FOREWORD

One of the Congress' major goals in enacting the Toxic Substances Control Act (TSCA) was to create an information base to help the Environmental Protection Agency (EPA) and other Federal agencies improve their knowledge of the potentially serious human health and environmental risks posed by chemical substances. Publication of this TSCA Inventory of chemical substances in commerce is an important step toward that goal.

For the first time, the Nation now has a detailed list of chemicals manufactured in, or imported into, the United States. This information, which will be updated periodically, is a key building block for current and future efforts to identify and evaluate hazards associated with chemical substances already in commercial use.

Equally important is the fact that publication of the TSCA Inventory sets the stage for EPA's new chemical review program. Thirty days after the official publication date of the TSCA Inventory, manufacturers (including bulk importers) must notify the Agency before beginning manufacture (or bulk importation) of chemical substances that are not on the Inventory. Their notifications will give EPA a unique opportunity to identify and control potential problems before new chemicals are introduced.

A great many people in government and industry have contributed to the compilation of the TSCA Inventory. I deeply appreciate the time and talent they devoted to this task. They have created a document which will have enduring value to all persons involved in the challenge of reaping the benefits of chemical technology without exposing the Nation to unintended and unreasonable risks.

INTRODUCTION

The Toxic Substances Control Act (TSCA) Chemical Substance Inventory: Initial Inventory and its indices are published by the U.S. Environmental Protection Agency (EPA) in accordance with section 8 of TSCA (Public Law 94-469). The Initial Inventory lists over 44,000 chemical substances (as defined by TSCA), identified by a preferred name and a unique Chemical Abstracts Service (CAS) Registry Number. Each preferred name (and, for some substances, an associated definition) identifies the composition of a chemical substance or category of chemical substances which has been manufactured, imported, or processed for a commercial purpose in the United States since January 1, 1975. All chemical substances appearing on the Initial Inventory, with the exception of "naturally occurring substances" (as defined by the regulations), which are automatically included on the Inventory, have been identified from reports submitted to EPA by manufacturers and importers in response to the TSCA inventory reporting regulations (40 CFR Part 710). The accompanying indices, in three volumes, are intended to aid in the use of the Initial Inventory by providing different access routes to the published list.

Before discussing the contents and use of the Initial Inventory and its indices, two points merit special emphasis: the purpose of the Inventory and its changing nature.

The Chemical Substance Inventory defines what chemical substances are "existing" in U.S. commerce for purposes of implementing the Toxic Substances Control Act. Substances that are not included on the Inventory are considered "new." Section 5 of TSCA requires premanufacture notification for new chemical substances. The Initial Inventory does not purport to identify *all* chemical substances currently in U.S. commerce, however, since some such substances are specifically excluded from the Inventory by regulation. Furthermore, the Inventory is not intended to be a list of toxic chemicals; toxicity was not a criterion used in determining the eligibility of chemical substances for inclusion on the Inventory.

The Inventory is intended to be dynamic, and will continue to change. For example, chemical substances which are not on the Initial Inventory but which have been processed, or imported as part of mixtures or articles since January 1, 1975 may be added to the Inventory during a 210-day reporting period beginning on the publication date of this Initial Inventory. In addition, chemical substances that complete premanufacture review will be added to the Inventory when they begin to be manufactured or imported for commercial purposes. Clearly, the published Inventory can never include all of the substances required to be listed under section 8(b) of TSCA. EPA will periodically publish supplements to keep the printed Inventory as current as possible. A current Inventory is continually maintained by the Chemical Information Division of EPA's Office of Toxic Substances.

This published list does *not* include all substances that were reported for the Initial Inventory. Substances that were manufactured or imported for the first time after May 1, 1978

may have been reported too late to be included on the published list. Some reported substances were inadequately identified, and publication of these substances has been delayed pending resolution of such identity problems. In July or August of 1979, EPA will publish the first supplement to the Initial Inventory, which is expected to include the substances that were reported for the Initial Inventory but do not appear on this published list for the reasons stated above. After processing the reports received during the 210-day reporting period for processors and importers of chemical substances as part of mixtures or articles, EPA will republish the Inventory sometime in 1980. That list will be called the Revised TSCA Chemical Substance Inventory.

A person who intends to manufacture or import a chemical substance that does not appear on the published Inventory or one of its supplements may contact EPA to determine whether the substance is, in fact, new. This may be accomplished by calling EPA's Industry Assistance Office at (800)424-9065 (in Washington, D.C., please call 554-1404) or by writing to: Director, Industry Assistance Office (TS-799), U.S. Environmental Protection Agency, 401 M Street, S.W., Washington, D.C. 20460. EPA will accept requests for determinations over the telephone, but will transmit the determinations in writing. All inquiries concerning the contents or use of the Inventory should be directed to the Industry Assistance Office.

The Initial Inventory lists, in ascending CAS Registry Number order, the preferred names of chemical substances included on the Inventory. Some names are accompanied by a dagger symbol (†) which denotes chemical substances that are more precisely defined in Appendix A: *Chemical Substance Definitions*. Volume I also includes Appendix B: *Confidential Chemical Substance Identities*, which lists generic (less specific) names for chemical substances that are included on the Inventory, but whose identities have been determined by EPA to be entitled to confidential treatment. These names were developed according to procedures specified in the EPA publication, "Guidelines for Creating Proposed Generic Names for Confidential Chemical Substance Identities for the TSCA Inventory." Each generic name actually describes a category of chemical substances. However, of the substances covered by a particular generic name, only those that were actually reported for the Inventory are considered to be included. Therefore, if a person believes that a chemical substance he intends to manufacture, import, or process for a commercial purpose may be included on the Inventory under a generic name, he should follow the procedures specified in section 710.7 of the inventory reporting regulations (refer to the Introduction to Appendix B in this volume).

EPA has also prepared and published three indices entitled *User Guide and Indices to the Initial Inventory* for use in conjunction with, but not as a substitute for, the Inventory. The three indices, the *Substance Name Index* (contained in Volumes II and III) and the *Molecular Formula and UVCB¹ Indices* (contained in Volume IV), provide alternate means

for finding substances which are listed on the Inventory.

The following discussion is divided into two sections. The first section, "Eligibility Criteria for Inclusion of Chemical Substances on the Inventory," discusses what is meant by a chemical substance under the TSCA inventory reporting regulations, and explains why certain kinds of substances are

included on this list while others are not. The second section, "Use of the Inventory," explains how the Inventory and its indices are organized and how to locate a chemical substance on the Inventory using the indices, and describes the elements of identification for substances on the Inventory and the indices.

ELIGIBILITY CRITERIA FOR INCLUSION OF CHEMICAL SUBSTANCES ON THE INVENTORY

TSCA identifies three types of materials: chemical substances, mixtures of chemical substances, and articles comprised of chemical substances and/or mixtures. The Inventory lists only chemical substances, and does not include mixtures or articles. It does list, however, chemical substances of which mixtures and articles are comprised.

The inventory reporting regulations established three major criteria for determining the eligibility of chemical substances for inclusion on the Inventory. Only those substances that satisfy *all* of these criteria are considered eligible. The three criteria are as follows:

- I. The substance must be a "chemical substance" as defined by section 710.2(h) of the inventory reporting regulations;
- II. The substance must have been manufactured, imported, or processed for a commercial purpose in the United States since January 1, 1975; and
- III. The substance must not be excluded from the Inventory by any provision of section 710.4 of the regulations.

The following discussion expands upon these criteria and clarifies why certain chemical substances are included on the Inventory while others are not.

CRITERION I

"Chemical substance" is defined in section 710.2 (h) of the regulations by chemical composition and by source or origin. In addition, this section identifies certain categories of materials which are not considered "chemical substances":

"Chemical substance" means any organic or inorganic substance of a particular molecular identity, including any combination of such substances occurring in whole or in part as a result of a chemical reaction or occurring in nature, and any chemical element or uncombined radical; except that "chemical substance" does *not* include:

- 1) any mixture,
- 2) any pesticide when manufactured, processed, or distributed in commerce for use as a pesticide,
- 3) tobacco or any tobacco product, but not including any derivative products,
- 4) any source material, special nuclear material, or byproduct material,
- 5) any pistol, firearm, revolver, shells and cartridges, and

- 6) any food, food additive, drug, cosmetic or device, when manufactured, processed, or distributed in commerce for use as food, food additive, drug, cosmetic, or device.

In terms of composition, some chemical substances are single compounds composed of molecules with particular atoms arranged in a definite, known structure. For purposes of this discussion, such substances will be denoted Class 1 substances. Examples of Class 1 substances are: acetone, iron, benzene, and dimethylmercury. Many commercial chemical substances are not in this class. They may have variable compositions, or be composed of a complex combination of different molecules. These substances will be denoted Class 2 substances. The Inventory lists both Class 1 and Class 2 chemical substances.

Class 2 substances can be further divided into three subgroups. The first subgroup includes substances which can be represented by definite molecular formulas² but have variable structural diagrams. An example of such a substance is xylene, in which the location of substituent groups is variable. The second subgroup includes substances which can be represented by definite molecular formulas but have unknown structural diagrams, e.g., aluminum cerium nickel sulfide, $\text{AlCe}_3\text{NiS}_7$. The third subgroup includes substances that have no definite molecular formula representation, and either partial structural diagrams or no structural diagrams. This kind of substance is typified by coke oven light oil (coal), which is defined on the Inventory as "the volatile organic liquid extracted from the gas evolved in the high temperature (greater than 700°C) destructive distillation of coal; composed primarily of benzene, toluene, and xylenes; may contain other minor hydrocarbon constituents." Substances that fall within this group are often called UVCB substances, for "Chemical Substances of Unknown or Variable Composition, Complex Reaction Products and Biological Materials."

Whether or not a material, and in particular a complex combination of species, is a chemical substance or mixture depends upon its source, origin, or method of preparation. The definition of chemical substance clearly identifies "any combination ... occurring ... in nature" as a chemical substance. Therefore, any material extracted or removed from nature is a chemical substance and is, by definition, not a mixture. In addition, if such a material is further separated into component parts, the original material and each component is considered a chemical substance.

Reporting a combination of substances produced by

²The term "molecular formula" means a summation of the actual numbers and kinds of atoms present in a molecule of a chemical substance.

chemical reaction called for a common sense determination by the manufacturer as to the status of the combination as a chemical substance or mixture. If the combination could have been prepared for commercial purposes by combining commercially available ingredients that did not chemically react when mixed, the combination manufactured was considered a mixture of the chemical substances and therefore excluded from the Inventory. (Economic considerations, i.e., the cost of such commercially available ingredients, was not considered a factor in determining whether or not the combination could have been prepared "for commercial purposes" by mixing. If the performance characteristics and chemical composition of the combination prepared by mixing would be essentially identical to that of the combination prepared by chemical reaction, the combination prepared by mixing could be expected to serve the same "commercial purpose.") Although the combination itself could not be reported, any chemical substances manufactured by the chemical reaction should have been reported.

EXAMPLE: If commercially available chemical substances A, B, and C are mixed, without chemical reaction, a combination of A, B, and C is produced which is a mixture. Alternatively, if that combination was prepared by mixing chemical substances A, B, D, and E, and D and E chemically reacted to form C, the combination (A, B, and C) is a mixture. However, chemical substance C has been manufactured.

CRITERION II

The concept of "manufacture or import for commercial purposes" was important for determining whether or not a manufactured or imported chemical substance was eligible for inclusion on the Inventory. Section 710.2(p) of the regulations defines the phrase:

"Manufacture or import for commercial purposes" means to manufacture or import:

- 1) For distribution in commerce, including for test-marketing purposes, or
- 2) For use by the manufacturer, including for use as an intermediate (as defined by section 710.2(n)).

Thus, the Initial Inventory includes not only chemical substances (not otherwise excluded by section 710.4 of the regulations) which have been manufactured or imported since January 1, 1975, for "distribution in commerce" but also those substances such persons have manufactured for their own use, including use as an "intermediate."

CRITERION III

Some manufactured or imported chemical substances are excluded from the Inventory under section 710.4(d) of the inventory reporting regulations because they are not manufactured or imported for distribution in commerce as chemical substances *per se*, and have no commercial purpose separate from the substance, mixture, or article of which they may be a part. Examples of such substances include impurities, byproducts which have no commercial purpose, and certain classes of substances (specified in the regulations) which result from a chemical reaction that occurs incidental to the manufacture, use, or storage of another chemical substance, mixture, or article.

In addition, chemical substances that are manufactured or

imported solely in small quantities for research and development (as defined by section 710.2(y) of the inventory reporting regulations) are excluded from the Inventory. EPA has proposed rules for Premanufacture Notification Requirements and Review Procedures (40 CFR Part 720; 44 FR 2242, January 10, 1979). Persons who wish to determine whether they would be exempt from premanufacture notification requirements with respect to chemical substances they consider to be research and development chemicals should consult the applicable section of 40 CFR Part 720 for EPA's proposed resolution to this question.

SPECIAL CASE CHEMICAL SUBSTANCES

Polymers: In reporting polymers for the Inventory, persons were required to list in the description of the polymer composition at least those monomers used at greater than two percent by weight in the manufacture of the polymer. ("The percent by weight" of a monomer is the weight of the monomer charged expressed as a percentage of the weight of the polymeric chemical substance manufactured.) Descriptions of polymers on the Inventory identify only monomers and other reactive ingredients such as chain-transfer or cross-linking substances. Other additives, such as emulsifiers and plasticizers, which are not chemically a part of the polymeric composition, are not identified in the description of the polymer.

Naturally Occurring Chemical Substances: Section 710.4(b) of the regulations defines a category of chemical substances:

"Chemical substances which are naturally occurring and (1) which are (i) unprocessed or (ii) processed only by manual, mechanical, or gravitational means; by dissolution in water; by flotation; or by heating solely to remove water; or (2) which are extracted from air by any means."

All substances falling within this category are automatically on the Inventory. The category includes only chemical substances which are derived from nature (including the land, water, atmosphere, and life forms which naturally inhabit the earth) by the means specified. This language is applied literally. For example, distillation is not considered a mechanical process, and dissolution in solvents other than water also does not fall within this definition. Some chemical substances which are considered naturally occurring according to this definition may be identified separately on the Inventory because they can also be manufactured. For example, CO₂ can be extracted from the air, and hence be naturally occurring, or it can be manufactured by a chemical reaction or by freezing natural gas, in which case it is eligible for inclusion on the Inventory.

Chemical Substances which are Fractionated into Component Chemical Substances: Some Class 2 chemical substances are complex combinations of different chemical species and are fractionated, in whole or in part, into component chemical substances (fractions). In this case, the unfractionated chemical substance did not need to be reported for the Inventory if it is completely separated by its manufacturer into its fractions, and each fraction which is manufactured for commercial purposes was reported instead. On the other hand, the unfractionated chemical substance should have been reported if a portion was not fractionated.

USE OF THE INVENTORY

Three indices are provided to facilitate use of the Initial Inventory. Each index provides a different means of locating

a chemical substance which may be on the Inventory. Once the user finds the CAS Registry Number for a particular

chemical substance in one of the indices, he should consult the Initial Inventory to determine whether, in fact, the substance is included and how it is identified there. Below is a brief description of the Inventory and each index.

The Initial Inventory: *Chemical Substance Identities:* a listing of preferred names for substances, ordered by Chemical Abstracts Service (CAS) Registry Number. It includes *Appendix A: Chemical Substance Definitions* and *Appendix B: Confidential Chemical Substance Identities*.

Substance Name Index: an alphabetically ordered listing of substance names, including selected synonyms, for all substances on the Inventory.

Molecular Formula Index: a listing of substances on the Inventory which can be represented by a molecular formula.

Chemical Substances of Unknown or Variable Composition, Complex Reaction Products, and Biological Materials (UVCB) Index: a listing of names of substances on the Inventory that do not have specific molecular formula representations, grouped into subsets of closely related substances. For the sake of brevity, this index is referred to henceforth as the *UVCB Index*.

ELEMENTS OF IDENTIFICATION

The elements of identification used in the Inventory and its indices include CAS Registry Numbers, preferred names, molecular formulas (for certain substances), definitions (for certain UVCB substances), and generic chemical names (for substances with confidential identities). These elements are described in greater detail below.

CAS Registry Numbers: A CAS Registry Number is included for each non-confidential substance on the Inventory. Registry Numbers have no chemical significance in themselves and are assigned in sequential order as new substances are entered into the CAS Chemical Registry System. Each Registry Number designates only one chemical substance in terms of atoms, valence bonds, and stereochemistry, insofar as that substance has been elucidated and defined.

A CAS Registry Number consists of up to nine digits which are separated into three groups by hyphens. The first group, starting from the left, has up to six digits; the second group has two digits; and the final group consists of a single check digit which is used to verify by computer the validity of the total Registry Number.

Certain CAS Registry Numbers which appear on the Inventory are followed by asterisks (*). The asterisk is used to highlight Registry Numbers for most substances which appear in the *UVCB Index*. (Those Registry Numbers which are followed by asterisks do not appear in any of the CAS abstract or index publications or services which cite Registry Numbers.) A Registry Number followed by a dagger (†) refers to a substance which is more fully defined in Appendix A of the Initial Inventory entitled *Chemical Substance Definitions*.

Substance Names

Two kinds of names are used in the Inventory and its indices: 1) preferred names, which include (a) Chemical Abstracts (CA) Index Names, and (b) names chosen to identify substances in the *UVCB Index*, and 2) various other names or synonyms by which substances are commonly known to chemists in commerce and manufacturing. Only preferred names appear on the Inventory beside a CAS Registry number. Synonyms appear only in the *Substance Name Index*.

Chemical Abstracts (CA) Index Names: For most chemical

substances which have been assigned CAS Registry Numbers, CAS has also assigned a unique, fully systematic name known as the CA Index Name. CA Index Names are derived according to a rigorous, comprehensive set of nomenclature rules³ to ensure that a single, preferred name can be constructed for each chemical substance. In most cases, the CA Index Name for a substance contains sufficient information to permit derivation of the corresponding chemical structural diagram.

A CA Index Name may be made up of several parts, each playing a specific role in completing the description of a chemical substance. The principal portion of a CA Index Name is the "heading parent," which describes the fundamental or most significant feature(s) of the chemical substance, as determined by application of CAS nomenclature rules. The heading parent forms the basis for ordering CA Index Names in alphabetical listings. Additional parts of the CA Index Name are appended to the heading parent to describe substituent groups attached to the parent substance, derivative information, and stereochemistry. Thus, CA Index Names appear in what is known as "inverted" form. For example, the CA Index Name for styrene is Benzene, ethenyl-; the "uninverted" form of this name is ethenylbenzene. The effect of using CA Index Names in their inverted form is to bring together in the *Substance Name Index* entries for related substances which have the same heading parent.

UVCB Substance Names: CAS does not assign CA Index Names to substances of the type appearing in the *UVCB Index*. Therefore, lacking CA Index Names, preferred forms of the name for each of these substances are listed in the *UVCB Index*, the *Substance Name Index*, and the Inventory. These names do not appear in the *Molecular Formula Index*.

Other Substance Names: The *Substance Name Index* also includes, for most substances, various other names which have been used for these substances in the chemical literature. Such names are variously described as synonymous names, common names, product names, trivial names, or nonsystematic names. All such names in the CAS files for Inventory substances, including synonyms reported to EPA during the Initial Inventory reporting period, are included in the *Substance Name Index*.

Persons are cautioned that errors in specificity may occur in using the *Substance Name Index*. Most chemical substances have several synonyms; similarly, a synonym may refer to more than one chemical substance. For example, the name "toluene diisocyanate," which refers to a particular Class 2 substance, may appear in the *Substance Name Index* because it is commonly used as a synonym for "2,4-toluene diisocyanate," which is a different chemical substance. One should not assume, therefore, that "toluene diisocyanate" is included on the Inventory simply because it appears in the *Substance Name Index*. Since substances on the Inventory are named according to precise nomenclature rules, one should always consult the Inventory to determine whether the substance referred to in the *Substance Name Index* is the same substance that is included on the Inventory.

Molecular Formulas: The term "Molecular Formula," as used in the *Molecular Formula Index* and the inventory reporting regulations, means a summation of the actual numbers and kinds of atoms present in a molecule of a chemical substance. For example, C₆H₆ is the molecular formula for benzene, and C₂H₆ is the molecular formula for ethane.

The element symbols in the molecular formulas in the *Molecular Formula Index* are arranged according to the Hill System, as follows:

- a. for carbon-containing compounds: -C first, followed immediately by H (if present), then the remaining symbols alphabetically.

³Information regarding CAS nomenclature rules can be found in the Chemical Abstracts 1977 *Index Guide*, Appendix IV.

- b. for compounds that do not contain carbon, the order of symbols is strictly alphabetical.

The use of molecular formulas in the *Molecular Formula Index* is presented in the user guide to that index. The comments in the following two paragraphs apply to molecular formulas as they appear in the *Substance Name Index* and the *Inventory*. Molecular formulas do not appear in the *UVCB Index*.

In the case of salts and molecular addition compounds, the molecular formulas for the components are presented separately. For example, the 1:1 molecular complex of aminoethane with trifluoroborane is presented as:

Component ratios for salts and molecular addition compounds are specified when known. In the case of salts the dot-disconnect format lists acidic hydrogens in the molecular formula, even though they may have been lost in the salt formation (for example, silver nitrate is represented as $\text{Ag}\cdot\text{HNO}_3$). A lower case x before the second or any subsequent formulas indicates that the ratio is unknown.

Copolymer formulas are presented with the formulas of the monomers shown individually. No ratios are indicated for copolymers; the total formula combination for copolymers or the single formula for homopolymers is enclosed in parentheses followed by a subscript, lower case x. For example:

Polyglycols are represented on the *Inventory* by their polymeric repeating unit formulas. These formulas are enclosed in parentheses and followed by subscript n. End groups, when included in the total formula, have the summation of their individual formula units cited at the end of the total formula. For example:

Generic chemical names: Chemical substances whose identities were determined by EPA to be entitled to confidential treatment (in accordance with section 710.7 of the inventory reporting regulations) are included on the *Inventory* under the category "Chemical Substances with Confidential Identities." Generic, or less specific, chemical names for these substances are listed in Appendix B of the *Initial Inventory*. The names were developed according to guideline procedures established by EPA and published in Appendix B of this volume. While the generic names are much like other chemical names, the part(s) of the names which, if specified, would directly or indirectly reveal the "trade secret" nature of the substance, has been "masked" by a more general term. Examples of such general terms are "alkyl," "heteropolycycle," "substituted," and "derivative." Consult Appendix B of this volume for a further description of these terms.

Definitions: For many UVCB chemical substances and certain categories of substances (e.g., "Chemical Substances Manufactured in the Production of Portland Cement"), the preferred substance name may not be sufficiently descriptive of the substance. In such cases, the substance has been further defined. A definition typically begins with a description of the process by which the substance is manufactured and ends with a specific or generic listing of the predominant chemical species of the composition. A definition may also include characteristic physical data, such as boiling range. In the definitions of certain biological extracts, the phrase "physically modified derivatives" occurs. In this context, "physically modified" means the application of certain processes which are often considered not to involve chemical reactions, namely: distillation, expression, filtration, drying, heating, cooling, extraction, and decolorization by adsorption. It is important to understand that "physically modified" means something

quite different from "manual, mechanical, or gravitational means," which is used in the definition of "naturally occurring substances" (refer to the section entitled "Eligibility Criteria for Inclusion of Chemical Substances on the *Inventory*").

NOTE: Entries on the *Inventory* should be considered as precisely descriptive as possible of the commercial chemical substance, consistent with industry practice. In a general sense, every substance identified on the *Inventory* is a category, with some categories broader than others. For example, a Class 1 substance, whose composition can be represented by a definite chemical structure diagram, can be manufactured by different processes, each of which may result in different impurities or different commercial grades of the substance. Since persons were not required to report the various commercial grades or impurity content of the substance, the substance that appears on the *Inventory* may actually represent a category consisting of the same compound in various degrees of purity. In the case of a Class 2 substance, whose composition cannot be represented by a definite chemical structure diagram, the substance may be identified on the *Inventory* in a less precise manner, e.g., "C₆₋₈ alkenes." Persons using the *Inventory* are cautioned, however, that such a category is not intended to encompass Class 1 substances which can be more precisely described. For example, "1-hexene," if manufactured as such, is considered a different substance than "C₆₋₈ alkenes," even though it falls within the C₆ to C₈ range, because "1-hexene" is a more precise description of the substance as it was actually manufactured.

DESCRIPTION OF THE INITIAL INVENTORY AND INDICES

The Initial Inventory: Volume I

The *Initial Inventory* lists in ascending CAS Registry Number order the preferred names of all substances included on the *Inventory*. Each Registry Number entry is accompanied by a preferred name (usually a CA Index Name) for the substance represented by that Registry Number. Where the molecular formula of a substance is known it is included.

Volume I includes two appendices. *Appendix A: Chemical Substances Definitions* identifies further those substances which were marked by a dagger (†) on the *Initial Inventory*. A user must consult this volume to determine reliably whether such a substance is included on the *Inventory*. Substances in this appendix are listed in ascending CAS Registry Number order. Because all definitions refer to UVCB substances, the entries in this volume include only Registry Numbers and definitions, and do not include molecular formulas. *Appendix A* includes a section entitled, *SDA Substance Identification Procedure*, which presents a procedure developed by the Soap and Detergent Association (SDA) in conjunction with EPA for identifying and reporting certain multicomponent Class 2 chemical substances derived from natural fats and oils and synthetic long-chain alkyl substitutes. Substances reported to EPA using this procedure were identified by a systematically-derived, chemically-descriptive SDA Substance Name and Reporting Number. Each reported substance has been assigned a CAS Registry Number, by which it is ordered on the *Inventory*.

Volume I also includes *Appendix B*, entitled *Confidential Chemical Substance Identities*. In this appendix, substances whose identities were determined to be confidential for purposes of the *Inventory* are listed by a number which has the same format as a CAS Registry Number, and a generic chemical name. The entries in this appendix do not include molecular formulas, and neither the identifying numbers nor the generic names appear in any of the indices.

2. The **preferred substance name** (usually a CA Index Name) appears in lightface type.
3. The **molecular formula** appears, where known, in lightface type.

Substance Name Index: Volumes II and III

The *Substance Name Index* consists of an alphabetical listing of names for the substances included on the Inventory. The names which appear in this index are of two main types: 1) preferred names, including (a) the CA Index Name for most substances other than for those presented in the *UVCB Index*, and (b) names chosen to represent substances which appear in the *UVCB Index*, and 2) the various synonymous names by which the substance is known to chemists and in commerce and manufacturing. This index does not include the generic chemical names appearing in Appendix B to the Inventory. The *User Guide to the Substance Name Index* describes how the names are ordered and in what form they may appear. Each entry in this index contains the CAS registry Number for the substance and its molecular formula, if known.

ILLUSTRATIVE KEY TO ENTRIES AS THEY APPEAR IN THE SUBSTANCE NAME INDEX

1. The **substance name** is the heading and appears in lightface type. The name may be comprised of a heading parent (1a) and an appended descriptive term (1b). When an entry cannot be completed on one line, the second and subsequent lines are indented under the heading.
2. The **CAS Registry Number** appears in lightface italic type, enclosed in brackets.
3. The **molecular formula** appears, where applicable, in lightface type.

Molecular Formula Index: Volume IV

In the *Molecular Formula Index*, molecular formulas are listed for all substances appearing on the Inventory with known molecular formulas. Where two or more substances share the same molecular formula, their names are ordered alphabetically by the same principles used in the *Substance Name Index*. The introduction to the *Molecular Formula Index* in Volume IV describes how the formulas are ordered and in what form they appear.

As illustrated below, each formula entry is accompanied by a preferred name and a CAS Registry Number.

ILLUSTRATIVE KEY TO ENTRIES AS THEY APPEAR IN THE MOLECULAR FORMULA INDEX

1. The **molecular formula** is the heading and appears in boldface type.
2. The **substance name(s)** appear in lightface type, arranged in alphabetic order below the heading. When the name or entry is not completed on one line, the second and subsequent lines are indented. A long dash (2a) replaces the heading parent name when it is repeated. When a modification phrase (2b) is required to complete the substance description, it is half-indented under the parent substance name.
3. The **CAS Registry Number** appears in lightface italic type enclosed in brackets.

Chemical Substances of Unknown or Variable Composition, Complex Reaction Products, and Biological Materials (UVCB) Index: Volume IV

Approximately one third of the substances included on the Inventory are substances of unknown or variable composition, complex reaction products, or biological materials. These substances lack an accepted molecular formula representation. They are listed in the *UVCB Index*, and can be found by name in the *Substance Name Index* or by CAS Registry Number on the Inventory; they cannot be found in the *Molecular Formula Index*.

Chemical substances in the *UVCB Index* have been grouped into subsets consisting of closely related substances. Typically, the subsets highlight a structural feature of the substance (e.g., the subset headings "Acid Chlorides," "Alkaline earth compounds," "Polyoxyalkylenes") or a significant precursor (e.g., "Castor oil," "Tallow"), or provide a general description (e.g., "Resins," "Waxes"). The subset headings used for this Index are presented in the form of a hierarchical listing which precedes the *UVCB Index* in Volume IV.

ILLUSTRATIVE KEY TO ENTRIES AS THEY APPEAR IN THE UVCB INDEX

In the *UVCB Index*, each subset heading (1) is listed in alphabetic order and appears in boldface type. The names of the individual substances (2) are then listed in alphabetic order under each subset heading, along with their CAS Registry Numbers (3). The names which appear in the *UVCB Index* are preferred names for the substances. The subset headings (1) are *not* Inventory substances. Only the substances listed under the subset headings along with their CAS Registry Numbers are Inventory substances.

USING THE INDICES TO LOCATE A SUBSTANCE ON THE INVENTORY

Determining the best way to locate a substance on the Inventory depends upon your knowledge of the chemical substance. The chemical substance may be known by a variety of substance names, all of which describe the substance. While a great many names are listed in the *Substance Name Index*, not all names which are known for all substances on the Inventory are included. The absence of a particular name in the *Substance Name Index* does not mean that the chemical substance is not identified on the Inventory; the substance may be identified in the Index by a synonymous substance name. If you are unable to find the name of the chemical substance in the *Substance Name Index*, consult one of the other indices before concluding that the substance itself is not cited.

If you know the CAS Registry Number of the substance, consult the Initial Inventory directly. If you do not know the CAS Registry Number, and the substance is not a UVCB substance, derive its molecular formula and search the *Molecular Formula Index*. Many chemical substances have identical molecular formulas but differ in their chemical structure; in the event that the molecular formula appears and

is associated with several different substances, search the names listed to determine if the substance is included.

NOTE: CAS Registry Numbers are very specific. One CAS Registry Number may identify a class of isomers; another Number, a specific isomer of that class. For example, the CAS Registry Number for trichloroethane (nonspecific) is 25323-89-1; the CAS Registry Number for the specific isomer 1,1,1-trichloroethane, however, is 71-55-6. Be certain the CAS Registry Number exactly identifies the chemical substance you are looking for on the Inventory.

A chemical substance which lacks a molecular formula representation may be on the Inventory but identified by a name with which you are not familiar. You should, therefore, check the name listed under the appropriate subset heading(s) in the *UVCB Index*. To determine the appropriate heading(s), first scan the hierarchical list of subset headings which appears at the beginning of the *UVCB Index*. Select the *most specific* headings applicable. A substance which falls within a given sequence of subset headings of increasing specificity (e.g., "Fats and Oils, plant"; "Coconut oil") will be found only under the most specific heading in the sequence which is applicable. In some cases, you will find a substance in a fairly specific subset, because the substance is one of a large number of related substances in the *UVCB Index* (e.g., the sodium salt of sulfated coconut oil will be found under "Coconut oil"). In other cases, the most specific applicable subset may be very generic because the substance does not come from a class of related materials which EPA judged large enough to justify a separate subset (e.g., the sodium salt of sulfated mustard seed oil will be found under "Fats and Oils, plant").

Once you have located the substance in one of the indices, use its CAS Registry Number to determine how the substance is named on the Inventory to be sure that the substance you are looking for is actually included.

CHEMICAL SUBSTANCE IDENTITIES

In addition to the chemical substances identified by the CAS Registry Numbers below, the Inventory includes:

- 1.) Chemical Substances with Confidential Identities: chemical substances whose chemical names would reveal the trade secret fact that the specific chemical substances are manufactured, imported, or processed for commercial purposes. (These chemical substances are identified by generic (less specific) chemical names in Appendix B of this volume.)
- 2.) Chemical Substances which are Naturally Occurring and (1) which are (i) unprocessed or (ii) processed only by manual, mechanical, or gravitational means; by dissolution in water; by flotation; or by heating solely to remove water; or (2) which are extracted from air by any means.

2-Propanone, 1-hydroxy $C_3H_6O_2$
- 116-11-0
1-Propene, 2-methoxy- C_4H_8O
- 116-14-3
Ethene, tetrafluoro- C_2F_4
- 116-15-4
1-Propene, 1,1,2,3,3,3-hexafluoro- C_3F_6
- 116-16-5
2-Propanone, 1,1,1,3,3,3-hexachloro- C_3Cl_6O
- 116-17-6
Phosphorous acid, tris(1-methylethyl) ester $C_6H_{21}O_3P$
- 116-22-3
1-Phenanthrenecarboxylic acid, 1,2,3,4,4a,4b,5,6,7,9,10,10a-dodecahy =
dro-1,4a-dimethyl-7-(1-methylethyl)-, oxydi-2,1-ethanediy ester,

 $C_{24}H_{20}O_5$
- 116-25-6
2,4-Imidazolidinedione, 1-(hydroxymethyl)-5,5-dimethyl-
 $C_6H_{10}N_2O_3$
- 116-26-7
1,3-Cyclohexadiene-1-carboxaldehyde, 2,6,6-trimethyl- $C_{10}H_{14}O$
- 116-31-4
Retinal $C_{20}H_{28}O$
- 116-37-0
2-Propanol, 1,1'-[(1-methylethylidene)bis(4,1-phenyleneoxy)]bis-
 $C_{21}H_{28}O_4$
- 116-53-0
Butanoic acid, 2-methyl- $C_5H_{10}O_2$
- 116-54-1
Acetic acid, dichloro-, methyl ester $C_3H_4Cl_2O_2$
- 116-63-2
1-Naphthalenesulfonic acid, 4-amino-3-hydroxy- $C_{10}H_9NO_4S$
- 116-64-3
2-Naphthalenesulfonamide, 4-hydroxy- $C_{10}H_9NO_3S$
- 116-66-5
1*H*-Indene, 2,3-dihydro-1,1,3,3,5-pentamethyl-4,6-dinitro-
 $C_{14}H_{18}N_2O_4$
- 116-71-2
Dinaphtho[1,2,3-*cd*:3',2',1'-*lm*]perylene-5,10-dione $C_{24}H_{16}O_2$
