Appendix P

Glossary of Terms

APPENDIX P

GLOSSARY OF TERMS

1-Year average concentration – The average of all measured detections and substituted zeros for non-detects for a given calendar year. This average is used in the trends analysis section and differs from an annual average because the criterion for the quarterly averages is not required for its calculation.

Accuracy – Indicates the extent to which experimental measurements represent their corresponding "true" or "actual" values. Also referred to as bias.

Acute risk – Risk associated with short-term exposures; acute health effects develop from a single exposure or from exposures over short periods of time (EPA, 2010).

Air Quality System (AQS) – EPA's online repository of ambient air quality data.

Air Toxics – Pollutants that are known or suspected to have the potential for negative human health effects.

Analytical precision – A measurement of errors associated with the process of analyzing environmental samples.

Annual average concentration – The average of all measured detections and substituted zeros for non-detects for a given calendar year. The calculation of annual averages includes the following criteria: 1) three valid quarterly averages must be available and 2) method completeness must be greater than or equal to 85 percent.

Anthropogenic sources – Sources of emissions that are man-made.

Audit samples – Samples that are prepared by an external source and analyzed by the laboratory, where the respective concentrations of the audit samples are unknown to the laboratory. The laboratory analyzes the samples and the external source compares the measured concentrations to the reference concentrations of those audit samples and calculates a percent difference.

Average Annual Daily Traffic (AADT) – The annual traffic count divided by the number of days in the year, and incorporates both directions of traffic (FHWA, 2013b).

Back Trajectory – A systematic way to trace the origin of an air parcel in relation to the location where it is currently being measured in time steps using meteorological parameters such as wind speed, wind direction, and atmospheric pressure.

Internal standard – A standard added to a test portion of a sample in a known amount and carried through the entire determination procedure as a reference for calibrating and controlling the precision and bias of the analytical method.

Mean (arithmetic), also called *average* – A measure of central tendency that is the sum of all the values of a set of measurements divided by the number of values in the set.

Measured detection – A quantifiable level or measurement of a given pollutant by a designated analytical instrument.

Method Detection Limit (MDL) – The lowest concentration at which laboratory equipment have been experimentally determined to reliably quantify concentrations of selected pollutants to a specific confidence level.

Method precision (also called sampling and analytical precision) – Quantifies random errors associated with collecting ambient air samples and analyzing the samples in the laboratory.

Measurement Quality Objective (MQO) – Objectives designed to evaluate and control the various phases of the measurement process (sampling, preparation, analysis) to ensure that the measurements meet the overall program objective(s).

Metropolitan Statistical Area (MSA) – A geographic entity defined by the Office of Management and Budget containing a core urban area of 50,000 people or more (Census Bureau, 2013b).

Micropolitan Statistical Area (MSA) – A geographic entity defined by the Office of Management and Budget containing a core urban area of at least 10,000 people but less than 50,000 people (Census Bureau, 2013b).

Minimum Risk Level (MRL) – A concentration of a hazardous substance that is likely to be without appreciable risk of adverse noncancer health effects over a specified duration of exposure (ATSDR, 2013b).

Noncancer risk – The risk associated with health effects other than cancer, such as asthma.

Noncancer hazard approximation – An approximation, based on the annual average, of the Noncancer Hazard Quotient (HQ), where an HQ greater than 1.0 indicates that adverse health effects are possible. If an HQ is equal to or less than 1.0, no adverse health effects are expected as a result of exposure (EPA, 2011b).

Pearson correlation coefficient – A number between -1 and +1 that indicates the degree of correlation between two variables or sets of numbers. The closer to -1 or +1, the stronger the linear relationship between the two (i.e., the better the correlation). Values close to zero suggest no correlation between the two variables.

Point sources include large industrial facilities but also many smaller industrial and commercial facilities, which have traditionally been included in Nonpoint sources (EPA, 2013c).
