, F002, F003, F004, F005, F010, F020, F021, F023, F024, F026, F027, F028
 K001, K009, K010, K011, K013, K014, K015, K016, K017, K018, K019, K020, K021, K022, K023, K024, K025, K026, K027, K029, K030, K031, K032, K033, K034, K035, K036, K037, K038, K039, K040, K041, K042, K043, K044, K045, K046, K047, K048, K049, K050, K051, K052, K054, K060, K065, K073, K083, K084, K085, K086, K087, K093, K094, K095, K096, K097, K098, K099, K101, K102, K103, K104, K105, K111, K112, K113, K114, K115, K116, K117, K118, K123, K124, K125, K126, K136
 D001, D012, D013, D014, D015, D016, D017

15. Appendix VI is added to part 268, to read as follows:

Appendix VI—Recommended Technologies to Achieve Deactivation of Characteristics in Section 268.42

The treatment standard for many subcategories of D001, D002, and D003 wastes as well as for K044, K045, and K047 wastes is listed in 268.42 simply as "Deactivation to remove the characteristics of ignitability, corrosivity, and reactivity". EPA has determined that many technologies, when used alone or in combination, can achieve this standard. The following appendix presents a partial list of these technologies, utilizing the five letter technology codes established in 40 CFR 268.42 Table 1. Use of these specific technologies is not mandatory and does not preclude direct reuse, recovery, and/or the use of other pretreatment technologies provided deactivation is achieved and these alternative methods are not performed in units designated as land disposal.

Waste code/subcategory	Nonwastewaters	Wastewaters
D001 Ignitable Liquids based on 261.21(a)(1)—Low TOC Nonwastewater Subcategory (containing 1% to <10% TOC).	RORGS INCIN WETOX CHOXD BIODG	n.a.
D001 Ignitable Liquids based on 261.21(a)(1)—Ignitable Wastewater Subcategory (containing <1% TOC)	n.a.	RORGS INCIN WETOX CHOXD BIODG
D001 Compressed Gases based on 261.21(A)(3)	RCGAS INCIN FSUBS ADGAS fb. INCIN ADGAS fb. (CHOXD; or CHRED)	n.a.
D001 Ignitable Reactives based on 261.21(a)(2)	WTRRX CHOXD CHRED STABL INCIN	n.a.
D001 Ignitable Oxidizers based on 261.21(a)(4)	CHRED INCIN	CHRED INCIN
D002 Acid Subcategory based on 261.22(a)(1) with pH less than or equal to 2	RCORR NEUTR INCIN	NEUTR INCIN
D002 Alkaline Subcategory based on 261.22(a)(1) with pH greater than or equal to 12.5	NEUTR INCIN	NEUTR INCIN
D002 Other Corrosives based on 261.22(a)(2)	CHOXD CHRED INCIN STABL	CHOXD CHRED INCIN
D003 Water Reactives based on 261.23(a) (2), (3), and (4)	INCIN WTRRX CHOXD CHRED	n.a.
D003 Reactive Sulfides based on 261.23(a)(5)	CHOXD CHRED INCIN STABL	CHOXD CHRED BIODG INCIN
D003 Explosives based on 261.23(a) (6), (7), and (8)	INCIN CHOXD CHRED	INCIN CHOXD CHRED BIODG CARBN
D003 Other Reactives based on 261.23(a)(1)	INCIN CHOXD CHRED	INCIN CHOXD CHRED BIODG CARBN

Waste code/subcategory	Nonwastewaters	Wastewaters
K044 Wastewater treatment sludges from the manufacturing and processing of explosives.....	CHOXD..... CHRED..... INCIN.....	CHOXD CHRED BICDG CARBN INCIN
K045 Spent carbon from the treatment of wastewaters containing explosives.....	CHOXD..... CHRED..... INCIN.....	CHOXD CHRED BICDG CARBN INCIN
K047 Pink/red water from TNT operations.....	CHOXD..... CHRED..... INCIN.....	CHOXD CHRED BICDG CARBN INCIN

Note: "n.a." stands for "not applicable"; "fb." stands for "followed by".

16. Appendix VII is added to part 268, to read as follows:

APPENDIX VII.—EFFECTIVE DATES OF SURFACE DISPOSED WASTES REGULATED IN THE LDRS *

[Comprehensive List]

Waste code	Waste category	Effective date
California list	Liquid hazardous wastes, including free liquids associated with solid or sludge, containing free cyanides at concentrations greater than or equal to 1,000 mg/l or certain metals or compounds of these metals greater than or equal to the prohibition levels.	July 8, 1987.
California list	Liquid (aqueous) hazardous wastes having a pH less than or equal to 2.	July 8, 1987.
California list	Dilute HOC wastewaters, defined as HCC-waste mixtures that are primarily water and that contain greater than or equal to 1,000 mg/l but less than 10,000 mg/l.	July 8, 1987.
California list	Liquid hazardous waste containing PCBs greater than or equal to 50 ppm.	July 8, 1987.

APPENDIX VII.—EFFECTIVE DATES OF SURFACE DISPOSED WASTES REGULATED IN THE LDRS *—Continued

[Comprehensive List]

Waste code	Waste category	Effective date
California list	Other liquid and non-liquid hazardous wastes containing HOCs in total concentration greater than or equal to 1,000 mg.	Nov. 8, 1988.
California list	Soil and debris HOCs not from CERCLA/RCRA corrective actions.	July 8, 1989.
California list	Soil and debris HOCs from CERCLA/RCRA corrective actions.	Nov. 8, 1990.
D001	All	Aug. 8, 1990.
D002	All	Aug. 8, 1990.
D003	All	Aug. 8, 1990.
D004	Inorganic solid debris.	May 8, 1992.
D004	Nonwastewater	May 8, 1992.
D004	Wastewater	Aug. 8, 1990.
D005	Inorganic solid debris.	May 8, 1992.
D005	All others	Aug. 8, 1990.
D006	Inorganic solid debris.	May 8, 1992.
D006	All others	Aug. 8, 1990.
D007	Inorganic solid debris.	May 8, 1992.
D007	All others	Aug. 8, 1990.
D008	Inorganic solid debris.	May 8, 1992.
D008	Lead acid batteries.	May 8, 1992.
D008	All others	Aug. 8, 1990.
D009	Inorganic solid debris.	May 8, 1992.
D009	High mercury non-wastewater.	May 8, 1992.
D009	Low mercury non-wastewater.	May 8, 1992.
D009	All others	Aug. 8, 1990.

APPENDIX VII.—EFFECTIVE DATES OF SURFACE DISPOSED WASTES REGULATED IN THE LDRS *—Continued

[Comprehensive List]

Waste code	Waste category	Effective date
D010	Inorganic solid debris.	May 8, 1992.
D010	All others	Aug. 8, 1990.
D011	Inorganic solid debris.	May 8, 1992.
D011	All others	Aug. 8, 1990.
D012	All	Aug. 8, 1990.
D013	All	Aug. 8, 1990.
D0014	All	Aug. 8, 1990.
D0015	All	Aug. 8, 1990.
D0016	All	Aug. 8, 1990.
D0017	All	Aug. 8, 1990.
F001-F005	All, except	Nov. 8, 1988.
F001-F005	Small quantity generators, CERCLA/RCRA corrective action, initial generator's solvent-water mixtures, solvent-containing sludges and solids, and non CERCLA/RCRA corrective action soils with less than 1 percent total solvent constituents.	Nov. 8, 1988.
F001-F005	Soil and debris	Nov. 8, 1990.
F002	All	Aug. 8, 1990.
F005	All	Aug. 8, 1990.
F006	Wastewater	Aug. 8, 1990.
F006	Nonwastewater	Aug. 8, 1988.
F006	Nonwastewater (cyanides).	July 8, 1989.
F007	All	July 8, 1989.
F008	All	July 8, 1989.
F009	All	July 8, 1989.
F010	Soil and debris	June 8, 1991.
F010	All others	June 8, 1989.
F011	All	July 8, 1989.
F012	All	July 8, 1989.
F019	All	Aug. 8, 1990.
F020	Soil and debris	Nov. 8, 1990.
F020	All others	Nov. 8, 1988.
F021	Soil and debris	Nov. 8, 1990.

APPENDIX VII.—EFFECTIVE DATES OF
SURFACE DISPOSED WASTES REGULAT-
ED IN THE LDRS *—Continued

[Comprehensive List]

K071.....	All.....	August 8, 1990.
K104.....	All.....	August 8, 1990.

* Wastes that are deep well disposed on-site receive a six-month variance, with restrictions effective in November 1990.
 † Deepwell injected D002 liquids with a pH less than 2 must meet the California List treatment standards on August 8, 1990.
 Note: This table is provided for the convenience of the reader.

PART 270—EPA ADMINISTERED PERMIT PROGRAMS: THE HAZARDOUS WASTE PERMIT PROGRAM

1. The authority citation for part 270 continues to read as follows:
 Authority: 42 U.S.C. 6905, 6912, 6924, 6925, 6927, 6939, and 6974.

Subpart D—Changes to Permit

2. Section 270.42, appendix I is amended by redesignating item B(1)(b) as B(1)(c), and adding item B(1)(b) as follows:

§ 270.42 Permit modification at the request of the permittee.

APPENDIX I TO SECTION 270.42—CLASSIFICATION OF PERMIT MODIFICATION

Modification	Class
B. General Facility Standards	
1.	
b. To incorporate changes associated with F039 (multi-source leachate) sampling or analysis methods....	1

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

Subpart A—Requirements for Final Authorization

2. Section 271.1(j) is amended by adding the following entry to Table 1 in chronological order by date of publication in the Federal Register:

§ 271.1 Purpose and scope.

 (j)

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

1. The authority citation for part 271 continues to read as follows:

TABLE 1.—REGULATIONS IMPLEMENTING THE HAZARDOUS AND SOLID WASTE AMENDMENTS OF 1984

Promulgation date	Title of regulation	Federal Register reference	Effective date
June 1, 1990.....	Land Disposal Restrictions for Third Third wastes.....	[Insert page numbers].....	May 8, 1990.

3. Section 271.1(j) is amended by revising the entry for May 8, 1990 in Table 2 to read as follows:

§ 271.1 Purpose and Scope.

 (j)

TABLE 2.—SELF-IMPLEMENTING PROVISIONS OF THE HAZARDOUS AND SOLID WASTE AMENDMENTS OF 1984

Effective	Self-implementing provision	RCRA citation	Federal Register reference
May 8, 1990.....	Prohibition on land disposal of 3/3 of listed wastes.	3004(g)(6)(C).....	[June 1, 1990 and page numbers of this document.]

PART 302—DESIGNATION, REPORTABLE QUANTITIES, AND NOTIFICATION

1. The authority citation for part 302 continues to read as follows:

Authority: Sec. 102 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, 42 U.S.C. 9602; secs. 311 and 501(a) of the Federal Water Pollution Control Act, 33 U.S.C. 1321 and 1361.

2. Section 302.4 is amended by adding the following entry in alphabetical order

under the column "Hazardous Substance" and adding as the first footnote, footnote † to read as follows. Footnotes 1* and 4 are republished.

§ 302.4 Designation of Hazardous Substances.

• • • • •

Hazardous Substance	CASRN	Regulatory Synonyms	Statutory			Final RQ	
			RQ	Code†	RCRA Waste Number	Category	Pounds (Kg)
Multi Source Leachate.....	•	•	1* •	4 •	F039 •	X •	1 (0.454)

† Indicates the statutory source as defined by 1, 2, 3, and 4 below.

4—indicates that the statutory source for designation of this hazardous substance under CERCLA is RCRA Section 3001.

1*—indicates that the 1-pound RQ is a CERCLA statutory RQ.

Environmental Fact Sheet

FINAL RULE FOR THIRD THIRD SCHEDULED WASTES COMPLETES STATUTORY REQUIREMENTS FOR LAND DISPOSAL RESTRICTIONS

The fifth in a series of five Land Disposal Restrictions (LDR) rulemakings establishes treatment standards and effective dates for "Third Third" wastes, including characteristic wastes, and soft hammer wastes from the First and Second Third lists. The treatment standards apply to hazardous wastes that are land disposed, including those that are injected into deep wells. The Environmental Protection Agency (EPA) is granting, at a minimum, a three-month national capacity variance for all wastes affected by this rule to provide industry with time needed to comply with the new regulations.

BACKGROUND

The 1984 amendments to the Resource Conservation and Recovery Act (RCRA) required EPA to establish treatment standards for all hazardous wastes destined for land disposal. These standards must specify a level or method of treatment which substantially reduces the toxicity or mobility of the hazardous constituents so as to minimize long-term threats to human health and the environment.

Congress specified strict dates when particular groups of hazardous wastes not meeting the treatment standards are prohibited from land disposal unless the Agency finds that there will be "no migration of hazardous constituents...for as long as the wastes remain hazardous." With this rulemaking, the Agency has met all of the statutory deadlines imposed by Congress:

- On November 7, 1986, spent solvent and dioxin-bearing wastes were regulated.
- On July 8, 1987, the "California List"¹ wastes were addressed.
- Except for those wastes in today's rulemaking, all other wastes listed as of November 8, 1984 were included in the land disposal restrictions on August 8, 1988 (First Third) and June 8, 1990 (Second Third).

¹"California List" wastes are liquid and nonliquid hazardous wastes containing halogenated organic compounds (HOCs) above 1,000 ppm, and liquid hazardous wastes containing polychlorinated biphenyls (PCBs) above 80 ppm, certain toxic metals above specified statutory concentrations, or corrosive liquid wastes that have a pH level below two.

The land ban provisions will change the way that industry must manage their hazardous waste and has given considerable impetus to the development of more economic and effective means of treating waste. As a result, treatment technologies have improved rapidly and include methods to destroy, detoxify, or incinerate waste. In addition, hazardous waste generators have developed new ways to recover and reuse waste as well as methods to reduce the volume of hazardous waste requiring treatment.

ACTION

The final rule specifies treatment standards and effective dates for all Third Third waste, characteristic wastes, First and Second Third soft hammer wastes, and five newly listed wastes. EPA also is promulgating treatment standards for multi-source leachate and mixed hazardous/radioactive waste, and is promulgating alternate treatment standards for lab packs. The Agency has rescheduled wastes from the petroleum refining industry to the Third Third and is revising existing standards for these wastes. Previously promulgated treatment standards expressed as "no land disposal" for nonwastewaters are being replaced with treatment levels or specified methods.

The effective date of the rule is May 8, 1990. However, EPA is granting, at a minimum, a three-month national capacity variance to the treatment standards for all wastes affected by this rule to allow the regulated community sufficient time to make necessary changes to comply with the regulations. During the period of variance, wastes that are placed in a landfill or into surface impoundments and do not meet the treatment standards, must be disposed of in units that meet the minimum technological requirements of Section 3004(o) of RCRA (e.g., ground-water monitoring and leachate collection) and comply with the recordkeeping requirements of 40 CFR 268.7.

For the characteristic wastes, EPA is specifying treatment levels below the characteristic for the EP toxic pesticide nonwastewaters and reactive cyanides. In addition, the Agency is specifying methods that require treatment below the characteristic level for high TOC ignitables and for EP toxic pesticide wastewaters. Concentrations are specified at the characteristic level for the EP toxic metals except for selenium, which is slightly higher than the EP level. For corrosive and remaining ignitable and reactive, the standards require that wastes be treated so that they no longer exhibit a characteristic.

The dilution prohibition developed for listed wastes is extended to characteristic wastes included in the Third Third. However, the final rule does not prohibit dilution of characteristic wastes that are generated and managed in wastewater treatment systems regulated under the Clean Water Act or underground injection wells regulated under the Safe Drinking Water Act. Prohibited wastes that are treated by

inappropriate methods or sent to treatment systems that do not treat the wastes are considered impermissibly diluted.

With regard to characteristic wastes, dilution is permissible when wastes are aggregated for legitimate treatment in centralized treatment systems.

Treatment standards for characteristic wastes require the following:

- Wastes that carry more than one characteristic waste code must be treated to meet the standard for each characteristic. Listed wastes that exhibit hazardous characteristics must meet the treatment standard for each waste code, unless each characteristic is specifically addressed in the treatment standard for the listed waste. In addition, land disposal of a waste that exhibits a characteristic is prohibited. The only exception to this standard is selenium where the data only supports a treatment level above the characteristic.
- During the period of a national capacity variance, hazardous wastes that are subject to more than one treatment standard must still meet the treatment standard for any waste that has not received an extension.
- The use of the Toxicity Characteristic Leaching Procedures (TCLP) in assessing whether a waste is subject to the Third Third land ban rule.

The Agency is promulgating alternate treatment standards for lab packs that contain certain prohibited organometallic and organic wastes. These standards are expressed as a specified technology for each of the waste categories. For the organometallic wastes, incineration, followed by treatment to meet the treatment standards for metals (included in the alternate standard) is required. For organic wastes incineration is a specified method. Generators and owners/operators who use the alternate treatment standards for lab pack wastes are required to list each waste code on the notification.

Due to inadequate treatment capacity for mixed hazardous/radioactive wastes included in the Third Third, EPA is granting a two-year national capacity variance for these wastes. Those hazardous wastes listed in the attached tables also are receiving a two-year national capacity variance. Furthermore, the Agency is granting wastes from the petroleum refining industry—EPA hazardous waste numbers K048-K052—a six-month national capacity variance.

EPA amended 40 CFR 268.7 to allow referencing treatment standards for all wastes except spent solvents, California List wastes, and multi-source leachate. The following information must be included in the reference: EPA hazardous waste number, subcategory of the waste code, treatability group, and CFR section where the treatment standards appear. In addition, EPA is allowing a one-time notification and certification for small quantity generator shipments that are subject to tolling agreements.

EPA promulgated waste analysis plan requirements for wastes treated in 90-day tanks or containers. Persons treating prohibited wastes to comply with treatment standards in such tanks and containers are required to prepare a plan justifying the frequency of testing and adhere to recordkeeping requirements.

CONCLUSION

The land disposal restrictions imposed by this rule completes the Agency's assessment of all hazardous waste as required by the Hazardous and Solid Waste Amendments (HSWA). Treatment standards have been established for all listed and characteristic wastes that existed when HSWA was enacted in 1984. Restricting the land disposal of wastes covered by this final rule will create significant changes in hazardous waste management, thereby minimizing threats to human health and the environment.

CONTACT

To order a copy of the *Federal Register* notice, or for additional information, contact the RCRA Hotline Monday-Friday, 8:30 a.m. to 7:30 p.m., EST. The national toll-free number is (800) 424-9346; for the hearing impaired, the number is TDD (800) 553-7672. In Washington, D.C., the number is (202) 382-3000 or TDD (202) 475-9652.

SUMMARY OF NATIONAL CAPACITY VARIANCES

Surface-Disposed Wastes¹

<u>Required Alternative Treatment Technology</u>	<u>Waste Code</u>	<u>Physical Form</u>	<u>Effective Date</u>
Acid Leaching & Chemical Precipitation	D009	Low Mercury Nonwastewater	May 1992
	K106	Low Mercury Nonwastewater	May 1992
	P065	Low Mercury Nonwastewater	May 1992
	P092	Low Mercury Nonwastewater	May 1992
	U151	Low Mercury Nonwastewater	May 1992
Combustion of Sludge/Solids	F039 ²	Nonwastewater	May 1992
	K048 ²	Nonwastewater	November 1990
	K049 ²	Nonwastewater	November 1990
	K050 ²	Nonwastewater	November 1990
	K051 ²	Nonwastewater	November 1990
	K052 ²	Nonwastewater	November 1990
Mercury Retorting	D009	High Mercury Nonwastewater	May 1992
	K106	High Mercury Nonwastewater	May 1992
	P065	High Mercury Nonwastewater	May 1992
	P092	High Mercury Nonwastewater	May 1992
	U151	High Mercury Nonwastewater	May 1992
Secondary Smelting Storage Area	D008	Lead Materials before Secondary Smelting	May 1992
Thermal Recovery	P067	Nonwastewater/Wastewater	May 1992
Vitrification	D004	Nonwastewater	May 1992
	K031	Nonwastewater	May 1992
	K084	Nonwastewater	May 1992
	K101	Nonwastewater	May 1992
	K102	Nonwastewater	May 1992
	P010	Nonwastewater	May 1992
	P011	Nonwastewater	May 1992
	P012	Nonwastewater	May 1992
	P036	Nonwastewater	May 1992
	P038	Nonwastewater	May 1992
	U136	Nonwastewater	May 1992

¹EPA is granting these wastes a two-year national capacity variance, except as otherwise noted. This table does not include mixed radioactive wastes or soil and debris, which are receiving a national capacity variance for all applicable treatment technologies.

²Multi-source Leachate.

³For K048-K052 petroleum-refining nonwastewaters, EPA is granting only a six-month variance.

SUMMARY OF NATIONAL CAPACITY VARIANCES

Deep Well Disposed			
<u>Required Alternative Treatment Technology</u>	<u>Waste Code</u>	<u>Physical Form</u>	<u>Effective Date</u>
Acid Leaching followed by Chemical Precipitation	D009	Low Mercury Nonwastewater	May 1992
Alkaline Chlorination	D003 ¹	Wastewater/Nonwastewater	May 1992
Chemical Oxidation followed by Chemical Precipitation	D003 ²	Wastewater/Nonwastewater	May 1992
Chemical Oxidation followed by Chromium Reduction and Chemical Precipitation	D003 ³	Wastewater/Nonwastewater	May 1992
Chromium Reduction followed by Chemical Precipitation	D007	Wastewater/Nonwastewater	May 1992
Mercury Retorting	D009	High Mercury Nonwastewaters	May 1992
Neutralization	D002 ⁴	Wastewater/Nonwastewater	May 1992
Wet-Air Oxidation	K011	Wastewater	May 1992
	K013	Wastewater	May 1992
	K014	Wastewater/Nonwastewater	May 1992
Wet-Air Oxidation followed by Carbon Adsorption followed by Chemical Precipitation; Biological Treatment followed by Chemical Precipitation	F039 ⁵	Wastewater	May 1992

Wastes that are deep well disposed on-site receive a six-month variance, with restrictions effective in ~~November~~ September 1990.

¹ D003 (Cyanides)

² D003 (Sulfides)

³ D003 (Explosives, Water Reactives, and Other Reactives)

⁴ Deepwell injected D002 liquids with a pH less than 2 must meet the California List treatment standards on August 8, 1990.

⁵ Multi-source Leachate

RCRA REVISION CHECKLIST 79

Organic air Emission Standards
for Process Vents and Equipment Leaks
55 FR 25454-25519
June 21, 1990
(HSWA Cluster II)

Note: The Federal Register addressed by this checklist is the first of a multiphased regulatory effort to control air emissions at new and existing hazardous waste treatment, storage and disposal facilities (TSDFs). On April 26, 1991 (56 FR 19290; Revision Checklist 87), a technical amendment for this rule was published. States are strongly encouraged to adopt the technical corrections at the same time the Revision Checklist 79 provisions are adopted.

			EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
5 except for 265.1034(d) and 265.1034(e), Subpart AA applies to process vents associated with operations managing hazardous wastes with at least 10-ppmw organic concentrations if conducted in specific units	265.1030(b)				
units subject to the permitting requirements of Part 270	265.1030(b)(1)				
hazardous waste recycling units located on hazardous waste management facilities otherwise subject to Part 270 permitting requirements	265.1030(b)(2)				
DEFINITIONS					
all terms have meaning given them in 264.1031, the Act, and Parts 260-266	265.1031				
STANDARDS: PROCESS VENTS					
owner or operator of facility with process vents meeting certain conditions shall either:	265.1032(a)				
reduce total organic emissions below 1.4 kg/h and 2.8 Mg/yr	265.1032(a)(1)				

RCRA REVISION CHECKLIST 79: Organic air Emission Standards
for Process Vents and Equipment Leaks (cont'd)

FEDERAL REQUIREMENT	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
			EQUIVALENT	MORE STRINGENT	BROADER IN SCOPE
using control device, reduce total organic emissions by 95 weight percent	265.1032(a)(2)				
265.1033 requirements must be met if owner or operator installs closed-vent system and control device to comply with 265.1032(a) provisions	265.1032(b)				
use of engineering calculations or performance tests conforming to 265.1034(c) requirements may be used for determination of vent emissions and emission reductions or total organic compound concentrations achieved by add-on control devices	265.1032(c)				
use of 265.1034(c) procedures to resolve disagreements between owner or operator and Regional Administrator on vent determinations	265.1032(d)				

STANDARDS: CLOSED-VENT SYSTEMS AND CONTROL DEVICES

compliance with provisions of 265.1033 by owners or operators of closed-vent systems and control devices used to comply with provisions of Part 265	265.1033(a)(1)				
---	----------------	--	--	--	--

SUBPART BB - AIR EMISSION STANDARDS FOR EQUIPMENT LEAKS

APPLICABILITY

owners and operators of facilities that treat, store or dispose of hazardous wastes except as provided in 265.1	265.1050(a)				
except as provided in 265.1064(j), applicability of Subpart BB to equipment that contains or contacts hazardous wastes with organic concentrations of at least 10 percent by weight that are managed in units or facilities subject to Part 270 permitting requirements	265.1050(b)				
	265.1050(b)(1)				
	265.1050(b)(2)				
equipment subject to Subpart BB, Part 265 shall be marked	265.1050(c)				
equipment in vacuum service excluded from requirements of 265.1052 to 265.1060 requirements if identified as required in 265.1064(g)(5)	265.1050(d)				

DEFINITIONS

all terms have meaning given them in 264.1031, the Act, and Parts 260-266	265.1051

[FRL-3614-3]

Hazardous Waste Treatment, Storage, and Disposal Facilities—Organic Air Emission Standards for Process Vents and Equipment Leaks

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The EPA is today promulgating standards that limit organic air emissions as a class at hazardous waste treatment, storage, and disposal facilities (TSDF) requiring a permit under subtitle C of the Resource Conservation and Recovery Act (RCRA). Today's action is the first part of a multiphased regulatory effort to control air emissions at new and existing hazardous waste TSDF. The rule establishes final standards limiting organic emissions from (1) process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction, and air or steam stripping operations that manage hazardous wastes with 10 parts per million by weight (ppmw) or greater total organics concentration, and (2) leaks from equipment that contains or contacts hazardous waste streams with 10 percent by weight or greater total organics. These standards were proposed in the Federal Register on February 5, 1987 (52 FR 3748).

The final standards are promulgated under the authority of section 3004 of the Hazardous and Solid Waste Amendments (HSWA) to the RCRA. The EPA is required by section 3004(n) of RCRA to promulgate standards for the monitoring and control of air emissions from hazardous waste TSDF as necessary to protect human health and the environment. The EPA plans to promulgate additional standards under this section in two further phases. Phase II will consist of air standards for organic emissions from surface impoundments, tanks, containers, and miscellaneous units. These standards are scheduled for proposal later this year. In Phase III, the residual risk from the first two phases will be assessed and, if necessary, EPA will develop further regulations or guidance to protect human health and the environment from the effects of TSDF air emissions.

EFFECTIVE DATE: This final rule is effective on December 21, 1990. The

incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of September 5 and October 11, 1989.

ADDRESSES: The official record for this final rulemaking is contained in Docket No. F-90-AESF-FFFF. This docket and the proposal docket (Docket No. F-86-AESP-FFFF) are available for public inspection at the EPA RCRA Docket Office (OS-300) in room 2427M of the U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460. Additional information concerning the development of the equipment leak standards is contained in Docket No. A-79-27, which is available for public inspection at EPA's Central Docket Section, room 2903B, Waterside Mall, 401 M Street SW., Washington, DC 20460. For further information, see the discussion of supporting documentation for the rules under section X of this preamble.

Background information document: The background information document (BID) for the final standards may be obtained from the U.S. EPA Library (MD-35), Research Triangle Park, North Carolina 27711, telephone (919) 541-2777. Please refer to "Hazardous Waste Treatment, Storage, and Disposal Facilities (TSDF)—Background Information for Promulgated Organic Emission Standards for Process Vents and Equipment Leaks" (EPA-450/3-89-009). The EPA has prepared a technical guidance document to aid in implementation of these rules. This document may also be obtained from the U.S. EPA Library (see above address). Please refer to "Hazardous Waste TSDF—Technical Guidance Document for RCRA Air Emission Standards for Process Vents and Equipment Leaks" (EPA-450/3-89-21).

FOR FURTHER INFORMATION CONTACT: The RCRA Hotline, toll-free at (800) 424-9346. For further information on regulatory aspects of these standards, contact Rick Colyer, Standards Development Branch, Emission Standards Division (MD-13), U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711, telephone number (919) 541-5262. For further information on the technical aspects of these standards, contact Robert Lucas, Chemicals and Petroleum Branch, telephone number (919) 541-0884, at the same address. For further information on test methods associated with these standards, contact Terry Harrison, Emission Measurement Branch, telephone number (919) 541-5233, at the same address as above.

I. Authority

These regulations are promulgated under the authority of sections 1008, 2002, 3001-3007, 3010, 3014, and 7004 of the Solid Waste Disposal Act of 1970, as amended by RCRA, as amended (42 U.S.C. 6905, 6912, 6921-6927, 6930, 6934, and 6974).

II. Summary of Final Standards

The standards limit emissions of organics from certain process vents and equipment leaks at new and existing hazardous waste TSDF requiring a permit under RCRA subtitle C (i.e.,

permitted TSDF and TSDF that need authorization to operate under RCRA section 3005(e)). This applicability includes all hazardous waste management units that require RCRA permits and recycling units that are not subject to RCRA permit requirements, if, independent of today's final rules, a RCRA permit is needed for another part of the facility operations.

A. Vents on Hazardous Waste Management Process Units

Today's final standards are applicable to vents on waste management units that manage hazardous waste with an annual average total organics concentration of 10 ppmw or greater (hereafter referred to as "process vents") and specifically include (1) process vents on distillation, fractionation, thin-film evaporation, solvent extraction, and air or steam stripping operations and vents on condensers serving these operations; and (2) process vents on tanks (e.g., distillate receivers, bottoms receivers, surge control tanks, separator tanks, and hot wells) associated with distillation, fractionation, thin-film evaporation, solvent extraction, and air or steam stripping processes if emissions from these process operations are vented through the tanks. Up-to-date information and data used to determine whether or not a hazardous waste management unit and its associated process vent(s) are subject to the subpart AA standards must be maintained in the facility operating record (§ 264.1035(f) and § 265.1035(f)). For example, documentation of a waste analysis showing that the waste managed in the unit is less than the 10-ppmw applicability criterion must be kept in the facility operating record.

The final rules for process vents require that owners or operators of TSDF subject to the provisions of new subpart AA: (1) Reduce total organic emissions from all affected process vents at the facility to below 1.4 kg/h (3 lb/h) and 2.8 Mg/yr (3.1 ton/yr), or (2) install and operate a control device(s) that reduces total organic emissions from all affected process vents at the facility by 95 weight percent. The owner or operator of the facility must determine through test data or engineering judgment and calculations that the facility is not expected to exceed the emission rate limit of 1.4 kg/h and 2.8 Mg/yr. Facilities with organic emissions from affected vents that never exceed the emission rate limit will not be required to install controls or monitor process vent emissions under this rule. For all other affected facilities, the owner or operator must install controls

to reduce total facility process vent emissions from all affected vents below the emission rate limit or to reduce total facility process vent organic emissions after primary recovery by 95 percent; if enclosed combustion devices are used, the owner/operator has the option of reducing the organic concentration of each affected vent stream at the facility to no more than 20 parts per million by volume (ppmv). Selection of the emission rate limit is addressed further in section VI.B below and in chapters 4.0 and 7.0 of the BID.

The final standards for process vents do not require the use of any specific types of equipment or add-on control devices. Condensers, carbon adsorbers, incinerators, and flares are demonstrated emission control equipment for the regulated processes, although the choice of control is not limited to these.

To demonstrate compliance with the process vent provisions, TSDF owners/operators must document process vent emissions and emission reductions achieved by add-on control devices and certify the emission reduction capability of the control equipment. Documentation must (1) identify affected process vents, provide the throughput and operating hours of each affected unit, and provide emission rate determinations for each affected vent and for the overall facility (i.e., the total emissions for all affected vents at the facility); and (2) show whether installed add-on control devices achieve the emission rate limit by design and during operation. Where the emission rate limit is not attained, documentation must show whether the add-on control devices achieve a 95-percent reduction in organics or the 20-ppmv organics concentration limit by design and during operation. The documentation must include the basis for determining the design emission reduction.

The rules for process vents require that specific control device operating parameters be monitored continuously and the monitoring information be recorded in the facility operating record to ensure that the devices perform according to their design and are properly operated and maintained. For facilities with final RCRA permits, periods when monitoring indicates that control device operating parameters exceed established tolerances for design specifications must be reported semiannually. The records and reports must include dates, duration, cause, and corrective measures taken. There are no reporting requirements for interim status facilities. These monitoring and recordkeeping requirements are

discussed below in section V.B and in the BID in chapter 11.0, section 11.4.

B. Equipment Leaks on Hazardous Waste Management Process Units

The equipment leak standards apply to emissions from valves, pumps, compressors, pressure relief devices, sampling connection systems, and open-ended valves or lines. Under the final standards, controls for these sources are required at TSDF where the equipment contains or contacts hazardous waste streams with organic concentrations of 10 percent by weight or greater. The owner or operator of a facility may choose any of the applicable test methods identified in the final rules for determining the organic content.

To comply with the equipment leak standards, the facility owner/operator must identify all affected equipment (i.e., pumps, valves, compressors, etc., that contain or contact hazardous waste streams with at least 10-percent-by-weight organics), establish which of the affected equipment is in heavy liquid service, and determine which valves are unsafe or difficult to monitor. By the effective date of this regulation, the facility owner/operator must conduct the initial monthly monitoring survey of pumps and valves in gas/vapor or light liquid service. A number of portable volatile organic monitoring devices are capable of detecting equipment leaks. Any analyzer can be used, provided it meets the specifications and performance criteria set forth in EPA Reference Method 21 (contained in appendix A of 40 CFR part 60).

Affected compressors must have a dual mechanical seal system that includes a barrier fluid system or must be designated as having "no detectable emissions," which means an instrument reading of less than 500 ppm above background using EPA Reference Method 21. Sampling connections must have a closed-purge system. Open-ended valves or lines must have a cap, blind flange, plug, or second valve. Pressure relief devices must operate with "no detectable emissions."

Recordkeeping and monitoring are also required by the equipment leak provisions. For example, leaking equipment as determined by Method 21 must be tagged as specified in the rule, and records of repair attempts, delay of repair, etc., must be recorded in a log and included as part of the facility's operating record. Monitoring of control device operating parameters is also required if a closed-vent system and control device are installed as a result of the equipment leak standards. The standards and recordkeeping

requirements are discussed below at section V.C.

III. Background

A. Regulatory Authority

In 1984, Congress passed HSWA, amending RCRA. Section 3004(n) of RCRA, as amended by HSWA, directs EPA to " * * * promulgate such regulations for the monitoring and control of air emissions at hazardous waste treatment, storage, and disposal facilities, including but not limited to open tanks, surface impoundments, and landfills, as may be necessary to protect human health and the environment." The standards being promulgated today address, in part, this congressional directive and are applicable to all TSDF that require authorization to operate under section 3005 of RCRA. These regulations are being promulgated under the authority of sections 1006, 2002, 3001-3007, 3010, 3014, and 7004 of the Solid Waste Disposal Act of 1970, as amended by RCRA, as amended (42 U.S.C. 6905, 6912, 6921-6927, 6930, 6934, and 6974).

B. Regulatory Scope of Today's Standards

Today's final rules apply to facilities that treat, store, or dispose of hazardous wastes as defined in 40 CFR 261.3 and, specifically, to certain hazardous waste management units at facilities requiring RCRA subtitle C permits. This includes facilities with permits and those operating under interim status. Today's rules, codified in new subparts AA and BB of 40 CFR parts 264 and 265, are applicable to the following units at TSDF: (1) Hazardous waste management units subject to the permitting requirements of part 270 (i.e., not 90-day accumulation tanks at TSDF), and (2) hazardous waste recycling units located on hazardous waste management facilities otherwise subject to the permitting requirements of part 270. Under 40 CFR 260.10, the term "facility" means all contiguous land, and structures, other appurtenances, and improvements on the land, used for treating, storing, or disposing of hazardous waste. (Note: This definition differs from the definition of "facility" for purposes of corrective action under RCRA section 3004(u). See 50 FR 28712, July 15, 1985.)

C. Air Standards Under RCRA Section 3004(n)

Air emissions from hazardous wastes are generated or released from numerous sources at TSDF, including distillation and other organic separation units, surface impoundments, tanks,

containers, landfills, land treatment facilities, wastepiles, and leaks from equipment associated with these operations.

In considering the regulation of air emissions under RCRA section 3004(n) and within the RCRA regulatory framework, EPA has concluded that air emissions from hazardous waste management facilities that are subject to RCRA subtitle C should be regulated under the authority of RCRA section 3004(n). Air emissions from facilities or units that manage solid wastes that are not regulated as hazardous wastes pursuant to 40 CFR part 261 (e.g., cement kiln dust waste) and air emissions from hazardous waste from units or facilities that are exempt from the permitting provisions of 40 CFR 270.1(c)(2) (e.g., wastewater treatment units with National Pollutant Discharge Elimination System (NPDES) permits) will be subject to control techniques guidelines or standards developed as needed under either the Clean Air Act (CAA) or RCRA authority. Air emissions from wastes managed in units subject to subtitle D (nonhazardous solid wastes such as those managed in municipal landfills) also will be subject to guidelines or standards issued under CAA or RCRA authority as appropriate.

Air emissions from hazardous wastes include photochemically reactive and nonphotochemically reactive organics, some of which are toxic or carcinogenic, and also may include toxic or carcinogenic inorganic compounds. Depending on the source, particulates (including metals, aerosols of organics, dust, as well as toxics and carcinogens) also may be released or generated. These emissions, which are released to the atmosphere from a wide variety of sources within TSDF, present diverse health and environmental risks. Therefore, EPA has developed a multiphased approach for regulating TSDF organic air emissions. This approach, described generally below, reflects EPA's understanding of the problem and knowledge of applicable, effective controls at this time.

Organic emissions from TSDF managing hazardous wastes contribute to ambient ozone formation and increase cancer and other health risks. Phases I and II of EPA's TSDF regulatory approach will significantly reduce emissions of ozone precursors and air toxics and carcinogens from TSDF by controlling emissions of organics as a class rather than controlling emissions of individual waste constituents. The regulation of organics as a class has the advantage of being relatively straightforward because

it can be accomplished with a minimum number of standards, whereas the control of individual toxic constituents will require multiple standards.

Regulating organics as a class also makes efficient use of EPA resource, avoids many of the complexities of having multiple standards, and reduces the number of constituents for which separate standards may be required.

The health and environmental effects of ambient ozone are well documented: measured in terms of monetary losses, they total hundreds of millions of dollars each year. Other health impacts of TSDF organic emissions are summarized in section VII.D of this preamble and are discussed in more detail in the BID that accompanies this final rule and in the draft BID for Phase II organic standards titled, "Hazardous Waste TSDF—Background Information for Proposed RCRA Air Emission Standards," available in Docket F-90-CESP-FFFFF. The substantial reductions in organic emissions achievable through implementation of Phase I and Phase II controls will reduce atmospheric ozone formation as a result of reductions in TSDF emissions of ozone precursors and will reduce nationwide cancer incidence and maximum individual risk due to exposure to air toxics and carcinogens emitted from TSDF.

Specifically, Phase I (which is being promulgated as final rules today) entails the promulgation of standards for the control of organic air emissions from selected hazardous waste management processes and equipment leaks. As discussed in the February 1987 proposal, EPA chose to develop this portion of its TSDF rulemaking first to prevent uncontrolled air emissions from land disposal restriction (LDR) treatment technologies. The technologies used in lieu of land disposal include the distillation/ separation processes subject to the Phase I rules. Publication of today's final rules for air emissions from hazardous waste management unit process vents from distillation, fractionation, thin-film evaporation, solvent extraction, and air or steam stripping processes and from leaks in piping and associated equipment handling hazardous wastes marks the completion of this first phase.

In the second phase, EPA will propose (in 1990) additional standards under section 3004(n) to control organic air emissions from other significant TSDF air emission sources not covered or not adequately controlled by existing standards. These sources include surface impoundments, tanks (including vents on closed, vented tanks), containers, and miscellaneous units.

The analyses of impacts indicate that, at some facilities, residual cancer risk to the most exposed individuals after implementing the first two phases of regulation will remain outside the risk range for other regulations promulgated under RCRA (which historically has been in the range of 1×10^{-4} to 1×10^{-6}). The EPA is therefore planning a third phase of the effort to control TSDF emissions in which various means for further reducing risk will be examined. In the interim, as explained in section VI.E, the omnibus permitting authority of RCRA is an available option for requiring additional emission and risk reductions beyond that achieved by today's final rules if it is decided, on a case-by-case basis, that additional control is needed to protect human health and the environment.

The EPA is currently involved in an effort to improve the data used in the current risk analyses and, in the third phase, will make use of any new data obtained. If additional constituent control is found to be necessary, the number of constituents for which additional control is needed is expected to be significantly less than if a constituent approach were used as the only means of regulating TSDF air emissions. Therefore, the EPA is convinced that the control of organics as a class followed by controls for individual toxic constituents, as necessary, will ultimately result in comprehensive standards that are protective while providing effective interim control.

Should additional regulation under Phase III be necessary, EPA is considering a variety of approaches for reducing residual risk associated with emissions from wastes managed at TSDF, and additional approaches may be developed in the future. For example, EPA could require additional technology control for toxic waste management (e.g., technology that ensures lower rates of leakage from equipment, if such technology can be developed for use at TSDF) or limit the quantities of specific constituents that can be managed at a TSDF. The constituents to be evaluated in Phase III will include those reported as being present in hazardous wastes managed by existing TSDF for which health effects have been established through the development of unit risk factors for carcinogens and reference doses for noncarcinogens.

D. Other RCRA Air Standards

The EPA has promulgated several standards under RCRA that reduce air emissions from TSDF. For example, several existing provisions in 40 CFR part 264 (40 CFR 264.251(f), 264.301(i),

and 264.273(f)) require the implementation of general design and operating practices at permitted wastepiles, landfills, and land treatment operations to limit the release of particulate air emissions. The EPA has prepared a technical guidance document to aid in the implementation of these particulate rules; the document ("Hazardous Waste TSDF—Fugitive Particulate Matter Air Emissions Guidance Document," EPA-450/3-89-019) provides information on the sources of, and control technology for, particulate air emissions at TSDF. Additionally, 40 CFR part 264, subpart X, contains provisions that require prevention of air releases that may have adverse effects on human health or the environment at miscellaneous hazardous waste management units.

Air standards also have been promulgated for the control of air emissions from permitted hazardous waste incinerators (40 CFR part 264, subpart O). These standards require that incinerators be operated to achieve a destruction and removal efficiency (DRE) of at least 99.99 percent for those primary organic hazardous constituents listed in the facility permit. Higher efficiencies are required when the incinerator is burning certain specified waste types. These standards also limit air emissions of organics, hydrochloric acid, and particulates from incinerator stacks.

Air standards for interim status hazardous waste incinerators (40 CFR 265, subpart O) require monitoring of visible emissions and operating conditions. When burning specified wastes, these incinerators must receive a certification from the Assistant Administrator stating that the incinerator can meet the performance standards specified for permitted incinerators in 40 CFR 264, subpart O.

Interim status standards for other thermal treatment units are found in 40 CFR part 265, subpart P. These standards apply to facilities that thermally treat hazardous waste in devices other than enclosed devices using controlled flame combustion. The standards require monitoring of visible emissions and operating conditions of the combustion devices and prohibit open burning except for open burning and detonation of waste explosives.

The EPA has also proposed standards covering the burning of hazardous waste in boilers and industrial furnaces (52 FR 16987; May 6, 1987). These standards would require such burning to achieve a DRE of 99.99 percent for each principal organic hazardous constituent identified in the facility permit. In addition, a DRE

of 99.99 percent must be achieved when burning certain specified constituents. The proposed standards also have provisions for burning low-risk wastes that allow an owner or operator to demonstrate that the burning of hazardous waste will not result in significant adverse health effects. To qualify for the low-risk waste exemption, an owner or operator would have to use dispersion modeling to demonstrate that emissions of carcinogenic compounds would not result in off-site ground-level concentrations that pose a risk to the most exposed individual of greater than 1×10^{-5} . For noncarcinogenic compounds, the dispersion modeling would demonstrate that the resulting air concentrations would not exceed the reference air concentration (RAC) of individual hazardous compounds. The proposed standards would also limit emissions of carbon monoxide, metals, and hydrochloric acid from boilers and furnaces burning hazardous wastes.

E. Relationship of Air Standards to Other Subtitle C Rules

In addition to the air emission standards discussed above, EPA has ongoing programs that indirectly affect air emissions from hazardous waste. Today's rules are designed to complement other air standards under RCRA and the rules that might otherwise affect air emissions. Existing RCRA regulations that have the potential for affecting air emissions from hazardous waste TSDF include: (1) The LDR and (2) the corrective action program.

The LDR, developed under section 3004(m) of the HSWA, require that hazardous waste be treated to reduce concentrations of specific chemicals or hazardous properties to certain performance levels or by certain methods before the waste may be disposed of on land. Affected land disposal units include surface impoundments, wastepiles, landfills, and land treatment units. The EPA anticipates that LDR will substantially reduce the potential for air emissions from these land disposal sources. The first set of LDR, for certain dioxins and solvent-containing hazardous wastes, was promulgated on November 7, 1986 (51 FR 46572); the second set of restrictions, the "California list," was promulgated on July 8, 1987 (52 FR 25760); the "First Third" was promulgated on August 17, 1988 (53 FR 31133), and the "Second Third" on June 23, 1989 (54 FR 26597).

The treatment technologies evaluated under LDR for both wastewater and

nonwastewater spent solvents include distillation and other separation processes subject to the requirements of the Phase I rules. Today's standards are designed to protect human health and the environment by reducing air emissions from technologies expected to be used to treat wastes prior to land disposal.

Under the authority of RCRA section 3004(u), EPA is developing rules to address releases of hazardous waste or hazardous constituents from solid waste management units (SWMU) that pose a threat to human health and the environment. Because this authority applies to contamination of soil, water, and air media, organic air emissions from SWMU at some TSDF would be addressed by the corrective action program EPA intends to propose under a separate rulemaking. The draft rules would establish health-based trigger levels measured at the TSDF boundary for determining whether further remedial studies are required to assess air emissions from a particular SWMU. Health-based cleanup standards would then be set for air emission levels that exceed acceptable health-based levels at the point at which actual exposure occurs. When such exposure is determined either through monitoring or modeling techniques, corrective action will be required to reduce such emissions at the point of compliance.

The corrective action program is designed to achieve site-specific solutions based on an examination of a particular TSDF and its environmental setting. It is not intended to set national standards that regulate organic air emissions from all TSDF. At sites where there are releases from SWMU to the atmosphere, organic emissions will be controlled based on site-specific exposure concerns. Furthermore, releases from the SWMU that contain hazardous solid wastes will also be subject to corrective action. Therefore, for air emissions, corrective action is in part designed to expeditiously address threats to human health and the environment that are identified prior to implementation of more comprehensive air emission standards. In addition, because corrective action can address a wider universe of SWMU, it will address, in some respects, exposure concerns that today's final standards do not address.

F. Relationship of Today's Final Standards to CERCLA

The CERCLA, as amended by the Superfund Amendments and Reauthorization Act (SARA), 42 U.S.C. 9601 et seq., authorizes EPA to undertake removal and remedial actions

to clean up releases of hazardous substances, pollutants, or contaminants. Removal actions typically are immediate or expedited activities necessary to minimize exposure or danger to human health and the environment from the release of a hazardous substance, pollutant, or contaminant. Remedial actions are longer term, planned activities performed at sites listed on the National Priorities List to permanently clean up hazardous substances, pollutants, or contaminants and any soils, surface waters, or ground waters contaminated by these materials. On-site remedial actions are required by CERCLA section 121(d)(2) to comply with the requirements of Federal and more stringent State public health and environmental laws that have been identified by EPA or the delegated State authority as applicable or relevant and appropriate requirements (ARAR) to the specific CERCLA site. In addition, the National Contingency Plan (NCP) provides that on-site CERCLA removal actions "should comply with Federal ARAR to the extent practicable considering the exigencies of the circumstances" (40 CFR 300.65(f)). Today's final standards may be considered ARAR for certain on-site remedial and removal actions.

A requirement under a Federal or State environmental law may either be "applicable" or "relevant and appropriate," but not both, to a remedial or removal action conducted at a CERCLA site. "Applicable requirements," as defined in the proposed revisions to the NCP, means those cleanup standards, standards of control, and other substantive environmental protection requirements, criteria, or limitations promulgated under Federal or State law that specifically address a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance found at a CERCLA site (40 CFR 300.5 (proposed), 53 FR 51475 (December 21, 1988)). "Relevant and appropriate requirements" means those Federal or State requirements that, while not applicable, address problems or situations sufficiently similar to those encountered at the CERCLA site that their use is well suited to the particular site (53 FR 51478).

Some waste management activities used for remedial and removal actions to clean up hazardous organic substances use the distillation/separation operations regulated under subpart AA of today's rules. For example, hazardous organic liquid wastes and ground and surface waters

contaminated with hazardous wastes may be treated on site using air stripping processes. Therefore, the organic emission control requirements of today's subpart AA rules may be "applicable" for on-site remedial and removal action activities that use distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations that treat substances that are identified or listed under RCRA as hazardous wastes and have a total organic concentration of 10 ppmw or greater. In addition, off-site storage, treatment, and disposal of all wastes classified under RCRA as hazardous waste must be performed at a TSDF permitted under RCRA subtitle C. Thus, CERCLA wastes that are defined as hazardous under RCRA, contain more than 10 ppmw of total organics, and are shipped off site for management in distillation, fractionation, thin-film evaporation, solvent extraction, and air or steam stripping operations, would be subject to today's final standards like any similar RCRA hazardous waste. The new subpart AA control requirements for process vents may also be "relevant and appropriate" to on-site CERCLA removal and remedial actions that use distillation, fractionation, thin-film evaporation, solvent extraction, and air or steam stripping operations to manage substances that contain organics that are not covered by this rule (e.g., organics less than 10 ppmw or organics from nonhazardous wastes).

Today's final rules do not include control requirements for process vents on operations not associated with organics distillation/separation but typically associated with CERCLA remedial or removal actions such as soil excavation, in situ soil vapor extraction, in situ steam stripping of soil, soil washing, stabilization, bioremediation (in situ or otherwise), dechlorination, and low temperature thermal desorption. Therefore, the final rule for process vents would not be "applicable" to remedial or removal actions involving these processes at CERCLA sites. Also, the final process vent standards may not be considered "relevant and appropriate" for these same activities at CERCLA sites. Waste management operations involving soil excavation, in situ soil vapor extraction, in situ steam stripping of soil, soil washing, bioremediation, dechlorination, and low temperature thermal desorption can be considerably different from the waste management operations (i.e., distillation/separation processes) regulated in subpart AA. Control technologies for reducing organic emissions from these types of processes

were not evaluated as part of today's rulemaking. However, the air emission potential of remedial and removal actions requiring excavation, land treatment, land farming, in situ treatment activities, and other treatment activities involving landfills and wastepiles should be determined, and, if necessary, the proper emission controls should be applied to these activities.

The organic emission control requirements of subpart BB for TSDF equipment leaks may also be considered as an ARAR for the equipment components (e.g., pumps and valves) installed at CERCLA cleanup sites that contain or contact substances containing 10 percent by weight or more total organics.

Although today's final standards would not be ARAR for all types of remedial and removal actions that are potential sources of organic air emissions, other existing RCRA or CAA regulations may qualify as ARAR for many of these activities. For example, subpart O of 40 CFR part 264 establishes standards of performance limiting organic emissions from thermal destruction processes (i.e., hazardous waste incinerators).

IV. Applicability and Requirements of Proposed Process Vent and Equipment Leak Standards

On February 5, 1987 (52 FR 3748), EPA proposed standards under RCRA section 3004(n) for the control of organic air emissions from certain equipment and process vents at hazardous waste TSDF. The proposed standards would have applied to equipment and process vents "in volatile hazardous air pollutant (VHAP) service" (i.e., containing or contacting liquids, gases, or other derivatives of hazardous waste in concentrations greater than 10 percent total organics) located at TSDF required to have a RCRA permit. The decision as to whether equipment or process vents would be covered by the rule (i.e., would ever contain or contact wastes greater than 10 percent total organics) could be based either on testing the waste and derivatives according to specified test procedures or on engineering judgment as to these materials, total organic content.

The proposed standards would have required a 95-percent reduction in organic emissions from vents in VHAP service on product accumulator vessels and on other process vent sources (e.g., vents on closed accumulator tanks on other processes). The preamble for the proposed standard, at 52 FR 3753, described "product accumulator vessels" as types of equipment that generate process emissions and include

distillate receivers, surge control vessels, product separators, or hot-wells that are vented to the atmosphere either directly or through a vacuum-producing system. Product accumulator vessels included units used to distill and steam or air strip volatile components from hazardous waste; examples include distillation columns, steam stripping columns, air stripping units, and thin-film evaporation units at TSDF.

The proposed standards would have regulated actual reclamation processes for the first time. Only recycling units at TSDF already subject to RCRA permit requirements (e.g., because of storage activity on the facility) would have been subject to the proposed air standards. Both new and existing units would have been required to have add-on control devices designed to achieve a 95-percent reduction (based on the application of secondary condensers) and to operate within that design. Once in operation, the facilities would have demonstrated compliance by monitoring the operation of the control device.

The proposed standards also would have required implementation of a monthly leak detection and repair (LDAR) program for valves, pumps, compressors, pressure relief devices, and closed-vent systems used to handle hazardous wastes and their derivatives at TSDF. Control systems, leak definition methodology, leak definitions, and repair schedules were based on existing equipment leak standards developed under sections 111 and 112 of the CAA.

Since proposal, EPA has made several important changes to the standards based on the public comments received after proposal and analyses resulting from these comments. The applicability and requirements of the final standards, including the changes made since proposal, are discussed in section V. The EPA's responses to the major comments are summarized in section VI. Additional information is presented in the BID for the final standards.

V. Applicability and Requirements of Today's Final Standards

This section provides a detailed summary of the final standards as they apply to the affected TSDF community and to process vents and equipment subject to today's rule. Also summarized is the relationship of the final standards to existing exemptions under the RCRA regulatory program.

A. Scope of Final Standards

Today's final standards limit organic air emissions as a class at TSDF that are subject to regulation under subtitle C of RCRA. This action is the first part of a

multiphased regulatory effort to control air emissions at new and existing hazardous waste TSDF. These rules establish final standards limiting organic emissions from (1) process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction, and air or steam stripping operations that manage hazardous wastes with 10 ppmw or greater total organics concentration on an annual average basis, and (2) leaks from equipment that contain or contact hazardous waste streams with 10 percent by weight or greater total organics.

The final standards do not expand the RCRA-permitted community for the purposes of air emissions control. As promulgated, the final standards control organic emissions only from process vents and equipment leaks at hazardous waste TSDF that are subject to permitting requirements under RCRA section 3005 and are applicable only to specific hazardous waste management units. The rules apply to hazardous waste management units that are subject to the permitting requirements of part 270 and to hazardous waste recycling units that are located at facilities otherwise subject to the permitting requirements of part 270. Exempt units, other than recycling units (e.g., 90-day accumulation tanks and wastewater treatment units as specified in § 270.1(c)(2)), are not subject to the rules even when they are part of a permitted facility. Permitting aspects are further discussed in section IX.

The term "organics" is used in the final standards instead of "volatile organics" to avoid confusion with "volatile organic compounds" (VOC) that are regulated as a class under the CAA. To be subject to the standards, a TSDF: (1) Must have equipment that contains or contacts hazardous wastes that are 10 percent or more by weight total organics, or (2) must have distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations that treat or process hazardous wastes with total organics concentrations of 10 ppmw or greater on a time-weighted annual average basis.

The final regulations require the facility owners or operators to determine whether their equipment is subject to the equipment leak rules, subpart BB of parts 264 and 265. The owner or operator of a facility may rely on engineering judgment for this determination, or, if the waste's organic content is questionable, the owner or operator may choose any of the test methods identified in the final rule for

determining whether a piece of equipment contains or contacts hazardous wastes that are 10 percent or more total organics by weight. As proposed, these methods include: ASTM Methods D-2267-88, E 169-87, E 168-88, and E 260-85 and Methods 9060 and 8240 of SW-846. The owner or operator also may use any other test method for determining total organic content that is demonstrated to be equivalent to the test methods identified in the rule using the petition process described in 40 CFR 260.21. The test method selected should be the one best suited for the characteristics of the waste stream. Regardless of the method chosen, the final standard requires the facility owner or operator to determine that the organic content is never expected to exceed 10 percent. The determination of organic content of the waste must at all times be appropriate to the wastes currently being managed in the relevant units. If any action is taken that would result in the determination no longer being appropriate to the facility's or a particular unit's operations (e.g., an upstream process change that results in a change in a waste's organic content), then a new determination is required.

To determine whether a particular hazardous waste management unit of the type specified in the rule (e.g., a steam stripping or air stripping unit) is subject to the provisions of subpart AA of parts 264 and 265, the owner/operator is required to determine the total organic concentration of the waste managed in the unit initially (by the effective date of the standards or when the waste is first managed in the waste management unit) and thereafter on a periodic basis (for continuously generated wastes). A waste determination for subpart AA applicability would not be necessary when an owner/operator manages the waste in a distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping unit that is controlled for organic emissions and meets the substantive requirements of subpart AA.

Determination that the time-weighted, annual average total organic concentration of the waste managed in the unit is less than 10 ppmw must be performed by direct measurement or by knowledge of the waste as described later in this section. Direct measurement of the waste's total organic concentration must be performed by collecting individual grab samples of the waste and analyzing the samples using one of the approved reference methods identified in the rule.

The EPA is requiring that analytical results for a minimum of four samples be used to determine the total organic concentration for each waste stream managed in the unit. In setting the minimum number of samples at four, EPA will obtain sufficient data to characterize the total organic concentration of a waste without imposing an unnecessary burden on the owner/operator to collect and analyze the samples.

Waste determinations must be performed under process conditions expected to result in the maximum waste organic concentration. For waste generated on site, the samples must be collected at a point before the waste is exposed to the atmosphere such as in an enclosed pipe or other closed system that is used to transfer the waste after generation to the first affected distillation/separation operation. For waste generated off site, the samples must be collected at the inlet to the first waste management unit that receives the waste, provided the waste has been transferred to the facility in a closed system such as a tank truck, and the waste is not diluted or mixed with other waste.

The location where the waste's total organic content is determined is important because sampling location can greatly affect the results of the determination. This effect occurs because the concentration level can decrease significantly after generation as the waste is transferred to (and managed in) various waste management units.

If the waste is directly or indirectly exposed to ambient air at any point, a portion of the organics in the waste will be emitted to the atmosphere, and the concentration of organics remaining in the waste will decrease. For example, for highly volatile organic compounds such as butadiene, all of the compound would evaporate within a few seconds of exposure to air. To ensure that the determination of total organic concentration is an accurate representation of the emission potential of a waste upon generation, it is essential that the waste determination be performed at a point as near as possible to where the waste is generated, before any exposure to the atmosphere can occur.

For the reasons stated above, the waste determination must be based on the waste composition before the waste is exposed, either directly or indirectly, to the ambient air. Direct exposure of the waste to the ambient air means the waste surface interfaces with the ambient air. Indirect exposure of the

waste to the ambient air means the waste surface interfaces with a gas stream that subsequently is emitted to the ambient air. If the waste determination is performed using direct measurement, the standards would require that waste samples be collected from an enclosed pipe or other closed system that is used to transfer the waste after generation to the first hazardous waste management unit. If the waste determination is performed using knowledge of the waste, the standards would require that the owner or operator have documentation attesting to the organic concentration of the waste before any exposure to the ambient air.

The location where the waste determination would be made for any one facility will depend on several factors. One factor is whether the waste is generated and managed at the same site or generated at one site and transferred to a commercial TSDF for management. Another important factor is the mechanism used to transfer the waste from the location where the waste is generated to the location of the first waste management unit (e.g., pipeline, sewer, tank truck). For example, if a waste is first accumulated in a tank using a direct, enclosed pipeline to transfer the waste from its generation process, then the waste determination could be made based on waste samples collected at the inlet to the tank. In contrast, if the waste is first accumulated in a tank using an open sewer system to transfer the waste from its generation process then the waste determination would need to be made based on waste samples collected at the point where the waste enters the sewer before the waste is exposed to the ambient air. Where the waste is generated off site, the owner or operator may make the determination based on samples collected at the inlet to the first waste management unit at the TSDF that receives the waste, provided the waste has been transferred to the TSDF in a closed system such as a tank truck and the waste is not diluted or mixed with other waste. If a waste determination indicates that the total organic concentration is equal to or greater than the applicability criterion, then the owner or operator would be required to comply with the standards.

As an alternative to using direct measurement, an owner/operator is allowed to use knowledge of the waste as a means of determining that the total organic concentration of the waste is less than 10 ppmw. Examples of information that might be considered by EPA to constitute sufficient knowledge

include: (1) Documentation that organics are not involved in the process generating the waste, (2) documentation that the waste is generated by a process that is identical to a process at the same or another facility that has previously been determined by direct measurement to generate a waste stream having a total organic content less than 10 ppmw, or (3) previous speciation analysis results from which the total concentration of organics in the waste can be computed and it can be documented that no process changes have occurred since the analysis that could affect the waste's total organic concentration. The final standards include the provision that EPA can require that the waste be analyzed using Method 8240 if EPA believes that the documentation is insufficient to determine an exception by knowledge of the waste (§§ 264.1034(f) and 265.1034(f)).

To address the temporal variability that can occur both within a particular waste stream and within the various waste streams managed in a hazardous waste management unit, the final rules require a time-weighted, annual average concentration to characterize the waste managed in the unit. The final rules require that an owner/operator repeat the waste determination whenever there is a change in the waste being managed or a change in the process that generates or treats the waste that may affect the regulatory status of the waste or, if the waste and process remain constant, at least annually. For example, continuous processes are more likely to generate a more homogeneous waste than batch operations; batch operations involve processes that may frequently involve change in materials or process conditions. Batch operations, therefore, usually generate wastes with varying characteristics, including such characteristics as organics content. Ground water concentrations would also be expected to show significant variation if more than one well provides influent to a waste management unit such as an air stripper and the wells that feed the unit are varied over time or if the proportions from the wells that make up the influent are changed. This is because there is typically considerable spatial variability in contaminated ground water concentrations. The situation where feed wells are changed and the change is not accounted for in the initial waste determination would be considered a process change or change in the waste being managed that would require a new determination.

With the time-weighted, annual average applicability criterion, a

hazardous waste management unit would not be subject to this rule if it occasionally treats wastes that exceed 10 ppmw if at other times the wastes being treated in the unit are such that the weighted annual average total organic concentration of all wastes treated is less than 10 ppmw. The time-weighted, annual average is calculated using the annual quantity of each waste stream managed in the unit and the mean organic concentration of each waste stream.

Determining the applicability of the standards to affected processes, units, and facilities is of paramount importance to the TSDF owner or operator in complying with the final standards. A mistake even an inadvertent one, will not excuse a facility owner or operator from the obligation to comply with either the requirements of the standards or with potential enforcement actions. Accurate determinations of what equipment and vents must be controlled are crucial to ensuring that all equipment and vents subject to this rule are in fact controlled. When the facility owner/operator and the Regional Administrator disagree on the determination of emissions or emission reduction achieved, then a performance test conducted as specified in the rules must be used to resolve the disagreement. In situations where the owner/operator and Regional Administrator disagree on whether a unit manages a waste with 10 ppmw or greater organics content or a piece of equipment contains or contacts a waste with 10 percent or more organics content, then procedures that conform to the test methods referenced in the rules may be used to resolve the disagreement.

Consistent with section 3010 of RCRA, the final standards for process vent and equipment leak control and monitoring become effective 6 months from today. Owners and operators must come into compliance with these requirements by the effective date; however, where compliance involves the installation of a control device, EPA is requiring that installation be completed as soon as possible but no later than 24 months from the date the regulatory action affecting the unit is published or promulgated. To obtain the extended time for compliance (18 months beyond the effective date), a facility must show that installation cannot reasonably be expected to be completed earlier. In these circumstances, an owner/operator must develop an implementation schedule that indicates when the installation will be completed and shows that additional time is necessary.

The implementation schedule must be included in the operating record by the effective date of the rules. Changes in the implementation schedule are allowed within the 24-month time frame if the owner/operator documents that the change cannot reasonably be avoided.

B. Standards for Process Vents

Affected Equipment

A "process vent" is a pipe, stack, or other opening through which emissions from a hazardous waste management unit are released to the atmosphere either directly, through a vacuum-producing system, or indirectly, through another tank. The process vents that would have been covered by the proposed standard included vents associated with any hazardous waste management process or waste management unit.

Review of the hazardous waste TSDF industry has shown that process vents are most typically associated with processes related to distillation or other separation operations. These technologies were also the type being evaluated under the LDR for spent solvents. Therefore EPA concentrated its analysis of process vents on those hazardous waste management units that are involved in solvent or other organic chemical separation or reclamation by distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations. This should include the largest segment of process vents at TSDF and address those sources with the greatest emission potential. Vents on other types of waste management units (e.g. vents on storage tanks) are being addressed in the Phase II rulemaking.

Two basic changes have been made since proposal that clarify the applicability of the final vent standard. First, to avoid confusion with tanks not associated with the processing of waste streams, the term "product accumulator vessel" has been deleted from the final standard and affected equipment is more specifically defined. The applicability of the final standard for process vents also has been clarified since proposal to exclude air emissions from vents on other closed (covered) and vented tanks not associated with the specified distillation/separation processes to avoid regulatory duplication of the Phase II standards as discussed above.

Thus, the final vent standards apply to: (1) Vents on distillation fractionation, thin-film evaporation, solvent extraction, and air or steam stripping

processes and vents on condensers serving these processes; and (2) vents on tanks (e.g., distillate receivers, bottoms receivers, surge control tanks, separator tanks, and hot wells associated with distillation, fractionation, thin-film evaporation, solvent extraction, and air or steam stripping processes) if emissions from these processes are vented through the tank. For example, *uncondensed overhead* emitted from a distillate receiver (which fits the definition of a tank) serving a hazardous waste distillation process unit is subject to these Phase I air controls. On the other hand, emissions from vents on tanks or containers that do not derive from a process unit specified above are not covered by these rules. For example, if the condensed (recovered) solvent is pumped to an intermediate holding tank following the distillate receiver mentioned in the above example, and the intermediate storage tank has a pressure-relief vent (e.g., a conservation vent) serving the tank, this vent will not be subject to the process vent standards. Emissions from vents that are not covered under today's rules will be addressed by Phase II of the air standards under section 3004(n).

Second, the terms "VHAP" and "in VHAP service" have been deleted from the final rule in response to public comments. Commenters found the terms inappropriate for transfer from equipment leak standards developed under section 111 or 112 of the CAA to RCRA standards for organic emissions from hazardous waste. The EPA agrees with these commenters; these terms can be confusing and they are unnecessary for these rules. Therefore, the cross-reference to part 81 has been eliminated and the wording of the final regulation has been revised to reflect applicability based on clearly specified hazardous waste management processes or unit operations that manage wastes with a 10 ppmw or greater total organic content.

Requirements of Final Standard for Process Vents

In response to public comments, several changes have been made to the proposed standard for process vents. While the proposed 95-percent emission reduction standard would have applied to individual process vents emitting organics with concentrations of 10 percent or greater by weight, the final process vent 95-percent emission reduction standard applies to total organic emissions from the combination of all affected vents (i.e., vents subject to the provisions of subpart AA) at the facility. As discussed in section VI of this preamble and in the BID for the

final rules, the term "facility" refers to the entire site that is under control of the owner or operator engaged in hazardous waste management. Thus, organic emissions from affected process vents anywhere on the hazardous waste management facility are subject to the standards.

The 10-percent concentration criterion for process vents has not been included in the final rules because the promulgated standards contain a facility-based emission rate limit of 1.4 kg/h (3 lb/h) and 2.8 Mg/yr (3.1 ton/yr) that is more effective in controlling emissions from affected sources and excluding facilities with little emission reduction potential. Based on emissions and health risk analyses conducted in response to comments, this emission rate limit represents an emission level from process vents that is protective of human health and the environment and below which additional meaningful reductions in nationwide health risk and environmental impacts attributable to process vents cannot be achieved. Control of facilities with process vent emissions less than the emission rate limit would not result in further reductions of either cancer risk or incidence on a nationwide basis. Facilities with organic emissions from process vents that do not exceed these emission rates will not have to install controls or monitor emissions from affected process vents. Selection of the emission rate limit is addressed in section VI.B of this preamble and in chapters 4.0 and 7.0 of the BID.

Because the emission rate limits (3 lb/h and 3.1 ton/yr) provide health-based limits, EPA considered dropping completely the organic content criterion (i.e., at least 10 percent total organics). However, EPA decided not to completely eliminate the organic content criterion because it is not clear that the same controls can be applied to very low concentration streams as can be applied to the higher concentration streams that generally are associated with emission rates greater than the limits. For low-concentration streams, EPA questions whether controls are needed on a national or generic basis but is unable to resolve this question at this time. Thus, EPA decided to defer controlling very low concentration streams until it is better able to characterize and assess these streams and the appropriate controls.

Once EPA decided to consider facilities that manage very low concentration organic wastes as a separate category, there remained the problem of determining the appropriate criterion. The EPA examined existing

data on air strippers, the treatment device most commonly used with low-concentration streams; it appeared that the quantity of emissions and the risk associated with air strippers treating streams with concentrations below 10 ppmw may be relatively small, thus minimizing the potential harm of deferring control until a later time. Examples of facilities managing low-concentration wastes are sites where ground water is undergoing remedial action under CERCLA or corrective action pursuant to RCRA. Given the limited set of precise data available, and the comments that the 10-percent criterion was too high, EPA determined that an appropriate criterion would be 10 parts per million (ppm) total organics in the waste by weight.

The 10-ppmw criterion is not an exemption from regulation; it is intended only as a way for EPA to divide the air regulations into phases. The EPA is deferring action on very low concentration streams (i.e., ones with less than 10 ppmw total organic content) from the final rule today but will evaluate and announce a decision later on whether to regulate these waste streams.

To comply with the final standards for process vents, the TSDf owner or operator is required to identify all process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction, and stripping processes that are treating hazardous waste with a 10-ppmw or greater total organics concentration on a time-weighted annual average basis (i.e., vents affected by the rules). Organic emission rates for each affected vent and for the entire facility from all affected vents must be determined. The facility process vent emission rate must then be compared to the short- and long-term process vent emission rate limits (3 lb/h or 3.1 ton/yr) to determine whether additional emission controls are required. If the process vent emission rate limit is exceeded, the owner or operator must take appropriate action to reduce total facility emissions from affected process vents to below the cutoff level or install additional emission controls to reduce total facility process vent organic emissions by 95 weight percent. If an incinerator, process heater, or boiler is used as a control device, the volume concentration standard of 20 ppmv can be met instead of the 95-weight-percent reduction (§§ 264.1033(c), 264.1060, 265.1033(c), and 265.1060).

Because the final rules could apply to dilute process vent streams and the rule is formatted in terms of a weight-percent

reduction standard, it is necessary to include the volume concentration standard in the final control device standards to account for the technological limitations of enclosed combustion devices (48 FR 48933, October 21, 1983), one of the control technologies examined as part of the rulemaking, treating dilute streams. Below a critical concentration level, the maximum achievable efficiency for enclosed combustion devices decreases as inlet concentration decreases; thus, for streams with low organic vapor concentrations, the 95-percent mass reduction may not be technologically achievable in all cases. Available data show that 20 ppmv is the lowest outlet concentration of total organic compounds achievable with control device inlet streams below approximately 2,000 ppmv total organics. Therefore, a concentration limit of 20 ppmv has been added as an alternative standard for incinerators, process heaters, and boilers to allow for the drop in achievable destruction efficiency with decreasing inlet organics concentration. For consistency, the 20-ppmv concentration is expressed as the sum of the actual individual compounds, not carbon equivalents, on a dry basis corrected to 3 percent oxygen. For facilities that do not meet the emission rate limit, the final process vent standards require that control devices achieve a 95-percent reduction in total organic emissions for the facility or, in the case of enclosed combustion devices, a reduction of each process vent stream to a concentration of no more than each process vent stream to a concentration of no more than 20 ppmv total organic compounds.

The final standards for process vents do not require the use of any specific equipment or add-on control device; the standards can be met using several types of controls. Depending on the characteristics of the process vent stream, either a condenser or a carbon adsorber will likely be the control technology of choice. However, other control devices such as flares, incinerators, process heaters, and boilers, as well as any other device of the owner or operator's choice, also can be used where applicable to achieve compliance.

Operating requirements for closed-vent systems and control devices are included in §§ 264.1033 and 265.1033. A closed-vent system means a system not open to the atmosphere and composed of piping, connections, and, if necessary, flow-inducing devices that transport gas or vapor from a piece or pieces of equipment to a control device. If vapor

recovery systems such as condensers and adsorbers are used as control devices, they must be designed and operated to recover the organic vapors vented to them with an efficiency of 95 percent or more unless the total organic emission limits for affected process vents (§§ 264.1032 and 265.1032) can be attained at efficiencies less than 95 percent. Vapor recovery systems whose primary function is the recovery of organics for commercial or industrial use or reuse (e.g., a primary condenser on a waste solvent distillation unit) are not considered a control device and should not be included in the 95-percent emission reduction determination.

If enclosed combustion devices such as incinerators, boilers, or process heaters are used, they must be designed and operated to achieve a total organic compound emission reduction efficiency of 95 percent or more or must provide a minimum residence time of 0.5 s at a minimum temperature of 730 °C. The latter are general design criteria established by EPA, and used in numerous rulemakings, that can be used by facilities in lieu of conducting a site-specific design for enclosed combustion devices. The operating requirements for closed-vent systems and control devices include a provision allowing enclosed combustion devices to reduce organic emissions to a total organic compound concentration of 20 ppmv, by compound, rather than achieve the 95-weight percent reduction.

If flares are used, they must be designed and operated with no visible emissions as determined by the procedures of Reference Method 22, except for periods not to exceed a total of 5 min during any 2 consecutive hours. The final standard specifies that flares must be operated with a flame present at all times and must be operated at all times when emissions may be vented to them. In addition, flares must provide a net heating value of the gas being combusted of 11.2 megajoules per standard cubic meter (MJ/scm) or more, be steam-assisted or air-assisted, or provide a net heating value of 7.45 MJ/scm or more if the flare is nonassisted. Specific design and operating requirements for steam-assisted, air-assisted and nonassisted flares also are included in the final standard. Calculations and procedures for determining the net heating value of the gas being combusted the actual exit velocity and the maximum allowed velocity are included in the final provisions for closed-vent systems and control devices (see §§ 264.1033(d) and 265.1033(d)).

Facilities must maintain documentation in the operating record supporting waste determinations, identifying affected process vents, affected waste management unit throughputs and operating hours, emission rates for each affected vent and for the overall facility, and the basis for determining the emission rates (§§ 264.1035(b)(2) and 265.1035(b)(2)). Regardless of the type of control device used, the documentation must certify that add-on control devices achieve the emission rate limit by design and during operation, or that add-on control devices achieve a 95-percent reduction in organics or achieve the 20-ppmv organics concentration limit by design and during operation where the emission rate limit is not attained. The design documentation must present the basis for determining the design emission reduction and establish the basic values for operating parameters used to monitor the control device's operation and maintenance. The design control level (i.e., the emission reduction needed to achieve the emission rate cutoff or 95-percent emission reduction) can be documented by vendor/manufacturer certifications, by engineering calculations, or through source tests to show that the control device removes the required percentage of organics entering the device. All required information and documentation must be kept in the facility's operating record. The facility's waste determinations and process vent emission rate determinations must at all times reflect the facility's current waste management unit designs and wastes managed. If the owner/operator takes any action that would result in the determination no longer being appropriate to the facility's operations (e.g., if a waste of different composition is managed, the operating hours of the affected management units are increased beyond what was originally considered, or a new affected unit is added that may impact its regulatory status), then a new determination is required (§§ 264.1035(b)(2)(ii) and 265.1035(b)(2)(ii)). In addition, certain information regarding the facility's emission determination and control device design must be included in the facility's part B permit application.

The final rules require the continuous monitoring of specific parameters on all control devices needed to meet the standards to ensure that the devices perform according to their design (§§ 264.1033(f) and 265.1033(f)). The final rules clarify the general parameters listed in the proposal by describing the requirements in greater detail. Operating

parameters are specified for condensers, carbon adsorbers, flares, incinerators, and other enclosed combustion devices. Although minimum operating conditions are identified for organic vapor destruction devices (e.g., incinerators and flares) to ensure 95-percent destruction, values or ranges of values for recovery device (i.e., condensers and carbon adsorbers) operating parameters cannot be specified on an industry-wide basis. Therefore, a recovery device must be designed for the particular application and monitored to ensure that it is being operated within design specifications. Proper design shall be determined through engineering calculations vendor certification, and/or emission testing.

The owner/operator is required to record the control device monitoring information, including the basis for the operating parameters used to monitor control device performance, in the facility operating record. Periods when monitoring indicates control device operating parameters are outside established tolerances on design specifications must be recorded. Facilities with final permits incorporating these standards (i.e., facilities subject to the provisions of 40 CFR part 264 subpart AA) must report exceedances that are not corrected within 24 hours to the Regional Administrator on a semiannual basis. The records and reports must include the dates, duration, cause, and corrective measures taken. (See §§ 264.1036(a) and 264.1065(a)(4).)

The specific monitoring requirements for control device operating parameters include: (1) Continuous monitoring of coolant fluid temperature and exhaust gas temperatures or the concentration level of organic compounds in the exit gas stream for condensers; (2) continuous monitoring of exhaust gas organic breakthrough for carbon adsorbers; (3) continuous monitoring of combustion zone temperature for incinerators, boilers and process heaters; and (4) the presence of a pilot flame using a thermocouple or any other equivalent device to detect the presence of a flame for flares.

The final standards would require that emission control equipment is properly designed, installed, operated, and maintained. Also, as previously described, the standards would require continuous monitoring of specific control device operating parameters. A control device monitor reading outside the operating range allowed by the standards (referred to in this preamble as a "control device exceedance") indicates that the control device is not

operating normally or is malfunctioning (i.e., not operating at the design setting necessary to achieve at least 95 percent organic emission control efficiency). Action must be taken by the owner or operator to return the control device to operating at the design setting. When a control device exceedance cannot be corrected within 24 hours of detection, the final standards would require the owner or operator to record specific information concerning the control device exceedance. Facilities with final RCRA permits must report this information to EPA on a semiannual basis; interim status facilities are not required to report control device exceedances. The exceedance report would need to describe the nature and period of each control device exceedance and to explain why the control device could not be returned to normal operation within 24 hours. A report would need to be submitted to EPA only if control device exceedances have occurred during the past 6-month reporting period. These reports would serve to aid EPA in determining the owner's or operator's ability to properly operate and maintain the control device. The EPA recognizes that a control device malfunction may occur due to circumstances beyond the control of the owner or operator (e.g., defective equipment supplied by the manufacturer). Therefore, a single control device exceedance may not necessarily be indicative of improper control device operation or maintenance.

C. Equipment Leak Standards

Affected Equipment

The final standards apply to each valve, pump, compressor, pressure relief device, open-ended valve or line, flange or other connector, and associated air emission control device or system that contains or contacts hazardous waste streams with 10 percent or more total organics by weight.

In response to public comments, EPA has changed the applicability of the final LDAR standards for pumps and valves to better relate to the volatility of the wastes managed and thus to air emission potential. The requirements for pumps and valves have been revised to include the heavy liquid provisions contained in EPA's new source performance standard (NSPS) for equipment leaks of VOC in the synthetic organic chemicals manufacturing industry (SOCMI) (40 CFR part 60, part VV). The heavy liquid provisions (§§ 264.1058 and 265.1058) exempt pumps and valves processing lower vapor pressure substances from the

routine leak detection monitoring requirements of the standards. By their nature, heavy liquids exhibit much lower volatilities than do light liquids, and because equipment leak rates and emissions have been shown to vary with stream volatility, emissions from heavy liquids are less than those for lighter, more volatile streams. For example, EPA analyses indicate that emissions from valves in heavy liquid service are more than 30 times lower than the emissions from valves in light liquid service.

Pumps and valves are in light liquid service if the vapor pressure of one or more of the components being handled by the piece of equipment is greater than 0.3 kilopascal (kPa) at 20 °C, if the total concentration of the pure components having a vapor pressure greater than 0.3 kPa at 20 °C is equal to or greater than 20 percent by weight, and if the fluid is a liquid at operating conditions. Pumps and valves not in light liquid service are defined to be in heavy liquid service.

The regulations governing equipment leaks also have been incorporated and reprinted in the final standards to eliminate cross-referencing to part 61 regulations and to consolidate the requirements under RCRA.

Equipment Leak Control Requirements

The control requirements for valves are based on LDAR requirements. Valves in light liquid or gas/vapor service (§§ 264.1057 and 265.1057) must be monitored using Reference Method 21; an instrument reading at or above 10,000 ppm indicates the presence of a leak. If a leak is detected, the valve must be repaired as soon as practicable but no later than 15 days after the leak is detected. A first attempt to repair the valve must be made no later than 5 days after the leak is detected. First attempts at repair include, but are not limited to, tightening or replacing bonnet bolts tightening packing gland nuts, or injecting lubricant into the lubricated packing.

Monthly monitoring is required; however, any valve for which a leak is not detected for 2 successive months may be monitored the first month of each succeeding quarter until a leak is detected (§§ 264.1057(c) and 265.1057(c)). If a leak is detected the valve must be monitored monthly until a leak is not detected for 2 successive months.

In addition, monthly monitoring is not required if: (1) A leakless valve, such as a sealed-bellows valve, is used to achieve a no-detectable-emissions limit (500 ppm above background, as measured by Method 21, with an annual performance test; §§ 264.1057(f) and

265.1057(f); (2) the owner or operator meets a performance level of 2 percent of all valves leaking (§§ 264.1061 and 265.1061); (3) the owner or operator elects to comply with a skip-period leak detection and repair program as described for valves (§§ 264.1062 and 265.1062); or (4) the valve is designated by the owner or operator as unsafe-to-monitor or difficult-to-monitor (§§ 264.1057 (g) and (h) and 265.1057 (g) and (h)). A valve may be designated as unsafe-to-monitor if monitoring personnel would be exposed to an immediate danger as a consequence of monitoring and if the owner or operator adheres to a written plan that requires monitoring of the valve as frequently as practicable during safe-to-monitor times. A valve may be designated as difficult-to-monitor if the valve cannot be monitored without elevating monitoring personnel more than 2 m above a support surface, the valve is in an existing hazardous waste management unit and the owner or operator follows a written plan that requires monitoring at least once a year.

The EPA is continuing to study the status of new technology available for the control of air emissions from valves. The EPA has issued a separate notice in the *Federal Register* that discusses available information on leakless valve technology (54 FR 30228, July 19, 1989). Public comments were requested in that notice on several aspects of the technology to assist EPA in determining applications for which leakless valve technology would be appropriate at hazardous waste TSDF.

The final standards also require monitoring for pumps at TSDF containing or contacting wastes with greater than 10 percent organics (§§ 264.1052 and 265.1052). Each pump in light liquid service must be monitored monthly with a portable vapor analyzer following the EPA Reference Method 21 protocol. In addition, each pump in light liquid service must be checked weekly by visual inspection for indications of liquids dripping from the pump seal. A pump is determined to be leaking if an instrument reading of 10,000 ppm or greater is measured or there are indications of liquids dripping from the pump seal. When a leak is detected, it must be repaired as soon as practicable, but not later than 15 days after it is detected unless the delay-of-repair provisions specified in the rule apply. The first attempt at repair must be made within 5 calendar days of the leak being detected.

Pumps in light liquid service are exempt from the monitoring requirements under §§ 264.1052 (d) and

(e) and 265.1052 (d) and (e) if: (1) The pump is equipped with a dual mechanical seal system that includes a barrier fluid between the two seals. (2) a magnetically coupled or diaphragm pump is used to achieve a no-detectable-emissions limit (indicated by a portable organic vapor analyzer reading of less than 500 ppm above background), or (3) the pump is equipped with a closed-vent system capable of transporting any leakage from the seal or seals to a 95-percent efficient control device. If pumps are equipped with a dual mechanical seal system, emissions from the barrier fluid reservoir must be vented to a control device designed and operated to achieve a 95-percent control efficiency, the barrier fluid must be purged and added to the hazardous waste stream, or the pressure of the barrier fluid must be maintained at a level above the pressure in the pump or exhauster stuffing box. A pressure or level indicator to detect any failure of the seal system or the barrier fluid system is required, with the indicator checked daily or equipped with an alarm to signal failure of the system. If leakless equipment is used, such as magnetically coupled or diaphragm pumps, the standards require an annual performance test by Method 21 to verify the no-detectable-emissions status of the equipment.

Compressors must be equipped with a seal system that includes a barrier fluid system that prevents leakage of organic emissions to the atmosphere. The seal system must be operated with the barrier fluid at a pressure that is greater than the compressor stuffing box pressure, be equipped with a barrier fluid system that is connected by a closed-vent system to a control device that meets the design and operating requirements established in §§ 264.1060 and 265.1060, or be equipped with a system that purges the barrier fluid into a hazardous waste stream with zero total organic emissions to the atmosphere. In addition, the barrier fluid system must be equipped with a sensor that detects failure of the seal system, barrier fluid system, or both. A compressor is determined to be leaking if the sensor indicates failure of the seal system, the barrier fluid system, or both. When a leak is detected, it must be repaired as soon as practicable, but not later than 15 calendar days after it is detected; a first attempt at repair must be made within 5 calendar days.

Except during emergency pressure releases, each pressure relief device in gas/vapor service must be operated with no detectable emissions (500 ppm above background, as measured by

Reference Method 21) (§§ 264.1054 and 265.1054). No later than 5 calendar days after any pressure release, the device must be returned to a condition of no detectable emissions and be monitored to confirm that status. Any pressure relief device that is equipped with a closed-vent system capable of capturing and transporting leakage to a control device that meets the requirements of §§ 264.1060 and 265.1060 is exempt from these requirements.

Each open-ended valve or line must be equipped with a cap, blind flange, plug, or second valve (§§ 264.1056 and 265.1056). The cap, blind flange, plug, or second valve must seal the open end at all times except during operation requiring hazardous waste stream flow through the open-ended valve or line. Operational requirements for second valves and double block and bleed systems also are specified in the final regulation.

Pumps and valves in heavy-liquid service, pressure relief devices in light-liquid or heavy-liquid service, and flanges and other connectors must be monitored within 5 days by Reference Method 21 if evidence of a potential leak is found by visual, audible, olfactory, or any other detection method (§§ 264.1058 and 265.1058). A leak is detected if an instrument reading of 10,000 ppm or greater is measured. When a leak is detected, it shall be repaired as soon as practicable but not later than 15 calendar days after detection. The first attempt at repair must be made within 5 calendar days of the leak being detected.

The final standards also include provisions for delay of repair (§§ 264.1059 and 265.1059). Delay of repair of leaking equipment is allowed if the repair is technically infeasible without a hazardous waste management unit shutdown (i.e., a work practice or operational procedure that stops operation of a hazardous waste management unit or part of a hazardous waste management unit). However, repair of the leak must be performed before the end of the next shutdown of that unit. Delay of repair also is allowed for equipment (i.e., either pumps or valves) that is isolated from the hazardous waste management unit and is prevented from containing or contacting a hazardous waste with 10 percent or more organic content. For valves, delay of repair is allowed if: (1) The owner or operator determines that emissions of purged material resulting from immediate repair are greater than the emissions likely to result from delay of repair, and (2) when the valve is repaired the purged materials are

collected and destroyed or recovered in a control device complying with the requirements of the standards. Delay of repair beyond a hazardous waste management unit shutdown is allowed only if valve assembly replacement is necessary during the next shutdown of the unit, valve assembly supplies have been depleted, and valve assembly supplies had been sufficiently stocked before supplies were depleted (i.e., the owner/operator has made a good-faith effort to maintain adequate spare parts). For pumps, delay of repair is allowed if: (1) Repair requires the use of a dual mechanical seal system that includes a barrier fluid system, and (2) repair is completed as soon as practicable, but not later than 6 months after the leak is detected.

The final standards also include design and operating requirements for closed-vent systems that may be used to comply with the equipment leak standards (§§ 264.1060 and 265.1060). Closed-vent systems must be designed for and operated with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background by Reference Method 21. A leak on a closed-vent system, indicated by an instrument reading of 500 ppm or by visual inspection, must be repaired within 15 calendar days after detection; a first attempt at repair must be made no later than 5 calendar days after detection. Monitoring must be conducted initially, annually, and at other times as requested by the Regional Administrator, to confirm the no-detectable-emissions status of the system. Like other control devices, closed-vent systems must be operated at all times when any emissions may be vented to them.

The provisions of 40 CFR 81.244, subpart V, which provide a formal mechanism for applying for use of an alternative means of emission limitation, were specifically not included in the proposed TSDF process vent and equipment leak rules and have not been included in these final standards. The alternative means of emission limitation provisions are not considered self-implementing; i.e., these provisions cannot be satisfied without the need for detailed explanation or negotiation between the facility owner/operator and EPA, and thus are not appropriate as requirements for interim status facilities under part 265. Therefore, the alternative means of emission limitation provisions were not included in the final subpart AA and BB rules. An owner or operator, however, may use an alternative means of emission limitation to comply with the process vent or

equipment leak standards of part 264. The owner/operator can use part B of the permit application to provide information that demonstrates the effectiveness of any alternative means of emission limitation and can use the negotiation process associated with issuance of a final permit to establish conditions for use of an alternative means of emission limitation. The owner or operator would be responsible for collecting and verifying test data to document that the emission reduction achieved by the alternative is equal to or greater than the emission reduction achieved by the equipment, design, or operational requirements in the standard.

Additional general recordkeeping requirements include information on pump, valve, compressor, and pressure relief device leak repair attempts; reasons for repair delays; and design criteria for sampling connection systems and closed-vent systems and control devices. There are also recordkeeping and monitoring requirements for pieces of equipment covered by alternative requirements.

Compliance with the equipment leak standards will be assessed through plant inspections and the review of records that document implementation of the requirements as required by the final standards.

D. Summary of Changes from Proposal

Several changes have been made to the standards since proposal as the result of EPA's evaluation of comments and of additional information gathered in response to comments. These changes respond primarily to commenters' concerns that additional controls are unnecessary for TSDF process vents and equipment with very low emissions and that the applicability, implementation, and compliance provisions of the standards should be clarified. The EPA has addressed these problems in the final rules.

The proposed standards would have required that organic emissions from all process vents that emit organics in concentrations of 10 percent or greater on all TSDF waste management units be reduced by 95 percent. The final rules apply to process vents on specific hazardous waste management units that treat wastes with total organics concentrations of 10 ppmw or greater and include (1) process vents on distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations and vents on condensers serving these operations and (2) process vents on tanks associated with distillation, fractionation, thin-film evaporation, solvent extraction, or air or

steam stripping operations if emissions from these process operations are vented through the tanks.

While the proposed standard would have required 95 percent emission reduction from each affected vent, the final vent standard's weight-percent reduction applies to total emissions from the combination of all affected vents at each facility. The final rules also add facility-based emission rate limits for all affected process vents of 1.4 kg/h (3 lb/h) and 2.8 Mg/yr (3.1 ton/yr) (§§ 264.1032(a)(1) and 265.1032(a)(1)). Facilities with organic emissions from vents below the emission rate limits will not have to reduce process vent organic emissions. The owner or operator of the facility must determine and document that emissions from affected vents will not exceed the emission rate limits. The EPA estimates that baseline emissions will be reduced by about 90 percent by controlling process vent emissions from about 55 percent of affected facilities, i.e., those with emissions above the emission rate limit.

Another major change affects the applicability of the final standards for pumps and valves to better relate to the volatility of the wastes managed and thus to air emission LDAR potential. The proposed LDAR requirements for pumps and valves have been revised to distinguish between equipment in heavy liquid service and equipment in gas/light liquid service. The provisions exempt pumps and valves processing relatively low vapor pressure substances (heavy liquids) from the routine instrument monitoring requirements of the standards. These provisions are included to avoid requiring unnecessary controls on equipment that poses little emission problem even when leaking.

Because of commenters' concerns with the administrative problems associated with obtaining a major permit modification, the final standards do not require modifications of RCRA permits issued before the effective date of these rules (§§ 264.1030(c) and 264.1050(c)). In such cases, requirements for affected hazardous waste management units and associated requirements for process vents and equipment must be added or incorporated into the facility's permit at review under § 270.50 or at reissue under § 124.15. However, in the forthcoming Phase II air rules, EPA will be proposing to modify §§ 264.1030(c) and 264.1050(c) as they apply to control of air emissions under subparts AA and BB. This action, if adopted, would mean that the air rules promulgated under RCRA section 3004(n) would be

applicable to all facilities as of the effective date of the Phase II rules. More details regarding implementation are presented in section IX of this preamble.

The proposed air emission standards for process vents and equipment leaks would have added part 269, Air Emission Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities. For consistency with standards for other TSDF sources under RCRA, the final standards have been incorporated into part 264, for permitted facilities, and part 265, for interim status facilities. In addition, whereas at proposal the equipment leak requirements of 40 CFR part 61, subpart V, were incorporated by reference, these provisions have been written into subpart BB with editorial revisions appropriate for a standard promulgated under RCRA authority rather than CAA authority.

E. Relationship of RCRA Exemptions to Final Standards

Under 40 CFR 261.4(c), hazardous wastes that are generated in process-related equipment such as product or raw material storage tanks or pipelines are exempt from RCRA regulation. This exemption applies until the waste is physically removed from the unit in which it was generated, unless the unit is a surface impoundment or unless the hazardous waste remains in the unit more than 90 days after the unit ceases to be operated for manufacturing, or for storage or transportation of product or raw materials. This exemption is not affected by this rule. Therefore, units such as *product* (not hazardous waste) distillation columns generating hazardous waste still bottoms containing organics are not subject to the standard while the wastes are in the product distillation column. However, distillation columns that receive hazardous wastes and that are used in hazardous waste treatment (i.e., hazardous waste management units) are subject to this standard if the waste's organic content exceeds the 10-ppmw applicability criterion. As discussed in the preamble to the proposed standard, only those recycling units that are part of a facility already subject to RCRA permit requirements are subject to the air standards. The EPA's authority to control air emissions from solvent reclamation operations not part of closed-loop systems is discussed further in section VI of this preamble and in the BID.

Totally enclosed treatment facilities also are exempt from RCRA subtitle C requirements under 40 CFR 264.1(g)(5), 40 CFR 265.1(c)(9), and 270.1(c)(2). A

"totally enclosed treatment facility" is a hazardous waste treatment facility that is "directly connected to an industrial production process and which is constructed and operated in a manner that prevents the release of any hazardous waste or any constituent thereof into the environment during treatment" (40 CFR 260.10).

Treatment facilities located off the site of generation are not directly connected to an industrial process. Thus, commercial waste treatment facilities with equipment affected by the final standards, such as solvent reclamation facilities, by definition ordinarily would not be totally enclosed. In addition, storage facilities, disposal facilities, and ancillary equipment not used for treating hazardous waste do not fall within the definition of a totally enclosed treatment facility.

The EPA believes that many on-site treatment facilities also are not totally enclosed. Distillation columns and other treatment technologies typically are designed to release emissions into the air. Therefore, by definition, these on-site technologies generally are not totally enclosed. (See 45 FR 33218, May 19, 1980 (no constituents released to air during treatment).)

Two important characteristics define a totally enclosed treatment facility. The key characteristic of a totally enclosed treatment facility is that it does not release any hazardous waste or constituent of hazardous waste into the environment during treatment. Thus, if a facility leaks, spills, or discharges waste or waste constituents, or emits waste or waste constituents into the air during treatment, it is not a totally enclosed treatment facility within the meaning of these regulations. The second important characteristic is that it must be directly connected to an industrial production process.

The EPA also excludes elementary neutralization and wastewater treatment tanks as defined by 40 CFR 260.10 from regulation under the hazardous waste rules. The EPA amended these definitions (see 53 FR 34080, September 2, 1988) to clarify that the scope of the exemptions applies to the tank systems, not just the tank. For example, if a wastewater treatment or elementary neutralization unit is not subject to RCRA subtitle C hazardous waste management standards, neither is ancillary equipment connected to the exempted unit. The amendments also clarify that, for a wastewater treatment unit to be covered by the exemption, it must be part of an onsite wastewater treatment facility. Thus, emissions from process vents associated with

distillation, fractionation thin-film evaporation, solvent extraction, or air or steam stripping operations and ancillary equipment (piping, pumps, etc.) that are associated with a tank that is part of the wastewater treatment system subject to regulation either under sections 402 or 307(b) of the Clean Water Act are not subject to these standards. However, air emission sources not subject to RCRA may be subject to CAA guidance and/or standards.

As noted in the preamble to the proposal, under 40 CFR 262.34, generators that accumulate hazardous waste in tanks and containers for 90 days or less are not subject to RCRA permitting requirements, provided they comply with the provisions of 40 CFR 262.34, which include the substantive requirements for tanks and containers storing hazardous waste, 40 CFR part 265, subparts I and J. This remains unchanged, and the final standards do not apply to generator tanks that accumulate hazardous waste for 90 days or less. However, as part of the Phase II TSDF air emission regulations, EPA intends to propose to modify the exemption conditions to require that 90-day tanks meet the control requirements of the Phase I and Phase II standards.

Today's final rules regulate the activity of reclamation at certain types of RCRA facilities for the first time. The EPA is amending 40 CFR 261.6 under its RCRA authority over reclamation to allow covering reclamation of hazardous wastes in waste management units affected by today's final rules. It should be recognized, however, that these final rules apply only at facilities otherwise needing a RCRA permit. In addition, the closed-loop reclamation exemption in § 261.4(a)(8) is not changed by these rules. Therefore, not all reclamation units will necessarily be affected by these rules.

VI. Summary of Comments and Responses

Numerous comments on the proposed rule were received that relate to nearly all aspects of the RCRA standards development process. The comment summaries cover topics relating to regulatory issues, applicability of the standards, control technologies impact analyses and implementation and compliance issues. Detailed responses to these and other comments are included in the BID for the promulgated standards, which is available in the public docket for this rule.

A. Regulatory Issues

Statutory Authority

Comment: Several commenters argued that TSDF air emissions should be regulated under the CAA rather than RCRA because (1) CAA standards under sections 111 and 112 are already in place in the SOCOMI and petroleum refining industries; (2) air emissions at some TSDF have already been permitted under State implementation plans (SIP), new source review programs, or under State regulations for VOC or air toxics control; (3) VOC and ozone control are the province of the CAA, not RCRA; and (4) a statutory mechanism already exists under the CAA for evaluating the risk posed by air emissions.

Response: Congress has required EPA to promulgate air emission monitoring and control requirements at hazardous waste TSDF, under section 3004(n) of RCRA, as may be necessary to protect human health and the environment. Congress was aware of the existence and scope of the CAA when it enacted section 3004(n) of RCRA. There is no indication that Congress intended that all air regulations be issued within the confines of the CAA. On the contrary, when adding section 3004(n), Congress specifically recognized EPA's dual authority to regulate these air pollutants (S. Rep. 98-284, page 63).

The EPA has conducted an analysis of current State and Federal controls and concluded that further regulation under section 3004(n) is necessary to protect human health and the environment. The EPA examined State regulations, as well as existing Federal standards (and those under development), to determine the potential for overlapping rules and permitting requirements. The EPA found that 6 States have established air toxics programs, 21 States have established generic standards for VOC independent of Federal regulations, and several States have extended control techniques guidelines (CTG) for VOC to TSDF. However, the standards vary widely in scope and application and in many cases controls have not been required when emissions are below 40 ton/yr, even in the 37 States with ozone nonattainment areas. The EPA believes that today's action will help alleviate the nonuniformity among the States' efforts and will help achieve emission reductions necessary to protect human health and the environment.

A few commenters also argued that the standards would duplicate existing CAA standards that apply to the SOCOMI and petroleum refineries. The EPA disagrees because the standards being promulgated today apply to waste management sources whereas the CAA

standards previously promulgated apply to the production process.

The EPA also disagrees with contentions that it is outside the province of RCRA to address VOC and ozone. As noted, section 3004(n) standards, like all RCRA subtitle C standards, are to protect "human health and the environment." VOC and ozone are threats to human health and the environment and thus are well within the regulatory scope of section 3004(n).

Organic emissions from TSDF contribute to ambient ozone formation. In fact, TSDF are estimated to emit nearly 12 percent of all VOC from stationary sources, and thus any reductions in these emissions will contribute to reducing ozone formation and associated health and environmental problems.

RCRA Authority Over Recycling

Comment: Several commenters argued that EPA does not have regulatory authority under RCRA to control solvent reclamation operations or units or equipment managing materials destined for reclamation such as spent solvent because they are producing or managing products and not wastes.

Response: The EPA disagrees with the commenters regarding EPA's authority to control solvent reclamation operations. In response to a court opinion (*American Mining Congress v. EPA*, 824 F.2d 1177, DC Circuit Court of Appeals, July 31, 1987) concerning the scope of EPA's RCRA authority, EPA proposed amendments to the RCRA definition of "solid waste" that would clarify when reclamation operations can be considered to be managing solid and hazardous wastes (53 FR 519, January 8, 1988). The EPA has accepted comments on its interpretation and proposed amendments. The EPA has not yet taken final action on this proposal. Thus, EPA is addressing the scope of its authority over reclamation operations under RCRA in the context of that rulemaking. This rule is based on EPA's current interpretation of its RCRA authority, as described in the January 1988 proposal.

The following summarizes EPA's proposed position. In general, the proposed amendments would exclude from RCRA control only those spent solvents reclaimed as part of a continuous, ongoing manufacturing process where the material to be reclaimed is piped (or moved by a comparably closed means of conveyance) to a reclamation device, any storage preceding reclamation is in a tank, and the material is returned after being reclaimed, to the original process where it was generated. (Other conditions on this exclusion relate to

duration and purpose of the reclamation process. See proposed § 261.4(a)(8).)

However, processes (or other types of recycling) involving an element of "discard" are (or can be) within RCRA subtitle C authority. When spent materials are being reclaimed, this element of discard can arise in two principal ways. First, when spent materials are reclaimed by someone other than the generator, normally in an off-site operation, the generator of the spent material is getting rid of the material and so is discarding it. In addition, the spent material itself, by definition, is used up and unfit for further direct use; the spent material must first be restored to a usable condition. This type of operation has been characterized by some of the worst environmental damage incidents involving recycling (50 FR 658-661, January 4, 1985). Moreover, storage preceding such reclamation has been subject to the part 264 and 265 standards since November 19, 1980. (See generally 53 FR 522 and underlying record materials.) The *American Mining Congress* opinion itself indicates that such materials are solid wastes (824 F.2d at 1187).

When a spent material is reclaimed on site in something other than a closed-loop process, EPA also considers that the spent material is discarded (i.e., spent solvents removed from the process, transferred to an on-site distillation unit, and regenerated have been removed from the production process). The EPA's reasoning is that these materials are no longer available for use in an ongoing process and have been disposed of from that operation, even if the reclamation operation is on site. Finally, EPA also considers that when hazardous secondary materials are reclaimed but then burned as fuels, the entire operation—culminating in thermal combustion—constitutes discarding via destructive combustion (53 FR 523). Consequently, under this reading, any intermediate reclamation step in these types of fuel production operations remains within EPA's subtitle C authority.

In summary, under EPA's current interpretation of the court's opinion, air emissions from distillation, fractionation, thin-film evaporation, solvent extraction, and stripping processes involving reclamation of spent solvent and other spent hazardous secondary materials can be regulated under RCRA subtitle C whenever the reclamation system is not part of the type of closed-loop reclamation system described in proposed part 261.4(a)(8). Any changes to this interpretation as

part of the solid waste definition final rule may affect the scope of this rule.

Selection of Source Category

Comment: Several commenters disagreed with the selection of TSDF and Waste Solvent Treatment Facility (WSTF) process vents and equipment leaks for regulation because they believed that (1) out-of-date data or extrapolated data were used in the analysis and, as a result, the estimate of the number of affected facilities nationwide and the number affected by the proposed rule is far too low; (2) the role of State regulations was not considered; (3) EPA should control larger, more hazardous air emission sources at TSDF, such as storage tanks, before controlling process vents and equipment leaks; and (4) air emissions from waste solvent reclamation operations do not pose a health risk warranting control.

Response: The EPA generally disagrees with the commenters that the selection of TSDF process vents and equipment leaks was inappropriate. However, EPA agrees that the standards will affect more than the 100 WSTF estimated at proposal. To respond to these and other comments, EPA conducted additional technical analyses. The EPA developed an industry profile using results of the 1986 National Screening Survey of Hazardous Waste Treatment, Storage, Disposal, and Recycling Facilities (hereafter called the "Screener Survey"). The Screener Survey data represent all of the TSDF active in 1985 with interim status or final RCRA permits, which totalled about 3,000 facilities. The Screener Survey data are for operations in 1985, the latest year for which such comprehensive data are available. A review of the Screener Survey data shows a total of about 450 facilities that need authorization to operate under RCRA section 3005 and report solvent recovery by operations such as batch distillation, fractionation, thin-film evaporation, or steam stripping at the facility; i.e., operations that would have process vents subject to the standards. The EPA used these facility counts together with the reported 1985 waste solvent throughputs as the basis for the final process vent standards impacts analyses. In addition, EPA estimates that about 1,000 on site and off site permitted TSDF that do not practice solvent recovery do manage hazardous waste streams containing 10 percent or more total organics and would be subject to the equipment leak requirements. In total, about 1,400 facilities are potentially subject to the provisions of subpart BB.

State and Federal regulations also were reviewed to help EPA better estimate baseline emission control levels. Although a few States have controls in place, it appears that there are no general control requirements for TSDF process vents. Moreover, because TSDF with solvent recycling generally are small operations, any new waste management units with process vents would likely have potential VOC emissions of less than 40 ton/yr; thus, prevention of significant deterioration (PSD) permit requirements would not apply. In addition, EPA sent section 3007 information requests to several large and small TSDF; respondents to the EPA section 3007 questionnaires did not indicate control requirements for process vents. Several of the facilities that were asked to provide information reported requirements for obtaining air contaminant source operating permits, but they reported no permit requirements for controlling process vent emissions. Therefore, the revised emission estimates (that are based on site-specific emission data) should reasonably reflect the current level of control of process vent emissions.

With respect to those commenters who argued that other air emission sources should be controlled instead of process vents and equipment leaks, it should be pointed out that section 3004(n) of RCRA requires EPA to promulgate regulations for the monitoring and control of air emissions from hazardous waste TSDF, *including but not limited to* open tanks, surface impoundments, and landfills, as may be necessary to protect human health and the environment. Organic emissions are generated from process vents on distillation and separation units such as air strippers, steam strippers, thin-film evaporators, fractionation columns, batch distillation units, pot stills, and condensers and distillate receiving vessels that vent emissions from these units. Distillation and separation processes may be found in solvent reclamation operations, wastewater treatment systems, and in other pretreatment processes. Organic emissions also are released from equipment leaks associated with these processes as well as from nearly all other hazardous waste management units.

As discussed in section III.D of this preamble, the EPA chose to develop the process vent and equipment leak portion of its TSDF rulemaking as the first phase of the TSDF air emission rules partly to prevent uncontrolled air emissions from LDR treatment technologies since these technologies were likely to have

increased use. In addition, EPA already had control technology information to support these regulations, and thus earlier development of these rules was possible. This is principally because effective controls now in place under the CAA to control emissions from the same types of emission points in chemical production facilities and petroleum refineries can be applied to reduce the health risk posed by air emissions from uncontrolled distillation, fractionation, thin-film evaporation, solvent extraction, and stripping processes and equipment leaks at TSDF. The EPA has limited the applicability of today's final standards to those types of process vents for which control techniques are well developed, i.e., those associated with processes designed to drive the organics from the waste, such as distillation, fractionation, thin-film evaporation, solvent extraction, and stripping operations.

Organic emissions also are generated from numerous other sources at TSDF. Preliminary estimates indicate that nationwide organic emissions (after control of process vents associated with distillation/separation units and equipment leaks) are about 1.8 million Mg/yr. The EPA is in the process of developing standards for these sources under section 3004(n) of RCRA, and the standards are scheduled for proposal in 1990. Source categories being examined include tanks, surface impoundments, containers, and miscellaneous units. These other TSDF source categories require different data and engineering evaluations; thus, standards for these other sources are on a separate rulemaking schedule. The emissions and risk analyses needed to support extension of the process vent standards to other closed (covered), vented tanks are also being developed in conjunction with this future rulemaking. These include vent emissions that are incidental to the process, such as emissions caused by loading or by agitation/aeration of the waste in a treatment tank.

The EPA has determined that organic emissions from TSDF/WSTF process vents and equipment leaks pose a significant risk to human health and the environment and that section 3004(n) provides authority to control TSDF air emissions from these sources. Therefore, EPA has decided to take measures to reduce the atmospheric release of organic air pollutants from these sources as quickly as possible. The fact that distillation, fractionation, thin-film evaporation, solvent extraction, and stripping processes and equipment leaks are regulated before other sources is not

germane. There is no reason to delay these rules while others are under development.

Other commenters criticized the selection of the source category for regulation because their process vent emissions either are already controlled or are low enough so as not to pose a threat to human health and the environment. However, EPA's analysis of process vent emissions and impacts indicates that for a large segment of the industry, TSDF process vent emissions can pose significant environmental and health risks. These facilities are the target of the subpart AA process vent standards. As discussed in section VI.B of this preamble, the final standards include facility process vent emission rate limits designed to avoid control of facilities where meaningful reductions in nationwide risk to human health and the environment cannot be achieved.

Several commenters also criticized the source category for regulation because emissions from generators who conduct on-site reclamation and off-site reclaimers with no prior storage (i.e., those recycling activities conducted at facilities not requiring a RCRA permit) would not be controlled.

The standards being promulgated today (under section 3004(n)) apply only to waste management facilities that need authorization to operate under section 3005 of RCRA. Air emissions from subtitle C waste management facilities that are excluded from RCRA permit requirements will be subject to regulation under either the CAA or RCRA authority as appropriate. Waste management facilities that fall under the requirements of subtitle D (i.e., nonhazardous waste operations) will also be subject to regulation under the CAA. The EPA limited the scope of the standards at proposal and in this final rule to facilities required to have a permit under RCRA to minimize disruption to the current permitting system (i.e., not expand the permit universe) and not impose a permit burden on facilities not otherwise subject to RCRA permits. Although EPA is controlling only some sources in this rule, other sources of significant levels of air emissions will also be controlled; i.e., it is a matter of timing rather than a decision not to control these other sources. This phased regulatory approach is discussed in section III.C of this preamble.

RCRA Decision Criteria

Comment: Several commenters alleged that the standards do not meet the mandate of RCRA section 3004(n) because (1) the standards are not protective in all cases; (2) the standards

are inconsistent with RCRA section 3004(m) that requires treatment standards based on best demonstrated available technology (BDAT); and (3) neither the RCRA statute nor its legislative history allows consideration of costs.

Response: The EPA believes that the standards promulgated today appreciably reduce health risks that are presented by air emissions at TSDF and provide protection to human health and the environment as required by section 3004(n) of RCRA, for the vast majority of the air emissions affected by these standards. The EPA's analysis of residual cancer risk after implementation of the standards for process vents indicates that maximum individual risk, even at the upper-bound emission rate, is well within the residual risk for other standards promulgated under RCRA, which historically has been in the range of 1×10^{-4} to 1×10^{-6} . On the other hand, the analysis indicates that residual cancer risk after implementing the equipment leak standards is higher than the residual risk for other standards promulgated under RCRA. However, EPA believes that the equipment leak standards achieve significant reductions in emissions and risk and, that after control, the vast majority of facilities are well within the risk range of other RCRA standards.

As was already described, EPA will be promulgating regulations to control TSDF air emissions in phases. Thus, in Phase III, EPA will be evaluating the need for additional control (e.g., control of individual toxic constituents after implementation of these standards) for cases where the risk from air emissions after implementation of the Phase I and II standards is higher than desirable. (This regulatory approach is discussed in section III.C of this preamble.) During the interim, permit writers should use EPA's omnibus permitting authority to require more stringent controls at facilities where a high residual risk remains after implementation of the standards for volatile organics. The permitting authority cited by section 3005 of RCRA and codified in § 270.32(b)(2) states that permits " * * * shall contain such terms and conditions as the Administrator or State Director determines necessary to protect human health and the environment." This section allows permit writers to require emission controls that are more stringent than those specified by a standard.

As has been described above, the approach that EPA is using to control TSDF air emissions is to proceed with promulgation of regulations to control

organic emissions as a class (Phases I and II) and to follow this with regulations that would require more stringent controls for cases where the risk after implementing the organic standards remains high. The EPA believes that this approach will ultimately be protective of human health and the environment for all TSDF air emissions on a nationwide basis.

The question of whether these standards implement the requirements of RCRA section 3004(m) is irrelevant. Regulations implementing section 3004(m), which is a pretreatment-based program that defines when hazardous wastes can be land-disposed, have been (and will continue to be) separately promulgated by EPA. For example, see 40 FR 268 (November 7, 1986) and 52 FR 25787 (July 8, 1987). In contrast, today's regulations under section 3004(n) of RCRA do not specify technology-based treatment levels for hazardous wastes but regulate air emissions from treatment units as necessary to protect human health and the environment. Therefore, in developing today's rule EPA has focused on achieving acceptable levels of health and environmental protection rather than on specifying pretreatment levels for hazardous wastes. The two regulatory efforts (i.e., 3004(m) and 3004(n) rules) are integrated and coordinated to the extent possible to reduce duplicate and conflicting regulations. Furthermore, today's rules are designed to ensure that treatment required under 3004(m) is protective of human health and the environment.

The role of costs as a decision criterion under RCRA in subtitle C is not explicitly addressed in the statute. The EPA's position is that it can consider cost information as a basis for choosing among alternatives either (1) when they all achieve protection of human health and the environment or (2) for alternatives that are estimated to provide substantial reductions in human health and environmental risks but do not achieve the historically acceptable levels of protection under RCRA, when they are equally protective. However, EPA does not believe that the cost burden on industry is a basis for reducing the stringency of standards EPA considers necessary to protect human health and the environment.

Total Organics Approach

Comment: Commenters argued that applicability should be limited to known or suspected carcinogens. In addition, several commenters argued that applicability of the standards should be based on volatility and not on total

organic content because the relative amount of organic content by weight does not determine potential air emissions and subsequent health effects.

Response: First, it should be pointed out that ozone presents a threat to human health and the environment that warrants control under RCRA. The EPA agrees that total organic content may not be a completely accurate gauge of potential environmental (e.g., ozone) or health (e.g., cancer) impacts for a source such as process vents, but it is a readily measurable indicator. In addition, the final rule's substantive control requirements do apply only to vents and equipment containing volatile components.

The final vent standard applies to certain process vents emitting organics if the vent is associated with one of the processes specified in the rule. A process vent is determined to be affected by the standard if the vent is part of a hazardous waste distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping unit that manages wastes with 10 ppmw or more total organics; this includes vents on tanks (e.g., distillate receivers or hot wells) if emissions from the process operations are vented through the tank. Total organic content of the vent stream (i.e., the emissions to the atmosphere) is not a consideration in determining process vent applicability. As public commenters pointed out, the 10-percent total organics concentration cutoff for the vent stream does not limit total emissions or relate to emissions that escape capture by existing control devices and therefore was not included in the final rules.

Furthermore, the process vents covered by this rule are typically associated with distillation/separation processes used to recycle spent solvents and other organic chemicals. By definition, distillation is a process that consists of driving gas or vapor from liquids or solids by heating and then condensing the vapor(s) to liquid products. Wastes treated by distillation are expected to contain organics that are driven off in the process. Thus, by their nature, process vent emissions contain volatile organics.

Under the final standards, the term "organic emissions" is used in lieu of "volatile organic emissions" to avoid confusion with "volatile organic compounds." As at proposal, the final rule applies to total organics. Because of the hundreds of hazardous constituents that could be contained in and contacted by the equipment covered by today's rules, EPA recognizes the potential for the residual risk at some

facilities to remain higher than the residual risk for other standards promulgated under RCRA. Regulations based only on specific constituents will therefore be developed, as necessary, in Phase III of EPA's regulatory approach. The constituents to be evaluated will include those reported as being present in hazardous wastes managed by existing TSDF for which health effects have been established through the development of unit risk factors for carcinogens and reference doses for noncarcinogens.

As is discussed in section VI.B of this preamble, emission potential from equipment leaks also was considered by incorporating the light-liquid definition in the section 111 CAA standards. Light liquids exhibit much higher volatilities than do heavy liquids, which are relatively nonvolatile. Equipment leak rates and emissions have been shown to vary with stream volatility; emissions from heavy liquids are far less than those for lighter, more volatile streams. For example, EPA analyses indicate that emissions from valves in heavy-liquid service are more than 30 times lower than the emissions from valves in light-liquid service (see the BID, § 4.6). The EPA examined the emissions and risk associated with light- and heavy-liquid waste streams and found that light-liquid streams are the overwhelming contributors to both emissions and risk. Thus, the final standards take into account the volatility of emissions and the subsequent impact on health and the environment.

Application of CAA Equipment Leak Standards

Comment: Several commenters did not agree that the standards should be based on the transfer of technology from the section 112 standards for benzene (40 CFR, subpart V) because TSDF waste streams and processes differ from the chemical plants and petroleum refineries upon which the CAA standards are based.

Response: Data used in establishing the benzene fugitive standards under CAA section 112 are based on extensive emission and process data collected at a variety of petroleum refinery and SOCM I operating units. Data were obtained for equipment and chemical component mixtures that include many of the same organic compounds that are treated, stored, and disposed of in hazardous waste management units. Because hazardous waste management units such as distillation units have the same sources of fugitive organic emissions (such as pumps and valves) and handle the same chemicals as do chemical manufacturing plants and

petroleum refineries, it is reasonable to expect similar performance and efficiency of the technology for controlling organic emissions at hazardous waste management units. The EPA has no reason to believe that the equipment standards would not be applicable to TSDF. Moreover, although EPA has not conducted actual equipment leak testing at TSDF, observations of equipment during plant visits have confirmed that the assumptions and analyses used in other equipment leak standards apply to TSDF as well.

Changes have been made in the final standards and analyses to incorporate provisions included in the CAA standards that reflect the effect of volatility on emissions. As is discussed in section V of this preamble, the LDAR requirements for pumps and valves have been revised to include the light-liquid provisions in EPA's NSPS for VOC equipment leaks in the SOCM I. Correspondingly, the emission and health risk analyses have been revised to reflect this change to the standards. Additional information on the appropriateness of the CAA data on the SOCM I and petroleum refineries is presented in the next section.

B. Standards and Applicability

Standards for Accumulator Vessels

Comment: Commenters contended that the regulatory approach of applying a single standard to the wide varieties of accumulator vessels irrespective of the chemical constituents that are present and the size of the vessel is not appropriate because the proposed standards result in the control of already low emission rates at disproportionately high costs. Standards for tanks (whether accumulation or storage tanks) should be conditioned by the size of the vessel, the vapor pressure of the material being stored, and the type of units that pose a risk to human health and the environment. The EPA's approach should be similar to or consistent with the CAA NSPS for petroleum liquid storage vessels (40 CFR part 60, subpart Ka). These standards exempt vessels that store liquids less than 1.5 psia or that store less than 40,000 gal.

Response: Commenters recommending that the air emission standards be conditioned by the size of the tank and the vapor pressure of the material being stored have misinterpreted the applicability of the proposed standards. To clarify the applicability of the standards, the term "product accumulator vessel" has been dropped

from the promulgated rule, including the equipment definition, and the process vent definition has been revised to be specific to the applicable emission sources. "Process vent" is defined to mean "any open-ended pipe or stack that is vented to the atmosphere either directly, through a vacuum-producing system, or through a tank (e.g., distillate receiver, condenser, bottoms receiver, surge control tank, separator tank, or hot well) associated with distillation fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations." Similarly, the definition of "vented" has been revised to specifically exclude the passage of liquids, gases, or fumes "caused by tank loading and unloading (working losses)." Because tank working and breathing losses are not considered process emissions, the comments concerning vapor pressure and tank size exemptions are not relevant. (It should be noted, however, that EPA intends to regulate hazardous waste storage tanks, along with various other TSD air emission sources in the Phase II, section 3004(n), TSD air standards now being developed and evaluated by the Agency.)

In conducting the impact analysis of the WSTF/TSD process vent standards, EPA considered and took into account the relative size of WSTF process units and the wide range of chemicals processed in the WSTF industry. For example, three sizes of WSTF model units were defined for analysis of emissions, health risks, and economic impacts in the final rulemaking (see section VI.D). In addition, the final standards for process vents promulgated by EPA contain emission rate limits and require controls only at facilities whose total process vent emissions are greater than 1.4 kg/h (3 lb/h) and 2.8 Mg/yr (3.1 ton/yr). More detailed descriptions of the model units and the process vent emission rate limits are provided in chapters 5.0 and 7.0, respectively, of the BID.

Comment: Several commenters objected to the proposed standard for process vents that requires a fixed 95-percent emission reduction. They believe that the process vent standard is inequitable because some operations could reduce emissions by 95 percent and still have higher emissions than some small uncontrolled operations and because facilities would have to install control devices on all condenser and still vents regardless of emissions or risk posed to human health or the environment. A few commenters asked EPA to consider exemptions for small solvent operations that have low

emissions and thus pose little health risk.

Response: In response to these comments, EPA estimated the TSD/TSD air quality and health impacts using updated model unit, emission rate, and facility throughput data. Although total facility waste solvent throughputs were available, the data base did not contain any information on the number or capacities of process units at each site. Therefore, the risk analysis is based on overall facility operations and total facility process vent emissions as opposed to individual process vent emissions. The impacts analysis results show that nationwide reductions in emissions, maximum individual risk (MIR), and cancer incidence level off (i.e., yield only insubstantial incremental reductions) at a facility emission rate of about 2.8 Mg/yr (3.1 ton/yr). At a typical rate of 2,080 h/yr of operation, this annual emission rate corresponds to 1.4 kg/h (3 lb/h) of organic emissions. Control of facilities with process vent emissions less than these values does not result in further reductions of nationwide MIR or cancer incidence. At this emission level, larger facilities (i.e., those with uncontrolled emissions above the emission rate limit) that are controlled to a 95-percent emission reduction result in MIR values higher than the remaining uncontrolled small facilities (i.e., those with uncontrolled emissions below the limit). The same holds true for nationwide cancer incidence. The reduction in cancer incidence achieved by controlling facilities below the limit is not significant relative to the nationwide reductions achieved by controlling the larger facilities.

Consequently, the analysis results indicate that provision of small facility emission rate limits of 1.4 kg/h (3 lb/h) and 2.8 Mg/yr (3.1 ton/yr) for process vent emissions provides essentially the same level of protection for human health and the environment (in terms of risk, incidence, and emissions) as does covering all facilities. In addition, the MIR after control is within the range of residual risk for other standards promulgated under RCRA. As a result, the final rule requires control of only those facilities emitting greater than 1.4 kg/h (3 lb/h) and 2.8 Mg/yr (3.1 ton/yr) organic emissions from all process vents. A more detailed discussion of the process vent emission rate limits is contained in chapter 7.0 of the BID.

Because the final standards contain process vent emission rate limits, it is anticipated that small solvent recovery operations would not be substantially affected by the final process vent

standards. The EPA estimates, based on the high emission rates and 1985 waste solvent throughput data, indicate that about 45 percent of the WSTF identified in the industry profile will have process vent emissions of less than 2.8 Mg/yr (3.1 ton/yr). Consequently, it is expected that a large number of small facilities would not be required to install additional process vent controls.

Selection of 10-Percent Cutoff

Comment: Commenters believed that the 10-percent level proposed is comparable to 100,000 ppm and may be too high, particularly when compared to the 10,000-ppm level that defines an equipment leak, and that EPA should evaluate the health and environmental impacts associated with the proposed limit. The 10-percent limit will allow excessive emissions from leaking equipment and is based on costs, not technical limitations. Commenters also argued that the 10-percent limit does not adequately protect the environment because emissions could be substantial if there are numerous leaking components with relatively dilute streams and that controls, such as carbon adsorbers, are available to capture emissions from dilute streams.

Response: First, for clarification, the 10-percent organic content limit for equipment leaks in no way relates to the 10,000-ppm leak definition. The leak definition, which is a Method 21 instrument reading used to define when a leak is detected, is discussed in a later comment. As proposed, the 10-percent total organics cutoff level for applicability of the standards covered both equipment leak (fugitive) emissions and process vent emissions. Control technologies for fugitive emissions comprise the use of control equipment, inspection of equipment, and repair programs to limit or reduce emissions from leaking equipment. These control technologies have been studied and evaluated for equipment containing fluids with more than 10 percent organics (EPA-450/3-80-32b, EPA-450/3-80-33b, EPA-450/3-82-010, and EPA-450/3-86-002). The 10-percent criterion was chosen in EPA's original benzene/SOCMI studies to focus the analyses on air emissions from equipment containing relatively concentrated organics and presumably having the greatest potential for air emissions. Available data from the original benzene/SOCMI studies do not suggest that fugitive emissions from leaking equipment (e.g., pumps and valves) handling streams containing less than 10 percent organics are significant or that the 10-percent cutoff allows excessive emissions from dilute streams

However, to reevaluate this would require several years to conduct field studies to collect and analyze additional emissions and control effectiveness data for equipment leaks. Because available data support the need for, and effectiveness of, standards for equipment handling streams containing at least 10 percent organics, the EPA does not believe that a delay in rulemaking to assess emissions and controls for equipment handling streams containing less than 10 percent organics is warranted.

The effectiveness of fugitive emission control technologies has been thoroughly evaluated for equipment containing fluids with at least 10 percent organics, and fugitive emission standards have been proposed or established under both sections 111 and 112 of the CAA. (See 46 FR 1136, January 5, 1981; 46 FR 1165, January 5, 1981; 48 FR 279, January 4, 1983; 48 FR 37598, August 18, 1983; 48 FR 48328, October 18, 1983; 49 FR 22598, May 30, 1984; 49 FR 23498, June 6, 1984; and 49 FR 23522, June 6, 1984.) As elaborated in these rulemakings, a 10-percent cutoff deals with the air emissions from equipment most likely to cause significant human health and environmental harm.

With regard to process vent emissions, EPA agrees with the commenter. Emission test data show that the 10-percent cutoff potentially may allow significant emissions from process vents on a mass-per-unit-time basis (e.g., kg per hour or Mg per yr). As public commenters pointed out, the 10-percent cutoff for process vents does not limit total emissions, nor does it relate to emissions that escape capture by existing control devices. Therefore the 10-percent cutoff may not be appropriate; as a result, EPA has eliminated the 10-percent cutoff as it applies to process vents. The EPA believes that an emission rate limit more effectively relates to emissions, emission potential, and health risks than does a 10-percent organic concentration cutoff. Accordingly, a health-risk-based facility process vent emission rate limit has been added to the final rules in lieu of the 10-percent cutoff.

Because the emission rate limits (3 lb/h and 3.1 ton/yr) provide health-based limits, EPA considered dropping completely the organic content criterion (i.e., at least 10 percent total organics). However, EPA decided not to eliminate completely the organic content criterion because it is not clear that the same controls can be applied to very low concentration streams as can be applied to the higher concentration streams that generally are associated with emission

rates greater than the limits. For low-concentration streams, EPA questions whether controls are needed on a national or generic basis, but is unable to resolve this question at this time. Thus, EPA decided to defer controlling very low concentration streams until it is able to better characterize and assess these streams and the appropriate controls.

Once EPA decided to consider facilities that manage very low concentration organic wastes as a separate category, there remained the problem of determining the appropriate criterion. The EPA examined existing data on air strippers, the treatment device most commonly used with low-concentration streams; it appeared that the quantity of emissions and the risk associated with air strippers treating streams with concentrations below 10 ppmw may be relatively small, thus minimizing the potential harm of deferring control until a later time. Examples of facilities managing low-concentration wastes are sites where ground water is undergoing remedial action under CERCLA or corrective action pursuant to RCRA. Based on the limited set of precise data available, and the comments that the 10-percent criterion was too high, EPA determined that an appropriate criterion would be 10 ppm total organics in the waste by weight.

The 10-ppmw criterion is not an exemption from regulation; it is intended only as a way for EPA to divide the air regulations into phases. The EPA is deferring action on very low concentration streams (i.e., ones with less than 10 ppmw total organic content) from the final rule today but will evaluate and announce a decision later on whether to regulate these waste streams.

Exemptions

Comment: Several commenters disagreed with EPA's interpretation that the definition of "totally enclosed treatment units" (which are exempt from regulation) may in certain circumstances include on-site treatment units that use engineered controls to prevent the release of emissions. One commenter stated that on-site treatment facilities directly tied with process equipment have the same potential for emissions as do other sources not exempted by the proposed regulation.

Response: This rule does not create or modify any exemption for totally enclosed treatment facilities; rather, the existing definition of an exemption for totally enclosed treatment facilities remains in effect, and existing regulatory interpretations remain in

effect as well. Although the preamble to the proposed rule repeated the existing definition, it also contained a request for comments on an interpretation of the totally enclosed facility exemption whereby the "use of effective controls such as those required by the proposed standards" would meet the criteria of 40 CFR 260.10. Upon consideration of the comments, EPA has determined that this interpretation would have conflicted with the regulatory definition and previous interpretations of the exemption and, therefore, has decided to withdraw it.

As presented in the preamble to the proposed rule, under 40 CFR 264.1(g)(5) and 40 CFR 265.1(c)(9), totally enclosed treatment facilities are exempt from RCRA regulation. A "totally enclosed treatment facility" is a facility treating hazardous waste that is "directly connected to an industrial production process and which is constructed and operated in a manner which prevents the release of any hazardous waste or constituent thereof into the environment during treatment" (40 CFR 260.10). Therefore, as stated in the proposal preamble, process equipment designed to release air emissions are not "totally enclosed."

The EPA agrees with the commenter that on-site treatment facilities associated with process equipment generally are designed to release air emissions and, thus, are not "totally enclosed." The EPA specifically stated this in the preamble to the proposed rule. To be considered "totally enclosed," units must meet the test of preventing the release of any hazardous constituent from the unit not only on a routine basis but also during a process upset. Thus, the risks from these units are expected to be less than from units that are not totally enclosed.

Comment: Commenters stated that the exemption for tanks storing or treating hazardous wastes that are emptied every 90 days and that meet the tank standards of 40 CFR 262.34 is not justified based on risk, as RCRA requires. The exclusion of less-than-90-day storage tanks from air emission control requirements will increase the use of the 90-day storage exemption and the resultant air emissions.

Response: In 40 CFR part 270, hazardous waste generators who accumulate waste on site in containers or tanks for less than the time periods provided in § 262.34 are specifically excluded from RCRA permitting requirements. To qualify for the exclusions in § 262.34, generators who accumulate hazardous waste on site for up to 90 days must comply with 40 CFR

265, subpart I or J (depending on whether the waste is accumulated in containers or tanks) and with other requirements specified in § 262.34. Small-quantity generators (i.e., generators who generate more than 100 kilograms but less than 1,000 kilograms per calendar month) are allowed to accumulate waste on site for up to 180 days or, if they must ship waste off site for a distance of 200 miles or more, and if they meet certain other requirements set out in § 262.34, for up to 270 days.

The promulgated regulation does not create a new exemption for 90-day accumulation, nor does it modify the existing regulation. As the commenter notes, EPA is considering what changes (if any) should be made to § 262.34 (the "90-day rule") under a separate rulemaking (51 FR 25487, July 14, 1986). As part of that effort, EPA currently is evaluating whether air emissions from these and other accumulator tanks, mentioned above, at the generator site should be subject to additional control requirements. Preliminary analysis indicates that 90-day tanks and containers may have significant organic air emissions; consequently, as part of the second phase of TSDF air emission regulations, EPA is considering proposing to modify the exemption to require that 90-day tanks meet the control requirements of the Phase I and II standards. (The multiphased standards development approach for regulating organic air emissions is discussed in section III.C of this preamble.) Until a final decision is made on regulating the emissions from these units, they will not be subject to additional controls. However, EPA does not believe that more generators will use the 90-day exemption if air emission controls are not imposed on these units. Those generators who are eligible for inclusion under § 262.34 are probably already taking advantage of the provision now by storing their hazardous wastes for less than 90 days.

LDAR Program

Comment: Several commenters criticized the incorporation of the national emission standard for hazardous air pollutants (NESHAP) for benzene because of differences in scope from the SOCM I NSPS in that (1) the NSPS distinguishes between light and heavy liquids and the proposed standards based on the benzene NESHAP do not; (2) the NSPS does not require testing of all SOCM I units because process fluid vapor pressure is the overriding consideration in predicting leak frequencies and leak rates (the proposed standards incorporating the NESHAP do not

recognize vapor pressure and require testing of all SOCM I units); and (3) the NSPS exempts facilities from routine fugitive emission monitoring, inspection, and repair provisions if a heavy-liquid product from a heavy-liquid raw material is produced and limits monitoring of equipment in heavy-liquid service only to where there is evidence of a potential leak.

Response: The EPA agrees with the commenters that the provisions for light and heavy liquids in the SOCM I NSPS should be incorporated in the section 3004(n) standards, even though the subpart V NESHAP does not contain the distinction. No distinction was made for the benzene NESHAP because benzene is a light liquid. By their nature, heavy liquids exhibit much lower volatilities than do light liquids and because equipment leak emissions have been shown to vary with stream volatility, emissions for heavy liquids are less than those for lighter and more volatile ones. As previously noted, EPA analyses have determined that the emission rate for a valve in heavy-liquid service is more than 30 times less than the emission rate for a valve in light-liquid service. In response to these comments, EPA examined the emission and risk associated with light- and heavy-liquid waste streams and found that light-liquid streams are the overwhelming contributors to both emissions and risk. Therefore, a routine LDAR monthly inspection is not necessary for heavy liquids.

Thus, the final regulations have been changed to incorporate the light/heavy-liquid service provisions for pumps and valves (40 CFR parts 264 and 265, subpart BB, §§ 264.1052, 264.1057, 265.1052, and 265.1057). Equipment is in light-liquid service if the vapor pressure of one or more of the components is greater than 0.3 kPa at 20 °C, if the total concentration of the pure components having a vapor pressure greater than 0.3 kPa at 20 °C is equal to or greater than 20 percent by weight, and if the fluid is a liquid at operating conditions. The 0.3-kPa vapor pressure criterion is based on fugitive emission data gathered in various EPA and industry studies (EPA-450/3-82-010). Equipment processing organic liquids with vapor pressures above 0.3 kPa leaked at significantly higher rates and frequencies than did equipment processing streams with vapor pressures below 0.3 kPa. Therefore, EPA elected to exempt equipment processing lower vapor pressure substances (i.e., heavy liquids) from the routine LDAR requirements of the standards. In addition, monitoring of equipment in heavy-liquid service is

required only where there is evidence by visual audible olfactory, or any other detection method of a potential leak.

Comment: Several commenters asked EPA to consider exemptions from fugitive emission monitoring for small facilities based on volume (as was done in the benzene NESHAP and the SOCM I NSPS), emission threshold, product applicability threshold or equipment component count, or equipment size. In support, the commenters pointed to similar exemptions in the CAA rules that were in the proposed standards.

Response: The commenters suggest that EPA consider other exemptions for fugitive emission monitoring that are applied in the benzene NESHAP or SOCM I NSPS (e.g., small facilities with the design capacity to produce less than 1,000 Mg/yr). The EPA recognizes that estimated emissions and health risks from small facilities should be considered in the final rules. With regard to the SOCM I NSPS small-facility exemption, the cutoff was based on a cost-effectiveness analysis. Under section 111 of the CAA, EPA may exempt units where costs of the standards are unreasonably high in comparison to the emission reduction achievable. Under RCRA, the statutory criterion is protection of human health and the environment. Therefore, any cutoff for RCRA standards must be risk-based. Cost effectiveness is only a relevant factor for choosing among alternatives either (1) when they all achieve protection of human health and the environment or (2) for alternatives that are estimated to provide substantial reductions in human health and environmental risks but do not achieve the historically acceptable levels of protection under RCRA, when they are equally protective.

In the benzene NESHAP (49 FR 23498, June 6, 1984), EPA concluded that control of units producing less than 1,000 Mg/yr did not warrant control based on the small health-risk potential. The benzene standards, however, did not have to deal with the many different pollutants covered by the TSDF process vent and equipment leak standards, some of which are much more carcinogenic than benzene. In addition to unit size (or throughput), fugitive emissions are also a function of the chemical characteristics of the hazardous wastes being handled.

Typically, TSDF have a variety of hazardous waste management processes (e.g., container storage, tank storage, treatment tanks, incinerators, injection wells, and terminal loading operations) located at the same facility, all of which have associated pumps, valves,

sampling connections, etc., and therefore, fugitive emissions from equipment leaks. Also, several different types of hazardous waste typically are managed at a facility. Because of the various factors affecting facility fugitive emissions from equipment leaks (e.g., equipment leak emissions are a function of component counts rather than waste throughput), it would be very difficult to determine a small-facility exemption based on risk but expressed as volume throughput. For these reasons, EPA did not include exemptions for fugitive emission monitoring such as those applied in the benzene NESHAP or SOCOMI NSPS (i.e., small process units with the design capacity to produce less than 1,000 Mg/yr).

Comment: Commenters stated that the TSDF fugitive emission standards should conform to the benzene NESHAP, which allows exemptions for vacuum systems, systems with no emissions, and systems whose leakage rate is demonstrated to be below 2 percent.

Response: The EPA has included in the final TSDF standards (§§ 264.1050 and 265.1050) the exemption for equipment "in vacuum service" found in the benzene NESHAP (40 CFR part 61, subpart V, 61.242-1). Also included are the identification requirements contained in the regulation, "In vacuum service" means that equipment is operating at an internal pressure that is at least 5 kPa below ambient pressure. The EPA has concluded that it is unnecessary to cover equipment "in vacuum service" because such equipment has little if any potential for emissions and, therefore, does not pose a threat to human health and the environment. Accordingly, this equipment has been excluded from the equipment leak fugitive emission requirements.

The proposed standards stated that owners and operators of facilities subject to the provisions of the rule must comply with the requirements of 40 CFR part 61, subpart V (equipment leak standards for hazardous air pollutants), except as provided in the rule itself. The provisions of the proposed rule did not exclude §§ 61.243-1 and 61.243-2 (alternative standards for valves in VHAP service), and the alternative standards have been incorporated as §§ 264.1061, 264.1062, 265.1061, and 265.1062 of the final rule. Therefore, an owner or operator may elect to have all valves within a TSDF hazardous waste management unit comply with an alternative standard that allows a percentage of valves leaking of equal to or less than 2 percent (§§ 264.1061 and

265.1061), or may elect for all valves within a hazardous waste management unit to comply with one of the alternative work practices specified in paragraphs (b) (2) and (3) of §§ 264.1062 and 265.1062.

Comment: One commenter suggested that releases from pressure relief devices in gas service should be directed to control equipment at least equal in performance to those for other process sources or an alternative means provided to prevent an uncontrolled discharge. According to the commenter, rupture discs or closed-vent systems restrict small leaks but not major releases; a closed-vent system connected to a control device is needed to capture releases. The commenter concluded that EPA has provided no data to support exempting flanges and pressure relief devices in liquid service from LDAR requirements and should not rely on operators to see, hear or smell leaks from this equipment.

Response: Pressure relief devices allow the release of vapors or liquids until system pressure is reduced to the normal operating level. The standards are geared toward control of routine low-level equipment leaks that may occur independently of emergency discharges. Pressure relief discharges are an entirely different source of emissions than equipment leaks or process vents and were not covered in the original equipment leak standards under the CAA. The new subpart BB rules require that pressure relief devices in gas service be tested annually by Method 21 (and within 5 days of any relief discharge) to ensure that the device is maintained at no detectable emissions by means of a rupture disc. In addition, because a pressure discharge constitutes a process upset that in many cases can lead to hazardous waste management unit downtime and might also pose a risk to workers, a facility has the incentive to minimize the occurrence of these events.

The frequency, duration, and air emissions associated with such emergency discharges at TSDF waste management units currently cannot be estimated with any certainty on a nationwide basis. However, if a pressure discharge does occur, records and reports (maintained at the site under §§ 264.1054, 264.1064, 265.1054, and 265.1064 of subpart BB) will indicate the frequency of such discharges, the estimated volume of excess emissions and other relevant information. If pressure discharges appear to be a problem at any facility the RCRA permitting system provides State or EPA permit writers the flexibility to require

closed-vent systems for these discharges on a site-specific basis.

The LDAR program transferred from the CAA standards does not exempt pressure relief devices in light liquid or heavy liquid service and flanges, but requires formal monitoring of these sources if operators see, smell, or hear discharges. The EPA considers that this is the most practical way to manage these sources. Although scheduled routine maintenance may be a way of avoiding the need for formal monitoring, it may not be a successful method for all sites in eliminating leaks due to the numerous variables affecting leak occurrence. For example, flanges may become fugitive emission sources when leakage occurs due to improperly chosen gaskets, poorly assembled flanges, or thermal stress resulting in the deformation of the seal between the flange faces. In these situations, operators will be able to detect such leaks by sight, smell, or sound. Support for this approach was presented and evaluated in developing several CAA rulemakings (EPA-450/3-83-016b, EPA-450/3-80-033b, and EPA-450/3-81-015b).

Comment: One commenter stated that the LDAR program should require preventive maintenance, such as the periodic replacement of valve packings, before waiting for the valve to fail. In support, the commenter argued that EPA's own data show that directed maintenance could reduce leaks from valves to below 10,000 ppm. The commenter also criticized the 10,000-ppm leak definition as being too high and states that EPA must consider the level in terms of the health effects.

Response: The key criterion for selecting a leak definition is the overall mass emission reduction demonstrated to be achievable. The EPA has not concluded that an effective lower leak definition has been demonstrated. Most data developed for current CAA standards (EPA-450/3-82-010) on leak repair effectiveness have applied 10,000 ppm as the leak definition and therefore do not indicate the effectiveness of repair for leak definitions between 1,000 and 10,000 ppm. Even though limited data between these values were collected for support of CAA standards, they are not sufficient to support a leak definition below 10,000 ppm. Data are insufficient to determine at what screening value maintenance efforts begin to result in increased emissions.

As the commenter noted, although there is some evidence that directed maintenance is more effective, available data are insufficient to serve as a basis

for requiring directed maintenance for all sources.

(Note: In "directed maintenance" efforts, the tightening of the packing is monitored simultaneously and is continued only to the extent that it reduces emissions. In contrast, "undirected" repair means repairs such as tightening valve packings without simultaneously monitoring the result to determine whether the repair is increasing or decreasing emissions.)

The EPA's rationale for selecting the 10,000-ppmv leak definition and for not requiring directed maintenance under the CAA LDAR program also has been discussed in the proposal and promulgation BIDs for benzene emissions from coke by-product recovery plants (EPA-450/3-83-016 a and b), for SOCOMI fugitive emissions (EPA-450/3-80-033 a and b), for petroleum refinery fugitive emissions (EPA-450/3-81-015 a and b), and for benzene fugitive emissions (EPA-450/3-80-032 a and b). (See also the "Response to Public Comments on EPA's Listing of Benzene Under section 112" (EPA-450/5-82-003) "Fugitive Emission Sources of Organic Compounds—Additional Information on Emissions, Emission Reductions, and Costs" (EPA-450/3-82-010), and EPA's "Response to Petition for Reconsideration" (50 FR 34144, August 23, 1985).)

The commenter also criticizes EPA for not reanalyzing the health effects of the 10,000-ppmv level before applying the limit to TSDF under RCRA. Because section 112 of the CAA and 3004(n) of RCRA are comparable in their recognition of health risk as the predominant decision factor, the EPA believes that the leak definition has been adequately analyzed under the CAA and that further evaluation is not needed prior to transferring it as part of the LDAR program under RCRA. It must also be pointed out that transfer of the CAA equipment leak standards is only the first phase of EPA's regulatory actions related to control of TSDF air emissions. In this phase, EPA transferred a known technology to reduce emissions. If new data show that a lower leak definition is appropriate, EPA will then consider whether it is appropriate to change the rules.

C. Control Technology

Feasibility of Condensers

Comment: Several commenters did not agree that condensers provide a feasible means of meeting the 95-percent emission reduction requirement for affected process vents in the proposed standard. Problems cited by the commenters limiting the application of condensers included the presence of

water in the waste stream in the TSDF portion of the facility and the wide variety of waste solvents treated by WSTF. One commenter claimed that a higher emission reduction efficiency could be achieved through an increased condenser area or a different condenser refrigerant with a lower boiling point than was used in the analysis for the proposal.

Response: In response to this comment, the feasibility of using condensers to achieve a 95-percent reduction of emissions from WSTF process vent streams was reexamined using a state-of-the-art chemical engineering computerized process simulator that includes a refrigeration unit capable of producing a coolant at a temperature as low as -29°C (-20°F) and a primary water-cooled heat exchanger to remove water vapor from the vent stream.

A variety of chemical constituents and operating conditions were examined to determine the organic removal efficiency achievable through condensation. The constituents selected for the condenser analysis (toluene, methyl ethyl ketone (MEK), 1,1,1 trichloroethane (TCE), and methylene chloride) were judged to be representative of the solvents recycled by the WSTF industry, based on a review of a National Association of Solvent Recyclers (NASR) survey, numerous site-specific plant trip reports, and responses to EPA section 3007 information requests. Three of these four solvents had been used in the proposal analysis; methylene chloride, at the lower end of the solvent boiling point range (i.e., more difficult to condense), was added to provide a broader range of volatilities for the condenser analysis. A total of 40 WSTF model unit cases consisting of combinations of organic emission rates, concentrations, and exhaust gas flows representing the wide range of operating conditions found at WSTF were included in the condenser analysis.

The results of the condenser analysis indicate that condensers cannot universally achieve a 95-percent emission reduction when applied to WSTF process vents. With regard to increasing organic removal efficiency by increasing condenser area or changing the condenser refrigerant, the analysis shows that there are technical limits on condenser efficiency that go beyond the condenser design and operating parameters. Specifically, the physical properties of the solvents being condensed and the solvent concentration in the gas stream affect condenser efficiency. In some situations, the partial pressure of the organic

constituent in the vapor phase was too low to support a liquid phase thermodynamically regardless of the refrigerant used or condensation area; as a result, no appreciable condensation could occur. Therefore, the analysis shows that condensers are not universally applicable to the control of WSTF process vents. However, the facility process vent emission reduction requirements are not based solely on the use of condensers; carbon adsorption and incinerators/flares are capable of attaining a 95-percent control efficiency for all WSTF organics, including cases where condensation is not feasible. In summary, although condensers may not by themselves achieve a 95-percent emission reduction at all process vents, condensers do provide a practical and economic means of reducing process vent emissions, and these devices will likely be the initial choice of control technology for cases where condensation is feasible.

Feasibility of Carbon Adsorbers

Comment: Several commenters objected to the identification of carbon adsorption as a control technique because of technical and safety concerns related to the application of carbon adsorbers to low organic concentration and multicomponent solvent streams. However, one commenter did cite authorities that support a 98-percent removal for this type of control device.

Response: First it should be noted that carbon adsorption is one of several control technologies that could be used to attain the standards. Other technologies include condensers, flares, incinerators, and any other device that the owner or operator can show will meet the standards.

Regarding carbon adsorption applications, EPA acknowledges that safety is an important consideration, but concludes that any safety problems can be avoided through proper design and sorbent selection. Multicomponent systems potentially can lead to excessive heat buildup (hot spots), particularly in large carbon beds with low flow rates, which in turn can lead to fire and explosion hazards. Multicomponent vapor streams can also lead to reduced removal efficiencies for particular components. However, these technical and efficiency problems can be overcome through proper design, operation, and maintenance.

In general, coal-based carbons have fewer heat generation problems than do wood-based carbons, and small diameter beds promote good heat transfer. The bed must be designed with

consideration for the least heat adsorbent (or fastest) component in the mix, as well as the component concentrations and overall flow rate. Other considerations include component interaction, gas stream relative humidity, and close monitoring of the bed effluent for breakthrough.

In response to these comments, the EPA examined carbon adsorption design, operation, and performance data from a number of plants in a wide variety of industries; in addition, the EPA has reexamined, with the help of carbon manufacturers and custom carbon adsorption equipment designers, the elements that affect carbon adsorption efficiency. This analysis has reinforced EPA's original conclusion that a well-designed, -operated, and -maintained adsorption system can achieve a 95-percent control efficiency for all organics under a wide variety of stream conditions over both short-term and long-term averaging periods. The major factors affecting performance of an adsorption unit are temperature, humidity, organics concentration, volumetric flow rate "channelling" (nonuniform flow through the carbon bed), regeneration practices, and changes in the relative concentrations of the organics admitted to the adsorption system. The WSTF/TSDf process vent stream characteristics are typically well within design limits in terms of gas temperature, pressure, and velocity for carbon adsorbers. For example, the bed adsorption rate decreases sharply when gas temperatures are above 38 °C (100 °F); a review of plant field data showed no high-temperature streams in WSTF/TSDf process vents. If high-temperature gas streams are encountered, the gas stream can be cooled prior to entering the carbon bed. Also, gas velocity entering the carbon bed should be low to allow time for adsorption to take place. The WSTF/TSDf stream flows are typically quite low and, as a result, bed depth should not be excessive.

Therefore, EPA concluded that, for WSTF/TSDf process vent streams, carbon adsorption can reasonably be expected to achieve a 95-percent control efficiency provided the adsorber is supplied with an adequate quantity of high-quality activated carbon, the gas stream receives appropriate conditioning (e.g., cooling or filtering) before entering the carbon bed, and the carbon beds are regenerated or replaced before breakthrough. The data gathered in the EPA carbon adsorption performance study do not support a higher control efficiency (i.e., 98 percent as opposed to 95 percent) for carbon adsorption units applied to WSTF/TSDf

process vents on an industrywide basis, particularly in light of the design considerations related to controlling multicomponent vent streams when the organic mix is subject to frequent change.

When carbon adsorption is used to remove organics from a gas stream, the carbon must periodically be replaced or regenerated when the capacity of the carbon to adsorb organics is reached. When either regeneration or removal of carbon takes place, there is an opportunity for organics to be released to the atmosphere unless the carbon removal or regeneration is carried out under controlled conditions. There would be no environmental benefit in removing organics from an exhaust gas stream using adsorption onto activated carbon if the organics are subsequently released to the atmosphere during desorption or during carbon disposal. The EPA therefore expects that owners or operators of TSDf using carbon adsorption systems to control organic emissions take steps to ensure that proper emission control of regenerated or disposed carbon occurs. For on-site regenerable carbon adsorption systems, the owner or operator must account for the emission control of the desorption and/or disposal process in the control efficiency determination. In the case of off-site regeneration or disposal, the owner or operator should supply a certification, to be placed in the operating file of the TSDf, that all carbon removed from a carbon adsorption system used to comply with subparts AA and BB is either (1) regenerated or reactivated by a process that prevents the release of organics to the atmosphere. (Note: The EPA interprets "prevents" as used in this paragraph to include the application of effective control devices such as those required by these rules) or (2) incinerated in a device that meets the performance standards of subpart 0.

Feasibility of Using Controls in Series

Comment: One commenter stated that EPA should evaluate carbon adsorption in series with a condenser because condensers work best with concentrated streams and carbon adsorbers with low concentration streams. The two systems together could yield an overall efficiency of 99 percent, even if each unit were only 90-percent effective.

Response: As discussed in section VII.E, the MIR from process vents after control (i.e., 4×10^{-9}) is within the range of what has been considered acceptable under RCRA. Consequently, no further control for process vents was considered necessary at this time. Nonetheless, in response to these

comments, EPA evaluated the feasibility of using a carbon adsorber in series with a condenser to control WSTF/TSDf process vent emissions. The objective of the analysis was to determine if the combination of control devices would yield an overall control efficiency greater than the 95 percent that is achievable using a single device. For example, if a 99-percent overall control efficiency is desired and it is assumed that the carbon adsorber is capable of achieving a 95-percent control efficiency in all cases (a reasonable assumption for a properly designed, operated, and maintained system), then a minimum efficiency of 80 percent would be required for the condenser followed in series by the 95-percent efficient carbon bed. However, in the EPA condenser analysis conducted for the WSTF model unit cases, an 80-percent control was not achieved for 16 of the 40 cases examined. (See section 7.7 of the BID.) In 7 of the 40 cases, the analysis showed that no appreciable condensation would occur because of low solvent concentration and/or the high volatility of some solvents. Because the model unit cases are considered representative of current WSTF operations, EPA does not believe that the use of carbon adsorption and condensation in series to achieve a 99-percent control is a technically feasible control option on an industrywide basis. Such control strategies will be considered further for Phase III standards for individual facilities, if necessary, should additional analyses reveal unexpectedly high risks in specific situations.

Feasibility of Flares

Comment: Several commenters objected to the use of flares at recycling facilities because of technical and safety concerns. A few commenters cite the requirement of a constant emission source for efficient flare operation, and other commenters contend that flares are not suitable on intermittent sources or the low-level emissions typical of recycling operations. With regard to safety, flares present the danger of explosion, especially if they malfunction; according to one commenter, many State laws prohibit the use of flares at recycling facilities.

Response: Available information on WSTF operations indicates that condensers, carbon adsorbers, and incinerators are the most widely used control technologies; therefore, they are expected to be the technologies of choice to reduce organic emissions at WSTF. The final technical analyses show that a 95-percent control efficiency can be achieved with secondary

condensers for many WSTF process vents or with carbon adsorbers in cases where secondary condensers are not feasible. Flares are not required controls, but are an available option for facilities so equipped provided they meet the criteria established in the final rules. Where State laws prohibit the use of flares at recycling facilities, other technologies are available.

With regard to the safety of flares, EPA has determined that the use of flares to combust organic emissions from TSDF process vents would not create safety problems if engineering precautions such as those used in the SOCOMI are taken in the design and operation of the system. The following are typical engineering precautions. First, the flare should not be located in such proximity to a process unit being vented that ignition of vapors is a threat to safety. In the analysis conducted for this standard at proposal, it was assumed that the flare would be located as far as 122 meters from the process unit. Second, controls such as a fluid seal or flame arrestor are available that would prevent flashback. These safety precautions were considered in EPA's analysis for the proposed rule. Finally, the use of a purge gas, such as nitrogen, plant fuel gas, or natural gas and/or the careful control of total volumetric flow to the flare would prevent flashback in the flare stack caused by low off-gas flow.

Feasibility of LDAR Program

Comment: One commenter opposed the fugitive standards as proposed because they failed to require the proper technology to control releases from pumps and valves. The commenter claimed that the standards should require a 100-percent control, based on what available technology (e.g., sealed bellows valves, sealless pumps, or dual mechanical seals for pumps) can achieve. According to the commenter, superior emission controls cannot be rejected under RCRA solely on the basis of cost effectiveness.

Response: Control technologies for fugitive emissions from equipment leaks, as required by the proposed standards, include the use of control equipment, inspection of process equipment, and repair programs to limit or reduce emissions from leaking equipment that handle streams with total organic concentrations of greater than 10 percent. These control technologies have been studied and evaluated extensively by EPA for equipment containing fluids with 10 percent or more organics and are similar to those required by national emission standards for chemical,

petrochemical, and refining facilities under the CAA.

A monthly LDAR program was proposed for WSTF/TSDF pumps and valves. Based on results of the EPA's LDAR model, once a monthly monitoring plan is in place, emission reductions of 73 percent and 59 percent can be expected for valves in gas and light liquid service, respectively, and a 81-percent reduction in emissions can be achieved for pumps in light-liquid service. For compressors, the use of mechanical seals with barrier fluid systems and control of degassing vents (95 percent) are required, although compressors are not expected to be commonly used at WSTF/TSDF. The use of control equipment (rupture disc systems or closed-vent systems to flares or incinerators) is the technical basis for control of pressure relief devices. Closed purge sampling is the required control for sampling connection systems and is the most stringent feasible control. For open-ended valves or lines the use of caps, plugs, or any other equipment that will close the open end is required; these are the most stringent controls possible. Flanges and pressure relief devices in liquid service are excluded from the routine LDAR requirements but must be monitored if leaks are indicated. For operations such as those expected at WSTF/TSDF, total reductions in fugitive emissions from equipment leaks of almost 75 percent are estimated for the entire program.

The EPA agrees with the commenter that the level of control required by the LDAR program does not result in the highest level of control that could be achieved for fugitive emissions from pumps and valves in certain applications. In some cases, there are more stringent, technologically feasible controls. For example, leakless equipment for valves, such as diaphragm and sealed bellows valves, when usable, eliminates the seals that allow fugitive emissions; thus, control efficiencies in such cases are virtually 100 percent as long as the valve does not fail. In appropriate circumstances, pumps can be controlled by dual mechanical seals that would capture nearly all fugitive emissions. An overall control efficiency of 95 percent could be achieved with dual mechanical seals based on venting of the degassing reservoir to a control device.

With regard to leakless valves, the applicability of these types of valves is limited for TSDF, as noted by EPA in the proposal preamble. The design problems associated with diaphragm valves are the temperature and pressure limitations of the elastomer used for the diaphragm.

It has been found that both temperature extremes and process liquids tend to damage or destroy the diaphragm in the valve. Also, operating pressure constraints will limit the application of diaphragm valves to low-pressure operations such as pumping and product storage facilities.

There are two main disadvantages to sealed bellows valves. First, they are, for the most part, only available commercially in configurations that are used for on/off valves rather than for flow control. As a result, they cannot be used in all situations. Second, the main concern associated with this type of valve is the uncertainty of the life of the bellows seal. The metal bellows are subject to corrosion and fatigue under severe operating conditions.

Over 150 types of industries are included in the TSDF community, and EPA does not believe that leakless valves can be used in an environmentally sound manner on the wide variety of operating conditions and chemical constituents found nationwide in TSDF waste streams, many of which are highly corrosive. Corrosivity is influenced by temperature and such factors as the concentration of corrosive constituents and the presence of inhibiting or accelerating agents. Corrosion rates can be difficult to predict accurately; underestimating corrosion can lead to premature and catastrophic failures. Even small amounts (trace quantities) of corrosives in the stream can cause corrosion problems for sealed bellows valves; these tend to aggressively attack the metal bellows at crevices and cracks (including welds) to promote rapid corrosion. Sealed bellows valves particularly are subject to corrosion because the bellows is an extremely thin metallic membrane.

At proposal, it was estimated that 20 percent of all plants process halogenated compounds, which tend to be highly corrosive. The subsequently obtained 1986 Screener Survey data show that, of the TSDF indicating solvent recovery operations, at least 33 percent of the total handle halogenated organics. Furthermore, of the 12 major chemicals determined from site-specific data to be commonly occurring in waste solvent streams, all of the chemicals determined to be carcinogenic are halogenated (i.e., methylene chloride, chloroform, and carbon tetrachloride). Similarly, of the 52 constituents in TSDF waste streams contributing to the emission-weighted unit risk factor, about 50 percent are halogenated and account for the vast majority of the estimated nationwide emissions of

carcinogens. Thus, TSDF are known to routinely handle and treat chemicals that may destroy sealed bellows and diaphragm valves.

The durability of metal bellows is highly questionable if the valve is operated frequently; diaphragm and bellows valves are not recommended in the technical literature for general service. The EPA does not believe that the application of sealed bellows and diaphragm valves is technologically feasible for all TSDF valve conditions or that their application would lead to a significant reduction in emissions and health risks. Valve sizes, configurations, operating temperatures and pressures, and service requirements are some of the areas in which diaphragm, pinch, and sealed bellows valves have limitations that restrict service. With regard to the emission reductions achieved by sealed bellows, diaphragm, and pinch valve technologies, these valves are not totally leakless. The technologies do eliminate the conventional seals that allow leaks from around the valve stem; however, these valves do fail in service from a variety of causes and, when failure occurs, these valves can have significant leakage. This is because these valves generally are not backed up with conventional stem seals or packing. The EPA currently is reevaluating the control efficiencies assigned to these technologies. Because these leakless types of equipment are limited in their applicability and in their potential for reducing health risks, EPA did not consider their use as an applicable control alternative at this time for nationwide TSDF standards. The EPA has requested, in a separate Federal Register notice (54 FR 30220, July 19, 1989), additional information on the applicability and use of leakless valves at TSDF.

For pumps, the most effective controls that are technologically feasible (e.g., dual seals) in some cases also were not selected as the basis for equipment leak standards. The impact analysis indicates that including LDAR results in less emission and risk reduction than does including equipment requirements for pumps. However, the difference in the emission and health risk reductions attributable to implementing a monthly LDAR program rather than the more stringent equipment standards for pumps appears to be small in comparison to the results of the overall standards (about 5 percent). The overall standards, including a LDAR program for pumps and valves, would achieve an expected emission reduction for TSDF equipment leaks of about 19,000 Mg/yr

(21,000 ton/yr). The estimated MIR from equipment leak emissions would be reduced to 1×10^{-3} from 5×10^{-3} based on the TSDF equipment leak emission-weighted unit risk factor; cancer incidence would be reduced to 0.32 case/yr from 1.1 cases/yr. In comparison, including dual seals for pumps could achieve an additional fugitive emission reduction of about 1,200 Mg/yr (1,320 ton/yr) and an additional incidence reduction of about 0.06 case/yr. The MIR, with leakless controls for pumps, at 1×10^{-3} would be unchanged from that achieved by the LDAR program.

Given the small magnitude and the imprecise nature of the estimated emission and risk reductions associated with including dual seals for pumps in the overall standard, EPA considers the two control alternatives (i.e., LDAR and dual seals) as providing essentially the same level of protection. The data and models on which the risk estimates are based are not precise enough to quantify risk meaningfully to a more exact level. The data and models include uncertainties from the emission estimates, the air dispersion modeling, and the risk assessment that involves unit risk factor, facility location, population, and meteorologic uncertainties (see section VII.E).

The EPA considered these factors when deciding whether to require TSDF to install dual seals on pumps to control air emissions rather than to rely on monthly LDAR. Considering the limited applicability of additional equipment controls and the low potential for additional reductions in health risks of applying equipment controls for valves at TSDF and the estimated emissions and risk reductions if leakless equipment for pumps were required, EPA is not requiring leakless equipment at this time.

In Phase III, EPA will further examine the feasibility and impacts of applying additional control technology beyond the level required by today's standards. For example, dual mechanical seals may be an appropriate emission control method when applied selectively to wastes with high concentrations of toxic chemicals. In such applications, the reduction in toxic emissions (and consequently the reduction in residual risk) may be significant for select situations. A summary of the health impacts is presented in section VII.E of this preamble.

D. Impact Analyses Methodologies

Environmental Impacts Analysis

Comment: Numerous commenters criticized the environmental impact

estimates for the proposed standards because (1) no actual data from operating facilities were used; (2) emission estimates were not supported by any technical data base; and (3) the waste constituents used in the analyses were not representative of waste solvent recycling operations and TSDF operations in general. Commenters also stated that the model plant solvent reclamation rates (throughputs), vent flow rates, and emission rates used at proposal were not representative of the industry.

Response: In response to these comments, EPA reviewed all available site-specific data on WSTF and TSDF, data submitted by commenters, and information generated through RCRA section 3007 questionnaires mailed to a limited number of small and large facilities. Based on all this information, EPA has revised both the TSDF model units and emission factors that serve as the bases for the impacts analyses.

With regard to the model unit revisions, the industry profile developed by EPA includes a frequency distribution of the waste volumes processed during 1985. Of the 450 facilities in the Screener Survey reporting solvent recovery by operations such as batch distillation, fractionation, or steam stripping that involved some form of hazardous waste, 365 reported the total quantity of waste recycled in 1985. The median facility throughput was slightly more than 189,000 L/yr (50,000 gal/yr); the mean throughput was about 4.5×10^6 L/yr (1.2×10^6 gal/yr). Based on the industry profile, three sizes of model units (small, medium, and large) were defined to facilitate the post-proposal analyses for control costs, emission reductions, health risks, and economic impacts.

The organic emission rates also were revised for the model units based on emission source testing conducted for EPA. The test data show that organic emission rates for primary condensers varied from a few hundredths of a kilogram (pound) to nearly 4.5 kg/h (10 lb/h), with six of the nine measurements less than 0.45 kg/h (1 lb/h). The two secondary condensers tested showed emission rates of 0.9 and 2.3 kg/h (2 and 5 lb/h), respectively.

The flow rate of 26 standard cubic feet per minute (scfm) used at proposal was found not to be generally valid for application to waste solvent recyclers. The flow rates specified for the revised model units, 3.9, 0.6, and 0.3 L/s, equivalent to 8.3, 1.2, and 0.6 scfm for the large, medium, and small model units, respectively, are based on a review of site-specific data from field

tests documented in site visit reports. The large and medium TSDF process vent unit flow rates also agree with those documented in the SOCOMI Distillation NSPS BID (see Docket No. F-86-AESP, item S0008) as characterizing distillation units with low overhead gas flows. The revised impact analyses are based on actual data from the industry and provide a reasonable characterization of the industry's operations and environmental impacts.

The constituents selected for the analysis of control technologies are considered to be representative of the industry, based on a review of relevant information and literature, including (1) a survey of member companies submitted by NASR, (2) 23 site-specific plant visit reports, (3) responses to the EPA section 3007 Questionnaires from 6 small and 11 large facilities (two respondents provided information for 4 facilities each), (4) the Industrial Studies Data Base (ISDB) and (5) a data base created by the Illinois EPA. The NASR survey provided information on the types of solvents most frequently recycled at member facilities; the site-specific information and EPA survey responses included waste composition data. The ISDB is a compilation of data from ongoing, in-depth surveys by EPA's Office of Solid Waste (OSW) on designated industries that are major waste generators. The Illinois EPA data base contains information from about 35,000 permit applications. Generators must submit one application for each hazardous and special nonhazardous waste stream managed in the State of Illinois. Each of these data bases contains waste stream characterization data for numerous generic spent solvent waste streams (EPA Hazardous Wastes F001-F005) and D001 wastes (ignitable), which information from the Screener Survey indicates also are recycled.

The three constituents used for the model facilities in the proposal analysis were toluene (with a boiling point (bp) of 110 °C), MEK (bp of 79 °C), and TCE (bp of 74 °C). Methylene chloride (bp of 40 °C) was added to the list of constituents evaluated in the final analysis to provide an even greater range of solvent volatilities for the analysis. Therefore, the technical feasibility and costs of applying the recommended control techniques were evaluated for constituents representing the range of characteristics and volatilities of commonly recycled solvents at TSDF.

Comment: Commenters also stated that it is inappropriate to apply the fugitive emission factors to TSDF that were developed to estimate leaks from a

typical hydrocarbon plant because they do not relate to the design, operating conditions, maintenance practices, or controls associated with processing of waste solvents and other toxic wastes. According to the commenters, the emission factors and model units also need adjustment to account for volatility because not accounting for differences in vapor pressure overestimates risk as well as emissions and underestimates costs for controls.

Response: The EPA disagrees; the data used in establishing the fugitive emission standards for TSDF are based on emission and process data collected at a variety of petroleum refinery and SOCOMI operating units. The EPA Industrial Environmental Research Laboratory (IERL) coordinated a study to develop information on fugitive emissions in the SOCOMI. A total of 24 chemical process units were tested; these data covered thousands of screened sources (pumps, valves, flanges, etc.) and included units handling such chemicals as acetone, phenol, MEK, ethylene dichloride, TCE, trichloroethylene, and perchloroethylene.

Refinery studies on fugitives also include tests on units handling both toluene and xylene. These same chemicals are included in those listed by the NASR as solvents commonly recycled by member facilities and are found in other sources of waste solvent constituent information that are described in the BID. The chemicals commonly recycled at TSDF are those produced in SOCOMI operating units and handled in petroleum refineries, and the equipment involved in these industries is typically the same (pumps, valves, etc.). Therefore, it is reasonable to conclude that the emissions associated with these chemicals and equipment are similar and to expect similar emission control performance and efficiencies at hazardous waste management units.

The EPA agrees that the equipment leak standards should take component volatility into consideration. Previous EPA and industry studies have shown that the volatility of stream components, as a process variable, does correlate with fugitive emission and leak rates. An analysis of the vapor pressures and emission rates has shown that substances with vapor pressures of 0.3 kPa or higher had significantly higher emission and leak rates than did those with lower vapor pressures (EPA-450/3-82-010). This result led to the separation of equipment component emissions by service: gas/vapor, light liquid, and heavy liquid. These classifications have been used in most CAA fugitive

emission standards to effectively direct the major effort toward equipment most likely to leak. Therefore the rules have been revised to account for volatility. For example, pumps and valves in heavy-liquid service must be monitored only if evidence of a potential leak is found by visual, audible, olfactory, or any other detection method. The determination of light- and heavy-liquid service is based on the vapor pressure of the components in the stream (less than 0.3 kPa at 20 °C defines a heavy liquid).

All of the constituents used in the model unit analysis, representing the ranges of characteristics of commonly recycled solvents, are light liquids to which the benzene and SOCOMI fugitive emission factors are applicable. Therefore, the revised risk and cost analyses for WSTF equipment leak fugitive emissions are based on the fugitive emission factors used in the proposal analysis. The analyses of risk and cost impacts on TSDF with affected fugitive emission sources also were revised after proposal to account for the differences in light and heavy liquids.

Health Risk Impacts Analysis

Comment: Several commenters objected to the limited support provided for selection and derivation of the unit risk factors used in the analysis of cancer risks and contend that the risk analysis and unit risk factors are not representative of the wide variety of wastes handled. A few of the commenters stated that the upper-bound risk factor was too high, and others stated it was too low.

Response: The selection of the range of unit risk factors (i.e., 2×10^{-7} and 2×10^{-5} ($\mu\text{g}/\text{m}^3$)⁻¹) used at proposal to estimate the cancer risk resulting from TSDF emissions was based on an analysis of the organic chemicals associated with TSDF operations. This analysis found that carbon tetrachloride is the organic chemical with the most individual impact vis-a-vis emissions and risk. Thus, it was used as the upper bound on the range of unit risk factors used to calculate health impacts (i.e., cancer risk) at proposal. However, this range of unit risk factors was not used in the final analysis.

Based on public comments, EPA revised its health risk impacts analysis. To estimate the cancer potency of TSDF air emissions in the revised analysis, an emission-weighted composite unit cancer risk estimate approach was used by EPA to address the problem of dealing with the large number of toxic chemicals that are present at many TSDF. Use of the emission-weighted

composite factor rather than individual component unit cancer risk factors simplifies the risk assessment so that calculations do not need to be performed for each chemical emitted. The composite unit cancer risk factor is combined with estimates of ambient concentrations of total organics and population exposure to estimate risk due to nationwide TSDF emissions. In calculating the emission-weighted average unit risk factor, the emission estimate for a compound is first multiplied by the unit cancer risk factor for that compound; then the emission-weighted average is computed by summing these products and dividing the sum by the total nationwide TSDF emission value, which includes both carcinogenic and noncarcinogenic organic emissions. Using this type of average would give the same results as calculating the risk for each chemical involved. However, only those carcinogens for which unit risk factors are available were included in the analysis of cancer risk under this approach.

Through use of the EPA's TSDF Waste Characterization Data Base (WCDB) (discussed in appendix D of the BID) and a computerized model developed for analysis of the regulatory options for TSDF emission sources, EPA estimated total nationwide TSDF organic emissions by specific waste constituent. Thirty-nine chemicals were identified as TSDF organic air pollutant emission constituents emitted from equipment leaks at all types of TSDF waste management processes. Unit cancer risk factors for these constituents were then averaged based on both individual constituent and total nationwide TSDF equipment leak organic emissions to calculate an emission-weighted composite mean TSDF cancer unit risk factor.

Numerous constituents with higher unit risk factors than carbon tetrachloride (including acrylonitrile and ethylene oxide) were included in the calculation of the emission-weighted unit cancer risk factor for TSDF equipment leaks. This emission-weighted unit risk factor value was determined to be $4.5 \times 10^{-6} (\mu\text{g}/\text{m}^3)^{-1}$ and was used to determine the health-related impacts associated with TSDF equipment leak (fugitive) emissions rather than the range of the unit cancer risk factors used at proposal that represented a limited number of chemical compounds emitted at WSTF. A more detailed discussion of the hazardous waste TSDF unit risk factor determination is contained in appendix B of the BID.

Characterization of WSTF waste streams in the final analysis indicates that the constituents used at proposal in the risk analysis are appropriate and representative of the waste solvent recycling industry. However, insufficient nationwide data on WSTF (a subset of the TSDF industry) waste stream chemical constituent quantities and concentrations were available to develop an emission-weighted, arithmetic mean cancer unit risk factor for WSTF process vents. While information on a small number of process vent streams was available for the revised analysis, the data were too limited to support the conclusion that the mix and percentage of constituents found were representative of the entire industry.

The WSTF waste streams and their associated process vent emissions were found to contain a variety of chemical constituents. Those constituents with established risk factors were, in all cases for the plant-specific data, the halogenated organics; these halogenated organic constituent concentrations tended to be quite low, generally less than 1 percent of organics emitted. Therefore, EPA judged, based on the limited data available, that use of a midrange unit risk factor would be appropriate in estimating nationwide health impacts associated with WSTF process vents. The unit cancer risk factor assumed at proposal, $2 \times 10^{-6} (\mu\text{g}/\text{m}^3)^{-1}$, was the geometric midrange between the highest and lowest unit risk factor for the constituents found in the WSTF process vent streams. The composite unit cancer risk factor calculated for the equipment leak emissions agrees favorably with the process vent number used at proposal. Because it is not unreasonable to assume a similar mix of constituents in process vents as in equipment leaks, and because available data do not suggest otherwise, for the purpose of estimating impacts, the same unit cancer risk factor was used for both process vents and equipment leaks, $4.5 \times 10^{-6} (\mu\text{g}/\text{m}^3)^{-1}$.

Comment: Several commenters also stated that the failure to address the weight of evidence for carcinogenicity is inconsistent with EPA's risk assessment guidelines and the principles for assessing cancer risk.

Response: Early in the rulemaking for TSDF, EPA looked at the contribution to total estimated risk (annual incidence) by weight of evidence. At that time, "C" carcinogens accounted for about 5 percent of the total risk, and "A" carcinogens about 10 percent. Thus, for all practical purposes, calculating

separate risk estimates for chemicals in each weight of evidence category adds little to the risk assessment. Moreover, EPA's Guidelines for Carcinogen Risk Assessment (51 FR 33992) and Guidelines for the Health Risk Assessment of Chemical Mixtures (51 FR 34014) do not describe a means to quantitatively incorporate weight of evidence into risk assessments. Thus, there is no inconsistency between the risk assessment guidelines and the presentation of health risk in this rulemaking.

Comment: Other commenters believed that the risk assessment for the proposed standards was flawed because EPA did not consider noncancer health effects and because large uncertainties are introduced when the additive or synergistic effects of carcinogens and the interindividual variability in response are not factored in.

Response: The EPA does recognize that health effects other than cancer may be associated with both short-term and long-term human exposure to the organic chemicals emitted to the air at WSTF/TSDF. The EPA believes, however, that a risk assessment based on cancer serves as the clearest basis for evaluating the health effects associated with exposure to air emissions from TSDF. A quantitative assessment of the potential nationwide noncancer health impacts (e.g., developmental, neurological, immunological, and respiratory effects) was not conducted due to deficiencies at this time in the health data base for these types of effects.

Although unable to numerically quantify noncancer health risks, EPA did conduct a screening analysis of the potential adverse noncancer health effects associated with short-term and long-term exposure to individual waste constituents emitted from TSDF. This analysis was based on a comparison of relevant health data to the highest short-term or long-term modeled ambient concentrations for chemicals at each of two selected TSDF. (A detailed presentation of the screening analysis is contained in the BID, appendix B.)

Results of this analysis suggest that adverse noncancer health effects are unlikely to be associated with acute or chronic inhalation exposure to TSDF organic emissions. It should be noted that the health data base for many chemicals was limited particularly for short-term exposures. The conclusions reached in this preliminary analysis should be considered in the context of the limitations of the health data; the uncertainties associated with the characterization of wastes at the

facilities; and the assumptions used in estimating emissions, ambient concentrations, and the potential for human exposure. Additional evaluation of noncancer health effects may be undertaken as part of the third phase of the TSDF regulatory program. To that effect, in the proposal preamble for the Phase II TSDF air rules, EPA is specifically requesting comments from the public on methodologies and use of health data for assessing the noncancer health effects of TSDF organic emissions. In addition, because there is a potential for cancer and noncancer health effects from TSDF chemicals from indirect pathways such as ingestion of foods contaminated by air toxics that have deposited in the soil, EPA will evaluate the need to include an indirect pathway element in the TSDF health risk analysis in the future.

The EPA is aware of the uncertainties inherent in predicting the magnitude and nature of toxicant interactions between individual chemicals in chemical mixtures. In the absence of toxicity data on the specific mixtures of concern, and with insufficient quantitative information on the potential interaction among the components (i.e., additivity, synergism, or antagonism), the EPA has assumed additivity to estimate the carcinogenicity of the mixtures of concern. This is consistent with guidance provided in the 1986 "EPA Guidelines for the Health Risk Assessment of Chemical Mixtures" (51 FR 34014).

The EPA also recognizes that there are uncertainties associated with the variability of individual human responses following exposures to toxicants. As stated in the 1986 "EPA Guidelines for Carcinogen Risk Assessment" (51 FR 33992) human populations are variable with respect to genetic constitution, diet, occupational and home environment, activity patterns, and other cultural factors. Because of insufficient data, however, the EPA is unable to determine the potential impact of these factors on the estimates of risk associated with exposure to carcinogens emitted from TSDF.

Cost Impacts Analysis

Comment: Various commenters questioned the cost estimates used in the analysis for carbon adsorbers and condensers as well as the nationwide recovery credits for WSTF and TSDF. Commenters contend that the costs for carbon adsorbers estimated at proposal are low because a device is needed for each vent if manifolding is not practiced as a result of (1) the potential for cross-contamination of new or recycled

materials and (2) additional incurred costs when the carbon is regenerated or disposed of.

Response: In response to these comments EPA evaluated controls for 40 model unit cases representing ranges and combinations of solvent physical properties, total flow rates, and organic concentrations in the vent stream. Both carbon canisters and fixed-bed regenerable carbon systems were costed for process vent streams where condensers would not achieve a 95-percent reduction because of stream conditions. The analysis showed that, for a stream with an emission rate greater than 0.45 kg/h (1 lb/h), a carbon bed can achieve the same emission reduction at lower cost than can a carbon canister. Thus, there is a level of emissions at which the facility owner or operator for economic reasons will switch from the use of replaceable carbon canisters to the use of a fixed-bed regenerable carbon adsorption system. The capital costs (1986 \$) of the fixed-bed regenerable carbon systems ranged from \$97,300 up to \$202,000, and annual operating costs ranged from \$40,200 to \$43,500 (from \$33,100 to \$43,100 when a recovery credit is included). The capital cost (1986 \$) of a carbon canister was \$1,050, and annual operating costs ranged from \$7,890 to \$24,800 (carbon canisters are not regenerated on site and a recovery credit is not included). The fixed-bed, regenerable carbon system operating costs include regeneration/disposal of spent carbon; carbon canister operating costs include carbon replacement and disposal. Thus, these costs were used in conducting the final impact analyses.

With regard to the requirement of a control device for each vent, EPA acknowledges that there are instances where vent manifolding is not allowed because of potential product contamination. However the product has already been recovered from the process prior to exhaust gases passing to the vents, which are sources of organic emissions to the atmosphere; therefore, manifolding of the vent streams should not lead to a product contamination problem.

In the absence of the site-specific information needed to determine control device requirements, for the purposes of estimating cost impacts, it was assumed in the revised analysis that one control device would be needed per WSTF. Although this assumption may underestimate the control cost for a facility that chooses to install carbon adsorbers on more than one vent, it is potentially a very small underestimate because the total annual cost of a

carbon canister, for example, is comprised almost totally of annual operating costs, which are directly proportional to the emissions removed. Thus the potential underestimate in total annual cost resulting from assuming one carbon adsorber per facility is not significant. Furthermore, the addition of the process vent emission limit to the rules based on the total facility emission rate lessens the likelihood that a facility will need to control multiple process vents to attain the allowable emission rate of 1.4 kg/h (3 lb/h) and 2.8 Mg/yr (3.1 ton/yr).

Several commenters also questioned the nationwide cost credit for secondary condensers estimated at proposal, stating that secondary condensers actually would result in substantial costs and that the cost estimates do not account for the more sophisticated systems needed in high-humidity areas to allow for equipment deicing or water removal. In response to concerns regarding the estimated condenser yields and the requirement for more sophisticated systems in high-humidity areas, EPA utilized a state-of-the-art computerized process simulator known as the Advanced System for Process Engineering (ASPEN) for reevaluating analyses of condenser design and cost. The ASPEN condenser configuration included an optional primary water-cooled heat exchanger to reduce the size of the refrigeration unit and to remove water vapor in order to avoid freezing problems because the condenser temperature is low enough to cause ice buildup on heat transfer surfaces. Therefore, the revised cost estimates account for water removal.

The model unit cases represent industrywide ranges and combinations of vent stream characteristics. For the large model unit cases (3.9 L/s total flow rate), total annual cost with recovery credit ranged from a credit of \$4,980 up to a net of no cost. For the medium model unit cases (0.6 L/s total flow rate), the total annual cost with recovery credit ranged from \$630 up to \$2,000. For the small model unit cases (0.3 L/s total flow rate), the total annual cost with recovery credit ranged from \$1,770 up to \$2,000. Therefore, in many cases, the use of secondary condensers does result in positive costs; these costs, however do not result in adverse economic impacts.

The model unit control cost estimates and the WSTF industry profile were used to generate nationwide control cost estimates of implementing the process vent regulations. The cost estimates are for 73 large facilities and 167 medium facilities. The 208 small facilities (less than 189,000 L (50,000 gal) throughput/yr

as defined in the post-proposal analysis) would not have to install additional controls because their emissions are less than the facility process vent cutoff.

Because there was insufficient site-specific information available to determine which facilities could apply condensation rather than carbon adsorption, upper- and lower-bound estimates were generated. The upperbound cost estimate is based on the assumption that fixed-bed, regenerable carbon adsorption systems would be required to control process vents at all facilities with emissions above the emission rate cutoff. Similarly the lower-bound cost estimate is based on the assumption that condensers could be used to control process vents at all facilities with emissions above the emission rate cutoff. The range in estimates of nationwide total annual cost is from a credit of \$68,000 up to a cost of \$12.9 million, assuming the installation of one control device per facility.

Finally, EPA agrees that a recovery credit is not applicable to TSDF in general because most of the hazardous wastes handled at TSDF are destined for disposal. In contrast, at a WSTF, the air emissions resulting from equipment leaks are potentially recyclable solvents. Thus, no recovery credit was applied for TSDF other than WSTF in the analyses for the final equipment leak standards.

E. Implementation and Compliance Test Methods

Comment: Commenters argued that the test methods proposed for use in determining whether waste streams contain more than 10 percent total organics are inappropriate primarily because they do not measure volatile organics. One commenter objected to the use of weight percent when defining "in VHAP service" based on liquid sample analyses.

Response: The EPA recognized that each of the various test methods proposed for determining the organic content of waste streams had limitations and that none was universally applicable. The determination of subpart BB applicability should not require precise measurement of the 10 percent total organics by weight in most cases. The EPA anticipates that most waste streams will have an organic content much lower or much higher than 10 percent. Furthermore, because the regulation requires control if the organic content of the waste stream ever equals or exceeds the 10-percent value, EPA believes that few owners or operators will claim that a waste stream is not

subject to the requirements of the standard based on a sample analysis with results near 10 percent. Therefore, a precise measurement of waste stream total organic content is not likely to be needed to determine applicability of the equipment leak standards.

If the facility does decide to test the waste, the choice of the appropriate method must be based on a knowledge of the process and waste. The EPA has prepared a guidance document that includes information to aid TSDF owners/operators and enforcement and permitting personnel in implementing the regulations. Additional detail is provided in the guidance document to aid in choosing the most appropriate test method. (Refer to "Hazardous Waste TSDF—Technical Guidance Document for RCRA Air Emission Standards for Process Vents and Equipment Leaks." EPA-450/3-89-21.)

In response to the commenters' concerns that volatility of the waste stream should be considered, the LDAR provisions of the regulation were changed to establish two potential levels of required monitoring. Those processes with the greater emission potential are designated to be in light-liquid service and are required to implement a more restrictive LDAR program. Those processes with a lesser emission potential are designated to be in heavy-liquid service and are required to implement a less restrictive LDAR program. The determination of being in light-liquid service is based on the concentration of organic components in a waste whose pure vapor pressure exceeds 0.3 kPa. This addresses the commenters' concerns that volatility of the waste stream should be considered. For the process vent portion of the regulation, if an organic is present at the vent, it is presumed to be volatile. Therefore, volatility is considered by virtue of where the determination of applicability is made.

With reference to the use of weight percent when defining "in VHAP service" (a term that has been dropped from the promulgated regulations), EPA believes that weight percentage is the unit of choice when the determination of organic content is made on a solid, liquid, or sludge waste. It is also commonly associated with those types of wastes. For gaseous streams that exceed 10 percent organics by weight, the commenter's point is well taken. Volume fractions are more commonly reported for gaseous streams. However, it is not easier to calculate the volume percent rather than weight percent. Additional information on the calibration standard used, the carrier gas in the standard, and both the

organic and other inorganic gases in the sample are required in both cases. For simplicity, the units of the standard are uniformly weight percent regardless of waste type.

Implementation Schedule

Comment: Several commenters objected to the time periods contained in the proposed standards for implementation schedules and requested that EPA not dictate a step-by-step schedule.

Response: The EPA agrees with the commenters that EPA should not dictate step-by-step implementation schedules for installing the control devices and closed-vent systems required to comply with these regulations because each affected facility needs some flexibility to budget funds, perform engineering evaluations, and complete construction. Therefore, EPA has dropped the interim dates in the schedule and retained only the final period of 2 years from the promulgation for completing engineering design and evaluation studies and for installing equipment. The final rules require that all affected facilities comply with the standards on the effective date; however, the rules allow up to 24 months from the promulgation date (i.e., 18 months after the effective date) for facilities to comply if they are required to install a control device and they can document that installation of the emission controls cannot reasonably be expected to be completed earlier. Existing waste management units that become newly regulated units subject to the provisions of subpart AA or BB because of a new statutory or regulatory amendment under RCRA (e.g., a new listing or identification of a hazardous waste) will have up to 18 months after the effective date of the statutory or regulatory amendments that render the facility subject to the provisions of subparts AA or BB to complete installation of the control device. New hazardous waste management units starting operation after the effective date of subparts AA and BB must meet the standards upon startup. This subject is discussed further in section IX. Implementation, of this preamble. The final standards require that both permitted and interim status facilities maintain the schedules and the accompanying documentation in their operating records. The implementation schedule must be in the operating record on the effective date of today's rule, which is 6 months after promulgation. No provisions have been made in the standards for extensions beyond 24 months after promulgation.

Permitting Requirements

Comment: Several commenters suggested that RCRA part B information requirements be limited to the units already included in the part B application. Units that must comply with this regulation because the facility is subject to RCRA permit requirements for other reasons should not be required to be added to the part B permit application. Other commenters objected to statements in the preamble regarding the role of the omnibus permitting authority under RCRA section 3005(c)(3). The commenters questioned the absence of criteria for establishing when such authority would be applied to require more stringent controls and argued that authorizing permit writers to impose more stringent controls based on unenforceable guidance is not a substitute for regulations.

Response: The EPA is aware that extending specific part B information requirements to those hazardous waste management units that are not subject to RCRA permitting but are located at facilities that are otherwise subject to RCRA permit requirements could result in the need for those facilities to modify RCRA permits or their part B applications. However, EPA believes that extending the part B information requirements to hazardous waste management units not subject to RCRA permitting is necessary to ensure compliance with the subpart AA and subpart BB standards.

The EPA also agrees that requiring a modification of RCRA permits (and part B applications) as part of this rule could result in delays in processing and issuing final RCRA permits. Therefore, the final rules do not require facilities to modify permits issued before the effective date of these rules. Consistent with 40 CFR 270.4, a facility with a final permit issued prior to the effective date is generally not required to comply with new part 264 standards until its permit is reissued or reviewed by the Regional Administrator. Hazardous waste management units and associated process vents and equipment affected by these standards must be added or incorporated into the facility permit when the permit comes up for review under § 270.50 or reissue under § 124.15. As previously noted, EPA intends to propose to modify this policy in the forthcoming Phase II rules such that permitted facilities must comply with the interim-status air rules.

Facilities that have obtained RCRA interim status, as specified in 40 CFR 270.70 (i.e., compliance with the requirements of section 3010(a) of RCRA pertaining to notification of hazardous

waste activity and the requirements of 40 CFR 270.10 governing submission of part A applications), will be subject to the part 265 standards on the effective date. Interim status facilities that have submitted their part B application prior to the effective date of the regulation will be required to modify their part B applications to incorporate today's requirements.

The omnibus permitting authority of § 270.32 allows permit writers to require, on a case-by-case basis, emission controls that are more stringent than those specified by a standard. The EPA has a mandate to use this authority for situations in which regulations have not been developed or in which special requirements are needed to protect human health and the environment. For example, this authority could be used in situations where, in the permit writers judgment, there is an unacceptably high risk after application of controls required by an emission standard. This aspect of the permitting process is discussed further in section IX of this preamble. The EPA is currently preparing guidance to be used by permit writers to help identify facilities that would potentially have high residual risk due to air emissions. The guidance will include procedures to be used to identify potentially high-risk facilities and will include guidance for making a formal, site-specific risk assessment.

Recordkeeping and Reporting

Comment: Commenters asked EPA to include a provision in the final standards to provide for the elimination of recordkeeping requirements that may be duplicative of State or Federal requirements for equipment leaks. Commenters also asked whether TSDF are subject to any notification requirements if their waste stream is less than 10 percent organics.

Response: The EPA agrees that duplicative recordkeeping and reporting should generally be eliminated to the extent possible. Because of the difficulties in foreseeing all situations in which this could occur, a provision to this effect has not been added to the final standards. However, when records and reports required by States are substantially similar, a copy of the information submitted to the State will generally be acceptable to EPA. When similar records and reports are required by other EPA programs (such as the visual observations required for pumps and valves associated with storage tanks and incinerators), EPA suggests that owners or operators of TSDF coordinate monitoring and recordkeeping efforts to reduce labor and costs. One set of records should be

maintained with emphasis on the more detailed monitoring records required by these standards. The EPA considers that the monitoring required for equipment leaks under these standards differs significantly from the monitoring required for ground water protection purposes under other RCRA rules. However, the monitoring and recordkeeping programs can be combined for efficiency.

There are no notification requirements in the equipment leak rules for waste streams that have been determined never to exceed 10 percent total organics by weight.

VII. Summary of Impacts of Final Standards

A. Overview of the Source Category

Hazardous waste TSDF are facilities that store, treat, or dispose of hazardous wastes. A TSDF may generate and manage hazardous waste on the same site, or it may receive and manage hazardous waste generated by others.

The EPA has conducted a number of surveys to collect information about the TSDF industry. The most recent of these surveys, the 1986 National Screening Survey of Hazardous Waste Treatment, Storage, Disposal, and Recycling Facilities, lists more than 2,300 TSDF nationwide. Available survey data further indicate that the majority (96 percent) of waste managed at TSDF is generated and managed on the same site and identifies more than 150 different industries, primarily manufacturing, that generate hazardous waste. Approximately 500 TSDF are commercial facilities that manage hazardous waste generated by others.

The types of wastes managed at TSDF and the waste management processes used are highly variable from one facility to another. The physical characteristics of wastes managed at TSDF include dilute wastewaters (representing more than 90 percent by weight of the total waste managed), organic and inorganic sludges, and organic and inorganic solids. Waste management processes differ according to waste type and include storage and treatment in tanks, surface impoundments, and wastepiles; handling or storage in containers such as drums, tank trucks, tank cars, and dumpsters; and disposal of waste in landfills, surface impoundments, injection wells, and by land treatment. In addition, hazardous waste may be managed in "miscellaneous units" that do not meet the RCRA definition of any of the processes listed above. Hazardous waste may also be handled

in research, development, and demonstration units as described in 40 CFR 270.85.

The promulgated standards limit organic emissions from (1) hazardous waste management unit process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction, and air and stream stripping operations that manage waste with 10 ppmw or greater total organics concentration, and (2) leaks from equipment at new and existing hazardous waste management units that contain or contact hazardous waste streams with 10 percent or more total organics. The final equipment leak standards apply to each pump valve, compressor, pressure relief device, sampling connection, open-ended valve or line, flange, or other connector associated with the affected hazardous waste management unit. About 1,400 facilities are estimated to be potentially subject to the equipment leak standards (i.e., TSDF managing hazardous waste containing at least 10 percent organics). Of these, 450 are estimated to have process vents subject to the vent standards in subpart AA.

B. Use of Models in the Regulatory Development Process

In estimating baseline (i.e., unregulated) emissions, emission impacts of the regulatory options, and control costs for the options for equipment leaks, EPA made use of a combination of analytical and physical models of waste management processes. This approach was selected because insufficient facility-specific data are available to conduct a site-specific characterization of the entire TSDF industry. For example, the physical models of waste management processes (or units) were used as simplified representations of the equipment component mix expected to be associated with each particular hazardous waste management process. The model unit provides an estimate of the number of pumps, valves, open-ended lines, pressure relief valves, and sampling connections that are used in the waste management process. Although these models are not exact for each type of process, they provide a reasonable approximation of what can be expected on average; precise equipment counts for each unit at each facility are not available.

In the absence of sufficient site-specific data, EPA developed a model to calculate nationwide health, environmental, and cost impacts associated with hazardous waste TSDF. Details of the national impacts model can be found in the BID, appendix D.

This national impacts model was used to estimate the nationwide impacts necessary for comparison of the various TSDF equipment leak emission control options. The national impacts model is a complex computer program that uses a wide variety of information and data concerning the TSDF industry to calculate nationwide impacts through summation of approximate individual facility results. Information processed by the model includes results of TSDF industry surveys as well as characterizations and simulations of TSDF processes and wastes, emission factors of each type of management unit, the efficiencies and costs of emission control technologies, and exposure and health impacts of TSDF pollutants. This information is contained in several independent data files developed by EPA for use as inputs to the model. These data files are briefly described below.

Industry profile data identify the name, location, primary standard industrial classification (SIC) code, waste management processes, waste types, and waste volumes for each TSDF. The industry data were obtained from three principal sources: A 1988 National Screening Survey of Hazardous Waste Treatment, Storage, Disposal, and Recycling Facilities; the Hazardous Waste Data Management System's RCRA part A permit applications; and the 1981 National Survey of Hazardous Waste Generators and Treatment, Storage, and Disposal Facilities Regulated Under RCRA. The industry data are used in the model to define the location and the SIC code for each facility and to identify the waste management units at each facility as well as the types and quantities of waste managed in each unit.

The hazardous waste characterization consists of waste data representative of typical wastes handled by facilities in each SIC code. The waste data are linked to specific facilities by the SIC code and the RCRA waste codes identified for that facility in the industry profile. The waste characterization data include chemical properties information that consists of constituent-specific data on the physical, chemical, and biological properties of a group of surrogate waste constituents that were developed to represent the more than 4,000 TSDF waste constituents identified in the waste data base. The surrogate categories were defined to represent actual organic compounds based on a combination of their vapor pressures, Henry's law constants, and biodegradability. The use of surrogate properties was instituted to compensate

for a lack of constituent-specific physical and chemical property data and to reduce the number of chemicals to be assessed by the model.

The emission factors data consist of emission factors, expressed as emissions per unit of waste throughput, for each combination of surrogate waste constituent and model waste management process. Each model waste management process was, in effect, a "national average model unit" that represented a weighted average of the operating parameters of existing waste management units. The EPA's LDAR model was used to develop emission control efficiencies and emission reductions for the TSDF equipment leak emission factors used in the analysis. This LDAR model is based on the Agency's extensive experience with equipment leaks in the petrochemical and synthetic organic chemical manufacturing industries.

Incidence data consist of estimates of annual cancer incidence for the population within 50 km of each TSDF. This information was developed using EPA's Human Exposure Model, 1980 census data, and local meteorological data summaries. Because some of the data used in the national impacts model are based on national average values rather than actual facility-specific data, maximum risk numbers generated by the model are not considered to be representative of facility-specific risks. Maximum individual risk has meaning only at the facility level. Therefore, EPA chose to use another methodology for estimating MIR for equipment leaks. This is discussed further in section VII.E.

Data related to emission control technologies and costs include information that describes control efficiencies, capital investment, and annual operating costs for each emission control option that is applicable to a particular waste management process. These data were obtained through engineering analyses of control device operations and the development of engineering cost estimates.

To make use of all of these data, the national impacts model contains procedures that (1) identify TSDF facilities, their waste management processes, waste compositions, and annual waste throughputs; (2) assign chemical properties to waste constituents and assign control devices to process units; and (3) calculate uncontrolled emissions, emissions reductions, control costs, and health impacts. Results produced by the model include, on a nationwide basis, uncontrolled emissions, controlled

emissions, capital investment costs, annual operating costs, annualized costs for controls, and annual cancer incidence. As previously stated, these nationwide values are obtained by summing the results of individual facility analyses across all facilities.

The primary objective and intended use of the national impacts model are to provide reasonable estimates of TSDF impacts on a nationwide basis. Because of the complexity of the hazardous waste management industry and the current lack of detailed information for individual TSDF, the model was developed to utilize national average data where site-specific data are not available. As a result, the estimated emissions and cancer incidence from the model do not represent the impacts for a specific individual facility. However, with national average data values used where site-specific data were missing, EPA believes that the estimates are reasonable on a nationwide basis and are adequate for decisionmaking.

C. Emission Impacts

Since proposal in February 1987, EPA has reviewed all available site-specific information and data on WSTF and TSDF, much of which has only become available since proposal. For example, EPA is conducting a multiyear project to collect information on the Nation's generation of hazardous waste and the capacity available to treat, store, dispose of, and recycle that waste. The initial phase of the project was the 1988 National Screening Survey of Hazardous Waste Treatment, Storage, Disposal and Recycling Facilities, which identified and collected summary information from all hazardous waste treatment, storage, disposal, and recycling facilities in the United States. The results of this "Screener Survey" together with data from other existing data bases (such as the Hazardous Waste Data Management System's RCRA part A applications; the National Survey of Hazardous Waste Generators and Treatment, Storage, and Disposal Facilities Regulated Under RCRA in 1981; the Industry Studies Database; a data base of 40 CFR 261.32 hazardous wastes from specific sources; the WET Model Hazardous Waste Data Base; and a data base created by the Illinois EPA) were used to support the development and analysis of these air emission regulations for hazardous waste TSDF. Additional sources of data on TSDF and waste solvent recycling operations included EPA field reports on hazardous waste facilities and responses to RCRA section 3007 information requests sent to a limited number of both large and small facilities. Based on all of this

information, EPA has revised and expanded the impact analyses, including estimates of emissions, risks, costs, and the economic impact on small businesses and on the industry as a whole.

Using the revised impact analyses, nationwide (unregulated) baseline equipment leak organic emissions from TSDF waste streams of 10 percent or greater total organics are estimated at 26,200 Mg/yr. This estimate includes equipment leak emissions from waste solvent treatment facilities and from other TSDF with hazardous waste management processes handling wastes with organic concentrations of 10 percent or greater, a total of about 1,400 facilities. The bases for these estimates are contained in the BID, appendix D.

Nationwide (unregulated) organic emissions from process vents at about 450 TSDF with solvent recovery operations range from 300 Mg/yr (based on lower-bound emission rates) to 8,100 Mg/yr (based on upper-bound emission rates). This wide emission range occurs because of variations in primary condenser recovery efficiencies and the use of secondary condensers at some sites. The lower-bound rate represents high recovery efficiencies at all facilities, and the upper-bound rate represents low recovery efficiencies at all facilities. Actual nationwide emissions should fall between these values.

With the implementation of the standards, nationwide TSDF equipment leak emissions will be reduced to about 7,200 Mg/yr; nationwide organic emissions from process vents will be reduced to a range from 270 Mg/yr (lower-bound emission rates) to 900 Mg/yr (upper-bound emission rates).

D. Ozone Impacts

Reductions in organic emissions from TSDF sources will have a positive impact on human health and the environment by reducing atmospheric ozone formation as a result of reductions in emissions of ozone precursors, primarily organic compounds. Ozone is a major problem in most larger cities, and EPA has estimated that more than 100 million people live in areas that are in violation of the ambient ozone standards. Ozone is a pulmonary irritant that can impair the normal functions of human lungs, may increase susceptibility to bacterial infections, and can result in other detrimental health effects. In addition, ozone can reduce the yields of citrus, cotton, potatoes, soybeans, wheat, spinach, and other crops, and can cause damage to conifer forests and a reduction in the fruit and seed diets of

wildlife. Because TSDF organic emissions account for about 12 percent of total nationwide organic emissions from stationary sources, today's rules will contribute to a reduction in ozone-induced health and environmental effects and will assist in attainment and maintenance of the ambient air quality standards for ozone. Table 1 summarizes the emissions and health risk impact estimates.

Ozone precursors and chlorofluorocarbons, whose emissions will be reduced by this rulemaking, are both considered greenhouse gases (i.e., gases whose accumulation in the atmosphere has been related to global warming). Although the regulation's direct impact on global warming has not been quantified, the direction being taken is a positive one. Implementation of these rules will reduce tropospheric ozone, which contributes to global warming.

E. Health Risk Impacts

Human health risks posed by exposure to TSDF air emissions are typically quantified in two forms: Annual cancer incidence and MIR. Annual cancer incidence is the estimated number of cancer cases per year due to exposure to TSDF emissions nationwide. The MIR, on the other hand, represents the potential risk to the one hypothetical individual who lives closest to a reasonable worst-case TSDF for a lifetime of 70 years. The MIR is derived from modeling a reasonable worst-case scenario and is not based on actual measurement of risk. It is not representative of the entire industry, and, in fact, may be experienced by few, if any, individuals. As explained in appendix B of the BID, there are great uncertainties in both these types of health risk estimates. These two health risk forms were used as an index to quantify health impacts related to TSDF emissions and emission controls. As discussed in section VI.D., an equipment-leak-specific, emission-weighted unit risk factor of 4.5×10^{-6} ($\mu\text{g}/\text{m}^3$)⁻¹ was used to estimate the nationwide annual cancer incidence and the MIR of contracting cancer associated with TSDF equipment leak organic emissions. See appendix B of the BID for a detailed analysis of the health risk impacts.

At proposal, order-of-magnitude health impacts were estimated for cancer risks from exposure to organic air emissions from WSTF and TSDF. The Human Exposure Model (HEM) was used to calculate the magnitude of risks posed by WSTF at both typical and maximum emission rates. Based on an

estimated urban/rural distribution, EPA selected six WSTF to represent the nationwide WSTF industry in performing the risk assessment. Using the results of the analysis of these "typical" facilities, health impacts were extrapolated to all WSTF and TSDF in general to provide nationwide estimates.

In the revised health impacts analysis for the final rules, annual cancer incidence and MIR were again used to quantify health impacts for the control alternatives for process vents and equipment leaks. However, in this followup analysis, the HEM was run using site-specific data on facility waste throughputs, emission rates, meteorology, and population density for each WSTF and TSDF nationwide identified in the various data bases.

The facility-specific information was obtained from three principal sources. Waste quantity and solvent recycling data were taken from the 1986 National Screener Survey; waste management

processing schemes and waste types managed in each facility were based on the Hazardous Waste Data Management System's (HWDMS) RCRA part A applications; the National Survey of Hazardous Waste Generators and Treatment, Storage, and Disposal Facilities Regulated Under RCRA in 1981 (Westat Survey); and the 1986 National Screener Survey.

In revising the methodology applied in assessing cancer risks, EPA conducted facility-specific HEM computer runs for nearly all of the 443 WSTF that reported, in the 1986 National Screener Survey, recycling and/or reuse of solvents and other organic compounds (i.e., TSDF expected to have the specified process vents) and for each of the more than 1,400 TSDF in the industry profile of 2,300 TSDF that were determined to manage wastes with at least 10 percent organic content. These HEM results were used to estimate nationwide cancer incidence for both

TSDF equipment leaks and process vents.

The nationwide annual incidence resulting from uncontrolled TSDF equipment leaks is estimated at 1.1 cases of cancer per year. Based on the estimated lower-bound emission rates, the nationwide cancer incidence from uncontrolled process vents is 0.015 case/yr. Based on the upper-bound emission rate, the incidence from process vents is 0.33 case/yr. With the application of the final process vent standards, based on lower-bound emission rates, the annual cancer incidence will be reduced to 0.001 from 0.015 case/yr. Based on upper-bound emission rates, annual incidence will be reduced to 0.027 case/yr from 0.33 case/yr. With the implementation of the LDAR program for equipment leak emissions, the annual cancer incidence associated with fugitive emissions will be reduced to about 0.32 case/yr.

TABLE 1. SUMMARY OF NATIONWIDE ENVIRONMENTAL AND HEALTH RISK IMPACTS OF TSDF AIR EMISSION REGULATIONS

ESDF source category	Nationwide emissions, Mg/yr		Annual incidence*, cases/yr		Maximum individual risk*	
	Uncontrolled	Controlled	Uncontrolled	Controlled	Uncontrolled	Controlled
Process vents ^b						
Lower bound.....	300	270	0.015	0.001	3×10^{-6}	2×10^{-6}
Upper bound.....	8,100	900	0.33	0.027	8×10^{-4}	4×10^{-5}
Equipment leaks.....	26,200	7,200	1.1	0.32	5×10^{-3}	1×10^{-3}

* Annual incidence and MIR are based on an emission-weighted average unit risk factor for TSDF.

^b The lower- and upper-bound process vent emission estimates reflect the range of primary condensers' removal efficiencies and the use of secondary condensers on some primary condenser vents.

The HEM results were also used to estimate the MIR for process vents. For estimates of MIR associated with TSDF equipment leaks, a separate methodology was used for reasons discussed below.

There are three major problems in applying the methodology used to estimate cancer incidence, a nationwide value, to estimate MIR from equipment leaks, a site-specific value. The first problem concerns the emission estimation technique. Equipment count, and not the amount of waste handled, is the major determining factor for emission estimates from equipment leaks. Equipment counts do not double or triple accordingly as throughput is increased. Because the size of the model plant (and thus the equipment count) assigned to a waste management process was based on the amount of waste handled, emissions from equipment leaks will be overstated for larger facilities and understated for smaller facilities. This averages out on a nationwide basis, but individual facility

estimates are not considered accurate for estimates of MIR.

The second problem deals with the waste compositions and forms (e.g., wastewater and concentrated organics) attributed to each RCRA waste code (e.g., F001). A waste code may involve wastes in several forms. The determination of impacts was based on the national average waste form distribution for each particular waste code occurring at each facility. For example, if on average across the Nation, a particular organic waste solvent appears as an aqueous waste (very dilute organics) 20 percent of the time, as a sludge 50 percent of the time, and as an organic liquid 30 percent of the time, those percentages were applied to every facility that was identified to handle that type of waste regardless of the actual percentages of waste form found at the facility. In some cases, this resulted in larger facilities being assigned a much greater percentage of an organic liquid form than would actually be the case. Again, this

averages out on a nationwide basis, but for site-specific estimates such as MIR more refined determinations are required.

The third problem with using the HEM for equipment leaks is that the HEM does not model area sources directly; it collocates all emission sources at one central point and models the emissions as point sources. This is appropriate for estimates for process vents that are actual point sources, but not for equipment leaks. A typical TSDF would have several hundred equipment components with the potential for leaks that could be located over the entire facility area.

In estimating MIR for equipment leaks, EPA based its hypothetical, reasonable worst-case facility, in large part, on an actual facility. The EPA was able to characterize the facility in sufficient detail that dispersion estimates could be generated using a true area source dispersion model. This was possible because more detailed site-specific information has become

available on a limited basis since proposal. The preliminary results of a multiyear project to collect information on the Nation's generation of hazardous waste and the capacity available to treat, store, dispose of, and recycle that waste were used as the basis of the analysis. In the survey, all active treatment, storage, disposal, and recycling facilities (TSDR) were sent a detailed package of questionnaires appropriate to the processes they operate. The completed questionnaires were reviewed for technical accuracy; after independent verification, the information collected was entered into a complex data base. The TSDR survey questionnaire responses contain the most detailed up-to-date nationwide information regarding the hazardous waste management technologies each facility has on site. For each facility, detailed information is available in the data base, including facility area, numbers of hazardous waste management units by process type (i.e., number of surface impoundments, incinerators, recycling units), annual throughput by process unit, and types of waste (i.e., RCRA waste codes) managed by each unit at the facility. The availability of this information in computerized format made it possible to use the TSDR survey data base to identify facilities that represent the population of worst-case facilities with regard to equipment leak emissions and the potential for high MIR values. A detailed discussion of the health impacts methodologies is presented in appendix B of the BID.

The MIR estimate was made first by screening detailed TSDR Survey data for more than 1,400 TSDF to identify the facility that has the highest potential equipment leak emissions and the highest potential for these emissions to result in high ambient air concentrations (i.e., high emissions on a small facility area). Next, it was assumed that this facility handles hazardous wastes that have carcinogens with an emission-weighted potency equal to that of the nationwide average and that an individual was residing at the shortest distance from the TSDF management units to the nearest apparent residence. The highest annual-average ambient concentration, resulting from this high emission-rate facility, predicted to occur at the residence nearest the facility was then determined by dispersion modeling. The Industrial Source Complex Long-Term (ISCLT) dispersion model was used in the equipment leak MIR analysis to model the worst-case facility as a true area source with the actual facility area of about 1 acre as input. The highest

annual average out of the results of 5 years of meteorological data modeled for each of the eight cities used to characterize nationwide meteorology was selected for use in the MIR calculation. Thus, this MIR estimate is considered a reasonable worst-case estimate for the industry and should not be interpreted to represent a known risk posed by any actual facility in the industry.

The MIR resulting from TSDF baseline (or uncontrolled) equipment leak emissions is estimated at 5×10^{-3} , i.e., 5 chances in 1,000. Based on the estimated lower-bound emission rates for process vents, the MIR for uncontrolled process vents is about 3 chances in 100,000 (3×10^{-5}); based on the upper-bound emission rate, the MIR is 8×10^{-4} . Because of the uncertainties inherent in nationwide emission and risk estimates that must characterize the many different constituents present in a variety of TSDF operations, EPA considered the upper-bound estimates in its decisionmaking.

With the application of the final process vent standards, based on lower-bound emission rates, the MIR will be reduced to 2×10^{-6} from 3×10^{-5} . Based on the upper-bound emission rates, the MIR will be reduced to 4×10^{-8} from 8×10^{-4} . With the implementation of control requirements for equipment leak emissions that include monthly LDAR requirements for pumps and valves, caps for open-ended lines, closed-purge sampling, and rupture discs for pressure relief devices, the MIR associated with fugitive emissions will be reduced to about 1×10^{-8} from 5×10^{-3} . Appendix B of the BID, EPA 450/3-89-009, presents a detailed explanation of the derivation of these risk estimates.

The MIR estimate for equipment leaks is sensitive to several factors. Emissions are the most obvious factor controlling risk. The facility associated with the reported MIR for equipment leaks is one of the highest emitting TSDF in terms of equipment leaks, in the upper 99.5 percent for potential equipment leak emissions. If the analysis were to use the 85-percentile emissions (i.e., 85 percent of the TSDF nationwide have lower equipment leak emissions than this value), then MIR would drop from 1×10^{-3} to 5×10^{-4} with all other factors held constant.

Another factor affecting the MIR estimates is area of the emitting source. For these types of sources, risk is inversely proportional to the area of the emitting source. For example, given equal emissions, a facility located over 10 acres generally poses less risk than a facility on 1 acre. For the facility

presenting the highest risk in this rule, the MIR would drop from 1×10^{-3} to 2×10^{-4} if 10 acres were used in the estimate rather than 1 acre. It should also be pointed out that for the more than 1,400 TSDF surveyed in the EPA 1987 TSDR Survey, the median facility area was greater than 50 acres.

Distance to the nearest resident is another key variable in the risk estimate. The actual distance to the nearest residence (i.e., 250 ft) for the worst-case facility was used in calculating the reported MIR value; however, the median distance in a random sample of distances to the nearest residence reported in a survey of the hazardous waste generators was 1,000 ft. If this median distance were used in the estimate, even with the high emissions and the small area, the maximum risk value would drop from 1×10^{-3} to 2×10^{-4} . Meteorology is also a factor; the worst-case dispersion was used in the reported estimate. If an average case were used, then risk would drop to 6×10^{-4} with all other factors held constant.

As the above examples show, facilities with anything other than the combined worst-case factors would pose significantly less risk than the MIR reported for equipment leaks. The MIR estimates presented are, for the most part, based on worst-case or conservative assumptions; the one exception is the weighted-average cancer potency value, or unit risk factor (URF), used. The EPA believes it is unreasonable to make all worst-case assumptions for a single facility. However, because of the overall conservative nature of the analysis, for the industry as a whole, the vast majority of TSDF would pose significantly lower risk from equipment leak emissions than the reported reasonable, worst-case value.

F. Cost Impacts

The EPA developed a detailed estimate of the total capital investment, annual operating costs, and total annual costs of each emission control technology applied to each affected waste management unit. Total capital investment represents the total original cost of the installed control device. Total annual cost represents the total payment each year to repay the capital investment for the control device as well as to pay for the control device (or work practice) operating and maintenance expenses. The costs of attaining the 95-percent control or emission reduction for process vents are based on the use of condensers to control process vent streams for which condensation is

technically feasible and on the use of carbon adsorption systems to control the remaining process vent streams subject to the regulations. Because site-specific information was insufficient to determine which facilities could apply condensers rather than carbon adsorbers industry-wide, upper- and lower-bound cost estimates were generated for process vent controls. The upper-bound cost estimates are based on the assumption that fixed-bed, regenerable carbon adsorption systems would be required to control process vents at all facilities with emissions above the emission rate limit. Similarly, the lower-bound cost estimate is based on the assumption that condensers could be used to control process vents at all facilities with emissions above the emission rate limit.

The nationwide capital investment and total annual cost of implementing the requirements of today's rule for process vent controls are estimated at \$24.6 million and \$12.9 million/year, respectively, for the upper-bound case. For the lower-bound case, capital investment is \$1.5 million and total annual costs represent a small savings of \$70,000/yr. These costs are based on an industry profile that includes 73 large recycling facilities and 167 medium-sized recycling facilities. The more than 200 small recycling facilities are not included in the cost estimates because they are projected not to have to install additional controls to meet the facility emission rate limit.

The capital investment and total annual costs of controlling TSDF equipment leak emissions with the LDAR program together with some equipment specifications are estimated at \$126.6 million and \$32.9 million/yr, respectively. Table 2 summarizes capital and annual costs associated with the final rules.

Further information on the economic impacts of the final standards for organic control from TSDF process vents and equipment leaks is presented in section VIII of this preamble. Details of the analysis are presented in the BID, chapter 9.0.

TABLE 2.—SUMMARY OF NATIONWIDE COST IMPACTS OF TSDF AIR EMISSION REGULATIONS

TSDF source category	Nation-wide capital cost, \$ millions (1986)	Nation-wide annualized cost*, \$ millions/yr
Process vents ^a		
Lower bound.....	1.5	(0.1)

TABLE 2.—SUMMARY OF NATIONWIDE COST IMPACTS OF TSDF AIR EMISSION REGULATIONS—Continued

TSDF source category	Nation-wide capital cost, \$ millions (1986)	Nation-wide annualized cost*, \$ millions/yr
Upper bound.....	24.6	12.9
Equipment leaks.....	126.6	32.9

() indicates a cost credit.

* Includes a recovery credit for recycling. No recovery credit was applied for TSDF without recycling processes.

^a The lower-bound cost estimates assume that condensers could be used to control process vents at all facilities with emissions above the emission rate limit; the upper-bound cost estimates assume that carbon adsorbers would be required to control process vents at all facilities with emissions above the emission rate limit.

VIII. State Authorization

A. Applicability of Rules in Authorized States

Under section 3006 of RCRA, EPA may authorize qualified States to administer and enforce the RCRA program within the State. (See 40 CFR part 271 for the standards and requirements for authorization.) Following authorization, EPA retains enforcement authority under sections 3008, 7003, and 3013 of RCRA, although authorized States have primary enforcement responsibility under section 7002.

Prior to the HSWA of 1984, a State with final authorization administered its hazardous waste program entirely in lieu of EPA administering the Federal program in that State. The Federal requirements no longer applied in the authorized State, and EPA could not issue permits for any facilities in the State that the State was authorized to permit. When new, more stringent Federal requirements were promulgated or enacted, the State was obliged to enact equivalent authority within specified timeframes. New Federal requirements did not take effect in an authorized State until the State adopted the requirements as State law.

In contrast, under section 3006(g)(1) of RCRA, 42 U.S.C. 6926(g), new requirements and prohibitions imposed by HSWA take effect in authorized States at the same time that they take effect in nonauthorized States. The EPA is directed to carry out those requirements and prohibitions in authorized States, including the issuance of permits, until the State is granted authorization to do so. While States must still adopt HSWA-related provisions as State law to retain final

authorization, the HSWA requirements apply in authorized States in the interim.

B. Effect on State Authorizations

Today's rule is promulgated pursuant to section 3004(n) of RCRA, a provision added by HSWA. Therefore, EPA is adding the requirements to Table 1 in 40 CFR 271.1(j), which identifies the Federal program requirements that are promulgated pursuant to HSWA and take effect in all States, regardless of authorization status. States may apply for either interim or final authorization for the HSWA provisions identified in Table 1, as discussed in this section of the preamble.

The EPA will implement today's rule in authorized States until (1) they modify their programs to adopt these rules and receive final authorization for the modification or (2) they receive interim authorization as described below. Because this rule is promulgated pursuant to HSWA, a State submitting a program modification may apply to receive either interim or final authorization under section 3006(g)(2) or section 3006(b), respectively, on the basis of requirements that are substantially equivalent or equivalent to EPA's. The procedures and schedule for State program modifications for either interim or final authorization are described in 40 CFR 271.21. It should be noted that all HSWA interim authorizations will expire automatically on January 1, 1993 (see 40 CFR 271.24(c)).

Section 271.21(e)(2) requires that authorized States must modify their programs to reflect Federal program changes and must subsequently submit the modifications to EPA for approval. The deadline for State program modifications for this rule is July 1, 1991 (or July 1, 1992, if a State statutory change is needed). These deadlines can be extended in certain cases [40 CFR 271.21(e)(3)]. Once EPA approves the modification, the State requirements become subtitle C RCRA requirements.

A State that submits its official application for final authorization less than 12 months after the effective date of these standards is not required to include standards equivalent to these standards in its application. However, the State must modify its program by the deadlines set forth in 40 CFR 271.21(e). States that submit official applications for final authorization 12 months after the effective date of these standards must include standards equivalent to these standards in their applications. Section 271.3 sets forth the requirements a State must meet when submitting its final authorization application.

States that are authorized for RCRA may already have requirements under State law similar to those in today's rules. These State regulations have not been assessed against the Federal regulations being promulgated today to determine whether they meet the tests for authorization. Thus, a State is not authorized to implement these requirements in lieu of EPA until the State program modification is approved. Of course, States with existing standards may continue to administer and enforce their standards as a matter of State law. In implementing the Federal program, EPA will work with States under cooperative agreements to minimize duplication of efforts. In many cases, EPA will be able to defer to the States in their efforts to implement their programs rather than take separate actions under Federal authority.

IX. Implementation

As proposed, the air emission standards for process vents and equipment leaks were included as subpart C of part 269, Air Emission Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities. Part 269 was to be added to the CFR with the promulgation of these standards. For consistency with standards for other TSDF sources under RCRA, the final standards have been incorporated into parts 264 and 265. Subpart AA applies to process vents and subpart BB to equipment leaks. In addition, whereas at proposal the equipment leak requirements of 40 CFR part 61, subpart V, were incorporated by reference, these provisions have been included in subpart BB with revisions appropriate for a standard promulgated under RCRA authority rather than CAA authority.

Under the current RCRA permitting system, a facility that has received a final permit must comply with all of the following requirements as specified in 40 CFR 270.4: (1) The specific conditions written into the permit (including conditions that demonstrate compliance with part 264 regulations); (2) self-implementing statutory requirements; and (3) regulations promulgated under 40 CFR part 268 restricting the placement of hazardous waste in or on the land. When new regulations are promulgated after the issuance of a permit, EPA may reopen the permit to incorporate the new requirements as stated in § 270.41. Otherwise, the new regulatory requirements are incorporated into a facility's permit at the time of permit reissuance, or at the 5-year review for land disposal facilities.

Facilities that have not been issued a final permit and that have fully complied with the requirements for interim status must comply with the regulations specified in CFR part 265. New regulations that are added to part 265 become applicable to interim status facilities on their effective dates.

Although EPA has the authority to reopen permits to incorporate the requirements of new standards, EPA is concerned about the resource burdens of this approach. To reopen permits for each new regulation at the time it is promulgated would impose a large administrative burden on both EPA and the regulated community because a major permit modification would generally require the same administrative procedures as are required for initial permits (e.g., development of a draft permit, public notice, and opportunity for public hearing). As a consequence, the requirements of new standards are usually incorporated into a permit when it is renewed. For standards implemented through the RCRA permit system, the effect of this policy is to "shield" facilities that have been issued a final permit from any requirements promulgated after the issuance of the permit until the time that the permit must be renewed and the new requirements are written into the permit. Thus, this policy is often referred to as the "permit-as-a-shield" policy. Although this policy is generally applied, EPA may evaluate the need to accelerate the implementation of standards developed under RCRA and, if warranted, make exceptions to the permit-as-a-shield policy. In today's rules, the permit-as-a-shield provision applies to control of air emissions from process vents and equipment leaks regulated under section 3004(n). However, as previously noted, in the Phase 11 TSDF air rules, EPA intends to propose modifications to permit-as-a-shield provisions as they apply to control of air emissions under these new subparts. With this proposed action, air rules promulgated under RCRA section 3004(n) would be applicable to all facilities, regardless of permit status.

Both interim status and permitted facilities must comply with the substantive control requirements of the final standards. However, facilities that have already been issued a final permit prior to the effective date of today's final rules are not required to comply with the rules until such time as the permit is reviewed or is reissued. Interim status facilities that have submitted their part B permit application are required to modify their part B

applications to incorporate the requirements of today's rules.

The EPA considers that the part 265 standards promulgated here can be satisfied without the need for detailed explanation or negotiation between the facility owner/operator and EPA and therefore, interim status facilities can comply without awaiting permit action. The self-implementing nature of these rules is achieved by including specific criteria for facility owners or operators to identify waste management units that are subject to the regulation and by clearly specifying the emission control and administrative requirements of the rules.

The criteria for applicability are that certain hazardous waste management units at new and existing TSDF that need authorization to operate under RCRA section 3005 are covered by the rules. The applicability includes all hazardous waste management units and recycling units at facilities that require RCRA permits. For the equipment leak standards to apply, the equipment must contain or contact hazardous wastes with a 10-percent-or-more total organics concentration. For the process vent standards to apply, the vents must be associated with specific hazardous waste management units, i.e., distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations, that manage wastes with 10 ppmw or greater total organics concentration.

Control requirements in the final regulation include specific design requirements for equipment and specific performance criteria (i.e., a weight-percent reduction and a volume concentration limit) for emission control devices. Provisions of the final standards also list specific types of equipment required. Owners and operators who use one of the listed types of equipment within the specified design and operational parameters would therefore be in compliance with the regulation as long as the required design, inspection, monitoring, and maintenance provisions were met. Specifications for emission controls that achieve at least a 95-weight-percent reduction in volatile organic emissions are somewhat less specific, but engineering design practices are sufficiently established that the combination of a good control device design and subsequent monitoring of operating parameters, as required by the final regulation, would offer reasonable assurance that the specified emission reduction is being achieved. Regardless of the type of control selected, owners and operators must maintain their own

records of control device design, installation, and monitoring and must submit reports identifying exceeders of monitored control device parameters. Periodic review of the required reports and records by EPA may be used to ensure compliance.

Because today's rules are promulgated under HSWA, all affected facilities must comply with these requirements on the effective date of the rule, regardless of the authorization status of the State in which they are located. In addition, because EPA will implement these rules in every State on the effective date, all reports should be sent to the EPA Regional Offices until the State receives authorization to implement these rules. Therefore, owners and operators of TSDF with existing waste management units subject to the provisions of subparts AA and BB must achieve compliance with the process vent and equipment leak control and monitoring requirements on the effective date of these rules (i.e., 6 months following promulgation) except where compliance would require the installation of a closed-vent system and control device. Information developed under other EPA regulations has shown that in some cases, the design, construction, and installation of a closed-vent system and control device can take as long as 24 months to complete. As a result, EPA is allowing up to 24 months from the promulgation date of the regulation for existing facilities to complete installation if they are required to install a closed-vent system and control device and if they can document that installation of the emission controls cannot reasonably be expected to be completed earlier. In these circumstances, owners/operators are required to develop an implementation schedule that indicates dates by which the design, construction, and operation of the necessary emission controls will be completed. This implementation schedule must document that installation of closed-vent systems and control devices required by the final standards would be achieved within a period of no more than 2 years from today and must be included as part of the facility's operating record on the effective date of these final rules (i.e., 6 months after promulgation). Changes in the implementation schedule are allowed within the 24-month timeframe if the owner or operator documents that the change cannot reasonably be avoided.

This extension would also apply to those existing facilities that are brought under regulation because of new statutory or regulatory amendments

under RCRA that render the facility subject to the provisions of subpart AA or BB (e.g., units handling wastes newly listed or identified as hazardous by EPA). That is, the owner or operator may be allowed up to 18 months from the effective date of the statutory or regulatory amendment to complete installation of a control device. However, for facilities adding new waste management units, EPA believes that the lead time involved in such actions provides adequate time for owners and operators to design, procure, and install the required controls. Therefore, all new units must comply with the rules immediately (i.e., must have control equipment installed and operating upon startup of the unit).

Under the approach discussed above, the standards promulgated today for process vents and equipment leaks would be implemented on the following schedule for existing TSDF:

- 180 days following promulgation, the new subparts AA and BB standards become effective; all facilities become subject to the new standards.
- On the effective date of the standards, compliance with the standards is required. Each facility that does not have the control devices required by the standards in place and operating must have one of the following in the facility's operating record: (1) An implementation schedule indicating when the controls will be installed, or (2) a process vent emission rate determination that documents that the emission rate limit is not exceeded (therefore, controls are not required).
- No later than 18 months following the effective date (2 years following promulgation), any control devices required by the standards for process vents and equipment leaks must be installed at all facilities.
- All permits issued after the effective date must incorporate the standards.

An existing solid waste management unit may become a hazardous waste management unit requiring a RCRA permit when a waste becomes newly listed or identified as hazardous. Owners and operators of facilities not previously requiring a RCRA permit who have existing units handling newly listed or identified hazardous waste can submit a part A application and obtain interim status. The air emission standards promulgated today would be implemented at these newly regulated facilities on the following schedule:

- 180 days following the date the managed waste is listed or identified as hazardous, the standards become effective; facilities become subject to the subpart AA and/or BB standards.

—On the effective date of the standards, each facility that does not have the control devices required by the process and/or equipment leak standards in place must have one of the following in the facility's operating record: (1) An implementation schedule indicating when the controls will be installed, or (2) a process vent emission rate determination that documents that the emission rate limit is not exceeded (therefore, controls are not required).

- No later than 18 months following the effective date (2 years following promulgation), the controls required by the standards must be installed at all facilities.

Newly constructed TSDF are required to submit part A and part B permit applications and to receive a final permit prior to construction as required by § 270.10. Following the effective date of the standards promulgated today, a part B application for a new facility must demonstrate compliance with the standards as contained in part 264, if applicable. Therefore, all controls required by the standards would have to be in place and operating upon startup.

Similarly, new waste management units added to existing facilities would have to be equipped with the required controls prior to startup. For a new unit added to an existing permitted facility, a permit modification would be necessary. Where a new unit is added to a facility in interim status, the owner or operator must submit a revised part A application (§ 270.72(c)), including an explanation of the need for the new unit, and then receive approval from the permitting authority.

For facilities with hazardous waste management units that previously were not subject to control requirements because the wastes in the units did not contain organics in concentrations greater than the applicability criterion of 10 ppmw or 10 percent, the owner or operator would be required to comply with all subpart AA or BB requirements on the date that the facility or waste management unit becomes affected by the rules (i.e., the date the facility begins to manage wastes in the units with organic concentrations greater than 10 ppmw for subpart AA or greater than 10 percent for subpart BB) irrespective of any change in permit status that is required by the change in waste concentration. In this situation, should the facility owner or operator elect to use a control device to comply with the process vent or equipment leak provisions, the control device must be installed and operating on the date when the unit becomes subject to the

rules; the 24-month extension is not applicable in this case. For the process vent emission rate limit, the situation is somewhat different. TSDF process vents associated with the distillation/separation operations specified in the rule that manage wastes with organics concentrations of 10 ppmw or greater are affected by the regulation regardless of whether the facility emissions are above or below the emission rate limit. Therefore, any change in the facility operations that results in a TSDF going above or below the emission rate limit does not cause a change in the applicability of the facility to subpart AA. The rules require that affected TSDF reduce total process vent organic emissions from all affected vents by 95 percent or reduce the facility's total process vent emissions to or below 1.4 kg/h and 2.8 Mg/yr. One of these conditions must be met at all times; the facility's emission rate determination, which documents the facility's status regarding compliance with the process vent standards, must also at all times reflect current design and operation and wastes managed in the affected units.

The permitting authority cited by section 3005 of RCRA and codified in § 270.32(b)(2) states that permits issued under this section " * * * shall contain such terms and conditions as the Administrator or State Director determines necessary to protect human health and the environment." This section, in effect, allows permit writers to require, on a case-by-case basis, emission controls that are more stringent than those specified by a standard. This omnibus authority could be used in situations where, in the permit writer's judgment, there is an unacceptably high residual risk after application of controls required by an emission standard. As has been stated, the approach that EPA is using in today's regulatory action is to proceed with promulgation of regulations to control organic emissions and to follow this with regulations that would require more stringent controls for individual hazardous constituents or would otherwise reduce risk where necessary. Until then, permit writers should use their omnibus permitting authority to require more stringent controls at facilities where a high residual risk remains after implementation of the standards for volatile organics.

X. Administrative Requirements

A. Regulatory Impact Analysis

Executive Order No. 12291 (E.O. 12291) requires each Federal agency to determine whether a regulation is a

"major" rule as defined by the order and, "to the extent permitted by law," to prepare and consider a Regulatory Impact Analysis (RIA) in connection with every major rule. Major rules are defined as those likely to result in:

1. An annual cost to the economy of \$100 million or more; or
2. A major increase in costs or prices for consumers or individual industries; or
3. Significant adverse effects on competition, employment, investment, productivity, innovation, or international trade.

The final rule establishes the specific emission levels and emission control programs that facilities must meet in reducing air emissions from hazardous waste management units. A complete assessment of the costs, impacts, and benefits of these rules has been conducted by EPA. This analysis indicates that the requirements of the rules for TSDF equipment leaks and process vents result in none of the economic effects set forth in section 1 of the E.O. 12291 as grounds for finding a regulation to be major. The industry-wide annualized costs of the standards are estimated to be \$46 million, which is less than the \$100 million established as the first criterion for a major regulation in E.O. 12291. Price increases associated with the final standards are not considered a "major increase in costs or prices" specified as the second criterion in E.O. 12291. The final standard's effect on the industry would not result in any significant adverse effects on competition, investment, productivity, employment, innovation, or the ability of U.S. firms to compete with foreign firms (the third criterion in E.O. 12291).

The final rule was submitted to the Office of Management and Budget (OMB) for review as required by E.O. 12291.

B. Regulatory Flexibility Act

Under the Regulatory Flexibility Act, whenever an Agency publishes any proposed or final rule in the Federal Register, it must prepare a Regulatory Flexibility Analysis (RFA) that describes the impact of the rule on small entities (i.e., small businesses, organizations, and governmental jurisdictions). This analysis is not necessary, however, if the Agency's Administrator certifies that the rule will not have a significant economic impact on a substantial number of small entities. The EPA has established guidelines for determining whether an RFA is required to accompany a rulemaking package. The guidelines state that if at least 20 percent of the universe of "small entities" is affected

by the rule, then an RFA is required. In addition, the EPA criteria are used to evaluate if a regulation will have a "significant impact" on small entities. If any one of the following four criteria is met, the regulation should be assumed to have a "significant impact":

1. Annual compliance costs increase the relevant production costs for small entities by more than 5 percent.
2. The ratio of compliance costs to sales will be 10 percent higher for small entities than for large entities.
3. Capital costs of compliance will represent a significant portion of the capital available to small entities, taking into account internal cash flow plus external financing capabilities.
4. The costs of the regulation will likely result in closures of small entities.

At proposal, EPA's Administrator certified that the rule would not have a significant impact on small businesses because the only entities subject to the rule are those required to have a permit for treatment, storage, and disposal of hazardous waste. Few, if any, of these facilities are small entities. Based on comments received at proposal, EPA reviewed this conclusion in light of the revisions made to the proposed standards and closely examined the potential impacts on the industry segment comprised primarily of small commercial recyclers. As a result of the revisions made to exempt small facilities from having to install control devices, EPA again concluded that the economic impact on small businesses will be minimal and did not prepare a formal RFA in support of the rule.

Accordingly, I hereby certify that this regulation will not have a significant impact on a substantial number of small entities. Therefore, this regulation does not require an RFA.

C. Paperwork Reduction Act

The information collection requirements contained in this rule have been approved by OMB under the provisions of the Paperwork Reduction Act, 44 U.S.C. 3501 et seq. and have been assigned OMB control number 2060-0195.

Public reporting burden resulting from this rulemaking is estimated to be about 9 hours per response (on average), including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Recordkeeping requirements are estimated to require 180 hours a year for each facility.

Send comments regarding the burden estimate or any other aspect of this

collection of information, including suggestions for reducing this burden, to Chief, Information Policy Branch, PM-223, U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs (Paperwork Reduction Project (2060-0195)), Office of Management and Budget, Washington, DC 20503, marked "Attention: Desk Officer for EPA."

D. Supporting Documentation

The dockets for this rulemaking (Docket No. F-86-AESP-FFFFF, which covers the development of the rules up to proposal, and Docket No. F-90-AESF-FFFFF, which covers development of the final rules from proposal to promulgation) are available for public inspection at the EPA RCRA Docket Office (OS-300) in room 2427M of the U.S. Environmental Protection Agency, 401 M Street SW., Washington, DC 20460. The docket room is open from 9 a.m. to 4 p.m., Monday through Friday, except for Federal holidays. The public must make an appointment to review docket materials and should call (202) 475-9327 for appointments. Docket A-79-27, containing support information used in developing the National Emission Standard for Hazardous Air Pollutants; Benzene Fugitive Emissions, is available for public inspection and copying between 8 a.m. and 4 p.m., Monday through Friday, at EPA's Central Docket Section, room 2903B, Waterside Mall, 401 M Street SW., Washington, DC 20460. The public may copy a maximum of 50 pages of material from any one regulatory docket at no cost. Additional copies cost \$0.20/page. The docket contains a copy of all references cited in the BID for the proposed and final rules, as well as other relevant reports and correspondence.

E. List of Subjects

40 CFR Part 260

Air stripping operation, Closed-vent system, Condenser, Control device, Distillation operation, Equipment, Fractionation operation, Process vent, Solvent extraction operation, Steam stripping operation, Thin-film evaporation operation, Vapor incinerator, Vented, Incorporation by reference.

40 CFR Part 261

Hazardous waste, Recyclable materials, Recycling, Hazardous waste management units.

40 CFR Parts 264 and 265

Hazardous waste, Treatment, storage, and disposal facilities, Air emission standards for process vents, Air emission standards for equipment leaks, Incorporation by reference, Process vents, Closed-vent systems, Control devices' Pumps, Valves, Pressure relief devices, Sampling connection systems, Open-ended lines, Alternative standards, Test methods, Recordkeeping requirements, Reporting requirements.

40 CFR Part 270

Administrative practices and procedures, Hazardous waste permit program, Process vents, Equipment leaks, Reporting and recordkeeping requirements.

40 CFR Part 271

Hazardous waste, State hazardous waste programs, Process vent and equipment leak air emission standards for TSDF.

Dated June 13, 1990.

William K. Reilly,
Administrator.

For the reasons set out in the preamble, chapter I, title 40, of the Code of Federal Regulations, parts 260, 261, 264, 265, 270, and 271, are amended as follows.

PART 260—HAZARDOUS WASTE MANAGEMENT SYSTEM: GENERAL

1. The authority citation for part 260 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6921 through 6927, 6930, 6934, 6935, 6937, 6938, and 6939.

2. Section 260.11 is amended by adding the following references to paragraph (a):

§ 260.11 References.

(a) * * *

"ASTM Standard Method for Analysis of Reformed Gas by Gas Chromatography," ASTM Standard D 1946-82, available from American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.

"ASTM Standard Test Method for Heat of Combustion of Hydrocarbon Fuels by Bomb Calorimeter (High-Precision Method)," ASTM Standard D 2382-83, available from American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.

"ASTM Standard Practices for General Techniques of Ultraviolet-Visible Quantitative Analysis," ASTM Standard E 169-87, available from American Society for Testing and

Materials, 1916 Race Street, Philadelphia, PA 19103.

"ASTM Standard Practices for General Techniques of Infrared Quantitative Analysis," ASTM Standard E 168-88, available from American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.

"ASTM Standard Practice for Packed Column Gas Chromatography," ASTM Standard E 260-85, available from American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.

"ASTM Standard Test Method for Aromatics in Light Naphthas and Aviation Gasolines by Gas Chromatography," ASTM Standard D 2267-88, available from American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.

"ASTM Standard Test Method for Vapor Pressure-Temperature Relationship and Initial Decomposition Temperature of Liquids by Isoteriscope," ASTM Standard D 2879-86, available from American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.

"APTI Course 415: Control of Gaseous Emissions," EPA Publication EPA-450/2-81-005, December 1981, available from National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161.

PART 261—IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

3. The authority citation for part 261 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912, 6921, 6922, and 6937.

Subpart A—General

4. In § 261.6, paragraph (c)(1) is revised and paragraphs (c)(2)(iii) and (d) are added to read as follows:

§ 261.6 Requirements for recyclable materials.

(c)(1) Owners or operators of facilities that store recyclable materials before they are recycled are regulated under all applicable provisions of subparts A through L, AA, and BB of parts 264 and 265, and under parts 124, 266, 268, and 270 of this chapter and the notification requirements under section 3010 of RCRA, except as provided in paragraph (a) of this section. (The recycling process itself is exempt from regulation except as provided in § 261.6(d).)

(2) * * *

(iii) Section 261.6(d) of this chapter.

(d) Owners or operators of facilities subject to RCRA permitting requirements with hazardous waste management units that recycle hazardous wastes are subject to the requirements of subparts AA and BB of part 264 or 265 of this chapter.

PART 264—STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

5. The authority citation for part 264 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), 6924, and 6925.

Subpart B—General Facility Standards

6. Section 264.13 is amended by revising paragraph (b)(6) to read as follows:

§ 264.13 General waste analysis.

(b) . . .

(6) Where applicable, the methods that will be used to meet the additional waste analysis requirements for specific waste management methods as specified in §§ 264.17, 264.314, 264.341, 264.1034(d), 264.1063(d), and 268.7 of this chapter.

7. Section 264.15 is amended by revising the last sentence of paragraph (b)(4) to read as follows:

§ 264.15 General inspection requirements.

(b) . . .

(4) . . .

At a minimum, the inspection schedule must include the terms and frequencies called for in §§ 264.174, 264.194, 264.228, 264.253, 264.254, 264.303, 264.347, 264.602, 264.1033, 264.1052, 264.1053, and 264.1058, where applicable.

Subpart E—Manifest System, Recordkeeping, and Reporting

8. Section 264.73 is amended by revising paragraphs (b)(3) and (b)(6) to read as follows:

§ 264.73 Operation record.

(b) . . .

(3) Records and results of waste analyses performed as specified in §§ 264.13, 264.17, 264.314, 264.341, 264.1034, 264.1063, 268.4(a), and 268.7 of this chapter.

(6) Monitoring, testing or analytical data, and corrective action where

required by subpart F and §§ 264.228, 264.253, 264.254, 264.276, 264.278, 264.280, 264.303, 264.309, 264.347, 264.602, 264.1034(c)–264.1034(f), 264.1035, 264.1063(d)–264.1063(i), and 264.1064.

9. Section 264.77 is amended by revising paragraph (c) to read as follows:

§ 264.77 Additional reports.

(c) As otherwise required by subparts F, K through N, AA, and BB.

10. 40 CFR part 264 is amended by adding subpart AA to read as follows:

Subpart AA—Air Emission Standards for Process Vents

- 264.1030 Applicability.
- 264.1031 Definitions.
- 264.1032 Standards: Process vents.
- 264.1033 Standards: Closed-vent systems and control devices.
- 264.1034 Test methods and procedures.
- 264.1035 Recordkeeping requirements.
- 264.1036 Reporting requirements.
- 264.1037–264.1049 [Reserved]

Subpart AA—Air Emission Standards for Process Vents

§ 264.1030 Applicability.

(a) The regulations in this subpart apply to owners and operators of facilities that treat, store, or dispose of hazardous wastes (except as provided in § 264.1).

(b) Except for §§ 264.1034(d) and 264.1035(e), this subpart applies to process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations that manage hazardous wastes with organic concentrations of at least 10-ppmw, if these operations are conducted in:

- (1) Units that are subject to the permitting requirements of part 270, or
- (2) Hazardous waste recycling units that are located on hazardous waste management facilities otherwise subject to the permitting requirements of part 270.

(c) If the owner or operator of process vents subject to the requirements of §§ 264.1032 through 264.1036 has received a permit under section 3005 of RCRA prior to December 21, 1990 the requirements of §§ 264.1032 through 264.1036 must be incorporated when the permit is reissued under § 124.15 or reviewed under § 270.50.

[Note: The requirements of §§ 264.1032 through 264.1036 apply to process vents on hazardous waste recycling units previously exempt under paragraph 261.6(c)(1). Other exemptions under §§ 261.4, 262.34, and 264.1(g) are not affected by these requirements.]

§ 264.1031 Definitions.

As used in this subpart, all terms not defined herein shall have the meaning given them in the Act and parts 260–266.

Air stripping operation is a desorption operation employed to transfer one or more volatile components from a liquid mixture into a gas (air) either with or without the application of heat to the liquid. Packed towers, spray towers, and bubble-cap, sieve, or valve-type plate towers are among the process configurations used for contacting the air and a liquid.

Bottoms receiver means a container or tank used to receive and collect the heavier bottoms fractions of the distillation feed stream that remain in the liquid phase.

Closed-vent system means a system that is not open to the atmosphere and that is composed of piping, connections, and, if necessary, flow-inducing devices that transport gas or vapor from a piece or pieces of equipment to a control device.

Condenser means a heat-transfer device that reduces a thermodynamic fluid from its vapor phase to its liquid phase.

Connector means flanged, screwed, welded, or other joined fittings used to connect two pipelines or a pipeline and a piece of equipment. For the purposes of reporting and recordkeeping, connector means flanged fittings that are not covered by insulation or other materials that prevent location of the fittings.

Continuous recorder means a data-recording device recording an instantaneous data value at least once every 15 minutes.

Control device means an enclosed combustion device, vapor recovery system, or flare. Any device the primary function of which is the recovery or capture of solvents or other organics for use, reuse, or sale (e.g., a primary condenser on a solvent recovery unit) is not a control device.

Control device shutdown means the cessation of operation of a control device for any purpose.

Distillate receiver means a container or tank used to receive and collect liquid material (condensed) from the overhead condenser of a distillation unit and from which the condensed liquid is pumped to larger storage tanks or other process units.

Distillation operation means an operation, either batch or continuous, separating one or more feed stream(s) into two or more exit streams, each exit stream having component concentrations different from those in the feed stream(s). The separation is

achieved by the redistribution of the components between the liquid and vapor phase as they approach equilibrium within the distillation unit.

Double block and bleed system means two block valves connected in series with a bleed valve or line that can vent the line between the two block valves.

Equipment means each valve, pump, compressor, pressure relief device, sampling connection system, open-ended valve or line, or flange, and any control devices or systems required by this subpart.

Flame zone means the portion of the combustion chamber in a boiler occupied by the flame envelope.

Flow indicator means a device that indicates whether gas flow is present in a vent stream.

First attempt at repair means to take rapid action for the purpose of stopping or reducing leakage of organic material to the atmosphere using best practices.

Fractionation operation means a distillation operation or method used to separate a mixture of several volatile components of different boiling points in successive stages, each stage removing from the mixture some proportion of one of the components.

Hazardous waste management unit shutdown means a work practice or operational procedure that stops operation of a hazardous waste management unit or part of a hazardous waste management unit. An unscheduled work practice or operational procedure that stops operation of a hazardous waste management unit or part of a hazardous waste management unit for less than 24 hours is not a hazardous waste management unit shutdown. The use of spare equipment and technically feasible bypassing of equipment without stopping operation are not hazardous waste management unit shutdowns.

Hot well means a container for collecting condensate as in a steam condenser serving a vacuum-jet or steam-jet ejector.

In gas/vapor service means that the piece of equipment contains or contacts a hazardous waste stream that is in the gaseous state at operating conditions.

In heavy liquid service means that the piece of equipment is not in gas/vapor service or in light liquid service.

In light liquid service means that the piece of equipment contains or contacts a waste stream where the vapor pressure of one or more of the components in the stream is greater than 0.3 kilopascals (kPa) at 20 °C, the total concentration of the pure components having a vapor pressure greater than 0.3 kPa at 20 °C is equal to or greater than

20 percent by weight, and the fluid is a liquid at operating conditions.

In situ sampling systems means nonextractive samplers or in-line samplers.

In vacuum service means that equipment is operating at an internal pressure that is at least 5 kPa below ambient pressure.

Malfunction means any sudden failure of a control device or a hazardous waste management unit or failure of a hazardous waste management unit to operate in a normal or usual manner, so that organic emissions are increased.

Open-ended valve or line means any valve, except pressure relief valves, having one side of the valve seat in contact with process fluid and one side open to the atmosphere, either directly or through open piping.

Pressure release means the emission of materials resulting from the system pressure being greater than the set pressure of the pressure relief device.

Process heater means a device that transfers heat liberated by burning fuel to fluids contained in tubes, including all fluids except water that are heated to produce steam.

Process vent means any open-ended pipe or stack that is vented to the atmosphere either directly, through a vacuum-producing system, or through a tank (e.g., distillate receiver, condenser, bottoms receiver, surge control tank, separator tank, or hot well) associated with hazardous waste distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations.

Repaired means that equipment is adjusted, or otherwise altered, to eliminate a leak.

Sensor means a device that measures a physical quantity or the change in a physical quantity, such as temperature, pressure, flow rate, pH, or liquid level.

Separator tank means a device used for separation of two immiscible liquids.

Solvent extraction operation means an operation or method of separation in which a solid or solution is contacted with a liquid solvent (the two being mutually insoluble) to preferentially dissolve and transfer one or more components into the solvent.

Startup means the setting in operation of a hazardous waste management unit or control device for any purpose.

Steam stripping operation means a distillation operation in which vaporization of the volatile constituents of a liquid mixture takes place by the introduction of steam directly into the charge.

Surge control tank means a large-sized pipe or storage reservoir sufficient

to contain the surging liquid discharge of the process tank to which it is connected.

Thin-film evaporation operation means a distillation operation that employs a heating surface consisting of a large diameter tube that may be either straight or tapered, horizontal or vertical. Liquid is spread on the tube wall by a rotating assembly of blades that maintain a close clearance from the wall or actually ride on the film of liquid on the wall.

Vapor incinerator means any enclosed combustion device that is used for destroying organic compounds and does not extract energy in the form of steam or process heat.

Vented means discharged through an opening, typically an open-ended pipe or stack, allowing the passage of a stream of liquids, gases, or fumes into the atmosphere. The passage of liquids, gases, or fumes is caused by mechanical means such as compressors or vacuum-producing systems or by process-related means such as evaporation produced by heating and not caused by tank loading and unloading (working losses) or by natural means such as diurnal temperature changes.

§ 264.1032 Standards: Process vents.

(a) The owner or operator of a facility with process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations managing hazardous wastes with organic concentrations of at least 10 ppmw shall either:

(1) Reduce total organic emissions from all affected process vents at the facility below 1.4 kg/h (3 lb/h) and 2.8 Mg/yr (3.1 tons/yr), or

(2) Reduce, by use of a control device, total organic emissions from all affected process vents at the facility by 95 weight percent.

(b) If the owner or operator installs a closed-vent system and control device to comply with the provisions of paragraph (a) of this section the closed-vent system and control device must meet the requirements of § 264.1033.

(c) Determinations of vent emissions and emission reductions or total organic compound concentrations achieved by add-on control devices may be based on engineering calculations or performance tests. If performance tests are used to determine vent emissions, emission reductions, or total organic compound concentrations achieved by add-on control devices, the performance tests must conform with the requirements of § 264.1034(c).

(d) When an owner or operator and the Regional Administrator do not agree on determinations of vent emissions and/or emission reductions or total organic compound concentrations achieved by add-on control devices based on engineering calculations, the procedures in § 264.1034(c) shall be used to resolve the disagreement.

§ 264.1033 Standards: Closed-vent systems and control devices.

(a)(1) Owners or operators of closed-vent systems and control devices used to comply with provisions of this part shall comply with the provisions of this section.

(2) The owner or operator of an existing facility who cannot install a closed-vent system and control device to comply with the provisions of this subpart on the effective date that the facility becomes subject to the provisions of this subpart must prepare an implementation schedule that includes dates by which the closed-vent system and control device will be installed and in operation. The controls must be installed as soon as possible, but the implementation schedule may allow up to 18 months after the effective date that the facility becomes subject to this subpart for installation and startup. All units that begin operation after December 21, 1990, must comply with the rules immediately (i.e., must have control devices installed and operating on startup of the affected unit); the 2-year implementation schedule does not apply to these units.

(b) A control device involving vapor recovery (e.g., a condenser or adsorber) shall be designed and operated to recover the organic vapors vented to it with an efficiency of 95 weight percent or greater unless the total organic emission limits of § 264.1032(a)(1) for all affected process vents can be attained at an efficiency less than 95 weight percent.

(c) An enclosed combustion device (e.g., a vapor incinerator, boiler, or process heater) shall be designed and operated to reduce the organic emissions vented to it by 95 weight percent or greater; to achieve a total organic compound concentration of 20 ppmv, expressed as the sum of the actual compounds, not carbon equivalents, on a dry basis corrected to 3 percent oxygen; or to provide a minimum residence time of 0.50 seconds at a minimum temperature of 760 °C. If a boiler or process heater is used as the control device, then the vent stream shall be introduced into the flame zone of the boiler or process heater.

(d)(1) A flare shall be designed for and operated with no visible emissions

as determined by the methods specified in paragraph (e)(1) of this section, except for periods not to exceed a total of 5 minutes during any 2 consecutive hours.

(2) A flare shall be operated with a flame present at all times, as determined by the methods specified in paragraph (f)(2)(iii) of this section.

(3) A flare shall be used only if the net heating value of the gas being combusted is 11.2 MJ/scm (300 Btu/scf) or greater if the flare is steam-assisted or air-assisted; or if the net heating value of the gas being combusted is 7.45 MJ/scm (200 Btu/scf) or greater if the flare is nonassisted. The net heating value of the gas being combusted shall be determined by the methods specified in paragraph (e)(2) of this section.

(4)(i) A steam-assisted or nonassisted flare shall be designed for and operated with an exit velocity, as determined by the methods specified in paragraph (e)(3) of this section, less than 18.3 m/s (60 ft/s), except as provided in paragraphs (d)(4) (ii) and (iii) of this section.

(ii) A steam-assisted or nonassisted flare designed for and operated with an exit velocity, as determined by the methods specified in paragraph (e)(3) of this section, equal to or greater than 18.3 m/s (60 ft/s) but less than 122 m/s (400 ft/s) is allowed if the net heating value of the gas being combusted is greater than 37.3 MJ/scm (1,000 Btu/scf).

(iii) A steam-assisted or nonassisted flare designed for and operated with an exit velocity, as determined by the methods specified in paragraph (e)(3) of this section, less than the velocity, V_{max} , as determined by the method specified in paragraph (e)(4) of this section and less than 122 m/s (400 ft/s) is allowed.

(5) An air-assisted flare shall be designed and operated with an exit velocity less than the velocity, V_{max} , as determined by the method specified in paragraph (e)(5) of this section.

(6) A flare used to comply with this section shall be steam-assisted, air-assisted, or nonassisted.

(e)(1) Reference Method 22 in 40 CFR part 60 shall be used to determine the compliance of a flare with the visible emission provisions of this subpart. The observation period is 2 hours and shall be used according to Method 22.

(2) The net heating value of the gas being combusted in a flare shall be calculated using the following equation:

$$H_T = K \left[\sum_{i=1}^n C_i H_i \right]$$

where:

H_T = Net heating value of the sample, MJ/scm; where the net enthalpy per mole of offgas is based on combustion at 25 °C and 760 mm Hg, but the standard temperature for determining the volume corresponding to 1 mol is 20 °C;

K = Constant, 1.74×10^{-7} (1/ppm) (g mol/scm) (MJ/kcal) where standard temperature for (g mol/scm) is 20 °C;

C_i = Concentration of sample component i in ppm on a wet basis, as measured for organics by Reference Method 18 in 40 CFR part 60 and measured for hydrogen and carbon monoxide by ASTM D 1946-82 (incorporated by reference as specified in § 260.11); and

H_i = Net heat of combustion of sample component i , kcal/9 mol at 25 °C and 760 mm Hg. The heats of combustion may be determined using ASTM D 2382-83 (incorporated by reference as specified in § 260.11) if published values are not available or cannot be calculated.

(3) The actual exit velocity of a flare shall be determined by dividing the volumetric flow rate (in units of standard temperature and pressure), as determined by Reference Methods 2, 2A, 2C, or 2D in 40 CFR part 60 as appropriate, by the unobstructed (free) cross-sectional area of the flare tip.

(4) The maximum allowed velocity in m/s, V_{max} , for a flare complying with paragraph (d)(4)(iii) of this section shall be determined by the following equation:

$$\log_{10}(V_{max}) = (H_T + 28.8) / 31.7$$

where:

28.8 = Constant.

31.7 = Constant.

H_T = The net heating value as determined in paragraph (e)(2) of this section.

(5) The maximum allowed velocity in m/s, V_{max} , for an air-assisted flare shall be determined by the following equation:

$$V_{max} = 8.706 + 0.7084 (H_T)$$

where:

8.706 = Constant.

0.7084 = Constant.

H_T = The net heating value as determined in paragraph (e)(2) of this section.

(f) The owner or operator shall monitor and inspect each control device required to comply with this section to ensure proper operation and maintenance of the control device by implementing the following requirements:

(1) Install, calibrate, maintain, and operate according to the manufacturer's specifications a flow indicator that provides a record of vent stream flow from each affected process vent to the control device at least once every hour. The flow indicator sensor shall be installed in the vent stream at the nearest feasible point to the control

device inlet but before the point at which the vent streams are combined.

(2) Install, calibrate, maintain, and operate according to the manufacturer's specifications a device to continuously monitor control device operation as specified below:

(i) For a thermal vapor incinerator, a temperature monitoring device equipped with a continuous recorder. The device shall have an accuracy of ± 1 percent of the temperature being monitored in $^{\circ}\text{C}$ or $\pm 0.5^{\circ}\text{C}$, whichever is greater. The temperature sensor shall be installed at a location in the combustion chamber downstream of the combustion zone.

(ii) For a catalytic vapor incinerator, a temperature monitoring device equipped with a continuous recorder. The device shall be capable of monitoring temperature at two locations and have an accuracy of ± 1 percent of the temperature being monitored in $^{\circ}\text{C}$ or $\pm 0.5^{\circ}\text{C}$, whichever is greater. One temperature sensor shall be installed in the vent stream at the nearest feasible point to the catalyst bed inlet and a second temperature sensor shall be installed in the vent stream at the nearest feasible point to the catalyst bed outlet.

(iii) For a flare, a heat sensing monitoring device equipped with a continuous recorder that indicates the continuous ignition of the pilot flame.

(iv) For a boiler or process heater having a design heat input capacity less than 44 MW, a temperature monitoring device equipped with a continuous recorder. The device shall have an accuracy of ± 1 percent of the temperature being monitored in $^{\circ}\text{C}$ or $\pm 0.5^{\circ}\text{C}$, whichever is greater. The temperature sensor shall be installed at a location in the furnace downstream of the combustion zone.

(v) For a boiler or process heater having a design heat input capacity greater than or equal to 44 MW, a monitoring device equipped with a continuous recorder to measure a parameter(s) that indicates good combustion operating practices are being used.

(vi) For a condenser, either:

(A) A monitoring device equipped with a continuous recorder to measure the concentration level of the organic compounds in the exhaust vent stream from the condenser, or

(B) A temperature monitoring device equipped with a continuous recorder. The device shall be capable of monitoring temperature at two locations and have an accuracy of ± 1 percent of the temperature being monitored in $^{\circ}\text{C}$ or $\pm 0.5^{\circ}\text{C}$, whichever is greater. One temperature sensor shall be installed at a location in the exhaust vent stream

from the condenser, and a second temperature sensor shall be installed at a location in the coolant fluid exiting the condenser.

(vii) For a carbon adsorption system that regenerates the carbon bed directly in the control device such as a fixed-bed carbon adsorber, either:

(A) A monitoring device equipped with a continuous recorder to measure the concentration level of the organic compounds in the exhaust vent stream from the carbon bed, or

(B) A monitoring device equipped with a continuous recorder to measure a parameter that indicates the carbon bed is regenerated on a regular, predetermined time cycle.

(3) Inspect the readings from each monitoring device required by paragraphs (1) and (2) of this section at least once each operating day to check control device operation and, if necessary, immediately implement the corrective measures necessary to ensure the control device operates in compliance with the requirements of this section.

(g) An owner or operator using a carbon adsorption system such as a fixed-bed carbon adsorber that regenerates the carbon bed directly onsite in the control device shall replace the existing carbon in the control device with fresh carbon at a regular, predetermined time interval that is no longer than the carbon service life established as a requirement of § 264.1035(b)(4)(iii)(F).

(h) An owner or operator using a carbon adsorption system such as a carbon canister that does not regenerate the carbon bed directly onsite in the control device shall replace the existing carbon in the control device with fresh carbon on a regular basis by using one of the following procedures:

(1) Monitor the concentration level of the organic compounds in the exhaust vent stream from the carbon adsorption system on a regular schedule, and replace the existing carbon with fresh carbon immediately when carbon breakthrough is indicated. The monitoring frequency shall be daily or at an interval no greater than 20 percent of the time required to consume the total carbon working capacity established as a requirement of § 264.1035(b)(4)(iii)(G), whichever is longer.

(2) Replace the existing carbon with fresh carbon at a regular, predetermined time interval that is less than the design carbon replacement interval established as a requirement of § 264.1035(b)(4)(iii)(G).

(i) An alternative operational or process parameter may be monitored if it can be demonstrated that another

parameter will ensure that the control device is operated in conformance with these standards and the control device's design specifications.

(j) An owner or operator of an affected facility seeking to comply with the provisions of this part by using a control device other than a thermal vapor incinerator, catalytic vapor incinerator, flare, boiler, process heater, condenser, or carbon adsorption system is required to develop documentation including sufficient information to describe the control device operation and identify the process parameter or parameters that indicate proper operation and maintenance of the control device.

(k)(1) Closed-vent systems shall be designed for and operated with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background and by visual inspections, as determined by the methods specified as § 264.1034(b).

(2) Closed-vent systems shall be monitored to determine compliance with this section during the initial leak detection monitoring, which shall be conducted by the date that the facility becomes subject to the provisions of this section, annually, and at other times as requested by the Regional Administrator.

(3) Detectable emissions, as indicated by an instrument reading greater than 500 ppm and visual inspections, shall be controlled as soon as practicable, but not later than 15 calendar days after the emission is detected.

(4) A first attempt at repair shall be made no later than 5 calendar days after the emission is detected.

(l) Closed-vent systems and control devices used to comply with provisions of this subpart shall be operated at all times when emissions may be vented to them.

§ 264.1034 Test methods and procedures.

(a) Each owner or operator subject to the provisions of this subpart shall comply with the test methods and procedures requirements provided in this section.

(b) When a closed-vent system is tested for compliance with no detectable emissions, as required in § 264.1033(k), the test shall comply with the following requirements:

(1) Monitoring shall comply with Reference Method 21 in 40 CFR part 60.

(2) The detection instrument shall meet the performance criteria of Reference Method 21.

(3) The instrument shall be calibrated before use on each day of its use by the

procedures specified in Reference Method 21.

(4) Calibration gases shall be:

(i) Zero air (less than 10 ppm of hydrocarbon in air).

(ii) A mixture of methane or n-hexane and air at a concentration of approximately, but less than, 10,000 ppm methane or n-hexane.

(5) The background level shall be determined as set forth in Reference Method 21.

(6) The instrument probe shall be traversed around all potential leak interfaces as close to the interface as possible as described in Reference Method 21.

(7) The arithmetic difference between

the maximum concentration indicated by the instrument and the background level is compared with 500 ppm for determining compliance.

(c) Performance tests to determine compliance with § 264.1032(a) and with the total organic compound concentration limit of § 264.1033(c) shall comply with the following:

(1) Performance tests to determine total organic compound concentrations and mass flow rates entering and exiting control devices shall be conducted and data reduced in accordance with the following reference methods and calculation procedures:

(i) Method 2 in 40 CFR part 60 for velocity and volumetric flow rate.

$$E_n = Q_{ad} \left\{ \sum_{i=1}^n C_i MW_i \right\} [0.0416] [10^{-9}]$$

where:

E_n = Total organic mass flow rate, kg/h;

Q_{ad} = Volumetric flow rate of gases entering or exiting control device, as determined by Method 2, dscm/h;

n = Number of organic compounds in the vent gas;

C_i = Organic concentration in ppm, dry basis, of compound i in the vent gas, as determined by Method 18;

MW_i = Molecular weight of organic compound i in the vent gas, kg/kg-mol;

0.0416 = Conversion factor for molar volume, kg-mol/m³ (@ 293 K and 760 mm Hg);

10⁻⁹ = Conversion from ppm, ppm⁻¹.

(v) The annual total organic emission rate shall be determined by the following equation:

$$E_A = (E_n)(H)$$

where:

E_A = Total organic mass emission rate, kg/y;

E_n = Total organic mass flow rate for the process vent, kg/h;

H = Total annual hours of operations for the affected unit, h.

(vi) Total organic emissions from all affected process vents at the facility shall be determined by summing the hourly total organic mass emission rates (E_n as determined in paragraph (c)(1)(iv) of this section) and by summing the annual total organic mass emission rates (E_A as determined in paragraph (c)(1)(v) of this section) for all affected process vents at the facility.

(2) The owner or operator shall record such process information as may be necessary to determine the conditions of the performance tests. Operations during periods of startup, shutdown, and malfunction shall not constitute

representative conditions for the purpose of a performance test.

(3) The owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

(i) Sampling ports adequate for the test methods specified in paragraph (c)(1) of this section.

(ii) Safe sampling platform(s).

(iii) Safe access to sampling platform(s).

(iv) Utilities for sampling and testing equipment.

(4) For the purpose of making compliance determinations, the time-weighted average of the results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances beyond the owner or operator's control, compliance may, upon the Regional Administrator's approval, be determined using the average of the results of the two other runs.

(d) To show that a process vent associated with a hazardous waste distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operation is not subject to the requirements of this subpart, the owner or operator must make an initial determination that the time-weighted, annual average total organic concentration of the waste managed by the waste management unit is less than

(ii) Method 18 in 40 CFR part 60 for organic content.

(iii) Each performance test shall consist of three separate runs; each run conducted for at least 1 hour under the conditions that exist when the hazardous waste management unit is operating at the highest load or capacity level reasonably expected to occur. For the purpose of determining total organic compound concentrations and mass flow rates, the average of results of all runs shall apply. The average shall be computed on a time-weighted basis.

(iv) Total organic mass flow rates shall be determined by the following equation:

10 ppmw using one of the following two methods:

(1) Direct measurement of the organic concentration of the waste using the following procedures:

(i) The owner or operator must take a minimum of four grab samples of waste for each waste stream managed in the affected unit under process conditions expected to cause the maximum waste organic concentration.

(ii) For waste generated onsite, the grab samples must be collected at a point before the waste is exposed to the atmosphere such as in an enclosed pipe or other closed system that is used to transfer the waste after generation to the first affected distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operation. For waste generated offsite, the grab samples must be collected at the inlet to the first waste management unit that receives the waste provided the waste has been transferred to the facility in a closed system such as a tank truck and the waste is not diluted or mixed with other waste.

(iii) Each sample shall be analyzed and the total organic concentration of the sample shall be computed using Method 9060 or 8240 of SW-846 (incorporated by reference under § 260.11).

(iv) The arithmetic mean of the results of the analyses of the four samples shall apply for each waste stream managed in the unit in determining the time-weighted, annual average total organic concentration of the waste. The time-

weighted average is to be calculated using the annual quantity of each waste stream processed and the mean organic concentration of each waste stream managed in the unit.

(2) Using knowledge of the waste to determine that its total organic concentration is less than 10 ppmw. Documentation of the waste determination is required. Examples of documentation that shall be used to support a determination under this provision include production process information documenting that no organic compounds are used, information that the waste is generated by a process that is identical to a process at the same or another facility that has previously been demonstrated by direct measurement to generate a waste stream having a total organic content less than 10 ppmw, or prior speciation analysis results on the same waste stream where it can also be documented that no process changes have occurred since that analysis that could affect the waste total organic concentration.

(e) The determination that distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations manage hazardous wastes with time-weighted, annual average total organic concentrations less than 10 ppmw shall be made as follows:

(1) By the effective date that the facility becomes subject to the provisions of this subpart or by the date when the waste is first managed in a waste management unit, whichever is later, and

(2) For continuously generated waste, annually, or

(3) Whenever there is a change in the waste being managed or a change in the process that generates or treats the waste.

(f) When an owner or operator and the Regional Administrator do not agree on whether a distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operation manages a hazardous waste with organic concentrations of at least 10 ppmw based on knowledge of the waste, the procedures in Method 8240 may be used to resolve the dispute.

§ 264.1035 Recordkeeping requirements.

(a)(1) Each owner or operator subject to the provisions of this subpart shall comply with the recordkeeping requirements of this section.

(2) An owner or operator of more than one hazardous waste management unit subject to the provisions of this subpart may comply with the recordkeeping requirements for these hazardous waste management units in one recordkeeping

system if the system identifies each record by each hazardous waste management unit.

(b) Owners and operators must record the following information in the facility operating record:

(1) For facilities that comply with the provisions of § 264.1033(a)(2), an implementation schedule that includes dates by which the closed-vent system and control device will be installed and in operation. The schedule must also include a rationale of why the installation cannot be completed at an earlier date. The implementation schedule must be in the facility operating record by the effective date that the facility becomes subject to the provisions of this subpart.

(2) Up-to-date documentation of compliance with the process vent standards in § 264.1032, including:

(i) Information and data identifying all affected process vents, annual throughput and operating hours of each affected unit, estimated emission rates for each affected vent and for the overall facility (i.e., the total emissions for all affected vents at the facility), and the approximate location within the facility of each affected unit (e.g., identify the hazardous waste management units on a facility plot plan).

(ii) Information and data supporting determinations of vent emissions and emission reductions achieved by add-on control devices based on engineering calculations or source tests. For the purpose of determining compliance, determinations of vent emissions and emission reductions must be made using operating parameter values (e.g., temperatures, flow rates, or vent stream organic compounds and concentrations) that represent the conditions that result in maximum organic emissions, such as when the waste management unit is operating at the highest load or capacity level reasonably expected to occur. If the owner or operator takes any action (e.g., managing a waste of different composition or increasing operating hours of affected waste management units) that would result in an increase in total organic emissions from affected process vents at the facility, then a new determination is required.

(3) Where an owner or operator chooses to use test data to determine the organic removal efficiency or total organic compound concentration achieved by the control device, a performance test plan. The test plan must include:

(i) A description of how it is determined that the planned test is going to be conducted when the hazardous waste management unit is operating at

the highest load or capacity level reasonably expected to occur. This shall include the estimated or design flow rate and organic content of each vent stream and define the acceptable operating ranges of key process and control device parameters during the test program.

(ii) A detailed engineering description of the closed-vent system and control device including:

- (A) Manufacturer's name and model number of control device.
- (B) Type of control device.
- (C) Dimensions of the control device.
- (D) Capacity.
- (E) Construction materials.

(iii) A detailed description of sampling and monitoring procedures, including sampling and monitoring locations in the system, the equipment to be used, sampling and monitoring frequency, and planned analytical procedures for sample analysis.

(4) Documentation of compliance with § 264.1033 shall include the following information:

(i) A list of all information references and sources used in preparing the documentation.

(ii) Records including the dates of each compliance test required by § 264.1033(k).

(iii) If engineering calculations are used, a design analysis, specifications, drawings, schematics, and piping and instrumentation diagrams based on the appropriate sections of "APTI Course 415: Control of Gaseous Emissions" (incorporated by reference as specified in § 260.11) or other engineering texts acceptable to the Regional Administrator that present basic control device design information. Documentation provided by the control device manufacturer or vendor that describes the control device design in accordance with paragraphs (b)(4)(iii)(A) through (b)(4)(iii)(C) of this section may be used to comply with this requirement. The design analysis shall address the vent stream characteristics and control device operation parameters as specified below.

(A) For a thermal vapor incinerator, the design analysis shall consider the vent stream composition, constituent concentrations, and flow rate. The design analysis shall also establish the design minimum and average temperature in the combustion zone and the combustion zone residence time.

(B) For a catalytic vapor incinerator, the design analysis shall consider the vent stream composition, constituent concentrations, and flow rate. The design analysis shall also establish the design minimum and average

temperatures across the catalyst bed inlet and outlet.

(C) For a boiler or process heater, the design analysis shall consider the vent stream composition, constituent concentrations, and flow rate. The design analysis shall also establish the design minimum and average flame zone temperatures, combustion zone residence time, and description of method and location where the vent stream is introduced into the combustion zone.

(D) For a flare, the design analysis shall consider the vent stream composition, constituent concentrations, and flow rate. The design analysis shall also consider the requirements specified in § 264.1033(d).

(E) For a condenser, the design analysis shall consider the vent stream composition, constituent concentrations, flow rate, relative humidity, and temperature. The design analysis shall also establish the design outlet organic compound concentration level, design average temperature of the condenser exhaust vent stream, and design average temperatures of the coolant fluid at the condenser inlet and outlet.

(F) For a carbon adsorption system such as a fixed-bed adsorber that regenerates the carbon bed directly onsite in the control device, the design analysis shall consider the vent stream composition, constituent concentrations, flow rate, relative humidity, and temperature. The design analysis shall also establish the design exhaust vent stream organic compound concentration level, number and capacity of carbon beds, type and working capacity of activated carbon used for carbon beds, design total steam flow over the period of each complete carbon bed regeneration cycle, duration of the carbon bed steaming and cooling/drying cycles, design carbon bed temperature after regeneration, design carbon bed regeneration time, and design service life of carbon.

(G) For a carbon adsorption system such as a carbon canister that does not regenerate the carbon bed directly onsite in the control device, the design analysis shall consider the vent stream composition, constituent concentrations, flow rate, relative humidity, and temperature. The design analysis shall also establish the design outlet organic concentration level, capacity of carbon bed, type and working capacity of activated carbon used for carbon bed, and design carbon replacement interval based on the total carbon working capacity of the control device and source operating schedule.

(iv) A statement signed and dated by the owner or operator certifying that the

operating parameters used in the design analysis reasonably represent the conditions that exist when the hazardous waste management unit is or would be operating at the highest load or capacity level reasonably expected to occur.

(v) A statement signed and dated by the owner or operator certifying that the control device is designed to operate at an efficiency of 95 percent or greater unless the total organic concentration limit of § 264.1032(a) is achieved at an efficiency less than 95 weight percent or the total organic emission limits of § 264.1032(a) for affected process vents at the facility can be attained by a control device involving vapor recovery at an efficiency less than 95 weight percent. A statement provided by the control device manufacturer or vendor certifying that the control equipment meets the design specifications may be used to comply with this requirement.

(vi) If performance tests are used to demonstrate compliance, all test results.

(c) Design documentation and monitoring, operating, and inspection information for each closed-vent system and control device required to comply with the provisions of this part shall be recorded and kept up-to-date in the facility operating record. The information shall include:

(1) Description and date of each modification that is made to the closed-vent system or control device design.

(2) Identification of operating parameter, description of monitoring device, and diagram of monitoring sensor location or locations used to comply with § 264.1033 (f)(1) and (f)(2).

(3) Monitoring, operating, and inspection information required by paragraphs (f) through (k) of § 264.1033.

(4) Date, time, and duration of each period that occurs while the control device is operating when any monitored parameter exceeds the value established in the control device design analysis as specified below:

(i) For a thermal vapor incinerator designed to operate with a minimum residence time of 0.50 second at a minimum temperature of 760 °C, period when the combustion temperature is below 760 °C.

(ii) For a thermal vapor incinerator designed to operate with an organic emission reduction efficiency of 95 weight percent or greater period when the combustion zone temperature is more than 28 °C below the design average combustion zone temperature established as a requirement of paragraph (b)(4)(iii)(A) of this section.

(iii) For a catalytic vapor incinerator, period when:

(A) Temperature of the vent stream at the catalyst bed inlet is more than 28 °C below the average temperature of the inlet vent stream established as a requirement of paragraph (b)(4)(iii)(B) of this section, or

(B) Temperature difference across the catalyst bed is less than 80 percent of the design average temperature difference established as a requirement of paragraph (b)(4)(iii)(B) of this section.

(iv) For a boiler or process heater, period when:

(A) Flame zone temperature is more than 28 °C below the design average flame zone temperature established as a requirement of paragraph (b)(4)(iii)(C) of this section, or

(B) Position changes where the vent stream is introduced to the combustion zone from the location established as a requirement of paragraph (b)(4)(iii)(C) of this section.

(v) For a flare, period when the pilot flame is not ignited.

(vi) For a condenser that complies with § 264.1033(f)(2)(vi)(A), period when the organic compound concentration level or readings of organic compounds in the exhaust vent stream from the condenser are more than 20 percent greater than the design outlet organic compound concentration level established as a requirement of paragraph (b)(4)(iii)(E) of this section.

(vii) For a condenser that complies with § 264.1033(f)(2)(vi)(B), period when:

(A) Temperature of the exhaust vent stream from the condenser is more than 6 °C above the design average exhaust vent stream temperature established as a requirement of paragraph (b)(4)(iii)(E) of this section; or

(B) Temperature of the coolant fluid exiting the condenser is more than 6 °C above the design average coolant fluid temperature at the condenser outlet established as a requirement of paragraph (b)(4)(iii)(E) of this section.

(viii) For a carbon adsorption system such as a fixed-bed carbon adsorber that regenerates the carbon bed directly onsite in the control device and complies with § 264.1033(f)(2)(viii)(A), period when the organic compound concentration level or readings of organic compounds in the exhaust vent stream from the carbon bed are more than 20 percent greater than the design exhaust vent stream organic compound concentration level established as a requirement of paragraph (b)(4)(iii)(F) of this section.

(ix) For a carbon adsorption system such as a fixed-bed carbon adsorber that regenerates the carbon bed directly onsite in the control device and complies with § 264.1033(f)(2)(viii)(B),

period when the vent stream continues to flow through the control device beyond the predetermined carbon bed regeneration time established as a requirement of paragraph (b)(4)(iii)(F) of this section.

(5) Explanation for each period recorded under paragraph (4) of the cause for control device operating parameter exceeding the design value and the measures implemented to correct the control device operation.

(6) For a carbon adsorption system operated subject to requirements specified in § 264.1033(g) or § 264.1033(h)(2), date when existing carbon in the control device is replaced with fresh carbon.

(7) For a carbon adsorption system operated subject to requirements specified in § 264.1033(h)(1), a log that records:

(i) Date and time when control device is monitored for carbon breakthrough and the monitoring device reading.

(ii) Date when existing carbon in the control device is replaced with fresh carbon.

(8) Date of each control device startup and shutdown.

(d) Records of the monitoring, operating, and inspection information required by paragraphs (c)(3)-(c)(8) of this section need be kept only 3 years.

(e) For a control device other than a thermal vapor incinerator, catalytic vapor incinerator, flare, boiler, process heater, condenser, or carbon adsorption system, the Regional Administrator will specify the appropriate recordkeeping requirements.

(f) Up-to-date information and data used to determine whether or not a process vent is subject to the requirements in § 264.1032 including supporting documentation as required by § 264.1034(d)(2) when application of the knowledge of the nature of the hazardous waste stream or the process by which it was produced is used, shall be recorded in a log that is kept in the facility operating record.

(Approved by the Office of Management and Budget under control number 2060-0195)

§ 264.1036 Reporting requirements.

(a) A semiannual report shall be submitted by owners and operators subject to the requirements of this subpart to the Regional Administrator by dates specified by the Regional Administrator. The report shall include the following information:

(1) The Environmental Protection Agency identification number, name, and address of the facility.

(2) For each month during the semiannual reporting period, dates

when the control device exceeded or operated outside of the design specifications as defined in § 264.1035(c)(4) and as indicated by the control device monitoring required by § 264.1033(f) and such exceedances were not corrected within 24 hours, or that a flare operated with visible emissions as defined in § 264.1033(d) and as determined by Method 22 monitoring, the duration and cause of each exceedance or visible emissions, and any corrective measures taken.

(b) If, during the semiannual reporting period, the control device does not exceed or operate outside of the design specifications as defined in § 264.1035(c)(4) for more than 24 hours or a flare does not operate with visible emissions as defined in § 264.1033(d), a report to the Regional Administrator is not required.

(Approved by the Office of Management and Budget under control number 2060-0195)

§§ 264.1037-264.1049 [Reserved].

11. 40 CFR part 264 is amended by adding subpart BB to read as follows:

Subpart BB—Air Emission Standards for Equipment Leaks

- 264.1050 Applicability.
- 264.1051 Definitions.
- 264.1052 Standards: Pumps in light liquid service.
- 264.1053 Standards: Compressors.
- 264.1054 Standards: Pressure relief devices in gas/vapor service.
- 264.1055 Standards: Sampling connecting systems.
- 264.1056 Standards: Open-ended valves or lines.
- 264.1057 Standards: Valves in gas/vapor service or in light liquid service.
- 264.1058 Standards: Pumps and valves in heavy liquid service, pressure relief devices in light liquid or heavy liquid service, and flanges and other connectors.
- 264.1059 Standards: Delay of repair.
- 264.1060 Standards: Closed-vent systems and control devices.
- 264.1061 Alternative standards for valves in gas/vapor service or in light liquid service: percentage of valves allowed to leak.
- 264.1062 Alternative standards for valves in gas/vapor service or in light liquid service: skip period leak detection and repair.
- 264.1063 Test methods and procedures.
- 264.1064 Recordkeeping requirements.
- 264.1065 Reporting requirements.
- 264.1066-264.1079 [Reserved]

Subpart BB—Air Emission Standards for Equipment Leaks

§ 264.1050 Applicability.

(a) The regulations in this subpart apply to owners and operators of facilities that treat, store, or dispose of

hazardous wastes (except as provided in § 264.1).

(b) Except as provided in § 264.1064(k), this subpart applies to equipment that contains or contacts hazardous wastes with organic concentrations of at least 10 percent by weight that are managed in:

(1) Units that are subject to the permitting requirements of part 270, or

(2) Hazardous waste recycling units that are located on hazardous waste management facilities otherwise subject to the permitting requirements of part 270.

(c) If the owner or operator of equipment subject to the requirements of §§ 264.1052 through 264.1065 has received a permit under section 3005 of RCRA prior to December 21, 1990, the requirements of §§ 264.1052 through 264.1065 must be incorporated when the permit is reissued under § 124.15 or reviewed under § 270.50.

(d) Each piece of equipment to which this subpart applies shall be marked in such a manner that it can be distinguished readily from other pieces of equipment.

(e) Equipment that is in vacuum service is excluded from the requirements of § 264.1052 to § 264.1060 if it is identified as required in § 264.1064(g)(5).

[Note: The requirements of §§ 264.1052 through 264.1065 apply to equipment associated with hazardous waste recycling units previously exempt under § 261.6(c)(1). Other exemptions under §§ 261.4, 262.34, and 264.1(g) are not affected by these requirements.]

§ 264.1051 Definitions.

As used in this subpart, all terms shall have the meaning given them in § 264.1031, the Act, and parts 260-266.

§ 264.1052 Standards: Pumps in light liquid service.

(a)(1) Each pump in light liquid service shall be monitored monthly to detect leaks by the methods specified in § 264.1063(b), except as provided in paragraphs (d), (e), and (f) of this section.

(2) Each pump in light liquid service shall be checked by visual inspection each calendar week for indications of liquids dripping from the pump seal.

(b)(1) If a instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(2) If there are indications of liquids dripping from the pump seal, a leak is detected.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is

detected, except as provided in § 264.1059.

(2) A first attempt at repair (e.g., tightening the packing gland) shall be made no later than 5 calendar days after each leak is detected.

(d) Each pump equipped with a dual mechanical seal system that includes a barrier fluid system is exempt from the requirements of paragraph (a) of this section, *provided* the following requirements are met:

(1) Each dual mechanical seal system must be:

(i) Operated with the barrier fluid at a pressure that is at all times greater than the pump stuffing box pressure, or

(ii) Equipped with a barrier fluid degassing reservoir that is connected by a closed-vent system to a control device that complies with the requirements of § 264.1060, or

(iii) Equipped with a system that purges the barrier fluid into a hazardous waste stream with no detectable emissions to the atmosphere.

(2) The barrier fluid system must not be a hazardous waste with organic concentrations 10 percent or greater by weight.

(3) Each barrier fluid system must be equipped with a sensor that will detect failure of the seal system, the barrier fluid system, or both.

(4) Each pump must be checked by visual inspection, each calendar week, for indications of liquids dripping from the pump seals.

(5)(i) Each sensor as described in paragraph (d)(3) of this section must be checked daily or be equipped with an audible alarm that must be checked monthly to ensure that it is functioning properly.

(ii) The owner or operator must determine, based on design considerations and operating experience, a criterion that indicates failure of the seal system, the barrier fluid system, or both.

(6)(i) If there are indications of liquids dripping from the pump seal or the sensor indicates failure of the seal system, the barrier fluid system, or both based on the criterion determined in paragraph (d)(5)(ii) of this section, a leak is detected.

(ii) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in § 264.1059.

(iii) A first attempt at repair (e.g., relapping the seal) shall be made no later than 5 calendar days after each leak is detected.

(e) Any pump that is designated, as described in § 264.1064(g)(2), for no detectable emissions, as indicated by an

instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraphs (a), (c), and (d) of this section if the pump meets the following requirements:

(1) Must have no externally actuated shaft penetrating the pump housing.

(2) Must operate with no detectable emissions as indicated by an instrument reading of less than 500 ppm above background as measured by the methods specified in § 264.1063(c).

(3) Must be tested for compliance with paragraph (e)(2) of this section initially upon designation, annually, and at other times as requested by the Regional Administrator.

(f) If any pump is equipped with a closed-vent system capable of capturing and transporting any leakage from the seal or seals to a control device that complies with the requirements of § 264.1060, it is exempt from the requirements of paragraphs (a) through (e) of this section.

§ 264.1053 Standards: Compressors.

(a) Each compressor shall be equipped with a seal system that includes a barrier fluid system and that prevents leakage of total organic emissions to the atmosphere, except as provided in paragraphs (h) and (i) of this section.

(b) Each compressor seal system as required in paragraph (a) of this section shall be:

(1) Operated with the barrier fluid at a pressure that is at all times greater than the compressor stuffing box pressure, or

(2) Equipped with a barrier fluid system that is connected by a closed-vent system to a control device that complies with the requirements of § 264.1060, or

(3) Equipped with a system that purges the barrier fluid into a hazardous waste stream with no detectable emissions to atmosphere.

(c) The barrier fluid must not be a hazardous waste with organic concentrations 10 percent or greater by weight.

(d) Each barrier fluid system as described in paragraphs (a) through (c) of this section shall be equipped with a sensor that will detect failure of the seal system, barrier fluid system, or both.

(e)(1) Each sensor as required in paragraph (d) of this section shall be checked daily or shall be equipped with an audible alarm that must be checked monthly to ensure that it is functioning properly unless the compressor is located within the boundary of an unmanned plant site, in which case the sensor must be checked daily.

(2) The owner or operator shall determine, based on design considerations and operating

experience, a criterion that indicates failure of the seal system, the barrier fluid system, or both.

(f) If the sensor indicates failure of the seal system, the barrier fluid system, or both based on the criterion determined under paragraph (e)(2) of this section, a leak is detected.

(g)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in § 264.1059.

(2) A first attempt at repair (e.g., tightening the packing gland) shall be made no later than 5 calendar days after each leak is detected.

(h) A compressor is exempt from the requirements of paragraphs (a) and (b) of this section if it is equipped with a closed-vent system capable of capturing and transporting any leakage from the seal to a control device that complies with the requirements of § 264.1060, except as provided in paragraph (i) of this section.

(i) Any compressor that is designated, as described in § 264.1064(g)(2), for no detectable emissions as indicated by an instrument reading of less than 500 ppm above background is exempt from the requirements of paragraphs (a) through (h) of this section if the compressor:

(1) Is determined to be operating with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as measured by the method specified in § 264.1063(c).

(2) Is tested for compliance with paragraph (i)(1) of this section initially upon designation, annually, and at other times as requested by the Regional Administrator.

§ 264.1054 Standards: Pressure relief devices in gas/vapor service.

(a) Except during pressure releases, each pressure relief device in gas/vapor service shall be operated with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as measured by the method specified in § 264.1063(c).

(b)(1) After each pressure release, the pressure relief device shall be returned to a condition of no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as soon as practicable, but not later than 5 calendar days after each pressure release, except as provided in § 264.1059.

(2) No later than 5 calendar days after the pressure release, the pressure relief device shall be monitored to confirm the condition of no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as

measured by the method specified in § 264.1063(c).

(c) Any pressure relief device that is equipped with a closed-vent system capable of capturing and transporting leakage from the pressure relief device to a control device as described in § 264.1060 is exempt from the requirements of paragraphs (a) and (b) of this section.

§ 264.1055 Standards: Sampling connecting systems.

(a) Each sampling connection system shall be equipped with a closed purge system or closed-vent system.

(b) Each closed-purge system or closed-vent system as required in paragraph (a) shall:

- (1) Return the purged hazardous waste stream directly to the hazardous waste management process line with no detectable emissions to atmosphere, or
- (2) Collect and recycle the purged hazardous waste stream with no detectable emissions to atmosphere, or
- (3) Be designed and operated to capture and transport all the purged hazardous waste stream to a control device that complies with the requirements of § 264.1060.

(c) *In situ* sampling systems are exempt from the requirements of paragraphs (a) and (b) of this section.

§ 264.1056 Standards: Open-ended valves or lines.

(a)(1) Each open-ended valve or line shall be equipped with a cap, blind flange, plug, or a second valve.

(2) The cap, blind flange, plug, or second valve shall seal the open end at all times except during operations requiring hazardous waste stream flow through the open-ended valve or line.

(b) Each open-ended valve or line equipped with a second valve shall be operated in a manner such that the valve on the hazardous waste stream end is closed before the second valve is closed.

(c) When a double block and bleed system is being used, the bleed valve or line may remain open during operations that require venting the line between the block valves but shall comply with paragraph (a) of this section at all other times.

§ 264.1057 Standards: Valves in gas/vapor service or in light liquid service.

(a) Each valve in gas/vapor or light liquid service shall be monitored monthly to detect leaks by the methods specified in § 264.1063(b) and shall comply with paragraphs (b) through (e) of this section, except as provided in paragraphs (f), (g), and (h) of this section, and §§ 264.1061 and 264.1062.

(b) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(c)(1) Any valve for which a leak is not detected for two successive months may be monitored the first month of every succeeding quarter, beginning with the next quarter, until a leak is detected.

(2) If a leak is detected, the valve shall be monitored monthly until a leak is not detected for two successive months.

(d)(1) When a leak is detected, it shall be repaired as soon as practicable, but no later than 15 calendar days after the leak is detected, except as provided in § 264.1059.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(e) First attempts at repair include, but are not limited to, the following best practices where practicable:

- (1) Tightening of bonnet bolts.
- (2) Replacement of bonnet bolts.
- (3) Tightening of packing gland nuts.
- (4) Injection of lubricant into lubricated packing.

(f) Any valve that is designated, as described in § 264.1064(g)(2), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraph (a) of this section if the valve:

(1) Has no external actuating mechanism in contact with the hazardous waste stream.

(2) Is operated with emissions less than 500 ppm above background as determined by the method specified in § 264.1063(c).

(3) Is tested for compliance with paragraph (f)(2) of this section initially upon designation, annually, and at other times as requested by the Regional Administrator.

(g) Any valve that is designated, as described in § 264.1064(h)(1), as an unsafe-to-monitor valve is exempt from the requirements of paragraph (a) of this section if:

(1) The owner or operator of the valve determines that the valve is unsafe to monitor because monitoring personnel would be exposed to an immediate danger as a consequence of complying with paragraph (a) of this section.

(2) The owner or operator of the valve adheres to a written plan that requires monitoring of the valve as frequently as practicable during safe-to-monitor times.

(h) Any valve that is designated, as described in § 264.1064(h)(2), as a difficult-to-monitor valve is exempt from the requirements of paragraph (a) of this section if:

(1) The owner or operator of the valve determines that the valve cannot be

monitored without elevating the monitoring personnel more than 2 meters above a support surface.

(2) The hazardous waste management unit within which the valve is located was in operation before June 21, 1990.

(3) The owner or operator of the valve follows a written plan that requires monitoring of the valve at least once per calendar year.

§ 264.1058 Standards: Pumps and valves in heavy liquid service, pressure relief devices in light liquid or heavy liquid service, and flanges and other connectors.

(a) Pumps and valves in heavy liquid service, pressure relief devices in light liquid or heavy liquid service, and flanges and other connectors shall be monitored within 5 days by the method specified in § 264.1063(b) if evidence of a potential leak is found by visual, audible, olfactory, or any other detection method.

(b) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in § 264.1059.

(2) The first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(d) First attempts at repair include, but are not limited to, the best practices described under § 264.1057(e).

§ 264.1059 Standards: Delay of repair.

(a) Delay of repair of equipment for which leaks have been detected will be allowed if the repair is technically infeasible without a hazardous waste management unit shutdown. In such a case, repair of this equipment shall occur before the end of the next hazardous waste management unit shutdown.

(b) Delay of repair of equipment for which leaks have been detected will be allowed for equipment that is isolated from the hazardous waste management unit and that does not continue to contain or contact hazardous waste with organic concentrations at least 10 percent by weight.

(c) Delay of repair for valves will be allowed if:

(1) The owner or operator determines that emissions of purged material resulting from immediate repair are greater than the emissions likely to result from delay of repair.

(2) When repair procedures are effected, the purged material is collected and destroyed or recovered in a control device complying with § 264.1060.

(d) Delay of repair for pumps will be allowed if:

(1) Repair requires the use of a dual mechanical seal system that includes a barrier fluid system.

(2) Repair is completed as soon as practicable, but not later than 6 months after the leak was detected.

(e) Delay of repair beyond a hazardous waste management unit shutdown will be allowed for a valve if valve assembly replacement is necessary during the hazardous waste management unit shutdown, valve assembly supplies have been depleted, and valve assembly supplies had been sufficiently stocked before the supplies were depleted. Delay of repair beyond the next hazardous waste management unit shutdown will not be allowed unless the next hazardous waste management unit shutdown occurs sooner than 6 months after the first hazardous waste management unit shutdown.

§ 264.1060 Standards: Closed-vent systems and control devices.

Owners or operators of closed-vent systems and control devices shall comply with the provisions of § 264.1033.

§ 264.1061 Alternative standards for valves in gas/vapor service or in light liquid service: percentage of valves allowed to leak.

(a) An owner or operator subject to the requirements of § 264.1057 may elect to have all valves within a hazardous waste management unit comply with an alternative standard that allows no greater than 2 percent of the valves to leak.

(b) The following requirements shall be met if an owner or operator decides to comply with the alternative standard of allowing 2 percent of valves to leak:

(1) An owner or operator must notify the Regional Administrator that the owner or operator has elected to comply with the requirements of this section.

(2) A performance test as specified in paragraph (c) of this section shall be conducted initially upon designation, annually, and at other times requested by the Regional Administrator.

(3) If a valve leak is detected, it shall be repaired in accordance with § 264.1057(d) and (e).

(c) Performance tests shall be conducted in the following manner:

(1) All valves subject to the requirements in § 264.1057 within the hazardous waste management unit shall be monitored within 1 week by the methods specified in § 264.1063(b).

(2) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(3) The leak percentage shall be determined by dividing the number of valves subject to the requirements in § 264.1057 for which leaks are detected by the total number of valves subject to the requirements in § 264.1057 within the hazardous waste management unit.

(d) If an owner or operator decides to comply with this section no longer, the owner or operator must notify the Regional Administrator in writing that the work practice standard described in § 264.1057(a) through (e) will be followed.

§ 264.1062 Alternative standards for valves in gas/vapor service or in light liquid service: skip period leak detection and repair.

(a)(1) An owner or operator subject to the requirements of § 264.1057 may elect for all valves within a hazardous waste management unit to comply with one of the alternative work practices specified in paragraphs (b) (2) and (3) of this section.

(2) An owner or operator must notify the Regional Administrator before implementing one of the alternative work practices.

(b)(1) An owner or operator shall comply with the requirements for valves, as described in § 264.1057, except as described in paragraphs (b)(2) and (b)(3) of this section.

(2) After two consecutive quarterly leak detection periods with the percentage of valves leaking equal to or less than 2 percent, an owner or operator may begin to skip one of the quarterly leak detection periods for the valves subject to the requirements in § 264.1057.

(3) After five consecutive quarterly leak detection periods with the percentage of valves leaking equal to or less than 2 percent, an owner or operator may begin to skip three of the quarterly leak detection periods for the valves subject to the requirements in § 264.1057.

(4) If the percentage of valves leaking is greater than 2 percent, the owner or operator shall monitor monthly in compliance with the requirements in § 264.1057, but may again elect to use this section after meeting the requirements of § 264.1057(c)(1).

(Approved by the Office of Management and Budget under control number 2060-0185)

§ 264.1063 Test methods and procedures.

(a) Each owner or operator subject to the provisions of this subpart shall comply with the test methods and procedures requirements provided in this section.

(b) Leak detection monitoring, as required in §§ 264.1052-264.1062, shall comply with the following requirements:

(1) Monitoring shall comply with Reference Method 21 in 40 CFR part 60.

(2) The detection instrument shall meet the performance criteria of Reference Method 21.

(3) The instrument shall be calibrated before use on each day of its use by the procedures specified in Reference Method 21.

(4) Calibration gases shall be:

(i) Zero air (less than 10 ppm of hydrocarbon in air).

(ii) A mixture of methane or n-hexane and air at a concentration of approximately, but less than, 10,000 ppm methane or n-hexane.

(5) The instrument probe shall be traversed around all potential leak interfaces as close to the interface as possible as described in Reference Method 21.

(c) When equipment is tested for compliance with no detectable emissions, as required in §§ 264.1052(e), 264.1053(i), 264.1054, and 264.1057(f), the test shall comply with the following requirements:

(1) The requirements of paragraphs (b)(1) through (4) of this section shall apply.

(2) The background level shall be determined as set forth in Reference Method 21.

(3) The instrument probe shall be traversed around all potential leak interfaces as close to the interface as possible as described in Reference Method 21.

(4) The arithmetic difference between the maximum concentration indicated by the instrument and the background level is compared with 500 ppm for determining compliance.

(d) In accordance with the waste analysis plan required by § 264.13(b), an owner or operator of a facility must determine, for each piece of equipment, whether the equipment contains or contacts a hazardous waste with organic concentration that equals or exceeds 10 percent by weight using the following:

(1) Methods described in ASTM Methods D 2267-88, E 169-87, E 168-88, E 260-85 (incorporated by reference under § 260.11);

(2) Method 9060 or 8240 of SW-846 (incorporated by reference under § 260.11); or

(3) Application of the knowledge of the nature of the hazardous waste stream or the process by which it was produced. Documentation of a waste determination by knowledge is required. Examples of documentation that shall

be used to support a determination under this provision include production process information documenting that no organic compounds are used, information that the waste is generated by a process that is identical to a process at the same or another facility that has previously been demonstrated by direct measurement to have a total organic content less than 10 percent, or prior speciation analysis results on the same waste stream where it can also be documented that no process changes have occurred since that analysis that could affect the waste total organic concentration.

(e) If an owner or operator determines that a piece of equipment contains or contacts a hazardous waste with organic concentrations at least 10 percent by weight, the determination can be revised only after following the procedures in paragraph (d)(1) or (d)(2) of this section.

(f) When an owner or operator and the Regional Administrator do not agree on whether a piece of equipment contains or contacts a hazardous waste with organic concentrations at least 10 percent by weight, the procedures in paragraph (d)(1) or (d)(2) of this section can be used to resolve the dispute.

(g) Samples used in determining the percent organic content shall be representative of the highest total organic content hazardous waste that is expected to be contained in or contact the equipment.

(h) To determine if pumps or valves are in light liquid service, the vapor pressures of constituents may be obtained from standard reference texts or may be determined by ASTM D-2879-86 (incorporated by reference under § 260.11).

(i) Performance tests to determine if a control device achieves 95 weight percent organic emission reduction shall comply with the procedures of § 264.1034(c)(1) through (c)(4).

§ 264.1064 Recordkeeping requirements.

(a)(1) Each owner or operator subject to the provisions of this subpart shall comply with the recordkeeping requirements of this section.

(2) An owner or operator of more than one hazardous waste management unit subject to the provisions of this subpart may comply with the recordkeeping requirements for these hazardous waste management units in one recordkeeping system if the system identifies each record by each hazardous waste management unit.

(b) Owners and operators must record the following information in the facility operating record:

(1) For each piece of equipment to which Subpart BB of Part 264 applies:

(i) Equipment identification number and hazardous waste management unit identification.

(ii) Approximate locations within the facility (e.g., identify the hazardous waste management unit on a facility plot plan).

(iii) Type of equipment (e.g., a pump or pipeline valve).

(iv) Percent-by-weight total organics in the hazardous waste stream at the equipment.

(v) Hazardous waste state at the equipment (e.g., gas/vapor or liquid).

(vi) Method of compliance with the standard (e.g., "monthly leak detection and repair" or "equipped with dual mechanical seals").

(2) For facilities that comply with the provisions of § 264.1033(a)(2), an implementation schedule as specified in § 264.1033(a)(2).

(3) Where an owner or operator chooses to use test data to demonstrate the organic removal efficiency or total organic compound concentration achieved by the control device, a performance test plan as specified in § 264.1035(b)(3).

(4) Documentation of compliance with § 264.1060, including the detailed design documentation or performance test results specified in § 264.1035(b)(4).

(c) When each leak is detected as specified in §§ 264.1052, 264.1053, 264.1057, and 264.1058, the following requirements apply:

(1) A weatherproof and readily visible identification, marked with the equipment identification number, the date evidence of a potential leak was found in accordance with § 264.1058(a), and the date the leak was detected, shall be attached to the leaking equipment.

(2) The identification on equipment, except on a valve, may be removed after it has been repaired.

(3) The identification on a valve may be removed after it has been monitored for 2 successive months as specified in § 264.1057(c) and no leak has been detected during those 2 months.

(d) When each leak is detected as specified in §§ 264.1052, 264.1053, 264.1057, and 264.1058, the following information shall be recorded in an inspection log and shall be kept in the facility operating record:

(1) The instrument and operator identification numbers and the equipment identification number.

(2) The date evidence of a potential leak was found in accordance with § 264.1058(a).

(3) The date the leak was detected and the dates of each attempt to repair the leak.

(4) Repair methods applied in each attempt to repair the leak.

(5) "Above 10,000" if the maximum instrument reading measured by the methods specified in § 264.1063(b) after each repair attempt is equal to or greater than 10,000 ppm.

(6) "Repair delayed" and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

(7) Documentation supporting the delay of repair of a valve in compliance with § 264.1059(c).

(8) The signature of the owner or operator (or designate) whose decision it was that repair could not be effected without a hazardous waste management unit shutdown.

(9) The expected date of successful repair of the leak if a leak is not repaired within 15 calendar days.

(10) The date of successful repair of the leak.

(e) Design documentation and monitoring, operating, and inspection information for each closed-vent system and control device required to comply with the provisions of § 264.1060 shall be recorded and kept up-to-date in the facility operating record as specified in § 264.1035(c). Design documentation is specified in § 264.1035(c)(1) and (c)(2) and monitoring, operating, and inspection information in § 264.1035(c)(3)-(c)(8).

(f) For a control device other than a thermal vapor incinerator, catalytic vapor incinerator, flare, boiler, process heater, condenser, or carbon adsorption system, the Regional Administrator will specify the appropriate recordkeeping requirements.

(g) The following information pertaining to all equipment subject to the requirements in §§ 264.1052 through 264.1060 shall be recorded in a log that is kept in the facility operating record:

(1) A list of identification numbers for equipment (except welded fittings) subject to the requirements of this subpart.

(2)(i) A list of identification numbers for equipment that the owner or operator elects to designate for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, under the provisions of §§ 264.1052(e), 264.1053(i), and 264.1057(f).

(ii) The designation of this equipment as subject to the requirements of §§ 264.1052(e), 264.1053(i), or 264.1057(f) shall be signed by the owner or operator.

(3) A list of equipment identification numbers for pressure relief devices required to comply with § 264.1054(a).

(4)(i) The dates of each compliance test required in §§ 264.1052(e), 264.1053(i), 264.1054, and 264.1057(f).

(ii) The background level measured during each compliance test.

(iii) The maximum instrument reading measured at the equipment during each compliance test.

(5) A list of identification numbers for equipment in vacuum service.

(h) The following information pertaining to all valves subject to the requirements of § 264.1057 (g) and (h) shall be recorded in a log that is kept in the facility operating record:

(1) A list of identification numbers for valves that are designated as unsafe to monitor, an explanation for each valve stating why the valve is unsafe to monitor, and the plan for monitoring each valve.

(2) A list of identification numbers for valves that are designated as difficult to monitor, an explanation for each valve stating why the valve is difficult to monitor, and the planned schedule for monitoring each valve.

(i) The following information shall be recorded in the facility operating record for valves complying with § 264.1062:

(1) A schedule of monitoring.

(2) The percent of valves found leaking during each monitoring period.

(j) The following information shall be recorded in a log that is kept in the facility operating record:

(1) Criteria required in § 264.1052(d)(5)(ii) and § 264.1053(e)(2) and an explanation of the design criteria.

(2) Any changes to these criteria and the reasons for the changes.

(k) The following information shall be recorded in a log that is kept in the facility operating record for use in determining exemptions as provided in the applicability section of this subpart and other specific subparts:

(1) An analysis determining the design capacity of the hazardous waste management unit.

(2) A statement listing the hazardous waste influent to and effluent from each hazardous waste management unit subject to the requirements in §§ 264.1052 through 264.1060 and an analysis determining whether these hazardous wastes are heavy liquids.

(3) An up-to-date analysis and the supporting information and data used to determine whether or not equipment is subject to the requirements in §§ 264.1052 through 264.1060. The record shall include supporting documentation as required by § 264.1063(d)(3) when application of the knowledge of the

nature of the hazardous waste stream or the process by which it was produced is used. If the owner or operator takes any action (e.g., changing the process that produced the waste) that could result in an increase in the total organic content of the waste contained in or contacted by equipment determined not to be subject to the requirements in §§ 264.1052 through 264.1060, then a new determination is required.

(l) Records of the equipment leak information required by paragraph (d) of this section and the operating information required by paragraph (e) of this section need be kept only 3 years.

(m) The owner or operator of any facility that is subject to this subpart and to regulations at 40 CFR part 60, subpart VV, or 40 CFR part 61, subpart V, may elect to determine compliance with this subpart by documentation either pursuant to § 264.1064 of this subpart, or pursuant to those provisions of 40 CFR part 60 or 61, to the extent that the documentation under the regulation at 40 CFR part 60 or part 61 duplicates the documentation required under this subpart. The documentation under the regulation at 40 CFR part 60 or part 61 shall be kept with or made readily available with the facility operating record.

(Approved by the Office of Management and Budget under control number 2060-0195)

§ 264.1065 Reporting requirements.

(a) A semiannual report shall be submitted by owners and operators subject to the requirements of this subpart to the Regional Administrator by dates specified by the Regional Administrator. The report shall include the following information:

(1) The Environmental Protection Agency identification number, name, and address of the facility.

(2) For each month during the semiannual reporting period:

(i) The equipment identification number of each valve for which a leak was not repaired as required in § 264.1057(d).

(ii) The equipment identification number of each pump for which a leak was not repaired as required in § 264.1052 (c) and (d)(6).

(iii) The equipment identification number of each compressor for which a leak was not repaired as required in § 264.1053(g).

(3) Dates of hazardous waste management unit shutdowns that occurred within the semiannual reporting period.

(4) For each month during the semiannual reporting period, dates when the control device installed as required by § 264.1052, 264.1053,

264.1054, or 264.1055 exceeded or operated outside of the design specifications as defined in § 264.1064(e) and as indicated by the control device monitoring required by § 264.1060 and was not corrected within 24 hours, the duration and cause of each exceedance, and any corrective measures taken.

(b) If, during the semiannual reporting period, leaks from valves, pumps, and compressors are repaired as required in §§ 264.1057 (d), 264.1052 (c) and (d)(6), and 264.1053 (g), respectively, and the control device does not exceed or operate outside of the design specifications as defined in § 264.1064(e) for more than 24 hours, a report to the Regional Administrator is not required.

(Approved by the Office of Management and Budget under control number 2060-0195)

§§ 264.1066-264.1079 [Reserved]

PART 265—INTERIM STATUS STANDARDS FOR OWNERS AND OPERATORS OF HAZARDOUS WASTE TREATMENT, STORAGE, AND DISPOSAL FACILITIES

12. The authority citation for part 265 continues to read as follows:

Authority: 42 U.S.C. 6095, 6912(a), 6924, 6925, and 6935.

Subpart B—General Facility Standards

13. Section 265.13 is amended by revising paragraph (b)(6) to read as follows:

§ 265.13 General waste analysis.

• • • • •
(b) • • •

(6) Where applicable, the methods that will be used to meet the additional waste analysis requirements for specific waste management methods as specified in §§ 265.193, 265.225, 265.252, 265.273, 265.314, 265.341, 265.375, 265.402, 265.1034(d), 265.1063(d), and 268.7 of this chapter.

14. Section 265.15 is amended by revising the last sentence of paragraph (b)(4) to read as follows:

§ 265.15 General inspection requirements.

• • • • •
(b) • • •

(4) • • • At a minimum, the inspection schedule must include the terms and frequencies called for in §§ 265.174, 265.193, 265.195, 265.226, 265.347, 265.377, 265.403, 265.1033, 265.1052, 265.1053, and 265.1058.

• • • • •

Subpart E—Manifest System, Recordkeeping, and Reporting

15. Section 265.73 is amended by revising paragraphs (b)(3) and (b)(6) to read as follows:

§ 265.73 Operating record.

(b) * * *

(3) Records and results of waste analyses and trial tests performed as specified in §§ 265.13, 265.193, 265.225, 265.252, 265.273, 265.314, 265.341, 265.375, 265.402, 265.1034, 265.1063, 268.4(a), and 268.7 of this chapter.

(6) Monitoring, testing or analytical data when required by §§ 265.90, 265.94, 265.191, 265.193, 265.195, 265.276, 265.278, 265.280(d)(1), 265.347, 265.377, 265.1034(c)–265.1034(f), 265.1035, 265.1063(d)–265.1063(i), and 265.1064.

16. Section 265.77 is amended by adding paragraph (d) as follows:

§ 265.77 Additional reports.

(d) As otherwise required by Subparts AA and BB.

17. 40 CFR part 265 is amended by adding Subpart AA to read as follows:

Subpart AA—Air Emission Standards for Process Vents

265.1030 Applicability.
265.1031 Definitions.
265.1032 Standards: Process vents.
265.1033 Standards: Closed-vent systems and control devices.
265.1034 Test methods and procedures.
265.1035 Recordkeeping requirements.
265.1036—265.1049 [Reserved]

Subpart AA—Air Emission Standards for Process Vents**§ 265.1030 Applicability.**

(a) The regulations in this subpart apply to owners and operators of facilities that treat, store, or dispose of hazardous wastes (except as provided in § 265.1).

(b) Except for §§ 265.1034(d) and 265.1035(d), this subpart applies to process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations that manage hazardous wastes with organic concentrations of at least 10 ppmw, if these operations are conducted in:

- (1) Units that are subject to the permitting requirements of part 270, or
- (2) Hazardous waste recycling units that are located on hazardous waste management facilities otherwise subject to the permitting requirements of part 270.

[Note: The requirements of §§ 265.1032 through 265.1036 apply to process vents on hazardous waste recycling units previously exempt under paragraph 261.6(c)(1). Other exemptions under §§ 261.4, 262.34, and 265.1(c) are not affected by these requirements.]

§ 265.1031 Definitions.

As used in this subpart, all terms shall have the meaning given them in § 264.1031, the Act, and parts 260–266.

§ 265.1032 Standards: Process vents.

(a) The owner or operator of a facility with process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction or air or steam stripping operations managing hazardous wastes with organic concentrations at least 10 ppmw shall either:

(1) Reduce total organic emissions from all affected process vents at the facility below 1.4 kg/h (3 lb/h) and 2.8 Mg/yr (3.1 tons/yr), or

(2) Reduce, by use of a control device, total organic emissions from all affected process vents at the facility by 95 weight percent.

(b) If the owner or operator installs a closed-vent system and control device to comply with the provisions of paragraph (a) of this section, the closed-vent system and control device must meet the requirements of § 265.1033.

(c) Determinations of vent emissions and emission reductions or total organic compound concentrations achieved by add-on control devices may be based on engineering calculations or performance tests. If performance tests are used to determine vent emissions, emission reductions, or total organic compound concentrations achieved by add-on control devices, the performance tests must conform with the requirements of § 265.1034(c).

(d) When an owner or operator and the Regional Administrator do not agree on determinations of vent emissions and/or emission reductions or total organic compound concentrations achieved by add-on control devices based on engineering calculations, the test methods in § 265.1034(c) shall be used to resolve the disagreement.

§ 265.1033 Standards: Closed-vent systems and control devices.

(a)(1) Owners or operators of closed-vent systems and control devices used to comply with provisions of this part shall comply with the provisions of this section.

(2) The owner or operator of an existing facility who cannot install a closed-vent system and control device to comply with the provisions of this subpart on the effective date that the

facility becomes subject to the provisions of this subpart must prepare an implementation schedule that includes dates by which the closed-vent system and control device will be installed and in operation. The controls must be installed as soon as possible, but the implementation schedule may allow up to 18 months after the effective date that the facility becomes subject to this subpart for installation and startup. All units that begin operation after December 21, 1990 must comply with the rules immediately (i.e., must have control devices installed and operating on startup of the affected unit); the 2-year implementation schedule does not apply to these units.

(b) A control device involving vapor recovery (e.g., a condenser or adsorber) shall be designed and operated to recover the organic vapors vented to it with an efficiency of 95 weight percent or greater unless the total organic emission limits of § 265.1032(a)(1) for all affected process vents can be attained at an efficiency less than 95 weight percent.

(c) An enclosed combustion device (e.g., a vapor incinerator, boiler, or process heater) shall be designed and operated to reduce the organic emissions vented to it by 95 weight percent or greater; to achieve a total organic compound concentration of 20 ppmv, expressed as the sum of the actual compounds, not carbon equivalents, on a dry basis corrected to 3 percent oxygen; or to provide a minimum residence time of 0.50 seconds at a minimum temperature of 760 °C. If a boiler or process heater is used as the control device, then the vent stream shall be introduced into the flame combustion zone of the boiler or process heater.

(d)(1) A flare shall be designed for and operated with no visible emissions as determined by the methods specified in paragraph (e)(1) of this section, except for periods not to exceed a total of 5 minutes during any 2 consecutive hours.

(2) A flare shall be operated with a flame present at all times, as determined by the methods specified in paragraph (f)(2)(iii) of this section.

(3) A flare shall be used only if the net heating value of the gas being combusted is 11.2 MJ/scm (300 Btu/scf) or greater, if the flare is steam-assisted or air-assisted; or if the net heating value of the gas being combusted is 7.45 MJ/scm (200 Btu/scf) or greater if the flare is nonassisted. The net heating value of the gas being combusted shall be determined by the methods specified in paragraph (e)(2) of this section.

(4)(i) A steam-assisted or nonassisted flare shall be designed for and operated with an exit velocity, as determined by the methods specified in paragraph (e)(3) of this section, of less than 18.3 m/s (60 ft/s), except as provided in paragraphs (d)(4) (ii) and (iii) of this section.

(ii) A steam-assisted or nonassisted flare designed for and operated with an exit velocity, as determined by the methods specified in paragraph (e)(3) of this section, equal to or greater than 18.3 m/s (60 ft/s) but less than 122 m/s (400 ft/s) is allowed if the net heating value of the gas being combusted is greater than 37.3 MJ/scm (1,000 Btu/scf).

(iii) A steam-assisted or nonassisted flare designed for and operated with an exit velocity, as determined by the methods specified in paragraph (e)(3) of this section, less than the velocity, V_{max} , as determined by the method specified in paragraph (e)(4) of this section, and less than 122 m/s (400 ft/s) is allowed.

(5) An air-assisted flare shall be designed and operated with an exit velocity less than the velocity, V_{max} , as determined by the method specified in paragraph (e)(5) of this section.

(6) A flare used to comply with this section shall be steam-assisted, air-assisted, or nonassisted.

(e)(1) Reference Method 22 in 40 CFR part 60 shall be used to determine the compliance of a flare with the visible emission provisions of this subpart. The observation period is 2 hours and shall be used according to Method 22.

(2) The net heating value of the gas being combusted in a flare shall be calculated using the following equation:

$$H_T = K \left[\sum_{i=1}^n C_i H_i \right]$$

where:

H_T = Net heating value of the sample, MJ/scm; where the net enthalpy per mole of offgas is based on combustion at 25 °C and 760 mm Hg, but the standard temperature for determining the volume corresponding to 1 mol is 20 °C;

K = Constant, 1.74×10^{-7} (1/ppm) (g mol/scm) (MJ/kcal) where standard temperature for (g mol/scm) is 20 °C;

C_i = Concentration of sample component i in ppm on a wet basis, as measured for organics by Reference Method 18 in 40 CFR part 60 and measured for hydrogen and carbon monoxide by ASTM D 1946-82 (incorporated by reference as specified in § 260.11); and

H_i = Net heat of combustion of sample component i , kcal/g mol at 25 °C and 760 mm Hg. The heats of combustion may be determined using ASTM D 2382-83 (incorporated by reference as specified in § 260.11) if published values are not available or cannot be calculated.

(3) The actual exit velocity of a flare shall be determined by dividing the volumetric flow rate (in units of standard temperature and pressure), as determined by Reference Methods 2, 2A, 2C, or 2D in 40 CFR part 60 as appropriate, by the unobstructed (free) cross-sectional area of the flare tip.

(4) The maximum allowed velocity in m/s, V_{max} , for a flare complying with paragraph (d)(4)(iii) of this section shall be determined by the following equation:

$$\text{Log}_{10}(V_{max}) = (H_T + 28.8) / 31.7$$

where:

H_T = The net heating value as determined in paragraph (e)(2) of this section.

28.8 = Constant.

31.7 = Constant.

(5) The maximum allowed velocity in m/s, V_{max} , for an air-assisted flare shall be determined by the following equation:

$$V_{max} = 8.706 + 0.7084 (H_T)$$

where:

8.706 = Constant.

0.7084 = Constant.

H_T = The net heating value as determined in paragraph (e)(2) of this section.

(f) The owner or operator shall monitor and inspect each control device required to comply with this section to ensure proper operation and maintenance of the control device by implementing the following requirements:

(1) Install, calibrate, maintain, and operate according to the manufacturer's specifications a flow indicator that provides a record of vent stream flow from each affected process vent to the control device at least once every hour. The flow indicator sensor shall be installed in the vent stream at the nearest feasible point to the control device inlet, but before being combined with other vent streams.

(2) Install, calibrate, maintain, and operate according to the manufacturer's specifications a device to continuously monitor control device operation as specified below:

(i) For a thermal vapor incinerator, a temperature monitoring device equipped with a continuous recorder. The device shall have an accuracy of ± 1 percent of the temperature being monitored in °C or ± 0.5 °C, whichever is greater. The temperature sensor shall be installed at a location in the combustion chamber downstream of the combustion zone.

(ii) For a catalytic vapor incinerator, a temperature monitoring device equipped with a continuous recorder. The device shall be capable of monitoring temperature at two locations and have an accuracy of ± 1 percent of the temperature being monitored in °C or ± 0.5 °C, whichever is greater. One temperature sensor shall be installed in the vent stream at the nearest feasible point to the catalyst bed inlet and a second temperature sensor shall be installed in the vent stream at the nearest feasible point to the catalyst bed outlet.

(iii) For a flare, a heat sensing monitoring device equipped with a continuous recorder that indicates the continuous ignition of the pilot flame.

(iv) For a boiler or process heater having a design heat input capacity less than 44 MW, a temperature monitoring device equipped with a continuous recorder. The device shall have an accuracy of ± 1 percent of the temperature being monitored in °C or ± 0.5 °C, whichever is greater. The temperature sensor shall be installed at a location in the furnace downstream of the combustion zone.

(v) For a boiler or process heater having a design heat input capacity greater than or equal to 44 MW, a monitoring device equipped with a continuous recorder to measure a parameter(s) that indicates good combustion operating practices are being used.

(vi) For a condenser, either:

(A) A monitoring device equipped with a continuous recorder to measure the concentration level of the organic compounds in the exhaust vent stream from the condenser; or

(B) A temperature monitoring device equipped with a continuous recorder. The device shall be capable of monitoring temperature at two locations and have an accuracy of ± 1 percent of the temperature being monitored in °C or ± 0.5 °C, whichever is greater. One temperature sensor shall be installed at a location in the exhaust vent stream from the condenser, and a second temperature sensor shall be installed at a location in the coolant fluid exiting the condenser.

(vii) For a carbon adsorption system such as a fixed-bed carbon adsorber that regenerates the carbon bed directly in the control device, either:

(A) A monitoring device equipped with a continuous recorder to measure the concentration level of the organic compounds in the exhaust vent stream from the carbon bed, or

(B) A monitoring device equipped with a continuous recorder to measure a

parameter that indicates the carbon bed is regenerated on a regular, predetermined time cycle.

(3) Inspect the readings from each monitoring device required by paragraphs (f) (1) and (2) of this section at least once each operating day to check control device operation and, if necessary, immediately implement the corrective measures necessary to ensure the control device operates in compliance with the requirements of this section.

(g) An owner or operator using a carbon adsorption system such as a fixed-bed carbon adsorber that regenerates the carbon bed directly onsite in the control device, shall replace the existing carbon in the control device with fresh carbon at a regular, predetermined time interval that is no longer than the carbon service life established as a requirement of § 265.1035(b)(4)(iii)(F).

(h) An owner or operator using a carbon adsorption system such as a carbon canister that does not regenerate the carbon bed directly onsite in the control device shall replace the existing carbon in the control device with fresh carbon on a regular basis by using one of the following procedures:

(1) Monitor the concentration level of the organic compounds in the exhaust vent stream from the carbon adsorption system on a regular schedule and replace the existing carbon with fresh carbon immediately when carbon breakthrough is indicated. The monitoring frequency shall be daily or at an interval no greater than 20 percent of the time required to consume the total carbon working capacity established as a requirement of § 265.1035(b)(4)(iii)(G), whichever is longer.

(2) Replace the existing carbon with fresh carbon at a regular, predetermined time interval that is less than the design carbon replacement interval established as a requirement of § 265.1035(b)(4)(iii)(G).

(i) An owner or operator of an affected facility seeking to comply with the provisions of this part by using a control device other than a thermal vapor incinerator, catalytic vapor

incinerator, flare, boiler, process heater, condenser, or carbon adsorption system is required to develop documentation including sufficient information to describe the control device operation and identify the process parameter or parameters that indicate proper operation and maintenance of the control device.

(j)(1) Closed-vent systems shall be designed for and operated with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background and by visual inspections, as determined by the methods specified as § 265.1034(b).

(2) Closed-vent systems shall be monitored to determine compliance with this section during the initial leak detection monitoring which shall be conducted by the date that the facility becomes subject to the provisions of this section, annually, and at other times as requested by the Regional Administrator.

(3) Detectable emissions, as indicated by an instrument reading greater than 500 ppm and visual inspections, shall be controlled as soon as practicable, but not later than 15 calendar days after the emission is detected.

(4) A first attempt at repair shall be made no later than 5 calendar days after the emission is detected.

(k) Closed-vent systems and control devices used to comply with provisions of this subpart shall be operated at all times when emissions may be vented to them.

§ 265.1034 Test methods and procedures.

(a) Each owner or operator subject to the provisions of this subpart shall comply with the test methods and procedures requirements provided in this section.

(b) When a closed-vent system is tested for compliance with no detectable emissions, as required in § 265.1033(j), the test shall comply with the following requirements:

(1) Monitoring shall comply with Reference Method 21 in 40 CFR part 60.

(2) The detection instrument shall meet the performance criteria of Reference Method 21.

(3) The instrument shall be calibrated before use on each day of its use by the procedures specified in Reference Method 21.

(4) Calibration gases shall be

(i) Zero air (less than 10 ppm of hydrocarbon in air).

(ii) A mixture of methane or n-hexane and air at a concentration of approximately, but less than, 10,000 ppm methane or n-hexane.

(5) The background level shall be determined as set forth in Reference Method 21.

(6) The instrument probe shall be traversed around all potential leak interfaces as close to the interface as possible as described in Reference Method 21.

(7) The arithmetic difference between the maximum concentration indicated by the instrument and the background level is compared with 500 ppm for determining compliance.

(c) Performance tests to determine compliance with § 265.1032(a) and with the total organic compound concentration limit of § 265.1033(c) shall comply with the following:

(1) Performance tests to determine total organic compound concentrations and mass flow rates entering and exiting control devices shall be conducted and data reduced in accordance with the following reference methods and calculation procedures:

(i) Method 2 in 40 CFR part 60 for velocity and volumetric flow rate.

(ii) Method 18 in 40 CFR part 60 for organic content.

(iii) Each performance test shall consist of three separate runs; each run conducted for at least 1 hour under the conditions that exist when the hazardous waste management unit is operating at the highest load or capacity level reasonably expected to occur. For the purpose of determining total organic compound concentrations and mass flow rates, the average of results of all runs shall apply. The average shall be computed on a time-weighted basis.

(iv) Total organic mass flow rates shall be determined by the following equation:

$$E_n = Q_{vd} \left[\sum_{i=1}^n C_i MW_i \right] [0.0418] [10^{-9}]$$

where:

E_n = Total organic mass flow rate, kg/h;

Q_{vd} = Volumetric flow rate of gases entering or exiting control device, as determined by Method 2, dscm/h;

n = Number of organic compounds in the vent gas;

C_i = Organic concentration in ppm, dry basis, of compound i in the vent gas, as determined by Method 18;

MW_i = Molecular weight of organic compound i in the vent gas, kg/kg-mol;

0.0416 = Conversion factor for molar volume, kg-mol/m³ (@ 293 K and 760 mm Hg);
10⁻⁶ = Conversion from ppm, ppm⁻¹.

(v) The annual total organic emission rate shall be determined by the following equation:

$$E_A = (E_n) (H)$$

where:

E_A = Total organic mass emission rate, kg/y;

E_n = Total organic mass flow rate for the process vent, kg/h;

H = Total annual hours of operations for the affected unit, h.

(vi) Total organic emissions from all affected process vents at the facility shall be determined by summing the hourly total organic mass emission rates (E_n , as determined in paragraph (c)(1)(v) of this section) and by summing the annual total organic mass emission rates (E_A , as determined in paragraph (c)(1)(v) of this section) for all affected process vents at the facility.

(2) The owner or operator shall record such process information as may be necessary to determine the conditions of the performance tests. Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test.

(3) The owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

(i) Sampling ports adequate for the test methods specified in paragraph (c)(1) of this section.

(ii) Safe sampling platform(s).

(iii) Safe access to sampling platform(s).

(iv) Utilities for sampling and testing equipment.

(4) For the purpose of making compliance determinations, the time-weighted average of the results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances beyond the owner or operator's control, compliance may, upon the Regional Administrator's approval, be determined using the average of the results of the two other runs.

(d) To show that a process vent associated with a hazardous waste distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operation is not subject to the requirements of this subpart, the owner or operator must make an initial determination that the time-weighted, annual average total organic

concentration of the waste managed by the waste management unit is less than 10 ppmw using one of the following two methods:

(1) Direct measurement of the organic concentration of the waste using the following procedures:

(i) The owner or operator must take a minimum of four grab samples of waste for each waste stream managed in the affected unit under process conditions expected to cause the maximum waste organic concentration.

(ii) For waste generated onsite, the grab samples must be collected at a point before the waste is exposed to the atmosphere such as in an enclosed pipe or other closed system that is used to transfer the waste after generation to the first affected distillation fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operation. For waste generated offsite, the grab samples must be collected at the inlet to the first waste management unit that receives the waste provided the waste has been transferred to the facility in a closed system such as a tank truck and the waste is not diluted or mixed with other waste.

(iii) Each sample shall be analyzed and the total organic concentration of the sample shall be computed using Method 9060 or 8240 of SW-846 (incorporated by reference under § 260.11).

(iv) The arithmetic mean of the results of the analyses of the four samples shall apply for each waste stream managed in the unit in determining the time-weighted, annual average total organic concentration of the waste. The time-weighted average is to be calculated using the annual quantity of each waste stream processed and the mean organic concentration of each waste stream managed in the unit.

(2) Using knowledge of the waste to determine that its total organic concentration is less than 10 ppmw. Documentation of the waste determination is required. Examples of documentation that shall be used to support a determination under this provision include production process information documenting that no organic compounds are used, information that the waste is generated by a process that is identical to a process at the same or another facility that has previously been demonstrated by direct measurement to generate a waste stream having a total organic content less than 10 ppmw, or prior speciation analysis results on the same waste stream where it can also be documented that no process changes have occurred since that analysis that

could affect the waste total organic concentration.

(e) The determination that distillation fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operations manage hazardous wastes with time-weighted annual average total organic concentrations less than 10 ppmw shall be made as follows:

(1) By the effective date that the facility becomes subject to the provisions of this subpart or by the date when the waste is first managed in a waste management unit, whichever is later; and

(2) For continuously generated waste, annually; or

(3) Whenever there is a change in the waste being managed or a change in the process that generates or treats the waste.

(f) When an owner or operator and the Regional Administrator do not agree on whether a distillation, fractionation, thin-film evaporation, solvent extraction, or air or steam stripping operation manages a hazardous waste with organic concentrations of at least 10 ppmw based on knowledge of the waste, the procedures in Method 8240 can be used to resolve the dispute.

§ 265.1035 Recordkeeping requirements.

(a)(1) Each owner or operator subject to the provisions of this subpart shall comply with the recordkeeping requirements of this section.

(2) An owner or operator of more than one hazardous waste management unit subject to the provisions of this subpart may comply with the recordkeeping requirements for these hazardous waste management units in one recordkeeping system if the system identifies each record by each hazardous waste management unit.

(b) Owners and operators must record the following information in the facility operating record:

(1) For facilities that comply with the provisions of § 265.1033(a)(2), an implementation schedule that includes dates by which the closed-vent system and control device will be installed and in operation. The schedule must also include a rationale of why the installation cannot be completed at an earlier date. The implementation schedule must be in the facility operating record by the effective date that the facility becomes subject to the provisions of this subpart.

(2) Up-to-date documentation of compliance with the process vent standards in § 265.1032, including:

(i) Information and data identifying all affected process vents, annual

throughput end operating hours of each affected unit, estimated emission rates for each affected vent and for the overall facility (i.e., the total emissions for all affected vents at the facility), and the approximate location within the facility of each affected unit (e.g., identify the hazardous waste management units on a facility plot plan); and

(ii) Information and data supporting determinations of vent emissions and emission reductions achieved by add-on control devices based on engineering calculations or source tests. For the purpose of determining compliance, determinations of vent emissions and emission reductions must be made using operating parameter values (e.g., temperatures, flow rates or vent stream organic compounds and concentrations) that represent the conditions that result in maximum organic emissions, such as when the waste management unit is operating at the highest load or capacity level reasonably expected to occur. If the owner or operator takes any action (e.g., managing a waste of different composition or increasing operating hours of affected waste management units) that would result in an increase in total organic emissions from affected process vents at the facility, then a new determination is required.

(3) Where an owner or operator chooses to use test data to determine the organic removal efficiency or total organic compound concentration achieved by the control device, a performance test plan. The test plan must include:

(i) A description of how it is determined that the planned test is going to be conducted when the hazardous waste management unit is operating at the highest load or capacity level reasonably expected to occur. This shall include the estimated or design flow rate and organic content of each vent stream and define the acceptable operating ranges of key process and control device parameters during the test program.

(ii) A detailed engineering description of the closed-vent system and control device including:

(A) Manufacturer's name and model number of control device.

(B) Type of control device.

(C) Dimensions of the control device.

(D) Capacity.

(E) Construction materials.

(iii) A detailed description of sampling and monitoring procedures, including sampling and monitoring locations in the system, the equipment to be used, sampling and monitoring frequency, and planned analytical procedures for sample analysis.

(4) Documentation of compliance with § 265.1033 shall include the following information:

(i) A list of all information references and sources used in preparing the documentation.

(ii) Records including the dates of each compliance test required by § 265.1033(j).

(iii) If engineering calculations are used, a design analysis, specifications, drawings, schematics, and piping and instrumentation diagrams based on the appropriate sections of "APTI Course 415: Control of Gaseous Emissions" (incorporated by reference as specified in § 260.11) or other engineering texts acceptable to the Regional Administrator that present basic control device design information. Documentation provided by the control device manufacturer or vendor that describes the control device design in accordance with paragraphs (b)(4)(iii)(A) through (b)(4)(iii)(G) of this section may be used to comply with this requirement. The design analysis shall address the vent stream characteristics and control device operation parameters as specified below.

(A) For a thermal vapor incinerator, the design analysis shall consider the vent stream composition, constituent concentrations, and flow rate. The design analysis shall also establish the design minimum and average temperature in the combustion zone and the combustion zone residence time.

(B) For a catalytic vapor incinerator, the design analysis shall consider the vent stream composition, constituent concentrations, and flow rate. The design analysis shall also establish the design minimum and average temperatures across the catalyst bed inlet and outlet.

(C) For a boiler or process heater, the design analysis shall consider the vent stream composition, constituent concentrations, and flow rate. The design analysis shall also establish the design minimum and average flame zone temperatures, combustion zone residence time, and description of method and location where the vent stream is introduced into the combustion zone.

(D) For a flare, the design analysis shall consider the vent stream composition, constituent concentrations, and flow rate. The design analysis shall also consider the requirements specified in § 265.1033(d).

(E) For a condenser, the design analysis shall consider the vent stream composition, constituent concentrations, flow rate, relative humidity, and temperature. The design analysis shall also establish the design outlet organic

compound concentration level, design average temperature of the condenser exhaust vent stream, and design average temperatures of the coolant fluid at the condenser inlet and outlet.

(F) For a carbon adsorption system such as a fixed-bed adsorber that regenerates the carbon bed directly onsite in the control device, the design analysis shall consider the vent stream composition, constituent concentrations, flow rate, relative humidity, and temperature. The design analysis shall also establish the design exhaust vent stream organic compound concentration level, number and capacity of carbon beds, type and working capacity of activated carbon used for carbon beds, design total steam flow over the period of each complete carbon bed regeneration cycle, duration of the carbon bed steaming and cooling/drying cycles, design carbon bed temperature after regeneration, design carbon bed regeneration time, and design service life of carbon.

(G) For a carbon adsorption system such as a carbon canister that does not regenerate the carbon bed directly onsite in the control device, the design analysis shall consider the vent stream composition, constituent concentrations, flow rate, relative humidity, and temperature. The design analysis shall also establish the design outlet organic concentration level, capacity of carbon bed, type and working capacity of activated carbon used for carbon bed, and design carbon replacement interval based on the total carbon working capacity of the control device and source operating schedule.

(iv) A statement signed and dated by the owner or operator certifying that the operating parameters used in the design analysis reasonably represent the conditions that exist when the hazardous waste management unit is or would be operating at the highest load or capacity level reasonably expected to occur.

(v) A statement signed and dated by the owner or operator certifying that the control device is designed to operate at an efficiency of 95 percent or greater unless the total organic concentration limit of § 265.1032(a) is achieved at an efficiency less than 95 weight percent or the total organic emission limits of § 265.1032(a) for affected process vents at the facility can be attained by a control device involving vapor recovery at an efficiency less than 95 weight percent. A statement provided by the control device manufacturer or vendor certifying that the control equipment meets the design specifications may be used to comply with this requirement.

(vi) If performance tests are used to demonstrate compliance, all test results.

(c) Design documentation and monitoring, operating, and inspection information for each closed-vent system and control device required to comply with the provisions of this part shall be recorded and kept up-to-date in the facility operating record. The information shall include:

(1) Description and date of each modification that is made to the closed-vent system or control device design.

(2) Identification of operating parameter, description of monitoring device, and diagram of monitoring sensor location or locations used to comply with § 265.1033(f)(1) and (f)(2).

(3) Monitoring, operating and inspection information required by paragraphs (f) through (j) of § 265.1033.

(4) Date, time, and duration of each period that occurs while the control device is operating when any monitored parameter exceeds the value established in the control device design analysis as specified below:

(i) For a thermal vapor incinerator designed to operate with a minimum residence time of 0.50 seconds at a minimum temperature of 760 °C, period when the combustion temperature is below 760 °C.

(ii) For a thermal vapor incinerator designed to operate with an organic emission reduction efficiency of 95 percent or greater, period when the combustion zone temperature is more than 28 °C below the design average combustion zone temperature established as a requirement of paragraph (b)(4)(iii)(A) of this section.

(iii) For a catalytic vapor incinerator, period when:

(A) Temperature of the vent stream at the catalyst bed inlet is more than 28 °C below the average temperature of the inlet vent stream established as a requirement of paragraph (b)(4)(iii)(B) of this section; or

(B) Temperature difference across the catalyst bed is less than 80 percent of the design average temperature difference established as a requirement of paragraph (b)(4)(iii)(B) of this section.

(iv) For a boiler or process heater, period when:

(A) Flame zone temperature is more than 28 °C below the design average flame zone temperature established as a requirement of paragraph (b)(4)(iii)(C) of this section; or

(B) Position changes where the vent stream is introduced to the combustion zone from the location established as a requirement of paragraph (b)(4)(iii)(C) of this section.

(v) For a flare, period when the pilot flame is not ignited.

(vi) For a condenser that complies with § 265.1033(f)(2)(vi)(A), period when the organic compound concentration level or readings of organic compounds in the exhaust vent stream from the condenser are more than 20 percent greater than the design outlet organic compound concentration level established as a requirement of paragraph (b)(4)(iii)(E) of this section.

(vii) For a condenser that complies with § 265.1033(f)(2)(vi)(B), period when:

(A) Temperature of the exhaust vent stream from the condenser is more than 6 °C above the design average exhaust vent stream temperature established as a requirement of paragraph (b)(4)(iii)(E) of this section; or

(B) Temperature of the coolant fluid exiting the condenser is more than 6 °C above the design average coolant fluid temperature at the condenser outlet established as a requirement of paragraph (b)(4)(iii)(E) of this section.

(viii) For a carbon adsorption system such as a fixed-bed carbon adsorber that regenerates the carbon bed directly onsite in the control device and complies with § 265.1033(f)(2)(vii)(A), period when the organic compound concentration level or readings of organic compounds in the exhaust vent stream from the carbon bed are more than 20 percent greater than the design exhaust vent stream organic compound concentration level established as a requirement of paragraph (b)(4)(iii)(F) of this section.

(ix) For a carbon adsorption system such as a fixed-bed carbon adsorber that regenerates the carbon bed directly onsite in the control device and complies with § 265.1033(f)(2)(vii)(B), period when the vent stream continues to flow through the control device beyond the predetermined carbon bed regeneration time established as a requirement of paragraph (b)(4)(iii)(F) of this section.

(5) Explanation for each period recorded under paragraph (3) of the cause for control device operating parameter exceeding the design value and the measures implemented to correct the control device operation.

(6) For carbon adsorption systems operated subject to requirements specified in § 265.1033(g) or § 265.1033(h)(2), date when existing carbon in the control device is replaced with fresh carbon.

(7) For carbon adsorption systems operated subject to requirements specified in § 265.1033(h)(1), a log that records:

(i) Date and time when control device is monitored for carbon breakthrough and the monitoring device reading.

(ii) Date when existing carbon in the control device is replaced with fresh carbon.

(8) Date of each control device startup and shutdown.

(d) Records of the monitoring, operating, and inspection information required by paragraphs (c)(3) through (c)(8) of this section need be kept only 3 years.

(e) For a control device other than a thermal vapor incinerator, catalytic vapor incinerator, flare, boiler, process heater, condenser, or carbon adsorption system, monitoring and inspection information indicating proper operation and maintenance of the control device must be recorded in the facility operating record.

(f) Up-to-date information and data used to determine whether or not a process vent is subject to the requirements in § 265.1032 including supporting documentation as required by § 265.1034(d)(2) when application of the knowledge of the nature of the hazardous waste stream or the process by which it was produced is used, shall be recorded in a log that is kept in the facility operating record.

(Approved by the Office of Management and Budget under control number 2080-0195)

§§ 265.1036-265.1049 [Reserved]

18. 40 CFR part 265 is amended by adding subpart BB to read as follows:

Subpart BB—Air Emission Standards for Equipment Leaks

- 265.1050 Applicability.
- 265.1051 Definitions.
- 265.1052 Standards: Pumps in light liquid service.
- 265.1053 Standards: Compressors.
- 265.1054 Standards: Pressure relief devices in gas/vapor service.
- 265.1055 Standards: Sampling connecting systems.
- 265.1056 Standards: Open-ended valves or lines.
- 265.1057 Standards: Valves in gas/vapor service or in light liquid service.
- 265.1058 Standards: Pumps and valves in heavy liquid service, pressure relief devices in light liquid or heavy liquid service, and flanges and other connectors.
- 265.1059 Standards: Delay of repair.
- 265.1060 Standards: Closed-vent systems and control devices.
- 265.1061 Alternative standards for valves in gas/vapor service or in light liquid service: percentage of valves allowed to leak.
- 265.1062 Alternative standards for valves in gas/vapor service or in light liquid service: skip period leak detection and repair.
- 265.1063 Test methods and procedures.
- 265.1064 Recordkeeping requirements.
- 265.1065-265.1079 [Reserved]

Subpart BB—Air Emission Standards for Equipment Leaks**§ 265.1050 Applicability.**

(a) The regulations in this subpart apply to owners and operators of facilities that treat, store, or dispose of hazardous wastes (except as provided in § 265.1).

(b) Except as provided in § 265.1064(j), this subpart applies to equipment that contains or contacts hazardous wastes with organic concentrations of at least 10 percent by weight that are managed in:

(1) Units that are subject to the permitting requirements of part 270, or

(2) Hazardous waste recycling units that are located on hazardous waste management facilities otherwise subject to the permitting requirements of part 270.

(c) Each piece of equipment to which this subpart applies shall be marked in such a manner that it can be distinguished readily from other pieces of equipment.

(d) Equipment that is in vacuum service is excluded from the requirements of § 265.1052 to § 265.1060 if it is identified as required in § 265.1064(g)(5).

[Note: The requirements of §§ 265.1052 through 265.1064 apply to equipment associated with hazardous waste recycling units previously exempt under paragraph 261.6(c)(1). Other exemptions under §§ 261.4, 262.34, and 265.1(c) are not affected by these requirements.]

§ 265.1051 Definitions.

As used in this subpart, all terms shall have the meaning given them in § 264.1031, the Act, and parts 260-266.

§ 265.1052 Standards: Pumps in light liquid service.

(a)(1) Each pump in light liquid service shall be monitored monthly to detect leaks by the methods specified in § 265.1063(b), except as provided in paragraphs (d), (e), and (f) of this section.

(2) Each pump in light liquid service shall be checked by visual inspection each calendar week for indications of liquids dripping from the pump seal.

(b)(1) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(2) If there are indications of liquids dripping from the pump seal, a leak is detected.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in § 265.1059.

(2) A first attempt at repair (e.g., tightening the packing gland) shall be made no later than 5 calendar days after each leak is detected.

(d) Each pump equipped with a dual mechanical seal system that includes a barrier fluid system is exempt from the requirements of paragraph (a), *provided* the following requirements are met:

(1) Each dual mechanical seal system must be:

(i) Operated with the barrier fluid at a pressure that is at all times greater than the pump stuffing box pressure, or

(ii) Equipped with a barrier fluid degassing reservoir that is connected by a closed-vent system to a control device that complies with the requirements of § 265.1060, or

(iii) Equipped with a system that purges the barrier fluid into a hazardous waste stream with no detectable emissions to the atmosphere.

(2) The barrier fluid system must not be a hazardous waste with organic concentrations 10 percent or greater by weight.

(3) Each barrier fluid system must be equipped with a sensor that will detect failure of the seal system, the barrier fluid system or both.

(4) Each pump must be checked by visual inspection, each calendar week, for indications of liquids dripping from the pump seals.

(5)(i) Each sensor as described in paragraph (d)(3) of this section must be checked daily or be equipped with an audible alarm that must be checked monthly to ensure that it is functioning properly.

(ii) The owner or operator must determine, based on design considerations and operating experience, a criterion that indicates failure of the seal system, the barrier fluid system, or both.

(6)(i) If there are indications of liquids dripping from the pump seal or the sensor indicates failure of the seal system, the barrier fluid system, or both based on the criterion determined in paragraph (d)(5)(ii) of this section, a leak is detected.

(ii) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in § 265.1059.

(iii) A first attempt at repair (e.g., relapping the seal) shall be made no later than 5 calendar days after each leak is detected.

(e) Any pump that is designated, as described in § 265.1064(g)(2), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraphs (a), (c), and

(d) of this section if the pump meets the following requirements:

(1) Must have no externally actuated shaft penetrating the pump housing.

(2) Must operate with no detectable emissions as indicated by an instrument reading of less than 500 ppm above background as measured by the methods specified in § 265.1063(c).

(3) Must be tested for compliance with paragraph (a)(2) of this section initially upon designation, annually, and at other times as requested by the Regional Administrator.

(f) If any pump is equipped with a closed-vent system capable of capturing and transporting any leakage from the seal or seals to a control device that complies with the requirements of § 265.1060, it is exempt from the requirements of paragraphs (a) through (e) of this section.

§ 265.1053 Standards: Compressors.

(a) Each compressor shall be equipped with a seal system that includes a barrier fluid system and that prevents leakage of total organic emissions to the atmosphere, except as provided in paragraphs (h) and (i) of this section.

(b) Each compressor seal system as required in paragraph (a) of this section shall be:

(1) Operated with the barrier fluid at a pressure that is at all times greater than the compressor stuffing box pressure, or

(2) Equipped with a barrier fluid system that is connected by a closed-vent system to a control device that complies with the requirements of § 265.1060, or

(3) Equipped with a system that purges the barrier fluid into a hazardous waste stream with no detectable emissions to atmosphere.

(c) The barrier fluid must not be a hazardous waste with organic concentrations 10 percent or greater by weight.

(d) Each barrier fluid system as described in paragraphs (a) through (c) of this section shall be equipped with a sensor that will detect failure of the seal system, barrier fluid system, or both.

(e)(1) Each sensor as required in paragraph (d) of this section shall be checked daily or shall be equipped with an audible alarm that must be checked monthly to ensure that it is functioning properly unless the compressor is located within the boundary of an unmanned plant site, in which case the sensor must be checked daily.

(2) The owner or operator shall determine, based on design considerations and operating experience, a criterion that indicates

failure of the seal system, the barrier fluid system or both.

(f) If the sensor indicates failure of the seal system, the barrier fluid system, or both based on the criterion determined under paragraph (e)(2) of this section, a leak is detected.

(g)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in § 265.1059.

(2) A first attempt at repair (e.g., tightening the packing gland) shall be made no later than 5 calendar days after each leak is detected.

(h) A compressor is exempt from the requirements of paragraphs (a) and (b) of this section if it is equipped with a closed-vent system capable of capturing and transporting any leakage from the seal to a control device that complies with the requirements of § 265.1060, except as provided in paragraph (i) of this section.

(i) Any compressor that is designated, as described in § 265.1064(g)(2), for no detectable emission as indicated by an instrument reading of less than 500 ppm above background is exempt from the requirements of paragraphs (a) through (h) of this section if the compressor:

(1) Is determined to be operating with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as measured by the method specified in § 265.1063(c).

(2) Is tested for compliance with paragraph (i)(1) of this section initially upon designation, annually, and at other times as requested by the Regional Administrator.

§ 265.1054 Standards: Pressure relief devices in gas/vapor service.

(a) Except during pressure releases, each pressure relief device in gas/vapor service shall be operated with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as measured by the method specified in § 265.1063(c).

(b)(1) After each pressure release, the pressure relief device shall be returned to a condition of no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as soon as practicable, but not later than 5 calendar days after each pressure release, except as provided in § 265.1059.

(2) No later than 5 calendar days after the pressure release, the pressure relief device shall be monitored to confirm the condition of no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as measured by the method specified in § 265.1063(c).

(c) Any pressure relief device that is equipped with a closed-vent system capable of capturing and transporting leakage from the pressure relief device to a control device as described in § 265.1060 is exempt from the requirements of paragraphs (a) and (b) of this section.

§ 265.1055 Standards: Sampling connecting systems.

(a) Each sampling connection system shall be equipped with a closed-purge system or closed-vent system.

(b) Each closed-purge system or closed-vent system as required in paragraph (a) shall:

(1) Return the purged hazardous waste stream directly to the hazardous waste management process line with no detectable emissions to atmosphere, or

(2) Collect and recycle the purged hazardous waste stream with no detectable emissions to atmosphere, or

(3) Be designed and operated to capture and transport all the purged hazardous waste stream to a control device that complies with the requirements of § 265.1060.

(c) *In situ* sampling systems are exempt from the requirements of paragraphs (a) and (b) of this section.

§ 265.1056 Standards: Open-ended valves or lines.

(a)(1) Each open-ended valve or line shall be equipped with a cap, blind flange, plug, or a second valve.

(2) The cap, blind flange, plug, or second valve shall seal the open end at all times except during operations requiring hazardous waste stream flow through the open-ended valve or line.

(b) Each open-ended valve or line equipped with a second valve shall be operated in a manner such that the valve on the hazardous waste stream end is closed before the second valve is closed.

(c) When a double block and bleed system is being used, the bleed valve or line may remain open during operations that require venting the line between the block valves but shall comply with paragraph (a) of this section at all other times.

§ 265.1057 Standards: Valves in gas/vapor service or in light liquid service.

(a) Each valve in gas/vapor or light liquid service shall be monitored monthly to detect leaks by the methods specified in § 265.1063(b) and shall comply with paragraphs (b) through (e) of this section, except as provided in paragraphs (f), (g), and (h) of this section and §§ 265.1061 and 265.1062.

(b) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(c)(1) Any valve for which a leak is not detected for two successive months may be monitored the first month of every succeeding quarter, beginning with the next quarter, until a leak is detected.

(2) If a leak is detected, the valve shall be monitored monthly until a leak is not detected for 2 successive months.

(d)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after the leak is detected, except as provided in § 265.1059.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(e) First attempts at repair include, but are not limited to, the following best practices where practicable:

- (1) Tightening of bonnet bolts.
- (2) Replacement of bonnet bolts.
- (3) Tightening of packing gland nuts.
- (4) Injection of lubricant into lubricated packing.

(f) Any valve that is designated, as described in § 265.1064(g)(2), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraph (a) of this section if the valve:

(1) Has no external actuating mechanism in contact with the hazardous waste stream.

(2) Is operated with emissions less than 500 ppm above background as determined by the method specified in § 265.1063(c).

(3) Is tested for compliance with paragraph (f)(2) of this section initially upon designation, annually, and at other times as requested by the Regional Administrator.

(g) Any valve that is designated, as described in § 265.1064(h)(1), as an unsafe-to-monitor valve is exempt from the requirements of paragraph (a) of this section if:

(1) The owner or operator of the valve determines that the valve is unsafe to monitor because monitoring personnel would be exposed to an immediate danger as a consequence of complying with paragraph (a) of this section.

(2) The owner or operator of the valve adheres to a written plan that requires monitoring of the valve as frequently as practicable during safe-to-monitor times.

(h) Any valve that is designated, as described in § 265.1064(h)(2), as a difficult-to-monitor valve is exempt from the requirements of paragraph (a) of this section if:

(1) The owner or operator of the valve determines that the valve cannot be monitored without elevating the

monitoring personnel more than 2 meters above a support surface.

(2) The hazardous waste management unit within which the valve is located was in operation before June 21, 1990.

(3) The owner or operator of the valve follows a written plan that requires monitoring of the valve at least once per calendar year.

§ 265.1058 Standards: Pumps and valves in heavy liquid service, pressure relief devices in light liquid or heavy liquid service, and flanges and other connectors.

(a) Pumps and valves in heavy liquid service, pressure relief devices in light liquid or heavy liquid service, and flanges and other connectors shall be monitored within 5 days by the method specified in § 265.1063(b) if evidence of a potential leak is found by visual, audible, olfactory, or any other detection method.

(b) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected, except as provided in § 265.1059.

(2) The first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(d) First attempts at repair include, but are not limited to, the best practices described under § 265.1057(e).

§ 265.1059 Standards: Delay of repair.

(a) Delay of repair of equipment for which leaks have been detected will be allowed if the repair is technically infeasible without a hazardous waste management unit shutdown. In such a case, repair of this equipment shall occur before the end of the next hazardous waste management unit shutdown.

(b) Delay of repair of equipment for which leaks have been detected will be allowed for equipment that is isolated from the hazardous waste management unit and that does not continue to contain or contact hazardous waste with organic concentrations at least 10 percent by weight.

(c) Delay of repair for valves will be allowed if:

(1) The owner or operator determines that emissions of purged material resulting from immediate repair are greater than the emissions likely to result from delay of repair.

(2) When repair procedures are effected, the purged material is collected and destroyed or recovered in a control device complying with § 265.1060.

(d) Delay of repair for pumps will be allowed if:

(1) Repair requires the use of a dual mechanical seal system that includes a barrier fluid system.

(2) Repair is completed as soon as practicable, but not later than 6 months after the leak was detected.

(e) Delay of repair beyond a hazardous waste management unit shutdown will be allowed for a valve if valve assembly replacement is necessary during the hazardous waste management unit shutdown, valve assembly supplies have been depleted, and valve assembly supplies had been sufficiently stocked before the supplies were depleted. Delay of repair beyond the next hazardous waste management unit shutdown will not be allowed unless the next hazardous waste management unit shutdown occurs sooner than 6 months after the first hazardous waste management unit shutdown.

§ 265.1060 Standards: Closed-vent systems and control devices.

Owners or operators of closed-vent systems and control devices shall comply with the provisions of § 265.1033.

§ 265.1061 Alternative standards for valves in gas/vapor service or in light liquid service: percentage of valves allowed to leak.

(a) An owner or operator subject to the requirements of § 265.1057 may elect to have all valves within a hazardous waste management unit comply with an alternative standard which allows no greater than 2 percent of the valves to leak.

(b) The following requirements shall be met if an owner or operator decides to comply with the alternative standard of allowing 2 percent of valves to leak:

(1) An owner or operator must notify the Regional Administrator that the owner or operator has elected to comply with the requirements of this section.

(2) A performance test as specified in paragraph (c) of this section shall be conducted initially upon designation, annually, and at other times requested by the Regional Administrator.

(3) If a valve leak is detected, it shall be repaired in accordance with § 265.1057 (d) and (e).

(c) Performance tests shall be conducted in the following manner:

(1) All valves subject to the requirements in § 265.1057 within the hazardous waste management unit shall be monitored within 1 week by the methods specified in § 265.1063(b).

(2) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(3) The leak percentage shall be determined by dividing the number of

valves subject to the requirements in § 265.1057 for which leaks are detected by the total number of valves subject to the requirements in § 265.1057 within the hazardous waste management unit.

(d) If an owner or operator decides no longer to comply with this section, the owner or operator must notify the Regional Administrator in writing that the work practice standard described in § 265.1057 (a) through (e) will be followed.

§ 265.1062 Alternative standards for valves in gas/vapor service or in light liquid service: skip period leak detection and repair.

(a)(1) An owner or operator subject to the requirements of § 265.1057 may elect for all valves within a hazardous waste management unit to comply with one of the alternative work practices specified in paragraphs (b) (2) and (3) of this section.

(2) An owner or operator must notify the Regional Administrator before implementing one of the alternative work practices.

(b)(1) An owner or operator shall comply with the requirements for valves, as described in § 265.1057, except as described in paragraphs (b)(2) and (b)(3) of this section.

(2) After two consecutive quarterly leak detection periods with the percentage of valves leaking equal to or less than 2 percent, an owner or operator may begin to skip one of the quarterly leak detection periods for the valves subject to the requirements in § 265.1057.

(3) After five consecutive quarterly leak detection periods with the percentage of valves leaking equal to or less than 2 percent, an owner or operator may begin to skip three of the quarterly leak detection periods for the valves subject to the requirements in § 265.1057.

(4) If the percentage of valves leaking is greater than 2 percent, the owner or operators shall monitor monthly in compliance with the requirements in § 265.1057, but may again elect to use this section after meeting the requirements of § 265.1057(c)(1).

§ 265.1063 Test methods and procedures.

(a) Each owner or operator subject to the provisions of this subpart shall comply with the test methods and procedures requirements provided in this section.

(b) Leak detection monitoring, as required in §§ 265.1052-265.1062, shall comply with the following requirements:

(1) Monitoring shall comply with Reference Method 21 in 40 CFR Part 60.

(2) The detection instrument shall meet the performance criteria of Reference Method 21.

(3) The instrument shall be calibrated before use on each day of its use by the procedures specified in Reference Method 21.

(4) Calibration gases shall be:

(i) Zero air (less than 10 ppm of hydrocarbon in air).

(ii) A mixture of methane or n-hexane and air at a concentration of approximately, but less than, 10,000 ppm methane or n-hexane.

(5) The instrument probe shall be traversed around all potential leak interfaces as close to the interface as possible as described in Reference Method 21.

(c) When equipment is tested for compliance with no detectable emissions, as required in §§ 265.1052(e), 265.1053(i), 265.1054, and 265.1057(f), the test shall comply with the following requirements:

(1) The requirements of paragraphs (b) (1) through (4) of this section shall apply.

(2) The background level shall be determined, as set forth in Reference Method 21.

(3) The instrument probe shall be traversed around all potential leak interfaces as close to the interface as possible as described in Reference Method 21.

(4) The arithmetic difference between the maximum concentration indicated by the instrument and the background level is compared with 500 ppm for determining compliance.

(d) In accordance with the waste analysis plan required by § 265.13(b), an owner or operator of a facility must determine, for each piece of equipment, whether the equipment contains or contacts a hazardous waste with organic concentration that equals or exceeds 10 percent by weight using the following:

(1) Methods described in ASTM Methods D 2267-88, E 169-87, E 168-88, E 260-85 (incorporated by reference under § 260.11);

(2) Method 9060 or 8240 of SW-846 (incorporated by reference under § 260.11); or

(3) Application of the knowledge of the nature of the hazardous waste stream or the process by which it was produced. Documentation of a waste determination by knowledge is required. Examples of documentation that shall be used to support a determination under this provision include production process information documenting that no organic compounds are used, information that the waste is generated by a process that is identical to a process at the same or another facility

that has previously been demonstrated by direct measurement to have a total organic content less than 10 percent, or prior speciation analysis results on the same waste stream where it can also be documented that no process changes have occurred since that analysis that could affect the waste total organic concentration.

(e) If an owner or operator determines that a piece of equipment contains or contacts a hazardous waste with organic concentrations at least 10 percent by weight, the determination can be revised only after following the procedures in paragraph (d)(1) or (d)(2) of this section.

(f) When an owner or operator and the Regional Administrator do not agree on whether a piece of equipment contains or contacts a hazardous waste with organic concentrations at least 10 percent by weight, the procedures in paragraph (d)(1) or (d)(2) of this section can be used to resolve the dispute.

(g) Samples used in determining the percent organic content shall be representative of the highest total organic content hazardous waste that is expected to be contained in or contact the equipment.

(h) To determine if pumps or valves are in light liquid service, the vapor pressures of constituents may be obtained from standard reference texts or may be determined by ASTM D-2879-86 (incorporated by reference under § 260.11).

(i) Performance tests to determine if a control device achieves 95 weight percent organic emission reduction shall comply with the procedures of § 265.1034 (c)(1) through (c)(4).

§ 265.1064 Recordkeeping requirements.

(a)(1) Each owner or operator subject to the provisions of this subpart shall comply with the recordkeeping requirements of this section.

(2) An owner or operator of more than one hazardous waste management unit subject to the provisions of this subpart may comply with the recordkeeping requirements for these hazardous waste management units in one recordkeeping system if the system identifies each record by each hazardous waste management unit.

(b) Owners and operators must record the following information in the facility operating record:

(1) For each piece of equipment to which subpart BB of part 265 applies:

(i) Equipment identification number and hazardous waste management unit identification.

(ii) Approximate locations within the facility (e.g., identify the hazardous

waste management unit on a facility plot plan).

(iii) Type of equipment (e.g., a pump or pipeline valve).

(iv) Percent-by-weight total organics in the hazardous waste stream at the equipment.

(v) Hazardous waste state at the equipment (e.g., gas/vapor or liquid).

(vi) Method of compliance with the standard (e.g., "monthly leak detection and repair" or "equipped with dual mechanical seals").

(2) For facilities that comply with the provisions of § 265.1033(a)(2), an implementation schedule as specified in § 265.1033(a)(2).

(3) Where an owner or operator chooses to use test data to demonstrate the organic removal efficiency or total organic compound concentration achieved by the control device, a performance test plan as specified in § 265.1035(b)(3).

(4) Documentation of compliance with § 265.1060, including the detailed design documentation or performance test results specified in § 265.1035(b)(4).

(c) When each leak is detected as specified in §§ 265.1052, 265.1953, 265.1057, and 265.1058, the following requirements apply:

(1) A weatherproof and readily visible identification, marked with the equipment identification number, the date evidence of a potential leak was found in accordance with § 265.1058(a), and the date the leak was detected, shall be attached to the leaking equipment.

(2) The identification on equipment, except on a valve, may be removed after it has been repaired.

(3) The identification on a valve may be removed after it has been monitored for 2 successive months as specified in § 265.1057(c) and no leak has been detected during those 2 months.

(d) When each leak is detected as specified in §§ 265.1052, 265.1053, 265.1057, and 265.1058, the following information shall be recorded in an inspection log and shall be kept in the facility operating record:

(1) The instrument and operator identification numbers and the equipment identification number.

(2) The date evidence of a potential leak was found in accordance with § 265.1058(a).

(3) The date the leak was detected and the dates of each attempt to repair the leak.

(4) Repair methods applied in each attempt to repair the leak.

(5) "Above 10,000" if the maximum instrument reading measured by the methods specified in § 265.1063(b) after

each repair attempt is equal to or greater than 10,000 ppm.

(6) "Repair delayed" and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

(7) Documentation supporting the delay of repair of a valve in compliance with § 265.1059(c).

(8) The signature of the owner or operator (or designate) whose decision it was that repair could not be effected without a hazardous waste management unit shutdown.

(9) The expected date of successful repair of the leak if a leak is not repaired within 15 calendar days.

(10) The date of successful repair of the leak.

(e) Design documentation and monitoring, operating, and inspection information for each closed-vent system and control device required to comply with the provisions of § 265.1060 shall be recorded and kept up-to-date in the facility operating record as specified in § 265.1035(c). Design documentation is specified in § 265.1035 (c)(1) and (c)(2) and monitoring, operating, and inspection information in § 265.1035 (c)(3)-(c)(8).

(f) For a control device other than a thermal vapor incinerator, catalytic vapor incinerator, flare, boiler, process heater, condenser, or carbon adsorption system, monitoring and inspection information indicating proper operation and maintenance of the control device must be recorded in the facility operating record.

(g) The following information pertaining to all equipment subject to the requirements in §§ 265.1052 through 265.1060 shall be recorded in a log that is kept in the facility operating record:

(1) A list of identification numbers for equipment (except welded fittings) subject to the requirements of this subpart.

(2)(i) A list of identification numbers for equipment that the owner or operator elects to designate for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, under the provisions of §§ 265.1052(e), 265.1053(i), and 265.1057(f).

(ii) The designation of this equipment as subject to the requirements of §§ 265.1052(e), 265.1053(i), or 265.1057(f) shall be signed by the owner or operator.

(3) A list of equipment identification numbers for pressure relief devices required to comply with § 265.1054(a).

(4)(i) The dates of each compliance test required in §§ 265.1052(e), 265.1053(i), 265.1054, and 265.1057(f).

(ii) The background level measured during each compliance test.

(iii) The maximum instrument reading measured at the equipment during each compliance test.

(5) A list of identification numbers for equipment in vacuum service.

(h) The following information pertaining to all valves subject to the requirements of § 265.1057 (g) and (h) shall be recorded in a log that is kept in the facility operating record:

(1) A list of identification numbers for valves that are designated as unsafe to monitor, an explanation for each valve stating why the valve is unsafe to monitor, and the plan for monitoring each valve.

(2) A list of identification numbers for valves that are designated as difficult to monitor, an explanation for each valve stating why the valve is difficult to monitor, and the planned schedule for monitoring each valve.

(i) The following information shall be recorded in the facility operating record for valves complying with § 265.1062:

(1) A schedule of monitoring.

(2) The percent of valves found leaking during each monitoring period.

(j) The following information shall be recorded in a log that is kept in the facility operating record:

(1) Criteria required in §§ 265.1052(d)(5)(ii) and 265.1053(e)(2) and an explanation of the criteria.

(2) Any changes to these criteria and the reasons for the changes.

(k) The following information shall be recorded in a log that is kept in the facility operating record for use in determining exemptions as provided in the applicability section of this subpart and other specific subparts:

(1) An analysis determining the design capacity of the hazardous waste management unit.

(2) A statement listing the hazardous waste influent to and effluent from each hazardous waste management unit subject to the requirements in §§ 265.1052 through 265.1060 and an analysis determining whether these hazardous wastes are heavy liquids.

(3) An up-to-date analysis and the supporting information and data used to determine whether or not equipment is subject to the requirements in §§ 265.1052 through 265.1060. The record shall include supporting documentation as required by § 265.1063(d)(3) when application of the knowledge of the nature of the hazardous waste stream or the process by which it was produced is used. If the owner or operator takes any action (e.g., changing the process that produced the waste) that could result in an increase in the total organic content of the waste contained in or contacted

by equipment determined not to be subject to the requirements in §§ 265.1052 through 265.1060, then a new determination is required.

(l) Records of the equipment leak information required by paragraph (d) of this section and the operating information required by paragraph (e) of this section need be kept only 3 years.

(m) The owner or operator of any facility that is subject to this subpart and to regulations at 40 CFR part 60, subpart VV, or 40 CFR part 61, subpart V, may elect to determine compliance with this subpart by documentation either pursuant to § 265.1064 of this subpart, or pursuant to those provisions of 40 CFR part 60 or 61, to the extent that the documentation under the regulation at 40 CFR part 60 or part 61 duplicates the documentation required under this subpart. The documentation under the regulation at 40 CFR part 60 or part 61 shall be kept with or made readily available with the facility operating record.

(Approved by the Office of Management and Budget under control number 2060-0195)

§§ 265.1065-265.1079 [Reserved]

PART 270—EPA-ADMINISTERED PERMIT PROGRAMS: THE HAZARDOUS WASTE PERMIT PROGRAM

19. The authority citation for part 270 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912, 6921-6927, 6930, 6934, 6935, 6937-6939, and 6974.

Subpart B—Permit Application

20. Section 270.14 is amended by revising the last sentence of paragraph (b)(5) and by revising paragraphs (b)(8)(iv), (v), and by adding paragraph (b)(8)(vi) to read as follows:

§ 270.14 Contents of Part B: General requirements

- • • • •
- (b) • • •
- (5) • • • Include, where applicable, as part of the inspection schedule, specific requirements in §§ 264.174, 264.193(i), 264.195, 264.226, 264.254, 264.273, 264.303, 264.602, 264.1033, 264.1052, 264.1053, and 264.1058.
- • • • •
- (8) • • •
- (iv) Mitigate effects of equipment failure and power outages;
- (v) Prevent undue exposure of personnel to hazardous waste (for example, protective clothing); and
- (vi) Prevent releases to atmosphere.
- • • • •

Section 270.24 is added to read as follows:

§ 270.24 Specific Part B information requirements for process vents.

Except as otherwise provided in § 264.1, owners and operators of facilities that have process vents to which subpart AA of part 264 applies must provide the following additional information:

(a) For facilities that cannot install a closed-vent system and control device to comply with the provisions of 40 CFR 264 subpart AA on the effective date that the facility becomes subject to the provisions of 40 CFR 264 or 265 subpart AA, an implementation schedule as specified in § 264.1033(a)(2).

(b) Documentation of compliance with the process vent standards in § 264.1032, including:

(1) Information and data identifying all affected process vents, annual throughput and operating hours of each affected unit, estimated emission rates for each affected vent and for the overall facility (i.e., the total emissions for all affected vents at the facility), and the approximate location within the facility of each affected unit (e.g., identify the hazardous waste management units on a facility plot plan).

(2) Information and data supporting estimates of vent emissions and emission reduction achieved by add-on control devices based on engineering calculations or source tests. For the purpose of determining compliance, estimates of vent emissions and emission reductions must be made using operating parameter values (e.g., temperatures, flow rates, or concentrations) that represent the conditions that exist when the waste management unit is operating at the highest load or capacity level reasonably expected to occur.

(3) Information and data used to determine whether or not a process vent is subject to the requirements of § 264.1032.

(c) Where an owner or operator applies for permission to use a control device other than a thermal vapor incinerator, catalytic vapor incinerator, flare, boiler, process heater, condenser, or carbon adsorption system to comply with the requirements of § 264.1032, and chooses to use test data to determine the organic removal efficiency or the total organic compound concentration achieved by the control device, a performance test plan as specified in § 264.1035(b)(3).

(d) Documentation of compliance with § 264.1033, including:

(1) A list of all information references and sources used in preparing the documentation.

(2) Records including the dates of each compliance test required by § 264.1033(k).

(3) A design analysis, specifications, drawings, schematics, and piping and instrumentation diagrams based on the appropriate sections of "APTI Course 415: Control of Gaseous Emissions" (incorporated by reference as specified in § 260.11) or other engineering texts acceptable to the Regional Administrator that present basic control device design information. The design analysis shall address the vent stream characteristics and control device operation parameters as specified in § 264.1035(b)(4)(iii).

(4) A statement signed and dated by the owner or operator certifying that the operating parameters used in the design analysis reasonably represent the conditions that exist when the hazardous waste management unit is or would be operating at the highest load or capacity level reasonably expected to occur.

(5) A statement signed and dated by the owner or operator certifying that the control device is designed to operate at an efficiency of 95 weight percent or greater unless the total organic emission limits of § 264.1032(a) for affected process vents at the facility can be attained by a control device involving vapor recovery at an efficiency less than 95 weight percent.

(Approved by the Office of Management and Budget under control number 2060-0195)

22. Section 270.25 is added as follows:

§ 270.25 Specific part B information requirements for equipment.

Except as otherwise provided in § 264.1, owners and operators of facilities that have equipment to which subpart BB of part 264 applies must provide the following additional information:

(a) For each piece of equipment to which subpart BB of part 264 applies:

(1) Equipment identification number and hazardous waste management unit identification.

(2) Approximate locations within the facility (e.g., identify the hazardous waste management unit on a facility plot plan).

(3) Type of equipment (e.g., a pump or pipeline valve).

(4) Percent by weight total organics in the hazardous waste stream at the equipment.

(5) Hazardous waste state at the equipment (e.g., gas/vapor or liquid).

(6) Method of compliance with the standard (e.g., "monthly leak detection and repair" or "equipped with dual mechanical seals").

(b) For facilities that cannot install a closed-vent system and control device to comply with the provisions of 40 CFR 264 subpart BB on the effective date that the facility becomes subject to the provisions of 40 CFR 264 or 265 subpart BB, an implementation schedule as specified in § 264.1033(a)(2).

(c) Where an owner or operator applies for permission to use a control device other than a thermal vapor incinerator, catalytic vapor incinerator, flare, boiler, process heater, condenser, or carbon adsorption system and chooses to use test data to determine the organic removal efficiency or the total organic compound concentration achieved by the control device, a performance test plan as specified in § 264.1035(b)(3).

(d) Documentation that demonstrates compliance with the equipment standards in §§ 264.1052 to 264.1059. This documentation shall contain the records required under § 264.1064. The Regional Administrator may request further documentation before deciding if compliance has been demonstrated.

(e) Documentation to demonstrate compliance with § 264.1060 shall include the following information:

(1) A list of all information references and sources used in preparing the documentation.

(2) Records including the dates of each compliance test required by § 264.1033(j).

(3) A design analysis, specifications, drawings, schematics, and piping and instrumentation diagrams based on the appropriate sections of "ATPI Course 415: Control of Gaseous Emissions" (incorporated by reference as specified in § 260.11) or other engineering texts acceptable to the Regional Administrator that present basic control device design information. The design analysis shall address the vent stream characteristics and control device operation parameters as specified in § 264.1035(b)(4)(iii).

(4) A statement signed and dated by the owner or operator certifying that the operating parameters used in the design analysis reasonably represent the conditions that exist when the hazardous waste management unit is operating at the highest load or capacity level reasonably expected to occur.

(5) A statement signed and dated by the owner or operator certifying that the control device is designed to operate at an efficiency of 95 weight percent or greater.

(Approved by the Office of Management and Budget under control number 2060-0915)

PART 271—REQUIREMENTS FOR AUTHORIZATION OF STATE HAZARDOUS WASTE PROGRAMS

23. The authority citation for part 271 continues to read as follows:

Authority: 42 U.S.C. 6905, 6912(a), and 6926.

Subpart A—Requirements for Final Authorization

24. Section 271.1(j) is amended by adding the following entry to Table 1 in chronological order by date of publication:

§ 271.1 Purpose and scope.

(j) . . .

TABLE 1. REGULATIONS IMPLEMENTING THE HAZARDOUS AND SOLID WASTE AMENDMENTS OF 1984

Promulgation date	Title of regulation	Federal Register reference	Effective date
[Insert date of publication].	Process Vent and Equipment Leak Organic Air Emission Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities.	[Insert FR reference on date of publication].	[Insert effective date.]

ATTACHMENT B

Consolidated Land Disposal Restrictions Checklist

CONSOLIDATED CHECKLIST
for the
Land Disposal Restrictions as of June 30, 1990

1) This checklist consolidates the changes to Federal Code addressed by the following Land Disposal Restrictions (LDR) checklists: Revision Checklist 34 [51 FR 40572 (November 7, 1986), 52 FR 21010 (June 4, 1987)], Revision Checklist 39 [52 FR 25760 (July 8, 1987), 52 FR 41295 (October 27, 1987)], Revision Checklist 50 [53 FR 31138 (August 17, 1988), 54 FR 8264 (February 27, 1989)], Revision Checklist 62 [54 FR 18836 (May 2, 1989)], Revision Checklist 63 [54 FR 26594 (June 23, 1989)], Revision Checklist 66 [54 FR 36967 (September 6, 1989), 55 FR 23935 (June 13, 1990)], and Revision Checklist 78 [55 FR 22520 (June 1, 1990)]. The "LDR Checklist Reference" column indicates which of these checklists have affected each listed citation. Subsequent to promulgation of the first LDR rule (i.e., the rule addressed by Revision Checklist 34), checklists other than the LDR checklists have also affected certain sections of code addressed by the LDR checklists. The effects of these subsequent checklists are indicated in footnotes. Of special note are 270.42(o)&(p) and 270.72(e). In both cases, subsequent checklists, either removed or redesignated these sections of code. The section numbering found in the associated LDR final rule for these paragraphs is used, rather than the new numbering found in the subsequent checklists.

An exception to the footnoting procedure is the effect which the Toxicity Characteristics Rule had on the TCLP procedure. Because the new TCLP procedure is integral to the Third Third Rule requirements (see Note 4 below), this change made by Revision Checklist 74, a non-LDR checklist, is noted in the LDR checklist reference column. An explanatory footnote is also included.

2) The following Part 268 sections are not delegable to States because of the national concerns which must be examined when decisions are made relative to them: 268.5 (case-by-case effective date extensions); 268.42(b) (application for alternate treatment method); and 268.44 (variance from a treatment standard). "No migration" petitions under 268.6 will be handled by EPA, even though States may be authorized to grant such petitions in the future. States have the authority to grant such petitions under RCRA Section 3006 because such decisions do not require a national perspective, as is the case for decisions under 268.5, 268.42(b) or 268.44. However, EPA has had few opportunities to implement the land disposal restrictions and expects to gain valuable experience and information from reviewing "no-migration" petitions.

3) In the past, the nondelegable sections/paragraphs of the LDR regulations have been omitted from the LDR checklists because States could not assume the authority for them. However, this procedure has led to confusion among the States on how to handle the sections/paragraphs in their code. For this reason, the Agency has decided to include these nondelegable sections on the LDR checklists. To differentiate these sections from the delegable portions of the LDR restrictions, asterisks precede (a single row) and follow (a double row) each non-delegable section. If States have already filled out a version of this Consolidated Land Disposal Restriction Checklist which does not include the nondelegable sections, they need not fill out a revised version containing these sections. This change in format was made only to improve clarity.

CONSOLIDATED CHECKLIST: Land Disposal Restrictions (cont'd)

The Agency suggests that States incorporate the nondelegable portions of the LDR regulation into their regulations because this incorporation aids the regulated community in knowing that the extensions, exemptions and variances addressed by the nondelegable sections of code are available to them. It is essential, however, that States leave the terms "Administrator", "Federal Register" and "Agency" unchanged, i.e., States may not substitute analogous State terms for these Federal terms. Similarly, States incorporating by reference must be careful to exclude these sections from blanket substitutions of State terms for Federal terms. For a more complete discussion of issues surrounding nondelegable sections, see Appendix J of the State Authorization Manual (SAM).

4) Note that while 268.40 is delegable to States, "Administrator" in the following phrase "Approved by the Administrator under the procedures set for this in 268.42(b)" should not be replaced with an analogous State term because it is referring to decisions under 268.42(b). Such decisions will be made by the EPA Administrator.

5) States do not need to adopt requirements equivalent to 40 CFR 268.10, 268.11, 268.12 and 268.13 because these sections of code contain the schedule by which EPA must evaluate wastes for land disposal restrictions. As such, these sections of code are not included in this consolidated checklist.

6) Note that the Toxicity Characteristic Leaching Procedure (TCLP) referred to by the Third Third Scheduled Waste Rule is the TCLP entered into the Federal code at 40 CFR 261 Appendix II by the Toxicity Characteristic Rule (55 FR 11798, March 29, 1990) and amended at 55 FR 26986 (June 29, 1990). (Both the Toxicity Characteristic Rule and the June amendment are addressed by Revision Checklist 74.) The TCLP procedure previously located at 40 CFR Part 268, Appendix I and introduced by the Solvents and Dioxins Land Disposal Restrictions Rule (51 FR 40572; November 7, 1986; Revision Checklist 34) is the outdated version of the TCLP. Thus, States adopting the Third Third Schedule Waste Rule must also adopt the new version of the TCLP. If a State has already adopted the Revision Checklist 34 TCLP, this version must be replaced with the Revision Checklist 74 TCLP. See Footnote 40.

7) Guidance regarding the use of the new TCLP versus the EP Toxicity Test may be found at 55 FR 22660 (June 1, 1990). The code (40 CFR 268.40(a) and 268.41(a)) addressing this issue contains a serious technical error which is discussed in Footnote 31 found at the end of this checklist.

8) Adopting the alternate treatment standards for lab packs is optional. However, if a State chooses to adopt these alternate standards, all of the requirements related to these standards must be adopted, including all of the provisions added by the Third Third Scheduled Waste Rule (i.e., Revision Checklist 78) at 264.316(f), 265.316(f), 268.7(a)(7), 268.7(a)(8), 268.42(c), 268.42(c)(1)-(4), and Appendices IV and V to Part 268.

PART 268 - LAND DISPOSAL RESTRICTIONS						
SUBPART A - GENERAL						
PURPOSE, SCOPE AND APPLICABILITY						
purpose	34	268.1(a)				
applicability	34	268.1(b)				
conditions for continued land disposal:	34,66	268.1(c)				
7 persons with an extension	34	268.1(c)(1)				
7 persons with an exemption	34	268.1(c)(2)				
10 wastes that are hazardous only because they exhibit a hazardous charac- teristic, and which are otherwise prohibited from land disposal if the wastes:	34,39,50 66,78	268.1(c)(3)				
disposed into a non- hazardous or hazardous injection well as defined in 40 CFR 144.6(a)	78	268.1(c)(3)(i)				
do not exhibit any prohibited charac- teristic of hazardous waste at the point of injection	78	268.1(c)(3)(ii)				
11 removed	34,39 50,66	268.1(c)(4)				
12 removed	39,50 78	268.1(c)(5)				
preserve waiver availability under 121(d)(4) of CERCLA	50	268.1(d)

SUBPART G - INTERIM STATUS

CHANGES DURING INTERIM STATUS

45 no reconstruction; changes do not include tank/ container changes to comply with land disposal restrictions	39	270.72(e)				
--	----	-----------	--	--	--	--

- 1 See amendment to rule addressed by Revision Checklist 39 at 52 FR 41295 (October 27, 1987).
- 2 Paragraph 260.11(a) is also affected by Revision Checklist 67 (54 FR 40260, September 29, 1989) and Revision Checklist 73 (55 FR 8948, March 9, 1990).
- 3 Paragraph 261.5(f)(2) is also affected by Revision Checklist 47 (53 FR 27162, July 19, 1988).
- 4 Note that the "TC Rule," Revision Checklist 74 (55 FR 11798, March 29, 1990), has also made changes to 261.24(b).
- 5 Paragraph 261.33(c) is also affected by Revision Checklist 41 (52 FR 26012, July 10, 1987).
- 6 Note that the final rule for Revision Checklist 39 (52 FR 25787) gives Subpart E, 262.51 as the citation for Farmers. This is not correct as the August 8, 1986 (51 FR 28664, Revision Checklist 31) final rule regarding exports changed this section and moved it to Subpart G, 262.70. This error in the final rule was deleted when Revision Checklist 39 was developed, and the proper citation (262.70) was used on that checklist. This error was ultimately corrected at 53 FR 27164 (July 19, 1988).
- 7 Also see technical correction to the rule addressed by Revision Checklist 34 at 52 FR 21010 (June 4, 1987).
- 8 Subparagraphs 264.13(a)(1) and 265.13(a)(1) are also affected by Revision Checklist 64 (54 FR 33376, August 14, 1989).
- 9 This code is part of the optional requirements for the alternate treatment standards for lab packs under the Third Third Scheduled Waste Rule. If adopted, all of the requirements (i.e., 264.316(f), 265.316(f), 268.7(a)(7), 268.7(a)(8), 268.42(c), 268.42(c)(1)-(4), and Appendices IV and V to Part 268) related to these alternate treatment standards must be adopted.

554

CONSOLIDATED CHECKLIST: Land Disposal Restrictions (cont'd)

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
10						
This is a new subparagraph introduced into the code by Revision Checklist 78. The original subparagraph 268.1(c)(3) was introduced by Revision Checklist 34, modified by Revision Checklist 39, then removed by Revision Checklist 50, with 268.1(c)(4) redesignated as (c)(3). The redesignated subparagraph 268.1(c)(3) was subsequently removed by Revision Checklist 66.						
11						
Subparagraph 268.1(c)(4) originated in Revision Checklist 34, was modified by Revision Checklist 39, redesignated by Revision Checklist 50, and finally removed by Revision Checklist 66. Revision Checklist 48 also made a technical correction.						
12						
Subparagraph 268.1(c)(5) originated in Revision Checklist 39, was revised by Revision Checklist 48, original text redesignated and new text introduced by Revision Checklist 50, and finally removed by Revision Checklist 78.						
13						
This paragraph was originally part of 268.2(a) when it was entered into the code by Revision Checklist 34. Revision Checklist 78 renumbered it as 268.2(b) and removed the old 268.2(b) introduced by Revision Checklist 34.						
14						
The definition of land disposal was introduced into the code as part of 268.2(a) by Revision Checklist 34. It was modified by Revision Checklist 39 and designated as 268.2(c) by Revision Checklist 78.						
15						
Note there is a typographical error in the <u>Federal Register</u> notice for Revision Checklist 78 (55 <u>FR</u> 22520, June 1, 1990). The reference to "(g)(6)" should be "(f)."						
16						
This definition was introduced by Revision Checklist 39 as part of 268.2(a). It was redesignated as 268.2(e) by Revision Checklist 78.						
17						
Paragraph 268.3(a) was originally introduced into the code by Revision Checklist 34 as 268.3, and was then revised by Revision Checklist 39. Revision Checklist 78 revised and redesignated it as 268.3(a).						
18						
268.6(c) was originally introduced by Revision Checklist 34. Revision Checklist 50 redesignated that 268.6(c) as 268.6(d) and inserted a new 268.6(c).						
19						
The original 268.6(d) was introduced by Revision Checklist 34. Revision Checklist 50 redesignated that paragraph as 268.6(g). That same checklist redesignated 268.6(c) as 268.6(d). See Footnote 18.						
20						
268.6(e) was introduced by Revision Checklist 34. Revision Checklist 50 redesignated that 268.6(e) as 268.6(h) and inserted a new 268.6(e).						
21						
268.6(f) was introduced by Revision Checklist 34. Revision Checklist 50 redesignated that 268.6(f) as 268.6(i) and inserted a new 268.6(f).						
22						
268.6(d)-(j) were originally introduced by Revision Checklist 34. Revision Checklist 50 redesignated these paragraphs as 268.6(g)-(m).						

CONSOLIDATED CHECKLIST: Land Disposal Restrictions (cont'd)

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
23						
268.6(k) was originally introduced by Revision Checklist 39. Revision Checklist 50 redesignated it as 268.6(n).						
24						
Note that the rule addressed by Revision Checklist 78 (55 FR 22520) makes it appear as if 268.7(a)(3)(iii)-(v) were removed (see page 22687). This was an error and these three subparagraphs should remain in the code.						
25						
Initially, subparagraphs 268.7(a)(4)(i)-(iv) were introduced into the code by Revision Checklist 50. Revision Checklist 78 completely changed the text of (a)(4)(i)-(iii) and removed (a)(4)(iv).						
26						
This subparagraph was originally 268.7(a)(4) when it was added to the code by Revision Checklist 34. However, it was redesignated as 268.7(a)(5) by Revision Checklist 50.						
27						
These subparagraphs were originally 268.7(b)(1) and 268.7(b)(1)(i)-(iv) when they were added to the code by Revision Checklist 34. However, they were redesignated as 268.7(b)(4) and 268.7(b)(4)(i)-(iv) by Revision Checklist 50.						
28						
These subparagraphs were originally 268.7(b)(2) and 268.7(b)(2)(i)-(ii) when they were added to the code by Revision Checklist 34. However, they were redesignated as 268.7(b)(5) and 268.7(b)(5)(i)-(ii) by Revision Checklist 50.						
29						
This paragraph was originally 268.7(b)(8) when it was entered into the code by Revision Checklist 50, but it was redesignated as 268.7(b)(7) by Revision Checklist 78 because the old 278.7(b)(7) and 278.7(b)(7)(i)-(iv) were removed by Revision Checklist 78. Revision Checklist 66 corrected 268.7(b)(8) before it was redesignated by Revision Checklist 78.						
30						
The notice, certification and test requirements currently found in Federal code at 268.7(c)(1) and (c)(2) were originally addressed in paragraph 268.7(c), as introduced into the code by Revision Checklist 34. 268.7(c) was subsequently modified by Revision Checklists 39 and 50. Revision Checklist 39 added the testing requirements now found at 268.7(c)(2), although at the time the paragraph was still designated as 268.7(c). It was Revision Checklist 50 that significantly revised the paragraph so that the notice and certification requirements now appear at (c)(1) and the testing requirements appear at (c)(2). The checklist reference column, then, includes all relevant checklists for 268.7(c)(1) and (c)(2), rather than just Revision Checklist 50 which primarily affected the formatting changes.						
31						
An error in the September 6, 1989 rule (54 FR 36967) makes it appear that the revisions to 268.8(a) include the removal of 268.8(a)(4). This was not the Agency's intent and 268.8(a)(4) remains in Federal code as introduced by Revision Checklist 50.						
32						
Note that 268.8(d) in the final rule addressed by Revision Checklist 50 has a typographical error. The reference to 263.33(f) should be 268.33(f), as corrected by Revision Checklist 66.						
33						
The 268.30(a) introduction appeared in the final rule addressed by Revision Checklist 50, but was not changed by that rule.						

CONSOLIDATED CHECKLIST: Land Disposal Restrictions (cont'd)

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
34						
<p>These subparagraphs were originally 268.30(c) and 268.30(c)(1)-(3) when they were introduced into the code by Revision Checklist 34. However, Revision Checklist 50 redesignated them as 268.30(d) and 268.30(d)(1)-(3) because that checklist inserted a new paragraph at 268.30(c).</p>						
35						
<p>These paragraphs were originally 268.31(b) and 268.31(b)(1)-(3) when they were introduced into the code by Revision Checklist 34. However, Revision Checklist 50 redesignated them as 268.31(d) and 268.31(d)(1)-(3), because that checklist inserted a new paragraph at 268.31(b).</p>						
36						
<p>While this subparagraph appeared in the final rule addressed by Revision Checklist 50, the rule did not change this subparagraph.</p>						
37						
<p>The current text of 268.40(a) and 268.41(a) indicates that an extract or treatment residue of certain wastes may be land disposed only if certain requirements are met using either the test method in Appendix I of Part 268 or the test method in Appendix II of Part 261. Following promulgation of the March 29, 1990 Toxicity Characteristics rule addressed by Revision Checklist 74 (55 <u>FR</u> 11798, as amended at 55 <u>FR</u> 26986), both of these appendices relate to the same test method, the TCLP. Previously, the Part 261 appendix contained the EP Toxicity test procedures while the Part 268 appendix contained the TCLP. EPA will issue a correction to the rule for these particular paragraphs in the near future, clarifying which procedures may be used. Until such time, however, EPA indicates that for the specific waste exceptions listed in these paragraphs, the TCLP can be used for measuring compliance with the treatment standards for those specified wastes, and if the extract or treatment residue fails that test, the EP Toxicity test can be used. If the extract or residue passes that less stringent test, then such waste is considered in compliance with the treatment standards. For more information related to the use of either of the two test methods, see the discussion at 55 <u>FR</u> 22660 (June 1, 1990).</p>						
38						
<p>The 55 <u>FR</u> 22520, June 1, 1990, code incorrectly states that a subparagraph 268.42(e) is added. The <u>Federal Register</u> did not contain a 268.42(e); it only added 268.42(d).</p>						
39						
<p>While 268.43(b) appeared in the final rule addressed by Revision Checklist 63, the text of the paragraph was not changed and remains the same as that introduced by Revision Checklist 50.</p>						
40						
<p>Revision Checklist 74, a non-LDR checklist, revised and moved the TCLP from Appendix I of Part 268 to Appendix II of Part 261. The TCLP is used in the LDR program to determine whether certain wastes require treatment prior to land disposal. Because the rule addressed by Revision Checklist 74 included modifications to the TCLP for use in the LDR program, Checklist 74 is included in the LDR Checklist Reference column for Appendix I of Part 268. Effectively, States adopting the Third Thirds Land Disposal Restrictions must also adopt this new version of the TCLP found at Part 261, Appendix II of the July 1, 1990 <u>CFR</u>. Note also that the placement of the TCLP within a State's hazardous waste regulations is not that important, per se. What is important, however, is that the TCLP introduced by Revision Checklist 34, an LDR checklist, is replaced by the TCLP entered into the code and amended by the final rules (55 <u>FR</u> 11798 and 55 <u>FR</u> 26986) addressed by Revision Checklist 74.</p>						

CONSOLIDATED CHECKLIST: Land Disposal Restrictions (cont'd)

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
41						
<p>Paragraphs 270.42(o) and (p) were introduced into the code by Revision Checklists 34 and 39, respectively. Subsequently, Revision Checklist 54 removed both paragraphs, though these deletions were optional. Though EPA strongly encourages States to adopt the permit modification rule as addressed by Revision Checklist 54, States may elect to retain paragraphs 270.42(o) and (p). Thus, the paragraphs are included in this consolidated checklist. If States have adopted the Revision Checklist 54 modifications, the section title should also be modified to read "Permit Modification at the Request of the Permittee" instead of "Minor Modifications of Permits" and the Revision Checklist 54 modifications made. <u>States should also note</u> that 270.42 was not required by 271.14 to be part of a State's authorized permit program. Thus, only States which elected to have a section analogous to 270.42 (Minor Modification of Permits) at the time of base program authorization need worry about the 270.42 modifications made by Revision Checklists 34 and 39. These changes are, of course, negated if the State chooses to also adopt the Revision Checklist 54 modification.</p>						
42						
<p>Appendix I was introduced by Revision Checklist 54 as an optional modification to Section 270.42. Changes to this appendix addressed by the LDR Revision Checklist 78 are relevant only if a State has modified its code to include Appendix I as per Revision Checklist 54.</p>						
43						
<p>Revision Checklist 78 redesignated item B(1)(b) as item B(1)(c) and added a new B(1)(b).</p>						
44						
<p>This item was entered into the code as Appendix I, B(1)(b) and was redesignated as B(1)(c) by Revision Checklist 78.</p>						
45						
<p>Revision Checklist 61 revised and redesignated 270.72(e) as 270.72(b). The Revision Checklist 61 changes are optional, however, some States may have retained 270.72(e) in their code as introduced by the LDR Revision Checklist 39.</p>

† Optional.

¹States have an additional year if statutory changes are required.

²A parenthesized number implies that this is not the main rule for the indicated checklist. However, the rule is included on the indicated checklist. Rules with parenthesized numbers are typically technical corrections or amendments to a major final rule. These corrections are usually close enough in time to the initial final rule that the correction was included on the checklist for the initial rule, rather than develop a new checklist for the correction.

³While Revision Checklists 27 and 43 are optional, States which have adopted or choose to adopt the changes addressed by Revision Checklist 27 must adopt Revision Checklist 43's changes.

⁴The May 2, 1986 amendments to 40 CFR 264.113 and 265.113, addressed by Revision Checklist 24, must be adopted before or simultaneous with adopting the provisions addressed by Revision Checklist 64. Also see Footnote 5.

**TABLE G-1. LIST OF REVISION CHECKLISTS BY CLUSTER (cont'd)
Through June 30, 1990**

<u>Revision Checklist Number</u>	<u>Federal Requirement</u>	<u>HSWA or FR Reference</u>	<u>Promulgation or HSWA Date</u>
----------------------------------	----------------------------	-----------------------------	----------------------------------

⁵Only those sections, i.e., 40 CFR 264.113 and 265.113, of Revision Checklist 24 (Amended) recharacterized as more stringent by the June 26, 1990 correction are included in non-HSWA Cluster VI. All other Revision Checklist 24 provisions continue to be included in non-HSWA Cluster II. States which have already adopted the 264.113 and 265.113 amendments as part of their authorization for Revision Checklist 24 in non-HSWA Cluster II, are not affected by this correction and do not have to submit an amended Revision Checklist 24.

⁶Revision Checklist 78 is in HSWA Cluster II, with the exception of the clarifying amendment to §268.33(c) which is in non-HSWA Cluster VI. This clarification is not immediately effective in authorized States since the requirements are not imposed pursuant to HSWA. Thus, these requirements are applicable only in those States that do not have interim or final authorization. In authorized States, the requirements will not be applicable until the State revises its program to adopt equivalent requirements under State law.

† Optional.

¹Only those sections, i.e., 40 CFR 264.113 and 265.113, of Revision Checklist 24 (Amended) recharacterized as more stringent by the June 26, 1990 correction are included in non-HSWA Cluster VI. All other Revision Checklist 24 provisions continue to be included in non-HSWA Cluster II. States which have already adopted the 264.113 and 265.113 amendments as part of their authorization for Revision Checklist 24 in non-HSWA Cluster II, are not affected by this correction and do not have to submit an amended Revision Checklist 24.

²While Revision Checklists 27 and 43 are optional, states which have adopted or choose to adopt the changes addressed by Revision Checklist 27, must adopt Revision Checklist 43's changes.

³The May 2, 1986 amendments to 40 CFR 264.113 and 265.113, addressed by Revision Checklist 24, must be adopted before or simultaneous with adopting the provisions addressed by Revision Checklist 64. Also see Footnote 1.

⁴Revision Checklist 78 is in HSWA Cluster II, with the exception of the clarifying amendment to §268.33(c) which is in non-HSWA Cluster VI. This clarification is not immediately effective in authorized States since the requirements are not imposed pursuant to HSWA. Thus, these requirements are applicable only in those States that do not have interim or final authorization. In authorized States, the requirements will not be applicable until the State revises its program to adopt equivalent requirements under State law.

NTIS does not permit return of items for credit or refund. A replacement will be provided if an error is made in filling your order, if the item was received in damaged condition, or if the item is defective.

This report was printed specifically for your order from our collection of more than 2 million technical reports.

For economy and efficiency, NTIS does not maintain stock of its vast collection of technical reports. Rather, most documents are printed for each order. Your copy is the best possible reproduction available from our master archive. If you have any questions concerning this document or any order you placed with NTIS, please call our Customer Services Department at (703)487-4660.

Always think of NTIS when you want:

- Access to the technical, scientific, and engineering results generated by the ongoing multibillion dollar R&D program of the U.S. Government.
- R&D results from Japan, West Germany, Great Britain, and some 20 other countries, most of it reported in English.

NTIS also operates two centers that can provide you with valuable information:

- The Federal Computer Products Center - offers software and datafiles produced by Federal agencies.
- The Center for the Utilization of Federal Technology - gives you access to the best of Federal technologies and laboratory resources.

For more information about NTIS, send for our *FREE NTIS Products and Services Catalog* which describes how you can access this U.S. and foreign Government technology. Call (703)487-4650 or send this sheet to NTIS, U.S. Department of Commerce, Springfield, VA 22161. Ask for catalog, PR-827.

Model Revision Attorney General's Statement

The following pages (numbered 9 through 47)
should replace pages 9 through 43 of
SAM Appendix E

MODEL REVISION ATTORNEY GENERAL'S STATEMENT FOR FINAL
AUTHORIZATION FOR CHANGES TO THE FEDERAL
RCRA PROGRAM FROM JANUARY 1983 THROUGH
JUNE 1990

I hereby certify, pursuant to my authority as _____ and in accordance with Section 3006(b) of the Resource Conservation and Recovery Act, as amended by the Hazardous and Solid Waste Amendments of 1984 (42 USC 6901 et seq.), and 40 CFR 271 that in my opinion the laws of the State [Commonwealth] of _____ provide adequate authority to carry out the revised program set forth in the revised "Program Description" submitted by the [State Agency]. The specific authorities provided are contained in statutes or regulations lawfully adopted at the time this Statement is signed and which are in effect now [shall be fully effective by _____], as specified below. These authorities and this certification supplement [or supercede (and indicate how supercede)] the previously certified authorities described in my [or my predecessors] certification(s) of _____ (date or dates).

Please add an explanation of how the Revision Attorney General's Statement you are submitting relates to any prior Attorney General's Statements you have submitted.

I. IDENTIFICATION AND LISTING

A. State statutes and regulations contain lists of hazardous waste which encompass all wastes controlled under the following Federal regulations as indicated in the designated Revision Checklists:

- (1) Chlorinated aliphatic hydrocarbons, 40 CFR 261.31, Part 261 Appendices VII and VIII as amended February 10, 1984 [49 FR 5308], Revision Checklist 4.
- ¹ (2) OPTIONAL: This is a reduced requirement.] Warfarin and zinc phosphide listing, 40 CFR 261.33(e) and (f), as amended May 10, 1984 [49 FR 19923], Revision Checklist 7.
- (3) TDI, DNT and TDA wastes, 40 CFR 261.32, 261.33(f), and Part 261 Appendices III, VII and VIII as amended October 23, 1985 [50 FR 42936], Revision Checklist 18.
- (4) Spent solvents, 40 CFR 261.31, as amended December 31, 1985 [50 FR 53319] and January 21, 1986 [51 FR 2702], Revision Checklist 20.
- (5) EDB wastes, 40 CFR 261.32 and Part 261 Appendices II, III and VIII, as amended February 13, 1986 [51 FR 5330], Revision Checklist 21.

¹The phrase "OPTIONAL: This is a reduced requirement" is used to indicate provisions that either are less stringent or reduce the scope of the program. Any State which adopts an "optional" requirement must ensure that it is at least as stringent as the Federal requirement.

- (6) Four spent solvents, 40 CFR 261.31, 261.33(f), and Part 261 Appendices III, VII and VIII as amended February 25, 1986 [51 FR 6541], Revision Checklist 22.
- (7) [OPTIONAL: This is a reduced requirement.] Listing of spent pickle liquor from steel finishing operations, 40 CFR 261.32, as amended May 28, 1986 [51 FR 19320] and September 22, 1986 [51 FR 33612], Revision Checklist 26.
- (8) Listing of commercial chemical products and Appendix VIII constituents, 40 CFR 261.33 and Part 261 Appendix VIII, as amended August 6, 1986 [51 FR 28296], Revision Checklist 29; as amended July 10, 1987 [52 FR 26012], Revision Checklist 41; and as amended April 22, 1988 [53 FR 13382], Revision Checklist 46.
- (9) EBDC wastes, 40 CFR 261.32 and Part 261 Appendices III and VII, as amended on October 24, 1986 [51 FR 37725], Revision Checklist 33.
- (10) Listing of spent potliners from aluminum reduction (K088), 40 CFR 261.32 and Part 261 Appendix VII, as amended September 13, 1988 [53 FR 35412], Revision Checklist 53.
- (11) [OPTIONAL: This is a reduced requirement.] Generic delisting of iron dextran (CAS No. 9004-66-4), 40 CFR 261.33(f) and Part 261 Appendix VIII, as amended October 31, 1988 [53 FR 43878], Revision Checklist 56.
- (12) [OPTIONAL: This is a reduced requirement.] Generic delisting of strontium sulfide (CAS No. 1314-96-1), 40 CFR 261.33(e) and Part 261 Appendix VIII, as amended October 31, 1988 [53 FR 43881], Revision Checklist 57.
- (13) Listing of two wastes (K131 and K132) generated during the production of methyl bromide, 40 CFR 261.32 and 261 Appendices III and VII, as amended October 6, 1989 [54 FR 41402], Revision Checklist 68.
- (14) Listing of one generic category (F025) of waste generated during the manufacture of chlorinated aliphatic hydrocarbons by free radical catalyzed processes and amending F024, 40 CFR 261.31 and 261 Appendix VII; adding one toxicant to 261 Appendix VIII; as amended December 11, 1989 [54 FR 50968], Revision Checklist 69.
- (15) [OPTIONAL: This is a reduced requirement.] Amendment to the F019 hazardous waste listing to exclude wastewater treatment sludges from zirconium phosphating in aluminum can washing, when such phosphating is an exclusive conversion coating process, 40 CFR 261.31, as amended February 14, 1990 [55 FR 5340], Revision Checklist 72.
- (16) Listing of four wastes (K107-K110) generated during the production of 1,1-dimethylhydrazine (UDMH) from carboxylic acid hydrazides, 40 CFR 261.31 and Part 261 Appendices III and VII, as amended May 2, 1990 [55 FR 18496], Revision Checklist 75.

SPA 9

- (17) Listing of multisource waste (F039), 40 CFR 261.31 and Part 261 Appendix VII, as amended June 1, 1990 [55 FR 22520], Revision Checklist 78.

Federal Authority: RCRA §3001(b).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. State statutes and regulations define hazardous waste so as to control the generation, transportation, treatment, storage and disposal of hazardous waste produced by small quantity generators of between 100 and 1000 kilograms/month as indicated in Revision Checklist 23 (which supercedes prior amendments by Revision Checklist 17 A) and Revision Checklist 47 (providing technical corrections to Checklist 23). State statutes and regulations also require small quantity generators to certify good faith efforts to minimize waste generation and to select the best available and affordable treatment, storage or disposal alternatives, 40 CFR Part 262 as amended October 1, 1986 [51 FR 35190], Revision Checklist 32 (see Item IX below).

Federal Authority: RCRA §3001(d); 40 CFR Parts 260-263 and 270 as amended March 24, 1986 (51 FR 10146), October 1, 1986 (51 FR 35190), and July 19, 1988 (53 FR 27162).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

C. [This requirement applies only if States have a delisting mechanism. This requirement is NOT OPTIONAL for such States.] State statutes and regulations provide authority to delist hazardous waste as indicated in Revision Checklist 17 B.

- (1) State statutes and regulations require that before deciding to delist a waste, the State must consider whether any listing factor (including additional constituents) other than those for which the waste was listed would cause the waste to be hazardous.

Federal Authority: RCRA §3001(f)(1); 40 CFR 260.22 as amended July 15, 1985 (50 FR 28702) and June 27, 1989 (54 FR 27114).

(2) State statutes and regulations require that there be no new temporary delistings without prior notice and comment. All temporary delistings received before November 18, 1984 without the opportunity for public comment and full consideration of such comment, shall lapse if not made final by November 8, 1986.

Federal Authority: RCRA §3001(f)(2); 40 CFR 260.20(d) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

D. [OPTIONAL: This is a reduced requirement.] State statutes and regulations define hazardous waste so as to exclude waste pickle liquor sludge generated by lime stabilization, but only to the extent that such waste is excluded by 40 CFR 261.3(c)(2), as indicated in Revision Checklist 8.

Federal Authority: RCRA §3001; 40 CFR 261.3(c) as amended June 5, 1984 (49 FR 23284).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

E. [OPTIONAL: This is a reduced requirement.] State statutes and regulations define hazardous waste so as to not exclude household waste other than those household wastes excluded in 40 CFR 261.4(b)(1), as indicated in Revision Checklists 9 and 17 C.

Federal Authority: RCRA §3001; 40 CFR 261.4(b)(1) as amended November 13, 1984 (49 FR 44980) and July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

F. State statutes and regulations incorporate the most recent edition and updates to "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (SW-846) as indicated in Revision Checklists 11 and 35.

Federal Authority: RCRA §§2002, 3001; 40 CFR 260.11, 260.21 and 270.6(a) as amended December 4, 1984 (49 FR 47390) and March 16, 1987 (52 FR 8072).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

G. State statutes and regulations define solid wastes to include the hazardous components of radioactive mixed wastes, July 3, 1986 [51 FR 24504]. See State Program Advisory (SPA) #2.

Federal Authority: RCRA §§1004(27) and 3001(b).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

H. [OPTIONAL: This is a reduced requirement.] State statutes and regulations exempt (with certain limitations) waste samples used in small scale treatability studies from Subtitle C regulation as indicated in Revision Checklist 49.

Federal Authority: RCRA §3001; 40 CFR 260.10 and 261.4(e)&(f) as amended July 19, 1988 (53 FR 27290).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

I. State statutes and regulations exclude from the mining waste exemption the six wastes listed at 40 CFR 261.4(b)(7)(i) through 261.4(b)(7)(vi), as indicated in Revision Checklist 53.

Federal Authority: RCRA §3001(b); 40 CFR 261.4(b)(7) as amended September 13, 1988 (53 FR 35412).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

J. State statutes and regulations that:

1. provide final criteria to define Bevill-excluded mineral processing wastes, finalize the Bevill status of nine mineral processing waste streams, and list those mineral processing wastes subject to conditional retention as indicated in Revision Checklist 65.

Federal Authority: RCRA §3001(b); 40 CFR 261.3 and 261.4 as amended September 1, 1989 (54 FR 36592).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

2. remove five conditionally retained mineral processing wastes from the exemption from hazardous waste regulation under the Bevill exclusion, and amend the definitions of "beneficiation" and "designated facility" as indicated in Revision Checklist 71.

Federal Authority: RCRA §3001(b)(3)(A)(ii); 40 CFR 260.10 and 261.4(b)(7) as amended January 23, 1990 (55 FR 2322).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

K. State statutes and regulations incorporate 47 new testing methods as approved methods for use in meeting the regulatory requirements under Subtitle C of RCRA as indicated in Revision Checklists 67 and 73.

Federal Authority: RCRA §§3001, 3004, 3005, and 3006; 40 CFR 260.11 and Part 261 Appendix III as amended September 29, 1989 (54 FR 40260) and March 9, 1990 (55 FR 8948).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

L. State statutes and regulations revise the existing toxicity characteristic by replacing the Extraction Procedure (EP) leach test with the Toxicity Characteristic Leaching Procedure (TCLP) for identifying wastes that are defined as hazardous and subject to regulation under Subtitle C of RCRA as indicated in Revision Checklist 74. State statutes and regulations add 25 organic chemicals and their regulatory levels to the list of toxic constituents of concern as indicated in Revision Checklist 74.

Federal Authority: RCRA §§1006, 2002(a), 3001, 3002, 3004, 3005 and 3006; 40 CFR Parts 261, 264, 265 and 268 as amended March 29, 1990 (55 FR 11798), and June 29, 1990 (55 FR 26986).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

M. State statutes and regulations contain language to result in consistent interpretation of the criteria for listing wastes as hazardous under RCRA as indicated in Revision Checklist 76.

Federal Authority: RCRA §3001(a); 40 CFR 261.11(a)(3) as amended May 4, 1990 (55 FR 18726).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

N. State statutes and regulations add eight new testing methods related to air emission control to the section of regulations that incorporates these methods by reference as indicated in Revision Checklist 79.

Federal Authority: RCRA §§3001, 3004, 3005 and 3006; 40 CFR 260.11(a) as amended June 21, 1990 (55 FR 25454).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

II. DEFINITION OF SOLID WASTE

A. State statutes and regulations define hazardous waste and impose management standards so as to control all the hazardous waste controlled under 40 CFR Parts 261, 264, 265 and 266 as indicated in Revision Checklists 13 and 37.

Federal Authority: RCRA §§3001 and 3004; 40 CFR Parts 260, 261, 264, 265, and 266 as amended January 4, 1985 (50 FR 614), April 11, 1985 (50 FR 14216), August 20, 1985 (50 FR 33541) and June 5, 1987 (52 FR 21306).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

III. MANAGEMENT OF DIOXIN WASTES

A. State statutes and regulations contain the following requirements regarding dioxin wastes as indicated in Revision Checklist 14:

(1) Dioxin wastes are listed and otherwise identified as hazardous wastes so as to encompass all such wastes controlled under 40 CFR 261.5(e), 261.7(b), 261.30(d), 261.31, 261.33(f), and Part 261 Appendix X.

(2) Special management and permitting standards for facilities managing dioxin wastes and prohibitions applicable to permitted and interim status facilities, as provided in 40 CFR Parts 264, 265, and 270.

Federal Authority: RCRA §§3001 and 3004; 40 CFR Parts 261, 264, 265 and 270 as amended January 14, 1985 (50 FR 1978).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

IV. SATELLITE ACCUMULATION

A. [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow generators to accumulate at the site of generation, without a permit or interim status, as much as 55 gallons of hazardous waste or one quart of acutely hazardous waste provided that the generator complies with the requirements specified in §262.34(c) as indicated in Revision Checklist 12.

Federal Authority: RCRA §§2002, 3002, 3004 and 3005; 40 CFR 262.34(c) as amended December 20, 1984 (49 FR 49571).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

V. APPLICABILITY OF INTERIM STATUS STANDARDS

A. State statutes and regulations contain the following requirements regarding interim status standards as indicated in Revision Checklists 3 and 10:

- (1) Interim status standards apply to facilities identified in 40 CFR 265.1(b).

Federal Authority: RCRA §3004; 40 CFR Part 265 as amended November 22, 1983 (48 FR 52718) and November 21, 1984 (49 FR 46095).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

VI. PAINT FILTER TEST

A. State statutes and regulations require the use of a paint filter test to determine the absence or presence of free liquids in either a containerized or bulk waste as indicated in Revision Checklists 16, 17 F and 25.

Federal Authority: RCRA §§3004 and 3005; 40 CFR Parts 260, 264, 265, and 270 as amended April 30, 1985 (50 FR 18370), July 15, 1985 (50 FR 28702) and May 28, 1986 (51 FR 19176).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

VII. NATIONAL UNIFORM MANIFEST SYSTEM AND RECORDKEEPING

A. State statutes and regulations require generators to use the national uniform manifest as indicated in Revision Checklists 5 and 32.

Federal Authority: RCRA §§2002, 3002 and 3003; 40 CFR Parts 260 and 262 as amended March 20, 1984 (49 FR 10490) and October 1, 1986 (51 FR 35190).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. State statutes and regulations require that generators, of between 100 and 1000 kg/mo of hazardous waste, file an exception report in those instances where the generator does not receive confirmation of delivery of his hazardous waste to the designated facility as indicated in Revision Checklist 42.

Federal Authority: RCRA §§3001(d) and 3002(a)(5); 40 CFR Parts 262.42 and 262.44 as amended September 23, 1987 (52 FR 35894).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

C. State statutes and regulations require that the following be recorded, as it becomes available, and maintained in the operating record, until facility closure, as indicated in Revision Checklist 45: monitoring, testing or analytical data, corrective action where required by Subpart F and §§264.226, 264.253, 264.254, 264.276, 264.278, 264.280, 264.303, 264.309, 264.347, and 264.602.

Federal Authority: RCRA §§3004 and 3005; 40 CFR 264.73(b) as amended December 10, 1987 (52 FR 46946).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

D. [OPTIONAL: This is a reduced requirement.] State statutes and regulations include a burden disclosure statement with each uniform manifest form and renew the use of this form as indicated in Revision Checklist 58.

Federal Authority: RCRA §§2002, 3002, and 3003; 40 CFR 262.20 and Part 262 Appendix as amended November 8, 1988 (53 FR 45089).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

E. State statutes and regulations require that generators, who ship hazardous waste to a designated facility in an authorized state which has not yet obtained

authorization to regulate that particular waste as a hazardous waste, assure that the designated facility agrees to sign and return the manifest to the generator, and that any out-of-state transporter signs and forwards the manifest to the designated facility, as indicated in Revision Checklist 71.

Federal Authority: RCRA §§2002, 3002 and 3003; 40 CFR 262.23(e) as amended on January 23, 1990 (55 FR 2322).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

VIII. BIENNIAL REPORT

A. State statutes and regulations contain the following reporting requirements as indicated in Revision Checklists 1 and 30.

(1) The biennial report contains the information indicated in 40 CFR 262.41(a), 264.75 and 265.75.

(2) Facilities must submit groundwater monitoring data annually to the State Director as indicated in 40 CFR 265.94.

Federal Authority: RCRA §§3002 and 3004; 40 CFR Parts 262, 264 and 265 as amended January 28, 1983 (48 FR 3977) and August 8, 1986 (51 FR 28566).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

IX. WASTE MINIMIZATION

A. State statutes and regulations contain the following requirements regarding waste minimization as indicated in Revision Checklists 17 D, 30 and 32 (see Item I B above).

(1) Generators must submit report and manifest certifications regarding efforts taken to minimize the amounts and toxicity of wastes.

Federal Authority: RCRA §3002(a)(6), (b); 40 CFR 262.41, 264.75 and 265.75 as amended July 15, 1985 (50 FR 28702), August 8, 1986 (51 FR 28556) and October 1, 1986 (51 FR 35190).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(2) RCRA permits for the treatment, storage, or disposal of hazardous waste on the premises where the waste was generated must contain a certification by the permittee regarding efforts taken to minimize the amount and toxicity of the generated wastes.

Federal Authority: RCRA §3005(h); 40 CFR 264.70, 264.73 and 270.30(j)(2) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

X. LIQUIDS IN LANDFILLS

A. State statutes and regulations contain the following requirements regarding liquids in landfills as indicated in Revision Checklists 17 F and 25.

(1) Effective May 8, 1985, there is a ban on the placement of bulk or non-containerized liquid hazardous waste or hazardous waste containing free liquids in any landfill pursuant to 40 CFR 264.314 and 265.314 as amended July 15, 1985 and May 28, 1986.

(2) Effective November 8, 1985, there is a ban on the placement of non-hazardous liquids in landfills unless the owner or operator satisfies the criteria set forth in 40 CFR 264.314(e) and 265.314(f), as amended July 15, 1985 and May 28, 1986.

(3) For bulk or non-containerized liquid wastes or wastes containing free liquids they may be placed in a landfill prior to May 8, 1985, only if the requirements of 40 CFR 264.314(a) and 265.314(a) are met.

Federal Authority: RCRA §3004(c); 40 CFR 264.314, 265.314 and 270.21(h) as amended July 15, 1985 (50 FR 28702) and May 28, 1986 (51 FR 19176).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XI. GROUND-WATER MONITORING

A. State statutes and regulations provide that the §3004 groundwater monitoring requirements applicable to surface impoundments, waste piles, land treatment units and landfills shall apply whether or not such units are located above the seasonal high water table, have two liners and a leachate collection system or have liners that are periodically inspected, as indicated in Revision Checklist 17 I.

Federal Authority: RCRA §3004(p); 40 CFR 264.222, 264.252, 264.253, and 264.302 as amended July 15, 1985 (50 FR 28702).²

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. [OPTIONAL: This is a reduced requirement.] State statutes and regulations may allow variances from the ground-water monitoring requirements as provided in §3004(p). However, those variances must be restricted as provided in RCRA §3004(p) as indicated in Revision Checklist 17 I.

Federal Authority: RCRA §3004(p); 40 CFR 264.90(b) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

C. State statutes and regulations provide that with regard to ground-water monitoring, all land based hazardous waste treatment, storage, and disposal facilities analyze for a specified core list (Part 264, Appendix IX) of chemicals plus those chemicals specified by the Regional Administrator on a site-specific basis as indicated in Revision Checklist 40.

Federal Authority: RCRA §§1006, 2002(a), 3001, 3004, and 3005; 40 CFR Parts 264.98, 264.99, Part 264 Appendix IX and 270.14 as amended July 9, 1987 (52 FR 25942).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

D. State statutes and regulations specify statistical methods, sampling procedures, and performance standards that can be used in groundwater monitoring procedures to detect groundwater contamination at permitted hazardous waste facilities as indicated in Revision Checklist 55.

²Note that Revision Checklist 17 I reserved the cited sections of 40 CFR Part 264. Prior to Revision Checklist 17 I, these sections of code addressed exemptions from the Subpart F groundwater monitoring requirements.

SPA 9

Federal Authority: RCRA §§1006, 2002(a), 3004 and 3005; 40 CFR 264.91, 264.92, 264.97, 264.98 and 264.99 as amended October 11, 1988 (53 FR 39720).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XII. BURNING AND BLENDING OF HAZARDOUS WASTES

A. State statutes and regulations provide the following requirements:

(1) The burning of fuel containing hazardous waste in a cement kiln is prohibited as specified in 40 CFR 266.31 and Revision Checklist 17 J.

Federal Authority: RCRA §3004(q); 40 CFR 266.31 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(2) Fuels containing hazardous waste and all persons who produce, distribute and market fuel containing hazardous wastes must be regulated as indicated in Revision Checklists 17 J, 17 K, and 19.

Federal Authority: RCRA §§3004(q)-(s); 40 CFR 261.31 and 266.34 as amended July 15, 1985 (50 FR 28702) and November 19, 1986 (51 FR 41900).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. [OPTIONAL: This is a reduced requirement.] State statutes and regulations provide exceptions to the burning and blending of hazardous waste as specified in §§3004(q)(2)(A) and 3004(r)(2) & (3).

Federal Authority: RCRA §§3004(q)2(A) and 3004(r)(2) & (3).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XIII. CORRECTIVE ACTION

A. State statutes and regulations contain the following corrective action requirements as indicated in Revision Checklist 17 L:

(1) Corrective action is required for releases of hazardous waste or constituents from any solid waste management unit at a facility seeking a permit, regardless of when the waste was placed in the unit, in all permits issued after November 8, 1984.

Federal Authority: RCRA §3004(u); 40 CFR 264.90, 264.101, and 270.60 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(2) Corrective action is required beyond a facility's boundary, in accordance with RCRA §3004(v). (States now may impose these requirements through a permit or a corrective action order. Once EPA promulgates the regulations required by RCRA §3004(v), States will need authority to impose corrective action in a permit following the RCRA §3004(v) regulations.)

Federal Authority: RCRA §3004(v)(1).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(3) Corrective action is required beyond a facility's boundary in accordance with RCRA §3004(v) for all landfills, surface impoundments and waste pile units (including any new units, replacements of existing units or lateral expansions of existing units) which receive hazardous waste after July 26, 1982.

Federal Authority: RCRA §3004(v)(2).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(4) There is evidence of financial responsibility for corrective action on- and off-site.

Federal Authority: RCRA §§3004(a)(6); (u); 40 CFR 264.90 and 264.101 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. State statutes and regulations provide for additional information and engineering feasibility plan requirements regarding groundwater contamination detected at the time of Part B permit application as indicated in Revision Checklist 38.

SPA 9

Federal Authority: RCRA §§3004 and 3005; 40 CFR 270.14 as amended June 22, 1987 (52 FR 23447) and September 9, 1987 (52 FR 33936).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

C. State statutes and regulations require owners and operators of facilities seeking permits to provide descriptive information on the solid waste management units themselves and all available information pertaining to any releases from the units as indicated in Revision Checklist 44 A.

Federal Authority: RCRA §3004(u); 40 CFR 270.14 as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

D. State statutes and regulations require that owners and operators of hazardous waste treatment, storage and disposal facilities (including permit-by-rule facilities subject to 264.101) institute corrective action beyond the facility boundary to protect human health and the environment, unless the owner/operator is denied access to adjacent lands despite the owner/operator's best efforts, as indicated in Revision Checklist 44 B.

Federal Authority: RCRA §3004(v); 40 CFR 264.100(e) and 264.101(c), as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

E. State statutes and regulations contain the following corrective action requirements for injection wells as indicated in Revision Checklist 44 C.

(1) Hazardous waste injection wells now operating under RCRA interim status may retain interim status after issuance of a UIC permit. Until a RCRA permit or a RCRA "rider" to a UIC permit, which addresses Section 3004(u) corrective action, is issued, the well must comply with applicable interim status requirements imposed by §265.430, Parts 144.146 and 147, and any UIC permit requirements.

Federal Authority: RCRA §3004(u); 40 CFR 144.1(h) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(2) As part of the UIC permit process, available information regarding operating history and condition of the injection well must be submitted as well as any available information on known releases from the well or injection zone.

Federal Authority: RCRA §3004(u); 40 CFR 144.31(g) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(3) UIC facility owners/operators must submit certain information related to corrective action with their UIC applications.

Federal Authority: RCRA §3004(u); 40 CFR 270.60(b)(3) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

F. State statutes and regulations require that miscellaneous units comply with regulations (Subpart F) regarding releases from solid waste management units when necessary to comply with §§264.601 through 264.603 as indicated in Revision Checklist 45.

Federal Authority: RCRA §3004(u); 40 CFR 264.90(d) as amended December 10, 1987 (52 FR 46946).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XIV. HAZARDOUS WASTE EXPORTS

A. State statutes and regulations require generators and transporters of hazardous waste destined for export outside the United States to comply with standards equivalent to those as indicated in Revision Checklists 17 R, 31, and 48 (with the latter providing technical corrections to Checklist 31).

Federal Authority: RCRA §3017; 40 CFR 262.50 as amended July 15, 1985 (50 FR 28702), August 8, 1986 (51 FR 28664), and July 19, 1988 (53 FR 27164).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XV. STANDARDS FOR FACILITIES³

A. State statutes and regulations prohibit the land disposal of hazardous waste prohibited under 40 CFR Parts 264 and 265 as indicated in Revision Checklist 17 E. Land disposal includes, but is not limited to, placement in landfills, surface impoundments, waste piles, deep injection wells, land treatment facilities, salt dome and bed formations and underground mines or caves. Deep injection well means a well used for the underground injection of hazardous wastes other than a well to which §7010(a) of RCRA applies.

Federal Authority: RCRA §§3004(b)-(q); 40 CFR 264.18 and 265.18 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. Effective on November 8, 1984, State statutes and regulations prohibit the placement of any non-containerized or bulk liquid hazardous waste in any salt dome or salt bed formation any underground mine or cave except as provided in §264.18(c) and §265.18(c) as indicated in Revision Checklist 17 E. Furthermore, State statutes and regulations prohibit the placement of any other hazardous waste in such formations until a permit is issued.

Federal Authority: RCRA §3004(b); 40 CFR 264.18 and 265.18 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

C. State statutes and regulations prohibit the use of waste oil or other materials contaminated with hazardous wastes (except ignitable wastes) as a dust suppressant as indicated in Revision Checklist 17 G.

³This section contains all changes to the Federal RCRA program concerning facility standards except for those specifically related to groundwater monitoring. This latter group of facility standard changes are addressed by Section XI.

Federal Authority: RCRA §3004(1); 40 CFR 266.23 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

D. State statutes and regulations allow direct action by third parties against the insurer or guarantor of an owner/operator's financial responsibilities if an owner/operator is in bankruptcy reorganization or arrangement or where (with reasonable diligence) jurisdiction in any State or Federal Court cannot be obtained over an owner/operator likely to be solvent at time of judgment.

Federal Authority: RCRA §3004(t).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

E. State statutes and regulations require the permittee to take steps to minimize releases to the environment in accordance with 40 CFR Part 270.30(d) as indicated in Revision Checklist 2.

Federal Authority: RCRA §3005(c); 40 CFR Part 270 as amended September 1, 1983 (48 FR 39622).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

F. State statutes and regulations require that closure and post-closure requirements and special requirements for containers apply to interim status landfills as indicated in Revision Checklist 15.

Federal Authority: RCRA §3004; 40 CFR 265.310 and 265.315 as amended April 23, 1985 (50 FR 16044).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

G. State statutes and regulations require compliance with closure/post-closure and financial responsibility requirements applicable to owners and operators of hazardous waste treatment, storage and disposal facilities, as indicated in Revision Checklists 24, 36, and 45.

SPA 9

Federal Authority: RCRA §§3004 and 3005; 40 CFR Parts 260, 264, 265, and 270 as amended May 2, 1986 (51 FR 16422), March 19, 1987 (52 FR 8704) and December 10, 1987 (52 FR 46946).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

H. [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow qualified companies that treat, store or dispose of hazardous waste to use a corporate guarantee to satisfy liability assurance requirements as indicated in Revision Checklists 27 and 43.

Federal Authority: RCRA §§2002, 3004, and 3005; 40 CFR 264.147, 264.151, and 265.147 as amended July 11, 1986 (51 FR 25350) and November 18, 1987 (52 FR 44314).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

I. State statutes and regulations require companies that generate, treat or store hazardous waste in tanks to comply with tank standards equivalent to those indicated in Revision Checklists 28 and 52.

Federal Authority: RCRA §§1006, 2002, 3001 - 3007, 3010, 3014, 3017 - 3019 and 7004; 40 CFR Parts 260, 261, 262, 264, 265, and 270 as amended July 14, 1986 (51 FR 25422), August 15, 1986 (51 FR 29430) and September 2, 1988 (53 FR 34079).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

J. State statutes and regulations require environmental performance standards; monitoring, testing, analytical data, inspection, response and reporting procedures; and post-closure care for miscellaneous units as indicated in Revision Checklist 45.

Federal Authority: RCRA §§3004 and 3005; 40 CFR 264.600, 264.601, 264.602, and 264.603 as amended December 10, 1987 (52 FR 46946).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

K. [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow owners and operators of landfills, surface impoundments, or land treatment units, under limited circumstances, to remain open after the final receipt of hazardous wastes in order to receive non-hazardous wastes in that unit as indicated in Revision Checklist 64.

Federal Authority: RCRA §§1006, 2002(a), 3004, 3005 and 3006; 40 CFR 264.13, 264.112, 264.113, 264.142, 265.13, 265.112, 265.113, 265.142 and Appendix I to 270.42 as amended August 14, 1989 (54 FR 33376).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

L. State statutes and regulations require new and existing hazardous waste treatment, storage or disposal facilities to control organic air emissions from process vents and equipment leaks as indicated in Revision Checklist 79.

Federal Authority: RCRA §§1006, 2002, 3001-3007, 3010, 3014 and 7004; 40 CFR Parts 261, 264, 265 and 270 as amended June 21, 1990 (55 FR 25454).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XVI. REQUIREMENTS FOR PERMITS

A. [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow a facility (1) to construct an approved TSCA facility for burning PCBs without first obtaining a RCRA permit and (2) to subsequently apply for a RCRA permit in accordance with Revision Checklist 17 M.

Federal Authority: RCRA §3005(a); 40 CFR 270.10(f)(3) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. State statutes and regulations require review of land disposal permits every five years and modification of such permits as necessary to assure compliance with the requirements in Parts 124, 260 through 266, and 270, as indicated in Revision Checklist 17 N.

Federal Authority: RCRA §3005(c)(3); 40 CFR 270.41(a)(6) and 270.50(d) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

C. State statutes and regulations require permits to contain any conditions necessary to protect human health and the environment in addition to any conditions required by regulations as indicated in Revision Checklist 17 O.

Federal Authority: RCRA §3005(c)(3); 40 CFR 270.32(b) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

D. State statutes and regulations require that:

(1) For land disposal facilities granted interim status prior to 11/8/84, interim status terminates 11/8/85; unless a Part B application and certification of compliance with applicable groundwater monitoring and financial responsibility requirements are submitted by 11/8/85, as indicated in Revision Checklist 17 P.

Federal Authority: RCRA §3005(e); 40 CFR 270.73(c) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(2) For land disposal facilities in existence on the effective date of statutory or regulatory changes under this Act that render the facility subject to the requirement to have a permit and which is granted interim status, interim status terminates 12 months after the date the facility first becomes subject to such permit requirement unless a Part B application and certification of compliance with applicable groundwater monitoring and financial responsibility requirements are submitted by that date as indicated in Revision Checklist 17 P.

Federal Authority: RCRA §3005(e); 40 CFR 270.73(d) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(3) Interim status terminates for incinerator facilities on 11/8/89 unless the owner/operator submits a Part B application by 11/8/86 as indicated in Revision Checklist 17 P.

Federal Authority: RCRA §3005(c)(2)(C); 40 CFR 270.73(e) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(4) Interim status terminates for any facility other than a land disposal or an incineration facility on 11/8/92 unless the owner/operator submits a Part B application by 11/8/88 as indicated in Revision Checklist 17 P.

Federal Authority: RCRA §3005(c)(2)(C); 40 CFR 270.73(f) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

E. [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow facilities to qualify for interim status if they (1) are in existence on the effective date of statutory or regulatory changes that render the facility subject to the requirement to have a permit and (2) comply with §270.70(a) as indicated in Revision Checklist 17 P.

Federal Authority: RCRA §3005(e); 40 CFR 270.70(a) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

F. State statutes and regulations provide that facilities may not qualify for interim status under the State's analogue to Section 3005(e) if they were previously denied a Section 3005(c) permit or if authority to operate the facility has been terminated as indicated in Revision Checklist 17 P.

Federal Authority: RCRA §3005(c)(3); 40 CFR 270.70(c) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

G. [OPTIONAL]: This is a reduced requirement.] State statutes and regulations allow the issuance of a one-year research, development, and demonstration permit (renewable each year, but not for a period longer than three years) for any hazardous waste treatment facility which proposes an innovative and experimental hazardous waste treatment technology or process not yet regulated as indicated in Revision Checklist 17 Q. If adopted, however, the State must require the facility to meet RCRA's financial responsibility and public participation requirements and retain authority to terminate experimental activity if necessary to protect health or the environment.

Federal Authority: RCRA §3005(g); 40 CFR 270.65 as amended July 15, 1985 (50 FR 28702)

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

H. State statutes and regulations require landfills, surface impoundments, land treatment units, and waste piles that received waste after July 26, 1982 and which qualify for interim status to comply with the groundwater monitoring, unsaturated zone monitoring, and corrective action requirements applicable to new units at the time of permitting as indicated in Revision Checklist 17 L.

Federal Authority: RCRA §3005(i); 40 CFR 264.90(a) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

I. State statutes and regulations require:

(1) Surface impoundments in existence on November 8, 1984 [or subsequently becoming subject to RCRA pursuant to §3005(j)(6)(A) or (B)] to comply with the double liner, leachate collection, and groundwater monitoring requirements applicable to new units by November 8, 1988 [or the date specified in §3005(j)(6)(A) or (B)] or to stop treating, receiving, or storing hazardous waste, unless the surface impoundment qualifies for a special exemption under §3005(j).

Federal Authority: RCRA §3005(j)(6)(A).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(2) Surface impoundments to comply with the double liner, leachate collection and ground-water monitoring requirements if the Agency allows a hazardous waste prohibited from land disposal under §3004(d), (e) or (g) to be placed in such impoundments.

Federal Authority: RCRA §3005(j)(11).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

(3) [OPTIONAL: This is a reduced requirement.] State statutes and regulations may allow variances from the above requirements as provided in RCRA §3005(j)(2-9) and (13). However, the availability of such variances must be restricted as provided in RCRA §3005(j).

Federal Authority: RCRA §3005(j)(2-9).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

J. [OPTIONAL: This is a reduced requirement.] Facility owners or operators are given the opportunity to cure deficient Part A applications in accordance with 40 CFR 270.70(b) before failing to qualify for interim status as indicated in Revision Checklist 6.

Federal Authority: RCRA §3005; 40 CFR Part 270 as amended April 24, 1984 (49 FR 17716).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

K. State statutes and regulations allow the permit granting agency to initiate modifications to a permit without first receiving a request from the permittee, in cases where statutory changes, new or amended regulatory standards or judicial decisions affect the basis of the permit as indicated in Revision Checklist 44 D.

Federal Authority: RCRA §3005(c); 40 CFR 270.41(a)(3) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

L. State statutes and regulations require that permittees must comply with new requirements imposed by the land disposal restrictions promulgated under Part 268 even when there are contrary permit conditions, as indicated in Revision Checklist 44 E.

Federal Authority: RCRA §3006(g); 40 CFR 270.4(a) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

M. State statutes and regulations require information from permit applicants concerning permit conditions necessary to protect human health and the environment as indicated in Revision Checklist 44 F.

Federal Authority: RCRA §3005(c); 40 CFR 270.10 as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

N. State statutes and regulations require post-closure permits for all landfills, surface impoundments, waste piles and land treatment units receiving hazardous waste after July 26, 1982 as indicated in Revision Checklist 44 G.

Federal Authority: RCRA §3005(i); 40 CFR 270.1(c) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

O. State statutes and regulations require that all owners and operators of units that treat, store, or dispose of hazardous waste in miscellaneous units must comply with the general application requirements (including Part A permit requirements), the Part B general application requirements of §270.14, and specific Part B information requirements for miscellaneous units as indicated in Revision Checklists 45 and 59.

Federal Authority: RCRA §§3004 and 3005; 40 CFR 264.600, 270.14 and 270.23 as amended December 10, 1987 (52 FR 46946) and January 9, 1989 (54 FR 615).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

P. [OPTIONAL: This is a reduced requirement.] State statutes and regulations provide owners and operators more flexibility to change specified permit conditions, to expand public notification and participation opportunities, and allow for expedited approval if

no public concern exists for a proposed permit modification. Owner/operator permit modifications are categorized into three classes with administrative procedures for approving modifications established in each class. These changes are as indicated in Revision Checklist 54.

Federal Authority: RCRA §§2002(a), 3004, 3005, and 3006; 40 CFR Parts 124, 264, 265, and 270 as amended September 28, 1988 (53 FR 37912) and October 24, 1988 (53 FR 41649).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

Q. State statutes and regulations make it clear that existing incinerator facilities must either conduct a trial burn or submit other information as specified in 270.19(a) or (c) before a permit can be issued for that facility as indicated in Revision Checklist 60.

Federal Authority: RCRA §3005(b); 40 CFR Part 270 as amended January 30, 1989 [54 FR 4286).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

R. [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow greater flexibility to interim status facilities to make changes during interim status following Director approval as indicated in Revision Checklist 61.

Federal Authority: RCRA §§2002(a), 3004, 3005 and 3006; 40 CFR 270.72 as amended March 7, 1989 (54 FR 9596).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

S. [OPTIONAL: This is a reduced requirement.] State statutes and regulations lift the reconstruction limit for changes: 1) to certain interim status units necessary to comply with Federal, State, or local requirements, 2) necessary to allow continued handling of newly listed or identified hazardous waste, 3) made in accordance with an approved closure plan, and 4) made pursuant to a corrective action order as indicated in Revision Checklist 61.

Federal Authority: RCRA §§2002(a), 3004, 3005, and 3006; 40 CFR 270.72 as amended March 7, 1989 (54 FR 9596).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

T. [OPTIONAL: This is a reduced requirement.] State statutes and regulations that clarify that a permit can be denied for the active life of a facility while a decision on post closure permitting is pending as indicated in Revision Checklist 61.

Federal Authority: RCRA §§2002(a), 3004, 3005, and 3006; 40 CFR 124.1, 124.15, 124.19, 270.1, 270.10 and 270.29 as amended March 7, 1989 (54 FR 9596).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

U. [OPTIONAL: This is a reduced requirement.] State statutes and regulations that classify as Class 1 certain permit modifications requested by owners/operators necessary to enable permitted facilities to comply with the land disposal restrictions as indicated in Revision Checklist 61. Specifically these modifications include 1) adding restricted wastes treated to meet applicable 40 CFR Part 268 treatment standards or adding residues from treating "soft hammer" wastes, 2) adding certain wastewater treatment residues and incinerator ash, 3) adding new wastes for treatment in tanks or containers under certain limited conditions, and 4) adding new treatment processes, necessary to treat restricted wastes to meet treatment standards, that take place in tanks or containers.

Federal Authority: RCRA §§2002(a), 3004, 3005 and 3006; 40 CFR 270.42 as amended March 7, 1989 (54 FR 9596).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

V. State statutes and regulations revise 40 CFR Part 124 as indicated in Revision Checklist 70.

Federal Authority: RCRA §§6901 and 6902; 40 CFR 124.3, 124.5, 124.6, 124.10 and 124.12 as amended April 1, 1983 (48 FR 14146), June 30, 1983 (48 FR 30113), July 26, 1988 (53 FR 28118), September 26, 1988 (53 FR 37396) and January 4, 1989 (54 FR 246).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XVII. MINIMUM TECHNOLOGICAL REQUIREMENTS

A. State statutes and regulations require that new units, expansions, and replacements of interim status waste piles meet the requirements for a single liner and leachate collection system in regulations applicable to permitted waste piles as indicated in the Revision Checklist 17 H.

Federal Authority: RCRA §3015(a); 40 CFR 265.254 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. State statutes and regulation require:

(1) New units, expansions, and replacement units at interim status landfills and surface impoundments and landfills and surface impoundments for which Part B of the permit application is received by the proper authority after November 8, 1984, meet the requirements for double liners and leachate collection systems applicable to new permitted landfills and surface impoundments in 40 CFR 264.221 and 264.301 and 265.221 and 265.301 as indicated in Revision Checklists 17 H and 77.

Federal Authority: RCRA §§1006, 2002(a), 3004, 3005 and 3015(b); 40 CFR 264.221, 265.221, 264.301 and 265.301 as amended July 15, 1985 (50 FR 28702) and May 9, 1990 (55 FR 19262).

(2) [OPTIONAL: This is a reduced requirement.] Facilities which comply in good faith need not retrofit at permit issuance unless the liner is leaking as provided in §§265.221(e) and 265.301(e) as indicated in Revision Checklist 17 H.

Federal Authority: RCRA §3015(b); 40 CFR 264.221, 265.221 and 265.301 as amended July 15, 1985 (50 FR 28702).

(3) [OPTIONAL: This is a reduced requirement.] Variances from the above requirements are optional. However, the availability of such variances is restricted as provided in §§264.221(d) and (e), 264.301(d) and (e), 265.221(c) and (d), and 265.301(c) and (d) as indicated in Revision Checklist 17 H.

Federal Authority: RCRA §3015(b); 40 CFR 264.221, 265.221 and 265.301 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XVIII. EXPOSURE ASSESSMENTS

A. State laws and regulations require permit applicants for landfills or surface impoundments to submit exposure information as indicated in Revision Checklist 17 S.

Federal Authority: RCRA §3019(a); 40 CFR 270.10(j) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. State laws and regulations allow the State to make assessment information available to the Agency for Toxic Substances and Disease Registry. [See CERCLA §104(i).]

Federal Authority: RCRA §3019(b).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XIX. AVAILABILITY OF INFORMATION

A. State statutes and regulations provide that:

(1) All records shall be available to the public unless they are exempt from the disclosure requirements of the Federal FOIA, 5 U.S.C. 552;

(2) All nonexempt records will be available to the public upon request regardless of whether any justification or need for such records has been shown by the requestor;

(3) The same types of records would be available to the public from the State as would be available from EPA. [In making this certification, the Attorney General should be aware of the types of documents EPA generally releases under the FOIA, subject to claims of business confidentiality: permit applications; biennial reports from facilities; closure plans; notification of a facility closure; contingency plan incident reports; delisting petitions; financial responsibility instruments; ground-water monitoring data (note that exemptions 5 U.S.C.552(b)(9) of the FOIA applies to such wells as oil and gas, rather than to ground-water wells); transporter spill reports; international shipment reports; manifest exception, discrepancy and unmanifested waste reports; facility EPA identification numbers; withdrawal requests; enforcement orders; and, inspection reports]; and,

(4) Information is provided to the public in substantially the same manner as EPA as indicated in 40 CFR Part 2 and the Revision Checklist in Appendix N of the State Authorization Manual. [OPTIONAL: Where the State agrees to implement selected provisions through the use of a Memorandum of Agreement (MOA) the Attorney General must certify that: "The State has the authority to enter into and carry out the MOA

provisions and there are no State statutes (e.g., State Administrative Procedures Acts) which require notice and comment or promulgation of regulations for the MOA procedures to be binding.]

(5) [OPTIONAL: The State statutes and regulations protect Confidential Business Information (CBI) to the same degree as indicated in 40 CFR 2 and the Revision Checklist in Appendix N of the State Authorization Manual. Note, that States do not have to protect CBI, to satisfy 3006(f). However, if a State does extend protection to CBI then it cannot restrict the release of information that EPA would require to be disclosed.]

Federal Authority: RCRA §3006(f); 40 CFR §271.17(c).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XX. BURNING OF WASTE FUEL AND USED OIL FUEL IN BOILERS AND INDUSTRIAL FURNACES

A. State statutes and regulations contain the following requirements regarding the burning of waste fuel and used oil fuel for energy recovery in boilers and industrial furnaces as indicated in Revision Checklist 19:

(1) Waste fuels and used oil fuels are identified as solid wastes so as to encompass all such wastes controlled under 40 CFR 261.3, 261.5 and 261.6.

(2) Special management standards for generators, transporters, marketers and burners of hazardous waste and used oil burned for energy, as set forth in 40 CFR 264.340, 265.340, 266.30-35 and 266.40-44.

Federal Authority: RCRA §§3001, 3004 and 3014(a); 40 CFR Parts 261, 264, 265 and 266 as amended November 29, 1985 (50 FR 49164), November 19, 1986 (51 FR 41900) and April 13, 1987 (52 FR 11819).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. State statutes and regulations provide the authority to obtain criminal penalties for violations of the waste fuel and used oil fuel requirements, as set forth in 40 CFR 266.40-44.

Federal Authority: RCRA §§3006(h), 3008(d) and 3014; 40 CFR 271.16.

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XXI. LAND DISPOSAL RESTRICTIONS

A. State statutes and regulations provide for the restrictions of the land disposal of certain spent solvents and dioxin-containing hazardous wastes as indicated in Revision Checklists 34, 39, and 50.

Federal Authority: §3004(d)-(k) and (m); 40 CFR Parts 260, 261, 262, 263, 264, 265, 268 and 270 as amended on November 7, 1986 (51 FR 40572), June 4, 1987 (52 FR 21010), July 8, 1987 (52 FR 25760), and August 17, 1988 (53 FR 31138).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. State statutes and regulations for restricting the disposal of certain California list wastes, including liquid hazardous waste containing polychlorinated biphenyls (PCBs) above specified concentrations, and hazardous waste containing halogenated organic compounds (HOCs) above specified concentrations as indicated in Revision Checklists 39, 50, and 66.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR Parts 262, 264, 265, 268 and 270 as amended on July 8, 1987 (52 FR 25760), October 27, 1987 (52 FR 41295), August 17, 1988 (53 FR 31138), and September 6, 1989 (54 FR 36967).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

C. State statutes and regulations for specific treatment standards and effective dates for certain wastes from the "First Third" of the schedule of restricted wastes listed in 40 CFR 268.10 as well as land disposal restrictions for those First Third wastes for which a treatment standard is not established as indicated in Revision Checklists 50, 62 and 66.

Federal Authority: RCRA §3004 (d)-(k) and (m); 40 CFR Parts 264, 265, 266, and 268 as amended on August 17, 1988 (53 FR 31138), February 27, 1989 (54 FR 8264), May 2, 1989 (54 FR 18836), September 6, 1989 (54 FR 36967) and June 13, 1990 (55 FR 23935).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

D. State statutes and regulations for certain treatment standards and prohibition effective dates for certain Second Third wastes and for imposing the "soft hammer" provisions of 40 CFR 268.8 on Second Third wastes for which the Agency is not establishing treatment standards as indicated in Revision Checklist 63.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR Part 268 as amended June 23, 1989 (54 FR 26594).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

E. State statutes and regulations for treatment standards and effective dates for certain First Third "soft hammer" wastes as well as for certain wastes originally contained in the Third Third of the Schedule as indicated in Revision Checklist 63.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR Parts 264, 265 and 268 as amended June 23, 1989 (54 FR 26594).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

F. State statutes and regulations provide specific treatment standards and effective dates for the "Third Third" wastes, "soft hammer" First and Second Third wastes⁴, five newly listed wastes, certain mixed radioactive/hazardous wastes, characteristic wastes, and multi-source leachate, as well as establish revised treatment standards for petroleum refining hazardous wastes (K048-K052) as indicated in Revision Checklist 78.

Federal Authority: RCRA §§3001 and 3004 (d)-(k) and (m); 40 CFR 261, 262, 264, 265, 268, and 270 as amended June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

⁴ "Soft hammer" wastes are those wastes for which EPA did not promulgate treatment standards by their respective effective dates. These wastes could continue to be disposed of in a landfill or surface impoundment until May 8, 1990 if certain demonstrations were made and the technology requirements of RCRA §3004(o) were met. Other types of land disposal (e.g., underground injection) were not similarly restricted. On May 6, 1990, wastes for which EPA had not established treatment standards became prohibited from all types of land disposal. This latter requirement is referred to as the "hard hammer" provision and ended the soft hammer provisions which were in effect prior to May 6, 1990.

G. [OPTIONAL: This is a reduced requirement.] State statutes and regulations provide for alternate treatment standards for lab packs meeting certain criteria as indicated in Revision Checklist 78.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR 264.316(f), 265.316(f), 268.7(a)(7), 268.7(a)(8), 268.42(c), 268.42(c)(1)-(4), and Part 268 Appendices IV and V, as amended June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XXII. MEMORANDUM OF AGREEMENT (MOA)

[If the State uses the MOA to satisfy Federal procedural requirements, the Attorney General must certify the following:

- (1) The State has the authority to enter into the agreement,
- (2) The State has the authority to carry out the agreement, and
- (3) No applicable State statute (including the State Administrative Procedure Act) requires that the procedure be promulgated as a rule in order to be binding.]

of SAM Appendix J**

RCRA REVISION CHECKLIST 17 H

Double Liners

Note: Corrections were made to 264.221(c) and 264.301(c) by a May 9, 1990 (55 FR 19262; Revision Checklist 77) notice. This correction notice was based on a decision reached in the U.S. Court of Appeals for the District of Columbia on June 23, 1987 concerning a lawsuit filed against EPA. States which have not yet adopted the Revision Checklist 17 H provisions are encouraged to adopt the Revision Checklist 77 corrections when adopting the requirements addressed by Revision Checklist 17 H.

Revision Checklist 19

**The following version of Revision Checklist 19
should replace the Revision Checklist 19
of SAM Appendix J**

RCRA REVISION CHECKLIST 19

Burning of Waste Fuel and Used Oil Fuel
in Boilers and Industrial Furnaces

50 FR 49164-49211

November 29, 1985

as amended on April 13, 1987, at 52 FR 11819-11822
(HSA Cluster I)Special Note on the Use of This Checklist

Used oil fuel standards at §266.40-44 are delegable to State programs although used oil is not specifically listed as a hazardous waste pursuant to Section 3001 of RCRA. This is because these regulations are promulgated pursuant to (1) the Used Oil Recycling Act (§3014(a) of RCRA) which directs EPA to regulate recycled used oil even if it is not a hazardous waste, and (2) the Superfund Amendments and Reauthorization Act of 1986 (SARA §205(j) adding RCRA §3006(h)). SARA §205(j) provides for delegation to States for used oil recycling standards even if used oil is not a listed waste or identified as a hazardous waste.

A November 19, 1986 (51 FR 41900) Federal Register article did not affect the RCRA regulations. Instead it addressed issues surrounding the potential listing of disposed used oil as hazardous.

² Revision Checklist 13 introduced 266.36 addressing a conditional exemption for spent materials and by-products exhibiting a classification of hazardous waste. Revision Checklist 19 removed this section.

Revision Checklist 53

**The following version of Revision Checklist 53
should replace the current version
of this checklist in SAM Appendix J**

RCRA REVISION CHECKLIST 53 (AMENDED)

Identification and Listing of Hazardous Waste;
and Designation, Reportable Quantities, and Notification
53 FR 35412-35421
September 13, 1988
(Non-HSWA Cluster V)

Note: 1) The listing of K064, K065, K066, K090 and K091 was remanded by the U.S. Court of Appeals for the D.C. Circuit (American Mining Congress vs. the U.S. Environmental Protection Agency, 907 F. 2d 1179 (D.C. Cir. 1990)). As such, States are not required to list these wastes at this time. However, since these wastes have been removed from the 261.4(b)(7) exclusion, they may be brought under regulation as characteristic hazardous wastes, especially under the Toxicity Characteristic.

2) Revision Checklist 53 has generally been superseded by Revision Checklists 65 and 71, except for the K088 listing, spent potliners from primary aluminum reduction.

RCRA REVISION CHECKLIST 54

Permit Modifications for Hazardous Waste Management Facilities
 53 FR 37912-37942
 September 28, 1988
 as amended on October 24, 1988, at 53 FR 41649
 (Non-HSWA Cluster V)

Note: The standards addressed by this checklist are less stringent than existing Federal requirements; thus, authorized States are not required to adopt them. However, EPA strongly encourages States to adopt this permit modification rule as promulgated. If preferred, States may amend their programs to incorporate only selected portions of the rule. See 53 FR 37933-37934 for a discussion of this option.

Appendix I to § 270.42—Classification of Permit Modification

Modifications	Class.
A. General Permit Provisions	
1. Administrative and informational changes.....	1
2. Correction of typographical errors.....	1
3. Equipment replacement or upgrading with functionally equivalent components (e.g., pipes, valves, pumps, conveyors, controls).....	1
4. Changes in the frequency of or procedures for monitoring, reporting, sampling, or maintenance activities by the permittee:	
a. To provide for more frequent monitoring, reporting, sampling, or maintenance.....	1
b. Other changes.....	2
5. Schedule of compliance:	
a. Changes in interim compliance dates, with prior approval of the Director.....	1
b. Extension of final compliance date.....	3
6. Changes in expiration date of permit to allow earlier permit termination, with prior approval of the Director.....	1
7. Changes in ownership or operational control of a facility, provided the procedures of § 270.40(b) are followed.....	1
B. General Facility Standards	
1. Changes to waste sampling or analysis methods:	
a. To conform with agency guidance or regulations.....	1
b. Other changes.....	2
2. Changes to analytical quality assurance/control plan:	
a. To conform with agency guidance or regulations.....	1
b. Other changes.....	2
3. Changes in procedures for maintaining the operating record.....	1
4. Changes in frequency or content of inspection schedules.....	2
5. Changes in the training plan:	
a. That affect the type or decrease the amount of training given to employees.....	2
b. Other changes.....	1
6. Contingency plan:	
a. Changes in emergency procedures (i.e., spill or release response procedures).....	2
b. Replacement with functionally equivalent equipment, upgrade, or relocate emergency equipment listed.....	1
c. Removal of equipment from emergency equipment list.....	2
d. Changes in name, address, or phone number of coordinators or other persons or agencies identified in the plan.....	1

Note: When a permit modification (such as introduction of a new unit) requires a change in facility plans or other general facility standards, that change shall be reviewed under the same procedures as the permit modification.

RCRA REVISION CHECKLIST 54: Permit Modifications
for Hazardous Waste Management Facilities (cont'd)

FEDERAL REQUIREMENT	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
			EQUIVALENT	MORE STRINGENT	BROADER IN SCOPE

Modifications

C Ground-Water Protection

- 1 Changes to wells:
 - a Changes in the number, location, depth, or design of upgradient or downgradient wells of permitted ground-water monitoring system
 - b Replacement of an existing well that has been damaged or rendered inoperable, without change to location, design, or depth of the well
- 2 Changes in ground-water sampling or analysis procedures or monitoring schedule, with prior approval of the Director
- 3 Changes in statistical procedure for determining whether a statistically significant change in ground-water quality between upgradient and downgradient wells has occurred, with prior approval of the Director
- 4 Changes in point of compliance
- 5 Changes in indicator parameters, hazardous constituents, or concentration limits (including ACLs)
 - a As specified in the groundwater protection standard
 - b As specified in the detection monitoring program
- 6 Changes to a detection monitoring program as required by § 264.98(j), unless otherwise specified in this appendix
- 7 Compliance monitoring program:
 - a Addition of compliance monitoring program as required by §§ 264.98(h)(4) and 264.99
 - b Changes to a compliance monitoring program as required by § 264.99(k), unless otherwise specified in this appendix
- 8 Corrective action program:
 - a Addition of a corrective action program as required by §§ 264.99(i)(2) and 264.100
 - b Changes to a corrective action program as required by § 264.100(n), unless otherwise specified in this Appendix

D Closure

- 1 Changes to the closure plan:
 - a Changes in estimate of maximum extent of operations or maximum inventory of waste on-site at any time during the active life of the facility, with prior approval of the Director
 - b Changes in the closure schedule for any unit, changes in the final closure schedule for the facility, or extension of the closure period, with prior approval of the Director
 - c Changes in the expected year of final closure, where other permit conditions are not changed, with prior approval of the Director
 - d Changes in procedures for decontamination of facility equipment or structures, with prior approval of the Director
 - e Changes in approved closure plan resulting from unexpected events occurring during partial or final closure, unless otherwise specified in this appendix
- 2 Creation of a new landfill unit as part of closure
- 3 Addition of the following new units to be used temporarily for closure activities:
 - a Surface impoundments
 - b Incinerators
 - c Waste piles that do not comply with § 264.250(c)
 - d Waste piles that comply with § 264.250(c)
 - e Tanks or containers (other than specified below)
 - f Tanks used for neutralization, dewatering, phase separation, or component separation, with prior approval of the Director

E Post-Closure

- 1 Changes in name, address, or phone number of contact in post-closure plan
- 2 Extension of post-closure care period
- 3 Reduction in the post-closure care period
- 4 Changes to the expected year of final closure, where other permit conditions are not changed
- 5 Changes in post-closure plan necessitated by events occurring during the active life of the facility, including partial and final closure

F Containers

- 1 Modification or addition of container units:
 - a Resulting in greater than 25% increase in the facility's container storage capacity
 - b Resulting in up to 25% increase in the facility's container storage capacity
- 2
 - a Modification of a container unit without increasing the capacity of the unit
 - b Addition of a roof to a container unit without alteration of the containment system
- 3 Storage of different wastes in containers:
 - a That require additional or different management practices from those authorized in the permit
 - b That do not require additional or different management practices from those authorized in the permit

Note: See § 270.42(g) for modification procedures to be used for the management of newly listed or identified wastes.

- 4 Other changes in container management practices (e.g., aisle space, types of containers, segregation)

G Tanks

- 1
 - a Modification or addition of tank units resulting in greater than 25% increase in the facility's tank capacity, except as provided in G(1)(c) and G(1)(d) of this appendix
 - b Modification or addition of tank units resulting in up to 25% increase in the facility's tank capacity, except as provided in G(1)(d) of this appendix

RCRA REVISION CHECKLIST 54: Permit Modifications
for Hazardous Waste Management Facilities (cont'd)

FEDERAL REQUIREMENT	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
			EQUIVALENT	MORE STRINGENT	BROADER IN SCOPE

Modifications

- c Addition of a new tank that will operate for more than 90 days using any of the following physical or chemical treatment technologies: neutralization, dewatering, phase separation, or component separation.
- d Alter prior approval of the Director, addition of a new tank that will operate for up to 90 days using any of the following physical or chemical treatment technologies: neutralization, dewatering, phase separation, or component separation.
- 2 Modification of a tank unit or secondary containment system without increasing the capacity of the unit.
- 3 Replacement of a tank with a tank that meets the same design standards and has a capacity within + / - 10% of the replaced tank provided:
 - The capacity difference is no more than 1500 gallons.
 - The facility's permitted tank capacity is not increased, and
 - The replacement tank meets the same conditions in the permit.
- 4 Modification of a tank management practice.
- 5 Management of different wastes in tanks:
 - a That require additional or different management practices, tank design, different fire protection specifications, or significantly different tank treatment process from that authorized in the permit.
 - b That do not require additional or different management practices, tank design, different fire protection specifications, or significantly different tank treatment process than authorized in the permit.

Note: See § 270.42(g) for modification procedures to be used for the management of newly listed or identified wastes

H Surface Impoundments

- 1 Modification or addition of surface impoundment units that result in increasing the facility's surface impoundment storage or treatment capacity.
- 2 Replacement of a surface impoundment unit.
- 3 Modification of a surface impoundment unit without increasing the facility's surface impoundment storage or treatment capacity and without modifying the unit's liner, leak detection system, or leachate collection system.
- 4 Modification of a surface impoundment management practice.
- 5 Treatment, storage, or disposal of different wastes in surface impoundments:
 - a That require additional or different management practices or different design of the liner or leak detection system than authorized in the permit.
 - b That do not require additional or different management practices or different design of the liner or leak detection system than authorized in the permit.

Note: See § 270.42(g) for modification procedures to be used for the management of newly listed or identified wastes

I Enclosed Waste Piles. For all waste piles except those complying with § 264.250(c), modifications are treated the same as for a landfill. The following modifications are applicable only to waste piles complying with § 264.250(c).

- 1 Modification or addition of waste pile units:
 - a Resulting in greater than 25% increase in the facility's waste pile storage or treatment capacity.
 - b Resulting in up to 25% increase in the facility's waste pile storage or treatment capacity.
- 2 Modification of waste pile unit without increasing the capacity of the unit.
- 3 Replacement of a waste pile unit with another waste pile unit of the same design and capacity and meeting all waste pile conditions in the permit.
- 4 Modification of a waste pile management practice.
- 5 Storage or treatment of different wastes in waste piles:
 - a That require additional or different management practices or different design of the unit.
 - b That do not require additional or different management practices or different design of the unit.

Note: See § 270.42(g) for modification procedures to be used for the management of newly listed or identified wastes

J Landfills and Unenclosed Waste Piles

- 1 Modification or addition of landfill units that result in increasing the facility's disposal capacity.
- 2 Replacement of a landfill.
- 3 Addition or modification of a liner, leachate collection system, leachate detection system, run-off control, or final cover system.
- 4 Modification of a landfill unit without changing a liner, leachate collection system, leachate detection system, run-off control, or final cover system.
- 5 Modification of a landfill management practice.
- 6 Landfill different wastes:
 - a That require additional or different management practices, different design of the liner, leachate collection system, or leachate detection system.
 - b That do not require additional or different management practices, different design of the liner, leachate collection system, or leachate detection system.

Note: See § 270.42(g) for modification procedures to be used for the management of newly listed or identified wastes

K Land Treatment

- 1 Lateral expansion of or other modification of a land treatment unit to increase areal extent.
- 2 Modification of run-on control system.
- 3 Modify run-off control system.
- 4 Other modifications of land treatment unit component specifications or standards required in permit.
- 5 Management of different wastes in land treatment units:
 - a That require a change in permit operating conditions or unit design specifications.
 - b That do not require a change in permit operating conditions or unit design specifications.

Note: See § 270.42(g) for modification procedures to be used for the management of newly listed or identified wastes

- 6 Modification of a land treatment unit management practice to:
 - a Increase rate or change method of waste application.
 - b Decrease rate of waste application.

758

RCRA REVISION CHECKLIST 54: Permit Modifications
for Hazardous Waste Management Facilities (cont'd)

FEDERAL REQUIREMENT	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
			EQUIVALENT	MORE STRINGENT	BROADER IN SCOPE

Modifications

- | Modifications | Class |
|--|-------|
| 7. Modification of a land treatment unit management practice to change measures of pH or moisture content, or to enhance microbial or chemical reactions..... | 2 |
| 8. Modification of a land treatment unit management practice to grow food chain crops, to add to or replace existing permitted crops with different food chain crops, or to modify operating plans for distribution of animal feeds resulting from such crops..... | 3 |
| 9. Modification of operating practice due to detection of releases from the land treatment unit pursuant to § 264.278(g)(2)..... | 3 |
| 10. Changes in the unsaturated zone monitoring system, resulting in a change to the location, depth, number of sampling points, or replace unsaturated zone monitoring devices or components of devices with devices or components that have specifications different from permit requirements..... | 3 |
| 11. Changes in the unsaturated zone monitoring system that do not result in a change to the location, depth, number of sampling points, or that replace unsaturated zone monitoring devices or components of devices with devices or components having specifications different from permit requirements..... | 2 |
| 12. Changes in background values for hazardous constituents in soil and soil-pore liquid..... | 2 |
| 13. Changes in sampling, analysis, or statistical procedure..... | 2 |
| 14. Changes in land treatment demonstration program prior to or during the demonstration..... | 2 |
| 15. Changes in any condition specified in the permit for a land treatment unit to reflect results of the land treatment demonstration, provided performance standards are met, and the Director's prior approval has been received..... | 1 |
| 16. Changes to allow a second land treatment demonstration to be conducted when the results of the first demonstration have not shown the conditions under which the wastes can be treated completely, provided the conditions for the second demonstration are substantially the same as the conditions for the first demonstration and have received the prior approval of the Director..... | 1 |
| 17. Changes to allow a second land treatment demonstration to be conducted when the results of the first demonstration have not shown the conditions under which the wastes can be treated completely, where the conditions for the second demonstration are not substantially the same as the conditions for the first demonstration..... | 3 |
| 18. Changes in vegetative cover requirements for closure..... | 2 |

L. Incinerators

- | | |
|--|---|
| 1. Changes to increase by more than 25% any of the following limits authorized in the permit: A thermal feed rate limit, a waste feed rate limit, or an organic chlorine feed rate limit. The Director will require a new trial burn to substantiate compliance with the regulatory performance standards unless this demonstration can be made through other means..... | 3 |
| 2. Changes to increase by up to 25% any of the following limits authorized in the permit: A thermal feed rate limit, a waste feed limit, or an organic chlorine feed rate limit. The Director will require a new trial burn to substantiate compliance with the regulatory performance standards unless this demonstration can be made through other means..... | 2 |
| 3. Modification of an incinerator unit by changing the internal size or geometry of the primary or secondary combustion units, by adding a primary or secondary combustion unit, by substantially changing the design of any component used to remove HCl or particulate from the combustion gases, or by changing other features of the incinerator that could affect its capability to meet the regulatory performance standards. The Director will require a new trial burn to substantiate compliance with the regulatory performance standards unless this demonstration can be made through other means..... | 3 |
| 4. Modification of an incinerator unit in a manner that would not likely affect the capability of the unit to meet the regulatory performance standards but which would change the operating conditions or monitoring requirements specified in the permit. The Director may require a new trial burn to demonstrate compliance with the regulatory performance standards..... | 2 |
| 5. Operating requirements: | |
| a. Modification of the limits specified in the permit for minimum combustion gas temperature, minimum combustion gas residence time, or oxygen concentration in the secondary combustion chamber. The Director will require a new trial burn to substantiate compliance with the regulatory performance standards unless this demonstration can be made through other means..... | 3 |
| b. Modification of any stack gas emission limits specified in the permit, or modification of any conditions in the permit concerning emergency shutdown or automatic waste feed cutoff procedures or controls..... | 3 |
| c. Modification of any other operating condition or any inspection or recordkeeping requirement specified in the permit..... | 2 |
| 6. Incineration of different wastes: | |
| a. If the waste contains a POHC that is more difficult to incinerate than authorized by the permit or if incineration of the waste requires compliance with different regulatory performance standards than specified in the permit. The Director will require a new trial burn to substantiate compliance with the regulatory performance standards unless this demonstration can be made through other means..... | 3 |
| b. If the waste does not contain a POHC that is more difficult to incinerate than authorized by the permit and if incineration of the waste does not require compliance with different regulatory performance standards than specified in the permit..... | |

* Also see technical correction to the rule at 53 FR 41649 (October 24, 1988).

Note: See § 270.42(g) for modification procedures to be used for the management of newly listed or identified wastes.

7. Shakedown and trial burn:

- | | |
|--|---|
| a. Modification of the trial burn plan or any of the permit conditions applicable during the shakedown period for determining operational readiness after construction, the trial burn period, or the period immediately following the trial burn..... | 2 |
| b. Authorization of up to an additional 720 hours of waste incineration during the shakedown period for determining operational readiness after construction, with the prior approval of the Director..... | 1 |
| c. Changes in the operating requirements set in the permit for conducting a trial burn, provided the change is minor and has received the prior approval of the Director..... | 1 |
| d. Changes in the ranges of the operating requirements set in the permit to reflect the results of the trial burn, provided the change is minor and has received the prior approval of the Director..... | 1 |
| 8. Substitution of an alternate type of fuel that is not specified in the permit..... | 1 |

revise last sentence by omitting "as a minor modification"	270.62(b)(10)

† PERMITS FOR LAND TREATMENT DEMONSTRATIONS USING FIELD TEST OR LABORATORY ANALYSES

remove "as a minor modification"; add a new sentence on second phase of permit	270.63(d)(1)
remove phrase on minor modifications	270.63(d)(2)
remove paragraph	270.63(d)(3)

The Land Disposal Restrictions
Checklists - 34, 39, 50, 62, 63 and 66

The following versions of
Revision Checklists 34, 39, 50, 62, 63 and 66
should replace the current versions
of these checklists in SAM Appendix J

RCRA REVISION CHECKLIST 34

Land Disposal Restrictions
 51 FR 40572-40654
 November 7, 1986
 as amended on June 4, 1987, at 52 FR 21010-21018
 (HSA Cluster I)

Notes: 1) The following Part 268 sections are not delegable to States because of the national concerns which must be considered when decisions are made relative to them: 268.5 (case-by-case effective date extensions); 268.42(b) (application for an alternate treatment method); and 268.44 (variance from a treatment standard). The preamble (51 FR 40618) to the November 7, 1986 rule (the first LDR rule), addressed by this present checklist, clearly states that 268.5 is not delegable. The second LDR rule, called the California List Waste Rule (52 FR 25760, July 8, 1987; Revision Checklist 39), clarified that 268.42(b) and 268.44 are nondelegable. It also clarified the delegability of 268.6. "No migration" petitions under 268.6 will be handled by EPA, even though States may be authorized to grant these petitions in the future. States have the authority to grant such petitions under RCRA Section 3006 because such decisions do not require a national perspective as is the case for decisions under 268.5, 268.42(b), or 268.44. However, EPA has had few opportunities to implement the land disposal restrictions and expects to gain valuable experience and information from reviewing "no-migration" petitions.

2) In the past, the nondelegable sections/paragraphs of the LDR regulations have been omitted from the LDR checklists because States could not assume the authority for them. However, this procedure has led to confusion among the States on how to handle the sections/paragraphs in their code. For this reason, the Agency has decided to include these nondelegable sections on the LDR checklists. To differentiate these sections from the delegable portions of the LDR restrictions, asterisks precede (a single row) and follow (a double row) each non-delegable section. If States have already filled out a version of Revision Checklist 34 which does not include the nondelegable sections, they need not fill out a revised version containing these sections. This change in format was made only to improve clarity.

The Agency suggests that States incorporate the nondelegable portions of the LDR regulation into their regulations because this incorporation aids the regulated community in knowing that the extensions, exemptions and variances addressed by the nondelegable sections of code are available to them. It is essential, however, that States leave the terms "Administrator", "Federal Register" and "Agency" unchanged, i.e., States may not substitute analogous State terms for these Federal terms. Similarly, States incorporating by reference must be careful to exclude these sections from blanket substitutions of State terms for Federal terms. For a more complete discussion of issues surrounding nondelegable sections, see Appendix J of the State Authorization Manual (SAM).

3) Note that while 268.40 is delegable to States, "Administrator" in the following phrase "Approved by the Administrator under the procedures set for this in 268.42(b)" should not be replaced with an analogous State term because it is referring to decisions under 268.42(b). Such decisions will be made by the EPA Administrator.

RCRA REVISION CHECKLIST 34: Land Disposal Restrictions (cont'd)

4) Revision Checklist 50 (53 FR 31138, August 17, 1988) amends certain sections of code addressed by Revision Checklist 34, but does not affect the delegability outlined in the previous note. Other related checklists include Revision Checklist 62 (54 FR 18836, May 2, 1989), Revision Checklist 63 (54 FR 26594, June 23, 1989), Revision Checklist 66 (54 FR 36967, September 6, 1989), Revision Checklist 78 (55 FR 22520, June 1, 1990), and Revision Checklist 83 (56 FR 3864).

Federal/State approval; allowable modifications	270.42(o)(4)				

- ¹ Also see technical correction to the rule at 52 FR 21010 (June 4, 1987).
- ² The reference to "Administrator" near the end of this paragraph should not be replaced with an analogous State term. See Note 3 as the beginning of this checklist.
- ³ States need to add 270.42(o) only if they adopted an analog to 270.42 - Minor Modification of Permits - as part of their base program. Adoption of 270.42 is up to each State's discretion as it is not required under 271.14.

183

RCRA REVISION CHECKLIST 39

California List Waste Restrictions

52 FR 25760-25792

July 8, 1987

as amended on October 27, 1987, at 52 FR 41295-41296
(HWA Cluster II)

Notes: 1) The following Part 268 sections are not delegable to States because of the national concerns which must be examined when decisions are made relative to them: 268.5 (case-by-case effective date extensions); 268.42(b) (application for alternate treatment method); and 268.44 (variance from a treatment standard). "No migration" petitions under 268.6 will be handled by EPA, even though States may be authorized to grant such petitions in the future. States have the authority to grant such petitions under RCRA Section 3006 because such decisions do not require a national perspective, as is the case for decisions under 268.5, 268.42(b) or 268.44. However, EPA has had few opportunities to implement the land disposal restrictions and expects to gain valuable experience and information from reviewing "no-migration" petitions.

2) In the past, the nondelegable sections/paragraphs of the LDR regulations have been omitted from the LDR checklists because States could not assume the authority for them. However, this procedure has led to confusion among the States on how to handle the sections/paragraphs in their code. For this reason, the Agency has decided to include these nondelegable sections on the LDR checklists. To differentiate these sections from the delegable portions of the LDR restrictions, asterisks precede (a single row) and follow (a double row) each non-delegable section. If States have already filled out a version of Revision Checklist 39 which does not include the nondelegable sections, they need not fill out a revised version containing these sections. This change in format was made only to improve clarity.

The Agency suggests that States incorporate the nondelegable portions of the LDR regulation into their regulations. It is essential, however, that States leave the terms "Administrator", "Federal Register" and "Agency" unchanged, i.e., States may not substitute analogous State terms for these Federal terms. Similarly, States incorporating by reference must be careful to except these sections from blanket substitutions of State terms for Federal terms. For a more complete discussion of issues surrounding nondelagable sections, see Appendix J of the State Authorization Manual (SAM).

3) Note that while 268.40(b) is delegable to States, "Administrator" in the following phrase "approved by the Administrator under the procedures set forth in 268.42(b)" should not be replaced with an analogous State term because it is referring to decisions under 268.42(b) which will be made by the EPA Administrator.

4) Revision Checklist 50 (53 FR 31138, August 17, 1988) amends certain sections of code addressed by Revision Checklist 39, but does not affect the delegability outlined in the previous note. Other related Checklists include Revision Checklist 62 (54 FR 18836, May 2, 1989), Revision Checklist 63 (54 FR 26594, June 23, 1989), Revision Checklist 66 (54 FR 36967, September 6, 1989), Revision Checklist 78 (55 FR 22520, June 1, 1990), and Revision Checklist 83 (56 FR 3864, January 31, 1991).

APPENDIX III TO PART 268

add new appendix: HOC definition and list of HOCs regu- lated under 268.32	Appendix III				
---	--------------	--	--	--	--

In determining the concentration of HOCs in a hazardous waste for purposes of the §268.32 land disposal prohibition, EPA has defined the HOCs that must be included in the calculation as any compounds having a carbon-halogen bond which are listed in this Appendix (see §268.2). Appendix III to Part 268 consists of the following compounds: (For electronic version of checklist see 52 FR 25791.)

Volatiles

Bromodichloromethane
Bromomethane
Carbon Tetrachloride
Chlorobenzene
2-Chloro-1,3-butadiene
Chlorodibromomethane
Chloroethane
2-Chloroethyl vinyl ether
Chloroform
Chloromethane
3-Chloropropene
1,2-Dibromo-3-chloropropane
1,2-Dibromomethane
Dibromomethane
Trans-1,4-Dichloro-2-butene
Dichlorodifluoromethane
1,1-Dichloroethane

1,2-Dichloroethane
1,1-Dichloroethylene
Trans-1,2-Dichloroethene
1,2-Dichloropropane
Trans-1,3-Dichloropropene
cis-1,3-Dichloropropene
Iodomethane
Methylene chloride
1,1,1,2-Tetrachloroethane
1,1,2,2-Tetrachloroethane
Tetrachloroethene
Tribromomethane
1,1,1-Trichloroethane
1,1,2-Trichloroethane
Trichloroethene
Trichloromonofluoromethane
1,2,3-Trichloropropane
Vinyl chloride

FEDERAL REQUIREMENT	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
			EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE

SUBPART G - INTERIM STATUS

CHANGES DURING INTERIM STATUS					
no reconstructing; changes do not include tank/ container changes to comply with land disposal restrictions	270.72(e)				

- ¹ See amendment to rule at 52 FR 41295 (October 27, 1987).
- ² Note that the FR gives Subpart E, 262.51 as the citation for Farmers. This is not correct as the August 8, 1986 (51 FR 28664) final rule regarding exports changed this section and moved it to Subpart G, 262.70. This error was corrected at 53 FR 27164 (July 19, 1988).
- ³ The reference to "Administrator" near the end of this paragraph should not be replaced with an analogous State term. See note 3 at the beginning of this checklist.
- ⁴ Note that 270.42 is not required by 271.14. Thus, this optional change applies only to States that opted to include an analog to 270.42, i.e., Minor Modifications to Permits.

134

RCRA REVISION CHECKLIST 50

Land Disposal Restrictions for First Third

Scheduled Wastes

53 FR 31138-31222

August 17, 1988

as amended on February 27, 1989, at 54 FR 8264-8266
(HWA Cluster II)

Notes: 1) The "First Third" Scheduled Waste rule addressed by this checklist is the third in a series of rules restricting the land disposal of hazardous waste. Previous related checklists include Revision Checklist 34 (51 FR 40572; November 7, 1986) and Revision Checklist 39 (52 FR 25760; July 8, 1987). The First Third Scheduled Waste rule was subsequently modified by corrections at 54 FR 18836 (May 2, 1989), and 54 FR 36967 (September 6, 1989) addressed by Revision Checklist 62 and Revision Checklist 66, respectively. Also, related to this present checklist are the Second Third Scheduled Wastes (54 FR 26594, Revision Checklist 63); the Third Third Scheduled Wastes (55 FR 22520, Revision Checklist 78), and a correction to the Third Third Scheduled Wastes (56 FR 3864; Revision Checklist 83). On August 19, 1991 (56 FR 41164; Revision Checklist 95), the treatment standards for the K061 nonwastewater in the high zinc subcategory were revised and finalized. The treatment standards for these wastes were first promulgated by the First Third Scheduled Wastes rule.

2) The following Part 268 sections are not delegable to States because of the national concerns which must be examined when decisions are made relative to them: 268.5 (case-by-case effective date extensions); 268.42(b) (application for alternate treatment method); and 268.44 (variance from a treatment standard). "No migration" petitions under 268.6 will be handled by EPA, even though States may be authorized to grant such petitions in the future. States have the authority to grant such petitions under RCRA Section 3006 because such decisions do not require a national perspective, as is the case for decisions under 268.5, 268.42(b) or 268.44. However, EPA has had few opportunities to implement the land disposal restrictions and expects to gain valuable experience and information from reviewing "no-migration" petitions.

3) In the past, the nondelegable sections/paragraphs of the LDR regulations have been omitted from the LDR checklists because States could not assume the authority for them. However, this procedure has led to confusion among the States on how to handle the sections/paragraphs in their code. For this reason, the Agency has decided to include these nondelegable sections on the LDR checklists. To differentiate these sections from the delegable portions of the LDR restrictions, asterisks precede (a single row) and follow (a double row) each non-delegable section. If States have already filled out a version of Revision Checklist 50 which does not include the nondelegable sections, they need not fill out a revised version containing these sections. This change in format was made only to improve clarity.

The Agency suggests that States incorporate the nondelegable portions of the LDR regulation into their regulations. It is essential, however, that States leave the terms "Administrator", "Federal Register" and "Agency" unchanged, i.e., States may not substitute analogous State terms for these Federal terms. Similarly, States incorporating by reference must be careful to exclude these sections from blanket substitutions of State terms for Federal terms. For a more complete discussion of issues surrounding nondelegable sections, see Appendix J of the State Authorization Manual (SAM).

RCRA REVISION CHECKLIST 50: Land Disposal Restrictions for First Third Scheduled Wastes (cont'd)

4) Certain sections or paragraphs of the land disposal restrictions are not delegable, specifically §§268.5, 268.42(b) and 268.44. These continue to be nondelegable. With regard to §268.6, "no-migration" petitions, EPA will continue to handle these petitions at Headquarters although States may be authorized to grant these petitions in the future.

RCRA REVISION CHECKLIST 50: Land Disposal Restrictions for First Third Scheduled Wastes (cont'd)

FEDERAL REQUIREMENT	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
			EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
treatment standard for combinations of wastes with different treatment standards, must meet lowest standard	268.43(b)				

 Guidance note: 268.44 is NOT DELEGABLE. States should see Note 3 at the beginning of this checklist regarding how to incorporate this section into their code.

VARIANCE FROM A TREATMENT STANDARD

8 apply to Assistant Administrator of OSWER or delegated representative for site-specific variance from a treatment standard if specified conditions are appropriate; what applicant must demonstrate	268.44(h)				
260.20(b)(1)-(4) information must be included	268.44(i)				
Assistant Administrator or delegated representative may request additional information	268.44(j)				

RCRA REVISION CHECKLIST 50: Land Disposal Restrictions for First Third Scheduled Wastes (cont'd)

FEDERAL REQUIREMENT	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
			EQUIVALENT	MORE STRINGENT	BROADER IN SCOPE
if site-specific treatment standard variance then compliance with 268.7 waste analysis requirements	268.44(k)				
during application review process, compliance with land disposal restrictions once effective date for waste reached	268.44(l)				

SUBPART E - PROHIBITIONS ON STORAGE

PROHIBITIONS ON STORAGE OF RESTRICTED WASTES

add to end of paragraph "or a valid certification under 268.8"	268.50(d)				
--	-----------	--	--	--	--

- ¹ In this section, the language is clarified and requirements are added to reflect soft hammer certification and retention of records and to apply to storage facilities.
- ² Revise this section to reflect soft hammer wastes.
- ³ In this section, apply testing and recordkeeping analyses to First Third wastes and storage facilities and add notification requirements for soft hammer wastes.
- ⁴ Note that 268.8(d) has a typographical error. The reference to 263.33(f) should be 268.33(f).
- ⁵ Note that while 268.30(a)(introduction), 268.30(a)(1), and 268.30(a)(4) appear in the FR addressed by this checklist, they have not been changed by this FR. As such, 268.30(a)(1) and 268.30(a)(4) were not included in this checklist. An entry for the 268.30(a) introduction was included, however, to help clarify the modifications to 268.30(a).
- ⁶ For this section, revise applicability from facility-wide to unit and reschedule CERCLA and RCRA corrective action soil and debris dioxin-containing wastes prohibition from land disposal.

**RCRA REVISION CHECKLIST 50: Land Disposal Restrictions for First Third
Scheduled Wastes (cont'd)**

FEDERAL REQUIREMENT	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
			EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE

- ⁷ Note that the FR addressed by this checklist did not change 268.32(e)(1), even though it appears in the FR. Consequently, 268.32(e)(1) was not included in this checklist.
- ⁸ Note that Revision Checklist 66 (54 FR 36967; September 6, 1989) amended this paragraph replacing "Assistant Administrator of the Office of Solid Waste and Emergency Response" with "Administrator."

RCRA REVISION CHECKLIST 62

Land Disposal Restrictions Amendments to
 First Third Scheduled Wastes
 54 FR 18836-18838
 May 2, 1989
 (HSWA Cluster II)

Notes: 1) This checklist amends the First Third Scheduled Waste requirements made to Part 268 by Revision Checklist 50 (53 FR 31138, August 17, 1988). Revision Checklist 66 (54 FR 36968, September 6, 1989) corrects the cross references in 268.33(a) to certain revisions made by this present checklist. Also, EPA rescheduled all K015 and K063 nonwastewaters to the Third Third as part of the May 2 rule addressed by Revision Checklist 62. Revision Checklist 66 removes these wastes from 268.33(a). States are encouraged to adopt the corrections addressed by both Revision Checklists 62 and 66 at the same time the provisions addressed by Revision Checklist 50 are adopted. States already authorized for the Revision Checklist 50 provisions are encouraged to adopt the amendments and corrections addressed by Revision Checklists 62 and 66 as soon as possible.

2) This checklist does not affect any of the nondelegable sections of Part 268.

RCRA REVISION CHECKLIST 63

Land Disposal Restrictions for
Second Third Scheduled Wastes
54 FR 26594-26652
June 23, 1989
(HWSA Cluster II)

Notes: 1) This is the fifth in a series of checklists (i.e., Revision Checklists 34, 39, 50 and 62) addressing the land disposal restrictions. This present checklist (Revision Checklist 63) does not amend any of the presently nondelegable sections of code (268.5, 268.6, 268.42(b), and 268.44). Other checklists affecting the land disposal restrictions are Revision Checklists 66 (54 FR 36967; September 6, 1989), Revision Checklist 78 (55 FR 22520; June 1, 1990) and Revision Checklist 83 (56 FR 3864; January 21, 1991).

2) This checklist may be subject to change in the future. EPA's State Programs Branch is currently discussing the relationship of hazardous waste injection issues to the State authorization program. In question are the changes made to 40 CFR Part 148 by the final rule addressed by this checklist and whether they should be included in the checklist. This present checklist does not include these changes.

RCRA REVISION CHECKLIST 66

Land Disposal Restrictions; Correction to the
 First Third Scheduled Wastes
 54 FR 36967
 September 6, 1989
 as amended on June 13 1990, at 55 FR 23935
 (HWA Cluster II)

Notes: 1) This is a correction and clarification of 53 FR 31138 (August 17, 1988) and 54 FR 18836 (May 2, 1989) addressed by Revision Checklists 50 and 62 which cover the First Third Scheduled Wastes. As such, States which are not yet authorized for these checklists are encouraged to apply for Revision Checklist 66 at the same time the provisions in Revision Checklists 50 and 62 are applied for. States already authorized for Revision Checklists 50 and 62 requirements are encouraged to adopt the corrections addressed by Checklist 66 as quickly as possible.

2) The following Part 268 sections are not delegable to States because of the national concerns which must be examined when decisions are made relative to them: 268.5 (case-by-case effective date extensions); 268.42(b) (application for alternate treatment method); and 268.44 (variance from a treatment standard). "No migration" petitions under 268.6 will be handled by EPA, even though States may be authorized to grant such petitions in the future. States have the authority to grant such petitions under RCRA Section 3006 because such decisions do not require a national perspective, as is the case for decisions under 268.5, 268.42(b) or 268.44. However, EPA has had few opportunities to implement the land disposal restrictions and expects to gain valuable experience and information from reviewing "no-migration" petitions.

3) In the past, the nondelegable sections/paragraphs of the LDR regulations have been omitted from the LDR checklists because States could not assume the authority for them. However, this procedure has led to confusion among the States on how to handle the sections/paragraphs in their code. For this reason, the Agency has decided to include these nondelegable sections on the LDR checklists. To differentiate these sections from the delegable portions of the LDR restrictions, asterisks precede (a single row) and follow (a double row) each non-delegable section. If States have already filled out a version of Revision Checklist 66 which does not include the nondelegable sections, they need not fill out a revised version containing these sections. This change in format was made only to improve clarity.

The Agency suggests that States incorporate the nondelegable portions of the LDR regulation into their regulations because this incorporation aids the regulated community in knowing that the extensions, exemptions and variances addressed by the nondelegable sections of code are available to them. It is essential, however, that States leave the terms "Administrator", "Federal Register" and "Agency" unchanged, i.e., States may not substitute analogous State terms for these Federal terms. Similarly, States incorporating by reference must be careful to exclude these sections from blanket substitutions of State terms for Federal terms. For a more complete discussion of issues surrounding nondelagable sections, see Appendix J of the State Authorization Manual (SAM).

- 1 An error in the September 6, 1989 rule (54 FR 36967) makes it appear that the revisions to 268.8(a) include the removal of 268.8(a)(4). This was not the Agency's intent and 268.8(a)(4) remains in the Federal code as introduced by Revision Checklist 50.
- 2 See technical correction at 55 FR 23935, June 13, 1990.

The following pages should replace
pages 1 through 3 of SAM Appendix G.

APPENDIX G

Table G-1. List of Revision Checklists by Cluster

**Table G-2. Numerical Listing of Revision Checklists
and Corresponding Cluster**

Cluster Rule 51 FR 33712 (September 22, 1986)

TABLE G-1. LIST OF REVISION CHECKLISTS BY CLUSTER

Purpose of Table G-1: This table lists revision checklists by cluster and includes the Federal Register reference and date for each checklist as well as the due date for each cluster. States should use this table for guidance on the timeframes for submitting the program revisions represented by each checklist. For specific guidance on how the overall cluster system works, States should refer to the requirements incorporated as part of the Cluster Rule at 51 FR 33712 (September 22, 1986). For convenience, this rule has been included at the end of this appendix.

"Non-Checklist" Entries: In addition to the checklists, Table G-1 contains two types of entries:

- unnumbered, unbracketed entries--Many of these are "non-checklist" requirements which States must adopt. These are also organized by cluster and include: State availability of information, direct action (third party) against insurers, and radioactive mixed waste. The rest of the "unbracketed, unnumbered" entries are HSWA provisions that were subsequently dealt with by Revision Checklist 17--the HSWA Codification Rule. These have a reference to Revision Checklists 17 A - 17 S.
- numbers in parentheses, bracketed entries--These typically are corrections or amendments to a major final rule that were incorporated into the checklist for that major final rule. Thus, the parenthesized number is used to indicate that the listed rule (in brackets) is not the main rule for the indicated checklist. These corrected amendments are usually close enough in time to the initial final rule that the correction/amendment was included on the checklist for the initial rule, rather than develop a new checklist for the correction.

"Optional" Checklists are denoted by the "†" which precedes the checklist number. In an optional checklist, all changes represented by the checklist are less stringent than existing Federal code. Thus, States are not required to adopt these regulatory changes. However, if a State chooses to adopt similar provisions, they must be at least as stringent as the Federal requirements. Note that, in most cases, it will make sense for a State that adopts part of an optional checklist to adopt all of the provisions in that checklist. Also, technical corrections which are included on "optional checklists" with numbers in parentheses (see "non-checklist-entries") are not marked as optional because, if a State chooses to adopt that checklist, the technical corrections included on that checklist are not optional. The reference to the checklist within the entry indicates whether or not the overall checklist is optional.

In regard to checklists that contain both required and optional provisions, the State need not adopt the less stringent requirements. For further information on optional provisions, see the discussion in Appendix J, p. 4.

Updates: Table G-1 will be updated semiannually by the State Program Advisories providing new revision checklists.

**TABLE G-2. NUMERICAL LISTING OF REVISION CHECKLISTS
AND CORRESPONDING CLUSTER**

Purpose of Table G-2: This table lists the revision checklists numerically. Also listed is the cluster for each checklist. This table was developed as a quick reference for determining which cluster a checklist is in. Previously, a table similar to Table G-1 listing the revision checklists by cluster was used for this information. However, as the number of revision checklists has grown, that table has become too lengthy to use efficiently for this information.

Placement of Checklists in Each Cluster: For information on how a checklist is placed in a cluster, see the discussion above for Table G-1.

Optional Checklists: See the discussion for Table G-1.

Updates: Table G-2 will be updated semiannually by the State Program Advisories providing new revision checklists.

APPENDIX X TO PART 261

METHOD OF ANALYSIS FOR CHLORINATED DIBENZO-P-DIOXINS AND -DIBENZOFURANS

analytical procedure to measure concentration of chlorinated dibenzo-p-dioxins and dibenzofurans in chemical wastes	14	Appendix X				
---	----	------------	--	--	--	--

- 1 Paragraph 261.2(a)-(e) originally appeared on Base Program Checklist I A, but Revision Checklist 13 completely superseded the original code.
- 2 The list of excluded wastes from the processing of ores and minerals, currently represented by 261.4(b)(7)(i)-(xx) as per Revision Checklist 71, has undergone extensive formatting changes over time. Checklist I A addressed a fairly short list of wastes numbered 261.4(b)(7)(i)-(vi). Revision Checklist 65 made significant changes in that 261.4(b)(7)(i)(A)-(E) represented five wastes retained under the exclusion, and 261.4(b)(7)(ii)(A)-(T) represented twenty wastes conditionally retained under the exclusion. Citations numbered (b)(7)(iii)-(vi) were omitted at that point in time. Finally, Revision Checklist 71 resulted in a list of 20 wastes retained under the exclusion, numbered 261.4(b)(7)(i)-(xx). Therefore, the references to Checklists I A and 65 in Column 2 are relevant only insofar as the numbering format of the Federal RCRA citations are concerned, as opposed to the text of the citations. Many of the wastes addressed by Revision Checklist 65 under paragraphs (i) and (ii) are addressed in paragraphs (i)-(xx) in Revision Checklist 71.
- 3 States do not have to include this subpart as long as they regulate all of the wastes which are listed by EPA or determined to be hazardous by the characteristics given in Subpart C of 40 CFR Part 261.

CONSOLIDATED CHECKLIST C2: Identification
and Listing of Hazardous Waste (cont'd)

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE

- 4 The title of this section was changed by Revision Checklist 74 from "CHARACTERISTIC OF EP TOXICITY" to "TOXICITY CHARACTERISTIC."
- 5 Revision Checklist 74 replaced the EP toxicity test procedures in this appendix with the toxicity characteristic leaching procedures.

uniform hazardous waste manifest form; instructions	*5, 17 D, 31,32,58	Appendix				
---	--------------------	----------	--	--	--	--

- 1 This section appeared in Base Program Checklist II but was completely reorganized and reworded by Revision Checklist 5.
- 2 Note that 262.34(d)(1)-(4) was originally introduced by Revision Checklist 23. Revision Checklist 28 added a new 262.34(d)(3) and redesignated 262.34(d)(3) and (4) as 262.34(d)(4) and (5).
- 3 This requirement appeared in the original program addressed by Base Program Checklist II as 262.41(a)(6).
- 4 This subpart appeared in the original program addressed by Base Program Checklist II (amended by Revision Checklist 5 and 17 R) as "Special Conditions". However Revision Checklist 31 (51 FR 28664, August 8, 1986) completely changed this subpart renaming it "Exports of Hazardous Waste".

SPA 9

CONSOLIDATED CHECKLIST C3: Standards Applicable
to Generators of Hazardous Waste (cont'd)

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE

- 5 Special Notes: (1) States cannot assume the authority to receive "Notifications of Intent to Export." In addition, States are not authorized to transmit such information to foreign countries through the Department of State or to transmit "Acknowledgements of Consent" (see 50 FR 28678 (August 8, 1986) and the instructions to Appendix J of the Revised SAM for further clarification). (2) Hazardous waste, identified or listed by the State as part of its authorized program which are broader in scope (not in the Federal universe), will not be subject to the export regulations.
- 6 Note that 262.51 was incorrectly changed to "Farmers" at 52 FR 25760 (July 8, 1987); however, this error was caught when the Revision Checklist (39) for this rule was developed and it was not incorporated into this checklist. This section was subsequently moved back to its correct place and the appropriate 262.51 put back into the CFR by the final rule (53 FR 27164, July 19, 1988) addressed by Revision Checklist 48.

CONSOLIDATED CHECKLIST C5

Standards for Owners and Operators of Hazardous Waste
Treatment, Storage, and Disposal Facilities
40 CFR Part 264 as of June 30, 1990

Note: Several sections of Part 264, Subpart H, were revised by the September 1, 1988 final rule (53 FR 33938, i.e., reserved Revision Checklist 51), entitled "Standards Applicable to Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities; Liability Coverage." Pursuant to the settlement agreement resulting from litigation surrounding this rule, EPA will be amending this rule in the future. States should not incorporate changes made by the September 1, 1988 rule until the amendments are promulgated, even though the changes were incorporated in the 1989 and the 1990 Code of Federal Regulations (CFR) when they were published by the Office of the Federal Register. Paragraphs that were changed, removed, or renumbered by the September 1, 1988 rule are marked with an "V" in this consolidated checklist. Because the September 1988 rule is the only rule since July 1, 1988 to affect these specific paragraphs, States may use the text of the 1988 CFR as guidance in modifying such paragraphs or in assessing their equivalency with Federal code. In addition to the changes to existing paragraphs, the September 1, 1988 rule inserted the following new paragraphs: 264.141(h), 264.147(a)(4)-(7), 264.147(b)(5)-(7), 264.147(h)-(j), and 264.151(k)-(m). These paragraphs will not be added to Consolidated Checklist C5 until the amendments to the rule are published. The following paragraphs were revised by Revision Checklist 51: 264.147(a); 264.147(a)(2)&(3); 264.147(b), (b)(2), (b)(3) and (b)(4); 264.147(g), (g)(1), and (g)(2); and 264.151(b)&(g)-(j). Revision Checklist 51 removed and reserved 264.147(g)(1)(i) and redesignated 264.147(h) as 264.147(k).

				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
front of the subsequent revision checklist number(s) if such subsequent changes are less stringent than or reduce the scope of the unit's requirements.						
16						Revision Checklist 64 redesignated a portion of 264.112(d)(2), introduced into the code by Revision Checklist 24, as 264.112(d)(2)(i).
17						Text from 264.118(a)(1)-(3) in Checklist IV A was moved to 264.118(b)(1)-(3) by Revision Checklist 24.
18						Part of the current text in this paragraph was introduced by Revision Checklist 24 while the remainder reflects the content of portions of 264.118(b)(3) in the base program.
19						Most of 264.118(d), including all subparagraphs, is code introduced by Revision Checklist 24. The introductory paragraph of 264.118(d), however, corresponds roughly to 264.118(c) in Checklist IV A.
20						Revision Checklist 24 extensively revised 264.119 as per Checklist IV A, including a new section title. The original code contained no subparagraphs.
21						Text from 264.120(a) in Checklist IV A was moved to 264.119(b)(1) and (b)(1)(i)-(iii) by Revision Checklist 24.
22						Text from 264.120(b) in Checklist IV A was moved to 264.119(c) by Revision Checklist 24.
23						The current text of 264.120 was introduced by Revision Checklist 24 whereas the original text of 264.120, as per Checklist IV A, was moved to 264.119(b) and (c) by Revision Checklist 24.
24						In Checklist IV A, this text was included in 264.142(a).
25						Although not included in Checklist IV A, the text of the current 264.147(h) was included in the base program as 264.147(g). This paragraph was moved by Revision Checklist 27.
26						In the base program, the content of this 264.190 introductory paragraph was located at 264.190(a).
27						Revision Checklist 28 completely revised this base program (Checklist IV A) paragraph.
28						Revision Checklist 28 completely reorganized and revised the regulations pertaining to tank systems which originally appeared in Checklist IV A at 264.191 through 264.197. Also, Revision Checklist 28 deletes 264.200, a section previously originated by Revision Checklist 14.
29						Paragraphs 264.221(f), (g), and (h) were redesignated as such by Revision Checklist 17 H. These paragraphs were originally designated as 264.221(c), (d), and (e), respectively, by Checklist IV A.

Hazardous Waste Treatment, Storage, and Disposal Facilities (cont'd)**

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
30						
Revision Checklist 17 I affected this subparagraph by removing the original 264.226(b)(3) and redesignating the original 264.226(b)(4) as (b)(3).						
31						
Revision Checklist 17 I affected this paragraph by removing the original 264.228(b)(2) and redesignating 264.228(b)(3) and (b)(4) as (b)(2) and (b)(3), respectively.						
32						
The old 264.254(b)(2) was removed by Revision Checklist 17 I. 264.254(b)(3) and (4) were also redesignated as 264.254(b)(2) and (3) by this checklist.						
33						
This variance was introduced by Revision Checklist 17 H. If a State chooses to adopt this optional provision at 264.301(e), it must adopt <u>all</u> of the requirements of 264.301(e)(1)-(4).						
34						
These paragraphs were originally 264.301(c), (d), (e), (f) and (g) on Checklist IV A. Revision Checklist 17 H redesignated them as 264.301(f), (g), (h), (i) and (j).						
35						
The old 264.303(b)(2) from Checklist IV B was removed by Revision Checklist 17 I. 264.303(b)(3) and (4) were then redesignated by this checklist as 264.303(b)(2) and (3).						
36						
Revision Checklist 17 I removed the old 264.310(b)(2) of Checklist IV A and redesignated 264.310(b)(3), (4), (5), and (6) as 264.310(b)(2), (3), (4) and (5).						
37						
Revision Checklist 17 F redesignated the old 264.314(b) of Checklist IV A as 264.314(d) and added a new 264.314(b). The redesignation is optional.						
38						
This code is part of the optional requirements for the alternate treatment standards for lab packs under the Third Third Scheduled Waste Rule. If adopted, all of the requirements (i.e., 264.316(f), 265.316(f), 268.7(a)(7), 268.7(a)(8), 268.42(c), 268.42(c)(1)-(4), and Appendices IV and V to Part 268) related to these alternate treatment standards must be adopted.						

CONSOLIDATED CHECKLIST C6

Interim Status Standards for Owners and Operators of Hazardous Waste
Treatment, Storage, and Disposal Facilities
40 CFR Part 265 as of June 30, 1990

Note: Several sections of Part 265, Subpart H, were revised by the September 1, 1988 final rule (53 FR 33938, i.e., reserved Revision Checklist 51) entitled "Standards Applicable to Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities; Liability Coverage." Pursuant to the settlement agreement resulting from litigation surrounding this rule, EPA will be amending this rule in the future. States should not incorporate changes made by the September 1, 1988 rule until the amendments are promulgated, even though the changes were incorporated in the 1989 and the 1990 Code of Federal Regulations (CFR) when they were published by the Office of the Federal Register. Paragraphs that were changed, removed, or renumbered by the September 1, 1988 rule are marked with a "∇" in this consolidated checklist. Because the September 1988 rule is the only rule since July 1, 1988 to affect these specific paragraphs, States may use the text of the July 1, 1988 CFR as guidance in modifying such paragraphs or in assessing their equivalency with Federal code. In addition to the changes to existing paragraphs, the September 1, 1988 rule inserted the following new paragraphs: 265.141(h), 265.147(a)(4)-(7), 265.147(b)(5)-(7), and 265.147(h)-(j). These paragraphs will not be added to Consolidated Checklist C5 until the amendments to the rule are published. The following paragraphs were revised by Revision Checklist 51: 265.147(a), 265.147(a)(2)&(3), 265.147(b), 265.147(b)(2)-(4), 265.147(g)&(g)(1) and 265.147(g)(2)(i)&(ii). Revision Checklist 51 removed and reserved 265.147(g)(1)(ii) and redesignated the old 264.147(h) as 264.147(k).

∇ This paragraph was affected by Revision Checklist 51 (September 1, 1988; 53 FR 33938) which was withheld by EPA. See note at the beginning of this checklist for explanation.

- 1 This subsection was modified by 50 FR 28702, the final rule addressed by Revision Checklists 17 A - 17 S, but was not included in these checklists.
- 2 Revision Checklist 54 removed the comment following 265.54(e).
- 3 This requirement was moved from 265.75(h) to 265.75(j) by Revision Checklist 30.
- 4 265.110(b) was added by Revision Checklist 24. It was amended by Revision Checklist 28 to read as 265.110(b)(3) presently reads. Revision Checklist 52 added a new 265.110(b)(2), redesignating the old 265.110(b)(2) as 265.110(b)(3). Interestingly, the wording of the 265.110(b)(2) added by Revision Checklist 52 is the same as the wording of the 265.110(b)(2) added by Revision Checklist 24.
- 5 Revision Checklist 24 significantly revised the 265.112 section. Much of the original code (Base Program Checklist IV B) survived but was modified and also moved to different paragraphs/subparagraphs by Revision Checklist 24. Thus, when IV B appears in the Checklist Reference column for any of the 265.112 citations, it more times than not indicates that the text of those citations is relevant to Checklist IV B while the actual citation number is not. For example, IV B appears as a checklist reference for 265.112(b)(4), (6) and (7), yet paragraph 265.112(b) was not broken down into subparagraphs (1)-(7) in code relevant to Checklist IV B. Footnotes at the paragraph level will indicate where the code appeared under the old formatting as per Base Program Checklist IV B.

2095

CONSOLIDATED CHECKLIST C6: Interim Status Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities (cont'd)

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
6						
<p>Many of the current requirements of 265.112(b) and (b)(1)-(b)(7), as designated and modified by Revision Checklist 24, were part of the base program at 265.112(a) and (a)(1)-(4). States which do not adopt the optional (less stringent) requirement at 265.112(b)(7) must be careful to retain the closure plan requirement for "an estimate of the expected year of closure" as first introduced into the base program as a portion of 265.112(a)(4).</p>						
7						
<p>Part or all of the text of the following citations was introduced into the code at 265.112(b) as per Base Program Checklist IV B: 265.112(c), (c)(1), (c)(1)(i)-(ii), and (c)(2). Revision Checklist 24 modified this text and moved it from paragraph (b) to paragraph (c).</p>						
8						
<p>Revision Checklist 24 designated the citations within the double lines as optional revisions (265.112(d)(1)-(d)(4)). Similar, more stringent and nonoptional provisions originated in the code at 265.112(c), (c)(1), (c)(2), and (d) as per Base Program Checklist IV B. If States choose to adopt the 265.112(d)(1)-(d)(4) optional provisions as per Revision Checklist 24, they must adopt them as a unit rather than by individual provision. In other words, all or none of the (d)(1)-(d)(4) provisions must be included in a State's code. The only exception for adopting States is the optional revisions subsequently made by Revision Checklist 64. These subsequent changes are less stringent than those addressed by Revision Checklist 24, so States may or may not make those changes. If a State chooses not to adopt the Revision Checklist 24 optional provisions, it must retain code equivalent to that found in the base program at 265.112(c), (c)(1), (c)(2), and (d).</p>						
9						
<p>Citations within the double lines are optional, but if a State chooses to modify its program to adopt requirements equivalent to these provisions, it must adopt such requirements as a unit rather than by individual provision. In other words, all or none of these provisions must be included in a State's code. Subsequent changes to these provisions may or may not be optional for States that have adopted the original unit of provisions. An optional sign appears in front of the subsequent revision checklist number(s) if such subsequent changes are less stringent than or reduce the scope of the original requirements.</p>						
10						
<p>Text from 265.118(a)(1-3) in Base Program Checklist IV B was moved to 265.118(c)(1-3) by Revision Checklist 24.</p>						
11						
<p>Text from 265.118(b) and (e) in Base Program Checklist IV B was moved to 265.118(d)(1-2) by Revision Checklist 24.</p>						
12						
<p>Text from 265.118(c)(1-2) in Base Program Checklist IV B was moved to 265.118(e)(1-2) by Revision Checklist 24.</p>						
13						
<p>Text from 265.118(d) in Base Program Checklist IV B was moved to 265.118(f) by Revision Checklist 24.</p>						
14						
<p>Text from 265.118(f)(1-2) in Base Program Checklist IV B was moved to 265.118(g)(1-2) by Revision Checklist 24.</p>						
15						
<p>Revision Checklist 24 extensively revised 265.119 as per Base Program Checklist IV B, including a new section title. The original code contained no subparagraphs.</p>						

**CONSOLIDATED CHECKLIST C6: Interim Status Standards for Owners and Operators
of Hazardous Waste Treatment, Storage, and Disposal Facilities (cont'd)**

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
16						
The current text of 265.120 was introduced by Revision Checklist 24 whereas the original text of 265.120 as in the base program was moved to 265.119(b) by Revision Checklist 24.						
17						
The text of 265.142(a)(1) was originally included in 265.142(a).						
18						
Note there is an error in both the July 1, 1989 and 1990 CFRs. Both incorrectly omit 265.147(a)(1)(i)&(ii) and 265.147(b)(1)(i)&(ii). A technical correction will be published in the near future to fix these omissions. In the meantime, States should include analogous requirements in their regulations.						
19						
Although not included in Checklist IV B, the text of the current 265.147(h) was included in the base program as 265.147(g). This paragraph was moved by Revision Checklist 27.						
20						
Revision Checklist 28 completely revised this base program (Checklist IV B) section, 265.190.						
21						
Revision Checklist 28 completely reorganized and revised the regulations pertaining to tank systems which originally appeared in Checklist IV B at 265.191 through 265.194 and 265.197.						
22						
Paragraphs 265.310(c) and (d) were removed by the final rule addressed by Revision Checklist 15; however, these removals were not included on Revision Checklist 15.						
23						
Revision Checklist 17 F made extensive changes to this section of code, including redesignating the original paragraphs 265.314(b) and (c) to (c) and (e), reserving (d), and adding new paragraphs (b) and (f).						
24						
Revision Checklist 15 completely revised the regulations at 264.315.						
25						
This code is part of the optional requirements for the alternate treatment standards for lab packs under the Third Third Scheduled Waste Rule. If adopted, all of the requirements (i.e., 264.316(f), 265.316(f), 268.7(a)(7), 268.7(a)(8), 268.42(c), 268.42(c)(1)-(4), and Appendices IV and V to Part 268) related to these alternate treatment standards must be adopted.

persons who reclaim batteries	13	266.80(a)				
		266.80(b)				
		266.80(b)(1)				
requirements for storage before reclamation	13	266.80(b)(2)				

- 1 In Revision Checklist 17 J, this requirement was 266.31(b)(1). Revision Checklist 19 moved this paragraph to 266.31(c), reworded it and removed the requirements of the former 266.31(b)(2) regarding petroleum refinery hazardous wastes.
- 2 This section was originally introduced by Revision Checklist 13, but Revision Checklist 19's changes completely superseded it. Revision Checklist 17 K also affected 266.34(d), but Revision Checklist 19's changes completely superseded these changes as well.
- 3 This subparagraph was introduced by Revision Checklist 13, but the changes made by Revision Checklist 19 completely superseded it.

CONSOLIDATED CHECKLIST C8

Land Disposal Restrictions
40 CFR Part 268 as of June 30, 1990

Notes: 1) The following Part 268 sections are not delegable to States because of the national concerns which must be examined when decisions are made relative to them: 268.5 (case-by-case effective date extensions); 268.42(b) (application for alternate treatment method); and 268.44 (variance from a treatment standard). "No migration" petitions under 268.6 will be handled by EPA, even though States may be authorized to grant such petitions in the future. States have the authority to grant such petitions under RCRA Section 3006 because such decisions do not require a national perspective, as is the case for decisions under 268.5, 268.42(b) or 268.44. However, EPA has had few opportunities to implement the land disposal restrictions and expects to gain valuable experience and information from reviewing "no-migration" petitions.

2) In the past, the nondelegable sections/paragraphs of the LDR regulations have been omitted from the LDR checklists because States could not assume the authority for them. However, this procedure has led to confusion among the States on how to handle the sections/paragraphs in their code. For this reason, the Agency has decided to include these nondelegable sections on the LDR checklists. To differentiate these sections from the delegable portions of the LDR restrictions, asterisks precede (a single row) and follow (a double row) each non-delegable section. If States have already filled out a version of this consolidated checklist which does not include the nondelegable sections, they need not fill out a revised version containing these sections. This change in format was made only to improve clarity.

The Agency suggests that States incorporate the nondelegable portions of the LDR regulation into their regulations. It is essential, however, that States leave the terms "Administrator", "Federal Register" and "Agency" unchanged, i.e., States may not substitute analogous State terms for these Federal terms. Similarly, States incorporating by reference must be careful to except these sections from blanket substitutions of State terms for Federal terms. For a more complete discussion of issues surrounding nondelagable sections, see Appendix J of the State Authorization Manual (SAM).

3) Note that while 268.40(b) is delegable to States, "Administrator" in the following phrase "approved by the Administrator under the procedures set forth in 268.42(b)" should not be replaced with an analogous State term because it is referring to decisions under 268.42(b) which will be made by the EPA Administrator.

4) Adopting the alternate treatment standards for lab packs is optional. However, if a State chooses to adopt these alternate standards, all of the requirements related to these standards must be adopted, including all of the provisions added by the Third Third Scheduled Waste Rule (i.e., Revision Checklist 78) at 264.316(f), 265.316(f), 268.7(a)(7), 268.7(a)(8), 268.42(c), 268.42(c)(1)-(4), and Appendices IV and V to Part 268.

7) Guidance regarding the use of the new TCLP versus the EP Toxicity Test may be found at 55 FR 22660 (June 1, 1990). The code (40 CFR 268.40(a) and 268.41(a)) addressing this issue contains a serious technical error which is discussed in Footnote 27 found at the end of this checklist.

 Guidance note: 268.6 is NOT DELEGABLE. States should see Note 2 at the beginning of this checklist regarding how to incorporate this section into their code.

PETITIONS TO ALLOW LAND DISPOSAL OF A WASTE PROHIBITED UNDER SUBPART C OF PART 268

submit petition to Administrator; demonstration of no waste migration; demonstration components	34	268.6(a)				
identify specific unit and waste	34	268.6(a)(1)				
waste analysis	34	268.6(a)(2)				
comprehensive disposal unit characterization	34	268.6(a)(3)				
monitoring plan detecting migration at the earliest time	50	268.6(a)(4)				
sufficient information to assure Administrator that owner/operator is in compliance with other applicable Federal State and local laws	50	268.6(a)(5)				
Administrator approved sampling, testing and estimation techniques	34	268.6(b)(2)				
model calibration; models verified with actual data	34	268.6(b)(3)				
quality assurance/control plan approved by Administrator	34	268.6(b)(4)				
uncertainty analysis	34	268.6(b)(5)				
8 what each petition must include:	50	268.6(c)

- 1 A new subparagraph was introduced into the code by Revision Checklist 78. The original subparagraph 268.1(c)(3) was introduced by Revision Checklist 34, modified by Checklist 39, then removed by Revision Checklist 50, with 268.1(c)(4) redesignated as (c)(3). The redesignated subparagraph 268.1(c)(3) was subsequently removed by Revision Checklist 66.
- 2 Subparagraph 268.1(c)(4) originated in Revision Checklist 34, was modified by Revision Checklist 39, redesignated as 268.1(c)(3) while the original 268.1(c)(5) was redesignated as 268.1(c)(4) by Revision Checklist 50, and finally removed by Revision Checklist 66.
- 3 Subparagraph 268.1(c)(5) originated in Revision Checklist 39, and was revised by Revision Checklist 48. This text was redesignated as 268.1(c)(4) and new 268.1(c)(5) text was introduced by Revision Checklist 50. This subparagraph was finally removed by Revision Checklist 78.
- 4 These definitions were introduced into the code as part of 268.2(a) by Revision Checklist 34. Revision Checklist 78 designated them as individual paragraphs 268.2(b) and (c). The text of the old 268.2(b), introduced into the code by Revision Checklist 34, was deleted from the section by Revision Checklist 78.
- 5 Note there is a typographical error in the Federal Register notice for Revision Checklist 78 (55 FR 22520, June 1, 1990). The reference to "(g)(6)" should be "(f)."
- 6 This definition was introduced into the code as part of 268.2(a) by Revision Checklist 39. Revision Checklist 78 designated it as an individual paragraph 268.2(e).
- 7 This subparagraph was originally 268.3 when it was added to the code by Revision Checklist 34. However, it was redesignated as 268.3(a) by Revision Checklist 78.

CONSOLIDATED CHECKLIST OF Land
Disposal Restrictions (cont)

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
8						
268.6(c) was originally introduced by Revision Checklist 34. Revision Checklist 50 redesignated that 268.6(c) as 268.6(d) and inserted a new 268.6(c).						
9						
The original 268.6(d) was introduced by Revision Checklist 34. Revision Checklist 50 redesignated that paragraph as 268.6(g). That same checklist redesignated 268.6(c) as 268.6(d).						
10						
268.6(e) was introduced by Revision Checklist 34. Revision Checklist 50 redesignated that 268.6(e) as 268.6(h) and inserted a new 268.6(e).						
11						
268.6(f) was introduced by Revision Checklist 34. Revision Checklist 50 redesignated that 268.6(f) as 268.6(i) and inserted a new 268.6(f).						
12						
268.6(d)-(j) were originally introduced by Revision Checklist 34. Revision Checklist 50 redesignated these paragraphs as 268.6(g)-(m).						
13						
268.6(k) was originally introduced by Revision Checklist 39. Revision Checklist 50 redesignated it as 268.6(n).						
14						
Note that the rule addressed by Revision Checklist 78 (55 FR 22520) makes it appear as if 268.7(a)(3)(iii)-(v) were removed (see page 22687). This was an error and these subparagraphs should remain in the code.						
15						
Initially, subparagraphs 268.7(a)(4)(i)-(iv) were introduced into the code by Revision Checklist 50. Revision Checklist 78 completely changed the text of (a)(4)(i)-(iii) and removed (a)(4)(iv).						
16						
This subparagraph was originally 268.7(a)(4) when it was added to the code by Revision Checklist 34. However, it was redesignated as 268.7(a)(5) by Revision Checklist 50.						
17						
This code is part of the optional requirements for the alternate treatment standards for lab packs under the Third Third Scheduled Waste Rule. If adopted, all of the requirements (i.e., 264.316(f), 265.316(f), 268.7(a)(7), 268.7(a)(8), 268.42(c), 268.42(c)(1)-(4), and Appendices IV and V to Part 268) related to these alternate treatment standards must be adopted.						
18						
These subparagraphs were originally 268.7(b)(1) and 268.7(b)(1)(i)-(iv) when they were added to the code by Revision Checklist 34. However, they were redesignated as 268.7(b)(4) and 268.7(b)(4)(i)-(iv) by Revision Checklist 50.						
19						
These subparagraphs were originally 268.7(b)(2) and 268.7(b)(2)(i)-(ii) when they were added to the code by Revision Checklist 34. However, they were redesignated as 268.7(b)(5) and 268.7(b)(5)(i)-(ii) by Revision Checklist 50.						
20						
This paragraph was originally 268.7(b)(8) when it was entered into the code by Revision Checklist 50, but it was redesignated as 268.7(b)(7) by Revision Checklist 78 because the old 278.7(b)(7) and 278.7(b)(7)(i)-(iv) were removed by Revision Checklist 78. Revision Checklist 66 corrected 268.7(b)(8) before it was redesignated by Revision Checklist 78.						

CONSOLIDATED CHECKLIST C8: Land
Disposal Restrictions (cont'd)

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
21						
<p>The notice, certification and test requirements currently found in Federal code at 268.7(c)(1) and (c)(2) were originally addressed in paragraph 268.7(c), as introduced into the code by Revision Checklist 34. 268.7(c) was subsequently modified by Revision Checklists 39 and 50. Revision Checklist 39 added the testing requirements now found at 268.7(c)(2), although at the time the paragraph was still designated as 268.7(c). It was Revision Checklist 50 that significantly revised the paragraph so that the notice and certification requirements now appear at (c)(1) and the testing requirements appear at (c)(2). The checklist reference column, then, includes all relevant checklists for 268.7(c)(1) and (c)(2), rather than just Revision Checklist 50 which primarily affected the format.</p>						
22						
<p>Subparagraphs 268.7(c)(3) and (c)(4), introduced into the code by Revision Checklists 50 and 66, respectively, were removed from the code by Revision Checklist 78.</p>						
23						
<p>An error in the September 6, 1989 rule (54 FR 36967) makes it appear that the revisions to 268.8(a) include the removal of 268.8(a)(4). This was not the Agency's intent and 268.8(a)(4) remains in Federal code as introduced by Revision Checklist 50.</p>						
24						
<p>The 268.30(a) introduction appeared in the final rule addressed by Revision Checklist 50, but was not changed by that rule. See Revision Checklist 50 for more information.</p>						
25						
<p>These subparagraphs were originally 268.30(c) and 268.30(c)(1)-(3) when they were introduced into the code by Revision Checklist 34. However, Revision Checklist 50 redesignated them as 268.30(d) and 268.30(d)(1)-(3) because that checklist inserted a new paragraph at 268.30(c).</p>						
26						
<p>These subparagraphs were originally 268.31(b) and 268.31(b)(1)-(3) when they were introduced into the code by Revision Checklist 34. However, Revision Checklist 50 redesignated them as 268.31(d) and 268.31(d)(1)-(3) because that checklist inserted a new paragraph at 268.31(b).</p>						
27						
<p>While this subparagraph appeared in the final rule addressed by Revision Checklist 50, this rule did not change this subparagraph. See Footnote 9 of Revision Checklist 50.</p>						
28						
<p>The current text of 268.40(a) and 268.41(a) indicates that an extract or treatment residue of certain wastes may be land disposed only if certain requirements are met using either the test method in Appendix I of Part 268 or the test method in Appendix II of Part 261. Following promulgation of the March 29, 1990 Toxicity Characteristics rule addressed by Revision Checklist 74 (55 FR 11798, as amended at 55 FR 26986), both of these appendices relate to the same test method, the TCLP. Previously, the Part 261 appendix contained the EP Toxicity test procedures while the Part 268 appendix contained the TCLP. EPA will issue a correction to the rule for these particular paragraphs in the near future, clarifying which procedures may be used. Until such time, however, EPA indicates that for the specific waste exceptions listed in these paragraphs, the TCLP can be used for measuring compliance with the treatment standards for those specified wastes, and if the extract or treatment residue fails that test, the EP Toxicity test can be used. If the extract or residue passes that less stringent test, then such waste is considered in compliance with the treatment standards. For more information related to the use of either of the two test methods, see the discussion at 55 FR 22660 (June 1, 1990).</p>						

CONSOLIDATED CHECKLIST C8: Land Disposal Restrictions (cont'd)

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE

- 29 268.42(a)(3) and 268.42(a)(4) were introduced into the code by Revision Checklist 63. Revision Checklist 78 removed these paragraphs.
- 30 The 55 FR 22520, June 1, 1990, code incorrectly states that a subparagraph 268.42(e) is added. The Federal Register did not contain a 268.42(e); it only added 268.42(d).
- 31 While 268.43(b) appeared in the final rule addressed by Revision Checklist 63, the text of the paragraph was not changed and remains the same as that introduced by Revision Checklist 50.
- 32 As background, the TCLP was originally promulgated in 268, Appendix I, on November 7, 1986 (51 FR 40572; Revision Checklist 34) for use in the Land Disposal Restrictions (LDR) program to determine whether certain wastes require treatment prior to land disposal and to determine whether certain treated wastes meet the applicable treatment standards. The TC rule and its June 29, 1990 modification promulgated a revised TCLP at 261, Appendix II, with modifications based on the Agency's own research and public comment. This TCLP is to be used in both the TC and the LDR programs. The objective of the above footnoted revision to 268, Appendix I, is to assure that the TCLP entered into the code by the November 7, 1986 notice (51 FR 40572; Revision Checklist 34) is removed and replaced by the TCLP entered into the code and amended by the final rules (55 FR 11798 and 55 FR 26986) addressed by Revision Checklist 74. The actual placement of the TCLP within a State's code is not that important, per se; what is important is that a State's code contains only the Revision Checklist 74 TCLP.

CONSOLIDATED CHECKLIST C9

EPA Administered Permit Programs: The Hazardous Waste Permit Program;
 Procedures for Decision Making
 40 CFR Parts 270 and 124 as of June 30, 1990

Notes: 1) States need not use a two-part permit application process. The State application process must, however, require information in sufficient detail to satisfy the requirements of §§270.13 through 270.29.

2) Note that this checklist uses "@" and "#" in the left margin as special footnoting symbols. These symbols are defined at the end of this checklist.

**CONSOLIDATED CHECKLIST C9: EPA Administered Permit Programs:
The Hazardous Waste Permit Program; Procedures for Decision Making (cont'd)**

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE

These provisions were not included in Base Program Checklist V, but were listed as provisions under 271.14 which States must have the legal authority to implement. Thus, if States do not have these provisions in their code, they must demonstrate legal authority to carry them out.

- 1 While included in the July 30, 1989 version of this consolidated checklist, 270.1(a) & (b) were removed from this consolidated checklist because EPA does not consider them essential for a State to be authorized for a permit program. States may include analogous paragraphs of code if they so choose, however.
- 2 Note that the 17 M & †17 M designation is correct. Revision Checklist 17 M deleted the old 270.10(f)(3) provision that allows a person to begin physical construction of a new hazardous waste management facility subsequent to November 19, 1980, but prior to the effective date of the unit-specific Part 264 Standards in limited circumstances. The Agency felt that this provision was legally inconsistent with the general preconstruction ban. This removal is required. However, the Agency added the 3005(a) TSCA exemption to 270.10(f)(3). Inclusion of this exemption is considered optional as indicated on Revision Checklist 17 M.
- 3 See guidance on contents of the application found in the instructions to the Consolidated Base Program Checklists.
- 4 The base program's 270.17(c)-(i) differs from the July 1, 1988, CFR because the July 15, 1985, Federal Register (50 FR 28752) removed the original paragraph (c) and redesignated paragraphs (d)-(j) as (c)-(i). This FR is addressed by Revision Checklists 17 A through 17 S, but this change was not included in these checklists.
- 5 The final rule at 50 FR 28752, addressed by Revision Checklists 17 A through 17 S, revised this subparagraph; however, this change was not included in any of these checklists.
- 6 The base program's 270.18(d)-(i) differs from the July 1, 1988, CFR because the July 15, 1985, Federal Register (50 FR 28752), addressed by Revision Checklists 17 A through 17 S, removed paragraph (d) and redesignated paragraphs (e)-(j) as (d)-(i). However, this change was not included in any of these checklists.
- 7 Revision Checklist 54 modified this paragraph, including the deletion of 270.41(a)(3)(i)-(iii). However, these are optional changes and States not adopting the modifications of Revision Checklist 54 should have code equivalent to that in the July 1, 1988 CFR.
- 8 Revision Checklist 54 removed the 270.41(a)(5) that originally appeared in Checklist V. Revision Checklist 17 N added 270.41(a)(6). Revision Checklist 54 then redesignated 270.41(a)(6) as 270.41(a)(5).
- 9 Section 270.42 existed as part of the original promulgated code but was not included in Checklist V for the base program. Checklist 54 completely revises and supersedes the original 270.42, including removing 270.42(i)-(o).
- 10 Revision Checklist 24 modified the original 270.42(d); Revision Checklist 54 completely revised it.

3030

**CONSOLIDATED CHECKLIST C9: EPA Administered Permit Programs:
The Hazardous Waste Permit Program; Procedures for Decision Making (cont'd)**

FEDERAL REQUIREMENT	CHECK- LIST REFERENCE	FEDERAL RCRA CITATION	ANALOGOUS STATE CITATION	STATE ANALOG IS:		
				EQUIV- ALENT	MORE STRINGENT	BROADER IN SCOPE
11						
Revision Checklist 34 added 270.42(o) and 270.42(o)(1)-(4) to the Federal code, and Revision Checklist 39 modified 270.42(o)(1) and (2) and added 270.42(p) and 270.42(p)(1)-(3). Revision Checklist 54 subsequently removed 270.42(i)-(p).						
12						
Appendix I was introduced by Revision Checklist 54 as an optional modification to Section 270.42. Changes to this appendix addressed by Revision Checklist 78 are relevant only if a State has modified its code to include Appendix I as per Revision Checklist 54.						
13						
Section 270.51 was inadvertently included in the June 30, 1989 version of this consolidated checklist, but was removed from this present version of this checklist because this section is not essential for a State to adopt for permit program authorization. States may include an analogous section of code if they so choose, however.						
14						
Checklist 61 made extensive revisions to 40 CFR 270.72, including the redesignation of 270.72(b)-(e) paragraphs. Because Checklist V lists only the 270.72 citation without a breakdown into subparagraphs, all current text corresponding to the base program that has undergone revision will be identified as being associated with both Checklist V and the relevant revision checklist(s), regardless of its current formatting.						
15						
All three 270.72(c)-(e) paragraphs were part of the base program. 270.72(c) was redesignated as 270.72(a)(3) by Revision Checklist 61. 270.72(d) was modified by Revision Checklist 24, then redesignated as 270.72(a)(4) by Revision Checklist 61. 270.72(e) was modified by Revision Checklist 28 and 39 before being redesignated as 270.72(b) by Revision Checklist 61.						
16						
These subparagraphs were designated as 270.73(e) and (f) when Revision Checklist 17 P introduced them. Revision Checklist 61 added a new 270.73(e) and redesignated 270.73(e) and (f) as 270.73(f) and (g).						
17						
The July 26, 1988 <u>Federal Register</u> (53 FR 28118) redesignated 124.10(c)(1)(viii) and (ix) as (c)(1)(ix) and (x). These changes were addressed by Revision Checklist 70.						

**MODEL CONSOLIDATED
ATTORNEY GENERAL'S STATEMENT
FOR FINAL AUTHORIZATION,
INCLUDING CHANGES TO THE
FEDERAL RCRA PROGRAM
THROUGH JUNE 1990**

I hereby certify, pursuant to my authority as _____ and in accordance with Section 3006(b) of the Resource Conservation and Recovery Act, as amended by the Hazardous and Solid Waste Amendments of 1984, and 40 CFR 271 that in my opinion the laws of the State [Commonwealth] of _____ provide adequate authority to carry out the program set forth in the "Program Description" submitted by the [State Agency]. The specific authorities provided are contained in statutes or regulations lawfully adopted at the time this Statement is signed and which are in effect now [shall be fully effective by _____], as specified below.

I. DEFINITION OF TERMS, REFERENCES AND TEST METHODS

A. State statutes and regulations contain definition of terms and a list of publications (as in 40 CFR 260.11) which have applicability throughout the statutes and regulations as indicated in Consolidated Checklist C1 which includes the revisions made by Revision Checklists 5, 11, 13, 23, 24, 28, 34, 35, 39, 45, 49, 52, 67, 71, 73, and 79.

Federal Authority: RCRA §§2002(a), 3001-3007, 3010, 3014, 3015, 3017-3019, 7004; 40 CFR 260.10 and 260.11, as amended March 20, 1984 (49 FR 10490), December 4, 1984 (49 FR 47390), January 4, 1985 (50 FR 614), March 24, 1986 (51 FR 10146), May 2, 1986 (51 FR 16422), July 14, 1986 (51 FR 25422), November 7, 1986 (51 FR 40572), March 16, 1987 (52 FR 8072), July 8, 1987 (52 FR 25760), October 27, 1987 (52 FR 41295), December 10, 1987 (52 FR 46946), July 19, 1988 (53 FR 27290), and September 2, 1988 (53 FR 34079), September 29, 1989 (54 FR 40260), January 23, 1990 (55 FR 2322), March 9, 1990 (55 FR 8948), and June 21, 1990 (55 FR 25454).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow petitions for equivalent testing or analytical methods as specified in 40 CFR 260.21 and as indicated in Consolidated Checklist C1 which includes the requirements indicated in Revision Checklist 11.

¹ The phrase "OPTIONAL: This is a reduced requirement" is used to indicate provisions that either are less stringent or reduce the scope of the program. Any State which adopts an "optional" requirement must ensure that it is at least as stringent as the Federal requirement.

Federal Authority: RCRA §§2002(a), 3001, 3004; 40 CFR 260.21 as amended December 4, 1984 (49 FR 47390).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

C. Specific provisions amending 40 CFR 260.10, 260.11 and 260.21 since January 1, 1983, which are included in State statutes and regulations are listed below.

- (1) State statutes and regulations amend the definition of "manifest" and "manifest document number" as indicated in Revision Checklist 5 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§2002(a), 3001; 40 CFR 260.10 as amended March 20, 1984 (49 FR 10490).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (2) State statutes and regulations incorporate the most recent edition and update to "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" (SW-846) as indicated in Revision Checklists 11 and 35 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§2002(a), 3001; 40 CFR 260.11 as amended December 4, 1984 (49 FR 47390) and March 16, 1987 (52 FR 8072).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (3) State statutes and regulations include definitions of "boiler" and "industrial furnace" and revise the definition of "incinerator" as indicated in Revision Checklist 13 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§2002(a), 3004; 40 CFR 260.10 as amended January 4, 1985 (50 FR 614).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (4) State statutes and regulations revise the definition of "designated facility" as indicated in Revision Checklists 13 and 71 and included in Consolidated Checklist C1.

SPA 9

Federal Authority: RCRA §§2002(a), 3004; 40 CFR 260.10 as amended January 4, 1985 (50 FR 614) and January 23, 1990 (55 FR 2322).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (5) State statutes and regulations define "small quantity generator" as indicated in Revision Checklist 23 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§2002(a), 3001, 3002; 40 CFR 260.10 as amended March 24, 1986 (51 FR 10146).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (6) State statutes and regulations define "active life," "final closure," "hazardous waste management unit," and "partial closure" as indicated in Revision Checklist 24 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§2002(a), 3004; 40 CFR 260.10 as amended May 2, 1986 (51 FR 16422).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (7) State statutes and regulations define "above ground tank," "ancillary equipment," "component," "corrosion expert," "existing tank system" or "existing component," "inground tank," "installation inspector," "leak-detection system," "new tank system" or "new tank component," "onground tank," "sump," "tank system," "underground tank," "unfit-for-use tank system" and "zone of engineering control" as indicated in Revision Checklist 28 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§2002(a), 3004, 3005; 40 CFR 260.10 as amended July 14, 1986 (51 FR 25422).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (8) State statutes and regulations include the definitions at 40 CFR 260.10 and the references at 260.11(a) as applying to the land disposal restrictions (40

CFR Part 268) as indicated in Revision Checklists 34 and 39 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§2002(a), 3004; 40 CFR 260.10 and 260.11(a) as amended November 7, 1986 (51 FR 40572), July 8, 1987 (52 FR 25760), and October 27, 1987 (52 FR 41295).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (9) State statutes and regulations include the definition of "miscellaneous unit" and revise the definition of "landfill" as indicated in Revision Checklist 45 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§2002(a), 3004, 3005; 40 CFR 260.10 as amended December 10, 1987 (52 FR 46946).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (10) State statutes and regulations define "treatability study" as indicated in Revision Checklist 49 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§2002(a), 3001, 3004, 3005; 40 CFR 260.10 as amended July 19, 1988 (53 FR 27290).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (11) State statutes and regulations revise the definitions of "elementary neutralization unit" and "wastewater treatment unit" as indicated in Revision Checklist 52 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§2002(a), 3001, 3004, 3005; 40 CFR 260.10 as amended September 2, 1988 (53 FR 34079).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (12) State statutes and regulations incorporate 47 new testing methods as approved methods for use in meeting the regulatory requirements under Subtitle C of RCRA as indicated in Revision Checklists 67 and 73 and included in Consolidated Checklist C1.

SPA 9

Federal Authority: RCRA §§3001, 3004, 3005, and 3006; 40 CFR 260.11 as amended September 29, 1989 (54 FR 40260) and March 9, 1990 (55 FR 8948).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (13) State statutes and regulations incorporate eight new testing methods to the section of regulations that incorporates these methods by reference as indicated in Revision Checklist 79 and included in Consolidated Checklist C1.

Federal Authority: RCRA §§3001, 3004, 3005, and 3006; 40 CFR 260.11(a) as amended June 21, 1990 (55 FR 25454).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

II. IDENTIFICATION AND LISTING

Federal Authority: Statutory Authorization RCRA §3001; 40 CFR 271.9 as amended September 22, 1986 (51 FR 33712).

A. State statutes and regulations contain a list of hazardous wastes and characteristics for identifying hazardous waste which encompass all wastes controlled under 40 CFR Part 261 as indicated in Consolidated Checklist C2 (formerly Checklists I B and I C), which includes the changes made by Revision Checklists 4, 7, 13, 14, 17 J, 18, 20, 21, 22, 23, 26, 29, 33, 34, 37, 41, 46, 53, 56, 57, 67, 68, 69, 72, 73, 74, 75, 76, and 78, the specific provisions of which are detailed further in other subsections of this Attorney General's Statement.

Federal Authority: RCRA §3001(b); 40 CFR 261.10 through 261.33 and applicable appendices as amended February 10, 1984 (49 FR 5308), May 10, 1984 (49 FR 19922), January 4, 1985 (50 FR 614), January 14, 1985 (50 FR 1978), April 11, 1985 (50 FR 14216), July 15, 1985 (50 FR 28702), October 23, 1985 (50 FR 42936), December 31, 1985 (50 FR 53315), February 13, 1986 (51 FR 5327), February 25, 1986 (51 FR 6537), March 24, 1986 (51 FR 10146), May 28, 1986 (51 FR 19320), August 6, 1986 (51 FR 28296), October 24, 1986 (51 FR 37725), November 7, 1986 (51 FR 40572), June 5, 1987 (52 FR 21306), July 10, 1987 (52 FR 26012), April 22, 1988 (53 FR 13382), September 13, 1988 (53 FR 35412), October 31, 1988 (53 FR 43878), and October 31, 1988 (53 FR 43881), September 29, 1989 (54 FR 40260), October 6, 1989 (54 FR 41402), December 11, 1989 (54 FR 50968), February 14, 1990 (55 FR 5340), March 9, 1990 (55 FR 8948), March 29, 1990 (55 FR 11798), May 2, 1990 (55 FR 18496), May 4, 1990 (55 FR 18726), and June 1, 1990 (55 FR 22520), and June 29, 1990 (55 FR 26986).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. State statute and regulations define solid and hazardous waste so as to control all hazardous waste controlled under 40 CFR Part 261, as indicated in Consolidated Checklist C2 (formerly Checklist I A) which includes the changes made by Revision Checklists 8, 9, 13, 17 C, 19, 23, 28, 34 49, 65, 71, and 74.

Federal Authority: RCRA §3001; 40 CFR 261.1 through 261.4 as amended June 5, 1984 (49 FR 23284), November 13, 1984 (49 FR 44978), January 4, 1985 (50 FR 614), April 11, 1985 (50 FR 14216), August 20, 1985 (50 FR 33541), July 15, 1985 (50 FR 28702), November 29, 1985 (50 FR 49164), November 19, 1986 (51 FR 41900), April 13, 1987 (52 FR 11819), March 24, 1986 (51 FR 10146), July 14, 1986 (51 FR 25422), November 7, 1986 (51 FR 40572), and July 19, 1988 (53 FR 27290), September 1, 1989 (54 FR 36592), January 23, 1990 (55 FR 2322), March 29, 1990 (55 FR 11798), and June 29, 1990 (55 FR 26986).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

² C. [OPTIONAL: This is a reduced requirement.] State statutes and regulations provide: 1) exemption from regulations for hazardous waste as specified at 40 CFR 261.5, 261.6, 261.7, 260.40 and 260.41, 2) variance from classification as a solid waste as specified at 260.30, 260.31 and 260.33, or 3) variance to be classified as a boiler as specified at 260.32 and 260.33 as indicated in Consolidated Checklists C1 and C2 (formerly Checklist I A) which include the changes made by Revision Checklists 13, 14, 17 A, 17 J, 19, 23, 31, 34 47, and 79.

Federal Authority: RCRA §3001; 40 CFR 260.30-260.41 and 261.5 through 261.7 as amended January 4, 1985 (50 FR 614), January 14, 1985 (50 FR 1978), April 11, 1985 (50 FR 14216), August 20, 1985 (50 FR 33541), July 15, 1985 (50 FR 28702), November 29, 1985 (50 FR 49164), March 24, 1986 (51 FR 10146), August 8, 1986 (51 FR 28664), November 7, 1986 (51 FR 40572), November 19, 1986 (51 FR 41900), April 13, 1987 (52 FR 11819), July 19, 1988 (53 FR 27162), and June 21, 1990 (55 FR 25454).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

D. [OPTIONAL: This is a reduced requirement.] State statutes and regulations for delisting hazardous wastes including public notice and opportunity for comment before requests are granted or denied as indicated in Consolidated Checklist C1 which includes

² If a State chooses not to adopt these provisions, its statutes and regulations must make it clear that the wastes covered by 40 CFR 261.5, 261.6 and 261.7 are subject to full regulation under that State's hazardous waste regulations. If a State chooses to adopt these provisions, its requirements must be at least as stringent as the Federal requirements of 261.5, 261.6 and 261.7.

the changes made by Revision Checklists 17 B and 34. The specific provisions of these revision checklists are detailed further in this Attorney General's Statement.

Federal Authority: RCRA §§2002(a), 3001; 260.20 and 260.22 as amended July 15, 1985 (50 FR 28702), November 7, 1986 (51 FR 40572), and June 27, 1989 (54 FR 27114).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

E. Specific provisions amending 40 CFR Part 261 and relevant portions of 40 CFR Part 260 since January 1, 1983, that are included in State statutes and requirements are as follows:

- (1) State statutes and regulations contain lists of hazardous waste which encompass all wastes controlled under the following Federal regulations as indicated in the designated Revision Checklists and included in Consolidated Checklist C2:
 - (a) Chlorinated aliphatic hydrocarbons, 40 CFR 261.31, as amended February 10, 1984 [49 FR 5308], Revision Checklist 4.
 - (b) OPTIONAL: This is a reduced requirement.] Warfarin and zinc phosphide listing, 40 CFR 261.33(e) and (f), as amended May 10, 1984 [49 FR 19923], Revision Checklist 7.
 - (c) Dioxin wastes are listed and otherwise identified as hazardous wastes so as to encompass all such wastes controlled under 40 CFR 261.5(e), 261.7(b), 261.30(d), 261.31, and 261.33(f), as amended January 14, 1985 [50 FR 1978], Revision Checklist 14.
 - (d) TDI, DNT and TDA wastes, 40 CFR 261.32 and 261.33(f), as amended October 23, 1985 [50 FR 42936], Revision Checklist 18.
 - (e) Spent solvents, 40 CFR 261.31, as amended December 31, 1985 [50 FR 53319] and January 21, 1986 [51 FR 2702], Revision Checklist 20.
 - (f) EDB wastes, 40 CFR 261.32, as amended February 13, 1986 [51 FR 5330], Revision Checklist 21.
 - (g) Four spent solvents, 40 CFR 261.31 and 261.33(f), as amended February 25, 1986 [51 FR 6541], Revision Checklist 22.
 - (h) OPTIONAL: This is a reduced requirement.] Listing of spent pickle liquor from steel finishing operations, 40 CFR 261.32, as amended May 28, 1986 [51 FR 19320] and September 22, 1986 [51 FR 33612], Revision Checklist 26.

- (i) Listing of commercial chemical products and Appendix VIII constituents, 40 CFR 261.33 and Appendix VIII, as amended August 6, 1986 [51 FR 28296], Revision Checklist 29; as amended July 10, 1987 [52 FR 26012], Revision Checklist 41; and as amended April 22, 1988 [53 FR 13382], Revision Checklist 46.
- (j) EBDC wastes, 40 CFR 261.32, as amended on October 24, 1986 [51 FR 37725], Revision Checklist 33.
- (k) Listing of spent potliners from aluminum reduction (K088) 40 CFR 261.32 and 261 Appendix VII as amended September 13, 1988 [53 FR 35412] as indicated in Revision Checklist 53.
- (l) [OPTIONAL: This is a reduced requirement.] Generic delisting of iron dextran (CAS No. 9004-66-4), 40 CFR 261.33(f) and Appendix VIII, as amended October 31, 1988 [53 FR 43878], Revision Checklist 56.
- (m) [OPTIONAL: This is a reduced requirement.] Generic delisting of strontium sulfide (CAS No. 1314-96-1), 40 CFR 261.33(e) and 261 Appendix VIII, as amended October 31, 1988 [53 FR 43881], Revision Checklist 57.
- (n) Listing of two wastes (K131 and K132) generated during the production of methyl bromide, 40 CFR 261.32 and 261 Appendices III and VII, as amended October 6, 1989 [54 FR 41402], Revision Checklist 68.
- (o) Listing of one generic category (F025) of waste generated during the manufacture of chlorinated aliphatic hydrocarbons by free radical catalyzed processes and amending F024, 40 CFR 261.31 and 261 Appendix VII; adding one toxicant to 261 Appendix VIII; as amended December 11, 1989 [54 FR 50968], Revision Checklist 69.
- (p) [OPTIONAL: This is a reduced requirement.] Amendments to the F019 hazardous waste listing to exclude wastewater treatment sludges from zirconium phosphating in aluminum can washing, when such phosphating is an exclusive conversion coating process, 40 CFR 261.31, as amended February 14, 1990 [55 FR 5340], Revision Checklist 72.
- (q) Listing of four wastes (K107-K110) generated during the production of 1,1-dimethylhydrazine (UDMH) from carboxylic acid hydrazides, 40 CFR 261.31 and 261 Appendices III and VII, as amended May 2, 1990 [55 FR 18496], Revision Checklist 75.
- (r) Listing of one waste (F039), 40 CFR 261.31 and 261 Appendix VII, as amended June 1, 1990 [55 FR 22520], Revision Checklist 78.

SPA 9

Federal Authority: RCRA §3001(b).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (2) [OPTIONAL: This is a reduced requirement.] State statutes and regulations define hazardous waste so as to exclude waste pickle liquor sludge generated by lime stabilization, but only to the extent that such waste is excluded by 40 CFR 261.3(c)(2) as indicated in Revision Checklist 8 and included in Consolidated Checklist C2.

Federal Authority: RCRA §3001; 40 CFR 261.3(c) as amended June 5, 1984 (49 FR 23284).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (3) [OPTIONAL: This is a reduced requirement.] State statutes and regulations define hazardous waste so as to not exclude household waste other than those household wastes excluded in 40 CFR 261.4(b)(1) and as indicated in Revision Checklists 9 and 17 C and included in Consolidated Checklist C2.

Federal Authority: RCRA §3001; 40 CFR 261.4(b)(1) as amended November 13, 1984 (49 FR 44980) and July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (4) State statutes and regulations define hazardous waste standards so as to control all the hazardous waste controlled under 40 CFR Part 261 as indicated in Revision Checklists 13 and 37 and included in Consolidated Checklists C1.

Federal Authority: RCRA §3001; 40 CFR Part 261 as amended January 4, 1985 (50 FR 614), April 11, 1985 (50 FR 14216), August 20, 1985 (50 FR 33541), and June 5, 1987 (52 FR 21306).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (5) State statutes and regulations regulate the wastes of generators generating 100 kg or less per month of hazardous waste and 1 kg or less per month of acutely hazardous waste as specified in 40 CFR 261.5 and as indicated in

Revision Checklists 23 (supercedes prior amendments by Revision Checklist 17 A), 31 (amends Revision Checklist 23) and 47 (provides technical corrections to Checklist 23). These requirements are included in Consolidated Checklist C2.

Federal Authority: RCRA §3001(d); 40 CFR 261.5 as amended March 24, 1986 (51 FR 10146), August 8, 1986 (51 FR 28664), and July 19, 1988 (53 FR 27162).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (6) [This requirement applies only if States have a delisting mechanism. This requirement is NOT OPTIONAL for such States.] State statutes and regulations provide authority to delist hazardous waste as indicated in Revision Checklist 17 B and included in Consolidated Checklist C1.
- (a) State statutes and regulations require that before deciding to delist a waste, the State must consider whether any listing factor (including additional constituents) other than those for which the waste was listed would cause the waste to be hazardous.
- (b) State statutes and regulations require that there be no new temporary delistings without prior notice and comment. All temporary delistings received before November 18, 1984, without the opportunity for public comment and full consideration of such comment, shall lapse if not made final by November 8, 1986.

Federal Authority: RCRA §3001(f)(1) & (2); 40 CFR 260.20(d) and 260.22 as amended July 15, 1985 (50 FR 28702) and June 27, 1989 (54 FR 27114).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (7) State statutes and regulations include as hazardous wastes those materials specified in 40 CFR Part 261.33 if and when they are discarded or intended to be discarded, when they are mixed with waste oil or used oil or other material and applied to the land for dust suppression or road treatment or when, in lieu of their original intended use, they are otherwise applied to the land, they are contained in products applied to the land, they are produced for use as a (or component of) a fuel, distributed for use as a fuel, or burned as a fuel as indicated in Revision Checklists 17 J and 37 and included in Consolidated Checklist C2.

SPA 9

Federal Authority: RCRA §§3001, 3014(a); 40 CFR 261.33 as amended July 15, 1985 (50 FR 28702) and June 5, 1987 (52 FR 21306).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (8) State statutes and regulations identify waste fuels and used oil fuels as solid wastes so as to encompass all such wastes as controlled under 40 CFR 261.3, 261.5, and 261.6 as indicated in Revision Checklist 19 and included in Consolidated Checklist C2.

Federal Authority: RCRA §§3001, 3014(a); 40 CFR Part 261 as amended November 29, 1985 (50 FR 49164), November 19, 1986 (51 FR 41900), and April 13, 1987 (52 FR 11819).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (9) [OPTIONAL]: This is an optional requirement.] State statutes and regulations exclude from regulation secondary materials that are reclaimed and returned to the original process or processes in which they were generated where they are reused in the production process provided they meet the requirements specified at 40 CFR 261.4(a)(8)(i)-(iv) as indicated in Revision Checklist 28 and included in Consolidated Checklist C2.

Federal Authority: RCRA §3001; 40 CFR 261.4 as amended July 14, 1986 (51 FR 25422).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (10) State statutes and regulations require that spent industrial ethyl alcohol, which is exported for reclamation, must be either covered by an international agreement specified in 262.58 or the person initiating its shipment and its transporters are subject to the requirements specified in 261.6(a)(3)(i)(A) & (B) as indicated in Revision Checklist 31 and included in Consolidated Checklist C2.

Federal Authority: RCRA §3017; 40 CFR 261.6(a)(3)(i) as amended August 8, 1986 (51 FR 28664).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (11) State statutes and requirements include reference to the land disposal restrictions (as specified at 40 CFR Part 268) so as to appropriately indicate that the hazardous waste, identified and defined as specified in 40 CFR Part 261, is also subject to this restriction as specified in Revision Checklist 34 and included in Consolidated Checklist C2.

Federal Authority: RCRA §3004(d)-(k) & (m); 40 CFR Part 261 as amended November 7, 1986 (51 FR 40572).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (12) [OPTIONAL: This is a reduced requirement.] State statutes and regulations exempt (with certain limitations) waste samples used in small scale treatability studies from Subtitle C regulation as indicated in Revision Checklist 49 and included in Consolidated Checklist C2.

Federal Authority: RCRA §3001; 40 CFR 261.4(e) & (f) as amended July 19, 1988 (53 FR 27290).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (13) State statutes and regulations exclude from the mining waste exemption the six wastes at 40 CFR 261.4(b)(7)(i) through 261.4(b)(7)(vi), as indicated in Revision Checklist 53.

Federal Authority: RCRA §3001(b); 40 CFR 261.4(b)(7) as amended September 13, 1988 (53 FR 34512).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (14) State statutes and regulations that:
- (a) provide final criteria to define Bevill-excluded mineral processing wastes, finalize the Bevill status of nine mineral processing waste streams, and list those mineral processing wastes subject to conditional retention as indicated in Revision Checklist 65.

SPA 9

Federal Authority: RCRA §3001(b); 40 CFR 261.3 and 261.4 as amended September 1, 1989 (54 FR 36592).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (b) remove five conditionally retained mineral processing wastes from the exemption from hazardous waste regulation under the Bevill exclusion, and amend the definitions of "beneficiation" and "designated facility" as indicated in Revision Checklist 71.

Federal Authority: RCRA §3001(b)(3)(A)(ii); 40 CFR 260.10 and 261.4(b)(7) as amended January 23, 1990 (55 FR 2372).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (15) State statutes and regulations replace first edition SW-846 information with third edition information as indicated in Revision Checklists 67 and 73 and included in Consolidated Checklist C2.

Federal Authority: RCRA §3001; 40 CFR 261 Appendix III as amended September 29, 1989 (54 FR 40260) and March 9, 1990 (55 FR 8948).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (16) State statutes and regulations revise the existing toxicity characteristic by replacing the Extraction Procedure (EP) leach test with the Toxicity Characteristic Leaching Procedure (TCLP) for identifying wastes that are defined as hazardous and subject to regulation under Subtitle C of RCRA as indicated in Revision Checklist 74 and included in Consolidated Checklist C2. State statutes and regulations also provide for the addition of 25 organic chemicals and their regulatory levels to the list of toxic constituents of concern as indicated in Revision Checklist 74 and included in Consolidated Checklist C2.

Federal Authority: RCRA §§1006, 2002(a), 3001, 3002 and 3006; 40 CFR Part 261 as amended March 29, 1990 (55 FR 11798) and June 29, 1990 (55 FR 26986).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (17) State statutes and regulations contain language to result in consistent interpretation of the criteria for listing wastes as hazardous under RCRA as indicated in Revision Checklist 76 and included in Consolidated Checklist C2.

Federal Authority: RCRA §3001(a); 40 CFR 261.11(a)(3) as amended May 4, 1990 (55 FR 18726).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (18) State statutes and regulations include language making the characteristic of hazardous waste requirements and the requirements regarding container residues and inner liners consistent with the Third Third Land Disposal Restrictions as indicated in Revision Checklist 78 and included in Consolidated Checklist C2.

Federal Authority: RCRA §§3001, 3004(d)-(k) and (m); 40 CFR 261.20, 261.21, 261.22, 261.23, 261.24, and 261.33(c) as amended June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (19) State statutes and regulations include requirements for recyclable materials addressing the organic air emission standards for process vents and equipment leaks as indicated in Revision Checklist 79 and included in Consolidated Checklist C2.

Federal Authority: RCRA §3001; 40 CFR 261.6(c)&(d) as amended June 21, 1990 (55 FR 25454).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

III. STANDARDS FOR GENERATORS

Federal Authority: RCRA §3002; 271.10 as amended on April 1, 1983 (48 FR 14146), June 30, 1983 (48 FR 30113), March 20, 1984 (49 FR 10490), March 26, 1984 (49 FR 11180), August 8, 1986 (51 FR 28664), and September 22, 1986 (51 FR 33712).

A. State statutes and regulations provide coverage of all generators covered by 40 CFR Part 262 and include requirements for EPA identification number, reporting and recordkeeping, accumulation of hazardous waste for short time periods, packaging, labeling, marking, placarding, international shipments, manifesting of hazardous waste for off-site shipment, notification procedures for interstate shipments as indicated in Consolidated

SPA 9

Checklist C3 (formerly Checklist II) which includes the revisions represented by Revision Checklists 1, 5, 12, 17 D, 17 R, 23, 28, 31, 32, 34, 39, 42 48, 71, and 78.

Federal Authority: RCRA §3002; 40 CFR Part 262 as amended January 28, 1983 (48 FR 3977), March 20, 1984 (49 FR 10490), December 20, 1984 (49 FR 49568), July 15, 1985 (50 FR 28702), March 24, 1986 (51 FR 10146), July 14, 1986 (51 FR 25422), August 8, 1986 (51 FR 28664), October 1, 1986 (51 FR 35190), November 7, 1986 (51 FR 40572), July 8, 1987 (52 FR 25760), September 23, 1987 (52 FR 35894), July 19, 1988 (53 FR 27164), January 23, 1990 (55 FR 2322), and June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. Specific provisions amending 40 CFR Part 262 since January 1, 1983 that are included in State statutes and requirements are as follows:

- (1) State statutes and regulations require that generators submit a biennial report and that the biennial report contain the information in 40 CFR 262.41(a) as indicated in Revision Checklist 1 and included in Consolidated Checklist C3.

Federal Authority: RCRA §3002; 40 CFR Part 262 as amended January 28, 1983 (48 FR 3977).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (2) State statutes and regulations require generators to use the national uniform manifest as indicated in Revision Checklists 5, 17 D and 32 and included in Consolidated Checklist C3.

Federal Authority: RCRA §§2002, 3002, 3003; 40 CFR Part 262 as amended March 20, 1984 (49 FR 10490), July 15, 1985 (50 FR 28702), and October 1, 1986 (51 FR 35190).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (3) [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow generators to accumulate at the site of generation, without a permit or interim status, as much as 55 gallons of hazardous waste or one quart of acutely hazardous waste provided that the generator complies with the requirements specified in §262.34(c) as indicated in Revision Checklist 12 and included in Consolidated Checklist C3.

Federal Authority: RCRA §§2002, 3002, 3004, 3005; 40 CFR 262.34(c) as amended December 20, 1984 (49 FR 49568).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (4) State statutes and regulations require generators to submit as part of a Biennial Report a description and certification regarding efforts taken to minimize the amounts and toxicity of wastes as indicated in Revision Checklists 17 D and included in Consolidated Checklist C3.

Federal Authority: RCRA §3002(a)(6), (b); 40 CFR 262.41(a)(6)-(8) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (5) State statutes and regulations require generators (including small quantity generators of between 100 and 1000 kg/mo) to certify to a good faith effort to minimize hazardous waste as specified in Revision Checklists 17 D and 32 and included in Consolidated Checklist C3.

Federal Authority: RCRA §3002(a)(6), b; 40 CFR Part 262 Appendix - Uniform Hazardous Waste Manifest Form as amended July 15, 1985 (50 FR 28702) and October 1, 1986 (51 FR 35190).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (6) State statutes and regulations require generators and transporters of hazardous waste destined for export outside the United States to comply with standards equivalent to those as indicated in Revision Checklists 17 R, 31, and 48 (with the latter providing technical corrections to Checklist 31) and included in Consolidated Checklists C3, C5, C6 and C9.

Federal Authority: RCRA §3017; 40 CFR 262.50, 264.1, 265.1, and 270.1(c)(2)(ii) as amended July 15, 1985 (50 FR 28702), August 8, 1986 (51 FR 28664), and July 19, 1988 (53 FR 27164).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

SPA 9

- (7) State statutes and regulations provide for special generator requirements for hazardous waste produced by small quantity generators of between 100 and 1000 kilograms/month as indicated in Revision Checklist 23 and included in Consolidated Checklist C3.

Federal Authority: RCRA §3001(d); 40 CFR Part 262 as amended March 24, 1986 (51 FR 10146).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (8) State statutes and regulations require that generators who accumulate hazardous waste on site in containers or tanks must comply with certain sections of 40 CFR Part 265 as indicated in Revision Checklist 28 and included in Consolidated Checklist C3.

Federal Authority: RCRA §§1006, 2002, 3001, 3002, 3010; 40 CFR 262.34 as amended on July 14, 1986 (51 FR 25422).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (9) State statutes and regulations require that, if a waste is determined to be hazardous, the generator must refer to the requirements specified in 40 CFR Parts 264, 265 and 268 for possible exclusions or restrictions pertaining to management of his specific waste as indicated in Revision Checklist 34 and included in Consolidated Checklist C3.

Federal Authority: §3004(d)-(k) and (m); 40 CFR 262.11(d) as amended on November 7, 1986 (51 FR 40572).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (10) [OPTIONAL]: This is a reduced requirement.] State statutes and requirements provide that a farmer disposing of waste pesticide from his own use in accordance with the requirements specified at 40 CFR 262.70 is not subject to the land disposal restrictions as indicated in Revision Checklist 39 and included in Consolidated Checklist C3.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR 262.70 as amended on July 8, 1987 (52 FR 25760) and July 19, 1988 (53 FR 27164).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (11) State statutes and regulations require that generators, of between 100 and 1000 kg/mo of hazardous waste, file an exception report in those instances where the generator does not receive confirmation of delivery of his hazardous waste to the designated facility as indicated in Revision Checklist 42 and included in Consolidated Checklist C3.

Federal Authority: RCRA §§3001(d) and 3002(a)(5); 40 CFR Parts 262.42 and 262.44 as amended September 23, 1987 (52 FR 35894).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (12) State statutes and regulations require that generators who ship hazardous waste to a designated facility in an authorized state which has not yet obtained authorization to regulate that particular waste as hazardous assure that the designated facility agrees to sign and return the manifest to the generator, and that any out-of-state transporter signs and forwards the manifest to the designated facility, as indicated in Revision Checklist 71 and included in Consolidated Checklist C3.

Federal Authority: RCRA §§2002, 3002 and 3003; 40 CFR 262.23(e) as amended on January 23, 1990 (55 FR 2322).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (13) State statutes and regulations provide for generator requirements as necessitated by the Third Third land disposal restrictions as indicated in Revision Checklist 78 and included in Consolidated Checklist C3.

Federal Authority: RCRA §§3002, 3004(d)-(k) and (m); 40 CFR 262.11(c), and 262.34(a) as amended June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

IV. STANDARDS FOR TRANSPORTERS

Federal Authority: RCRA §3003; 40 CFR 271.11 as amended on April 1, 1983 (48 FR 14146), August 8, 1986 (51 FR 28664), and September 22, 1986 (51 FR 33712).

A. State statutes and regulations provide coverage of all the transporters covered by 40 CFR Part 263 and include requirements for EPA identification number, recordkeeping, manifesting, and actions regarding hazardous waste discharged during transit, as indicated in Consolidated Checklist C4 (formerly Checklist III) which includes the changes made by Revision Checklists 23, 31 and 34.

Federal Authority: RCRA §3003; 40 CFR Part 263 as amended on March 24, 1986 (51 FR 10146), August 8, 1986 (51 FR 28664), and November 7, 1986 (51 FR 40572).

Citation of Laws and Regulations; Date of Enactment and AdoptionRemarks of the Attorney General

B. Specific provisions amending 40 CFR Part 263 since January 1, 1983 that are included in State statutes and requirements are as follows:

- (1) State statutes and regulations provide that transporters transporting hazardous waste from a generator who generates greater than 100 kg but less than 1000 kg of hazardous waste in a calendar month need not comply with the manifest and recordkeeping system requirements specified in 40 CFR 263.20 and 263.22 provided the requirements specified in 40 CFR 263.20(h)(1)-(4) are complied with as indicated in Revision Checklist 23 and included in Consolidated Checklist C4.

Federal Authority: RCRA §3001(d); 40 CFR Part 263 as amended March 24, 1986 (51 FR 10146).

Citation of Laws and Regulations; Date of Enactment and AdoptionRemarks of the Attorney General

- (2) State statutes and regulations prohibit transporters from accepting wastes from an exporter unless an EPA Acknowledgement of Consent is attached to the manifest (except for transport by rail and water which must comply with the requirements specified at 263.20(e)(2) & (f)(2)). Both documents must accompany the waste enroute. The transporter is required to deliver a copy of the manifest to a U.S. Customs Official at the point where the waste leaves the U.S., and the transporter must refuse a waste for export if he knows the waste does not conform to the Acknowledgement of Consent. These requirements are indicated in Revision Checklist 31 and are included in Consolidated Checklist C4.

Federal Authority: RCRA §3017; 40 CFR 263.20 as amended August 8, 1986 (51 FR 28664).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (3) State statutes and regulations exempt, from the land disposal requirements, transporters who store hazardous waste shipments at transfer facilities, meeting the requirements specified in 263.12, as indicated in Revision Checklist 34 and included in Consolidated Checklist C4.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR 263.12 as amended November 7, 1986 (51 FR 40572).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

V. STANDARDS FOR FACILITIES

Federal Authority: RCRA §§3004, 3004(e); 40 CFR 271.12 and 271.13(a) as amended on April 1, 1983 (48 FR 14146) and September 22, 1986 (51 FR 33712).

A. State statutes and regulations provide standards for hazardous waste management facilities equivalent to 40 CFR Parts 264 and 266 including: 1) technical standards for tanks, containers, waste piles, incineration, chemical, physical and biological treatment facilities, surface impoundments, landfills and land treatment facilities, 2) financial responsibility during facility operation, 3) preparedness for and prevention of discharges or releases of hazardous waste, 4) contingency plans and emergency procedures, 5) closure and post-closure requirements, including financial requirements ensuring that money will be available during these periods for monitoring and maintenance, 6) ground-water monitoring, 7) security to prevent unauthorized access to the facility, 8) facility personnel training, 9) inspections, monitoring, recordkeeping and reporting; 10) manifest requirements, and 11) other requirements to the extent they are included in 40 CFR Parts 264 and 266. These standards for hazardous waste management facilities are as indicated in Consolidated Checklists C5 (formerly Checklist IV A) and C7 which include the changes made by Revision Checklists 1, 13, 14, 16, 17 D, 17 E, 17 F, 17 G, 17 H, 17 I, 17 J, 17 K, 17 L, 19, 24, 27, 28, 30, 34, 37, 39, 40, 43, 44 B, 45, 48, 50, 52, 54, 55, 64, 66, 74, 77, 78, and 79.

Federal Authority: RCRA §3004; 40 CFR Parts 264 and 266 as amended January 28, 1983 (48 FR 3977), January 4, 1985 (50 FR 614), January 14, 1985 (50 FR 1978), April 11, 1985 (50 FR 14216), April 30, 1985 (50 FR 18370), July 15, 1985 (50 FR 28702), August 20, 1985 (50 FR 33541), November 29, 1985 (50 FR 49164), May 2, 1986 (51 FR 16422), July 11, 1986 (51 FR 25350), July 14, 1986 (51 FR 25422), August 15, 1986 (51 FR 29430), August 8, 1986 (51 FR 28556), November 7, 1986 (51 FR 40572), November 19, 1986 (51 FR 41900), April 13, 1987 (52 FR 11819), June 4, 1987 (52 FR 21010), June 5, 1987 (52 FR 21306), July 8, 1987 (52 FR 25760), July 9, 1987 (52 FR 25942),

SPA 9

November 18, 1987 (52 FR 44314), December 1, 1987 (52 FR 45788), December 10, 1987 (52 FR 46946), July 19, 1988 (53 FR 27164), August 17, 1988 (53 FR 31138), September 2, 1988 (53 FR 34079), September 28, 1988 (53 FR 37912), October 11, 1988 (53 FR 39720), August 14, 1989 (54 FR 33376), September 6, 1989 (54 FR 36967), March 29, 1990 (55 FR 11798), May 9, 1990 (55 FR 19262), June 1, 1990 (55 FR 22520), and June 21, 1990 (55 FR 25454).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

[Where a State provides for interim status for facilities, analysis of the State's authority should be included here. Model language is presented in Section B below.]

B. State statutes and regulations provide for interim status and include interim status standards for hazardous waste management facilities covered by 40 CFR Part 265 as indicated in Consolidated Checklist C6 (formerly Checklist IV B) which includes the changes made by Revision Checklists 1, 3, 10, 13, 14, 15, 16, 17 E, 17 F, 17 H, 19, 24, 25, 27, 28, 30, 34, 36, 39, 43, 44 C, 48, 50, 52, 54, 64, 74, 78, and 79. Specific requirements are as follows:

- (1) State statutes and regulations authorize owners and operators of hazardous waste management facilities which would qualify for interim status under the federal program to remain in operation until a final decision is made on the permit application;
- (2) State law and regulations authorize continued operation of hazardous waste management facilities provided that owners and operators of such facilities comply with standards at least as stringent as EPA's interim status standards at 40 CFR Part 265; and
- (3) State law and regulations assure that any facility qualifying for State interim status continues to qualify for Federal interim status.

Federal Authority: RCRA §3005(e); 40 CFR Part 265 as amended on January 28, 1983 (48 FR 3977), November 22, 1983 (48 FR 52718), November 21, 1984 (49 FR 46094), January 4, 1985 (50 FR 614), January 14, 1985 (50 FR 1978), April 23, 1985 (50 FR 16044), April 30, 1985 (50 FR 18370), July 15, 1985 (50 FR 28702), November 29, 1985 (50 FR 49164), November 19, 1986 (51 FR 41900), May 2, 1986 (51 FR 16422), May 28, 1986 (51 FR 19176), July 11, 1986 (51 FR 25350), July 14, 1986 (51 FR 25422), August 15, 1986 (51 FR 29430), August 8, 1986 (51 FR 28556), November 7, 1986 (51 FR 40572), March 19, 1987 (52 FR 8704), July 8, 1987 (52 FR 25760), November 18, 1987 (52 FR 44314), December 1, 1987 (52 FR 45788), July 19, 1988 (53 FR 27164), August 17, 1988 (53 FR 31138), September 2, 1988 (53 FR 34079), September 28, 1988 (53 FR 37912), August 14, 1989 (54 FR 33376), March 29, 1990 (55 FR 11798), June 1, 1990 (55 FR 22520), and June 21, 1990 (55 FR 25454).

C. Specific provisions amending 40 CFR Parts 264, 265 and 266 since January 1, 1983 which are included in State statutes and requirements are listed below. Also included are specific State statutes and regulations regarding 1) third party direct action

against insurers or guarantor of an owner/operator's financial responsibilities under certain circumstances, 2) criminal penalties for waste fuel and used oil fuel requirement violators, and 3) exceptions to burning and blending of hazardous waste as specified in RCRA §§3004(q)(2)(A) & 3004(r)(2) & (3). These latter provisions are not addressed by a Revision Checklist.

- (1) State statutes and requirements provide for the requirements regarding the biennial report, unmanifested waste report and additional reporting as indicated in Revision Checklist 1 and included in Consolidated Checklists C5 and C6. As also indicated in these same checklists, facilities must also submit groundwater monitoring data annually to the State Director as specified in 40 CFR 265.94.

Federal Authority: RCRA §3004; 40 CFR Parts 264 and 265 as amended January 28, 1983 (48 FR 3977).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (2) State statutes and regulations contain requirements in which interim status standards apply to facilities identified in 40 CFR 265.1(b) and as specified in 265.1(a) as indicated in Revision Checklists 3 and 10 and included in Consolidated Checklist C6.

Federal Authority: RCRA §3004; 40 CFR Part 265 as amended November 22, 1983 (48 FR 52718) and November 21, 1984 (49 FR 46095).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (3) State statutes and regulations define hazardous waste and impose management standards so as to control all the hazardous waste controlled under 40 CFR Parts 261, 264, 265 and 266 as indicated in Revision Checklists 13 and 37 and included in Consolidated Checklists C5, C6 and C7.

Federal Authority: RCRA §§3001, 3004; 40 CFR Parts 261, 264, 265 and 266 as amended January 4, 1985 (50 FR 614), April 11, 1985 (50 FR 14216), August 20, 1985 (50 FR 33541), and June 5, 1987 (52 FR 21306).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

SPA 9

- (4) State statutes and regulations contain special management standards for facilities managing dioxin wastes and prohibitions applicable to permitted and interim status facilities as provided in 40 CFR Parts 264 and 265 and indicated in Revision Checklist 14. These requirements are also included in Consolidated Checklists C5 and C6.

Federal Authority: RCRA §3004; 40 CFR Parts 264 and 265 as amended January 14, 1985 (50 FR 1978).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (5) State statutes and regulations require that closure and post-closure requirements and special requirements for containers apply to interim status landfills as indicated in Revision Checklist 15 and included in Consolidated Checklist C6.

Federal Authority: RCRA §3004; 40 CFR 265.310 and 265.315 as amended April 23, 1985 (50 FR 16044).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (6) [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow a variance to the two-foot freeboard requirement for surface impoundments, allow a variance for placement of ignitable or reactive wastes in surface impoundments and clarify the allowable treatment mechanisms at land treatment units as indicated in Revision Checklist 15 and included in Consolidated Checklist C6.

Federal Authority: RCRA §3004; 40 CFR 265.222, 265.229, and 265.272 as amended April 23, 1985 (50 FR 16044).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (7) State statutes and regulations require the use of a paint filter test to determine the absence or presence of free liquids in either a containerized or bulk waste as indicated in Revision Checklists 16, 17 F and 25 and included in Consolidated Checklists C5, C6 and C9.

Federal Authority: RCRA §§3004, 3005; 40 CFR Parts 264, 265, and 270 as amended April 30, 1985 (50 FR 18370), July 15, 1985 (50 FR 28702), and May 28, 1986 (51 FR 19176).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (8) State statutes and regulations require that the permittee, no less often than annually, certify in the operating record 1) the existence of a program to minimize the amount and toxicity of the generated wastes and 2) that the proposed method of treatment, storage, or disposal minimizes present and future threat to human health and the environment as indicated in Revision Checklist 17 D and included in Consolidated Checklist C5.

Federal Authority: RCRA §§3004, 3005(h); 40 CFR 264.70 and 264.73 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (9) State statutes and regulations prohibit the land disposal of hazardous waste prohibited under 40 CFR Parts 264 and 265 as indicated in Revision Checklist 17 E and included in Consolidated Checklists C5 and C6. Land disposal includes, but is not limited to, placement in landfills, surface impoundments, waste piles, deep injection wells, land treatment facilities, salt dome and bed formations and underground mines or caves. Deep injection well means a well used for the underground injection of hazardous wastes other than a well to which §7010(a) of RCRA applies.

Federal Authority: RCRA §§3004(b)-(q); 40 CFR 264.18, and 265.18 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (10) Effective on November 8, 1984 State statutes and regulations prohibit the placement of any non-containerized or bulk liquid hazardous waste in any salt dome or salt bed formation, any underground mine or cave except as provided in §264.18(c) and §265.18(c) as indicated in Revision Checklist 17 E and included in Consolidated Checklists C5 and C6. Furthermore, State statutes and regulations prohibit the placement of any other hazardous waste in such formations until a permit is issued.

SPA 9

Federal Authority: RCRA §3004(b); 40 CFR 264.18 and 265.18 as amended July 15, 1985 (50 FR 28702); 40 CFR 264.600 et seq., December 10, 1987 (52 FR 46946).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (11) State statutes and regulations contain the following requirements regarding liquids in landfills as indicated in Revision Checklists 17 F and 25.
- (a) Effective May 8, 1985, there is a ban on the placement of bulk or non-containerized liquid hazardous waste or hazardous waste containing free liquids in any landfill pursuant to 40 CFR 264.314 and 265.314 as amended July 15, 1985 and May 28, 1986.
 - (b) Effective November 8, 1985, there is a ban on the placement of non-hazardous liquids in landfills unless the owner or operator satisfies the criteria set forth in 40 CFR 264.314(e), 265.314(e), as amended July 15, 1985 and May 28, 1986.
 - (c) Bulk or non-containerized liquid wastes or wastes containing free liquids may be placed in a landfill prior to May 8, 1985, only if the requirements of 40 CFR 264.314(a) and 265.314(a) are met.

Federal Authority: RCRA §3004(c); 40 CFR 264.314, 265.314 and 270.21(h) as amended July 15, 1985 (50 FR 28702) and May 28, 1986 (51 FR 19176).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (12) State statutes and regulations prohibit the use of waste oil or other materials contaminated with hazardous wastes (except ignitable wastes) as a dust suppressant as indicated in Revision Checklist 17 G and as included in Consolidated Checklist C7.

Federal Authority: RCRA §3004(1); 40 CFR 266.23 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (13) State statutes and regulations require that new units, expansions, and replacements of interim status waste piles meet the requirements for a single liner and leachate collection system in regulations applicable to permitted waste piles as indicated in the Revision Checklist 17 H and included in Consolidated Checklist C6.

Federal Authority: RCRA §3015(a); CFR 265.254.

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (14) State statutes and regulations require that:
- (a) New units, expansions, and replacement units at interim status landfills and surface impoundments and permitted landfills and surface impoundments meet the requirements for double liners and leachate collection systems applicable to new permitted landfills and surface impoundments in 40 CFR 264.221 and 264.301 and in 40 CFR 265.221 and 265.301 as indicated in Revision Checklists 17 H and 77 and included in Consolidated Checklists C5 and C6.
 - (b) [OPTIONAL: This is a reduced requirement.] Facilities which comply in good faith need not retrofit at permit issuance unless the liner is leaking as provided in §§264.221, 264.301, 265.221 and 265.301 as indicated in Revision Checklist 17 H and included in Consolidated Checklist C6.
 - (c) [OPTIONAL: This is a reduced requirement.] Variances from the above requirements are optional. However, the availability of such variances is restricted as provided in §§264.221, 264.301, 265.221 and 265.301 as indicated in Revision Checklist 17 H and included in Consolidated Checklists C5 and C6.

Federal Authority: RCRA §3015(b); 40 CFR 264.221, 264.301, 265.221 and 265.301 as amended July 15, 1985 (50 FR 28702) and May 9, 1990 (55 FR 19262).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (15) State statutes and regulations provide that the §3004 groundwater monitoring requirements applicable to surface impoundments, waste piles, land treatment units and landfills shall apply whether or not such units are located above the seasonal high water table, have two liners and a leachate collection system or have liners that are periodically inspected, as indicated in Revision Checklist 17 I and included in Consolidated Checklist C5.

SPA 9

Federal Authority: RCRA §3004(p); 40 CFR 264.222, 264.252, 264.253, and 264.302 as amended July 15, 1985 (50 FR 28702).³

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (16) [OPTIONAL: This is a reduced requirement.] State statutes and regulations may allow variances from the ground-water monitoring requirements as provided in §3004(p). However, those variances must be restricted as provided in RCRA §3004(p) as indicated in Revision Checklist 17 I and included in Consolidated Checklist C5.

Federal Authority: RCRA §3004(p); 40 CFR 264.90(b) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (17) State statutes and regulations provide the following requirements:
- (a) The burning of fuel containing hazardous waste in a cement kiln is prohibited except as specified in 40 CFR 266.31 and Revision Checklist 17 J and included in Consolidated Checklist C7.

Federal Authority: RCRA §3004(q); 40 CFR 266.31 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (b) Fuels containing hazardous waste and all persons who produce, distribute and market fuel containing hazardous wastes must be regulated as indicated in Revision Checklists 17 J and 17 K and included in Consolidated Checklist C7.

³ Note these sections of code were reserved by Revision Checklist 17 I. The cited sections of 40 CFR Part 264 contained a series of exemptions from Subpart F groundwater protection requirements.

Federal Authority: RCRA §§3004(q)-(s); 40 CFR 266.31, 266.34 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (18) [OPTIONAL: This is a reduced requirement.] State statutes and regulations provide exceptions to the burning and blending of hazardous waste as specified in §§3004(q)(2)(A) and 3004(r)(2) and (3).

Federal Authority: RCRA §§3004(q)(2)(A) and 3004(r)(2) & (3).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (19) State statutes and regulations contain the following corrective action requirements as indicated in Revision Checklist 17 L:
- (a) Corrective action is required for releases of hazardous waste or constituents from any solid waste management unit at a facility seeking a permit, regardless of when the waste was placed in the unit, in all permits issued after November 8, 1984.

Federal Authority: RCRA §3004(u); 40 CFR 264.90 and 264.101 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (b) Corrective action is required beyond a facility's boundary, in accordance with RCRA §3004(v). (States now may impose these requirements through a permit or a corrective action order. Once EPA promulgates the regulations required by RCRA §3004(v), States will need authority to impose corrective action in a permit following the RCRA §3004(v) regulations.)

Federal Authority: RCRA §3004(v)(1).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (c) Corrective action is required beyond a facility's boundary in accordance with RCRA §3004(v) for all landfills, surface

SPA 9

impoundments and waste pile units (including any new units, replacements of existing units or lateral expansions of existing units) which receive hazardous waste after July 26, 1982.

Federal Authority: RCRA §3004(v)(2).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (d) There is evidence of financial responsibility for the completion of corrective action on- and off-site.

Federal Authority: RCRA §§3004(a)(6); (u); 40 CFR 264.90 and 264.101 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (20) State statutes and regulations require landfills, surface impoundments, land treatment units, and waste piles that received waste after July 26, 1982 and which qualify for interim status to comply with the groundwater monitoring, unsaturated zone monitoring, and corrective action requirements applicable to new units at the time of permitting as indicated in Revision Checklist 17 L.

Federal Authority: RCRA §3005(i); 40 CFR 264.90(a) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (21) State statutes and regulations contain special management standards for generators, transporters, marketers and burners of hazardous waste and used oil burned for energy, recovery in boilers, and industrial furnaces, as provided in 40 CFR 264.340, 265.340, 266.30-35 and 266.40-45 as indicated in Revision Checklist 19 and included in Consolidated Checklists C5, C6 and C7.

Federal Authority: RCRA §§3001, 3004, 3014(a); 40 CFR Parts 264, 265 and 266 as amended November 29, 1985 (50 FR 49164), November 19, 1986 (51 FR 41900), and April 13, 1987 (52 FR 11819).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (22) State statutes and regulations provide the authority to obtain criminal penalties for violations of the waste fuel and used oil fuel requirements, as provided in 40 CFR 266.40-45.

Federal Authority: RCRA §§3006(h), 3008(d), 3014; 40 CFR 271.16.

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (23) State statutes and regulations require compliance with closure/post-closure and financial responsibility requirements applicable to owners and operators of hazardous waste treatment, storage and disposal facilities, as indicated in Revision Checklists 24, 36, and 45 and included in Consolidated Checklists C5 and C6.

Federal Authority: RCRA §§3004 and 3005; 40 CFR Parts 264 and 265 as amended May 2, 1986 (51 FR 16422), March 19, 1987 (52 FR 8704), and December 10, 1987 (52 FR 46946).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (24) [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow qualified companies that treat, store or dispose of hazardous waste to use a corporate guarantee to satisfy liability assurance requirements as indicated in Revision Checklists 27 and 43 and included in Consolidated Checklists C5 and C6.

Federal Authority: RCRA §§2002, 3004, and 3005; 40 CFR 264.147, 264.151, and 265.147 as amended July 11, 1986 (51 FR 25350) and November 18, 1987 (52 FR 44314).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (25) State statutes and regulations require owners/operators of facilities that generate, treat or store hazardous waste in tank systems to comply with tank system standards equivalent to those indicated in Revision Checklists 28 and 52 and included in Consolidated Checklists C5 and C6.

SPA 9

Federal Authority: RCRA §§1006, 2002, 3001-3007, 3010, 3014, 3017-3019 and 7004; 40 CFR Parts 264 and 265 as amended July 14, 1986 (51 FR 25422), August 15, 1986 (51 FR 29430), and September 2, 1988 (53 FR 34079).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (26) State statutes and regulations require facilities who generate waste to provide information in their biennial reports regarding efforts taken to minimize the amount and toxicity of wastes and the results of such efforts as specified in 40 CFR 264.75(h)-(j) and 265.75(h)-(j). These requirements are indicated in Revision Checklist 30 and included in Consolidated Checklists C5 and C6.

Federal Authority: RCRA §3004; 40 CFR 264.75 and 265.75 as amended August 8, 1986 (51 FR 28556).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (27) State statutes and regulations provide hazardous waste facility requirements regarding land disposal restrictions as indicated in Revision Checklists 34, 39, 50, 66, and 78 and included in Consolidated Checklists C5, C6 and C7.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR Parts 264, 265 and 266 as amended on November 7, 1986 (51 FR 40572), June 4, 1987 (52 FR 21010), July 8, 1987 (52 FR 25760), August 17, 1988 (53 FR 31138), September 6, 1989 (54 FR 36967), and June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (28) State statutes and regulations provide that with regard to ground-water monitoring, all land based hazardous waste treatment, storage, and disposal facilities analyze for a specified core list (Part 264, Appendix IX) of chemicals plus those chemicals specified by the Regional Administrator on a site-specific basis as indicated in Revision Checklist 40 and included in Consolidated Checklists C5 and C9.

Federal Authority: RCRA §§1006, 2002(a), 3001, 3004, and 3005; 40 CFR Parts 264.98, 264.99 and Appendix IX of Part 264, and 270.14 as amended July 9, 1987 (52 FR 25942).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (29) State statutes and regulations require that owners and operators of hazardous waste treatment, storage and disposal facilities (including permit-by-rule facilities subject to 264.101) institute corrective action beyond the facility boundary to protect human health and the environment, unless the owner/operator is denied access to adjacent lands despite the owner/operator's best efforts, as indicated in Revision Checklist 44 B and included in Consolidated Checklist C5.

Federal Authority: RCRA §3004(v); 40 CFR 264.100(e) and 264.101(c) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (30) State statutes and regulations do not exempt underground injection wells from interim status requirements if the only permit issued for these wells was a permit issued under either the Safe Drinking Water Act or the Underground Injection Control Program, as indicated in Revision Checklist 44 C and included in Consolidated Checklist C9.

Federal Authority: RCRA §3004(u); 40 CFR 265.1(c)(2) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (31) State statutes and regulations require that the following be recorded, as it becomes available, and maintained in the operating record until facility closure, as indicated in Revision Checklist 45: monitoring, testing or analytical data and corrective action where required by Subpart F and §§264.226, 264.253, 264.254, 264.276, 264.278, 264.280, 264.303, 264.309, 264.347, and 264.602. These requirements are also included in Consolidated Checklist C5.

Federal Authority: RCRA §§3004 and 3005; 40 CFR 264.73(b) as amended December 10, 1987 (52 FR 46946).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (32) State statutes and regulations require that miscellaneous units comply with Subpart F regulations regarding releases from solid waste management units when necessary to comply with §264.601 through 264.603 as indicated in Revision Checklist 45 and included in Consolidated Checklist C5.

Federal Authority: RCRA §3004(u); 40 CFR 264.90(d) as amended December 10, 1987 (52 FR 46946).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (33) State statutes and regulations require environmental performance standards; monitoring, testing, analytical data, inspection, response and reporting procedures; and post-closure care for miscellaneous units as indicated in Revision Checklist 45 and included in Consolidated Checklist C5.

Federal Authority: RCRA §§3004 and 3005; 40 CFR 264.600, 264.601, 264.602, and 264.603 as amended December 10, 1987 (52 FR 46946).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (34) [OPTIONAL: This is a reduced requirement.] State statutes and regulations include changes to facility requirements regarding permit modifications relative to the requirements specified in 264.54, 264.112(c), 264.118(a), 265.112(c) and 265.118(d) as indicated in Revision Checklist 54 and included in Consolidated Checklists C5 and C6.

Federal Authority: RCRA §§3004, 3005; 40 CFR 264.54, 264.112(c), 264.118(d), 265.112(c) and 265.118(d) as amended September 28, 1988 (53 FR 37912).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (35) State statutes and regulations specify statistical methods, sampling procedures, and performance standards that can be used in groundwater monitoring procedures to detect groundwater contamination at permitted hazardous waste facilities as indicated in Revision Checklist 55 and included in Consolidated Checklist C5.

Federal Authority: RCRA §§1006, 2002(a), 3004 and 3005; 40 CFR 264.91, 264.92, 264.97, 264.98 and 264.99 as amended October 11, 1988 (53 FR 39720).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (36) State statutes and regulations allow direct action by third parties against the insurer or guarantor of an owner/operator's financial responsibilities if an owner/operator is in bankruptcy reorganization or arrangement or where (with reasonable diligence) jurisdiction in any State or Federal Court cannot be obtained over an owner/operator likely to be solvent at time of judgment.

Federal Authority: RCRA §3004(t).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (37) [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow owners and operators of landfills, surface impoundments, or land treatment units, under limited circumstances, to remain open after the final receipt of hazardous wastes in order to receive non-hazardous wastes in that unit as indicated in Revision Checklist 64 and included in Consolidated Checklists C5 and C6.

Federal Authority: RCRA §§1006, 2002(a), 3004, 3005, and 3006; 40 CFR 264.13, 264.112, 264.113, 264.142, 265.13, 265.112, 265.113, and 265.142 as amended August 14, 1989 (54 FR 33376).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (38) State statutes and regulations provide hazardous waste facility requirements regarding the Toxicity Characteristics provisions as indicated in Revision Checklist 74 and included in Consolidated Checklists C5 and C6.

Federal Authority: RCRA §§3004, 3005; 40 CFR 264.301, 265.221, and 265.273 as amended March 29, 1990 (55 FR 11798).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (39) State statutes and regulations require new and existing hazardous waste treatment, storage or disposal facilities to control organic air emissions from process vents and equipment leaks as indicated in Revision Checklist 79 and included in Consolidated Checklists C5 and C6.

SPA 9

Federal Authority: RCRA §§1006, 2002, 3004, 3005, 3010, 3014, and 7004; 40 CFR Parts 264 and 265 as amended June 21, 1990 (55 FR 25454).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

VI. LAND DISPOSAL RESTRICTIONS

Federal Authority: RCRA §§1006, 2002(a), 3001, 3004

A. State statutes and regulations restrict the land disposal of hazardous wastes as specified in 40 CFR Part 268 and indicated in Consolidated Checklist C8 which includes the provisions of Revision Checklists 34, 39, 50, 62, 63, 66, 74, and 78.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR Part 268 as amended November 7, 1986 (51 FR 40572), June 4, 1987 (52 FR 21010), July 8, 1987 (52 FR 25760), October 27, 1987 (52 FR 41295), August 17, 1988 (53 FR 31138), February 27, 1989 (54 FR 8264), May 2, 1989 (54 FR 18836), June 23, 1989 (54 FR 26594), September 6, 1989 (54 FR 36967), June 13, 1990 (55 FR 23935), March 29, 1990 (55 FR 11798), and June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. Specific provisions affecting 40 CFR Part 268 which are included in State statutes and regulations are listed below:

- (1) State statutes and regulations provide for the restrictions of the land disposal of certain spent solvents and dioxin-containing hazardous wastes as indicated in Revision Checklists 34, 39 and 50 and included in Consolidated Checklist C8.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR Part 268 as amended on November 7, 1986 (51 FR 40572), June 4, 1987 (52 FR 21010), July 8, 1987 (52 FR 25760), and August 17, 1988 (53 FR 31138).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (2) State statutes and regulations for restricting the disposal of certain California list wastes, including liquid hazardous waste containing polychlorinated biphenyls (PCBs) above specified concentrations, and hazardous waste containing halogenated organic compounds (HOCs) above specified

concentrations as indicated in Revision Checklists 39, 50, and 66 and included in Consolidated Checklist C8.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR Part 268 as amended on July 8, 1987 (52 FR 25760), October 27, 1987 (52 FR 41295), and August 17, 1988 (53 FR 31138), and September 6, 1989 (54 FR 36967).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (3) State statutes and regulations for specific treatment standards and effective dates for certain wastes from the "First Third" of the schedule of restricted wastes listed in 40 CFR 268.10 as well as land disposal restrictions for those First Third wastes for which a treatment standard is not established as indicated in Revision Checklists 50, 62, and 66 and included in Consolidated Checklist C8.

Federal Authority: RCRA §3004 (d)-(k) and (m); 40 CFR Part 268 as amended on August 17, 1988 (53 FR 31138), February 27, 1989 (54 FR 8264) and May 2, 1989 (54 FR 18836), September 6, 1989 (54 FR 36967), and June 13, 1990 (55 FR 23935).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (4) State statutes and regulations for certain treatment standards and prohibition effective dates for certain Second Third wastes and for imposing the "soft hammer" provisions of 40 CFR 268.8 on Second Third wastes for which the Agency is not establishing treatment standards as indicated in Revision Checklist 63 and included in Consolidated Checklist C8.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR Part 268 as amended June 23, 1989 (54 FR 26594).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (5) State statutes and standards for treatment standards and effective dates for certain First Third "soft hammer" wastes⁴ as well as for certain wastes

⁴ "Soft hammer" wastes are those wastes for which EPA did not promulgate treatment standards by their respective effective dates. These wastes could continue to be disposed of in a landfill or surface impoundment until May 8, 1990 if certain demonstrations were made and the technology requirements of RCRA §3004(o) were met. Other types of land disposal (e.g., underground injection) were not

SPA 9

originally contained in the Third Third of the Schedule as indicated in Revision Checklist 63 and included in Consolidated Checklist C8.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR Part 268 as amended June 23, 1989 (54 FR 26594).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (6) State statutes and regulations provide specific treatment standards and effective dates for the "Third Third" wastes, "soft hammer" First and Second Third wastes⁴, five newly listed wastes, four wastes that fall into the F002 and F005 (spent solvent) waste codes, F025, mixed radioactive/hazardous wastes, characteristic wastes, and multi-source leachate, as well as establish revised treatment standards for petroleum refining hazardous wastes (K048-K052) as indicated in Revision Checklist 78 and Consolidated Checklist C8.

Federal Authority: RCRA §§3001 and 3004 (d)-(k) and (m); 40 CFR 268 as amended June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (7) [OPTIONAL: This is a reduced requirement.] State statutes and regulations provide for alternate treatment standards for lab packs meeting certain criteria as indicated in Revision Checklist 78 and Consolidated Checklist C8.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR 264.316(f), 265.316(f), 268.7(a)(7), 268.7(a)(8), 268.42(c), 268.42(c)(1)-(4), and 268 Appendices IV and V, as amended June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

VII. REQUIREMENTS FOR PERMITS

Federal Authority: RCRA §§3005, 7004; 40 CFR 271.13 and 271.14 as amended April 1, 1983 (48 FR 14146), June 30, 1983 (48 FR 30113), and September 22, 1986 (51 FR 33712).

similarly restricted. On May 6, 1990, wastes for which EPA had not established treatment standards became prohibited from all types of land disposal. This latter requirement is referred to as the "hard hammer" provision and ended the soft hammer provisions which were in effect prior to May 6, 1990.

A. State statutes and regulations provide permit requirements consistent with the specifications of 271.13 and 271.14 as indicated in Consolidated Checklist C9 (formerly Checklist V) which includes the amendments of Revision Checklists 1, 2, 6, 11, 14, 17 D, 17 F, 17 L, 17 M, 17 N, 17 O, 17 P, 17 Q, 17 S, 23, 24, 28, 34, 35, 38, 39, 40, 44 A, 44 C, 44 D, 44 E, 44 F, 44 G, 45, 48, 52, 54, 59, 60, 61, 64, 70, 78, and 79.

[Where there are no State regulations covering one or more of the procedural requirements designated in Consolidated Checklist C9, and the State has agreed in the MOA to follow equivalent requirements, the Attorney General's Statement must provide a discussion of the State's authority (1) to enter into such an agreement and (2) to carry out the agreement. This discussion should include an explanation of why (under any State administrative procedure act) the particular requirements the State has agreed to follow in the issuance of all hazardous waste permits need not be in the form of rules. Also, States need not use a two-part permit application process. The State application process must, however, require information in sufficient detail to satisfy the requirements of §§270.13 through 270.29.]

Federal Authority: RCRA §§3005, 7004; 40 CFR Parts 124 and 270 as amended January 28, 1983 (48 FR 3977), April 1, 1983 (48 FR 14146), June 30, 1983 (48 FR 30113), September 1, 1983 (48 FR 39611), April 24, 1984 (49 FR 17716), December 4, 1984 (49 FR 47390), January 14, 1985 (50 FR 1978), July 15, 1985 (50 FR 28702), March 24, 1986 (51 FR 10146), May 2, 1986 (51 FR 16422), July 14, 1986 (51 FR 25422), August 15, 1986 (51 FR 29430), November 7, 1986 (51 FR 40572), March 16, 1987 (52 FR 8072), June 22, 1987 (52 FR 23447), September 9, 1987 (52 FR 33936), July 8, 1987 (52 FR 25760), July 9, 1987 (52 FR 25942), December 1, 1987 (52 FR 45788), December 10, 1987 (52 FR 46946), July 19, 1988 (53 FR 27164), July 26, 1988 (53 FR 28118), September 2, 1988 (53 FR 34079), September 26, 1988 (53 FR 37396), September 28, 1988 (53 FR 37912), October 24, 1988 (53 FR 41649), January 4, 1989 (54 FR 246), January 9, 1989 (54 FR 615), January 30, 1989 (54 FR 4286), March 7, 1989 (54 FR 9596), August 14, 1989 (54 FR 33376), June 1, 1990 (55 FR 22520), and June 21, 1990 (55 FR 25454).

B. Specific provisions amending 40 CFR Parts 124 and 270 since January 1, 1983 that are included in State statutes and requirements as indicated below. Also included are requirements for surface impoundments regarding RCRA 3005(j)(6)(A), 3005(j)(2)-(9) and 3005(j)(11). These latter requirements are not covered by a checklist.

- (1) State statutes and regulations requiring 1) the Director to prepare on a biennial basis summary information on the quantities and types of hazardous waste generated, transported, treated, stored and disposed during the preceding odd numbered year, and 2) that the biennial report must be submitted as specified in the permit and must cover facility activities during odd-numbered calendar years. These requirements are indicated in Revision Checklist 1 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§3002, 3004; 40 CFR 270.5 and 270.30 as amended January 28, 1983 (48 FR 3977).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (2) State statutes and regulations require the permittee to take steps to minimize releases to the environment in accordance with 40 CFR Part 270.30(d) as indicated in Revision Checklist 2 and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005(c); 40 CFR Part 270 as amended September 1, 1983 (48 FR 39611).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (3) [OPTIONAL: This is a reduced requirement.] Facility owners or operators are given the opportunity to cure deficient Part A applications in accordance with 40 CFR 270.70(b) before failing to qualify for interim status as indicated in Revision Checklist 6 and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005; 40 CFR Part 270 as amended April 24, 1984 (49 FR 17716).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (4) State statutes and regulations incorporating corrections to the EPA manual "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods" as indicated by Revision Checklists 11 and 35 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§2002, 3001; 40 CFR 270.6(a) as amended December 4, 1984 (49 FR 47390) and March 16, 1987 (52 FR 8072).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (5) State statutes and regulations require special permitting standards for facilities managing dioxin wastes as indicated in Revision Checklist 14 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§3001, 3005; 40 CFR 270.14, 270.16, 270.18, and 270.21 as amended January 14, 1985 (50 FR 1978).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (6) State statutes and regulations 1) address record retention, 2) treat as having interim status those existing facilities that become subject to RCRA due to a statutory or regulatory change, and 3) restrict interim status from any facilities previously denied a hazardous waste permit or that had their authority to operate a facility under RCRA terminated as indicated in Revision Checklist 17 D and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005; 40 CFR 270.30(j)(2) and 270.70(a) & (c) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (7) State statutes and regulations require that if bulk or non-containerized waste or wastes containing free liquids is to be landfilled prior to May 8, 1985, an explanation of how the requirements of 264.314(a) will be complied with will be submitted with the Part B information as indicated in Revision Checklist 17 F and included in Consolidated Checklist C9.

Federal Authority: RCRA §§3004, 3005; 40 CFR 270.21(h) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (8) State statutes and regulations require that in regard to permits by rules UIC and NPDES permits issued after November 8, 1984, must comply with the requirements specified in 264.101 as specified in Revision Checklist 17 L and included in Consolidated Checklist C9.

Federal Authority: RCRA §3004; 40 CFR 270.60 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (9) [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow a facility (1) to construct an approved TSCA facility for burning PCBs without first obtaining a RCRA permit and (2) to subsequently apply for a RCRA permit in accordance with Revision Checklist 17 M and included in Consolidated Checklist C9.

SPA 9

Federal Authority: RCRA §3005(a); 40 CFR 270.10(f)(3) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (10) State statutes and regulations require review of land disposal permits every five years and modification of such permits as necessary to assure compliance with the requirements in Parts 124, 260 through 266, and 270, as indicated in Revision Checklist 17 N and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005(c)(3); 40 CFR 270.41, 270.50 as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (11) State statutes and regulations require permits to contain any conditions necessary to protect human health and the environment in addition to any conditions required by regulations as indicated in Revision Checklist 17 O and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005(c)(3); 40 CFR 270.32(b) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (12) State statutes and regulations require that:
- (a) For land disposal facilities granted interim status prior to 11/8/84, interim status terminates 11/8/85 unless a Part B application and certification of compliance with applicable groundwater monitoring and financial responsibility requirements are submitted by 11/8/85, as indicated in Revision Checklist 17 P and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005(e); 40 CFR 270.73(c) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (b) For land disposal facilities in existence on the effective date of statutory or regulatory changes under this Act that render the facility subject to the requirement to have a permit and which is granted interim status, interim status terminates 12 months after the date the facility first becomes subject to such permit requirement unless a Part B application and certification of compliance with applicable groundwater monitoring and financial responsibility requirements are submitted by that date as indicated in Revision Checklist 17 P and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005(e); 40 CFR 270.73(d) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (c) Interim status terminates for incinerator facilities by 11/8/89 unless the owner/operator submits a Part B application by 11/8/86 as indicated in Revision Checklist 17 P and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005(c)(2)(C); 40 CFR 270.73(e) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (d) Interim status terminates for any facility other than a land disposal or an incineration facility by 11/8/92 unless the owner/operator submits a Part B application by 11/8/88 as indicated in Revision Checklist 17 P and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005(c)(2)(C); 40 CFR 270.73(f) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (13) [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow facilities to qualify for interim status if they (1) are in existence on the effective date of statutory or regulatory changes that render the facility subject to the requirement to have a permit and (2) comply with §270.70(a) as indicated in Revision Checklist 17 P and included in Consolidated Checklist C9.

SPA 9

Federal Authority: RCRA §3005(e); 40 CFR 270.70(a) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (14) State statutes and regulations provide that facilities may not qualify for interim status under the State's analogue to Section 3005(e) if they were previously denied a Section 3005(c) permit or if authority to operate the facility has been terminated as indicated in Revision Checklist 17 P and Consolidated Checklist C9. (Also see Subsection VII B6.)

Federal Authority: RCRA §3005(c)(3); 40 CFR 270.70(c) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (15) [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow the issuance of a one-year research, development, and demonstration permit (renewable 3 times) for any hazardous waste treatment facility which proposes an innovative and experimental hazardous waste treatment technology or process not yet regulated as indicated in Revision Checklist 17 Q and included in Consolidated Checklist C9. If adopted, however, the State must require the facility to meet RCRA's financial responsibility and public participation requirements and retain authority to terminate experimental activity if necessary to protect health or the environment.

Federal Authority: RCRA §3005(g); 40 CFR 270.65 as amended July 15, 1985 (50 FR 28702)

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (16) State statutes and regulations require:
- (a) Surface impoundments in existence on November 8, 1984 [or subsequently becoming subject to RCRA pursuant to §3005(j)(6)(A) or (B)] to comply with the double liner, leachate collection, and groundwater monitoring requirements applicable to new units by November 8, 1988 [or the date specified in §3005(j)(6)(A) or (B)] or to stop treating, receiving, or storing hazardous waste, unless the surface impoundment qualifies for a special exemption under §3005(j).

Federal Authority: RCRA §3005(j)(6)(A).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (b) Surface impoundments to comply with the double liner, leachate collection and ground-water monitoring requirements if the Agency allows a hazardous waste prohibited from land disposal under §3004(d), (e) or (g) to be placed in such impoundments.

Federal Authority: RCRA §3005(j)(11).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (c) [OPTIONAL: This is a reduced requirement.] State statutes and regulations may allow variances from the above requirements as provided in RCRA §3005(j)(2-9) and (13). However, the availability of such variances must be restricted as provided in RCRA §3005(j).

Federal Authority: RCRA §3005(j)(2-9).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (17) State statutes and regulations require permit applicants for landfills or surface impoundments to submit exposure information as indicated in Revision Checklist 17 S and included in Consolidated Checklist C9.

Federal Authority: RCRA §3019(a); 40 CFR 270.10(j) as amended July 15, 1985 (50 FR 28702).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (18) State statutes and regulations require that generators, generating greater than 100 kg but less than 1000 kg of hazardous waste in a calendar month, who treat, store or dispose of these wastes on-site must submit their Part A application no later than March 24, 1987, as indicated in Revision Checklist 23 and included in Consolidated Checklist C9.

SPA 9

Federal Authority: RCRA §3001(d); 40 CFR Part 270 as amended March 24, 1986 (51 FR 10146).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (19) State statutes and regulations require the following as indicated in Revision Checklist 24 and included in Consolidated Checklist C9. (Also see Subsection VII B(35) and (36).)
- (a) Documentation in the Part B application that the notice in the deed required under §264.119 has been filed for facilities with hazardous waste disposal units closed prior to the submission of the application.
 - (b) Demonstration of financial assurance must be included with the submission of the Part B application, or at least 60 days prior to the initial receipt of hazardous waste, whichever is later.
 - (c) When there is a change in ownership or control of a facility, the new owner or operator must demonstrate financial assurance within six months of the ownership transfer. The old owner or operator is responsible for financial assurance obligations if the new owner or operator fails to meet his obligations.

Federal Authority: RCRA §3005; 40 CFR 270.14(b)(14), (15) & (16), 270.42(d) and 270.72(a)(4) as amended May 2, 1986 (51 FR 16422).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (20) State statutes and regulations require general and specific Part B information requirements as indicated in Revision Checklist 28 and included in Consolidated Checklist C9. Additionally, as indicated in these checklists, changes, made solely to comply with 265.193 for tanks and containers during interim status, do not constitute reconstruction as specified in 270.72(e). (Also see Subsection VII B (35) and (36)).

Federal Authority: RCRA §3005; 40 CFR 270.14, 270.16 and 270.72 as amended July 14, 1986 (51 FR 25422) and August 15, 1986 (51 FR 29430).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (21) State statutes and regulations make the following requirements: 1) a copy of the notice of approval must be submitted in the Part B application for

disposal facilities subject to a case-by-case extension under 268.5 or a petition has been approved under 268.6, and 2) allow, as a minor permit modification, treatment of hazardous wastes not previously specified in the permit under four specified situations. These requirements are indicated in Revision Checklist 34 and included in Consolidated Checklist C9.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR Part 270 as amended November 7, 1986 (51 FR 40572).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (22) State statutes and regulations provide for additional information and engineering feasibility plan requirements regarding groundwater contamination detected at the time of Part B permit application as indicated in Checklist 38 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§3004, 3005; 40 CFR 270.14 as amended June 22, 1987 (52 FR 23447) and September 9, 1987 (52 FR 33936).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (23) [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow owners or operators to use the minor modification process for changes made to treat or store restricted wastes in tanks or containers to comply with the 40 CFR Part 268 land disposal restrictions provided the requirements of 270.42(o) and (p) are met as indicated in Revision Checklist 39 and included in Checklist C9.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR 270.42(o) & (p) as amended July 8, 1987 (52 FR 25760).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (24) State statutes and regulations provide for changes during interim status to treat or store in containers or tanks hazardous waste subject to land disposal restrictions when specified conditions are met as indicated in Revision Checklist 39 and included in Consolidated Checklist C9.

Federal Authority: RCRA §3004(d)-(k) and (m); 40 CFR 270.72(e) as amended July 8, 1987 (52 FR 25760).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (25) State statutes and regulations require owners and operators of facilities seeking permits to provide descriptive information on the solid waste management units and all available information pertaining to any releases from the units as indicated in Revision Checklist 44 A and included in Consolidated Checklist C9.

Federal Authority: RCRA §3004(u); 40 CFR 270.14 as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (26) State statutes and regulations require UIC facility owners/operators to submit information related to corrective action with their UIC applications as indicated in Revision Checklist 44 C and included in Consolidated Checklist C9.

Federal Authority: RCRA §3004(u); 40 CFR 270.60(b)(3) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (27) State statutes and regulations allow the permit granting agency to initiate modifications to a permit without first receiving a request from the permittee, in cases where statutory changes or new or amended regulatory standards or judicial decisions affect the basis of the permit as indicated in Revision Checklists 44 D and 54 and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005(c); 40 CFR 270.41(a)(3) as amended December 1, 1987 (52 FR 45788) and September 28, 1988 (53 FR 37912).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (28) State statutes and regulations require that permittees must comply with new requirements imposed by the land disposal restrictions promulgated under

Part 268 even when there are contrary permit conditions, as indicated in Revision Checklist 44 E and included in Consolidated Checklist C9.

Federal Authority: RCRA §3006(g); 40 CFR 270.4(a) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (29) State statutes and regulations require information from permit applicants concerning permit conditions necessary to protect human health and the environment as indicated in Revision Checklist 44 F and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005(c); 40 CFR 270.10(k) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (30) State statutes and regulations require post-closure permits for all landfills, surface impoundments, waste piles and land treatment units receiving hazardous waste after July 26, 1982, unless closure by removal as provided under 270.1(c)(5) and (6) can be demonstrated as indicated in Revision Checklist 44 G and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005(i); 40 CFR 270.1(c) as amended December 1, 1987 (52 FR 45788).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (31) State statutes and regulations require that all owners and operators of units that treat, store, or dispose of hazardous waste in miscellaneous units must comply with the general application requirements (including Part A permit requirements), the Part B general application requirements of §270.14, and specific Part B information requirements for miscellaneous units as indicated in Revision Checklists 45 and 59 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§3004 and 3005; 40 CFR 264.600, 270.14 and 270.23 as amended December 10, 1987 (52 FR 46946) and January 9, 1989 (54 FR 615).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (32) State statutes and regulations incorporate the revisions to the definition of "elementary neutralization unit" and "wastewater treatment unit" as indicated in Revision Checklist 52 and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005; 40 CFR 270.2 as amended September 2, 1988 (53 FR 34079).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (33) [OPTIONAL: This is a reduced requirement.] State statutes and regulations provide owners and operators more flexibility to change specified permit conditions, to expand public notification and participation opportunities, and to allow for expedited approval if no public concern exists for a proposed permit modification. Owner/operator requested permit modifications are categorized into three classes with administrative procedures for approving modifications established in each class. These changes are as indicated in Revision Checklists 54 and 78 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§2002(a), 3004, 3005, and 3006; 40 CFR Parts 124 and 270 as amended September 28, 1988 (53 FR 37912), October 24, 1988 (53 FR 41649), and June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (34) State statutes and regulations require that existing incinerator facilities must either conduct a trial burn or submit other information as specified in 270.19(a) or (c) before a permit can be issued for that facility as indicated in Revision Checklist 60 and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005; 40 CFR Part 270 as amended January 30, 1989 [54 FR 4286).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (35) [OPTIONAL: This is a reduced requirement.] State statutes and regulations allow greater flexibility to interim status facilities to make changes during interim status following Director approval, as indicated in Revision Checklist 61 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§2002(a), 3004, 3005, 3006; 40 CFR 270.72 as amended March 7, 1989 (54 FR 9596).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (36) [OPTIONAL]: This is a reduced requirement.] State statutes and regulations lift the reconstruction limit for changes to certain interim status units 1) necessary to comply with Federal, State, or local requirements, 2) necessary to allow continued handling of newly listed or identified hazardous waste, 3) made in accordance with an approved closure plan, and 4) made pursuant to a corrective action order as indicated in Revision Checklist 61 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§2002(a), 3004, 3005, and 3006; 40 CFR 270.72 as amended March 7, 1989 (54 FR 9596).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (37) [OPTIONAL]: This is a reduced requirement.] State statutes and regulations provide that a permit can be denied for the active life of a facility while a decision on post-closure permitting is pending as indicated in Revision Checklist 61 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§2002(a), 3004, 3005, and 3006; 40 CFR 124.1, 124.15, 124.19, 270.1, 270.10 and 270.29 as amended March 7, 1989 (54 FR 9596).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (38) [OPTIONAL]: This is a reduced requirement.] State statutes and regulations classify as Class 1 certain permit modifications requested by the owner/operator necessary to enable permitted facilities to comply with the land disposal restrictions as indicated in Revision Checklist 61 and included in Consolidated Checklist C9. Specifically these modifications include 1) adding restricted wastes treated to meet applicable 40 CFR Part 268 treatment standards or adding residues from treating "soft hammer" wastes, 2) adding certain wastewater treatment residues and incinerator ash, 3) adding new wastes for treatment in tanks or containers under certain limited conditions, and 4) adding new treatment processes that are necessary to treat restricted wastes to meet treatment standards as long as the treatment processes are to take place in tanks or containers.

SPA 9

Federal Authority: RCRA §§2002(a), 3004, 3005 and 3006; 40 CFR 270.42 as amended March 7, 1989 (54 FR 9596).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (39) [OPTIONAL: This is a reduced requirement.] State statutes and regulations include in the Permit Modification List as a Class 2 modification the extension of the closure period to allow a landfill, surface impoundment or land treatment unit to receive nonhazardous wastes after final receipt of hazardous wastes as indicated in Revision Checklist 64 and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005; 40 CFR 270.42, Appendix I as amended August 14, 1989 (54 FR 33376).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (40) State statutes and regulations incorporate updates to 40 CFR Part 124 as indicated in Revision Checklist 70 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§6901 and 6902; 40 CFR 124.3, 124.5, 124.6, 124.10 and 124.12 as amended April 1, 1983 (48 FR 14146), June 30, 1983 (48 FR 30113), July 26, 1988 (53 FR 28118), September 26, 1988 (53 FR 37396), and January 4, 1989 (54 FR 246).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (41) State statutes and regulations include changes to the Permit Modification List necessitated by the Third Third Land Disposal Restrictions as indicated in Revision Checklist 78 and included in Consolidated Checklist C9.

Federal Authority: RCRA §§3004(d)-(k) and (m) and 3005; 40 CFR 270.42, Appendix I as amended June 1, 1990 (55 FR 22520).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

- (42) State statutes and regulations provide for Part B general content requirements and specific Part B information requirements for process vents

and equipment as indicated in Revision Checklist 79 and included in Consolidated Checklist C9.

Federal Authority: RCRA §3005; 40 CFR 270.14(b), 270.24, and 270.25 as amended June 21, 1990 (55 FR 25454).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

VIII. INSPECTIONS

State law provides authority for officers engaged in compliance evaluation activities to enter any conveyance, vehicle, facility or premises subject to regulation or in which records relevant to program operation are kept in order to inspect, monitor, or otherwise investigate compliance with the State program including compliance with permit terms and conditions and other program requirements. (States whose law requires a search warrant prior to entry conform with this requirement.)

Federal Authority: RCRA §3007; 40 CFR 271.15.

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

IX. ENFORCEMENT REMEDIES

State statutes and regulations provide the following:

A. Authority to restrain immediately by order or by suit in State court any person from engaging in any unauthorized activity which is endangering or causing damage to public health or the environment.

Federal Authority: RCRA §3006; 40 CFR 271.16(a)(1).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B. Authority to sue in courts of competent jurisdiction to enjoin any threatened or continuing violation of any program requirement, including permit conditions, without the necessity of a prior revocation of the permit.

Federal Authority: RCRA §3006; 40 CFR 271.16(a)(2).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

SPA 9

C. Authority to assess or sue to recover in court civil penalties in at least the amount of \$10,000 per day for any program violation.

Federal Authority: RCRA §3006; 40 CFR 271.16(a)(3)(i).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

D. Authority to obtain criminal penalties in at least the amount of \$10,000 per day for each violation, and imprisonment for at least six months against any person who knowingly transports any hazardous waste to an unpermitted facility; who treats, stores, or disposes of hazardous waste without a permit; or who makes any false statement or representation in any application, label, manifest, record, report, permit, or other document filed, maintained, or used for the purposes of program compliance.

Federal Authority: RCRA §3006; 40 CFR 271.16(a)(3)(ii).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

X. PUBLIC PARTICIPATION IN THE STATE ENFORCEMENT PROCESS

State laws and regulations provide for public participation in the State enforcement process by providing either:

A. Authority to allow intervention as of right in any civil or administrative action to obtain the remedies specified in Section VII A, B and C above by any citizen having an interest which is or may be adversely affected; or

B. Assurances that the State agency or enforcement authority will:

- (1) Investigate and provide written response to all citizen complaints duly submitted;
- (2) Not oppose intervention by any citizen where permissive intervention may be authorized by statute, rule, or regulations; and
- (3) Publish and provide at least 30 days for public comment on any proposed settlement of a State enforcement action.

Federal Authority: RCRA §7004; 40 CFR 271.16(d).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XI. AUTHORITY TO SHARE INFORMATION WITH EPA

State statutes and regulations provide authority for any information obtained or used in the administration of the State program to be available to EPA upon request without restriction.

Federal Authority: RCRA §3007(b); 40 CFR 271.17.

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XII. AUTHORITY OVER INDIAN LANDS

[Where a State seeks authority over Indian lands, appropriate analysis of the State's authority should be included here.]

Federal Authority: 40 CFR 271.7(b).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XIII. EXPOSURE ASSESSMENTS

A. State laws and regulations allow the State to make assessment information available to the Agency for Toxic Substances and Disease Registry. (See CERCLA §104(i).)

Federal Authority: RCRA §3019(b).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XIV. RADIOACTIVE MIXED WASTES

A. State statutes and regulations define solid wastes to include the hazardous components of radioactive mixed wastes, July 3, 1986 [51 FR 24504]. See State Program Advisory (SPA) #2.

Federal Authority: RCRA §§1004(27) and 3001(b).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

XV. AVAILABILITY OF INFORMATION

A. State statutes and regulations provide that:

- (1) All records shall be available to the public unless they are exempt from the disclosure requirements of the Federal FOIA, 5 U.S.C. 552;
- (2) All nonexempt records will be available to the public upon request regardless of whether any justification or need for such records has been shown by the requestor;
- (3) The same types of records would be available to the public from the State as would be available from EPA. [In making this certification, the Attorney General should be aware of the types of documents EPA generally releases under the FOIA, subject to claims of business confidentiality: permit applications; biennial reports from facilities; closure plans; notification of a facility closure; contingency plan incident reports; delisting petitions; financial responsibility instruments; ground-water monitoring data (note that exemptions 5 U.S.C. 552(b)(9) of the FOIA applies to such wells as oil and gas, rather than to ground-water wells); transporter spill reports; international shipment reports; manifest exception, discrepancy and unmanifested waste reports; facility EPA identification numbers; withdrawal requests; enforcement orders; and inspection reports]; and,
- (4) Information is provided to the public in substantially the same manner as EPA as indicated in 40 CFR Part 2 and the Revision Checklist in Appendix N of the State Authorization Manual. OPTIONAL: Where the State agrees to implement selected provisions through the use of a Memorandum of Agreement (MOA) the Attorney General must certify that: "The State has the authority to enter into and carry out the MOA provisions and there are no State statutes (e.g., State Administrative Procedures Acts) which require notice and comment or promulgation of regulations for the MOA procedures to be binding.]
- (5) OPTIONAL: The State statutes and regulations protect Confidential Business Information (CBI) to the same degree as indicated in 40 CFR 2 and the Revision Checklist in Appendix N of the State Authorization Manual. Note that States do not have to protect CBI to satisfy 3006(f). However, if a State does extend protection to CBI, then it cannot restrict the release of information that EPA would require to be disclosed.]

Federal Authority: RCRA §3006(f); 40 CFR §271.17(c).

Citation of Laws and Regulations; Date of Enactment and Adoption

Remarks of the Attorney General

B31
6

XVI. MEMORANDUM OF AGREEMENT (MOA)

[If the State uses the MOA to satisfy Federal procedural requirements, the Attorney General must certify the following:

- (1) The State has the authority to enter into the agreement,
- (2) The State has the authority to carry out the agreement, and
- (3) No applicable State statute (including the State Administrative Procedure Act) requires that the procedure be promulgated as a rule in order to be binding.]

National Technical Information Service
U.S. Department of Commerce
Springfield, VA 22161*

This report was printed specifically for your order from our collection of more than 2 million technical reports.

For economy and efficiency, NTIS does not maintain stock of its vast collection of technical reports. Rather, most documents are printed for each order. Your copy is the best possible reproduction available from our master archive. If you have any questions concerning this document or any order you placed with NTIS, please call our Customer Services Department at (703)487-4660.

Always think of NTIS when you want:

- Access to the technical, scientific, and engineering results generated by the ongoing multibillion dollar R&D program of the U.S. Government.
- R&D results from Japan, West Germany, Great Britain, and some 20 other countries, most of it reported in English.

NTIS also operates two centers that can provide you with valuable information:

- The Federal Computer Products Center - offers software and datafiles produced by Federal agencies.
- The Center for the Utilization of Federal Technology - gives you access to the best of Federal technologies and laboratory resources.

For more information about NTIS, send for our FREE *NTIS Products and Services Catalog* which describes how you can access this U.S. and foreign Government technology. Call (703)487-4650 or send this sheet to NTIS, U.S. Department of Commerce, Springfield, VA 22161. Ask for catalog, PR-827.
