The actual health burden from truck pollution may be larger still, as analyses often do not account for the potential impact from after-market defeat devices on medium- and heavy-duty trucks. The EPA believes the use of aftermarket defeat devices 'occurs within most or all categories of vehicles and engines, including commercial trucks...'30 A zero-emitting truck and bus fleet would avoid this problem of emission control tampering. Zero emitting vehicles would also protect against unanticipated excess in-use emissions deterioration not properly accounted for during EPA’s engine/vehicle certification process. [EPA-HQ-OAR-2019-0055-1265-A1, p.7]

30 https://int.nyt.com/data/documenttools/epa-on-tampered-diesel-pickups-11-20/6d70536b06182ad2/full.pdf

A shift to zero emitting medium- and heavy-duty vehicles – including rapid deployment in communities long overburdened by this pollution – is critically important to save lives and bring cleaner air to neighborhoods across the nation. [EPA-HQ-OAR-2019-0055-1265-A1, p.7]

California and other states around the nation are paving the way for ZEVs and creating a strong foundation for the federal government to move forward with protective emissions standards. In September 2020, California Governor Gavin Newsom announced a bold plan for the state to achieve 100 percent zero emitting passenger vehicle sales by 2035 and 100 percent zero emitting freight trucks and buses for all feasible operations by 2045, while accelerating mobilization of zero emitting vehicles in urban and community applications to address environmental injustice.53 [EPA-HQ-OAR-2019-0055-1265-A1, p.12]

Inequity in consumption of goods and services adds to racial-ethnic disparities in air pollution exposure. Proc Natl Acad Sci U S A. 2019 Mar 26;116(13):6001-6006. doi: 10.1073/pnas.1818859116. Epub 2019 Mar 11. PMID: 30858319; PMCID: PMC6442600.

Organization: *Florida Council of Churches*

Florida is home now to nearly 22 million people and is growing by 1000 new residents a day. Almost half of Floridians live in the ten counties with the highest density of population and thus traffic congestion. Density can be determined in various ways. If one excludes land area with zero population, the ten most dense counties are respectively Broward, Pinellas, Miami-Dade, Palm Beach, Orange, Seminole, Hillsborough, Duval, Sarasota, and Lee. These counties also have significant, historic populations of African descent and Latine populations who live in urban neighborhoods ringed by inner-city interstates and expressways. It has been well-documented by scholars how the road systems were intentionally designed in conjunction with redlining to box these people in. They bear the brunt of exhaust pollution in Florida. Asthma is common across the state in these hemmed in communities and life-expectancy is lower. [EPA-HQ-OAR-2019-0055-1006, p.1]

Organization: Gardener Manjikian Consulting LLC

we demand a zero emissions future where all communities can thrive without breathing in toxic heavy duty truck pollution. EJ communities across the country are exposed to 28% more NOx pollution than other neighborhoods because warehouses, truck routes, and industrial areas are disproportionately built in frontline communities. The proposed HDT rule doesn't go nearly far enough to protect EJ communities. It ignores the long-standing demands for protective solutions from the folks experiencing the pollution of the freight transportation system firsthand. [EPA-HQ-OAR-2019-0055-2599, p.1]

Organization: *Great Rivers Environmental Law Center and Dutchtown South Community Corporation (DSCC)*

EPA should take action on the Proposed Regulation and enact the most stringent options available to it so as to protect the health of all Americans, but in particular, the low-income people of color who have been systematically overburdened by air pollution in this country and as a result, are most vulnerable to its continued impacts. Doing so would be of direct benefit to of DSCC and Great Rivers. [EPA-HQ-OAR-2019-0055-1323-A1, p.2]

It is well-established in the Proposed Regulation that Heavy Duty ('HD') vehicles are a significant source of NOx, contributing to high concentrations of ozone and PM2.5.1. The Proposed Regulation also points out that these impacts more severely impact low-income minority communities, already overburdened by air pollution.2. In particular, the Proposed Regulation demonstrates that HD vehicles are more often operated close to people of color.3 This is the case because people of color, as well as those with lower incomes, are more likely to live near truck routes.4 The St. Louis metropolitan area is no exception – many areas bordering major highways and traffic thoroughfares in the St. Louis area are populated by persons of color and other economically disadvantaged communities.5 [EPA-HQ-OAR-2019-0055-1323-A1, p.2]

See also, US EPA, EJScreen, Map Comparisons for St. Louis, Missouri, Pct. People of Color and Traffic Proximity, located at https://ejscreen.epa.gov/mapper/comparemapper.html.

As is established in the Proposed Regulation, heightened exposure to HD vehicle traffic also contributes to a variety of adverse health impacts – in particular asthma and respiratory illness, as well as cardiovascular problems.6 Unfortunately, these heightened health risks bear out in St. Louis, especially in the low-income minority neighborhoods in St. Louis City and County. In St. Louis County and the City of St. Louis, the same zip code areas that have large low-income minority populations also have significantly higher rates of asthma-related emergency room visits than the Missouri and National averages.7 The City of St. Louis has the dubious honor of ranking first out of the 35 largest United States metropolitan areas in terms of asthma risk.8 This risk has increased over the last decade.9 Perhaps more startlingly, in a recent equity study compiled by the City of St. Louis, the City was awarded an equity score of 1 out of a possible 100 in the category of child asthma. The exceedingly low score was bestowed as a result of data showing that black children living in the City of St. Louis are more than 10 times as likely as white children to visit emergency rooms for asthma-related complications.10 [EPA-HQ-OAR-2019-0055-1323-A1, pp.2-3]

6 Proposed Regulation at p.17417.

The unique features of the St. Louis area highlight the pressing need for EPA to take immediate action to address transportation-related pollution. Focusing on pollution from HD vehicles offers a great start. As emissions modeling performed by EPA in connection with the Proposed Regulation reveals, 'heavy-duty engines will continue to be one of the largest contributors to mobile source NOx emissions nationwide in the future'.23 Unless and until EPA tackles this significant pollution source, the problem will not improve, but will instead continue to worsen.

Further, this is not a problem that can be put off to future generations - peoples' very lives are at risk. [EPA-HQ-OAR-2019-0055-1323-A1, p.5]

23 Proposed Regulation at p.17418.

At a minimum, EPA must include the above-described provisions in the Final Regulation. Doing so will begin the process of protecting the low-income minority people that have already shouldered to much of the pollution burden in urbanized communities such as St. Louis. [EPA-HQ-OAR-2019-0055-1323-A1, p.6]

Organization: *King County, Washington County Executive*

In King County, through the Washington State Environmental Health Disparities Map developed by the University of Washington Department of Environmental and Occupational Health Sciences, we know that communities of color, low-income communities, and road-proximate communities suffer from the highest rates of exposure to pollutants. This long-overdue rule must benefit our communities. The Clean Air Act is clear in requiring EPA to set a standard not just protective for healthy individuals, but also of these vulnerable populations. [EPA-HQ-OAR-2019-0055-1188-A2, p.1]

Organization: *Lydia Heye*

The Biden administration has made a public commitment to help protect environmental justice ("EJ") communities throughout the United States. However, EPA's heavy duty truck rule fails our EJ communities. This proposal ignores the longstanding demands from EJ communities to move the most protective solutions that will require air pollution reductions in EJ communities. EPA's proposed rule punts meaningful action into the uncertain future, yet again delaying justice for communities of color and frontline communities and perpetuating environmental racism.

Heavy Duty Trucks contribute to the worsening of the public health, environmental, and climate crisis. With this current rule the Biden Administration is falling short of their commitments to prioritize EJ and address the climate crisis. EJ communities cannot wait. We need strong regulations now, justice delayed is justice denied! Environmental justice communities are choking to death from the pollution from heavy duty trucks. The Biden Administration needs to prioritize community health over corporate wealth and at minimum require a just transition towards zero emission trucks.

We need to see a just transition towards zero emissions across the freight sector. Here in Southern California, we see this clearly in our port communities and communities near freeways. Through redlining and other racist land use practices, Black and Brown communities are forced to subject themselves and their families to deadly air when they decide to open their windows or walk outside. No one should be forced to experience that. Everyone should be entitled to breathe clean air.

EPA should be proposing solutions aimed at phasing out our dependency on deadly diesel. We will not accept partial solutions that leave us further burdened by pollution for decades to come.

Zero Emissions must mean zero – not near zero! EPA needs to do its part to end diesel-deaths in our communities. [EPA-HQ-OAR-2019-0055-1405]

Organization: *Maine Department of Environmental Protection (Department)*

Addressing heavy-duty NOx emission is particularly important for systemically disinvested communities, where low-income and people of color are disproportionately harmed by heavy-duty truck emissions because they are more likely to live, work, or go to school in areas with high truck activity, such as ports, highways, railyards, and distribution centers. [EPA-HQ-OAR-2019-0055-1288-A1,pp.1-2]

Organization: *Mass Comment Campaign sponsored by Climate Action Campaign (22,659)*

- Families in diesel death zones, particularly communities of color and low wealth communities, have suffered long enough and cannot wait extra model years for clean air, and drivers cannot wait extra model years for more efficient, pollution-free trucks. [EPA-HQ-OAR-2019-0055-1193, p.1]

Organization: *Mass Comment Campaign sponsored by Consumer Reports (CR) (17,499)*

These vehicles cause the majority of lung-damaging air pollutants, and disproportionately impact vulnerable communities located near trucking corridors. [EPA-HQ-OAR-2019-0055-1613-A1, p.1]

Organization: *Mass Comment Campaign sponsored by Evangelical Environmental Network (EEN) (67,755)*

Almost 60% of NOx and PM2.5 exhaust emissions from the trucks and buses were in urban areas, where 45 million people in the United States live, work, or attend school within 300 feet of a major road, airport, or railroad. 45% of U.S. residents live in counties with unhealthy levels of smog or soot. Medical experts have labeled these areas diesel death zones, and link exposure to diesel exhaust to more than four dozen toxic air pollutants that cause birth defects, lung damage, and cancer. Moreover, this type of pollution is inequitably distributed and disproportionately harms Blacks and Latinos compared to whites. [EPA-HQ-OAR-2019-0055-1192-A1, p.2]

The residents of Arizona, especially those living in Maricopa County, have been plagued with the health impacts of both the climate crisis and Air Pollution. The American Lung Association has consistently graded the Maricopa County and Pinal County areas with failing grades on air quality. The latest report came out this month and again, the Phoenix area has received an F on the American Lung Association “State of the Air Report”. Out of over 220 metropolitan areas, the Phoenix area ranked 5th worst for high ozone days, 11th worst for 24-hour participle pollution and 8th worst for annual particle pollution. The air we breathe is harming all of us, but especially our children and elderly. [EPA-HQ-OAR-2019-0055-1192-A1,p.2]

Heavy duty vehicles are major contributors to the valley's air pollution. Diesel engines emit deadly particle pollution. And NOx combines with heat and sunlight in the atmosphere to form ground level ozone, or smog, a lung irritant and asthma trigger. Health officials tell us that the following groups are most at risk:

- Babies and children, whose bodies are rapidly developing.
- Pregnant women, whose risk of premature birth and low weight birth increases when exposed to air-pollution.
- Children and adults with asthma – as air pollution can both trigger asthma attacks and cause the development of the disease.
- People with COPD.
- People with lung cancer.
- People with cardiovascular disease.
- People with COVID-related lung problems or long-COVID, or people with active cases of COVID or other respiratory infections.
- People with any chronic disease such as cancer
- Older adults (over age 65), whose risk of premature death increases with exposure to air pollution. [EPA-HQ-OAR-2019-0055-1192-A1,p.2]

Organization: *Mass Comment Campaign sponsored by National Religious Partnership for the Environment (4,677)*

As Black Church leaders and congregants, we experience the tragedies of environmental justice on a regular basis. Communities of color face an undue, disproportionate and unjust burden of air pollution and climate impacts from the production of fossil fuels. Reducing emissions from the transportation sector offers an opportunity to reduce the pollution and climate impact burden in our communities. [EPA-HQ-OAR-2019-0055-1122-A1, p.1]

Exhaust from heavy duty vehicles is one of the main pollution sources in black communities. As our country moves a vast amount of goods from manufacturing plants to warehouse to businesses and homes, the distribution contributes to significant localized pollution in our communities, which are already suffering from pollution. This disproportional impact by truck pollution is a result of historical and ongoing systemic racism, which has placed interstates and heavily travelled roads through the heart of our communities and neighborhoods. [EPA-HQ-OAR-2019-0055-1122-A1, p.1]

Trucks, which only account for 10 percent of vehicles on the road, produce nearly 25 percent of the transportation sectors greenhouse gases. A 2021 report stated that a 62% reduction in diesel emissions would decrease race-ethnicity and income inequalities by 37%. [EPA-HQ-OAR-2019-0055-1122-A1, p.1]

President Biden’s in January 2021 that directed the Environmental Protection Agency (EPA) and other agencies to make environmental justice part of their mission. To help fulfill that mission, the EPA must make reducing air pollution from heavy duty trucks a priority. [EPA-HQ-OAR-2019-0055-1122-A1, p.1]

Organization: *Mass Comment Campaign sponsored by Neighbors for Clean Air and Elders Climate Action (43)*

Vehicle pollution inequitably harms Black and Latinx communities that are much more likely compared to whites to reside near heavy truck traffic on highways, and at truck terminals, ports and distribution centers. In fact, Multnomah County communities with larger black populations have three times higher diesel particulate matter pollution than neighborhood with majority white residents. [EPA-HQ-OAR-2019-0055-1619-A1,p.2]

Organization: *Mass Comment Campaign sponsored by Public Citizen (168)*

Diesel emissions most severely harm communities of color and working class communities, and cleaning up dirty diesel pollution helps to create a more just society. [EPA-HQ-OAR-2019-0055-1597-A2, p.1]

Improving these standards will improve health outcomes for communities hardest hit by diesel pollution. EPA should adopt requirements to address disproportionate health impacts so that those who are most harmed by diesel pollution can find relief quickly. [EPA-HQ-OAR-2019-0055-1597-A2, p.1]

I encourage the EPA to boldly pursue environmental justice as it reduces diesel emissions and improves the health of communities near ports and freight corridors. [EPA-HQ-OAR-2019-0055-1597-A2,p.1]

Organization: *Mass Comment Campaign sponsored by Union of Concerned Scientists - 1 (13,985)*

Marginalized communities living in highly trafficked areas have suffered the health impacts of diesel trucks for too long. And the science clearly shows that zero-emission trucks can be deployed now. [EPA-HQ-OAR-2019-0055-1194-A1, p.1]

Organization: *Mass Comment Campaign sponsored by Union of Concerned Scientists - 2 (959)*

The Environmental Protection Agency (EPA) has made explicit commitments to climate, clean air, and environmental justice under this administration. Environmental justice communities suffer a disproportionate burden of pollution from the goods movement sector writ large.1 Thus, we believe that this NOx rule should be strengthened to live up to these important stated commitments and to set us on a path to a zero-emission transportation future. [EPA-HQ-OAR-2019-0055-1608-A1, p.1]

Organization: *Mass Comment Campaign sponsoring organization unknown – 1 (2,443)*

This pollution is particularly dangerous for communities located close to high truck traffic areas, affecting millions of people that live near highways, warehouses, or ports. [EPA-HQ-OAR-2019-0055-1594-A1,p.1]

Organization: *Mass Comment Campaign sponsoring organization unknown – 3 (605)*

Truck pollution disproportionately impacts low-wealth communities and communities of color, leading to higher rates of asthma and other respiratory illness. With solid heavy-duty vehicle emission standards, we can cut deadly smog pollution for our children, families, and communities to breathe the clean air they deserve. [EPA-HQ-OAR-2019-0055-1606, p.1]

Organization: Mass Comment Campaign sponsoring organization unknown – 5 (52,051)

This makes it critical to ensure that heavy-duty vehicles are as efficient as possible and that we adopt and enforce strict emissions limits as we shift away from fleets powered by fossil fuels. Our communities cannot afford to wait for cleaner air. Black and Brown communities need a rapid transition to zero- emitting trucks and a clear path towards 100% electrification of polluting big rigs, trucks, and buses. [EPA-HQ-OAR-2019-0055-1600]

Organization: *Mass Comment Campaign sponsoring organization unknown – 8 (2,804)*

Diesel emissions most severely harm communities of color and working class communities, and cleaning up dirty diesel pollution helps to create a more just society. [EPA-HQ-OAR-2019-055-1605]

Organization: *Mass Comment Campaign sponsoring organization unknown – 13 (165)*

Because of discriminatory transportation practices, highways and transportation depots are often placed near and through communities of color, placing these communities in greater danger from vehicle pollution. Reducing diesel emissions would not only address climate change but significantly reduce pollution in communities of color. [EPA-HQ-OAR-2019-0055-1599]

Organization: *Mayor, City of Albuquerque, NM et al.*

As mayors, our cities are highly trafficked freight destinations for the movement of goods, and we are on the front lines of protecting the safety and well-being of our constituents. This long-overdue rule must benefit our communities. According to the American Lung Association's 2022 State of the Air report1, approximately 40% of Americans—over 137 million people—are living in areas that received a grade of "F" for their air pollution. This is especially problematic for vulnerable populations such as children, the elderly, low-income families and communities of color. The Clean Air Act is clear in requiring EPA to set a standard not just protective for healthy individuals, but also of these vulnerable populations. [EPA-HQ-OAR-2019-0055-1316-A1, p.1]

1 https://www.lung.org/research/sota/key-findings

Smog and soot air pollution caused by trucks and buses are among the greatest threats to public health for the more than 45 million people in the U.S. living within 300 feet of a major roadway or transportation facility.4 The pollution from diesel trucks disproportionately harms frontline communities near heavy vehicle traffic and trucking corridors - which by design tends to be low-income and communities of color - and leads to increased risk for cardiovascular disease, lung cancer, and other respiratory health illnesses. Recent studies show that diesel traffic is the largest source of nitrogen oxide disparity by race in the United States. Transitioning from combustion to zero-emission trucks is therefore one of our greatest opportunities to tackle both the climate crisis and environmental injustice. [EPA-HQ-OAR-2019-0055-1316-A1, p.2]

4 https://www.epa.gov/air-research/research-near-roadway-and-other-near-source-air-pollution

Organization: *Metropolitan Washington Air Quality Committee (MWAQC) et al.*

As noted in the Metropolitan Washington 2030 Climate and Energy Action Plan,2 underserved communities have been disproportionately affected by harmful environmental exposures, such as ambient air pollution and climate-change-related health impacts. Therefore, more stringent controls on air pollution from heavy-duty vehicles and subsequent emissions reductions have the potential to help the most vulnerable populations. [EPA-HQ-OAR-2019-0055-0996-A1, pp. 1 - 2]

2. “Metropolitan Washington 2030 Climate and Energy Action Plan” (Washington, D.C.: Metropolitan Washington Council of Governments, November 18, 2020), https://www.mwcog.org/documents/2020/11/18/metropolitanwashington-2030-climate-and-energy-action-plan/.

Organization: *Mid-America Regional Council (MARC) Air Quality Forum*

Emissions from heavy duty trucks concentrate near freight corridors and hubs where they impact overburdened and underserved communities from surrounding neighborhoods. In the Kansas City region, like many other metropolitan areas, these communities are where many low-income individuals and people of color call home. These communities face a prevalence of asthma that is higher than the national average and are medically underserved. Without further reductions, heavy-duty vehicles will continue to be one of the largest contributors to mobile source emissions of NOx, which react in the atmosphere to form ozone and particulate matter. These pollutants create or exacerbate respiratory and cardiovascular problems and other adverse health impacts that lead to hospital admissions, emergency room visits, and premature deaths. For the health of our vulnerable communities, we urge the EPA to enact the strongest possible limits on emissions from heavy-duty trucks possible to transition to zero-emissions vehicles more quickly in the heavy-duty fleet. [EPA-HQ-OAR-2019-0055-1131-A1, p. 1]

Organization: *Midwest Ozone Group (MOG)*

The modeling data provided in these comments illustrates the need for measurable improvements to environmental conditions in communities that are heavily impacted by dense traffic. Ambient improvements to PM, PM2.5, and ozone represented by this proposed rule will serve to facilitate the development of implementation outcomes of local environmental benefits attributable to controls on mobile sources like heavy duty trucks. EPA's burden is to effectively implement this rule per Executive Order 12898, 'Federal agencies must identify and address, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations.' This comment is also found in Section 20.1. [EPA-HQ-OAR-2019-0055-1272-A1, p.11]

Organization: *Minnesota Pollution Control Agency (MPCA)*

It is the MPCA's responsibility to protect Minnesotans' health and environment in collaboration with the federal government, through cooperative federalism. Although Minnesota is currently in attainment for the National Ambient Air Quality Standards for NOx and ozone, MPCA research demonstrates that environmental justice communities are disproportionately exposed to air pollution from transportation. People in these communities are also more vulnerable to air pollution health impacts due to underlying issues, like their socioeconomic status and access to health care. National studies have identified significant disparities in NOx exposure based on race; researchers at the University of Minnesota estimate that people of color in America experience 38% more NOx pollution where they live than white Americans. Further, previous EPA research, as demonstrated in the proposed rulemaking, shows that there are significant, known co-benefits to health outcomes related to NOx emissions reductions. [EPA-HQ-OAR-2019-0055-1044-A1, p. 1]

Organization: *Motor & Equipment Manufacturers Association (MEMA)*

MEMA urges EPA to consider the impacts of NOx emissions on underserved and inner-city communities. While all communities are impacted by climate change and air quality, the effects on communities of differing socioeconomic statuses are not proportionate. Historically, environmental policies, including but not limited to electric vehicles, engine emissions standards, carbon emissions trading or taxation, chemical bans or restrictions and other industrial regulations, may have caused disproportionate harm to disadvantaged communities. It is critical that EPA finalize NOx standards that will ensure all commercial vehicles, not just electric vehicles, are equipped with best-in-class technology to ensure that every community is afforded cleaner air. [EPA-HQ-OAR-2019-0055-1322-A1, pp. 8 - 9]

Organization: *National Parks Conservation Association (NPCA)*

Sadly, the brunt of the air pollution burden is felt in communities outside of our parks, where residents who live near high freight traffic areas, such as highways, warehouse districts, or ports, are forced to breathe in dangerous pollutants from heavy duty trucks. As highlighted in the proposed rule, 72 million Americans live within 200 meters of freight routes with high levels or HD truck traffic.21 Of those 72 million, people of color make up a disproportionate number of the individuals harmed by pollution from freight traffic, greatly exacerbating the health and environmental justice impacts felt by nonwhite populations across the nation. [EPA-HQ-OAR-2019-0055-1314-A1, p.4]

21 87 Fed. Reg. at 17,451

Overall, when researchers isolate race, nonwhite people have a 28 percent higher health burden, and Black people had a 54 percent higher than the population at large.22 Emission source types, in particular, disproportionately affect racial-ethnic minorities and make the air that people of color breathe dirtier than it is for White people.23 This relationship between emissions and race is systemic and statistically significant for all major sectors, and heavy-duty vehicles is one of the larges sources of disparity.24 Further, even when social class is held constant, the relationship between race and the distribution of air pollution remains, independent of socioeconomic status.25 This clear example of environmental justice must be rectified in every way possible, including through the adoption of this EPA rule. This would begin the climb to racial and environmental justice, and it would allow the national parks to provide cleaner air to its visitors and the residents of its gateway communities. [EPA-HQ-OAR-2019-0055-1314-A1, p.4]

Heavy-duty vehicles are a key contributor to ozone and PM National Ambient Air Quality Standards (NAAQS) nonattainment in air basins across the country. This is of particular concern in states like California, where NOx pollution from HD vehicles is an outsized source of ozone and PM2.5 in regions such as the San Joaquin Valley and South Coast Air Basins. When it comes to meeting the CAA's NAAQS, The San Joaquin Valley is now in extreme nonattainment with the 1997, 2008, and 2015 ozone standards, serious nonattainment with the 1997 annual and 24-hour and 2006 24-hour PM2.5 standards, and moderate nonattainment with the 2012 annual PM2.5 standard. The San Joaquin Valley is also home to the environmental justice communities of Fresno, Visalia, and Bakersfield, which are ranked by American Lung Association (ALA) as being three of the most polluted cities in the country for ozone, annual PM2.5, and short-term PM2.5 pollution.26 In terms of the economic impact, one study found that '[i]n the San Joaquin Valley overall, the cost of air pollution is more than $1,600 per person per year, which translates into a total of nearly $6 billion in savings if federal ozone and PM2.5 standards were met.'27 [EPA-HQ-OAR-2019-0055-1314-A1, pp.4-5]

When viewed alongside other heavily impacted areas, like West Oakland or communities in the South Coast Air Basin, the total impact to vulnerable populations in the state is enormous, both from an economic and public health standpoint. Attaining statewide standards for PM and ozone just in California would annually prevent 9,000 premature deaths—more than the total number of deaths from second-hand smoke and motor vehicle crashes combined—and avoid the annual $2.3 billion price tag in the State's economy associated with hospitalizations and treatment related to air pollution.28 The uneven distribution of health, social, and livelihood costs of the freight sector is one of California's deepest forms of environmental injustice, where freight hubs and corridors disproportionately poison the State's low-income communities and communities of color.29 In West Oakland, where CARB attributes 71% air pollution risk to truck traffic,30 residents have life expectancies as much as 24 years shorter than their neighbors in the Oakland Hills.31 This story will sound familiar to communities in Wilmington, Roseville, Shafter, Fresno, Commerce, North Richmond, rural Riverside, and many other predominantly low-income communities and communities of color that live near freight hubs and truck corridors.32 [EPA-HQ-OAR-2019-0055-1314-A1, p.5]

Organization: *National Religious Partnership for the Environment*

The pollution generated by heavy duty vehicles is not an equal burden. Black, Indigenous, Latinx and Asian-American communities disproportionately bear the brunt of air pollution from our national transportation priorities. Reducing diesel emissions would not only address climate change, which is felt first and worst in communities of color, but significantly reduce pollution in black, brown and Asian-American neighborhoods. [EPA-HQ-OAR-2019-0055-1221-A1, p.1]

Organization: *Northeast States for Coordinated Air Use Management (NESCAUM)*

Low load cycles and excess NOx emissions are of particular concern in Overburdened Communities located near busy truck routes and where trucks operate in stop and go conditions where exhaust temperatures are potentially too low to enable selective catalytic reduction (SCR) emissions control function. [EPA-HQ-OAR-2019-0055-1249-A1, p. 11] [Also in Section 3.3]

Organization: *Ozone Transport Commission (OTC) and Mid-Atlantic/Northeast Visibility Union (MANE-VU)*

In addition, urban residents can be exposed to higher levels of health-damaging PM2.5 and toxic air pollutants concentrated at 'hot-spots' near high-density traffic arteries. Freight transportation relies on trucks, trains, and ships operating within communities in the Northeast and mid-Atlantic to move goods. This activity generates a significant amount of localized air pollution in communities already overburdened by diesel exhaust pollution. Local emissions contribute to an ongoing health crisis in these communities. [EPA-HQ-OAR-2019-0055-1250-A1, p.4]

Low load cycles and excess NOx emissions are of particular concern in Overburdened Communities located near busy truck routes and where trucks operate in stop and go conditions. [EPA-HQ-OAR-2019-0055-1250-A1, p.14] [Also in Section 3.3]

Organization: *Public Citizen and Healthy Port Communities Coalition (HPCC)*

Cleaner technology results in tangible health benefits that will protect public health in communities of color and low-income communities. [EPA-HQ-OAR-2019-0055-1417-A2, p. 1]

These recommendations will further improve health outcomes in the communities of color and low-income communities most burdened by diesel pollution. We encourage the EPA to boldly pursue environmental justice as it reduces diesel emissions and improves the health of communities near ports and freight corridors. [EPA-HQ-OAR-2019-0055-1417-A2, p. 5]

Organization: *San Joaquin Valley Air Pollution Control District (District)*

The challenges faced by the San Joaquin Valley with respect to air quality are unmatched by any other region in the nation. The Valley’s topography, climate, geography, and the presence of two major transportation corridors connecting Northern and Southern California all contribute to the region’s air quality challenges. Additionally, a number of Valley communities are highly impacted by environmental and socioeconomic challenges. Since its adoption, the Clean Air Act has led to significant improvements in air quality and public health benefits throughout the San Joaquin Valley. Through a comprehensive regulatory program, the District has adopted over 650 rules since 1992. With an investment of over $40 billion, air pollution from San Joaquin Valley businesses has been reduced by over 80%. The pollution released by industrial facilities, agricultural operations, and cars and trucks is at a historical low for all pollutants. As a result, San Joaquin Valley residents’ exposure to high smog levels has been reduced by over 90%. [EPA-HQ-OAR-2019-0055-1291-A1, p.1]

Organization: *South Coast Air Quality Management District (SCAQMD)*

We further applaud the analytical effort in the RIA to study whether communities saddled with the worst air quality will stand to particularly benefit from more stringent standards. We concur in the assessment that areas with worse air quality, including swaths of the Los Angeles area, may stand to benefit from reductions in ozone. Similarly, the assessment that '[t] hose in areas with the worst air quality would experience a greater reduction in PM2.5 than those in the remaining 95 percent of grid cells' is an important one.25 Putting aside the potential for further and future refinements in this mode of analysis, as is generally known, persons living in proximity to freeways and heavily trafficked areas do suffer worse air quality on average. Those who live in significant proximity to sources of heavy truck or other transportation emissions can experience negative health outcomes, and those population areas can correlate with other negative socioeconomic indicators. Providing environmental health benefits and relief to burdened communities is rightfully at the core of EPA's responsibility to exercise its Title II rulemaking duties. Thus, while securing emission reductions from trucks is needed for NAAQS attainment throughout the entirety of South Coast AQMD's jurisdiction of 10,700 miles, it should not be overlooked that having cleaner heavy truck traffic also helps assure significant benefits for certain, highly impacted communities. We urge EPA to consider the most stringent standards in favor of those communities. [EPA-HQ-OAR-2019-0055-1201-A1, p.7]

25 RIA at pg. 308.

Organization: *Southern Environmental Law Center (SELC)*

Exposure to this type of pollution is also an environmental justice issue; '[r]elative to the rest of the population, people of color and those with lower incomes are more likely to live near truck routes.'11 This is in part due to zoning practices and land use decisions, including in the South, that have consistently sited highways and commercial and industrial facilities that often rely on frequent truck deliveries in communities of color and low-income communities.12 [EPA-HQ-OAR-2019-0055-1247-A1, pp.2-3]

Organization: *States of California, et al. (The States)*

Impoverished communities and communities of color are disproportionately harmed by heavy-duty truck emissions because they are more likely to live, work, or go to school in areas with high truck activity, such as ports, highways, railyards, and distribution centers. [EPA-HQ-OAR-2019-0055-1255-A1, p. 2]

Emissions from heavy-duty trucks disproportionately endanger residents of environmental justice communities by exposing them to harmful air pollution that causes significant health impacts. Heavy-duty trucks concentrate their emissions along transportation corridors and near ports and warehouses.12 Communities located near this infrastructure are disproportionately lower-income and communities of color and typically face industrial pollution cumulatively with truck emissions.13 For example, EPA modeling has shown that race and income are significantly associated with living near truck routes nationally, even when controlling for other factors.14 EPA research has also indicated that people of color are more likely to live within 300 feet of major transportation facilities and go to school within 200 meters of the largest roadways.15 Likewise, a comprehensive study by the South Coast Air Quality Management District—which covers Los Angeles and the Inland Empire, the largest logistics hub nationwide—found that communities located near large warehouses scored far higher on California's environmental justice screening tool, which measures overall pollution and demographic vulnerability.16 That study concluded that, compared to the South Coast basin averages, communities in the South Coast basin near large warehouses had a substantially higher proportion of people of color; were exposed to more diesel particulate matter; had higher rates of asthma, cardiovascular disease, and low birth weights; and had higher poverty and unemployment rates.17 [EPA-HQ-OAR-2019-0055-1255-A1, pp. 4 - 5]

As the South Coast Air Quality Management District study demonstrates, and as many others corroborate,18 residents of environmental justice communities near logistics infrastructure suffer from health effects due to exposure to NOx and associated heavy-duty truck emissions. These issues are particularly acute in our States, which proudly generate a majority of the nation’s economic activity associated with the logistics industry, yet also bear its detrimental environmental impacts. Major ports in some of our States handled 61 percent of all container traffic nationwide in 2020, including the three megaports of Los Angeles, Long Beach, and New York and New Jersey, which together accounted for 43 percent of all container traffic.19 Additionally, Chicago’s central location makes it a national leader in intermodal transit.20 Reflecting historical redlining,21 the communities near these ports are overwhelmingly comprised of residents with lower-incomes and people of color who disproportionately suffer exposures and health impacts from pollution from heavy-duty truck engine emissions. Data from the census tracts surrounding the Ports of Los Angeles and Long Beach exemplify these inequalities: [[See docket number EPA-HQ-OAR-2019-0055-1255-A1, pp. 7-8 for data tables.]] [EPA-HQ-OAR-2019-0055-1255-A1, pp. 5 - 7]

Data from the Bureau of Transportation Statistics, Container TEUs (Twenty-foot Equivalent Units) (2020), https://data.bts.gov/stories/s/Container-TEU/x3fb-aeda/ (ports of Baltimore, Boston, Honolulu, Long Beach, Los Angeles, New York and New Jersey, Oakland, Seattle, South Jersey, Tacoma, and Wilmington combined for 24.956 million TEUs, 61% of 41.24 million TEUs total nationwide; ports of Long Beach, Los Angeles, and New York and New Jersey combined for 17.62 million TEUs, 43% of 41.24 million TEUs) (last accessed May 16, 2022).

20. Chicago Metropolitan Agency for Planning, The Freight System: Leading the Way, at 16 (2017), attached as Exhibit 8.

21. Beginning in the 1930s, federal housing policy directed investment away from "risky" communities of color. Nearly all of the communities adjacent to the three megaports (the Ports of Los Angeles, Long Beach, and New York and New Jersey) and the intermodal terminals in Chicago were coded red, signifying the least desirable areas where investment was to be avoided. See Univ. of Richmond Digital Scholarship Lab, Mapping Inequality, https://dsl.richmond.edu/panorama/redlining/#loc=12/33.748/-118.272&city=los-angeles-ca (Los Angeles, CA), https://dsl.richmond.edu/panorama/redlining/#loc=14/40.678/-74.004&city=brooklyn-ny (Brooklyn, NY), https://dsl.richmond.edu/panorama/redlining/#loc=13/40.704/-74.068&city=hudson-co.-nj (Hudson County, NJ), https://dsl.richmond.edu/panorama/redlining/#loc=13/40.627/-74.233&city=union-co.-nj (Union County, NJ), https://dsl.richmond.edu/panorama/redlining/#loc=12/41.854/-87.772&city=chicago-il (Chicago, IL) (last accessed May 16, 2022).

Logistics hubs demand extensive networks of highways and warehouses to move and store cargo via millions of truck trips annually. Southern California was home to nearly 1.2 billion square feet of warehouse space as of 2014,24 the South Coast Air Basin now contains approximately 3,000 warehouses over 100,000 square feet,25 and the Ports of Los Angeles and Long Beach alone generate about 35,000 container truck trips every day.26 Aggravating historical injustices, decision makers disproportionately site highways and warehouses in environmental justice communities whose residents, like those of port communities, suffer higher levels of pollution exposure from heavy-duty trucks than do whiter and higher-income communities. Data demonstrate that the census tracts in California with the highest levels of ozone, PM2.5, and DPM exposure are communities of color bordering such logistics thoroughfares—Highway 99 in the San Joaquin Valley and Highways 10 and 60 in the Inland Empire: [[See docket number EPA-HQ-OAR-2019-0055-1255-A1, p. 9 for data table.]] [EPA-HQ-OAR-2019-0055-1255-A1, p. 8]

24. South Coast Air Qual. Mgmt. Dist., Final Socioeconomic Assessment, supra note 13, at 7-8.

25. Southern California Association of Governments, Industrial Warehousing in the SCAG Region: Task 2. Inventory of Warehousing Facilities, at 2-11 (2018), available at https://scag.ca.gov/sites/main/files/file-attachments/task2_facilityinventory.pdf (last accessed May 16, 2022).

Accordingly, achieving emissions reductions from heavy-duty trucks is a critical step to begin dismantling historical patterns of environmental injustice burdening communities near ports, highways, and warehouses. [EPA-HQ-OAR-2019-0055-1255-A1, p. 9]

Organization: *Sustainable Solar Systems*

Diesel pollution from heavy duty trucks and buses is a massive public health threat. Even without considering climate change, the air pollution caused by heavy duty trucks is a environmental justice issue that causes more health issues in frontline and marginalized communities. Diesel pollution worsens asthma and is particularly dangerous to children's developing lungs. Here in Philadelphia, 21% of children have asthma, which is more than double the national rate. Indoor and outdoor air pollution are major contributors to the high prevalence of asthma in Philadelphia. The air pollution doesn't only affect childrens' health. It increases costs for LMI families, increases absentee rates in school and days missed from work for their parents. It affects childrens ability to learn in school, affecting lifetime income levels for those children. [EPA-HQ-OAR-2019-0055-2737, p.1]

We urgently need cleaner heavy-duty vehicles on the road, especially in underserved communities that are overburdened with truck pollution due to their proximity to highways and high-traffic corridors. [EPA-HQ-OAR-2019-0055-2737, p.1]

This is more than a financial issue. It's a justice and equity issue. But soon, these cleaner vehicles will actually be cheaper to own and operate than diesel vehicles anyway - making it the smart financial choice to invest in these vehicles now. The EPA must not delay in the adoption of these standards or the next round starting in 2030. Families in diesel death zones have suffered long enough. [EPA-HQ-OAR-2019-0055-2737, p.1]

Organization: *United Methodist Church - General Board of Church and Society*

The United Methodist Church further states that 'clean air is a basic right and necessity for all life' (2016 Book of Resolutions, #1033). Communities of color face an undue, disproportionate, and unjust burden of air pollution and climate impacts from the production of fossil fuels. Most significantly, these new regulations would safeguard communities of color from continued, disproportionate impacts of vehicular pollution and the health effects of greenhouse gas emissions. [EPA-HQ-OAR-2019-0055-1042-A1, p.1]

Organization: *Various Academic Researchers*

Strengthening HDV NOx emissions standards is necessary to reduce air pollution injustice

NOx emissions are not distributed equally throughout the urban landscape, resulting in disproportionately higher NO2 concentrations in marginalized and minoritized communities of the U.S. These disparities have persisted despite overall reductions in ambient NO2. Our research in progress indicates that in 2019, NO2 levels in communities with the largest shares of non-white residents were 2.1 times higher and rates of NO2-attributable pediatric asthma were 7.6 times higher than levels and rates in communities with the largest shares of white residents [Kerr et al., in prep]. [EPA-HQ-OAR-2019-0055-1220-A1, p. 2]

HDV NOx emissions are a leading source of NOx in urban areas of the U.S. On average across the U.S., HDV NOx accounts for 16% of total NOx emissions, but in some cities this proportion can be as high as 30%.5 Marginalized and minoritized communities are located closer to a higher density of interstates, highways, and other major roads. For example, the number of major roads within a kilometer of the least white communities in the U.S. was about 4.5 times higher than the number in the most white communities.5 [EPA-HQ-OAR-2019-0055-1220-A1, p. 2]

5. Kerr, G. H.; Goldberg, D. L.; Anenberg, S. C. COVID-19 Pandemic Reveals Persistent Disparities in Nitrogen Dioxide Pollution. Proc Natl Acad Sci USA 2021, 118 (30), e2022409118. https://doi.org/10.1073/pnas.2022409118.

The unique natural experiment provided by the COVID-19 pandemic allowed us to better understand NO2 disparities and the source of these disparities. Despite an approximately 50% decrease in passenger vehicle activity during the early phase of the pandemic, we found that NO2 levels in marginalized and minoritized communities of the U.S. during the pandemic still exceeded levels in non-marginalized and minoritized communities prior to the pandemic.5 The modest impact that removing ~50% of passenger vehicles from roadways had on NO2 disparities during the pandemic, the important contribution of HDVs to NOx emissions, and the colocation of heavily trafficked roadways with marginalized and minoritized communities point to the importance of HDV NOx emissions in creating and maintaining NO2 inequality. Given their impact, strengthening HDV NOx emissions standards is necessary to advance environmental justice in the nation’s most vulnerable communities. [EPA-HQ-OAR-2019-0055-1220-A1, p. 2]

5. Kerr, G. H.; Goldberg, D. L.; Anenberg, S. C. COVID-19 Pandemic Reveals Persistent Disparities in Nitrogen Dioxide Pollution. Proc Natl Acad Sci USA 2021, 118 (30), e2022409118. https://doi.org/10.1073/pnas.2022409118.

Organization: *WE ACT for Environmental Justice*

These adverse impacts are a preventable reality for people living in low-income areas and communities of color because of their close proximity to high-traffic roadways and trucking routes, bus depots, and goods movement facilities.4,5 These are the areas that scientists have deemed 'diesel death zones' due to adverse environmental and health impacts linked to exposure to toxic air pollutants in diesel exhaust.6 A recent study that utilized space-based observations of NOx air pollution across 52 U.S. cities revealed the striking inequities in exposure for low-income Black, Hispanic, Asian, and Indigenous people compared to white residents.7 [EPA-HQ-OAR-2019-0055-1347-A1, p.1]

Organization: *Wisconsin Department of Natural Resources (WDNR)*

Finally, low-income communities and communities of color represent a higher fraction of populations living along high heavy-duty vehicle traffic corridors and bear a disproportionately high pollution burden from mobile sources. Reducing the ozone and particulate matter pollution from heavy-duty trucks will improve health outcomes throughout Wisconsin. Most importantly, it will take a critical step toward attainment of the 2015 ozone NAAQS, improving air quality in areas overburdened by pollution. [EPA-HQ-OAR-2019-0055-1162-A1, p. 2]

Organization: *World Resources Institute (WRI)*

Pollution from trucks, buses, and other medium- and heavy-duty vehicles directly affects the health of people who live near highways, ports, and depots. EPA’s own analysis estimates that 72 million people in this country live within 200 meters of a truck freight route, and relative to the rest of the population, people of color and those with lower incomes are more likely to live near these transportation corridors. [EPA-HQ-OAR-2019-0055-1298-A1, p.1]

In addition to these ambient conditions, also of concern are the on-board emissions from the diesel school buses that represent more than 90 percent of the 480,000 school buses on the road today, transporting over 20 million students daily and driving 3.3 billion miles annually. Children are particularly susceptible to the negative health effects of diesel exhaust from school buses, a known carcinogen linked to reduced lung development and increased risk for asthma and pneumonia in children, among other risks. In addition, there is evidence that reducing diesel exhaust exposure can improve not only students' respiratory health, but also their academic outcomes. [EPA-HQ-OAR-2019-0055-1298-A1, p.2]

Electric school buses, which produce zero tailpipe emissions, are the healthiest solution for all students, bus drivers, and the communities they travel through. Because students from low-income communities are more likely to ride a school bus - 60% of students from low-income families ride the bus to school, compared to 45% of students from families with higher incomes - a more stringent rule will advance the transition to an electric school bus fleet and simultaneously help address this transportation inequity. [EPA-HQ-OAR-2019-0055-1298-A1, p.2]

Organization: *Yellowstone Integrated Architecture and Construction*

Dangerous nitrogen oxides and other pollution that heavy duty vehicles like trucks and buses spew into our air hurt communities of color and low wealth communities first and worst, but affect all of us, especially our children. [EPA-HQ-OAR-2019-0055-2816, p.1]

EPA Summary and Response

Summary:

Commenters pointed out the need to control emissions from heavy-duty vehicles to improve public health and welfare, especially to those who live, work, or attend school close to major roadways and in communities with EJ concerns.

Response:

Thank you for your comments. EPA agrees that actions to control emissions from heavy-duty vehicles are necessary to improve public health and welfare. The standards in this rule will bring about significant health benefits in the U.S., including to those who live, work, or attend school close to major roadways and in communities with EJ concerns. EPA notes that, as explained in preamble Sections I and III, EPA is promulgating these standards under our authority in CAA section 202(a)(3)(A) and has appropriately assessed the statutory factors specified in that section.

Please refer to Section 1 of this document for responses to comments regarding concerns that the proposal does not go far enough to reduce emissions from heavy-duty vehicles. Please refer to Section 3 for responses to comments about the stringency of the proposed standards.

EPA is committed to taking decisive action to advance environmental justice and civil rights as part of its FY2022-2026 Strategic Plan. This rulemaking advances that strategic goal by setting stronger national emission standards for heavy duty engines and vehicles.

EPA acknowledges comments from many stakeholders on the impacts of COVID on underserved communities. While we were not able to incorporate COVID 19 into our modeling, we have evaluated the impacts we expect the rule to have on communities overburdened by pollution; this analysis is included in preamble Section IV.H, with additional discussion on environmental justice in preamble Sections II and XII.

24 Comparison of Benefits and Costs

Comments by Organizations

Organization: *Clean Air Task Force, Environmental Law & Policy Center, National Parks Conservation Association, and Sierra Club*

Cost-benefit analysis also supports establishing stringent standards in this rulemaking. EPA's cost-benefit analysis should quantify the rule's climate benefits based on the social cost of greenhouse gases (SC-GHG), and EPA should consider these benefits—as well as the additional benefits from Commenters' proposed improvements—in finalizing the standards.

Organization: *Great Rivers Environmental Law Center and Dutchtown South Community Corporation (DSCC)*

It is not without meaning that EPA's own cost analysis demonstrates more stringent emissions controls will actually cost less money and save more lives.25 [EPA-HQ-OAR-2019-0055-1323-A1, p.6]

25 Proposed Regulation at p.17589, Table IX-1.

Organization: *Manufacturers of Emission Controls Association (MECA)*

MECA estimated that the proposed NOx reductions could be achieved with an approximate cost-effectiveness from $1,000 to $5,000 per ton of NOx reduced. We used a cost-effectiveness methodology that is based on both certification emission levels as well as in-use emissions reported by CARB [40] following the 2017 Carl Moyer Guidelines [41], and assuming typical heavy-duty engine power, load and annual use. Benefits were calculated for a vehicle's current full useful life of 435,000 miles. The resulting range of cost-effectiveness values is due to variability in vehicle and engine characteristics. For example, replacing a higher-emitting vehicle that operates more frequently and lasts longer on the road will be more cost-effective than replacing a lower-emitting vehicle that operates for less time. EPA's estimate of $2,000 per ton NOx reduced for the 2010 heavy-duty NOx standards is within this range [42], and both are significantly below the average cost of controls on stationary power plants and industrial NOx sources, which have been reported to range from $2,000-$21,000 per ton [43]. Similarly, CARB estimated the cost-effectiveness for future low-NOx requirements to be approximately $6,000 per ton [44]. [EPA-HQ-OAR-2019-0055-1320-A1, p.27]

It is well established that agencies should consider a range of regulatory alternatives in order to properly evaluate the costs and benefits of a regulatory proposal. Executive Order 12,866 explains that “agencies should select those approaches that maximize net benefits” when “choosing among alternative regulatory approaches.”21 Accomplishing such a goal of maximizing net benefits is impossible without first considering a broad range of alternatives at different levels of stringency.22 The Office of Management and Budget (“OMB”) Circular A-4 directs agencies to “describe the alternatives available to [the agency] and the reasons for choosing one alternative over another.”23 When, as here, there is a continuum of possible alternatives based on the level of stringency, agencies “generally should analyze at least three options: the preferred option; a more stringent option that achieves additional benefits (and presumably costs more) beyond those realized by the preferred option; and a less stringent option that costs less (and presumably generates fewer benefits) than the preferred option.”24 Circular A-4 makes clear that an analysis that, as here, does not discuss the incremental costs and benefits of alternatives is not adequate.25 [EPA-HQ-OAR-2019-0055-1256-A1, pp. 5 - 6]

25. Id.

Organization: *Our Children's Trust*

What is at stake in this proposed rule are lives of children—their health and safety. Nonetheless, EPA's RIA applies discount rates of 3% and 7% to the benefits of reducing pollution. Even in the context of 'valuing PM2.5-related premature **mortality, we discount the value of premature mortality occurring in future years using rates of 3 percent and 7 percent.'3** At the same time EPA discounts the benefits of eliminating pollution substantially devaluing those benefits for children today who will become adults in 20 years, or children born in 20 years and beyond, EPA has also ignored 'future changes to climate [that] may create conditions more conducive to forming ozone' and 'the potential for climate-induced changes in temperature to modify the relationship between ozone and the risk of premature death.'4 [EPA-HQ-OAR-2019-0055-1317-A1, p.2]

3 U.S. EPA, Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards: Draft Regulatory Impact Analysis, EPA-420-D-22-001, at 388 (Mar. 2022).

4 Id.

The RIA does not include any valuation for the social cost of carbon ('SCC'). As we have written in other comments, given the catastrophic harms to young people and future generations posed by ongoing GHG pollution and the intergenerational injustice and lack of political power of these generations, EPA should not be discounting the benefits accruing to those generations when it makes decisions today that will profoundly affect their health and welfare and indeed their ability to sustain life in their communities and in their homes. Please stop using this discounting practice that is unjustified from any ethical, legal or economic perspective, and use a zero percent discount rate and a meaningful valuation of the SCC. Discounting as conducted in this RIA is not required by any law of Congress and it is unconstitutional. It has real-life implications. EPA does not even evaluate alternative regulations that could 'cost' more in dollars today to implement because it does not fully value the benefit of doing so. Every one of the RIAs EPA has prepared in the past thirty years has systematically undervalued the benefit of stringent pollution control to protect air quality, and human health and welfare, and discriminates against children and future generations. [EPA-HQ-OAR-2019-0055-1317-A1, pp.2-3]

5 U.S. EPA, Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards: Draft Regulatory Impact Analysis, EPA-420-D-22-001, at 3 (Mar. 2022).

EPA has in the past performed a sensitivity analysis with zero % discounting and discounting as low as 2%. Please explain why EPA refuses for the past three decades to engage in that analysis to provide a more accurate picture of the benefit cost analysis to children of today and tomorrow. [EPA-HQ-OAR-2019-0055-1317-A1, p.3]

The RIA acknowledges that: 'The benefits associated with the standards presented here do not include the full complement of health, environmental, and climate-related benefits that, if quantified and monetized, would increase the total monetized benefits.'5 By monetizing all costs and only a margin of the economic benefits (then substantially discounted) gives a very imbalanced and inaccurate picture of the enormous benefits of stopping GHG pollution. The totality of health and climate harms from these GHGs are well-documented and relevant to the burdens imposed by the proposed rule on youth and future generations. EPA should provide a very clear explanation up front that the monetized benefits are so undervalued that they outweigh costs by an order of magnitude and provide some tangible explanation for the American public, judges and policymakers to understand how substantially the benefits outweigh any costs. EPA should also explain how the discounting process, which is not lawful, not authorized by Congress, nor allowed constitutionally also gives a skewed view of the benefits of these proposed regulations and has foreclosed EPA from evaluating even more protective regulations that would care for the health of the youngest citizens and the voiceless future generations who will live with the consequences of these rules. [EPA-HQ-OAR-2019-0055-1317-A1, p.3]

Organization: *Truck and Engine Manufacturers Association (EMA)*

Using the foregoing numbers, on a per-vehicle basis, the proposed Option 1 low-NOx regulations likely would have a costs-to-benefits ratio (or a negative benefits-to-costs ratio) on a per-HHD-vehicle basis of approximately 10:1. As a result, Option 1 is not implementable. In addition, EPA will need to revise Option 2 in a manner consistent with EMA's recommendations to enhance the cost-effectiveness of the Agency's final low-NOx regulations. [EPA-HQ-OAR-2019-0055-1203-A1, p. 144]

In light of the foregoing, the Agency will need to revise its RIA and benefits estimates, and make the necessary changes to the resultant cost-benefit calculations before finalizing this rulemaking. As it stands, it remains clear that the Agency's Option 1 proposal is cost-prohibitive. [EPA-HQ-OAR-2019-0055-1203-A1, p. 165]

EPA Summary and Response

Summary:

The commenters made several observations about the comparison of costs and benefits associated with the proposal, including that EPA's cost-benefit analysis should quantify the rule's climate benefits based on the social cost of greenhouse gases (SC-GHG), that costs and benefits should be compared across alternatives, that there are unquantified benefits that, when accounted for, would further increase net benefits, and that the Agency needs to revise its cost-benefit calculations.

Response:

EPA acknowledges the commenters' input and observations about the comparison of benefits and costs in the proposal. EPA's benefit-cost analysis is consistent with applicable guidance and best practices for conducting such analyses, including OMB Circular A-4 and EPA's Guidelines for Preparing Economic Analyses, including guidance on which discount rate estimates to apply, and how to apply them, when monetizing benefits and costs. We consider our analysis consistent with the guidance, methodologically rigorous, and a best estimate of the projected societal benefits and costs associated with the proposed and final program. In the proposal, we found that the benefits of both scenarios we analyzed, Option 1 and Option 2, far outweighed the costs associated with those same scenarios (RIA Chapter 8 describes EPA's benefits methodology and assumptions). See also our response in sections 18 and 21 of this document for further detailed response about the appropriateness of EPA's cost and benefits methods.

We note that EPA is not taking final action at this time on the proposed revisions to certain Heavy-Duty GHG Phase 2 standards. As a result, the benefits analysis for this final rulemaking does not monetize the Social Cost of GHGs associated with reductions in GHG emissions related to any changes to the Heavy-Duty GHG Phase 2 standards.

In setting the final emission standards, EPA appropriately assessed the statutory factors specified in CAA section 202(a)(3)(A). EPA's assessment of the relevant statutory factors in CAA section 202(a)(3)(A) justify the final emission standards. We also evaluated additional factors, including factors to comply with E.O. 12866; our assessment of these factors lends further support to the final rule. For additional discussion on our assessment in setting the final standards, see sections 3.1 and 3.2 of this Response to Comments document and preamble Sections III, IV, and V.

EPA also acknowledges that the benefits associated with the proposed program do not include the full complement of health and environmental benefits that, if quantified and monetized, would increase the total monetized benefits. However, EPA demonstrated that the benefits it did monetize would provide society with a substantial net gain in welfare. Unquantified benefits generally scale with the emissions impacts of the proposed standards and benefits far outweighed costs under each regulatory option. The omission of unquantified benefits did not impact the Agency's evaluation of the proposed regulatory options.

25 Impact on vehicles sales, mode shift, fleet turnover

25.1 Commenters who Agree with the Conclusions of EPA's Sales Analysis

Comments by Organizations

Organization: *Clean Air Task Force, Environmental Law & Policy Center, National Parks Conservation Association, and Sierra Club*

And while EPA has previously found that sales impacts from heavy-duty emissions standards were too uncertain to quantify—a position with which Commenters continue to agree—Commenters generally endorse the Agency's conclusions regarding the potential sales impacts of this rulemaking. Despite uncertainties, Commenters agree with EPA that the adverse sales impacts, if any, from proposed Option 1 (including pre-buy and low-buy effects) are likely to be minimal and short lived. [EPA-HQ-OAR-2019-0055-1302-A1, p.8]

EPA has previously declined to quantify the sales impacts of heavy-duty regulations, determining that adverse impacts were not certain to occur, and that it was not possible to isolate the effects of the standards from other, potentially stronger, factors, such as broader macroeconomic conditions. In the 2011 Phase 1 GHG standards, EPA and NHTSA noted that 'whether pre-buy or delayed purchase is likely to play a significant role in the truck market depends on the specific behaviors of purchasers in that market,' and explained that the Agencies would not project fleet turnover effects '[w]ithout additional information' about the likelihood of future market conditions. EPA & NHTSA, Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles, 76 Fed. Reg. 57,106, 57,332 (Sept. 15, 2011). Similarly, in the 2014 Tier 3 standards, EPA explained that it had 'not attempted to estimate explicitly the effects of the rule on scrappage of older vehicles and the turnover of the vehicle fleet,' because it did not 'have a good estimate of the effect of new vehicle price changes on vehicle turnover.' EPA, Control of Air Pollution from Motor Vehicles: Tier 3 Motor Vehicle Emission and Fuel Standards, 79 Fed. Reg. 23,414, 23,617 (Apr. 28, 2014). And most recently, in the 2016 Phase 2 GHG standards, EPA and NHTSA again declined to project sales and turnover effects, explaining that while the standards might affect sales to some degree, 'the size of that effect is likely to be swamped' by macroeconomic conditions, and that it was 'unlikely to be possible to separate the effects of the existing standards from other confounding factors.' 81 Fed. Reg. at 73,875.255 [EPA-HQ-OAR-2019-0055-1302-A1, pp.69-70]

> 255 CARB similarly declined to attempt to estimate sales impacts from the Omnibus, observing that while some studies had explored the relationship between general cost increases and purchasing behavior, they resulted in a 'very wide range' of 'highly uncertain' estimates, which CARB cautioned 'may change markedly in the span of only several years due to the dynamics of industry, and modern global economics.' CARB, Attachment B to Resolution 20-23, Response to Comments on the Environmental Analysis for the Proposed Heavy-Duty Engine and Vehicle Omnibus Regulation and Associated Amendments 14 (Aug. 26, 2020). https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2020/hdomnibuslownox/res20-23attbrtc.pdf.

We recognize that EPA has now developed a peer-reviewed methodology to estimate the sales impacts of heavy-duty regulations, which it suggests could be applied in the final rule. While we do not think EPA should quantify sales effects in the final rule, for the reasons noted above in the previous rulemakings, we do concur in the Agency's ultimate conclusion that any such effects are likely to be minimal and short-lived. According to the Agency's example results, proposed Option 1 is unlikely to cause extensive or long-lasting adverse sales impacts, with potential pre- and low-buy for Class 8 trucks ranging 'from zero to approximately two percent increase in sales over a period of up to 8 months before the 2031 standards begin (pre-buy), and a decrease in sales from zero to approximately two percent over a period of up to 12 months after the 2031 standards begin (low-buy).' 87 Fed. Reg. at 17,429. [EPA-HQ-OAR-2019-0055-1302-A1, p.70]

As EPA's analysis of previous, comparable heavy-duty regulations determined, historical pre-buy/low-buy effects have been limited—where there is evidence that they have even occurred at all.256 Specifically, these effects have been shown to be limited by *vehicle type* (with 'some evidence for Class 8 vehicles' but no such evidence for Classes 6 or 7257), limited in *magnitude* (with '[s]mall' pre-buy effects for Class 8 vehicles prior to the 2010 and 2014 regulations258), and limited in *duration* (with ‘some evidence for Class 8 vehicles of short-term pre-buy and low-buy’ lasting ‘typically less than 8 months’259).260 And on the limited occasions when both pre-buy and low-buy effects have occurred in the past, they often cancel each other out in a matter of months, with a net sales impact of zero.261 [EPA-HQ-OAR-2019-0055-1302-A1, pp.70-71]

256 EPA, Analysis of Heavy-Duty Vehicle Sales Impacts Due to New Regulation at 8–16 , EPA-420-R-21-013 (2021), https://cfpub.epa.gov/si/si_public_pra_view.cfm?dirEntryID=349838&Lab=OTAQ.

257 Id. at 8.

258 Id.

259 Id.

260 See id. at 9 ('Pre-buy and low-buy effects, where they occur, are short lived, with the period of significance not extending beyond 8 months pre and post regulation.').

261 See id. at 20 (citing Rittenhouse and Zaragoza-Watkins’s (2018) finding that pre-buy prior to the 2007 regulation was 'followed by a near-symmetrical reduction in sales in the months immediately after the regulation went into effect—for an overall near zero net sales impact'); National Academies of Sciences Engineering and Medicine, Reducing Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty Vehicles, Phase Two: Final Report 329 (2020), https://doi.org/10.17226/25542 ('The pre-buy and low-buy impacts [of the 2007 standards] were short-lived and small in volume…and they roughly canceled out, leaving an insignificant net impact on sales.').

Moreover, while there is mixed evidence of limited pre-buy and low-buy behaviors surrounding some prior heavy-duty vehicle regulations, the evidence is neither definitive nor predictably consistent across regulations or vehicles. As EPA concluded from its literature review, ‘pre-buy and low-buy do not occur universally. These effects do not appear to show up in all rules, or for Class 7 vehicles.’262 In fact, in the case of the 2010 regulations, Class 7 vehicles actually showed some evidence of reduced sales before the implementation of the regulations, and increased sales after the implementation of the regulations—the opposite of pre-buy/low-buy and contrary to a simplistic assumption that higher expected regulatory costs necessarily result in greater adverse sales impacts, given that the 2007–2010 regulations ‘are largely seen as the most extensive (and expensive) HDV emissions standards.’263 [EPA-HQ-OAR-2019-0055-1302-A1, p.71]

262 EPA, Analysis of Heavy-Duty Vehicle Sales Impacts Due to New Regulation at 99.

263 Id. at 39.

Similarly, not all purchasers can be expected to engage in the same kind of behavior in response to regulations. For example, smaller firms, which make up a plurality of trucking companies, 'typically have lower pricing power, and as such are less likely to engage in pre-buy, low-buy, or class-shifting behavior.'264 Likewise, contrary to claims regularly advanced by industry advocates, trucking firms' responses to increased costs 'may not always follow what would be expected by theory.'265 Studies 'suggest that trucking companies may pass on, and recoup (or more than recoup) certain costs, and that economic responses to HDV emissions regulations may be more complex than anticipated and may be counterintuitive in certain respects.'266 [EPA-HQ-OAR-2019-0055-1302-A1, p.71]

264 Id. at 16.

265 Id. at 43.

266 Id.

Further, as EPA noted in its 2021 analysis, '[g]iven the high relative costs of [HDVs], we also do not expect much of a pre-buy effect, as any advantage associated with increasing early purchases because of anticipated HDV price increases are offset by the costs of managing excess vehicle capacity, which can be expensive, or selling or scrapping older stock.'267 Commenters agree with this assessment. [EPA-HQ-OAR-2019-0055-1302-A1, p.71]

267 Id. at 54.

Commenters also strongly support EPA's view that the extended useful life and warranty periods of proposed Option 1—in addition to ensuring critical real-world emissions reductions—are likely to reduce the potential for adverse sales impacts. As EPA explains, '[t]his is because longer useful life periods are expected to make emission control technology components more durable, and more durable components, combined with manufacturers paying for repairs during the proposed longer warranty periods, would in turn reduce repair costs for vehicle owners.' 87 Fed. Reg. at 17,590. The reduced repair costs can be expected to alleviate some of the effect of increased vehicle purchase costs, and '[a]s a result, they may reduce incentives for pre- and low-buy and mitigate adverse sales impacts.' Id. at n.785. [EPA-HQ-OAR-2019-0055-1302-A1, pp.71-72]

The Proposal's reliance on familiar technology, combined with the enhanced durability and warranty provisions, means that purchasers can be expected to face reduced incentives to engage in pre-buy behavior in response to these standards. See Comments of MFN, to be filed in Docket EPA-HQ-OAR-2019-0055 on May 16, 2022. [EPA-HQ-OAR-2019-0055-1302-A1, p.72]

Finally, Commenters' proposed improvements to the GHG standards can also be expected to reduce the potential for adverse sales impacts of the standards. Manufacturers often improve the fuel efficiency of their vehicles as part of their strategy for complying with GHG standards, which are less likely to cause adverse sales impacts because the benefits of fuel savings accrue to the vehicle purchaser, thereby lowering transport costs and stimulating the economy.270 Fuel efficiency and GHG standards also reduce the impact of fuel price volatility on new vehicle demand, and insulate manufacturers and workers from fuel price shocks, leading to more stable sales and employment numbers.271 [EPA-HQ-OAR-2019-0055-1302-A1, p.72]

> 270 See Katherine Rittenhouse & Matthew Zaragoza-Watkins, Anticipation and Environmental Regulation, 89 J. Envtl. Econ. & Mgmt. 255, 267 (2018).
>
> 271 See id.; Matthew Zaragoza-Watkins, Analysis of Market Impacts of GHG and Fuel-Economy Standards for Heavy-Duty Vehicles (May 11, 2015), attachment to Comment of EDF on EPA's Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2 (Docket No. EPA-HQ-OAR-2014-0827) (Aug. 16, 2016).

Organization: *Environmental Defense Fund (EDF) (1265 and 2855)*

Certain companies continue to inaccurately make the argument that protective pollution standards disrupt the market for new trucks because of a pre-buy/low buy phenomenon. These arguments are based almost entirely on inflated cost projections for compliance with EPA Option 1, which aligns with the California Heavy-Duty Omnibus rule, including assumed substantial additional costs for replacing diesel NOx controls based on warranty and extended useful life provisions. [EPA-HQ-OAR-2019-0055-1265-A1, pp.25-26]

However, CARB's cost projections are reasonable and indeed, similar claims related to past standards have proven incorrect. For instance, some companies often incorrectly cite the 2006/2007 emissions standards as an example of standards that caused a pre-buy/low-buy effect. A prior analysis by EDF has shown that standards, including the 2007 standards, did not meaningfully result in 'pre-buy' or 'low-buy.'108 The study found that the net impact of the 2007 criteria standards on sales, and likely employment, was quite small.109 Instead, GDP, the price of diesel fuel, and controls for annual and month-of-year differences described the vast majority of the variation in sales and employment,110 Failing to control for these underlying economic trends biases analysis of the impact of regulation.111 The study found that other previous criteria pollutant standards, in 1998, 2002, 2004, and 2010, also had no impact on new-vehicle sales.112 The study concluded that the empirical evidence suggests that compliance with criteria pollutant standards has not generally caused a demand shift or net impact on new-vehicle sales.113 [EPA-HQ-OAR-2019-0055-1265-A1, p.26]

> 108 Analysis of Market Impacts of GHG and Fuel-Economy Standards for Heavy Duty Vehicles by Dr. Matthew Zaragoza-Watkins in comments of Environmental Defense Fund on Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2; Proposed Rule, 80 Fed. Reg. 40138 (July 13, 2015), EPA-HQ-OAR-2014-0827-1971, https://www.regulations.gov/comment/EPA-HQ-OAR-2014-0827-1971; See also Katherine Rittenhouse and Matthew Zaragoza-Watkins, Anticipation and Environmental Regulation, Journal of Environmental Economics and Management 89, 255-277 (2018), https://doi.org/10.1016/j.jeem.2018.03.005.

Organization: *Moving Forward Network (MFN)*

A frequent industry claim that EPA should forcefully reject in response to comments is that new emission standards cause a “pre-buy/no-buy” phenomenon. The theory goes that complying with new standards comes at an exorbitant cost, causing fleets to stock up on older truck models before the new standard comes into effect (“pre-buy”) resulting in a sharp decrease in sales after the standard begins (“no-buy”). Because of this wild oscillation in demand, manufacturers claim standards will result in job cuts—something they claim happened with previous heavy-duty vehicle emission standards. Any scrutiny of the impact of past emission standards on purchasing behavior shows that manufacturers are superimposing trendlines and erroneously calling that a causal relationship. [EPA-HQ-OAR-2019-0055-1277-A1, p. 38]

A more rigorous econometric approach was conducted to evaluate the 2007 federal truck emission update impact on truck sales. The analysis found that regulatory “anticipation” caused a spike in truck sales before the rule began, followed by a slump once it came into effect.154 But, critically, the spike and slump were extremely short-lived (only seven months before and after), and caused by other macroeconomic factors (GDP and oil price changes). Moreover, the number of vehicle sales impacted was small, roughly 30,000 nationally, and almost 30 percent of these sales were attributable to GDP and oil price changes. In fact, further examination of historical Class 3-8 sales data shows a clear correlation between decreased truck sales and periods of economic downturn (Figure 6). [EPA-HQ-OAR-2019-0055-1277-A1, pp. 38 - 39]

154. https://www.sciencedirect.com/science/article/abs/pii/S0095069617306848?via%3Dihub

Further, the 2007 standard required an entirely new emission control technology. In comparison, the 2010 federal truck standard, which the report also evaluated, only required minor improvements to existing technology and did not experience any pre-buy/no-buy behavior. This is vital because an enhanced version of EPA’s Option 1 that aligns with the Heavy-Duty Omnibus rule only necessitates improvements to existing technology, not entirely new technologies, and is much more similar to the 2010 update. [EPA-HQ-OAR-2019-0055-1277-A1, p. 39]

Additionally, the only cost data that manufacturers can point to comes from an unverifiable survey conducted on their members with wildly inflated projections. In contrast, numerous third parties, including the California Air Resources Board156 and the manufacturers of emission control systems,157 have published extensive cost projections that are orders of magnitude less than the industry survey. Many of these studies are backed by actual lab testing and all results are publicly available. [EPA-HQ-OAR-2019-0055-1277-A1, pp. 39 - 40]

EPA Summary and Response

Summary:

Some commenters, including a comment from Clean Air Task Force, Environmental Law & Policy Center, National Parks Conservation Association and Sierra Club (CATF, et. al), agreed with EPA's analysis of the proposed rule, specifically stating that pre- and low-buy sales effects will be limited and short-lived. CATF, et, al also stated that, though they agree that any sales effects are likely to be minimal and short-lived, EPA should not quantify the sales effects in the final rule, highlighting uncertainties EPA noted in previous HD rulemakings with respect to estimating sales and fleet turnover effects. EDF and MFN further commented that pre- and low-buy sales effects analyses by some manufacturers rely on inflated cost projections and "an unverifiable survey," as opposed to published, public cost projections which are often backed by lab testing.

Commenters, including CATF, et. al, EDF and MFN pointed out that there is evidence of limited pre- and low-buy from previous HD standards, with EDF and MFN stating that the sales effects around the 2007 standards can be largely explained by changes in factors such as GDP and the price of oil or diesel. CATF, et.al commented that the familiar technology available to meet this proposed regulation's standards, as well as the increased durability and warranty provisions proposed, would lead to reduced incentive for pre-buy. Similarly, MFN commented that the proposed standards could be met with mostly existing technology, "similar to the 2010 update," which the commenter stated resulted in minimal pre- and low-buy.

Response:

EPA maintains our assessment that any possible sales effects of the final rule are likely to be minimal and short lived, see RIA Chapter 10 for more detail. EPA agrees that there are many uncertainties associated with estimating pre-buy and low-buy, including those discussed in past rules. For this reason, we have presented the sales analysis for this rule as an illustrative example. EPA agrees that the costs used by some manufacturers to analyze possible pre- and low-buy effects from the proposed rule were larger than the publicly available cost estimates EPA used in the proposed analysis, as well as the cost estimates used in the final rule analyses. See RIA Chapter 7 for more information on the cost estimates used in the final rule analyses, and section 18 of this document for EPA's response to commenters' cost estimates submitted to the docket on the proposed rule.

EPA agrees that macroeconomic factors are the main driver of changes in HD vehicle sales, as shown in the peer reviewed EPA report "Analysis of Heavy-Duty Vehicle Sales Impacts Due to New Regulation" (EPA sales impacts report).[57] Though EPA disagrees with MFN's characterization of the 2010 standards as an update to the 2007 Heavy-Duty Engine and Vehicle Rule, noting that the "2010 update" refers to the full phase-in of that rule, we agree that the standards in this final rule can be met with technologies that are an evolution of today's emissions control technologies.

25.2 Commenters who Disagree With our Analysis and Provide Supporting Data from ACT Research, Ricardo or Ramboll

Comments by Organizations

Organization: *Allison Transmission, Inc. (Allison)*

- EPA has also underestimated the potential impact of "pre-buy" and "low-buy" behavior. Based on data submitted with these comments, Allison believes that these periods will be both more extensive and of greater impact to vehicle sales, particularly with respect to the two-phased approach adopted in Option 1. [EPA-HQ-OAR-2019-0055-1231-A1, p.6]

EPA has proposed two-different options with regard to the stringency of new standards to control emissions of nitrogen oxides ("NOx") from heavy-duty vehicles ("HDVs"). EPA is also taking comments on the range of alternative standards that lie between the two options.5 On the whole, Allison supports the single-phase regulatory structure of Option 2, rather than imposing two different sets of standards in Model Years ("MYs) 2027 and 2031 under Option 1. As indicated in more detail below, the imposition of new standards for heavy-duty commercial vehicles has historically been preceded by a "pre-buy" period where trucking companies and other fleet and individual purchasers seek to avoid a step-up in price and change in emissions architecture for vehicles that will be used in their business. This is followed by a downturn in business after the new standards take effect (the "low-buy" period). Thus, rather than smoothing out any pre-buy period by phasing-in two sets of standards taking effect within four years of each other, Allison believes that EPA's Option 1 would likely exacerbate the turmoil that normally attaches to the imposition of new standards. [EPA-HQ-OAR-2019-0055-1231-A1, p.7]

5 87 Fed. Reg. at 17,421.

Under Option 1, it is likely that pre-buys would start before 2027, followed by decreases in demand that would extend well into the 2030s. Many vehicle buyers, when confronting new requirements in the second phase of Option 1, would seek to avoid a step-up in costs, changes in proven technology, and the costs of new maintenance procedures. These potential buyers --

[57] The full document can be found on EPA's Science Inventory website: https://cfpub.epa.gov/si/si_public_pra_view.cfm?dirEntryID=349838&Lab=OTAQ and in the docket on this rule

having purchased during the “pre-buy” period or during the first phase of Option 1 --would likely not re-enter the market for some time after the MY 2031 standards were implemented. As provided below, Allison’s data indicates that EPA may have underestimated this “pre-buy” effect by orders of magnitude in the vocational vehicle market. Overall, Allison believes that Option 1 has the potential to extend economic dislocation and, with it, create market inefficiencies that will raise the ultimate cost of a transition to cleaner HDV technology. [EPA-HQ-OAR-2019-0055-1231-A1, p.7]

EPA has projected that Option 1 would result in a pre-buy of approximately zero to 2 percent and a corresponding decrease in sales of the same magnitude for up to 12 months following implementation of the 2031 Option 1 standards.44 EPA bases this estimate, in part, on a study of previous transitions in regulatory standards in 2004, 2007, 2010 and 2014.45 [EPA-HQ-OAR-2019-0055-1231-A1, p.19]

44 87 Fed. Reg. at 17,429.

45 Id. at 17,590. See also: RIA Chapter 10.1

As the RIA notes, however, the results of EPA’s study vary by regulation. In the month prior to the implementation of the 2014 regulations, pre-buy activity reached 13.2 percent.46 In other months prior to implementation of the same standard, particularly those further away from the implementation date, the percentages of pre-buy were generally lower and included months where no change was detected.47 Thus, assuming an averaged zero to 2 percent effect as across all vehicles may not be justified or fully reveal the actual real-world effects (including volatility in sales) that may be experienced in different segments of the market. While the RIA notes that there are several limitations to EPA’s analysis, including the observation that other effects of the proposed rule apart from price could have an impact on buying behavior, neither EPA or the outside study attempted to further quantify how different vocational vehicle or Class 7-8 tractors could be affected by pre-buy and low-buy behavior. [EPA-HQ-OAR-2019-0055-1231-A1, p.19]

46 Table 10-2, RIA at 410.

47 Id.

In general, Allison believes that a more significant pre-buy and low-buy than EPA analysis has projected should be expected. As reflected in Table 4 below, Allison has conducted an analysis using ACT Research’s historical North America build data pulled in April. This data represents the CL6/7/8 North American On-Highway portfolio over previous fifteen-year period, i.e., for 2006-2021 sales, and shows that there are substantial differences in how new EPA criteria and GHG regulations have affected vehicle sales.48 In many cases, the pre-buy and low-buy effects are substantially more than projected by EPA. [EPA-HQ-OAR-2019-0055-1231-A1, p.19]

48 In reviewing Table 4, it should be noted that most of Allison’s fully automatic transmission sales during this fifteen-year period were attributable to vocational truck and bus sales in classes 4 through 8. In the

chart above, the 2000 series was used in Class 4/5 walk-in vans and class 6/7 pickup & delivery vehicles as well as school buses. The 3000 series was utilized in Class 6/7 and 8 vocational trucks as well as Class 8 transit and school buses. The 4000 series was used in Class 8 vocational vehicles.

Allison Transmission performed an analysis using ACT Research data pulled from April 2021, supporting finalization of Option 2 to moderate anticipated pre-buy and low-buy effects. See Appendix 3. Specifically, based on a review of our analysis, we would note that:

- Allison analysis of ACT Research historical build data reflects a more significant pre-buy/low-buy effect from the EPA 2007 Heavy-Duty Engine and Vehicle Rule than EPA projects for the current rulemaking. Across weight classes CL6/7/8, pre-buy activity ranged up to 47-56%, far exceeding EPA assumption of 0-2% pre-buy resulting from the proposed emission standards. While Allison data regarding EPA's Phase 1 and Phase 2 GHG rules show lower relative effects, they are still above EPA projections.
- In addition, based on the same data for the 2007 rule, EPA's estimate of low-buy impacts is almost certainly underestimated. As reflected above, both the extent and duration of the low buy period exceeds what EPA estimates for this rulemaking. In comparison with EPA 0-2% twelve-month estimate, one-year impacts during 2006-2007 ranged from 28 to 44%. And these effects persisted beyond twelve months duration. Allison analysis using a smoothed average based off of ACT Research data reflects approximately six years of lower-than-average sales from 2007-2013. (based on fifteen-year build average 2006-2021).
- Pre-buy and low-buy effects were not limited to Class 8, rather sales data shows substantial prebuy and low-buy activity in medium- and heavy-duty Class 6/7 vehicles. Our analysis of data showed evidence of stronger pre-buy effects for Class 6/7 (56% above fifteen-year average) compared to Class 8 in 2007 (47% above fifteen-year average)
- Pre-buy and low-buy effects showed similar patterns across all CL6/7/8 vocations industry-wide Additional detail by vocation is provided in Appendix 2. 49 [EPA-HQ-OAR-2019-0055-1231-A1, p.20]

  49 One possible explanation is that the Heavy Heavy-Duty Class 8 engine design capability allowing rebuild may lead to stronger low-buy affects without as much related pre-buy activity, compared to Medium Heavy-Duty engines which showed stronger pre-buy activity.

EPA also requested comment on impact from events external to industry. A high level of year over year volatility is common in commercial vehicle markets due to replacement cycles and multi-year capital planning at the fleet level. Allison's analysis in Table 4 above smooths averages during multi-year periods to better understand sustained impacts over a longer period of time. At EPA's request we included some one-year impacts in Table 5. In general, Allison believes that external events can create significant volatility. However, unlike regulatory impacts which are more easily factored into replacement cycles and capital planning by fleets, external events can be more challenging to anticipate and therefore can have sharp one-year impacts and rebounds as industry and customers recover (as in 2019-2020 COVID-19 and 2021 recovery as GHG Phase 2 began). [EPA-HQ-OAR-2019-0055-1231-A1, p.20]

External events can also exacerbate a period of pre-buy / low-buy, e.g., as was experienced during the Great Recession of 2008 that took place before full phase in of 2010 NOx standards. Specifically:

- As the previous NOx standards began to be partially phased in during 2006 to 2007, on-highway sales and industry builds dropped 28% to 44% across Class 6/7/8. These effects also persisted in subsequent years.
- Builds dropped 34% to 42% from 2008 to 2009. In this period of time, a reasonable assumption could be made that external factors like the Great Recession of 2008 contributed to the decline. But the market stayed lower than the fifteen-year average for an extended period (2007-2013) even during a time period when the U.S. economy could be viewed as being in full recovery. Thus, it is reasonable to conclude that other factors, such as the impact of stricter NOx regulations combined with external factors to cause a decrease in builds. In our analysis within Table 4, Allison chose to smooth the average across multiple years to show short term and sustained regulatory effects of the previous NOx rulemaking and avoid relying on any particular year, such as 2009, when there were unclear reasons for low sales apart from prevailing economic conditions.
- Builds also dropped 30% to 38% over 2019 to 2020 which one could assume may be attributed, in large part, to the economic impacts flowing from COVID. In contrast however, these, this unexpected setback could not be factored into end-user buy cycles ahead of time, and builds rebounded 5% to 23% in 2021 despite continuing supply-chain headwinds. [EPA-HQ-OAR-2019-0055-1231-A1, p.21]

North America Commercial Vehicle Production forecasts from ACT Research's Charging Forward 1st Edition CEV study in Q1 2021 project a nearly 26% drop in Class 4-8 vehicle sales from 2026-2027 that may be attributed to pre-buy in 2026 and the costs that would flow from regulations to be implemented in 2027. (For further detail, see Appendix 2). When Allison sought permission from ACT Research to share our analysis based on ACT Research, we understood that ACT Research is engaging in further study of pre-buy and low-buy of 2027 regulations in a forthcoming report, and there may be minor differences in the developing report compared to Allison analysis of ACT Research data. However, ACT Research reviewed and agreed with the general trends Allison Transmission analysis reflects within this comment. [EPA-HQ-OAR-2019-0055-1231-A1, p.21]

Overall, Allison believes that this pre-buy and low-buy analysis is an important consideration for determining the level of control required by the final rule. Given this importance, EPA should conduct a sensitivity analysis of different levels of economic impact this rule may have prior to finalizing the final rule, particularly considering that initial cost of equipment and lower compliance margin may drive more severe effects for Option 1 compared to Option 2. 50 [EPA-HQ-OAR-2019-0055-1231-A1, pp.21-22]

50 EPA should make such analysis available in the docket for this rulemaking.

Allison also believes Option 1 benefits are overcounted in Proposed Rule due to an expectation that higher indirect costs, greater compliance risks from insufficient margin, and a two-step phase-in rule structure could undermine EPA goals through pre-buy and low-buy effects. Allison believes that EPA analysis of 8-month pre-buy and 12- month low buy only to CL8 at 0-2% is a severe underestimation and that EPA should engage in further sensitivity analysis modeling a moderate pre-buy with Option 2 and a more severe and protracted pre-buy with Option 1 prior to finalization of rule.[EPA-HQ-OAR-2019-0055-1231-A1, p.22]

Comparing sales during periods transitioning in EPA/NHTSA Phase 1 GHG and fuel efficiency program and Heavy-Duty Phase 2, one can note that GHG rulemakings have less apparent pre-buy, low-buy affects compared to the 2007 NOx rulemaking. There could of course be many reasons for this variability, but one aspect could be that the technology to reduce GHG emissions may positively impact total operating costs for the buyer and/or lead to the perception that such technology will have a lesser impact on vehicle maintenance and related uptime that could affect the mission of affected vehicles. Based on our review of the proposed rule, the associated draft RIA and our own data, Allison would encourage the following actions: [EPA-HQ-OAR-2019-0055-1231-A1, p.22]

- EPA should further consider historical data from 2007 HD Engine and Vehicle Rule to check assumptions regarding the impact of additional NOx regulation on commercial vehicles during this timeframe on sales. Allison's analysis based on ACT Research data exceeds the estimated impacts that EPA has relied on in this rulemaking. [EPA-HQ-OAR-2019-0055-1231-A1, p.22]

Allison would also encourage EPA to carefully consider the potential impacts of increased prices for engines/vehicles that could result from extended emission warranty and useful life provisions and how these impacts could affect pre-buy and low-buy periods. As noted above, warranty and useful life periods are proposed to undergo a substantial increase in length, up to 6 times for some vehicle categories. This level of increase also follows an extended period during which warranty periods have not changed, potentially increasing the level of uncertainty for those manufacturers who will need to price-in the extended periods into an engine/vehicle sales price. In terms of relevant data, EPA should consider the price impacts flowing from the California Air Resources Board's Step 1 increase that took effect with MY 2022.[EPA-HQ-OAR-2019-0055-1231-A1, pp.22-23]

Organization: *American Truck Dealers (ATD)*

ATD has long supported continuous emission improvements for HDEs. At the same time, ATD has suggested consistently that any new emissions mandates must not compromise the affordability, reliability, fuel economy, and/or serviceability of HDEs and CMVs. This position reflects the fact that prospective customers will avoid purchasing or leasing new CMVs which cost too much, offer performance compromises, or pose risks of unacceptable downtime. CMV customers purchase or lease new equipment only when necessary to meet the needs of their private or for-profit business models and use cases. New medium- and heavy-duty CMVs are expensive, but unlike high-priced light-duty vehicles, they are not luxuries but specially built to do a wide variety of jobs in a reliable and cost-effective manner. [EPA-HQ-OAR-2019-0055-1321-A1, p. 1]

Appropriately structured HDE NOx standards must involve a national, wholistic approach to reducing the impact of CMVs on air quality. Specifically, EPA must only adopt new HDE emission standards that will enhance (and not delay) fleet turnover. If EPA instead moves too far, too fast, as the California Air Resources Board (CARB) and other states have done, the cost of new CMVs will increase dramatically even as their performance degrades, resulting in a decline in the otherwise applicable rate of fleet turnover and environmental improvement.3 [EPA-HQ-OAR-2019-0055-1321-A1, p. 2]

> 3. In October 2021, several states urged EPA to adopt CARB's newly adopted HDE NOx Omnibus mandates. ATD categorically opposes EPA's adoption of those mandates.

Together, the higher CMV prices and operating costs that directly stemmed from EPA's 2002-10 HDE NOx standards led to a significant disruption of the new CMV marketplace, leading to lost employment, lost profits, and even the shuttering of some businesses. New CMV customers acted rationally and predictably to avoid higher new CMV prices and performance compromises. Many opted to pre-buy new CMVs equipped with older HDEs. Others opted to hold onto their existing equipment for longer than they otherwise planned to. Still others met their business needs by seeking out late model used CMVs. Employees suffered, the industry suffered, and the environment suffered as fleet turnover ground to a halt. [EPA-HQ-OAR-2019-0055-1321-A1, p. 2]

This history must not be repeated. EPA must ensure that the new NOx mandates for MY 2027 and later will be technologically feasible and cost effective, both up front and over the useful life of the HDEs they will apply to. Otherwise, if faced with products that are too costly up front, too expensive to operate, or too unreliable, prospective new CMV buyers will once again opt to pre-buy CMVs equipped with older HDEs, opt to hold onto older CMVs longer, or opt for the used truck market. In addition to disrupting CMV suppliers, manufacturers, dealers, and the employees who work for them, the resulting delay in fleet turnover will undermine the continuous environmental improvements we all seek. [EPA-HQ-OAR-2019-0055-1321-A1, p. 2]

Based on industry cost analyses and data related to the marketplace reactions to EPA's MY 2002-2010 HDE NOx standards, ATD is concerned that EPA's proposed NOx standards, assuming that they are even achievable, will cause CMV prices to skyrocket, resulting in reduced fleet turnover and an increase in the average age of the on-road CMV fleet. The most effective near term option for reducing CMV NOx emissions is to accelerate the turnover of the on-road CMV fleet. Currently, the average age of CMVs on the road in the U.S. is over 14 years.7 Consequently, almost 50% of the in-use CMV fleet is equipped with pre-MY 2010 HDEs. [EPA-HQ-OAR-2019-0055-1321-A1, p. 4]

> 7. Association for the Work Truck Industry, Aging Trucks Create More Service Opportunities, (Nov. 2019).

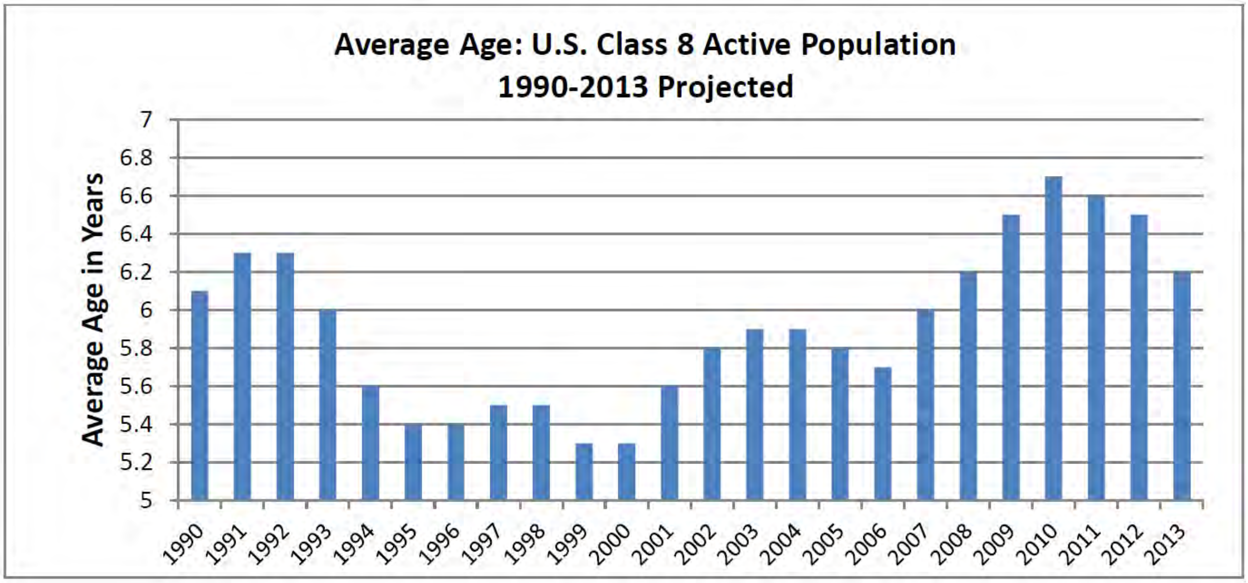
Given RSC's projected average CMV price increase, ATD concludes that EPA's proposed Option 1 NOx standards could have a major disruptive impact on new CMV sales resulting from a major pre-buy/no buy, a significant deferral of new CMV sales, and a spike in later model used CMV purchases prior to 2031. This conclusion runs counter to EPA's suggestion that a pre- and low-buy for Class 8 trucks may range from zero to an approximately two percent increase in sales over a period of up to 8 months before the 2031 standards begin (pre-buy), and a decrease in sales from zero to approximately two percent over a period of up to 12 months after the 2031 standards begin (low-buy).10 [EPA-HQ-OAR-2019-0055-1321-A1, p. 4]

10. 87 Fed. Reg. 17414, 17590.

Figure 1 below, which graphs annual retail Class 4-8 CMV sales between 2000 and 2010, shows how prospective new truck purchasers rushed to "pre-buy" trucks equipped with pre-compliant technologies to avoid the cost and performance impacts of EPA's NOx mandates. A surge of orders began in 2002 for the pre-MY 2004 equipment, after which orders slumped significantly. In 2006, orders surged for pre-MY 2007 equipment, and then fell off precipitously. Lastly, in the 2009 timeframe, orders increased for pre-MY 2010 equipped trucks. In each instance, the new CMV marketplace recognized, anticipated, and sought to avoid the higher prices and poorer performance of the phased-in NOx mandate-compliant equipment. [EPA-HQ-OAR-2019-0055-1321-A1, p. 5]

It would be unconscionable for EPA to adopt new NOx mandates that would result in a similar scenario given the negative economic and employment impacts that would result and, as importantly, the lost emissions reduction benefits associated with a slowdown in fleet turnover. [EPA-HQ-OAR-2019-0055-1321-A1, p. 5]

In addition to undermining anticipated environmental benefits, delays in CMV fleet turnover caused by new EPA NOx reduction mandates, by increasing the average age of trucks and tractors on the road, will exacerbate reliability and safety concerns. Simply put, older CMVs are, on average, not as clean, green, safe, and reliable as newer vehicles. As noted above and detailed in Appendix B, when faced with higher truck pricing and lower truck performance, prospective new CMV truck customers acted rationally and held on to their older equipment longer. This delayed turnover resulted in an aging fleet largely made up of CMVs built prior to 2004. Figure 2 below indicates that the age of the class 8 fleet increased to 6.6 years, about 11 months older than the historical average dating back to 1979. [EPA-HQ-OAR-2019-0055-1321-A1, p. 5]



Organization: *Daimler Truck North America LLC (DTNA) (1045 and 1168)*

EPA's proposed standards would impose inordinate costs upon manufacturers and vehicle owners alike and thus present a significant possibility of market-disrupting pre-buy and no-buy scenarios.9 As acknowledged in the draft Regulatory Impact Analysis (RIA), EPA's regulatory program must be premised upon the availability of 'technically feasible, cost-effective technologies to achieve the [desired emission] reductions in the 2027-2031 timeframe at reasonable cost per vehicle, with no compromise to vehicle or safety.'10 EPA has not, however, proposed standards and requirements with 'reasonable' per-vehicle costs. Both the Proposed Rule and accompanying draft RIA dramatically underestimate the increased costs to achieve compliance with the proposal, which ultimately would be borne at every level of the heavy-duty transportation industry. As discussed in more detail in Section II.B.2 of these comments, the anticipated manufacturing cost increases will have ripple effects across the United States and world economies—potentially disincentivizing the production of certain classes of vehicles, which in turn may constrain the options available for affordable domestic freight transportation. To fulfill its statutory obligation to give 'appropriate consideration' to costs, EPA must fully account for these impacts in its cost analysis. [EPA-HQ-OAR-2019-0055-1168-A1, p.11]

> 9 While Daimler Truck focuses primarily here on increased incremental technology, warranty, and other direct/indirect compliance costs, we also note that paperwork burdens would increase under EPA's proposal. The Proposed Rule implicates a number of information collection activities, all of which will significantly increase compliance burdens and costs for manufacturers. Daimler Truck has reviewed EPA's 'Supporting Statement for Information Collection Request' (EPA ICR Number 2621.01) (April 19,

2022) and notes that EPA's summary—in particular the respondent burden and cost estimates in Table 3 of the 'Supporting Statement'—captures some but perhaps not all of the information collection burdens and costs accompanying implementation of the Proposed Rule. These costs should not only be factored in to OMB's consideration of the Proposed Rule under the Paperwork Reduction Act, but should also be accounted for in evaluating whether EPA's proposal reflects adequate consideration of costs as required under CAA Section 202.

10 See EPA, Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, Draft Regulatory Impact Analysis (March 2022) ('Draft RIA').

EPA's conclusions regarding anticipated effects of the Proposed Rule on HD vehicles (e.g., sales, mode shift, fleet turnover) similarly undermine the lessons of past industry experience, including the Agency's projections that the market would likely see a modest 'pre-buy' scenario for Class 8 trucks under proposed Option 1 (around a 0-2% increase over a period of up to 8 months before the 2031 standards begin) and a similarly modest 'low-buy' scenario (namely a 0-2% decrease in sales over a period up to 12 months after the 2013 standards begin).53 EPA opines that the expected dramatic increases in vehicle purchase price will be offset by reduced operating costs, reasoning that longer useful life periods will make emission control technology components more durable, and more durable components—combined with manufacturers paying for repairs during the proposed longer warranty periods—would in turn reduce repair costs for vehicle owners. Through this reasoning, EPA reaches the conclusion that these combined effects may <u>*increase sales of new HD vehicles*</u> 'if fleets and independent owner-operators prefer to purchase more durable vehicles with overall lower repair costs.'54 Yet EPA has not, nor can it, provide empirical or historic support for this assertion. [EPA-HQ-OAR-2019-0055-1168-A1, p.20]

53 Id. (noting that if pre-buy and low-buy behaviors occur, then the initially projected emission reductions are likely to be smaller than expected).

54 Id. (noting, however, that EPA is unable to quantify these effects because existing literature does not provide clear guidance on the relationship between warranty changes, price increases due to increased warranty periods, and sales impacts).

Further, it is notable that EPA anticipates no change in the price or mode of freight transportation associated with the regulatory proposal, concluding simply that 'the Proposed Rule is not expected to have a large impact on truck freight rates given that the price of the truck is only a small part of the cost per mile of a ton of goods' and, for this reason, 'the Agency expects little mode shift due to the proposed standards.'55 [EPA-HQ-OAR-2019-0055-1168-A1, p.21]

55 Id. at 17,590.

The suppositions underlying EPA's economic impact analysis lead the Agency to overlook market impacts that are widely expected to follow from the Proposed Rule. To assemble a more accurate picture of anticipated impacts, EMA engaged third party market expert ACT Research to study the likely economic effects of implementing EPA's proposal.56 The ACT Research

Impacts Study, submitted with the EMA comments on the Proposed Rule, examines three different scenarios to help predict vehicle market and labor impacts related to the anticipated increases in operating costs for Class 8 vehicles, working off of both the incremental cost estimates provided in the Ricardo Cost Study and EPA's cost estimates in the Proposed Rule. Specifically, the ACT Research Impacts Study considers the pre-buy effects of three different cost scenarios: Scenario 1, which uses the Ricardo Cost Study estimates discussed above; Scenario 2, which uses EPA's significantly lower cost estimates in the Proposed Rule and draft RIA; and Scenario 3, which uses the Ricardo Cost Study estimates but removes the proactive aftertreatment system replacement system cost that was included in the Ricardo study. ACT Research then analyzes anticipated heavy-duty manufacturing sector employment impacts of projected pre-buy and low-buy under each of these three scenarios. [EPA-HQ-OAR-2019-0055-1168-A1, p.21]

> 56 See ACT Research, 'Pre-Buy/Low-Buy Analysis of Heavy-Duty Sector Impacts from Emissions Regulations' (April 29, 2022) (the 'ACT Research Impacts Study') (submitted with Truck and Engine Manufacturers Association comments on EPA-HQ-OAR-2019-0055).

ACT Research's analysis arrives at pre-buy estimates ranging from **94,428 units** total (for the years leading up to both MY 2027 and MY 2031 standards implementation) under the conservative EPA cost scenario (Scenario 2) to **211,900 units** total under the Ricardo cost scenario (Scenario 1). These estimates lead to a projection of employment impacts in 2027 and 2031 from **98,335 jobs lost** in EPA's lower cost scenario, to **220,666 jobs lost** in the Ricardo cost scenario. [EPA-HQ-OAR-2019-0055-1168-A1, p.21]

Aside from these numerical projections, a number of key observations emerged from the ACT Research Impacts Study:

• **EPA Significantly Underestimates the Magnitude of Expected Pre-Buy.** ACT Research projects, based upon the history of previous standards implementation, that implementation of the Proposed Rule will result in two large pre-buys in the years immediately preceding MY 2027 (i.e., MY 2025 and 2026) and MY 2031 (i.e., MY 2029 and MY 2030). Even under the most conservative Scenario 2, which builds off of EPA cost estimates in the Proposed Rule, ACT Research estimates that pre-buy could be around **14%** of market share for new MY 2025-2026 Class 8 vehicles and **8%** of market share for new MY 2029-2030 Class 8 vehicles.57 Under Scenario 1, using the higher cost estimates of the Ricardo Cost Study, ACT Research estimates that pre-buy could be the 'largest ever,' around **34%** of market share for new MY 2025-2026 Class 8 vehicles and **19%** of market share for new MY 2029-2030 Class 8 vehicles.58 EPA's **0-2%** pre-buy estimates in the Proposed Rule are off by a factor of at least 8 using the Agency's own conservative cost estimates; and, applying the more realistic cost estimates from the Ricardo Cost Study, are off by a factor of around 35. These pre-buy estimates are based upon ACT Research's assessment of operating cost increases for Class 8 tractors and vocational trucks, which (under the study's Scenario 1) could be as high as 14% and 12% for these categories of vehicles, respectively, in MY 2027 and 9% and 7%, respectively, in MY 2031.59 [EPA-HQ-OAR-2019-0055-1168-A1, pp.21-22]

• **EPA's Analysis Fails to Account for the Labor Effects of Pre-Buys**. Based upon the ACT Research analysis, it is clear that EPA's economic impact analysis fails to appreciate, and therefore assess, each link of the causal chain triggered by more stringent emission regulation, namely (1) price and operating cost increases, (2) prebuy/ low-buy scenarios, and (3) job losses in the commercial vehicle manufacturing sector. The ACT Research Impacts Study evaluates the low-buy effects anticipated to flow from the pre-buy scenarios described above, applying Newton's Third Law that 'every action has an equal and opposite reaction.'60 In other words, every pre-bought unit is pulled forward from the future and will not recur, meaning that pre-buy volumes in the years immediately preceding new standard implementation correlate directly with a reduction in units that would otherwise be sold in the years following the new standards taking effect. Thus, pre-buys can be expected to have adverse impacts on the truck manufacturing supply chain by proportionately reducing demand for future model year vehicles. [EPA-HQ-OAR-2019-0055-1168-A1, p.22]

60 Id. at 23.

• **EPA Erroneously Concludes That There Will Be No Freight Rate Impacts.** ACT Research also considers a significant downside of a pre-buy scenario, namely the inevitable rebalancing of excess trucking capacity that results from a pre-buy, which in turn causes lower freight rates and reduced earnings in the trucking industry during the pre-buy/low-buy period. The ACT Research analysis concludes, for instance, that prebuy in the Class 8 tractor market ahead of the MY 2027 standards (using Scenario 1 cost figures) could have as much as a 2.9% negative impact on truckload freight rates, which would mean about $10.4 billion in lost earnings, which is discounted to $8.4 billion in 2021 dollars. ACT Research estimates a similar earnings impact in 2031, with a total of $17.9 billion (2021$) combined impact from implementation of the Proposed Rule standards. Adding to the further adverse impacts in the freight transportation industry, it is widely expected that, as increased costs associated with more stringent regulation are realized and fleets are required to purchase more expensive trucks, there will ultimately be a long-term freight rate increase above today's rates. This will consequently increase the price of every good that is shipped domestically by truck, increasing the price of consumer goods and exacerbating rapidly-rising inflation. [EPA-HQ-OAR-2019-0055-1168-A1, p.22]

EPA should also consider the strong potential for its proposal (and attendant pre-buy and no-buy effects) to encourage older commercial fleets to remain on the road longer, thereby significantly delaying the anticipated emission reductions under the Proposed Rule. As observed by Diesel Technology Forum in testimony given during EPA's April 2022 public hearings on the Proposed Rule, market research reflects that nearly half of the vehicles currently on the road are pre-2011 model years, suggesting that a significant portion of fleet owners would prefer to maintain and operate older vehicles rather than invest in more costly, new-technology vehicles.61 This phenomenon of continued and widespread use of legacy vehicles—many of which do not have particulate traps and/or selective catalytic reduction technology to help reduce emissions—defeats the emission reduction aims of the Proposed Rule and begs the question of whether government resources are better spent incentivizing turnover of these older fleets rather than mandating costly reductions from the vehicles of the future. [EPA-HQ-OAR-2019-0055-1168-A1, pp.23-24]

> 61 See Testimony of the Diesel Technology Forum before the U.S. Environmental Protection Agency (April 12, 2022), available at https://www.dieselforum.org/news/testimony-of-the-diesel-technology-forum-before-the-u-senvironmental-protection-agency-april-12-2022 (stating that 'According to our most recent analysis of vehicles in operation (VIO) data from IHSMarkit as of the end of 2021, 53 percent are 2011 and newer model year vehicles and 47 percent are an older generation. These are pre-2011 model year vehicles with relatively higher emissions.').

Organization: *International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)*

We urge the EPA to avoid creating economic insecurity for the hardworking men and women who build heavy duty vehicles and parts. It is important to note that the customers for medium and heavy-duty vehicles are often commercial customers capable of in-depth cost analysis and fleet planning. If these customers believe that new regulations will increase the cost of future trucks and operations, they will pull truck purchases forward to avoid those costs. In an industry that is already highly cyclical, this can create a 'pre-buy/no-buy' cycle in which there is a surge of purchases for older vehicles prior to the regulations and a steep decline in the purchase of new vehicles following the regulations. Overly aggressive regulations could also result in truck makers delaying or reducing new product offerings. This type of market disruption can result in layoffs or job losses for American workers. This concern is not just theoretical. For many UAW workers in the heavy truck industry, they will still remember the wave of layoffs in 2007 that came out of a pre-buy/no-buy cycle. [EPA-HQ-OAR-2019-0055-1138-A1, p.3]

We recognize that economic projections always come with uncertainty and are strongly shaped by modeling assumptions. However, it is important to recognize there are studies from credible organizations that suggest there is a real possibility the regulations will create a major 'pre-buy/no-buy' cycle. For example, [Figure can be found on p.4 in EPA-HQ-OAR-2019-0055-1138-A1] analysis by the Americas Commercial Transportation (ACT) Research, an industry leading research firm, raises concerns that the proposed regulations will create a major market disruption resulting in significant job impacts.1 [EPA-HQ-OAR-2019-0055-1138-A1, p.4]

> 1 ACT Research. April 2022. 'Pre-Buy/Low-Buy: Analysis of Heavy-Duty Sales Effects from Emissions Regulations': https://static1.squarespace.com/static/624ddf53a2360b6600755b47/t/625cbf7329b4af630a080311/1650245492139/ACT.pdf; See also Ricardo. January 14, 2022, 'Cost Impact Study for Potential Next-Tier EPA HDOH Emission Regulations': https://static1.squarespace.com/static/624ddf53a2360b6600755b47/t/625cbec8f7aef559cbc4c9a7/1650245321849/Ricardo.pdf

Importantly, market disruption that hurts vehicle sales can also hinder the environmental goals the regulations are hoping to achieve. Well-crafted regulations must also consider market responses that could lead to unintended consequences. If overly aggressive regulations significantly reduce truck sales or create a pre-buy cycle, it will take longer to turn over the U.S. truck fleet with new vehicles using the latest technologies. This does not just have economic and employment impacts, it also results in customers purchasing and holding onto older, less efficient, and higher emitting trucks that will be on the road longer.2 Without sufficient fleet turnover, regulations could result in delaying the deployment of cleaner and more efficient trucks they are meant to promote. [EPA-HQ-OAR-2019-0055-1138-A1, p.4]

> 2 Ramboll. February 10, 2022. 'Alternative Regulatory Scenarios for Heavy-Duty Diesel Trucks: NOx Emissions Effects': https://static1.squarespace.com/static/624ddf53a2360b6600755b47/t/624f66f9ccfff63904f2a967/1649370873280/Ramboll_EMA_Scenarios_10Feb2022.pdf

Organization: *Truck and Engine Manufacturers Association (EMA)*

In order to ensure the adoption of fully achievable and cost-effective HDOH low-NOx regulations, and notwithstanding our broader agreement, the Agency should revise the proposed standards in the following manner: The pending rulemaking — arguably the last rulemaking for HD diesel engines — needs to be truly cost-effective to ensure that the market is fully receptive to the new low-NOx trucks. Otherwise fleet turnover will be stalled or delayed, which will diminish the envisioned benefits of the low-NOx regulations. Fashioning a final rule that will not impede fleet turnover will help to ensure that the reasonably estimated benefits from this rulemaking can be achieved. [EPA-HQ-OAR-2019-0055-1203-A1, p. 6]

Significantly, EPA's cost-benefit analysis also does not adequately account for the significant pre-buy/no-buy impacts that the proposed low-NOx regulations will cause. To the contrary, EPA downplays the potential impacts of any pre-buy/no-buy market response, claiming that "our results for proposed Option 1 suggest pre- and low-buy for Class 8 trucks may range from zero to approximately two percent increase in sales over a period of up to 8 months before the 2031 standards begin (pre-buy), and a decrease in sales from zero to approximately two percent over a period of up to 12 months after the 2031 standards begin (low-buy)." (87 FR at p. 17429.) As detailed below, that is a fundamentally unrealistic assessment of how the HD vehicle market is likely to respond to Option 1. [EPA-HQ-OAR-2019-0055-1203-A1, pp. 155 - 156]

The HD commercial vehicle truck market is very sensitive to the introduction of new technology-forcing emissions regulations. The most recent example of that is when EPA and CARB implemented a 90% reduction in the PM standard for 2007 MY and later heavy-duty engines, which required the introduction of diesel particulate filters into the HD marketplace. In parallel, NOx standards were reduced by 50%. HD vehicle purchasers, wary of the cost and reliability implications of the major new HDOH technology launches, significantly accelerated their vehicle-replacement purchasing cycles in 2005 and 2006 to avoid purchases of the new technology vehicles in 2007 – the classic manifestation of a pre-buy/no-buy response to new aggressive emissions regulation. More specifically, in the Class 8 market, vehicle purchases ramped-up significantly in 2005 and 2006, with the result that 40% more vehicles were sold in

2006 (284,000 units) than in 2004 (203,000). In 2007, the market then dropped by a full 47%, to just 151,000 units. Among the other adverse consequence of that pre-buy/no-buy response, air quality benefits were delayed, and very significant layoffs ensued at vehicle assembly plants and powertrain production facilities, with similar cascading unemployment effects and other dislocations throughout the HDOH supply chain. See Polk Automotive Services Data; ATD's Report, "Look Back at EPA's Cost and Other Impact Projections for 2004-2010 HDOH Standards" (Feb. 13, 2012); UAW Comments (Oct. 15, 2015; RIN 2060-A816). See also ERG Report, "Analysis of Heavy-Duty Vehicle Sales Impacts Due to new Regulations" (May 2021, EPA-420- R-21-013). [EPA-HQ-OAR-2019-0055-1203-A1, p. 156]

With respect to this rulemaking, Ricardo and ACT Research Group (ACT) have conducted a detailed analysis of the pre-buy/no-buy vehicle-purchasing practices that HD vehicle fleet operators likely would engage in to try to avoid the cost and other impacts of the proposed low-NOx regulations, with specific reference to Option 1. As set forth in Tables 32 and Figure 8 of the Ricardo Report (reproduced below), EPA's Option 1 low-NOx regulations likely would result in an initial "pre-buy" of approximately 93,000 Class 8 vehicles, followed by a second two-year prebuy in advance of the 2031MY that would amount to approximately $53,000 Class 8 vehicles — for a total of approximately 146,000 "pre-bought" HHD vehicles. A pre-buy of that magnitude would eliminate a correspondingly large percentage of EPA's assumed emission-reduction benefits from the low-NOx regulations, and would cause an additional increase in the per-vehicle costs resulting from the proposed regulations, given the reduced number of new vehicles that would be sold and therefore available to recoup the costs of the regulations. [EPA-HQ-OAR-2019-0055-1203-A1, p. 156]

In addition to Ricardo's analysis, ACT has conducted its own detailed assessment of the pre-buy/no-buy response that likely would occur in the heavy-duty vehicle market in response to the per-vehicle cost increases associated with EPA's Option 1 proposal. A copy of ACT's report is attached hereto as Exhibit D. ACT has concluded that proposed Option 1 regulations would lead to the "largest ever" pre-buy/no-buy market response. The specific results of ACT's analysis are summarized in the following tables: [EPA-HQ-OAR-2019-0055-1203-A1, p. 157]

Similar to what Ricardo has estimated, and by way of example, ACT estimates that the anticipated pre-buys of HHD vehicles in response to the implementation of Option 1 regulations and costs would impact more than 37% of the market in advance of the MY 2027, and an additional 19% of the market in advance of the MY 2031. The impact on the overall HD market would be an aggregate pre-buy of approximately 211,900 trucks. Thus, when factoring-in the likely actual prebuy/ no-buy impacts at issue, it is evident that EPA has understated the per-vehicle cost impacts of its proposed low-NOx regulations, in part, due to the fact that the Agency has over-estimated the number of low-NOx-compliant trucks that will be acquired in the years starting in 2027, and extending out through 2031 and beyond. [EPA-HQ-OAR-2019-0055-1203-A1, p. 158]

In addition, the reasonably anticipated pre-buy/no-buy response will substantially diminish the potential environmental benefits from a nationwide program centered around a 0.02 g/bhp-hr standard, as opposed to Option 2-like standards. In that regard, Ramboll has compared the relative efficacy, from a national NOx emissions-inventory perspective, of a low-NOx program based on a 0.02 g/bhp-hr standard, including the expected associated pre-buy/no-buy response, with a low- NOx program based on a 0.05 g/bhp-hr standard, which Ramboll assumes would result in a 50% lower pre-buy/no-buy response and greater availability of new emissions-compliant HD vehicles. A copy of Ramboll's report is attached hereto as Exhibit E. The overall results of Ramboll's comparative inventory analysis are set forth below. [EPA-HQ-OAR-2019-0055-1203-A1, p. 158]

Ramboll's emissions-inventory analysis shows that an Option 2-like low-NOx program targeting a 0.05 g/bhp-hr FTP/RMC NOx standard would reduce baseline-projection NOx emissions by approximately 23% as of 2035, while a program centered around a 0.02 g/bhp-hr NOx standard could actually increase NOx emissions from current baseline projections by as much as 11% as of 2035 due to the "largest-ever" pre-buy/no-buy response, and due to the projected unavailability of new HDOH diesel vehicles and engines that would be fully-compliant with the associated Option 1 low- NOx requirements. Thus, Ramboll's analysis helps to confirm the enhanced efficacy of EMA's more feasible alternative proposal. [EPA-HQ-OAR-2019-0055-1203-A1, p. 159]

Organization: *PACCAR, Inc (PACCAR)*

In particular, PACCAR agrees with the following aspects of EMA's comments: A nationwide program centered around Option 2-like requirements, and including higher interim in-use standards, would be more cost-effective, and would reduce the prospects for further delaying fleet turnover or creating disruptive pre-buy/no-buy responses from the market. [EPA-HQ-OAR-2019-0055-1346-A1, p.2]

Organization: *Truckload Carriers Association (TCA)*

A workable solution is needed to help bridge gaps on emissions, not widen them. Under the proposed standards, due to compliance-driven demand, the price is expected to steeply increase for newer model engines, further delaying fleet turnover for many motor carriers. [EPA-HQ-OAR-2019-0055-1160-A1, p. 2]

An incremental cost would also reflect manufacturers' added stringency for emissions and an increase in useful life and warranties for emission-related components. One report found that if the proposed standards go into effect, the price of heavy-duty diesel engines would increase between $18,000 to $35,000 per vehicle, depending on the level of requirement4. [EPA-HQ-OAR-2019-0055-1160-A1, p. 2]

> 4. Ricardo Strategic Consulting, "Cost Impact Study for Potential Next-Tier EPA HDOH Emission Regulations", January 14, 2022, 360b6600755b47/t/625cbec8f7aef559cbc4c9a7/1650245321849/Ricardo.pdf

If motor carriers, due to the proposed standards, are unable to find available, reliable, and affordable technology and parts, they will be incentivized to keep their older, higher-emission vehicles and engines longer – leading to worse environmental consequences than intended. TCA argues that a more practical standard would better lay the groundwork for timely and affordable fleet transition. According to a 2022 study, which forecasted market response, a 0.02g/bhp-hr FTP standard scenario would increase NOx emissions between 2.2 to 11.6 percent, while a more-feasible 0.05 g/bhp-hr FTP standard would decrease NOx emissions between 0.7 to 23 percent8. [EPA-HQ-OAR-2019-0055-1160-A1, p. 2.]

> 8. Ramboll, “NOx Emission Effects”, February 10, 2022, https://static1.squarespace.com/static/624ddf53a2360b6600755b47/t/624f66f9ccfff63904f2a967/1649370873280/Ramboll_EMA_Scenarios_10Feb2022.pdf

Organization: *U.S. Chamber of Commerce*

While our comments tend to focus primarily on potential impacts to long haul freight trailers and the traditional trucking sector, similar concerns exist with respect to potential impacts on all vehicle classes covered by the rule, including transit buses, commercial delivery vehicles, and vehicles designed for waste removal, construction, agriculture, and more. [EPA-HQ-OAR-2019-0055-1245-A1, p. 3]

First, it should be recognized that trucking is enormously important to the economy—it moves 72 percent of goods in America and is the foundation of a well-functioning supply chain.6 When trucking costs go up, the costs of nearly all goods go up along with them. [EPA-HQ-OAR-2019-0055-1245-A1, p. 3]

> 6. Economics and Industry Data, American Trucking Association, https://www.trucking.org/economics-and-industry-data

Moreover, long-haul trucking in particular is overwhelmingly comprised of small businesses that are disproportionately vulnerable to changing economic circumstances. According to the Truck and Engine Manufacturers Association, 98 percent of U.S. fleet owners are small businesses operating 20 or fewer commercial vehicles. These small businesses operate on tight margins and typically do not have the financial resources necessary to absorb significant regulatory cost increases, which therefore must be passed on to American consumers in the form of higher costs for shipped goods. [EPA-HQ-OAR-2019-0055-1245-A1, pp. 3 - 4]

As the White House pointed out at an event in April, trucking costs grew more than 20 percent last year as a surge in demand for goods combined with a decline in trucking employment that preceded the pandemic.7 In 2022, sharply increased fuel costs have added to economic burdens on the industry, which also faces major challenges due to supply chain disruptions and labor shortages. [EPA-HQ-OAR-2019-0055-1245-A1, p. 4]

> 7. April 4, 2022 White House event: The Biden Administration’s Unprecedented Actions to Expand and Improve Trucking Jobs. Available at https://www.whitehouse.gov/briefing-room/statements-releases/2022/04/04/fact-sheet-the-biden-administrations-unprecedented-actions-to-expand-and-improve-trucking-jobs/

As indicated above, steady fleet turnover is arguably the most important factor relevant to ensuring continuing NOx emissions reductions from the trucking sector. A regulation that adds significant cost for new vehicles, or other significant uncertainties, could delay this progress. [EPA-HQ-OAR-2019-0055-1245-A1, p. 7]

We are particularly concerned that EPA's proposal underestimates the likely negative consequences associated with large scale "pre-buys" prior to compliance deadlines. While EPA's proposal dedicates attention to this issue, stating that "if pre-buy and low-buy behaviors occur, then the initial emission reductions are likely to be smaller than expected." [EPA-HQ-OAR-2019-0055-1245-A1, p .7]

However, the agency ultimately projects nearly negligible pre- and post-compliance impacts of between zero and two percent of sales. These projections appear low based on recent history—a recent detailed analysis by industry sales consultancy ACT Research details the significantly higher pre-buy/low-buy phenomenon that resulted from prior medium- and heavy-duty rules.14 Moreover, EPA admits that these projections are guesswork, noting that "existing literature does not provide clear guidance on the relationship between warranty changes, increases in prices due to increased warranty periods, and sales impacts." [EPA-HQ-OAR-2019-0055-1245-A1, p .7]

14. Pre-Buy/Low-Buy Analysis of Heavy-Duty Sales Effects From Emissions Regulations. Available at https://static1.squarespace.com/static/624ddf53a2360b6600755b47/t/625cbf7329b4af630a080311/1650245492139/ACT.pdf

If technology and warranty costs exceed EPA's estimates as many industry experts expect, pre-buy behavior will be further incentivized beyond EPA's already low estimates. This could significantly delay emissions reductions benefits that are the central purpose of the rule. Accordingly, prior to finalization of the rule, it should be a top priority for EPA to perform further careful analysis to resolve discrepancies in pre-buy projections. Indeed, a 2022 study by Ramboll finds that under a scenario similar to EPA's proposed Option 1, emissions of nitrogen oxides would actually increase between 2.2% and 11.6% due to pre-buy/low-buy effects.15 [EPA-HQ-OAR-2019-0055-1245-A1, p. 7]

15. Alternative Regulatory Scenarios for Heavy-Duty Diesel Trucks. Available at https://static1.squarespace.com/static/624ddf53a2360b6600755b47/t/624f66f9ccfff63904f2a967/1649370873280/Ramboll_EMA_Scenarios_10Feb2022.pdf

Delayed adoption of safety features. Delayed fleet turnover can have impacts beyond just emissions. Slowed fleet turnover delays adoption and use of enhanced automated safety features that are common on newer trucks. [EPA-HQ-OAR-2019-0055-1245-A1, p. 7]

Organization: *Institute for Policy Integrity at New York University School of Law (Policy Integrity)*

EPA should consider revising its estimation of sales impacts and fleet turnover. EPA should consider discussing sales impacts and fleet turnover qualitatively, or, in the alternative, identifying and discussing the assumptions baked into its quantitative model that may result in an overestimate of sales impacts. [EPA-HQ-OAR-2019-0055-1256-A1, p. 2]

EPA lays out three effects of regulation on heavy trucks in its fleet turnover analysis. First, there is a pre-buy effect, whereby the Proposed Rule encourages companies and individuals to buy vehicles before the implementation date to avoid the (potential) increased (net) cost of their vehicle. Second, there is a low-buy effect whereby the (potential) pre-buy behavior displaces purchases that would have occurred in the absence of regulation from after the implementation date to before the implementation date and out of the new truck market altogether (either through not buying a truck or shifting to purchase a used truck). The net effect of this pre-buy and low-buy effect on overall demand for new heavy-duty vehicles captures the elasticity of demand to the regulation.107 Finally the Gruenspecht effect, also known as the scrappage effect, whereby substitution from new vehicles to used vehicles increases used vehicle price and the longevity of these vehicles by making it more economical to fix them. These three impacts jointly determine the impact of the regulation on fleet size and thereby emissions, as vehicles sold before the implementation date emit relatively more air pollutants than those sold after the regulations take effect. [EPA-HQ-OAR-2019-0055-1256-A1, p. 19]

> 107. We use “net” here to note that there are also improvements in the quality of the vehicle, including a longer warranty and improved durability, which has the opposing effect on pre-buy behavior than price. Theoretically, these quality improvements could reverse the impact of an increase in price leading to an elasticity of zero or even a shift in sales from before to after the rule implementation. In the final SAFE rule (see “Equation 3 – Calculation of Change in Sales”), NHTSA and EPA folded fuel efficiency savings into the vehicle price to construct a measurement of the net price change. In this context, this is also possible with decreased maintenance and repair costs.

EPA uses a new methodology to forecast the sales impacts of the proposed regulation. Specifically, EPA estimates changes in truck sales across the months before and after the compliance deadline of previous EPA standards. It then calculates the demand elasticities based on the estimated sales effects of the 2007 and 2010 standards. Based on its estimated compliance costs, EPA further uses the elasticities to forecast changes in truck sales due to the proposed regulation. As we explain in detail below, this methodology could be improved by strengthening the key assumption of 100% cost pass-through and correcting the econometric errors that could bias the forecast. [EPA-HQ-OAR-2019-0055-1256-A1, p. 19]

EPA fails to recognize that the reduced-form identification effects capture both the increased price due to the regulation and the improved vehicle quality such as longer warranties and improved durability. The pre-buy effects estimated by the agencies capture the anticipation effects, i.e., the increased pre-regulation purchases in anticipation of higher new-truck prices along with improved vehicle attributes (i.e., the cross-price elasticity over time), whereas the low-buy effects capture both systematic post-regulation sales slump due to this shift in demand over time and the direct effects of policy (i.e., the own-price elasticity of demand).108 In particular, the own-price elasticity implied by EPA captures the net change in sales due to higher purchase vehicle prices, which are passed through to buyers from sellers with higher compliance costs, and improved vehicle attributes. EPA is thus essentially jointly estimating the two elasticities without isolating the direct effects of policy, which are the most relevant estimates for the forecast of the sales impacts of the new rule in its methodology. [EPA-HQ-OAR-2019-0055-1256-A1, pp. 19 - 20]

108. The anticipation effects led to 31,164 more truck sales before the implementation of the 2007 heavy-duty emission standards. See Katherine Rittenhouse & Matthew Zaragoza-Watkins, Anticipation and Environmental Regulation, 89 J. ENV'T ECON. & MGMT. 255–77, 266 (2018).

In the sales effects estimation, the agencies have omitted and/or failed to address a number of confounding factors that may bias the effects of the proposed regulation on truck sales, including:

• The adverse fuel consumption effects, i.e., excessive fuel consumption due to improved fuel efficiency with the new emission standards, and buyers' concerns about the reliability of untested control technology;109

• Rule stringency, e.g., the required emission reductions level, technology requirement, and compliance costs;

• Vehicle attributes, e.g., improved efficiency, increased longevity and warranty, and decreased repair costs;110

• Endogenous vehicle purchase prices;111 and

• Previous truck sales.112 [EPA-HQ-OAR-2019-0055-1256-A1, p. 20]

109. DRIA, supra note 41, at 412.

110. Id. at 226.

111. The pre-buy effects may be confounded by higher pre-regulation vehicle prices due to sellers' anticipation of an increased demand shock. The endogenous vehicle price is particularly the case in a non-competitive freight market. An instrumental variable approach is called for to address this supply-side confounder if the vehicle purchase price is to be controlled for in the model. See Rittenhouse & Zaragoza-Watkins (2018), supra note 108, at 262; see also Terence Lam & Charles Bausell, Strategic Behaviors Toward Environmental Regulation: A Case of Trucking Industry, 25 CONTEMP. ECON. POL'Y 3–13, 11 (2007).

112. See Lam & Bausell (2007), supra note 111 at 10-11.

These omissions are critical because they may be effects from these elements that EPA is observing, rather than effects from the factors EPA is explicitly considering. Unlike the two papers that EPA cites,113 EPA uses these estimates to make forecasts about the impact of the proposed regulation on future vehicle sales over time. Failure to address the omission of the above unobservable time-varying variables raises serious questions about the accuracy of the agencies' forecast of the sales impacts of the proposed regulation. [EPA-HQ-OAR-2019-0055-1256-A1, pp. 20 - 21]

These forecasting issues are unsurprising, as the published studies upon which the agency relies were not peer reviewed for the express purpose of forecasting the future impact of a proposed regulation. Instead, these studies focused solely on identifying the existence of pre-buy and low-buy effects. With this more limited goal in mind, these papers only have limited success, as their estimates of these effects were only statistically significant for a subset of the truck regulations only providing mixed evidence of their existence; EPA has similarly mixed results with respect to statistical significance.114 Policy Integrity has previously commented on similar identification and forecasting problems in the light-duty context when EPA and NHTSA advanced their modeling of the scrappage effect beyond the peer-reviewed literature.115 [EPA-HQ-OAR-2019-0055-1256-A1, p. 21]

114. DRIA, supra note 41, at 410, tbl. 10-1.

115. See, e.g., Inst. for Pol'y Integrity, Comments on The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021–2026 Passenger Cars and Light Trucks at 56–78 (Oct. 26, 2018).

EPA has three options to address the potential forecasting errors. First, EPA could improve its current reduced-form estimation by exploiting available data to account for the impact of these confounding changes on truck sales and testing the sensitivity of the estimation to alternative model specifications. Alternatively, EPA could consider estimating a structural model, as it has indicated it may do for future regulations in the light-duty context.116 As a final alternative—that Policy Integrity recommends—EPA could qualitatively discuss the potential impact of the pre-buy and low-buy effect in a similar manner as its current discussion of the Gruenspecht effect.117 In this discussion, the agency could discuss the identification problems above as limiting factors on their analysis, along with the non-existence of literature using these estimates to forecast sales effects. [EPA-HQ-OAR-2019-0055-1256-A1, p. 21]

116. See Jacobsen et al., The Effects of New-Vehicle Price Changes on New- and Used-Vehicle Markets and Scrappage (EPA, Aug. 2021), https://cfpub.epa.gov/si/si_public_record_Report.cfm?dirEntryId=352754&Lab=OTAQ.

117. DRIA, supra note 41, at 416.

In response to the rule, EPA assumes that the required extended warranties and increased truck durability will reduce repair costs, which will be a benefit for the trucking industry that partially or fully offsets increased sale prices.118 The impact on repair costs for the trucking industry is to extend the period of low maintenance costs—which are covered by the manufacturer under the Proposed Rule's longer warranties—thereby lowering their repair costs in the medium run until increased technology costs result in higher long-run per-mile maintenance costs after roughly 7 years of operation.119 These benefits should in turn increase demand for trucks holding price constant. Therefore, the overall impact of the regulation on sales could theoretically be positive or negative, just as the sign of the pre-buy effect is theoretically unclear.120 At a minimum, this improvement in truck quality will lower the overall impact of the regulation on fleet-turnover, including pre-buy and no-buy behavior. However, EPA's current methodology for estimating fleet size impacts is unable to capture the opposing price and quality effects separately, and so is unable to determine if trucking companies will be better off after the Proposed Rule. [EPA-HQ-OAR-2019-0055-1256-A1, pp. 21 - 22]

118. Id. at 342 & n.370.

119. Id. at 348, fig. 7-4.

120. Assuming perfect information and no information shocks after the implementation date (a potentially reasonable assumption for trucking companies making long-run fleet size decisions), a trucking company would only move up their planned purchase of a new truck if the expected post-implementation increase in sales price exceeds the decrease in maintenance and repair costs.

Currently, the EPA implicitly captures quality changes, including longer warranties and increased durability, along with other "unobserved factors, such as concerns over vehicle reliability and control technology uncertainty," in the price coefficient of their pre-buy and no-buy analyses. However, it is unclear if truck manufacturers and trucking companies will respond to the Proposed Rule in the same manner as they did to the past rules. In fact, based on the mixed results with respect to statistical significance and coefficient magnitudes in RIA Table 10-1 of the pre-buy and low-buy effects, it is even unclear if truck manufacturers and truck companies responded to past regulations in 2002, 2007, 2010, and 2014 in the same manner. Moreover, as the price increases stem from the cost of implementing a specific set of production processes and technology changes in the truck manufacturing assumed by EPA, it is unclear if the past estimates are consistent with the assumed quality changes that EPA forecasts. Therefore, it is unclear the extent to which EPA captures the offsetting effect of lower repair costs on fleet turnover in its analysis of the pre-buy and low-buy effects. To accurately capture the impact of EPA's projected quality changes, consistent with its assumed price increases, EPA needs to identify the price and quality effects on sales separately. [EPA-HQ-OAR-2019-0055-1256-A1, p. 22]

There may be long-run impacts not captured in EPA's simple short-run estimates comparison. Specifically, as the demand for capital goods, like heavy-duty trucks, becomes more inelastic over time, we should expect any negative sales effect to be small and temporary (as discussed above). This is particularly true given that EPA predicts minimal to no fleet turnover, transportation mode shifting, or changes in site locations. [EPA-HQ-OAR-2019-0055-1256-A1, p. 22]

The result of EPA's analysis is strongly dependent on the assumption that manufacturers can fully pass along the additional compliance cost to consumers (i.e., the trucking companies purchasing heavy-duty vehicles) through higher prices for new vehicles. However, EPA does not adequately discuss its reasoning for this assumption. Theoretically,121 in a perfectly competitive market, increased marginal costs are expected to be passed onto consumers as price equals the marginal cost of production. However, the degree to which the costs would be borne by producers and consumers depends on the sensitivity of consumers to prices. Consumers would not fully bear the costs unless they were completely insensitive to price changes. In other words, if consumers choose not to buy or buy fewer units because of price increases, then manufacturers are not able to pass on 100% of the additional costs. Moreover, the pass-through rate varies with the share of fixed costs within total compliance costs, i.e., costs that would occur regardless of the quantity of the product sold and do not affect the price in competitive markets. In an imperfectly competitive market, the validity of the 100% pass-through assumption also relies on producers' market power. Empirically, the agencies' estimates of the demand elasticities indicate some change in overall demand, which is not consistent with perfectly inelastic demand and thus does not support the 100% cost pass-through assumption.122 [EPA-HQ-OAR-2019-0055-1256-A1, pp. 22 - 23]

122. DRIA, supra note 41, at 412.

EPA implicitly discusses the scrappage effect in the context of pre-buy and low-buy impacts. Specifically, EPA states that "potential buyers decid[e] not to purchase at all. In this case, the vehicle miles traveled (VMT) of older vehicles may increase to make up for the VMT otherwise expected of the newer ('missing') vehicles. To the extent that the older vehicles emit more than the missing vehicles, emissions may increase. However, because the VMT is likely to be shifted to the newer [heavy-duty] vehicles among the existing fleet, and most of those vehicles are expected to be in compliance with the existing [heavy-duty] vehicle standards, this effect is expected to be small."123 EPA then goes on to argue against the scrappage effect due to the absence of a robust methodology.124 [EPA-HQ-OAR-2019-0055-1256-A1, p. 23]

123. DRIA, supra note 41, at 416.

124. Id. EPA explicitly states that "Quantifying these effects would require a robust method to estimate the effects of the standards on pre-buy and low-buy, as well as a method to estimate shifts in VMT among vehicle vintages in the case of an expected change in the net sales of newer vehicles. In the absence of robust methods to estimate these effects, EPA is not quantifying the fleet turnover or emissions impacts in this proposed rule, though, as with pre-buy and low-buy, we acknowledge these potential impacts."

We agree that modeling the scrappage effect is potentially unnecessary in this instance, but recommend that EPA provide a fuller explanation of why this is the case. EPA cannot simply claim it lacks the methodology given the use of such methodology by NHTSA and EPA in the light-duty vehicle context. In the 2020 SAFE rulemaking, EPA and NHTSA estimated the scrappage effect using a reduced-form model. More recently, EPA issued a report outlining a structural-form methodology for estimating the scrappage effect.125 While Policy Integrity has previously submitted comments critical of EPA and NHTSA's methods of estimating the scrappage effect for light-duty vehicles,126 EPA cannot now ignore its prior methodologies without a fuller explanation. [EPA-HQ-OAR-2019-0055-1256-A1, p. 23]

125. See generally Jacobsen et al, supra note 116.

126. See, e.g., Inst. for Pol'y Integrity Comments, supra note 115.

We recommend that EPA briefly discuss the scrappage estimates in the light-duty vehicle context. The agency should explain why this estimate lacks robustness (i.e., is challenging or flawed) in the heavy-duty vehicle context relative to the light-duty vehicle context. Alternatively, EPA could discuss why NHTSA and EPA's current estimation strategies are weak more generally (i.e., in both light and heavy-duty contexts). Part of this justification should also include EPA's expectation that the scrappage effect will be "small" in the heavy truck context. [EPA-HQ-OAR-2019-0055-1256-A1, p. 23]

This suggestion should not be read as a recommendation to include the scrappage effect. Instead, we recommend that EPA provide a more comprehensive explanation for its modeling decisions, particularly where it is inconsistent with past EPA modeling practices in the vehicle market more generally. If EPA now believes its prior methodologies for estimating scrappage are flawed more generally—even in the light-duty vehicle context—this should be explained. We believe a similar consideration and discussion may be warranted for EPA's estimates of the pre-buy elasticities. [EPA-HQ-OAR-2019-0055-1256-A1, p. 24]

EPA makes clear that the sales effect of the regulation should be small due to the competing effects of increased capital costs and decreased operating costs. However, as EPA notes, the evidence is unclear and mixed as to whether the net effect of sales is zero127 or negative.128 In fact, this is consistent with EPA's finding that the sales impacts of regulations in 2002 and 2014 are insignificant, while it finds significant low-buy effect in 2007 and 2010.129 But even in 2007 and 2010, EPA notes that the "observed effects are short-lived, on the order of months rather than years."130 [EPA-HQ-OAR-2019-0055-1256-A1, p. 24]

129. DRIA, supra note 41, at 410.

130. Id.

The net effect of the proposed regulation on sales is unclear based on EPA's illustrative examples using the 2007 and 2010 estimates.131 Despite the estimation problems discussed above, it is clear that EPA's analysis indicates that the net sales effect should be interpreted as zero based on the above evidence, including the likely small and temporary effect on sales. This interpretation is consistent with EPA's prediction of low turnover effects and no mode shifting due to the Proposed Rule. EPA should be explicit about the near-zero impact on sales based on previous studies and their own estimates. [EPA-HQ-OAR-2019-0055-1256-A1, p. 24]

131. Id. at 412–15 (showing pre-buy effects that are statistically insignificant using the 2007 estimates and slightly positive effects using the 2010 estimates and small, negative low-buy effects using both the 2007 and 2010 estimates).

Organization: *National Association of Chemical Distributors (NACD)*

Lastly, the pre-buy effects of this rule will likely be smaller under option 2 than option 1. Pre-buy effects are likely to follow this rulemaking as owners of these fleets are operating under slim margins and must think of long-term viability when purchasing trucks. This was seen during the implementation of EPA's MY2004-2010 emission standards, as there was a spike in truck purchases before stringent emission standards went into effect for MY2007-2010 and then a subsequent slowing of fleet turnover to avoid purchasing new trucks with harsher standards. The annual retail sales in 2005 was over 250,000 higher than 2010 and the average fleet age was nearly one year higher in 2010 compared to 2005.4 Since option 2's requirements are less severe, fleet owners will not bear as high a cost and can have more confidence in reliability, creating a smaller pre-buy effect than option 1. The EPA should also consider creating incentives for fleet owners to transition to new trucks versus more stringent NOx requirements - requirements that will only serve to keep older trucks on the road longer. [EPA-HQ-OAR-2019-0055-1279-A1, p. 4]

EPA Summary and Response:

Summary:

Commenters stated that EPA overestimated costs, underestimated pre- and low-buy effects and fleet turnover effects, and failed to account for additional market disruptions. Some commenters compared EPA results to an analysis completed by ACT Research. Some commenters made suggestions on changes to EPA's sales effects methodology.

Response:

Commenters expressed their concern about potential market disruptions and employment effects associated with standards that commenters asserted are not feasible or cost-effective (particularly proposed Option 1). Some commenters stated that the pre- and low-buy analysis should be an important consideration for determining the level of control in the final rule. Some commenters stated that EPA underestimated costs of the proposed regulation, as well as pre- and low-buy, and failed to account for some of the effects of market disruptions (such as employment effects, changes to freight rates, and delayed fleet turnover). One commenter (Daimler) commented that EPA did not propose standards "with 'reasonable' per-vehicle costs.'" One commenter (ATD) stated that if EPA moves too far, too fast, new vehicle costs will increase dramatically and performance will decline, resulting in a decline in fleet turnover and environmental improvements. Commenters cited external studies and data that yield higher estimates of costs, as well as pre- and low-buy, including ACT Research, Ricardo, and Ramboll studies and data.

Commenters stated that EPA overestimated fleet turnover, as well as the emissions reductions achievable by the proposed regulation, and underestimated the effect of the proposed rule on trucking capacity and freight rates. One commenter, Institute for Policy Integrity (IPI), stated that EPA overestimated pre-buy and low-buy, and that EPA should discuss these impacts qualitatively due to limitations of the methodology.

The final NO_X standards will be implemented with a single step in MY 2027 (which was the type of approach used in proposed Option 2) and reflect the greatest emission reductions achievable starting in MY 2027, giving appropriate consideration to costs and other statutory factors. Regarding commenters' statements that the new emission standards must be cost-effective, EPA notes that CAA section 202(a)(3) neither requires that EPA consider all the statutory factors equally nor mandates a specific method of cost analysis; rather EPA has discretion in determining the appropriate consideration to give such factors. See, e.g., Sierra Club v. EPA, 325 F.3d 374, 378 (D.C. Cir. 2003) (explaining that similar technology forcing language in CAA section 202(l)(2) ‘‘does not resolve how the Administrator should weigh all [the statutory] factors in the process of finding the ‘greatest emission reduction achievable' ''); Husqvarna AB v. EPA, 254 F.3d 195, 200 (D.C. Cir. 2001) (explaining that under CAA section 213's similar technology-forcing authority that ‘‘EPA did not deviate from its statutory mandate or frustrate congressional will by placing primary significance on the ‘greatest degree of emission reduction achievable' '' or by considering cost and other statutory factors as important but secondary). As explained in the final rule preamble Sections III and V, and sections 3 and 18 of this document, in setting the final emission standards EPA appropriately assessed the statutory factors specified in CAA section 202(a)(3)(A), including giving appropriate consideration to the cost associated with the application of technology EPA determined will be available for the model year the final standards apply (i.e., cost of compliance for the manufacturer associated with the application of such technology). EPA's assessment of the relevant statutory factors in CAA section 202(a)(3)(A) justify the final emission standards.

We also undertook additional analyses, including a sales analysis; however, since there are many uncertainties associated with estimating pre-buy and low-buy, including those discussed in past rules,[58] we have presented the sales analysis for this rule as an illustrative example. Our evaluation suggests that if pre-buy or low-buy occur, they will be small in magnitude (~2%) and short in duration (8 to 12 months) (see preamble section X and RIA Chapter 10 for more information). EPA has also provided a cost analysis for the final rule and disagrees that our final regulation will lead to dramatic cost increases (see preamble Section V, RIA Chapter 7, and section 18 of this document for more information). In addition, EPA has carefully and appropriately assessed sales and other economic impacts, and we continue to believe that our peer-reviewed methodology is appropriate, even considering the uncertainties we acknowledge in the RIA and in the EPA sales impacts report.[59] The EPA sales impact report and the method used to estimate illustrative results in Chapter 10 of the RIA, which stemmed from that report, is

[58] For example, see Chapter 8.4 of the Regulatory Impact Analysis for the Phase 2 Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles, found at https://www.epa.gov/regulations-emissions-vehicles-and-engines/final-rule-phase-2-greenhouse-gas-emissions-standards, or the EPA sales impact resort found at https://cfpub.epa.gov/si/si_public_pra_view.cfm?dirEntryID=349838&Lab=OTAQ

[59] The study can be found at https://cfpub.epa.gov/si/si_public_pra_view.cfm?dirEntryID=349838&Lab=OTAQ an in the docket for this rule.

transparent, reproducible, and "is based on the best reasonably obtainable scientific, technical, and economic information available," in compliance with OMB Circular A-4.[60]

Many commenters stated that EPA underestimated the costs due to the proposed regulation. In addition, some commenters stated that EPA cost estimates should include taxes and additional insurance and financing costs as outlined in the ACT Research Impacts Study (submitted with Truck and Engine Manufacturers Association comments). Allison commented that EPA should consider the price impacts flowing from the California Air Resources Board's Step 1 increase that took effect with MY 2022. Daimler commented that paperwork burden costs should be accounted for in regulatory costs. Many commenters, including Daimler, UAW, and TCA, referred to cost estimates from Ricardo Strategic Consulting. The ACT Research study referred to by commenters also relies on costs estimated from Ricardo.

EPA believes that the estimates and methodologies presented in the RIA are appropriate, even considering the uncertainties we acknowledge in RIA. As explained above in this response, in Preamble Sections III IV, and V, EPA explains that the final standards are appropriate and technologically feasible for MY 2027 based on EPA's consideration of the statutory factors. The sales analysis for this rule is an illustrative example, using the technology costs as estimated and discussed in Chapter 7 of the RIA as a proxy for the change in price due to this rule. In the context of the sales analysis, EPA does not have data to estimate additional insurance or financing costs for purchasers of HD engines and vehicles as a function of this regulation. In the context of the cost analyses, because such taxes, insurance, and financing costs are paid by purchasers of vehicles, those costs are not part of the manufacturers' costs of compliance. Also, EPA does not agree that we should include transfer payments such as taxes in the cost analysis for the total program. See Section 18.3 of this document for responses to similar comments about transfer payments.

Regarding Allison's comment, EPA has considered the price information from California Air Resources Board along with data from the Truck and Engine Manufacturers Association in developing the warranty-related costs for the final standards. EPA has provided a cost analysis and estimate for the final rule and disagrees that our final regulation will lead to dramatic cost increases. Regarding Daimler's comment, EPA includes paperwork burden costs in the "Other" category of indirect costs. Regarding commenters' reference to cost estimates from Ricardo, EPA has provided a cost analysis and estimate for the final rule and disagrees that our final regulation will lead to dramatic cost increases. For more information on EPA's response to comments regarding estimated costs of this EPA regulation, including to the cost estimates in Ricardo Strategic Consulting's report, please refer to section 18 of this document, Section V of the Preamble, and RIA chapter 7.

Several commenters stated concerns that the proposed NOx standards, particularly proposed Option 1, may lead to increasing truck prices, and therefore result in pre- and low-buy sales effects. Commenters also stated that the phase-in approach of Option 1 would lead to larger sales effects than the single-step implementation time frame of Option 2. NACD commented that proposed Option 2 would be less costly and be associated with more confidence in reliability

[60] OMB Circular A-4 (found at https://obamawhitehouse.archives.gov/omb/circulars_a004_a-4/#d) provides guidance to Federal Agencies on the development of regulatory analyses as required under Executive Order 12866.

than proposed Option 1, leading to a smaller pre-buy effect compared to proposed Option 1. PACCAR commented that a program with Option 2-like requirements would be more cost-effective, and less likely to lead to delays in fleet turnover or pre-buy/no-buy responses from the market. Allison Transmission stated that EPA does not attempt to quantify how different vocational vehicles or Class 7-8 tractors could be affected by pre- and low-buy, and assuming an average effect across all vehicles may not fully reveal real-world effect in different segments of the market. Commenters including Allison, Daimler, UAW, EMA, and U.S. Chamber of Commerce stated that pre- and low-buy effects will be larger in magnitude and duration than EPA estimates. Daimler, ACT, EMA, and Allison all referred directly to estimates made in the ACT Research study. ACT estimated two years of pre-buy, with low-buy being an opposite but equal effect, using cost estimates outlined in the Ricardo study. In addition, ACT estimated effects across Classes 4-8. ATD pointed out that Ricardo also estimated larger pre- and low-buy than EPA as a result of the Proposed Option 1, as well as reduced turnover and increased used vehicle sales.

EPA disagrees that pre- and low-buy estimates are underestimated in the RIA. Our estimates rely on peer-reviewed methodology and EPA cost estimates for the final program presented in the RIA. We believe our estimates and methodology are appropriate even considering the uncertainties we acknowledge in the RIA and in the EPA sales impacts report. EPA also notes that the final rule includes a single step approach in MY 2027, which was the approach proposed until Option 2. See also our response further below regarding possible emission effects from pre-buy and low-buy of the final standards. EPA also notes that the pre- and low-buy analysis in the RIA is an illustrative example of how this methodology could be used to estimate sales impacts of a HD regulation and does not impact cost and benefit estimates of this final rule. EPA believes that effects on fleet turnover due to pre- and low-buy will be minimal and short-lived, as discussed in Chapter 10.1 of the RIA. In the EPA sales impacts report supporting the pre- and low-buy methodology introduced in the proposed rule, the sales effects for Classes 6-8 were each examined separately. The data and estimated results for Classes 6 and 7 were economically insignificant or inconsistent with market expectations; therefore, we are unable to estimate effects on those two HDV classes at this time. In addition, we do not have data to separate out different HD applications within a class.

The analysis estimated by ACT Research uses much higher cost estimates from Ricardo as opposed to those estimated by EPA. Even for the cost scenario ACT Research states is based on EPA cost estimates, the final costs used by ACT Research are adjusted upward compared to EPA cost estimates for the proposed rule. In addition, the significantly larger results from ACT Research mentioned by commenters are estimated assuming a strong economic outlook. ACT Research pointed out that if a neutral economic outlook is assumed, results would be smaller. In addition, though ACT Research explained their methodology in broad strokes (they use measures of both willingness and ability to buy to estimate pre-buy), they did not provide enough detail on the model or assumptions for EPA to further respond to their specific estimation method and results. Without sufficient information, EPA cannot fully evaluate the study or results.

ACT Research assumed low-buy estimates were equal in magnitude and opposite in direction to the estimated pre-buy. In other words, pre-buy effects in the ACT Research study were entirely due to planned purchases shifting forward in time to before the standards are in place. Published literature on pre- and low-buy in the HD vehicle market is mixed on whether pre- and low-buy are equal and opposite. See Chapter 10 of the RIA for this rule for more information on HD sales effects literature. The results from the EPA sales impacts report are also unclear on this issue, with economic significance and magnitude varying across the pre-buy and low-buy sales effects for the different standards. Assuming equal and opposite reactions assumes all pre-bought vehicles are purchases pulled forward in time and are vehicles that would have been purchased after the regulation if the regulation had not been finalized. This ignores alternative reasons pre- or low-buy may happen, including HD vehicle owners that do not pre-buy, but instead delay a purchase for some period after a regulation is finalized.

Some commenters raised specific points on what should be additionally included or assessed differently in EPA's estimates and analyses. Allison Transmission commented that EPA should carefully consider potential impacts of increased prices due to extended warranty and useful life provisions. In their comments, Daimler partially quoted EPA with respect to the discussion on the effect of extended warranties and longer useful provisions, stating that EPA cannot provide support for the assertion that "the conclusion that these combined effects may *increase sales of new HD vehicles* 'if fleets and independent owner-operators prefer to purchase more durable vehicles with overall lower repair costs.'" IPI commented that the method EPA used to estimate pre- and low-buy effects does not separate out the improved quality effects from the effect of increasing costs, and that EPA must identify price and quality effect separately. IPI commented that improvements in truck quality will reduce the impact of the regulation on fleet turnover, including pre- and low-buy. IPI also commented that failing to address the omission of unobservable time-varying variables (including adverse fuel consumption effects, rule stringency, vehicle attributes, endogenous vehicle purchase price and previous truck sales) leads to serious questions about the accuracy of EPA's forecast of sales effects. IPI suggested three options for addressing the potential errors they point out in their comment. IPI first suggested EPA exploit available data to account for the impact of these factors, and test the sensitivity of the estimation to alternative model specification. The second suggestion made by IPI was to estimate a structural model. IPI's third recommendation was to qualitatively discuss potential pre- and low-buy effects. In addition to discussing sales impacts qualitatively, IPI commented that EPA should consider discussing fleet turnover qualitatively, or identify assumptions within the quantitative model that may lead to overestimation. IPI also stated that EPA should be explicit about the near-zero impacts on sales based on previous studies and on the EPA estimates.

In the analyses for the final rule, as in the proposed rule, EPA estimated pre- and low-buy effects using total per-vehicle direct and indirect EPA cost estimates for the final program, which include the estimated cost of longer warranty and useful life. For information on EPA's approach to estimating warranty and useful life costs, see RIA Chapter 7. In the final RIA, the full sentence Daimler is referring to states "More durable components coupled with manufacturers paying for repairs during a longer warranty period would in turn reduce repair costs, which may increase (or reduce the decrease in) sales of new HD vehicles due to fleets and independent owner-operators being inclined to purchase vehicles with lower repair costs." EPA points out that the effect of longer warranties and useful life provisions may increase, or reduce the incentive for, pre- and low-buy, mitigating adverse sales impacts. Longer useful life and longer warranty may also lead to reduced perception of risk (for example, that quality of post-regulation implementation vehicles will be lower compared to pre-regulation implementation vehicles), as well as lower overall repair costs, which may mitigate downward pressure on sales through pre- and/or low-buy. In addition, this may lead to increased sales of new HD vehicles compared to a counterfactual where these regulations are not in place, especially in the long term, when uncertainty of the effect of the rule on vehicle performance decreases. In the nearer term, the effect depends on the magnitude of 1) purchaser preferences for any or all of the following: durability, lower repair costs, and decreased emissions; and 2) purchaser aversion to either, or both, increased costs and perceived risk. EPA does not have the data to estimate the direct effect of longer useful life and longer warranty on sales impacts for this rule. EPA considered multiple sensitivities in our inputs and assumptions in the course of estimating effects for the proposed and final rules. In the pre- and low-buy effects analysis, we estimated pre- and low-buy using multiple estimated elasticities to get a range of possible sales effects.

EPA states in Chapter 10.1 of the RIA and in the EPA sales impacts report that the sales impacts estimates likely capture unobserved aspects of the regulation, which includes quality changes. Therefore, we assume the pre- and low-buy results are an upper-bound estimate for sales effects due to the cost of the rule. EPA agrees that the expected quality improvements, and possible fuel or other operating cost savings due to the rule, may reduce those effects to below the upper-bound estimates.

With respect to IPI's suggestion that EPA exploit available data to account for unobservable variables, the EPA sales impacts report containing the HD sales effects literature review and methodology for the EPA sales effects estimates explains the data the researchers considered, as well as the reasoning behind including or excluding it from the analysis. In section 2.4 of the EPA sales impacts report, we discuss how the model specification was chosen, and the considerations made in choosing it. In addition, the data and method used in EPA's estimates were informed by published literature examining the effect of HD regulations on pre- and low-buy, and included multiple tests on the validity of the data, as described in section 3 of the EPA report. In section 3 of the EPA sales impacts report, we also discuss the econometric framework used, including testing on different forms of the month of year indicator variables, and determining the appropriate leads and lags, if any, that should be included. EPA believes we appropriately identified and used available, relevant data. With respect to IPI's second suggestion, that EPA estimate a structural model, "structural model" is a broad term, but generally requires assumptions on the relationship of the variables used in the analysis. Reduced-form methods, like the one used in the sales effects analysis in the RIA, identify the relationship between the variables. EPA believes the reduced-form method applied, without assumptions regarding the relationship between variables, is useful for this illustrative analysis, and moves the sparse HD sales effects literature forward. With respect to IPI's third suggestion that EPA discuss sales effects and fleet turnover qualitatively, EPA points out that sales impacts and fleet turnover effects are discussed qualitatively in RIA Chapter 10.1. Quantitative estimates of sales impacts are introduced as an illustrative example of how EPA may estimate pre- and low-buy in RIA Chapter 10.1.2.2. In addition, the RIA cites the EPA sales impacts report where the method EPA illustrates is identified and explained. In fact, EPA clearly states in the RIA and in sections 2 and 4 of the cited EPA sales impacts report that estimated effects found in the literature are mixed, and that the lower-bound for all pre- and low-buy results in the EPA study is zero, or no effect.

IPI asserted that there are likely long-run impacts that are not captured by EPA's short-run sales effects estimates, and that like other capital goods, the demand for HD trucks is more inelastic, leading to temporary and small long-term sales effects.

EPA agrees with the assertion that long-term sales effects of this regulation are likely to be small. EPA clearly states that the sales effects estimated and illustrated in the RIA are short-term effects and cover a range of possible outcomes, including no effect.

IPI commented that EPA could improve our methodology by strengthening the assumption of 100% cost pass-through, and states that EPA does not adequately discuss its reasoning for this assumption. IPI stated that in a perfectly competitive world, consumers would not fully bear the costs unless they were completely insensitive to prices (perfectly inelastic demand – demand would not change with a change in price), and in an imperfectly competitive world, cost pass-through relies on producers' market power. IPI stated that because EPA's estimated demand elasticities indicate some change in overall demand, the assumption of 100% cost pass-through is not supported.

EPA does not have data to support a lower level of cost pass-through. The assumption of 100% cost pass-through is consistent with EPA's characterization of the sales effects as range between upper-bound (under full cost pass-through) and lower-bound (or no effect) estimates. Full cost pass-through is associated with upper-bound estimates because it will lead to the greatest increase in estimated costs as a function of the rule for consumers, which will lead to the largest estimated impacts on sales. Assuming partial cost pass-through, without changing other assumptions, will lead to smaller estimated impacts of the rule.

Allison Transmission stated the EPA should conduct a sensitivity analysis of different levels of economic impacts the regulation might have, and that this analysis should be available in the docket. The pre- and low-buy analysis method EPA outlined and illustrated in Chapter 10 of the RIA includes estimating multiple elasticities, as well as the effects of those multiple elasticities. Our analyses, both for the proposal and final rule, are available in the docket for this rule.

Commenters stated that EPA-estimated historical effects of previous EPA regulation are underestimated in both magnitude and direction. Allison, EMA, UAW, and the U.S. Chamber of Commerce comments reflect estimates and conclusions ACT Research made in its study on sales effects of previous EPA HD regulations in comparison to sales effects estimated in EPA's report. Allison Transmission stated that EPA should consider further historical data from the 2007 rule to check assumptions regarding the impact of NOx regulations on commercial vehicles during that timeframe. ATD included figures showing annual retail sales of Class 4-8 vehicles from 2000 through 2010. ATD commented that these sales show pre-buy starting in 2002 ahead of the 2004 HD rule, as well as in 2006 ahead of the initial implementation of the 2007/2010 HD rule with sales falling after the rules were implemented. ATD also stated that sales increased before 2010, when the 2007/2010 HD rule was fully phased in. Allison Transmission stated that there were about six years of lower-than-average sales from 2007-2013 based on the 15-year build average over 2006 to 2021. NACD stated that there was a spike in truck purchases ahead of the start of the 2007/2010 HD rule, followed by a slow-down in fleet turnover, which they attribute to consumer avoiding purchasing new trucks with "harsher standards." IPI commented that it is unclear if truck manufacturers and trucking companies will respond to the Proposed Rule in the same manner as they did to the past rules.

In building a method to estimate sales impacts, EPA considered the effect of four previous EPA HD rule implementations, including data surrounding the 2004 HD rule, the 2007/2010 HD rule and the 2014 HD rule. In response to ATD stating that sales increased starting in 2002, ahead of the 2004 HD rule, EPA points out that the Department of Justice and EPA completed consent decrees with seven of the largest heavy-duty diesel engine manufacturers in the U.S., under which six of the manufacturers were required, among other things, to meet a 2.5 g/bhphr limit on NMHC+NOX no later than October 1, 2002, thus pulling much of the regulatory implementation timeline ahead to October 2002.[61] Because of this, much of the pre-buy for that rule, if there was any, would have been felt in the time frame preceding the end of 2002. In the EPA study, we find no evidence for pre-buy in Class 8 vehicles ahead of the 2002 implementation. In response to comments stating that EPA underestimated the effect of the 2007/2010 HD rule, specifically citing the fall in retail sales starting around 2005, EPA points out that there were external factors affecting the market, and economy as a whole, at that time, including the Great Recession, which officially began at the end of 2007.[62] In addition, for the 3 years prior, starting in 2004, the Federal Reserve steadily increased interest rates. This made it costlier to purchase expensive goods, especially those purchased through the use of credit, like HD vehicles. This ultimately led to reduced purchases of those expensive goods. Attributing all, or even most, of the decline between 2005 and 2009 to the 2007 HD regulation is not appropriate. The EPA sales impacts report does find evidence of pre-buy in Class 8 vehicles before the final phase-in of the 2007/2010 HD rule implementation in 2010, though results are smaller than those cited by commenters. EPA agrees with IPI that the results in the EPA sales impacts report were mixed with respect to statistical significance and magnitude for the previous EPA regulations, which indicates that is it not clear that truck manufacturers and truck companies responded to past regulations in a similar manner.

Allison Transmissions chose to smooth vehicle sales averages across multiple years to better understand sustained impacts over a longer period of time, pointing out that there is a lot of year-over-year volatility due to replacement cycles and multi-year capital planning. Impacts of year-over-year volatility are mitigated in EPA's estimation methodology, as the effect of each historical regulation were estimated separately and built upon previous literature, extending our analysis from accounting for only 8 months of data to including data from the 12 months preceding and following implementation of the rule. This is consistent with annual cycles in vehicle purchasing and model year updates. Also, with the exception of the sales effects for low-buy surrounding the 2007 implementation date, our results show no effects after 8 months, and the results for low-buy using the effects estimated for the 2007 implementation date decrease from 7 to 12 months. In addition, EPA accounts for macroeconomic events through the inclusion of monthly GDP, oil prices, imports and exports, and a measure of consumer sentiment. Within-

[61] More information on these consent decrees can be found on EPA's Civil Cases and Settlements by Statute webpage:
https://cfpub.epa.gov/compliance/cases/index.cfm?templatePage=12&ID=1&sortby=RELEASE_DATE,RELEASE_DATE&stat=Clean%20Air%20Act

[62] https://www.nber.org/news/business-cycle-dating-committee-announcement-december-1-2008

year volatility is also accounted for in EPA's estimation through the use of controls for month-of-year seasonality.

Many commenters stated that because EPA underestimated pre-buy and low-buy, we overestimated the number of low-NOx compliant trucks that will be purchased starting in 2027 through 2031, and this reduced turnover, and associated increase in the average age of the fleet, will reduce the emissions impacts from the rule. In addition, commenters stated that EPA should estimate emissions effects due to pre- and low-buy. Some of these commenters cited a study by Ramboll stating that the proposed Option 1 can result in increased NOx emissions due to a large pre-buy, while the proposed Option 2 could result in a smaller sales effect and more emissions compliant trucks on the road.

In section 10 of the RIA, we qualitatively discuss possible emission effects from pre-buy and low-buy. As discussed in preamble Section III.A, in setting the final standards we gave appropriate consideration to costs associated with the application of technology to achieve the greatest emissions reductions in MY 2027 (i.e., cost of compliance for manufacturers associated with the standards[63]) and other statutory factors, including energy and safety. In preamble Section III.A, and throughout Sections III and IV more broadly, we detail our determination that the combination of elements in the final standards are appropriate, feasible, and consistent with our authority under the CAA to set technology-forcing criteria pollutant standards for heavy-duty engines for their useful life.[64] In turn, it is our assessment that the final standards, including when combined with the final useful life and warranty requirements, will lead to a minimal effect on the duration or magnitude of any possible pre- or low-buy (see preamble Section X for additional discussion). Since we expect minimal effects on duration or magnitude of pre- and low-buy, and since there are many uncertainties associated with estimating pre-buy and low-buy (including those discussed in past rules), we have chosen a qualitative approach to evaluate potential emissions impacts of pre- and low-buy, as provided in RIA Chapter 10.

Some commenters pointed out the ACT Research estimates of employment effects due to low-buy. EPA has added an illustrative method to estimate a sales effect on employment. For more information on EPA's response to the ACT Research employment impact estimates, and on

---

[63] More specifically, for this rule in setting the final standards and consistent with CAA section 202(a)(3)(A), the cost of compliance for manufacturers associated with the standards that EPA gave appropriate consideration to includes the direct manufacturing costs and indirect costs incurred by manufacturers associated with meeting the final standards over the corresponding final useful life values, given that this rule sets new more stringent standards through both the numeric level of the standard and the length of the useful life period.

[64] CAA section 202(a)(3)(A) is a technology-forcing provision and reflects Congress' intent that standards be based on projections of future advances in pollution control capability, considering costs and other statutory factors. See National Petrochemical & Refiners Association v. EPA, 287 F.3d 1130, 1136 (D.C. Cir. 2002) (explaining that EPA is authorized to adopt ''technology-forcing'' regulations under CAA section 202(a)(3)); NRDC v. Thomas, 805 F.2d 410, 428 n.30 (D.C. Cir. 1986) (explaining that such statutory language that ''seek[s] to promote technological advances while also accounting for cost does not detract from their categorization as technology-forcing standards''); see also Husqvarna AB v. EPA, 254 F.3d 195 (D.C. Cir. 2001) (explaining that CAA sections 202 and 213 have similar language and are technology-forcing standards). In this context, the term ''technology-forcing'' has a specific legal meaning and is used to distinguish standards that may require manufacturers to develop new technologies (or significantly improve existing technologies) from standards that can be met using existing off-the-shelf technology alone. Technology-forcing standards such as those in this final rule do not require manufacturers to use specific technologies.

EPA's illustrative sales effect on employment estimation, see section 26 of this document and Chapter 10.2 of the RIA.

Commenters stated that pre-buy would lead to excess capacity, and excess low-buy (beyond the estimated pre-buy level) would lead to tight capacity. In addition, Daimler and other commenters reported ACT Research conclusions that, due to excess trucking capacity due to pre-buy, freight rates would be lower, which would lead to reduced earnings in the trucking industry during the pre-buy/low-buy period. Daimler also commented that increased costs due to the proposed rule would lead to long-term freight rate increases above today's rates. EPA acknowledges that pre-buy may lead to excess trucking capacity, and low-buy may lead to tight capacity in the short run, but such impacts would be small. Results in the EPA sales impacts report indicate that if pre- and low-buy occur, they would be short-run effects, and therefore, in the event that excess or tight capacity exists due to pre- or low-buy, those effects would also be short-term as the market reverts to expected levels. Also, as EPA estimates indicate that any pre- or low-buy effects would be small in magnitude, possible resulting capacity effects would be small as well. In addition, the assumptions by these commenters ignore planned replacement, scrappage, and delayed scrappage in a fleet. If a pre-bought truck is a truck that would have been purchased later in absence of the regulation, this indicates there were plans to either purchase an additional truck for a fleet, or to replace a truck in a fleet. Excess capacity would not exist unless the fleet owner(s) retained the vehicle they otherwise would have sold or scrapped when they pre-bought their new truck. In addition, if there is tight capacity after a regulation due to excess low-buy, this indicates that not only were new trucks not purchased, but truck/fleet owners scrapped or sold trucks they currently owned without replacing them. Alternatively, excess low-buy due to delayed purchase could be associated with delayed scrappage, again leading to minimal effects on capacity.

The U.S. Chamber of Commerce pointed out that long-haul trucking is mainly comprised of small businesses, and that 98% of U.S. fleet owners are categorized as small businesses; they are disproportionately vulnerable to changing economic circumstances and typically do not have the financial resources to absorb significant regulatory cost increases, and therefore pass those increases on to the consumer. As explained in preamble Section V, EPA's cost analysis for the final program includes "technology costs," that represent the costs incurred by manufacturers--i.e., regulated entities--to comply with the final program, and "operating" costs, that represent the costs of using the technology in the field and which accrue to the owner/operator of MY 2027 and later heavy-duty vehicles. EPA notes that U.S. fleet owners are owner/operators, not manufacturers, and are not regulated entities under the final program's requirements.[65] As previously noted above in this response, EPA's assessment of the relevant statutory factors in CAA section 202(a)(3)(A) justify the final emission standards. EPA recognizes that the costs of our rules are often ultimately passed on to the consumer through increased upfront prices; however, we also expect that the longer useful life and warranty periods in the rule will result in lower emission repair costs for many vehicle types and fewer emission control failures, which we anticipate could be particularly impactful for small businesses. We further expect that several provisions in the final rule will improve the operating experience of small fleet owners; for

[65] See Chapter 11 of the RIA for EPA's discussion of the impacts of the final program on directly regulated entities that are small businesses and section 17.1 of this document for responses to additional comments regarding impacts on small businesses.

instance, we expect the serviceability provisions in the final rule will result in better service experiences for owners who repair their own equipment, as is typical of small fleets (see preamble Section IV and sections 3, 4, and 5 of this document for additional details on warranty, useful life, and serviceability provisions in the final rule). Our assessment of the total program costs (i.e., both technology and operating costs) lend further support to the final rule.

IPI recommended that EPA provide a fuller explanation of why modelling scrappage is potentially unnecessary, including a discussion of scrappage in the light-duty context. IPI cited the scrappage effects estimated in prior NHTSA and EPA light-duty vehicle rulemakings, as well as the recent EPA issues report outlining a structural-form methodology for estimating the scrappage effect.

The scrappage models EPA has used to estimate responses in the light-duty market to vehicle regulations, and the effects that have been estimated using them, were all built using data exclusively from the light-duty vehicle market. Purchase and use decisions are made differently in heavy and light-duty contexts, and assumptions about inputs that affect scrappage decisions in the light-duty market are not the same as those that would be made in the heavy-duty market. Though we do not have data or a methodology to estimate dynamic scrappage in the HD vehicle context, or the changing of scrappage decisions due to the cost of the rule, the EPA MOVES model includes an estimate of static scrappage rates. EPA has added further discussion on modeling scrappage in the HD context to Chapter 10.1.3 of the RIA, including a reference to the static scrappage modeling in the MOVES model.

Some commenters, including ATD and NACD, stated that EPA emission standards should focus on increasing fleet turnover as opposed to disincentivizing purchases of new HD vehicles through dramatic increases in costs and decreased performance.

As explained in the final rule preamble, sections 3 and 18 of this document, and above in this response, the final standards are promulgated under and consistent with our authority in CAA section 202(a), which includes EPA giving appropriate consideration to cost associated with the application of technology EPA determines will be available for the model year the final standards apply. EPA also provides a cost analysis and estimate for the final rule and disagrees that our final program will lead to dramatic cost increases or decreased performance. See Chapters 3 and 7 of the RIA for this rule for more information on our feasibility and cost analyses. Finally, while we agree with the importance of encouraging fleet turnover, state or other federal programs are best positioned to offer incentives for retiring older heavy-duty trucks and purchasing new, lower emitting trucks or zero-emissions vehicles and such programs are outside the scope of this rulemaking (see Section 12.1.1 of this document for additional discussion on fleet turnover).[66] For example, the recently passed Inflation Reduction Act (IRA)

[66] For example, other Federal programs that are well positioned to help encourage fleet turnover include the Diesel Emissions Reduction Act funding, which grants and rebates that protect human health and improve air quality by reducing harmful emissions from diesel engines.

has many incentives for promoting zero-emission vehicles that are anticipated to assist in fleet turnover.[67]

25.3 Commenters who Disagree With our Analysis

Comments by Organizations

Organization: *American Truck Dealers (ATD)*

To illustrate the importance of fleet turnover and safety, it was not until 2018 that all major CMV manufacturers began including such advanced driver assistance systems (ADAS) as forward collision avoidance and lane departure warning to standard package offerings. ADAS features have led to a reduction in accidents involving CMVs, along with a reduction in related injuries and deaths. Bottom line: to the extent EPA's new NOx mandates serve to inhibit fleet turnover, they also will inhibit the roll-out of important new accident-reducing features and systems such as ADAS, by no means yet prevalent on the road today.12 [EPA-HQ-OAR-2019-0055-1321-A1, p. 6]

> 12. According to a Fleet Advantage survey, as of 2020, over 50% of the CMV fleet was MY 2017 and older.

Organization: *American Farm Bureau Federation (Farm Bureau)*

Specifically, we are concerned that the agency's projection of extremely modest technology and warranty costs associated with the rule will result in a significant overestimation of future fleet turnover and underestimation of the negative emissions consequences associated with large-scale 'pre-buys' prior to compliance deadlines. To its credit, EPA openly admits that its projections are guesswork, but it does not quantitatively explore how underestimating costs could drive higher pre-buy behavior that could significantly delay and undermine emissions reductions benefits that are the central purpose of the rule. So, before finalizing this rule, we urge EPA to work collaboratively with industry, states, and other affected stakeholders to resolve discrepancies related to technology costs and achievability, warranty impacts, corresponding fleet turnover and environmental impacts of the proposal. [EPA-HQ-OAR-2019-0055-1163-A1, p.2]

Organization: *Autocar, LLC (Autocar)*

Autocar is proud to say that it has a strong, longstanding relationship with Cummins. As partners, the two companies consistently communicate and work collaboratively to address challenges and explore potential solutions to enable both companies to comply with and honor the spirit of CARB's and EPA's greenhouse gas and NOx rules. [EPA-HQ-OAR-2019-0055-1292-A1, p. 4]

[67] For example, see Sections 13403 (Qualified Clean Vehicles), 13404 (Alternative Refueling Property Credit), 60101 (Clean Heavy-Duty Vehicles), 60102 (Grants to Reduce Air Pollution at Ports), and 70002 (United States Postal Service Clean Fleets) of H. R. 5376.

Through that regular dialogue, Cummins has informed Autocar that production of Autocar's top-selling diesel engines will be modified significantly in 2024-2026 as a result of CARB's Low NOx rule and now in 2027 and after under the Proposed Rule. Under the CARB rule, Cummins' sales volume of these engines is limited to 45% in 2024 and 25% in 2025, and it is not yet known what portion of those restricted sales will be to Autocar. Further, sales of those engines will create credit deficits for Cummins. In order to take the actions necessary to offset the deficits, the cost of these engines are anticipated to increase by $4,000-$5,000 per engine. Although Cummins understands the problems this causes for Autocar and its customers that rely on diesel trucks, including municipalities purchasing trucks with taxpayer dollars, they can't bear all of the cost to meet the new standards. They anticipate similar issues with other engines when more stringent standards are implemented over time, particularly for small-volume product lines. [EPA-HQ-OAR-2019-0055-1292-A1, p .4]

In addition, the California NOx standards, and now the EPA NOx standards in the Proposed Rule, present ongoing development demand for Cummins. Engine fuel maps and emissions levels are a constantly-moving target. This complicates Autocar's efforts toward compliance for the vehicle, making it impossible to predict performance against 2027 standards. By contrast, large vertically-integrated manufacturers develop their engines and vehicles simultaneously and in a complementary manner, without the many challenges of a third-party engine-vehicle relationship. [EPA-HQ-OAR-2019-0055-1292-A1, p. 4]

Organization: *Engine and Truck Organizations*

Based on our assessment, EPA's "Option 1" rule as proposed will be:

- Cost prohibitive. The additional technology required for diesel engines will drive new and used vehicle prices higher, reducing or delaying fleet turnover to newer, cleaner, safer trucks. Higher operating costs will also deter the attractiveness of those trucks. [EPA-HQ-OAR-2019-0055-1177-A1, p.1]
- Counter to environmental goals. When new truck prices rise and their costs of operation increase, customers will hold onto older, higher emitting trucks longer, undermining the continuous improvements in air quality we all seek. [EPA-HQ-OAR-2019-0055-1177-A1, p.1]

Organization: *American Bus Association (ABA) (1070 and 1308)*

In addition to the extremely burdensome potential costs associated with the Proposal, both in terms of direct and indirect costs to manufacture and maintain new emissions control technology, which may not even be feasible, the Notice also mentions EPA's review of the Proposal's potential impact on the sale of new vehicles and fleet turnover. Here, again, ABA believes EPA's estimates are insufficient because the underlying cost estimates in the analysis do not fully capture the costs and economic impact on motorcoach operators, or other property-carrying stakeholders. With the potential cost to purchase a new vehicle under the Proposal increasing by $42,000 or more, along with additional costs associated with maintaining the system, and likelihood of increased repair costs and other operational costs resulting from the likelihood of increased derate situations, motorcoach operators will take every measure possible to avoid the need to purchase a new vehicle for as long as possible. This outcome will not only affect air quality, it will also affect safety, with older vehicles remaining on the road. Alternatively, the cost to purchase a new vehicle will force more motorcoach companies out of business. [EPA-HQ-OAR-2019-0055-1308-A1, p.7]

Organization: *American Trucking Associations (ATA)*

ATA has established 12 fleet Guiding Principles that should be considered in the development of HD2027 including:

• Implementation must not result in pre-buys/low-buys/no-buys of new equipment. [EPA-HQ-OAR-2019-0055-1326-A1, p. 5]

If pre-buy and low-buy behaviors occur, the initial emission reductions will be smaller than expected. In other words, if new truck buyers anticipate adverse technological and/or financial impacts, changes in purchase patterns could reduce the anticipated benefits. This highlights the importance of correctly assessing the potential impacts of the rule. [EPA-HQ-OAR-2019-0055-1326-A1, p. 15]

Fleets that purchase new trucks typically to do so on a consistent basis which supports a steady manufacturing schedule, including the labor and supplies needed to produce new vehicles. According to a recent sampling of fleets, 30% of respondents indicated they would not consider pre-buying ahead of a new standard while a majority (54%) indicated they would consider a prebuy depending upon the additional price of a new truck.12 [EPA-HQ-OAR-2019-0055-1326-A1, p. 15]

12. See Appendix A.

Similarly, low-buying after a new standard takes effect was slightly less appealing with 27% of respondents indicating they would not consider a low-buy while 44% would depending upon the additional price. Finally, a no-buy scenario where purchases shift to the used truck market was the least considered approach with 42% of respondents indicating they would not consider this approach. As these results indicate, a large percentage of fleet respondents that purchase new trucks would consider pre-buys or low-buys depending upon the anticipated purchase price increase resulting from the new standard. This highlights the importance of accurately quantifying and minimizing the cost impacts of the proposed rulemaking in order to avoid these adverse impacts. [EPA-HQ-OAR-2019-0055-1326-A1, pp. 15 - 16]

Organization: *Coach USA, Inc. (Coach USA)*

Given the economic challenges still facing the motorcoach industry, any rules that will increase the cost of a new bus by over $40,000, as proposed here (and that will likely also increase vehicle maintenance and repair costs) will counterproductively encourage the continued use of older, less emissions-efficient motorcoaches. Such rules could also have the perverse effect of forcing some motorcoach operators to abandon the business altogether, as many have already done in recent years. The impact could well be more personal cars on the highway, and higher emissions. To prevent these results, EPA needs to be more mindful of the role of motorcoaches in the nation's transportation system and develop emissions rules that balance reasonable emissions goals with the constraints facing our industry. [EPA-HQ-OAR-2019-0055-1307-A1, p. 3.]

Organization: *International Union, United Automobile, Aerospace & International Union, United Automobile, Aerospace & Agricultural Implement Workers of America - UAW Region 1A*

To be effective, the final rule must be: Customer-acceptable. If truck owners and operators choose not to purchase new trucks due to cost or reliability concerns that result from a bad federal rule, older trucks will stay on the roads longer and environment goals will not be achieved. [EPA-HQ-OAR-2019-0055-1062-A1, pp.1-2]

Organization: *National Association of Small Trucking Companies (NASTC)*

The rule applies to manufacturers of heavy-duty vehicles; still, it directly affects the motor carriers that must purchase the vehicles and the drivers who must operate them on the job. As Bloomberg reports, "whether the rule succeeds will be determined by how quickly trucks with the new technologies are sold."3 NASTC has served our sector of the trucking industry for more than 30 years, providing a range of services that facilitate our members' business operations and help them remain competitive. In our estimation based on three decades of experience, the outcome of such dramatic emissions standards is fairly predictable. [EPA-HQ-OAR-2019-0055-1130-A1, p. 5]

> 3. Bloomberg, "Truckers Say This Is the Worst Time for Biden's Plan to Cut Emissions," March 1, 2022. https://www.supplychainbrain.com/articles/34662-truckers-say-this-is-the-worst-timefor- bidens-plan-to-cut-emissions

If the proposed rule, either option, is adopted, many if not most carriers and truckers will opt to keep the vehicle(s) they have for longer than they otherwise would have. Small-business truckers in general cannot afford to buy brand-new power units, which today cost around $140,000. New vehicles complying with the proposed rule as of MY '27 will cost significantly more—reflecting the sophisticated new technologies that enable their engines to meet the new standards and requirements, a period of inflation-fed cost increases, and new technologically complex systems still working out the bugs. So, for the large percentage of carriers having 20 or fewer trucks, the new vehicles will be even less of an option; these carriers will remain in the used heavy-duty truck market. [EPA-HQ-OAR-2019-0055-1130-A1, p. 5]

Organization: *NC Commerce*

History has shown that dramatic changes in emissions standards materially drive costs up. That creates an economic "perfect storm" whereby customers either pre-buy trucks or defer the purchase of new vehicles entirely. Both effectively circumvent the objective of getting new technology on the road. More important, both are highly detrimental to efforts to preserve and grow employment in North Carolina. In other words, there will be a dramatic loss of jobs in

North Carolina (and in America) if the proposed rule by EPA is adopted as written. [EPA-HQ-OAR-2019-0055-1434]

Organization: *North Carolina Assembly House of Representatives, John Faircloth*

We need to avoid an economic “perfect storm” whereby customers either pre-buy trucks or defer the purchase of new vehicles entirely. Both effectively circumvent the objective of getting new technology on the road. More important, both are highly detrimental to efforts to preserve and grow employment. In other words, there will be a dramatic loss of jobs in North Carolina (and in America) if the proposed rule by EPA is adopted as written. [EPA-HQ-OAR-2019-0055-2446, p. 2]

In other words, there will be a dramatic loss of jobs in North Carolina (and in America) if the proposed rule by EPA is adopted as written. [EPA-HQ-OAR-2019-0055-1061-A1, p. 2]

Organization: *NTEA - The Association for the Work Truck Industry*

In response to the Environmental Protection Agency’s (EPA) proposed rule (Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards) published in the March 28, 2022 Federal Register, NTEA – The Association for the Work Truck Industry submits the following comments expressing our concern that the costs associated with these proposed changes would delay the introduction of newer and cleaner trucks and be counterproductive to the goal of decreasing truck emissions. [EPA-HQ-OAR-2019-0055-1164-A1, p. 1]

The EPA proposal would significantly increase the purchase price of a new truck. As indicated, today's trucks that are already 98% cleaner than older trucks. Currently, more than 50% of the trucks operating are pre-2010. An old (pre-2010) truck emits some 30 times more NOx than today's engines. EPA should be incentivizing the sale of current trucks not making them more expensive and creating a disincentive to the replacement of old trucks. [EPA-HQ-OAR-2019-0055-1164-A1, p. 3]

The federal government levies a 12% excise tax on the retail sale of new heavy-duty trucks. This tax would apply to any additional costs associated with compliance to the proposed EPA rules. Placing an additional tax burden on what are primarily domestically manufactured trucks will only serve to disincentivize their sale. The best way to reduce emissions is to incentivize the replacement of the oldest trucks on the road. Making new trucks more expensive – possibly by $40,000 – will guarantee keeping old trucks on the road longer than is healthy for both the environment and the economy. [EPA-HQ-OAR-2019-0055-1164-A1, p. 3]

EPA's proposal would require manufacturers to develop new technology for further NOx reduction at the same time as these manufacturers are trying to develop zero emission advanced fuel trucks like EV's. [EPA-HQ-OAR-2019-0055-1164-A1, p. 3]

Promulgating regulations that would significantly increase the cost of replacing older, less environmentally friendly trucks while forcing manufacturers to divert critical R&D resources away from further development of zero-emissions technology trucks seems counterproductive. [EPA-HQ-OAR-2019-0055-1164-A1, p. 3]

Many localities that face significant air quality concerns are in and around areas of heavy truck traffic, such as ports, warehouses, terminals and urban areas. Because of the economic challenges in many of these places the trucks operating locally are often older. As mentioned, pre-2010 trucks emit significantly more tailpipe emissions than newer trucks. The best and fastest way to improve air quality in these areas is to replace the numerous older trucks with newer and cleaner ones. Unfortunately, regulations that make trucks marginally cleaner but dramatically more expensive than post 2010 trucks will only serve to keep those older trucks in operation longer. [EPA-HQ-OAR-2019-0055-1164-A1, pp. 3 - 4]

What is needed from these regulations are trucks that are affordable, durable and meet the customer's vocational needs. The regulations must not act as a financial barrier to cleaner trucks and ultimately ZEV's. Rather, federal regulations should focus on reducing the current high costs associated with ZEV's and building the infrastructure needed to operate the next generation of work trucks. [EPA-HQ-OAR-2019-0055-1164-A1, p. 4]

EPA has the opportunity to issue a single, nationwide rule that is both reasonable and reduces emissions while allowing manufacturers to continue developing the future of ZEV's. Issuing a rule that is technologically infeasible and increases acquisition costs such that it forces fleets to delay the turnover of their oldest trucks will not help the environment. [EPA-HQ-OAR-2019-0055-1164-A1, p. 4]

Organization: *State Trucker Associations (2)*

As EPA develops the final rule on tailpipe emissions from heavy-duty trucks as part of the "Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards", we file these comments in support of a single national low-NOx rule that is technologically feasible, protects American jobs, and is not disruptive to the nation's economy or supply chains. An approach such as Option 1 that cannot be achieved by all classes of trucks under widely varied business models will cause significant uncertainty among fleets and will result in purchasing new trucks before new standards are implemented. This pre-buy/low-buy/no-buy scenario would jeopardize thousands of good paying jobs and slow environmental success. To be effective, the final rule must result in new trucks that are:

Affordable - If trucking companies choose not to purchase new trucks due to cost or reliability concerns, older trucks will stay on the road longer and environmental goals will not be achieved; [EPA-HQ-OAR-2019-0055-1039-A1, p.2]

Durable - New, more expensive trucks are not purchased to sit in repair bays. Trucks are unproductive pieces of equipment unless they are moving freight; [EPA-HQ-OAR-2019-0055-1039-A1, p.2]

Safe - Safety is a top priority in every trucking operation. Putting off the purchase of the newest equipment will delay the use of the latest safety technologies; and [EPA-HQ-OAR-2019-0055-1039-A1, p.2]

Cleaner - An unworkable rule will delay fleet turnover and impede environmental progress. [EPA-HQ-OAR-2019-0055-1039-A1, p.2]

Fleets don't make trucks - they are consumers that buy trucks. While this rule is directed at manufacturers, it is trucking companies buying new technologies that determine the success or failure in the implementation of every trucking emission regulation. Fleets remain extremely sensitive to the many difficulties involved in running a trucking company - a matter that is especially significant to the 97% of fleets classified as small businesses. [EPA-HQ-OAR-2019-0055-1039-A1, p.2]

[Additional comment by one commenter who joined this mail campaign]: We believe it is equally important to look for solutions that will not jeopardize American jobs too. … Running a trucking operation is extremely difficult and challenging, but trucks are the backbone of our economy and impact every American every single day. Now more than ever, it is incumbent that all the stakeholders work together to find solutions that can and will work for everyone. [EPA-HQ-OAR-2019-0055-1089]

[Additional comment by one commenter who joined this mail campaign]: RITA [Rhode Island Trucking Association, Inc.], whose members move roughly 90% of the state's fright (sic), is comprised primarily of small businesses who operate trucks to perpetuate their businesses. The aforementioned factors are critical to their sustainability and survival, [EPA-HQ-OAR-2019-0025-2051]

Organization: *Truck Renting and Leasing Association (TRALA)*

As we have seen in years past, significant environmental rules tied to a specific model year have led to large pre-buys in the years preceding the adoption of new rules. Pre-buys have led to a boom-and-bust market, as customers do not want to pay for the increased cost and new maintenance requirements associated with the newer environmental regulations. Given the significant increases in purchase costs and operating costs expected from Option 1, TRALA believes that Option 1 will trigger significant pre-buys that could strain the new truck market. This could dramatically hinder the ability of its members to acquire new trucks in the years preceding the new rule, harming small businesses who need new trucks to operate or expand their business. For these reasons TRALA urges the EPA to reject Option 1. [EPA-HQ-OAR-2019-0055-1180-A1, p. 3]

Organization: *United Motorcoach Association (UMA)*

Additionally, buses and motorcoaches significantly reduce emissions by removing private passenger automobiles. Consumers that cannot afford the inevitable fare and charter cost increases will select less efficient means of travel, counterproductive to EPA's goals of reducing overall emissions. [EPA-HQ-OAR-2019-0055-1311-A1, p.2]

Another consideration is the general havoc mandated by the earlier rounds of NOx emissions reductions. [EPA-HQ-OAR-2019-0055-1311-A1, p.2]

Organization: *Worldwide Equipment Enterprises, Inc.*

Secondly, this regulation, like most others, burdens both small businesses and small trucking operations with much higher costs. That additional burden and cost will, therefore, simply keep fleet and individual truck owners from upgrading their existing heavy-duty trucks to the newer, more efficient and environmentally friendly engines and systems that were mandated back in 2014. In fact, this regulation, regardless of which Option is implemented, would have a negative environmental impact because those cost increases would effectively incentivize a truck owner to keep a dirty pre-2014 truck on the road for much longer than would otherwise be the case. [EPA-HQ-OAR-2019-0055-1275-A1, pp.1-2]

Organization: *Retail Industry Leaders Association (RILA)*

EPA should therefore build consensus with market participants in identifying a balance that maintains strong emissions standards over a reasonable length of time for these engines without inducing an overly burdensome cost-increase to owners and operators of vehicles that use heavy-duty engines. Such increases in vehicle price could be especially challenging to owners of smaller fleets, whose operations might be less resilient to significant unanticipated rises in vehicle prices. Furthermore, although EPA acknowledges the potential issues related to reduced fleet-turnover counteracting the intended reduction of pollutants in Section 10.1.3 of its regulatory impact analysis (RIA) for this proposed rule, the Agency also admits that it has not performed analyses to quantify the impacts of such issues. EPA is therefore encouraged to investigate such impacts and incorporate updated findings into its economic impact analysis. [EPA-HQ-OAR-2019-0055-1189-A2, p.4]

EPA Summary and Response

Summary:

Commenters stated EPA underestimated costs and that the technology needed might not be feasible. Commenters stated that the rule will lead to slower reductions in emissions than estimated, and lead to additional tax burden. Some commenters state that we do not fully capture effects on the motorcoach industry.

Response:

Commenters stated that EPA's estimated costs in the proposed rule were too low, and that the price of HD trucks would increase significantly under the proposed regulation. ABA stated that costs to make and maintain the technology needed might not be feasible. AFBF and RILA stated that EPA does not qualitatively explore the sales and emissions effects of potentially underestimating costs. Commenters stated that the increased cost due to the regulation would lead to pre- and low-buy, reduced fleet turnover and associated slower reductions in emissions. NTEA stated that that the proposed rule would lead to higher purchase price of a new truck, which disincentivizes replacement of older, less environmentally friendly trucks, and the increased costs will lead to additional tax burden. NTEA also states that the proposal would require the development of new technology, diverting critical R&D resources away from further development of zero-emission technology. Some commenters, including TRALA, RILA and State Trucker Associations, stated that small business fleets are particularly sensitive to increased prices, with RILA stating that small fleets are less resilient to increases in vehicle prices and ABA stating that the increased costs could force companies out of business. Some commenters stated that pre- and low-buy, and associated reduced fleet turnover, will affect safety due to older vehicles remaining on the road longer.

See our responses to similar comments in section 25.2 of this document. We note that, besides the survey information responded to below, the commenters in this subsection additionally did not provide data or other information to support their assertions. With respect to NTEA's comments about additional tax burden, see our response to similar comments in section 25.2 of this document. With respect to comments about fleet turnover and the impact on zero-emission vehicles, see our response to similar comments in section 25.2 of this document. We note that the safety concerns related to fleet turnover raised by commenters were not safety concerns related to the technology that may be applied beginning in MY 2027 to meet the new emission standards, but rather concerns related to older vehicles remaining on the road longer. We estimate little to no pre-buy and low-buy due to this rule, as further explained in section 25.2 of this document and other documents referenced in our responses there; therefore, we do not expect fleet turnover to impact HD vehicle safety.

TRALA stated that previous rules led to large pre-buy, and, along with Engine and Truck Organizations, that proposed Option 1 will lead to significant uncertainty and pre-buy.

In the EPA study, we find no evidence for pre-buy in Class 8 vehicles ahead of the 2002 implementation. The EPA sales impacts report does find evidence of pre-buy in Class 8 vehicles before the phase in of the 2007/2010 HD rule implementation in 2007 and 2010, though we disagree that there is evidence of "large" pre-buy. There were external factors affecting the market, and economy as a whole, in the lead up to the 2007, especially, and attributing all, or even most, of the decline between 2005 and 2009 to the 2007 HD regulation is not appropriate. See our responses in section 25.2 of this document as well.

ABA, Coach, and UMA stated that EPA costs do not fully capture the cost and economic impact on the motorcoach industry, and these costs will lead to motorcoach operators delaying purchases of new vehicles as long as possible. Commenters also stated that increased costs will lead to increased fares which will lead consumers to choose less efficient means of personal travel, like personal vehicles.

EPA has not conducted an analysis in this rule of the effects on individual sectors such as the bus or motorcoach industry, instead analyzing this rule by heavy-duty vehicle groups. See our response to comments in sections 18.6 and 18.9 for more information.

ATA commented on results of a survey of fleet members, stating that 30% of truck buyers would not consider pre-buying, while 54% say that would, depending on the additional price of a new truck. The survey ATA discussed in their comments consisted of 26 responses, the largest group of which (8 responses) reported not being price sensitive. 5 respondents indicated they would consider pre-buying at an additional price of $5,000 or more, and an additional 4 respondents indicated they would start considering pre-buying at an additional price of $10,000 or more. Similar responses to low-buy were seen in the survey results, where the largest group would not consider it. In the final rule, EPA estimates costs of this rule for Class 8 vehicles to be under $5,000. If the survey results ATA provided are representative of national heavy-duty vehicle buyers, they support our estimates of little to no pre- and low-buy as a function of this rule.

AFBF stated that EPA should collaborate with industry, states, and other affected stakeholders to resolve discrepancies related to technology costs and achievability, warranty impacts, fleet turnover, and environmental impacts. EPA conducted extensive stakeholder outreach in this rulemaking. See Preamble Section I and the introduction of this Response to Comments document for information on the extensive stakeholder input EPA received on the proposed rule. Details on meetings with stakeholders and materials shared with EPA post-proposal can be found in the docket for this rulemaking.[68]

[68] For a complete list of stakeholder meetings post-proposal see "U.S. EPA. Stakeholder Meeting Log. November, 2022.", located at docket EPA-HQ-OAR-2019-0055,

Autocar expressed their concern that the combination of the new NOx standards and the sales volume limitations due to the CARB rule will lead to uncertainty in the volume of engines they will be able to purchase from their supplier, Cummins. Autocar commented that this will also adversely affect their business and customers because Cummins will increase the cost of their engines by as much as $4,000 to $5,000 because Cummins cannot bear all of the cost of meeting the new standards. In addition, Autocar stated that, not being vertically integrated, it is at a disadvantage with respect to development and compliance costs.

We acknowledge Autocar’s concerns regarding potential impacts on their company. EPA is acting on our authority under Clean Air Act section 202(a)(3)(A) for this final rule (see our response in section 25.2 for more information). After considering comments on the proposed rule, we have updated our technology costs per vehicle estimates in the final RIA (see RIA Chapter 7).

26 Employment impacts

26.1 Commenters Supporting our Analysis

<u>Comments by Organizations</u>

Organization: *International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)*

We appreciate the EPA’s willingness to engage with the UAW on heavy-duty and light-duty regulations. It is refreshing that Administrator Regan and his team have made it clear at by their actions that workers have a seat at the table on regulatory matters that have a direct impact on their jobs both now and in the future. The final regulations could have a direct impact on the over 40,000 UAW members working at manufacturing plants building medium and heavy-duty trucks, vocational trucks, commercial vans, school buses and medium and heavy-duty pickup vehicles and parts. Our heavy truck members work in communities throughout the country for major truck manufacturers at assembly, engine, and component manufacturing facilities. UAW members are proud to meet our economy’s diverse trucking needs while incorporating technologies to aid in fuel economy and reduce harmful emissions. [EPA-HQ-OAR-2019-0055-1138-A1, p.2]

Whether the heavy truck industry can achieve such ambitious standards and remain globally competitive will depend in large part on additional policies that promote domestic manufacturing and support quality jobs. The Biden Administration has supported consumer incentives that simultaneously encourage manufacturers to build vehicles in the United States that support great union jobs as well as investing in infrastructure and retooling factories for a successful transition. We agreed with the Biden Administration and are disappointed that the Senate has thus far failed to pass legislation that is needed for a successful transition. Whether it is government support for manufacturing investments, production volumes, government procurement, consumer purchases, or workforce development, all policies should be crafted to promote and strengthen the domestic supply chain for traditional and electrified vehicles that are a source of quality union jobs for American workers now and in the future. [EPA-HQ-OAR-2019-0055-1138-A1, p.2]

Balanced regulations should set a feasible path to address the impact of pollutants and position the U.S. truck manufacturing industry to innovate and lead with clean technologies that improve fuel efficiency, reduce emissions, and advance emerging powertrain technologies like battery electric or fuel cells. This, in turn, would strengthen U.S. competitiveness and ensure stability for the thousands of workers and communities benefiting from quality manufacturing jobs. [EPA-HQ-OAR-2019-0055-1138-A1, p.3]

A significant market disruption can have a devastating impact on workers and the economy. Surrounding communities are also negatively impacted by layoffs as families suddenly have less to spend on housing, car payments, groceries, clothes, and other essential and discretionary items. The potential for layoffs is not limited to worker assembly trucks and buses, the impacts would ripple through the network of manufacturing communities that produce components and materials for the medium and heavy-duty truck industry. [EPA-HQ-OAR-2019-0055-1138-A1, p.4]

EPA Summary and Response

Summary:

The commenter above (UAW) stated that the final regulation could have an impact on many UAW workers at manufacturing plants, and that significant market disruption can be devastating for workers. UAW also stated that significant market disruption can lead to potential layoffs that span from those working in assembly plants and rippling through the community. UAW commented that the regulation should feasibly reduce pollution, lead to innovation, improve fuel efficiency, strengthen US competitiveness, and ensure job stability.

Response:

EPA agrees that this regulation might impact employment at vehicle manufacturing plants, and discusses possible impacts qualitatively and quantitatively in Chapter 10 of the RIA. EPA is unable to estimate effects of this regulation on industries outside of the directly regulated HD engine and vehicle manufacturing industries due to lack of data and appropriate methods. As required by CAA 202(a)(3)(A) for the standards in this final rule, we are setting standards that will result in the greatest emissions reductions achievable through the application of technology beginning in model year 2027 after giving appropriate consideration to costs and other statutory factors associated with the application of such technology. See preamble Sections III and V for additional discussion on feasibility and costs of the final standards, and our assessment of the cost impacts of the final program.

26.2 Commenters who Disagree with our Analysis and Provide Data

<u>Comments by Organizations</u>

Organization: *Daimler Truck North America LLC (DTNA) (1045 and 1168)*

EPA's economic impact analysis is not informed by real world data and, due to fundamental analytical flaws, reflects the Agency's failure to give informed consideration to the likely impacts its Proposed Rule will have on jobs, the cost of goods transportation, the HD transportation market, and the economy more generally. The Agency's analysis of the impacts of the proposed standards on vehicle sales and employment treats these considerations as entirely separate and overlooks the links between the two. Indeed, EPA acknowledges that its employment analysis is divorced from any consideration of how 'demand-effect' impacts of the Proposed Rule will affect firm-level employment, 'due to data limitations.'51 This omission leads EPA to conclude that more costly vehicles and parts will in fact lead to an ***<u>increase</u>*** in manufacturing sector employment, an assertion that ignores how price increases are likely to affect sales and, in turn, the labor market.52 [EPA-HQ-OAR-2019-0055-1168-A1, p.20]

> 51 Proposed Rule, 87 Fed. Reg. at 17,592 (noting that EPA's employment impact analysis is not based upon any projected changes in vehicle sales; rather that EPA's analysis assumes that output would be held 'constant').
>
> 52 Id. (reflecting EPA's projections that increased vehicle and parts costs would be expected to increase employment by 400 to 2,200 job years in 2027 and 300 to 1,800 job years in 2032 under proposed Option 1, and that—for similar reasons—employment would be expected to increase under proposed Option 2 by 400 to 2,200 job years in 2027 and 300 to 1,500 job years in 2032).

Not surprisingly, low-buy years cause the loss of manufacturing jobs. ACT Research reviews the pre-buys that took place in MY 2005 and 2006 ahead of the MY 2007 standards, which precipitated a loss of about 10,000 truck assembly jobs from low-buy in 2007. The 10,000 jobs lost represented a labor decrease of approximately 26% from the previous year, which ACT Research points out is a conservative estimate when compared to the 48% decline in Class 6-8 unit production that took place in 2007. Thus, the 26% reduction in commercial manufacturing jobs may be used to benchmark potential job losses associated with the current Proposed Rule. [EPA-HQ-OAR-2019-0055-1168-A1, p.22]

Organization: *Truck and Engine Manufacturers Association (EMA)*

The market impacts from the expected pre-buy go beyond the number of impacted HD vehicles. Pre-buys also trigger subsequent low-buys or no-buys, which in turn can result in significant layoffs in the vehicle-manufacturing industry and in related market sectors as well. ACT's report analyses and quantifies those reasonably anticipated employment impacts, which, if the Option 1 standards are finalized, would be dramatic. More specifically, and as detailed in the ACT report, the likely layoffs resulting from the pre-buy/low-buy that the costs of the Option 1 requirements will trigger would amount to approximately 220,700 jobs in the aggregate. (See ACT Report, pp. 14-17.) [EPA-HQ-OAR-2019-0055-1203-A1, p. 158]

Organization: *National Association of Chemical Distributors (NACD)*

However, continually adding more aggressive, yet unproven emission requirements to heavy-duty trucks will significantly burden the chemical distribution industry and the American economy as a whole. This is supported by an analysis conducted by NACD economist John Dunham & Associates (JDA), which used the EPA's regulatory impact analysis estimate that calculated the cost of this rule would be between $1.9 and $2.1 billion per year to implement. JDA's economic analysis found that chemical distributors would bear a cost of $429.6 million with a loss of 716 full time equivalent (FTE) jobs in the chemical distribution industry and a loss of over $208 million of economic output if this rule is implemented. When applied to the total economy, this would force a loss of over 3,000 FTE jobs and negative impact of over $675 million of economic output. [EPA-HQ-OAR-2019-0055-1279-A1, p. 2]

EPA Summary and Response

Summary:

Daimler and EMA commented that pre-buy will trigger low-buy, which will lead to significant layoffs in the HD truck industry, pointing out that EPA did not estimate sales effects on employment. These commenters referred to the ACT Research report and the employment analysis discussed within it.

Response:

In response to commenters, EPA has added an illustrative method to estimate a sales effect on employment due to pre- and low-buy in the RIA for the final rule. This method uses an average estimate of job-years per truck produced in the U.S. and focuses on employees in the sectors identified as directly affected by the regulation. Our results indicate that employment effects due to sales effects would be small in magnitude. For more information on methodology and results, see chapter 10 of the RIA.

The ACT Research method referred to by commenters assumes low-buy is an equal but opposite counter to pre-buy. For EPA's response to the assumption that low-buy is equal but opposite to pre-buy, see our responses to the comments in section 25.2. To estimate the effect of low-buy on employment, ACT Research found the change in employment between 2006 and 2007 and divided that by their estimate of pre-buy in 2006 to get an estimate of jobs lost per low-bought truck in 2007. The method used by ACT attributes all changes in employment to low-buy and does not account for any changes that may have occurred in this time frame separate from the 2007/2010 HD rule. This approach by ACT Research thus does not account for factors mentioned in section 25.2 above, like the Federal Reserve increasing interest rates or the official beginning of the Great Recession.

Daimler commented that EPA's analyses are not informed by real world data. For the sales and employment effects estimated in Chapter 10 of the RIA, EPA uses data from many sources, including the Census Bureau, Bureau of Labor Statistics, Wards Automotive Group, Energy Information Administration, Bureau of Economic Analyses and more. In addition, the analyses performed by EPA are informed by peer-reviewed and published literature.

NACD commented that the rule will lead to millions of dollars in cost and economic output to the chemical distribution industry, as well as hundreds of job-years reduced, stating that aggressive, unproven requirements for HD trucks will lead to significant burdens for the chemical distribution industry and the American Economy as a whole. They also commented that there will be thousands of job-years lost to the total economy along with a negative impact of millions of dollars to economic output. In setting the final emission standards, EPA appropriately assessed the statutory factors specified in CAA section 202(a)(3)(A), including giving appropriate consideration to the cost associated with the application of technology EPA determined will be available for the model year the final standards apply (i.e., cost of compliance for the manufacturer associated with the application of such technology). EPA's assessment of the relevant statutory factors in CAA section 202(a)(3)(A) justify the final emission standards.[69] We also evaluated additional factors, including factors to comply with E.O. 12866; our assessment of these factors lends further support to the final rule. EPA acknowledges there are costs to society associated with this final rule; our evaluation of the costs and benefits of the final program concludes that the benefits to society far exceed the costs, as explained in Chapter 9 of the RIA. EPA is unable to estimate the effects of this regulation on industries outside of the directly regulated HD engine and vehicle manufacturing industries due to lack of data and appropriate methods, and we cannot evaluate the NACD estimates because the analysis and data was not provided in the comment.

26.3 Commenters who Disagree with our Analysis

Comments by Organizations

Organization: *Charter Township of Redford*

I have recently learned that your agency has proposed new regulations regarding commercial vehicles emission standards in the U.S. that are intended to reduce emissions by 90%, increase the useful life period by 84%, and increase the emissions warranty period by 500% in 8 ½ years. [EPA-HQ-OAR-2019-0055-1099-A1, p. 1]

While I appreciate your concern for air quality, and your goals to reduce the carbon footprint and safeguard our environment, I fear that such aggressive measures could cripple the commercial vehicle industry, that account for thousands of jobs in my community and many more than that nationwide. [EPA-HQ-OAR-2019-0055-1099-A1, p. 1]

Still suffering the impact of the Covid-19 pandemic, our community has witnessed the closing of many local businesses, an increase in unemployment, a growing number of delinquent tax accounts and water bills, and more and more residents in need of government assistance. This is all too reminiscent of the most recent recession that will already take us another 20 years to fully recover from. The last thing we need right now, is another impediment to employment. [EPA-HQ-OAR-2019-0055-1099-A1, p. 1]

[69] For information on the numeric level and feasibility of standards of the final rule see preamble Section III.

I am NOT writing you today to suggest that you abandon your mission to protect the environment, as I respect and appreciate those efforts very much. I encourage you only to take a more balanced approach in doing so. Give industry the time it needs to retool and adjust, so more jobs aren't lost and more families and communities aren't decimated in the process. [EPA-HQ-OAR-2019-0055-1099-A1, p. 1]

Organization: *American Trucking Associations (ATA)*

ATA has established 12 fleet Guiding Principles that should be considered in the development of HD2027 including:

• Standards should be based upon sound science and account for economic and employment impacts on fleet operators, manufacturers, and suppliers. [EPA-HQ-OAR-2019-0055-1326-A1, p. 5]

Organization: *Engine and Truck Organizations*

Based on our assessment, EPA's "Option 1" rule as proposed will be:

- Bad for jobs. As was caused by previous EPA NOx rules, we anticipate a pre-buy/no buy scenario, that could result in dramatic job losses for our employees. [EPA-HQ-OAR-2019-0055-1177-A1, p.1]

Organization: *Institute for Policy Integrity at New York University School of Law (Policy Integrity)*

EPA should clarify that any employment impacts from the Proposed Rule are likely small and short-lived. EPA should quantify upstream and downstream employment effects, and if it cannot, the agency should at a minimum identify the direction and magnitude of total net employment effects. [EPA-HQ-OAR-2019-0055-1256-A1, p. 2]

Ideally, EPA should quantitatively measure employment effects. Currently, EPA addresses employment effects qualitatively except for the cost effect, as discussed below. If EPA continues to address employment qualitatively, it should at least attempt to give an idea of the direction of the employment impacts and its relative size. [EPA-HQ-OAR-2019-0055-1256-A1, p. 24]

EPA discusses total employment impacts in the manufacturing sector qualitatively, indicating that the impact of the regulation on employment could be positive or negative.132 [EPA-HQ-OAR-2019-0055-1256-A1, p. 25]

> 132. Id. at 420.
>
> But EPA does conduct a quantitative analysis of the cost effect, i.e., the increased employment analysis necessary to adopt technologies needed for trucks to meet the standards.133 For these employment effects, it uses the ratio of workers to production cost for all vehicle manufacturing to imprecisely infer the specific ratio for production

processes related to emission reductions compliance activities in the heavy-duty sector.134 [EPA-HQ-OAR-2019-0055-1256-A1, p. 25]

133. Id. at 425.

134. Id. at 421-22.

Qualitatively, EPA accounts for two additional impacts on employment in the manufacturing sector: the demand effect, i.e., changes in demand for labor in the manufacturing sector due to changes in sales, and the factor-shift effects, i.e., the employment changes due to changes in labor intensity of production resulting from changes in the production process and compliance activities.135 EPA predicts the demand effect to be negative, but since EPA also predicts that the sales impact will be small and indistinguishable from zero,136 this employment effect should also be small and indistinguishable from zero.137 In contrast, EPA cannot even determine the direction of the factor-shift effect on manufacturing employment.138 [EPA-HQ-OAR-2019-0055-1256-A1, p. 25]

135. Id. at 420.

136. See section V.C, supra.

137. EPA misleadingly states that “a demand effect caused by higher production costs raising market prices. Higher prices reduce consumption (and production) reducing demand for labor within the regulated industry.” DRIA at 419. However, this statement ignores the opposing effect of quality improvements later recognized in Section 10.2.2.1. In fact, based on EPA’s own analysis, the net impact on sales is unclear and currently indistinguishable from zero.

138. DRIA, supra note 41, at 420.

Overall, the direction of overall employment effect on manufacturing is unclear. Even so, EPA should attempt to qualitatively determine whether the overall net effect on employment is likely to be small or large, as the former seems more likely due to the small sales effect and the overall unclear direction on manufacturing employment. [EPA-HQ-OAR-2019-0055-1256-A1, p. 25]

In addition, EPA also needs to qualitatively assess the impact of the Proposed Rule on downstream employment. For consumers of heavy-duty trucks (i.e., truckers and trucking companies), the impact is again unclear due to the opposing effects of the cost increase and the presumptive improvement in vehicle quality that leads to the small and essentially zero sales effect.139 A similar logic applies to middlemen, such as dealers and service providers, because the sales effect is likely to be small and indistinguishable from zero. Furthermore, the counter-veiling impacts on competing sources of transportation such as rail and air that would result from any negative impact is a further reason that employment impacts downstream should be small and indistinguishable from zero. We again recommend that EPA discuss the potential magnitude of this impact, particularly given its statement that the agency does not expect transportation mode shifts, again clarifying that the evidence does not support an impact different than zero.140 [EPA-HQ-OAR-2019-0055-1256-A1, pp. 25 - 26]

139. Id. at 426.

140. Id. at 416.

Finally, EPA's analysis fails to discuss the upstream employment impacts of the Proposed Rule. Specifically, it should discuss the impact on the upstream sectors, such as steel or electronic producers.141 As with downstream employment impacts, because the overall impact of vehicle sales is potentially small and close to zero, the impact on upstream employment is again likely small. [EPA-HQ-OAR-2019-0055-1256-A1, p. 26]

141. Id. at 421.

Given the interest in employment effects, EPA should attempt to measure the employment effects quantitively. However, if this is not possible, EPA should at least attempt to qualitatively assess the direction and magnitude of the employment effects. Based on the above assessment, the direction of the employment effect is unclear and likely to be relatively small, though the existing evidence points to a small impact that is either zero or slightly positive. [EPA-HQ-OAR-2019-0055-1256-A1, p. 26]

Organization: *International Union, United Automobile, Aerospace & International Union, United Automobile, Aerospace & Agricultural Implement Workers of America - UAW Region 1A*

To be effective, the final rule must be: Economically viable. If the final rule results in higher costs for manufacturers and fleet owners, manufacturers and small business owners may have no choice but to lay off workers and eliminate jobs. [EPA-HQ-OAR-2019-0055-1062-A1, pp.1-2]

History has shown that dramatic changes in emissions standards materially drive costs up. That creates an economic perfect storm whereby customers either pre-buy trucks or defer the purchase of new vehicles entirely. Both effectively circumvent the objective of getting new technology on the road. More important, both are highly detrimental to efforts to preserve and grow employment. Bottom line: **there will be a dramatic loss of jobs in Michigan (and in America) if the proposed rule by EPA is adopted as written.** [EPA-HQ-OAR-2019-0055-1062-A1, p.2]

Organization: *NC Commerce*

History has shown that dramatic changes in emissions standards materially drive costs up. That creates an economic "perfect storm" whereby customers either pre-buy trucks or defer the purchase of new vehicles entirely. Both effectively circumvent the objective of getting new technology on the road. More important, both are highly detrimental to efforts to preserve and grow employment in North Carolina. In other words, there will be a dramatic loss of jobs in North Carolina (and in America) if the proposed rule by EPA is adopted as written. [EPA-HQ-OAR-2019-0055-1434]

Organization: *U.S. Chamber of Commerce*

The Chamber's America Works Data Center has documented the ongoing worker shortage crisis in detail.8 More than 3 million people have left the workforce since the beginning of the COVID pandemic, and we now have nearly 11.5 million job openings with only 5.9 million unemployed workers. Truck drivers are no exception; the American Trucking Association estimates that the driver shortage has reached an all-time high of 80,000 unfilled jobs.9 These circumstances, combined with EPA's proposal, led United Auto Workers Regional Director Laura Dickerson to warn that the rule will create an economic "perfect storm" resulting in "a dramatic loss of jobs in Michigan and in America if the proposed rule by EPA is adopted as written."10 [EPA-HQ-OAR-2019-0055-1245-A1, p. 4]

> 10. UAW Region 1a comments. Available at https://www.regulations.gov/comment/EPA-HQ-OAR-2019-0055-1062

Accordingly, in light of the ongoing worker shortage crisis, EPA should take extra caution to avoid exacerbating the historic inflation, labor, and supply chain disruptions facing the industry. [EPA-HQ-OAR-2019-0055-1245-A1, p. 4]

Exacerbation of labor shortages. In addition to delayed adoption of safety features, other technological features and amenities found on newer trucks tend to aid in driver recruitment—an important priority due to aforementioned labor shortages. The impact of delayed fleet turnover could therefore become a factor negatively impacting driver recruitment efforts. [EPA-HQ-OAR-2019-0055-1245-A1, pp. 7 - 8]

Organization: *Volvo Group*

Truck sales plummeted in 2007 and 2008 because of the regulation and this behavior led to a reduction in force for Volvo Group UAW-represented production workers in our three truck and engine plants from more than 4600 jobs in 2006 down to only 2300 jobs in June 2008 (before the great recession began) representing a 50% loss of good paying union jobs. These production job losses were not fully recouped until seven years later (i.e., 2014). [EPA-HQ-OAR-2019-0055-1324-A1, p. 4.]

<u>EPA Summary and Response</u>

<u>Summary</u>:

The Engine and Truck Organizations, UAW, NC Commerce and U.S. Chamber of Commerce stated that the proposed rule will lead to a dramatic loss of jobs and reduced fleet turnover. The UAW commented that if the final rule results in higher costs for manufacturers and fleet owners, manufacturers and small business owners may have to lay off workers. The US Chamber of Commerce stated that the EPA should avoid exacerbating historical inflation and the labor and supply chain disruptions facing the industry. The U.S. Chamber of Commerce also stated delayed fleet turnover could negatively impact driver recruitment efforts because the new trucks, and the draw of the technological features and amenities found on them, would not be available to help attract new drivers. Volvo commented that reduced truck sales in 2007 and 2008 were due to EPA regulation, and that they led to job losses in Volvo's UAW-represented production workforce that were not recouped until about 7 years later. Charter Township of Redford stated that the aggressive proposal could lead to many job losses. The commenter pointed out similarities in the effect Covid-19 and the most recent recession had on their community, and stated their hope to avoid another impediment to employment. The commenter asked EPA to take a more balanced approach to the proposed regulation and give the industry time to retool and adjust to prevent job loss. The US Chamber of Commerce stated that the EPA should avoid exacerbating historical inflation and the labor and supply chain disruptions facing the industry. ATA stated that "standards should be based upon sound science and account for economic and employment impacts on fleet operators, manufacturers, and suppliers."

Response:

As required by CAA section 202(a)(3)(A) for the emission standards in this final rule, we are setting technology-forcing standards. In setting the final emission standards, EPA appropriately assessed the statutory factors specified in CAA section 202(a)(3)(A), including giving appropriate consideration to the cost associated with the application of technology EPA determined will be available for the model year the final standards apply (i.e., cost of compliance for the manufacturer associated with the application of such technology). EPA's assessment of the relevant statutory factors in CAA section 202(a)(3)(A) justify the final emission standards. See preamble Sections III and V for additional discussion.

EPA's analyses of the cost effects of this final rule on employment indicate that employment effects are expected to be small, as explained in Chapter 10.2 of the RIA. In the final RIA, we also include an illustrative analysis of the demand effect on employment.[70] These illustrative results also indicate that employment effects are expected to be small. EPA analyses of employment and other economic impacts are transparent, reproducible, and are "based on the best reasonably obtainable scientific, technical, and economic information available," in compliance with OMB Circular A-4.[71] With respect to the commenter's statement that delayed fleet turnover will lead to new negative impacts on driver recruitment efforts, to the extent that this might happen, EPA does not expect significant impacts on fleet turnover. EPA estimates pre- and low-buy would be small in magnitude and short lived, and therefore effects on fleet turnover would be small and short-lived as well. See Chapter 10.1.3 of the RIA for EPA's discussion of

[70] The demand effect on employment analysis added to the final RIA is presented as illustrative because it is based on the illustrative sales analysis discussed in section 25 of this document, as well as in Chapter 10.1 of the RIA.
[71] OMB Circular A-4 (found at https://obamawhitehouse.archives.gov/omb/circulars_a004_a-4/#d) provides guidance to Federal Agencies on the development of regulatory analyses as required under Executive Order 12866.

fleet turnover. In addition, there are factors outside the scope of this rulemaking that could impact driver retention, including job quality, driver pay and driver benefits, and EPA does not have data, and the commenter did not provide data, to support that fleet turnover is a predominant factor in driver retention.

In response to Volvo's assertion of the decrease in sales and associated employment effects in 2007 and 2008, EPA points out that there were external factors affecting the market and the economy as a whole at that time, including the Great Recession which officially began at the end of 2007.[72] Attributing all, or even most, of the decline in sales, and associated employment losses, in those years to the 2007 HD regulation is not appropriate. See also our response regarding similar comments in section 25.2 of this document.

The Institute for Policy Integrity at New York University School of Law (IPI) commented that EPA should clarify that employment impacts are likely small and short lived, as well as quantify, or at least identify the direction and magnitude on total net employment of, the upstream and downstream employment effects. IPI also commented that the statement in the proposal "a demand effect caused by higher production costs raising market prices. Higher prices reduce consumption (and production) reducing demand for labor within the regulated industry" is misleading. The commenter stated that this statement ignores the opposing effect of quality improvements recognized later in the draft RIA, and that the net impact on sales in unclear and indistinguishable from zero. IPI requested that EPA attempt to qualitatively determine if the net employment effect will be small or large. IPI stated that the direction of employment effects is unclear, and likely to be relatively small, pointing out that existing evidence indicates a small impact, ranging from zero to slightly positive.

In RIA Chapter 10.2, we are clear that our employment estimates are only partial employment effects, and that we are uncertain as to the magnitude or direction of full employment effects. In addition, we are unable to estimate upstream or downstream impacts due to data and methodology being unavailable. EPA does not agree with IPI that the draft RIA discussion about how higher prices can lead to reduced labor demand is misleading and ignores the effect of quality improvements. We are clear in the RIA that the demand effect is a result of the change in cost, ignoring other effects, which includes changes in quality. Later in Chapter 10.2 of the RIA, we qualitatively discuss how quality changes might impact employment effects.

26.4 Commenters Providing Information on Employment Effects due to Electrification

Comments by Organizations

Organization: *CALSTART*

CARB's macroeconomic analysis of the ACT found the policy would result in a net increase of over 7,000 jobs in California through 2040 (CARB, 2019a). In an examination of labor requirements associated with manufacturing combustion passenger vehicles compared to a

[72] https://www.nber.org/news/business-cycle-dating-committee-announcement-december-1-2008

similar battery electric vehicle, one study found nearly identical per vehicle labor hours associated with battery electric vehicle manufacturing as combustion vehicles. This finding indicates the commonly held belief that battery electric vehicles are less labor intensive is inaccurate (Küpper, 2020). [EPA-HQ-OAR-2019-0055-1313-A1, p.8]

Organization: *Lion Electric Co. USA Inc. (Lion)*

Lion supports the expected job growth associated with the proposed Options 1 and 2. As Lion grows, we continue to expand our team of change-makers dedicated to transforming the future of transportation. Our Joliet factory will initially provide over 750 clean energy jobs in a field that is in high demand, as states across the U.S. introduce laws to deploy more zero-emission vehicles in the next decade. In the next four years, we expect that this plant will add over 1,400 jobs that will create an abundance of economic opportunities in clean manufacturing for local communities. Lion will directly contribute to reducing unemployment in Joliet, thereby strengthening the local economy. In addition, Lion will continue to create jobs in our nationwide Experience Centers with a focus on hiring locally and training technicians to provide service and support to a variety of clients. These are stable, well-paying positions in a growing industry that will have long-term sustainability as the electric vehicle sector continues to expand. By implementing programs that facilitate the switch to ZEVs, the EPA can help boost projected job growth across OEMs in the field of electrification, while meeting its primary goal of reducing air pollution in the United States. [EPA-HQ-OAR-2019-0055-1151-A2, pp. 3 - 4]

Organization: *Moving Forward Network (MFN)*

Labor and those working in the freight sector (including truckers, equipment operators, warehouse and logistics workers, and others) are essential constituents in the quest for a just transition to a cleaner energy economy, air quality improvements, zero emissions, and climate mitigations. Many workers not only work in industries (such as trucking) that expose them to toxics and impact their health, but they also live in communities disproportionately bearing the burdens of pollution. Regulations to strengthen emission standards as well as further zero emission trucks need to account for more than just the effects of the policy on job growth. Standards should include an economic analysis of the proposed regulation and alternatives as well as include provisions to ensure that these increases in jobs are coupled with labor standards to ensure that workers are benefiting by more than just access but quality of job. [EPA-HQ-OAR-2019-0055-1277-A1, p. 37]

MFN provided a detailed analysis in our Making the Case for Zero-Emission Solutions in Freight151 report on the economic benefits of zero emissions for different labor sectors through the freight transportation system, including manufacturing, maintenance, etc. MFN found that if money and resources were prioritized for the commercial fleet infracture, the job creation alone from direct and indirect work would be at around 30,000 additional jobs by 2037 (Figure 4). This estimate far outweighs the claims that under the current structures of the rule EPA could be affecting jobs. [EPA-HQ-OAR-2019-0055-1277-A1, p. 37]

151. https://www.movingforwardnetwork.com/wp-content/uploads/2021/10/MFN_Making-the-Case_Report_May2021.pdf

A strong ZEV sales requirement coupled with the emission standard has the potential to achieve one of the goals of the Biden administration to develop domestic manufacturing jobs. A new report from SAFE highlights the potential for more than 270,000 jobs “through investment in transportation manufacturing grants and tax incentives” and nearly 154,000 jobs through “incentives that make it cheaper to buy medium and heavy-duty electric vehicles, like trucks and buses.” [EPA-HQ-OAR-2019-0055-1277-A1, p. 37]

Many of the components that make up an MHD internal combustion engine (ICE) vehicle are the same as a ZEV. However, there are key electric drive components that differentiate a ZEV, such as battery packs, electric motor, inverters and converters, along with other electrical parts. These various components, from materials sourcing, to design, to assembly, all make up the long list of sub-segments within the ZEV manufacturing segment of the supply chain. [EPA-HQ-OAR-2019-0055-1277-A1, p. 38]

ERM’s analysis found that a national ACT-style rule combined with a federal NOx standard that aligns with the Heavy-Duty Omnibus rule would generate a 63,000 net increase in jobs and net GDP growth of over $10 billion by 2035.153 Importantly, the average wages for the new jobs created are roughly double the average wages of those replaced. [EPA-HQ-OAR-2019-0055-1277-A1, p. 38]

153. Robo et al. 2022, p. 4.

Organization: *National Coalition for Advanced Transportation (NCAT)*

The growth in the electric vehicle industry has created jobs and will continue to do so. About 10% of the employees in the motor vehicles and component parts sector (including manufacturing, repair and maintenance, and professional services) work on alternative fuel vehicles.40 Component parts manufacturing employs nearly half a million people in jobs that work on increasing fuel economy in the United States.41 The domestic manufacturing of alternative fuels vehicles and hybrids grew from 2018 to 2019 in most technologies, with electric vehicles adding 6,200 manufacturing jobs.42 The jump was even greater in 2020: electric and hybrid electric vehicle employment grew more than 6% from 2019, adding over 12,000 new jobs.43 This was the largest jobs increase of any clean energy category.44 One study found that the electric vehicle industry (defined broadly to include professional services, management, personal services, etc.) in California employed 275,600 people in 2018, and these jobs grew an average of 2.9% per year (2010-2018).45 Securing America’s Future Energy estimates that updating fuel economy standards and sustaining emission reductions over five years will lead to the creation of 60,378 new jobs nationwide.46 [EPA-HQ-OAR-2019-0055-1290-A1, pp. 8 - 9]

Organization: *WE ACT for Environmental Justice*

Moreover, the transition supports employment opportunities economy-wide. The current workforce and communities most affected by disinvestment, climate change and generations of environmental degradation must and deserve to benefit, accessing potential jobs across the electric vehicle supply chain and opportunities to build community wealth. An analysis found that electrifying cars and trucks by 2035 would produce over 2 million jobs.29 Again, this emphasizes the importance of the EPA to create the regulatory conditions to transition to 100% zero-emission medium- and heavy-duty vehicle sales by 2035. As outlined in our Green Jobs Report,30strategic interventions such as workforce development and STEM training are necessary to help displaced workers, people of color, and under- and unemployed residents in disadvantaged communities earn the relevant technical skills to access and retain family-sustaining jobs in the clean energy and electric transportation industry. [EPA-HQ-OAR-2019-0055-1347-A1, p.6]

Organization: *Zero Emission Transportation Association (ZETA)*

HDV electrification is also precipitating tremendous job creation. A 2019 study found that in California alone, policies designed to electrify HDVs could generate 1.31 million more job-years than the status-quo policies.10 The charging infrastructure necessary to accommodate this transaction could alone create more than 29,000 jobs across the country.11 [EPA-HQ-OAR-2019-0055-1283-A1, p.3]

10 https://calstart.org/wp-content/uploads/2022/02/ZIO-ZETs-Report_Updated-Final-II.pdf

11 https://secureenergy.org/the-commanding-heights-ofglobal-transportation-quantifying-the-employment-effects/

Relatedly, the transportation industry is also experiencing considerable shortages of available truck drivers, and HDV electrification could ameliorate this crisis. The trucking industry is an estimated 80,000 drivers short, with many long-term employees citing stress as a reason for quitting.12 This trend is expected to worsen by 2030 as the industry struggles to meet the growth in freight demand.13 Drivers consistently report higher satisfaction with the EV driving experience compared to fossil fuel-powered vehicles, however, and trucking is expected to benefit from the same trend. EVs provide a smoother ride with minimal vibrations, less noise pollution, and a high-tech driving experience free from the fumes of diesel exhaust.14 As a result, the health benefits associated with eliminating diesel fume inhalation and improved experience from a quieter drivetrain may reduce healthcare costs and increase driver retention.15 [EPA-HQ-OAR-2019-0055-1283-A1, p.3]

EPA Summary and Response

Summary:

Commenters including CALSTART, MFN, NCAT, WE ACT, and ZETA cited published studies indicating that there could be job growth with increasing electric vehicle production. ZETA went on to say that electrification can help reduce truck driver shortages due to the improved experience of driving a HD electric vehicle over driving the ICE counterpart, as well as leading to reduced healthcare costs and increased driver retention. In their comment, Lion supported the expected job growth under the proposed Options 1 and 2, and discussed the clean energy jobs they are planning on introducing over the next decade. Lion stated that by implementing programs that facilitate the switch to ZEVs, EPA can help job growth in the field of electrification, and reduce air pollution. MFN stated that regulations that further zero emission trucks need to account for more than the effects of the policy on job growth, but should include provisions that ensure that growth is paired with labor standards to lead to improvements in both job access and quality. They also stated that many of workers, including those in trucking, work in industries that expose them to pollutants that impact their health, but also live in communities that disproportionately bear the burden of pollution.

Response:

EPA appreciates the information provided on the possible effect that increasing the penetration of electrified vehicles in the heavy-duty market might have on jobs. Since the final standards are not based on projected utilization of ZEV technology, we have not incorporated additional production of ZEV technologies into our assessments of the impacts of the final rule; therefore, these comments are outside the scope of this final rule.[73]

27 This Section is Blank

28 Proposed changes to HD Phase 2 GHG program

28.1 Zero Emission Vehicle (ZEV) Penetration rates for MY 2027, 2028, and 2029

28.1.1 Support Proposed Standards or More Stringent

Comments by Organizations

Organization: *Advanced Engine Systems Institute (AESI)*

AESI supports EPA's decision to revisit the Phase II GHG standards and propose that they be tightened to reflect the pace of electrification. [EPA-HQ-OAR-2019-0055-1281-A1, p. 2]

Organization: *Air Products and Chemicals, Inc. (Air Products)*

While Air Products applauds EPA's regulatory effort to reduce NOx and greenhouse gas emissions from heavy-duty vehicles, we do not believe the proposed regulation goes far enough with respect to zero-emission vehicle (ZEV) technologies in light of truck manufacturer developments and the number of states adopting the California Advanced Clean Truck (ACT) regulations, which stipulate an implementation schedule for the introduction of ZEV trucks – including both hydrogen fuel cell electric vehicles (FCEV) and battery electric vehicles (BEV) – into the commercial market. [EPA-HQ-OAR-2019-0055-1166-A1, p. 1]

[73] See preamble Section III for discussion on the technology pathway we evaluated for complying with the final standards. Manufacturers may choose to comply with the standards through using other technologies, including ZEV technologies.

The scientific community agrees that hydrogen must play an important role in decarbonizing heavy-duty transportation, because of its unique ability to deliver the performance characteristics needed for this class of vehicles. Heavy-duty FCEVs are exceeding heavy-duty battery electric vehicle performance, including faster refuel times, longer range, and larger payloads, while performing better in extreme climate conditions. Without hydrogen powered fuel cell drive trains, the supply logistics of many of these markets will have to change considerably. Hydrogen as a transportation fuel most closely mirrors the traditional transportation fuel experience and when deployed at scale, hydrogen FCEVs provide cost savings on a total cost of ownership basis for most single vehicles and fleet applications. [EPA-HQ-OAR-2019-0055-1166-A1, p. 2]

The last few years have seen considerable commercial development in fuel cell transportation and hydrogen fueling. Today, over 13,000 light-duty fuel cell electric consumer vehicles have been sold in California, accompanied by dozens of fuel cell electric buses in revenue service across the country, and a growing deployment of medium- and heavy-duty vehicles for long-haul transport and delivery services, including customers like DHL, UPS, and FedEx. [EPA-HQ-OAR-2019-0055-1166-A1, p. 2]

The Biden Administration in 2021 established significant goals to reduce greenhouse gas emissions from the transportation sector to address global warming. These include the January 2021 Executive Order which initiated a Federal Clean Vehicle Procurement Strategy that directed federal officials to develop plans to convert all federal fleets to zero emission vehicles, including Postal Service vehicles. President Biden's American Jobs Plan includes $15 billion to fund deployment of a national network of 500,000 public chargers for electric vehicles by 2030. In further support of the deployment of zero emission vehicles nationwide, US DOT announced in April 2021 its latest round of Alternative Fuel Corridor designations established by the FAST Act of 2015. This program recognizes highway segments that have infrastructure plans to enable travel on alternative fuels, including hydrogen. Cumulative designations for all fuel types (electric, hydrogen, propane, natural gas) include 134 Interstates and 125 US highways/State roads, covering almost 166,000 miles of the NHS in 49 States plus DC. [EPA-HQ-OAR-2019-0055-1166-A1, p. 2]

The initiatives above are in addition to the bold initiatives of California and New York to eliminate sales of internal combustion engine vehicles starting in 2035 for all classes of on-road vehicles. California's light-duty ZEV program is also currently being implemented in 15 other states. In addition, the Advanced Clean Truck (ACT) regulations adopted by California and several other states focus on requiring manufacturers to supply increasing numbers of M/HD ZEVs to the market, including hydrogen FCEVs. Moreover, President Biden signed an executive order in August 2021 setting the goal of 50 percent of all new vehicle sales for light, medium and heavy-duty vehicles be zero emission vehicles in 2030. This action was supported by announcements from GM and Ford of their plans to sell 40 percent to 50 percent zero-emissions vehicles by 2030. GM has said it will sell only electric vehicles by 2035. [EPA-HQ-OAR-2019-0055-1166-A1, p. 2]

As the White House American Jobs Plan May 2021 statement urged, "now is the…time for long-term transformative investments." Instead, the proposed update to the EPA heavy-duty engine standards regulation supports a slow walk to zero-emission vehicles, allowing new low emission, internal combustion engine vehicles to remain acceptable through 2030. Zero emission vehicles simplify or eliminate many of the current and proposed EPA regulations related to controlling emissions under a broad range of engine operating conditions and maintaining emission control over a greater portion of an engine's operational life. With zero emission vehicles, the EPA no longer needs to police vehicle exemptions and deterioration of vehicle life-time performance, and non-compliance resulting from non-certified engines that are introduced into the market can be eliminated. [EPA-HQ-OAR-2019-0055-1166-A1, pp. 2 - 3]

In recognition of the rapidly expanding adoption of zero-emission vehicle requirements across the country and the potential regulatory program enforcement benefits associated with their introduction, Air Products strongly recommends that the US EPA accelerate the deployment of zero emission vehicles, including fuel cell electric vehicles, and more closely align its proposed regulation with the ZEV goals initiated by the Biden Administration and heavy-duty ZEV regulations being adopted by California and other individual states across the country. [EPA-HQ-OAR-2019-0055-1166-A1, p. 3]

Given our global experience in these areas, Air Products been a resource for policy development in many leading jurisdictions. We look forward to greater coordination and collaboration with US EPA and other federal agencies on hydrogen fuel cell vehicle infrastructure deployment going forward. [EPA-HQ-OAR-2019-0055-1166-A1, p. 3]

Organization: *American Council for an Energy Efficient Economy (ACEEE)*

In the original Phase 2 rulemaking EPA projected no EV sales and noted that the model year (MY) 2027 standards were achievable with improvements in internal combustion vehicle (ICV) technology alone. However, EV sales and developments in EV technology have grown rapidly since the rule was adopted and these changes have the potential to significantly decrease the GHG benefit of the rule, by allowing ICVs to lag in performance, or even backslide. Thus, EPA should increase rule stringency to deliver at least the same improvements in ICVs as the original rule expected to deliver, while considering the emissions reduction benefits of an increase in EV market share. Increasing the stringency of the proposed rule by the expected EV market share will not only prevent unnecessary losses in GHG reductions but also preserve manufacturer freedom to choose between ICV improvements or even faster electrification to comply with the rules. [EPA-HQ-OAR-2019-0055-2852-A1, p.2]

In the proposed rulemaking EPA projects that EVs will reach 1.5% of the combined vocational and day cab markets in 2027 (p.17601)1. This projection is based upon heavy-duty sales data that shows that California accounts for 3.1% of the national HDV market2 (p17600-17601), Advanced Clean Truck (ACT) rule requirements and assumptions on California's share of the total EV market ix (p.17601). [EPA-HQ-OAR-2019-0055-2852-A1, p.3]

1 All page numbers refer to this rules NPRM, unless otherwise noted.
2 As discussed further below, however, we find this to be an implausibly low market share for California.

ix Ben Sharpe and Claire Buysse, 'Zero-Emission Bus and Truck Market in the United States and Canada: A 2020 Update' (ICCT, May 21, 2021), https://theicct.org/publication/zero-emission-bus-and-truck-market-in-the-united-states-and-canada-a-2020-update/.

The adoption of the ACT rule in additional states will have a significant effect on the heavy-duty EV market. To date this rule has been adopted by 6 states *x* and is in the process of being adopted in Connecticut *xi*. Based on EPA's California sales projection and these states' own analyses of the ACT rule, ACEEE estimates that the states that have already adopted the ACT represent at least 6% of the HDV sales market (see Appendix A). [EPA-HQ-OAR-2019-0055-2852-A1, p.3]

> x State of Oregon, 'DQC Approves Clean Trucks Rule, a Significant Move toward Fighting Climate Change and Protecting Human Health,' State of Oregon Newsroom, November 17, 2021, https://www.oregon.gov/newsroom/Pages/NewsDetail.aspx?newsid=64571; Department of Ecology, 'WAC 173-423-400,' Washington State Department of Ecology, November 29, 2021, https://ecology.wa.gov/Regulations-Permits/Laws-rules-rulemaking/Rulemaking/WAC-173-423-400; Edmund Coletta, 'MassDEP Files New Regulations to Reduce Emissions, Advance Market for Clean Trucks in the Commonwealth | Mass.Gov,' December 30, 2021, https://www.mass.gov/news/massdep-files-new-regulations-to-reduce-emissions-advance-market-for-clean-trucks-in-the-commonwealth; Lawrence Hajna and Caryn Shinske, 'NJDEP - News Release 21/P043 - DEP Commissioner LaTourette Announces Adoption of Clean Truck Rules, Setting New Jersey on Path for Zero-Emission Vehicle Future,' Department of Environmental Protection, accessed May 4, 2022, https://www.nj.gov/dep/newsrel/2021/21_0043.htm; NY Press Office, 'Governor Hochul Announces Adoption of Regulation to Transition to Zero-Emission Trucks,' New York State, December 30, 2021, https://www.governor.ny.gov/news/governor-hochul-announces-adoption-regulation-transition-zero-emission-trucks.

> xi 'AN ACT CONCERNING EMISSIONS STANDARDS FOR MEDIUM AND HEAVY-DUTY VEHICLES,' Pub. L. No. Bill No. 931 (2021), https://www.cga.ct.gov/2021/fc/pdf/2021SB-00931-R000218-FC.PDF.

Given these market shares, ACEEE estimates that required EV sales in the states that have already adopted the ACT will account for at least 1% of all HDV sales nationally in MY 2027. Additionally, as the NPRM analysis rightly anticipates (p.17601), the ACT rule will also spur EV sales outside of ACT adopting states, albeit at a slower rate. Assuming that EV sales share in non-ACT states is at least 15% of that of ACT states, EV sales will be 3.5% nationally at a bare minimum in MY 2027. The 1.5% EV sales share in the NPRM underestimates the EV market share by more than a factor of 2 and, therefore, fails to take advantage of the emissions reductions made possible by growing EV sales, potentially allowing ICVs to improve at a slower rate than intended under the Phase 2 standards. [EPA-HQ-OAR-2019-0055-2852-A1, p.3]

EPA requests comment on additional increases in stringency for 2028 and 2029, correctly noting (17419) that there is information to support higher HDV EV share in those years. ACT requirements will increase to 40% for class 4-6 vocational vehicles, and 25% for class 2b-3 and all class 7-8 vehicles, in MY 2029 *xii*, and consequently the EV share in ACT states will account for 3% of the HDV market by MY 2029. Continuing to increase stringency through MY 2029 is vital to setting the stage for the next round of rule making, especially given the rapid growth in EVs that is expected in these years. Neglecting to increase stringency during these years would lower the baseline for standards in MY 2030 and lead to a growth in credits that would hinder the adoption of appropriately stringent standards. ACEEE projects national EV sales in MY 2029 of no less than 6.5%. Estimated nationwide EV sales are summarized in Table 1. [EPA-HQ-OAR-2019-0055-2852-A1, p.4]

> xii CARB, 'Advanced Clean Trucks Fact Sheet',' California Air Resources Board, June 25, 2020, https://ww2.arb.ca.gov/resources/fact-sheets/advanced-clean-trucks-fact-sheet.

Importantly, California's projected 3.1% share of national heavy-duty sales in 2027 shown in the EPA proposal (p. 17600) is surprisingly small. California HDV registrations accounted for 10% of national tractor registrations in 2020 *xiii*. We understand that California's share of HDV sales does in fact trail registration share, but the disparity shown in the NPRM figures is very large. Furthermore, the dollar value of medium- and heavy-duty vehicle sales in California was 6.9% of the national total in 2021 *xiv*. Given that California EV sales were calculated as a fixed (ACT-mandated) percentage of all heavy-duty sales in California, low heavy-duty sales projections would result in an underestimate of EV sales. This concern is compounded by the fact that several ACT states scaled their sales to California's reported sales based on truck VMT. Using the states' calculations from their rule adoptions as discussed above leads to the conclusion that the non-California ACT states account for about 3.5% of the HD market, when one would expect them instead to account for 12% based on statistics such as registrations *xv*. Given that the NPRM's own analysis of EV sales is based upon scaling California's projected sales to its share of EV registrations (p.17601), it is worth noting that only looking at registrations would instead lead to nationwide EV sales of 5% in MY 2027. [EPA-HQ-OAR-2019-0055-2852-A1, p.4]

California is also in the process of adopting the Advanced Clean Fleets (ACF) rule, which will enforce a Zero-Emission Vehicle (ZEV) mandate on fleets operating in the state *xvi*. This rule will create a ZEV mandate for many new vehicle registrations, preventing non-compliant out of state vehicles from being registered in California. This will likely bring California's share of sales closer to its share of registrations and affect the projection of EVs as a percentage of the national heavy-duty market in 2027. Thus, it is crucial that EPA base its EV projections for the final rule on consistent, up-to-date data on state heavy-duty vehicle markets. [EPA-HQ-OAR-2019-0055-2852-A1, p.4]

> xvi CARB, 'Advanced Clean Fleets,' California Air Resources Board, 2022, https://ww2.arb.ca.gov/our-work/programs/advanced-clean-fleets

EPA proposes to increase GHG emissions stringency by 1.5% for MY 2027 vocational vehicles and day cab tractors based on its projection of 1.5% EV sales share among these vehicles in MY 2027. EPA, however, proposes an exclusion that carveout that reduces this stringency by half. EPA excludes spark ignition (SI) vocational vehicles from the increase in stringency, proposing that all vocational EVs be certified under the compression ignition (CI) standard, while noting that SI and CI vocational vehicles belong to the same averaging set. However, strengthening standards by 1.5% for only a subset of vehicle types fails to reflect the emissions benefits gained by the 1.5% EV sales share that EPA projects across all vocational vehicles and day cabs. SI vehicles account for 60% of class 4 vocational vehicles, and more than 30% of class 5 and 6 vehicles *xvii*. As a result, applying the proposed improvements to just the CI vehicles effectively halves the stringency increase for vocational vehicles to under 1% on average. [EPA-HQ-OAR-2019-0055-2852-A1, p.5]

> xvii Dana Lowell and Jane Culkin, 'Medium- & Heavy-Duty Vehicles: Market Structure, Environmental Impact, and EV Readiness' (EDF, n.d.), https://www.edf.org/sites/default/files/documents/EDFMHDVEVFeasibilityReport22jul21.pdf.

If EPA excludes SI vehicles from stringency increases in the final rule, the standards for CI vehicles must be strengthened further to account for the SI market share of each vehicle class. This requires projecting the CI/SI sales split into the future and considering how electrification may change this split. ACEEE recommends that EPA instead increase emission stringency for both SI and CI vehicles, which avoids the need to correct for SI market share. This stringency increase should also be tailored to expected EV sales, which we have already noted is currently underestimated in the proposal. The stringency increase for both CI and SI vehicles, therefore, should not be under 3.5%. [EPA-HQ-OAR-2019-0055-2852-A1, p.5]

EPA does not propose any changes in Class 2b-3 vehicle emission standards, nor do they provide evidence that these vehicles are less likely to be electrified over the life of the rule. As of this point in time GHG emissions from Class 2b-3 pickup trucks and vans are regulated under the heavy-duty standards alone. EPA has discussed potentially regulating these vehicles as light-duty vehicles (P. 17417), however there are no proposals on the table to do so yet. EPA should include them in any and all rule updates. Excluding them without reason misses the opportunity and the need to hold them to more appropriate standards. Should EPA decide to include these vehicles in future LD regulations, they can then amend the HDV regulations accordingly. [EPA-HQ-OAR-2019-0055-2852-A1, p.5]

Until this point, our comments have focused on improving EV sales projections and the corresponding stringency increases, and ensuring that the rule does not allow ICV performance to degrade. The Phase 2 GHG emission program, however, is meant not merely to reflect real-world technological trends, but to push them further to achieve greater GHG reduction. Simply updating EV sales estimates and rule stringency to recognize current state commitments to vehicle electrification, will not push developments in ICV technology or EV sales as far as feasible or as fast as needed to meet broader climate goals. [EPA-HQ-OAR-2019-0055-2852-A1, p.6]

In addition to the states that have already adopted the ACT rule, 10 other states are parties to a Memorandum of Understanding committing to rapid electrification of heavy-duty vehicles. Strong federal standards would help encourage these states to adopt the ACT, which would push the market further and set the stage for stronger standards in MY 2030 and beyond. [EPA-HQ-OAR-2019-0055-2852-A1, p.6]

Likewise, many manufacturers have announced accelerated schedules for heavy-duty EV production, with several companies announcing targets of 50% worldwide electrification by 2030, including Volvo and Scania *xviii*. Vehicle standards of comparable ambition would provide crucial support for these leading companies and ensure that their targets can be met in the U.S. market. [EPA-HQ-OAR-2019-0055-2852-A1, p.6]

> xviii Scania, 'Scania's Electrification Roadmap,' Scania Group, November 24, 2021, https://www.scania.com/group/en/home/newsroom/news/2021/Scanias-electrification-roadmap.html; AB Volvo, 'Volvo Trucks Launches Electric Truck with Longer Range,' Volvo Group, January 14, 2022, https://www.volvogroup.com/en/news-and-media/news/2022/jan/news-4158927.html.

Historically, EPA has developed proposals for vehicle standard stringency using analysis of technology cost-effectiveness, among other considerations. Yet no up-to-date analysis of heavy-duty EV ownership cost parity appears in the proposal. A recent National Renewable Energy Laboratory (NREL) study found that EVs will make up 42% of the medium-duty (MDV) and HDV market share by calendar year 2030, based on a lower total cost of ownership for more EV types *xix*. This finding suggests that EPA could feasibly set standards that decrease emissions in new vehicles by 20% in MY 2027 and linearly increase to 40% in MY 2029, compared to the current standards; either by increased EV sales or even greater improvement to ICV performance. This is supported by the NREL study, which predicts that many EVs will become cost competitive by MY 2027 *xx*. The NREL study additionally suggests that EVs could rapidly grow in cost performance and market share even as ICVs continue to improve efficiency, undercutting arguments that one must come at the expense of the other *xxi*. This rate of electrification is also roughly consistent with the ACT requirements, supporting EPA standards consistent with the year-by-year EV sales shares required by the ACT on a nationwide basis. [EPA-HQ-OAR-2019-0055-2852-A1, p.6]

xxi Catherine Ledna et al., ‘Decarbonizing Medium-& Heavy-Duty On-Road Vehicles: Zero-Emission Vehicles Cost Analysis’ (NREL, March 2022), https://www.nrel.gov/docs/fy22osti/82081.pdf.

Such ambitious actions are necessary to deliver the progress on ICV efficiency and EV adoption to meet broader climate goals. Global warming is a critical threat to our nation and we need to limit the increase in global average temperatures to less than 2°C. Research from the International Council for Clean Transportation (ICCT) suggests that mild increases in rule strigency are not enough to have an impact. Accounting for the fact that vehicles sold today will remain on the roads for over a decade, and their GHG emissions much longer, HD ZEV sales must reach at least 20% in MY 2027 and 50% in 2030% *xxii*. ICCT’s estimates are summarized by vehicle class and type in Table 2. These sales numbers are excedingly close to levels that NREL and industry actions suggest are possible. For this reason ACEEE suggests that EPA increase average strigency by 19% in MY2027 and increase this linearly to 40% in MY 2029. [EPA-HQ-OAR-2019-0055-2852-A1, p.7]

xxii Claire Buysse, Sara Kelly, and Ray Minjares, ‘Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the United States,’ *International Council on Clean Transportation* (blog), April 8, 2022, https://theicct.org/racing-to-zero-hdv-us-apr22/; Arijit Sen and Josh Miller, ‘Emissions Reduction Benefits of a Faster, Global Transition to Zero-Emission Vehicles’ (ICCT, March 8, 2022), https://theicct.org/publication/zevs-global-transition-benefits-mar22/.

EPA has rightly proposed to strengthen MY 2027-2029 GHG and NOx emissions regulations. However, the rule needs improvements. As discussed, the rule does not follow the historical standard of using technology cost-effectiveness analysis to set stringency and instead simply attempts to follow market trends. In doing so it also significantly underestimates the pace of technological development. The proposed rule is also weakened by counterproductive credit provision and vehicle exclusions. Even without these credits and exclusions the proposed rule is not stringent enough to ensure the predicted improvements in ICV efficiency. Moreover, a much stronger rule is needed to support an EV adoption trajectory consistent with the cost-effectiveness of electrification in a rapidly growing number of heavy-duty vehicle segments and the urgent need to curtail transportation greenhouse gas emissions. While our comments are focused on the GHG portion of the NPRM, ACEEE also recognizes the value and pressing need to reduce NOx and other criteria pollutant emissions as much as possible. ACEEE encourages EPA to ensure that the final rule protects the health of our nation by ensuring that the final rule pushes NOx standards and technology further than what the current market can support and drives innovation. [EPA-HQ-OAR-2019-0055-2852-A1, pp.9-10]

EPA should improve its EV sales estimates to reflect consistent, up-to-date data on state heavy-duty vehicle markets. Reference case EV sales estimates of at least 3.5%, 5%, and 6.5% in MYs 2027, 2028, and 2029, respectively, are warranted. GHG stringency increases of these same percentages would be required just to ensure that the ICV improvements in the original rule are preserved. [EPA-HQ-OAR-2019-0055-2852-A1, p.10]

EPA should not exclude vehicles that will see significant electrification, such as class 2b-3 pickup trucks and vans, from stringency increases and should, likewise, not exclude SI vehicles. [EPA-HQ-OAR-2019-0055-2852-A1, p.10]

EPA should set standards that reflect an EV share of 19% by MY 2027, 30% in MY 2028, and 40% in MY 2029. This is also in line with the pressing need to prevent global temperatures from rising more than 2°C. [EPA-HQ-OAR-2019-0055-2852-A1, p.10]

Organization: *American Lung Association et al.*

Support stronger climate pollution reductions and boost the transition to zero-emission trucks. We support a widespread and rapid transition to zero-emission trucks, noting that the proposed Option 1 assumes extremely limited growth in the zero-emission truck market and may work at cross purposes to both emission reductions and more rapid electrification. Six states have now adopted zero-emission truck standards, and more are in the process of adopting standards and other agreements that will further accelerate the zero-emission truck market. To truly spur the transition to zero emissions, the final rule must account for greater growth in the zero-emission truck market and establish more stringent greenhouse gas standards that account for this growth. Failing to account for the growth in the zero-emission vehicle market may reduce the overall benefits of the rule if higher emitting trucks are balanced against advanced technology credits. Conversely, establishing a stronger signal via Phase 2 is essential to setting the stage for accelerating to zero-emission technologies throughout the trucking sector. [EPA-HQ-OAR-2019-0055-1271-A1, p.3]

Organization: *AMPLY Power et al.*

We, the undersigned businesses, write to support the US Environmental Protection Agency (EPA) in finalizing a Clean Trucks Plan that accelerates the transition to zero-emission medium- and heavy-duty vehicles. [EPA-HQ-OAR-2019-0055-1236-A1, p. 1]

The Clean Trucks Plan represents a critical opportunity for the US to transition to widespread electrification of trucks and buses. The emissions and economic benefits of the transition to zero-emission medium- and heavy-duty vehicles are well documented and the urgency to reduce global warming and criteria emissions is paramount to human health and the economy.1 [EPA-HQ-OAR-2019-0055-1236-A1, p. 1]

> 1. For example see, Sen, A., R. Minjares, J. Miller, and C. Braun. 2022. “Benefits of the 2020 Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Memorandum of Understanding,” Washington, DC: International Council on Clean Transportation. Online at: https://theicct.org/publication/md-hd-mou-benefits-apr22/ and Ledna, C., M. Muratori, A. Yip, P. Jadun, and C. Hoehne. 2022. “Decarbonizing Medium- and Heavy-Duty On-Road Vehicles: Zero-Emission Vehicles Cost Analysis,” Golden, CO: National Renewable Energy Laboratory. Online at: https://www.nrel.gov/docs/fy22osti/82081.pdf

We are concerned with the level of zero-emission vehicles expected to be deployed through the proposed Clean Trucks Plan. To avoid the most severe impacts of climate change and attain clean air in communities impacted by vehicle emissions, **we need federal standards that at a minimum, achieve zero-emission truck and bus deployments on par with the Advanced Clean Trucks standard in model years 2027-2029.** [EPA-HQ-OAR-2019-0055-1236-A1, p. 1]

Six states, representing 20 percent of national medium- and heavy-duty vehicle registrations, have adopted the Advanced Clean Trucks standard, which sets a minimum level of zero-emission vehicle sales in these states. Through this policy, zero-emission vehicles in these states will comprise nearly 20 percent of Class 4-8 sales in model year 2027, nearly 30 percent in model year 2028, and nearly 40 percent in model year 2029.2 Several other states are actively considering adoption of the Advanced Clean Trucks standard. [EPA-HQ-OAR-2019-0055-1236-A1, p. 1]

> 2. Based on sales-weighted averages of zero-emission vehicle sales requirements in the Advanced Clean Trucks standard for Class 4-8 straight trucks and Class 7-8 tractors.

There are many policy mechanisms that EPA can use to achieve this transition. No matter the path chosen, the results should be the same: accelerating national zero-emission vehicle deployments in model years 2027-2029 at least to levels in the Advanced Clean Trucks standard. Federal policy supporting zero-emission vehicle deployments in these years is critical to achieving even greater deployments of zero-emission vehicles in subsequent policies, such as a Phase 3 GHG standard, that would apply to vehicles in model year 2030 and later. [EPA-HQ-OAR-2019-0055-1236-A1, p. 2]

EPA's assessment of the zero-emission truck and bus market in its proposed updates to the Phase 2 GHG standards—that zero-emission trucks and buses will comprise just 1.5 percent of Class 4-8 vehicle national vehicle sales in model year 2027—greatly underestimates the number of zero-emission trucks and buses needed and possible to be deployed. [EPA-HQ-OAR-2019-0055-1236-A1, p. 2]

Parallel to our support of regulatory action at EPA is our support of federal policies for incentives and investments in zero-emission vehicles and infrastructure. Such policies include the Infrastructure Investment and Jobs Act and tax incentives proposed in Congress for zero-emission vehicles and infrastructure. [EPA-HQ-OAR-2019-0055-1236-A1, p. 2]

Our businesses are building the vehicles, infrastructure, and business models to support the zero-emission vehicle market. We stand by ready to work with EPA to enable and encourage this market. [EPA-HQ-OAR-2019-0055-1236-A1, p. 2]

Organization: *BorgWarner*

We strongly urge EPA to avoid tailpipe-specific ZEV definitions that exclude technologies that could make a timely real-world difference in CO2 emissions. For example, hydrogen combustion is an advanced technology that is under development and more ready to be rapidly deployed in high volumes to make an impact on the environment. This technology can be readily adapted from existing systems and therefore, could be used as a bridging strategy to significantly decrease CO2 during the transition to electric and fuel cell vehicles. [EPA-HQ-OAR-2019-0055-1234-A1, p. 3]

We recommend EPA look to future Commercial Vehicle (CV) Battery Electric Vehicle (BEV) growth forecasts when considering the new standard. While BorgWarner supports adjustments to the Phase II standards, we recognize that CV BEV forecasts are rapidly shifting. Industry forecasts increasingly expect more CV BEVs and consequently we believe that, even with adjustments, EPA is underestimating the level of CV ZEV penetration. [EPA-HQ-OAR-2019-0055-1234-A1, p. 4]

Organization: *BYD Motors, LLC (BYD)*

As the global leader in the manufacture of zero-emission vehicles, BYD is uniquely positioned to assess the feasibility of significant long-term deployment of ZEVs. [EPA-HQ-OAR-2019-0055-1207-A1, p. 1]

Our own data shows that globally BYD Motors has delivered and sold 72,222 battery electric buses; 17,974 battery electric trucks and 1,898,219 New Energy Passenger Vehicles (including pure electric and hybrids). We expect that number to continue to rise, indicating that the capacity is there and will continue to grow. [EPA-HQ-OAR-2019-0055-1207-A1, p. 1]

This same U.S. factory, operating as BYD Bus & Coach in Lancaster, California, has begun producing zero-emission battery electric school buses that will transport school children to and from their schools and provide emerging Vehicle-to-Grid technologies that will transform communities reliance on the grid. [EPA-HQ-OAR-2019-0055-1207-A1, pp. 1 - 2]

In support of EDF, we urge EPA to ensure its standards help achieve 80 percent ZEVs for new school and transit buses by MY2029. We also support EDF's encouragement of EPA to ensure its standards help achieve 40% ZEV sales by 2029 for new Classes 4-7 Vehicles and Class 8 Short-Haul Trucks. [EPA-HQ-OAR-2019-0055-1207-A1, p. 2]

A 2022 study done for EDF by Rousch supports the case that a significant near-term deployment of ZEVs is, in fact, feasible. [EPA-HQ-OAR-2019-0055-1207-A1, p. 2]

As the Official Sponsor of Mother Nature, BYD is committed to manufacturing products, including buses, school buses, trucks, forklifts and passenger vehicles that are emission-free and safe. BYD announced in April it has ceased manufacturing internal combustion engines to focus on hybrid and battery electric vehicles including its full line of passenger vehicles. [EPA-HQ-OAR-2019-0055-1207-A1, p. 2]

Organization: *California Air Resources Board (CARB)*

The NPRM requests comment on all aspects of the proposed targeted updates to the 2027 MY HD GHG Phase 2 program, including the projections of the four vehicle types affected and if additional vehicle types should be considered. CARB staff supports U.S. EPA's proposed adjustment of the 2027 MY CO_2 emission standards to account for higher HD ZEVs penetration in the HD vehicle market than originally expected in the existing U.S. EPA's HD Phase 2 GHG standards. As also mentioned in the NPRM, in March 2021, CARB adopted the ACT regulation which requires manufactures to produce a certain percentage of HD ZEV for sale in California. CARB's ACT HD ZEV requirement will start with the 2024 MY (5 to 9 percent of total HD vehicle sales) and ramp up significantly through 2035 MY and beyond (40 to 75 percent of total HD vehicle sales).138 Furthermore, some section 177 states such as Washington, Massachusetts, Oregon, New Jersey, and New York have followed California and adopted the ACT regulation, and other states are in the process of adopting the regulation. This will significantly increase HD ZEV production starting in 2024 MY, not only in California, but also in the whole nation. [EPA-HQ-OAR-2019-0055-1186-A2, p.79]

> 138 California Air Resources Board, Final Regulation Order, Advanced Clean Truck Regulation, effective date March 15, 2021. https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/fro2.pdf

While CARB staff supports U.S. EPA's proposed adjustment of CO_2 emission standards for 2027 and later MY vehicles, we have significant concerns on the proposed CO_2 emission standard adjustment values as well as the U.S. EPA's targeted subcategories and respectfully urge U.S. EPA to consider the two following recommendations. [EPA-HQ-OAR-2019-0055-1186-A2, p.79]

CARB staff has significant concerns regarding the methodology used for calculating the percentage of national 2027 MY HD ZEVs in the NPRM. One key assumption in the U.S. EPA's calculation is that 42 percent of HD ZEVs sold in the U.S. would be sold in California. This 42 percent estimate is based on an International Council on Clean Transportation report showing that in 2020, almost 1,100 of the 2,600 zero-emission commercial vehicles in the U.S. were in California. The report noted in its introduction that the market for zero-emission buses and trucks is still in its early stages and provided an overview of the 2020 market. However, that report neither projects HD ZEV sales beyond 2020 nor considers that zero-emission technology continues to advance nor accounts for the fact that other states adopt CARB's ACT regulation. Consequently, both that report, and U.S. EPA's estimates of HD ZEVs in the nation improperly failed to consider an important aspect of the problem, State Farm, 463 U.S. at 43; specifically, factors that, as discussed below, indicate that as a number of other states implement HD ZEV requirements and encourage electrification of commercial vehicles, the number of HD ZEVs will increase in the nation. [EPA-HQ-OAR-2019-0055-1186-A2, pp.79-80]

In the NPRM, U.S. EPA used CARB's ACT rulemaking's estimates of 2027 MY California sales of 3,938 HD ZEVs and divided it by 42 percent, to arrive at the national sales of 9,376 HD ZEVs, as shown in Section XI.C.1. of the NPRM. However, this method of estimating the quantities of HD ZEVs throughout the nation is highly inaccurate and therefore projects inappropriately low numbers of HD ZEVs in the 2027 MY, less than 10,000 HD ZEVs sold in the U.S. compared to total national sales of all heavy-duty vehicles of almost 600,000 vehicles. [EPA-HQ-OAR-2019-0055-1186-A2, p.80]

In Table XI-3 of the NPRM, the total number (conventional and HD ZEV) of California vehicle sales was taken from CARB's ACT projections for the 2027 MY, which was 20,938 vehicles. For the national sales, the sales projection was from the Phase 2 Final Rule (Table XI-5). If CARB's ACT California sales were divided by the Phase 2 national sales, the California sales constitute a little over 3 percent of national sales, which is low compared to the typical California sales of about 7 to 10 percent of national sales. The effect of this lower number of California sales compared to national sales would also result in an inaccurate lower fraction of calculated national HD ZEVs in 2027 MY. [EPA-HQ-OAR-2019-0055-1186-A2, p.80]

As U.S. EPA mentioned in the NPRM, California's HD vehicle population is approximately 10 percent of the U.S. HD population. Based on CARB's HD certification data in the 2019 and 2020 MYs, California's HD vehicle sales are about 7 percent of the national sales. Based on these facts, CARB staff estimates about 7 to 10 percent of national sales are California sales in 2027 MY. With the required HD ZEV sales of 15 to 20 percent of total California HD vehicle sale in 2027 under CARB's ACT regulation, the California ZEV sales alone are already about 1 to 2 percent of the total U.S. HD sales. It is also worth noting that CARB staff is currently working on developing the proposed Advanced Clean Fleet regulation that would accelerate the market for zero-emission trucks and buses by requiring California fleets that are well suited for electrification to transition to ZEVs where feasible.139 In the NPRM, U.S. EPA assumed only 1.5 percent national HD ZEV penetration in their proposed 2027 MY CO2 emission standards, which seems to only account for California's adoption of the ACT. However, as noted earlier, in addition to California, several section 177 states have already adopted CARB's ACT regulation, which will definitely result in national ZEV penetration much greater than 1.5 percent as proposed in the NPRM. [EPA-HQ-OAR-2019-0055-1186-A2, p.80]

139 California Air Resources Board, Advanced Clean Fleets, March 3, 2022. Advanced Clean Fleets Fact Sheet (ca.gov)

HD ZEV sales will likely increase beyond CARB's ACT regulatory push in 2027. As mentioned in the NPRM, an MOU organized by Northeast States for Coordinated Air Use Management, sets a target of an interim goal of 30 percent of all new medium-duty and HD vehicles sales being HD ZEVs no later than 2030.140 Currently, 18 signatories, including California and the section 177 states noted above, are part of this agreement. In order to achieve this interim goal, a significant number of vehicles sales in 2027 must be HD ZEVs. [EPA-HQ-OAR-2019-0055-1186-A2, p.81]

140 https://www.nescaum.org/documents/medium-and-heavy-duty-zero-emission-vehicles-action-plan-development-process/. Accessed March 21, 2022.

A report by the ACT Research shows projections of HD ZEV sales to be 21 percent in 2027.141 The report predicts that in the early years, regulatory requirements will drive HD ZEV sales; however, past 2030, technology gains will far exceed regulatory influences due to increasingly favorable total cost of ownership of ZEVs over conventional vehicles. A recent report by Roush projects that by 2027 to 2030, the total cost of ownership for a HD ZEV will be less for a conventional commercial vehicle in certain vehicle types.142 NREL conducted a study that projected HD ZEV sales would account for 42 percent of all new HD sales by 2030 based solely on economics, assuming the charging and refueling infrastructure is established (a very conservative scenario showed 7 percent of HD ZEV sales by 2030.143) Furthermore, recent federal, state,144,145 and private146 programs and agreements are being implemented in the near-term to build infrastructure for HD ZEVs. CARB staff accordingly urges U.S. EPA to account for the aforementioned factors that individually and collectively indicate there will be significantly greater quantities of HD ZEVs in the nation than as estimated in the NPRM and that the proposal will consequently result in the generation of more credits than U.S. EPA is anticipating, which will likely not fulfill U.S. EPA's objective of maintaining the stringency of the Phase 2 GHG program. State Farm, 463 U.S. at 43. [EPA-HQ-OAR-2019-0055-1186-A2, p.81]

CARB staff believes that more accurate and realistic national HD ZEV penetration projection rates will likely be at least 20 percent of all nationwide HD sales per year for 2027 and beyond, in adjusting the 2027 and subsequent MY CO2 emission standards. If U.S. EPA moves forward with a proposal that is based on the NPRM's projection of weak HD ZEV sales like the 1.5 percent proposed in the NPRM, then the Phase 2 GHG standards need to be adjusted to ensure higher HD ZEV sales do not destroy the efficacy of the Phase 2 GHG standards. The standards must be amended with some backstop in allowable credits for HD ZEVs to prevent higher HD ZEV sales resulting in substantial delays or the elimination of needed and cost effected vehicle and engine technologies initially identified during the adoption of Phase 2 GHG program. Applying HD ZEV emission credit caps or significantly reducing HD ZEV credits after a threshold volume is reached would be necessary to assure that the projected vehicle and engine technologies identified as feasible and cost effective are realized in the implementation of the Phase 2 GHG program. [EPA-HQ-OAR-2019-0055-1186-A2, pp.81-82]

In addition to the four vehicle types most likely to be electrified through 2030, U.S. EPA should also consider the refuse hauler vehicle type. As part of CARB's ACT rulemaking package, CARB staff conducted an assessment of the ZEV market and the suitability of ZEVs in the MD and HD commercial space.147 The ZEV suitability was assessed based on four factors: weight, route/range, charging/fueling infrastructure, and battery/vehicle space constraints. Each of these factors for each market segment (i.e., vehicle category) was assigned a number value of 1, 3, or 10 (with 1 representing a highly suitable characteristic, 3 representing a challenging suitability characteristic, and 10 representing a poorly suitable characteristic). These values were then averaged for each market segment to assign each segment a value between 1 and 10, where the lowest values would suggest the highest suitability for electrification. The market segment with an average suitability score that is above 5 has at least two characteristics identified with poor suitability factors. This indicates that electrification with today's technology is not likely to be feasible for most of that market segment. According to the assessment, refuse haulers have a ZEV suitability score of 1 to 2, indicating that they are the most suitable segments to transition to ZEP due to their typical operation on predictable routes with frequent stop-and-go. Hence, CARB staff recommends U.S. EPA to consider refuse haulers in their targeted vehicle types that are subject to the proposed adjustment of the 2027 MY CO2 emission standards. [EPA-HQ-OAR-2019-0055-1186-A2, p.82]

> 147 California Air Resources Board. Appendix E: Zero Emission Truck Market Assessment, to the Staff Report: Initial Statement of Reasons, 'Public Hearing to Consider the Proposed ACT Regulation,' October 22, 2019. https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/appe.pdf

In addition, CARB staff urges U.S. EPA to also include HD vehicles subjected to SI GHG standards (or HD gasoline vehicles) as part of the targeted subcategories for adjusting 2027 and newer MY CO2 emission standards. The projected higher ZEV penetration in 2027+ timeframe, which had necessitated the proposed 2027 and newer MY GHG standards adjustment for HD diesel vehicles, should be accounted for all HD internal combustion vehicle standards regardless of their powered fuel types. HD gasoline vehicles still make up a significant portion in HD transportation sector, especially in light and medium HD vehicle categories. It can also be argued that all gasoline-fueled HD vehicles have targeted applications that do not require high engine torque (i.e., less vehicle payload) or high fuel efficiency (i.e., shorter operating routes), thereby making this segment highly feasible for electrification. Therefore, CARB staff recommends U.S. EPA to adjust 2027 and newer MY CO2 emission standards for HD vehicles certified to SI GHG standards following the same approach that U.S. EPA proposed in the NPRM, incorporating CARB staff's suggested revised HD ZEV penetration projection discussed in the comment above, for diesel vehicles. [EPA-HQ-OAR-2019-0055-1186-A2, pp. 82-83]

Organization: *CALSTART*

As significant as the benefits of the ACT were estimated to be in California, CARB's emissions analysis also illustrates the need for even greater emission reductions. The 2.9 million metric tons of global warming emissions estimated to be reduced in California by the ACT in 2040 is small compared to the baseline of roughly 33 million metric tons per year in 2040. The 5,301 tons of NOx reduced per year in 2040 is also small compared to an annual estimate of nearly

60,000 tons in 2040. Adoption of the ACT is a significant step in deploying zero-emission medium- and heavy-duty vehicles, but it alone will not reduce emissions of criteria pollutants or GHGs enough to achieve air quality or climate goals. [EPA-HQ-OAR-2019-0055-1313-A1, p.7]

Similar NOx and GHG emission benefits of adopting the ACT result from multi-state analyses. Adoption of ACT in 12 states and the District of Columbia, assuming implementation in 2025, will reduce GHG emissions an estimated 15 percent below business as usual in 2050 (Figure 3). ACT adoption in these states would similarly reduce NOx emissions by 15 percent in 2050 compared to business as usual (ICCT, 2022). [EPA-HQ-OAR-2019-0055-1313-A1, p.7]

While the widespread transition to zero-emission vehicles will require large scale production of vehicles, small businesses have enabled the early stages of the medium- and heavy-duty zero-emission market (CARB, 2021). Zero-emission vehicles produced by small businesses have helped demonstrate the suitability of zero-emission technologies, while generating new jobs and economic growth in the process. Such companies manufacture buses and shuttles (e.g, Greenpower Motor, Motiv Power Systems, and Lion Electric), on-road trucks and vans (e.g., Phoenix Motorcars and Lightning Systems), and off-road yard trucks (e.g., Orange EV) and have combined to manufacture over 560 vehicles for California fleets alone as of May 2021. As larger manufacturers enter the marketplace, small business will continue to provide critical innovations and products in the transition to zero-emission vehicles. The US Department of Energy recognizes how critical small-business contributions are to the development of clean energy technological solutions—in June 2021, 235 small businesses were awarded $54 million in seed funding for projects ranging from electric vehicle batteries to advanced grid technologies (DOE, 2021). [EPA-HQ-OAR-2019-0055-1313-A1, pp.7-8]

Regulatory actions to accelerate the deployment of zero-emission medium- and heavyduty vehicles have taken place at the state level in the US to-date. In June 2020, California became the first state to adopt the ACT standard, a regulation requiring an increasing fraction of zero-emission Class 2b-8 sales beginning in model year 2024, according to Table 1. Five more states—Oregon, Washington, New Jersey, New York, and Massachusetts—adopted the ACT in 2021, with implementation beginning in model year 2025. Based on Class 2b-8 vehicle registrations in 2019, these six states represent 20 percent of the national truck and bus market and 17 percent of Class 4-8 sales.6 Three other states are actively considering adoption of the ACT including Colorado, Maine, and Connecticut (CDPHE, 2022; Maine Department of Environmental Protection, 2021; State of Connecticut, 2022). [EPA-HQ-OAR-2019-0055-1313-A1, p.8]

> 6 Class 2b-8 vehicle registrations are based on Atlas' evaluation of 2019 IHS Markit registration data, available at: https://www.atlasevhub.com/materials/medium-and-heavy-duty-vehicleregistrations- dashboard/. Sales are based on an unpublished CALSTART analysis of 2019 IHS Markit data that uses a 1 percent growth in total annual sales for all vehicle classes (Al-Alawi, 2022).

In 2020, state governors, under a memorandum of understanding (MOU), committed to accelerating deployments of zero-emission medium- and heavy-duty vehicles in their states with at least 30 percent of sales being zero-emission vehicles in 2030 and 100 percent no later than

2050. As of May 2022, 17 states, Washington, DC, and Quebec have adopted this Multi-state MOU (O'Dea, 2022). Note, these commitments apply to Class 2b-8 vehicles. A summary of states adopting the ACT, Heavy-Duty Omnibus, and Multi-state MOU are shown in Figure 4. [EPA-HQ-OAR-2019-0055-1313-A1, p.9]

At the international level, CALSTART's Global Drive to Zero program is a strategic, international initiative designed to catalyze the growth of the zero-emission medium and heavy-duty vehicle sector, focused on key vehicle segments, from transit buses to semi-trucks (Global Drive to Zero, n.d.). More than 100 Drive to Zero pledge partners promise to collaboratively put in place supporting mechanisms to speed the early market for these vehicles and equipment.7 Similar to the Multi-state MOU, fifteen countries have signed the Global MOU committing to zero-emission vehicles comprising 30 percent of medium- and heavy-duty sales and 100 percent of sales no later than 2040. The 100 percent sales target signed by countries is ten years earlier than that in the Multistate MOU. An additional 42 sub-national governments, businesses, and other organizations in the freight and bus industry and road transport, have fully endorsed the ambition of the Global MOU. [EPA-HQ-OAR-2019-0055-1313-A1, pp.9-10]

7 A current listing of Drive to Zero Pledge Partners is available at https://globaldrivetozero.org/about/pledge-partners/

CALSTART urges EPA to increase the number of zero-emission vehicles deployed through the final rule. There are many mechanisms that EPA can use to achieve this outcome, including increasing the stringency of the Phase 2 GHG standards or crediting of zero-emission vehicles for compliance with NOx emission standards while achieving net 90 percent NOx reductions compared to current engines. No matter the path chosen, CALSTART recommends the final rule set the regulatory framework on a path to accelerate national zero-emission vehicle deployments in model years 2027-2029 at least to levels achieved by the ACT for Class 4-8 vehicles. In model years 2027-2029, the ACT achieves Class 4-8 zero-emission sales of 18 percent, 26 percent, and 34 percent based on analysis by CALSTART (weighted for national sales of Class 4-8 straight vehicles and Class 7-8 tractors) (Table 2 and Figure 5). [EPA-HQ-OAR-2019-0055-1313-A1, p.10]

A final rule supporting zero-emission vehicle deployments in model years 2027-2029 is critical to building a ramp to even greater deployments of zero-emission vehicles in subsequent policies, namely the Phase 3 GHG standard, that would apply to vehicles in model year 2030 and later. The world is already behind the pace of reductions needed for addressing climate change and air quality. The Clean Trucks Plan must move the path to zero-emission vehicles upward. Otherwise, Phase 3 GHG standards will never push industry to the levels of zero-emission trucks that are achievable and needed. As discussed and shown below, EPA's assessment of the zero-emission truck and bus market in its proposed updates to the Phase 2 GHG standards—that zero-emission trucks and buses will comprise just 1.5 percent of Class 4-8 vehicle national vehicle sales in model year 2027—greatly underestimates the number of zero-emission trucks and buses expected and possible. [EPA-HQ-OAR-2019-0055-1313-A1, pp.10-11]

As shown in our market adoption analysis below, zero-emission vehicles can be deployed at levels similar to the ACT standard in segments ready for electrification today, i.e., in urban regions where the duty cycles and distances best match with technology capabilities and production capacity. These applications, some of which are already called out by EPA in the proposed rule (transit, school bus, delivery and regional tractors) could be mapped to EPA's existing matrix bin structure created for EPA's Phase 2 GHG standard. Each bin would be assigned a discrete emission reduction target based on segment-based projections of zero-emission sales. The total GHG emissions reductions from such a scheme would adjust the 1.5 percent GHG reduction called for in the proposed rule to at least match emission reductions achieved by the ACT standard. [EPA-HQ-OAR-2019-0055-1313-A1, p.11]

More stringent GHG emission standards could work in parallel to flexibility given to manufacturers to comply with NOx emission standards through the accelerated deployment of zero-emission vehicles. The NOx reductions from these deployments would meet or exceed a net 90 percent NOx reduction. [EPA-HQ-OAR-2019-0055-1313-A1, p.11]

CALSTART analyzed IHS Markit sales data by state and vehicle class to estimate sales of zero-emission Class 4-8 vehicles in the six states that have adopted the ACT standard (Al- Alawi, 2022). Compared to the 9,376 zero-emission vehicles estimated will be sold in model year 2027, CALSTART's analysis indicates 16,347 vehicles will be sold across the six states that have adopted the ACT (Table 3). This represents 3.3 percent of total Class 4-8 sales in model year 2027 (estimated at 297,574 Class 4-8 straight vehicles and 189,117 Class 7-8 tractors), compared to the 1.5 percent estimated in the proposed rule. In model years 2028 and 2029, CALSTART estimates zero-emission vehicles from the six ACT states will comprise 4.8 percent and 6.3 percent of total Class 4-8 sales in the US, respectively. While annual sales of all vehicles have decreased since 2019 as a result of the pandemic, the fraction of zero-emission vehicles from the six ACT states will remain similar no matter the basis for annual sales. For example, in CALSTART's estimate of zero-emission Class 4-8 vehicle sales using both 2019 and 2021 sales as baselines, the number of zero-emission vehicle sales in the six ACT states doubles from model year 2027 to 2029 from roughly 3 percent to 6 percent. [EPA-HQ-OAR-2019-0055-1313-A1, p.12]

While six states have currently adopted the ACT standard, another 11 states and Washington, DC have committed to achieving 30 percent zero-emission Class 2b-8 vehicle sales by 2030. Three of these states are actively considering adoption of the ACT, including Colorado, Maine, and Connecticut, and it is likely that more than six states will be implementing the ACT in model years 2027-2029. Modifications to the Phase 2 GHG standards and crediting in the NOx standard should account for states that adopt the ACT in the future and whose implementation begins sometime between model years 2026 and 2029. If all of the 18 jurisdictions in the US that have adopted the Multi-state MOU were to achieve ACT-like sales in line with the MOU's 2030 commitment, CALSTART estimates 32,470 zero-emission Class 4-8 vehicles would be sold nationally in model year 2027 corresponding to 6.5 percent of national Class 4-8 sales and increasing to 12.4 percent of sales in model year 2029 (Table 4).8 [EPA-HQ-OAR-2019-0055-1313-A1, p.12]

8 In MOU jurisdictions that have not adopted the ACT, implementation was assumed to begin in model year 2026. In the six states that have adopted the ACT, implementation

was consistent with regulatory actions in these states, i.e., 2024 in California and 2025 in the other five states.

The Clean Trucks Plan should also account for zero-emission vehicles deployed through states' adoption of the ACF standard, which sets requirements for fleets to purchase zero-emission medium- and heavy-duty vehicles. This policy has been in development at CARB since 2019 and is expected to be adopted by the CARB Board in 2023, with implementation beginning in 2024. Other states will have the ability to adopt this policy (CARB, n.d.). The ACF will result in three times the number of Class 4-8 zero-emission vehicles (straight vehicles and tractors) than the ACT in model years 2027-2029, as shown in the Table 5 (CARB, 2021a). Unaccounted for, credits from zero-emission vehicles in the ACF could overwhelm the Clean Trucks Plan and greatly compromise its intended reductions in emissions. [EPA-HQ-OAR-2019-0055-1313-A1, p.13]

EPA's projection of zero-emission vehicle sales should also take into account state and local requirements for the deployment of zero-emission transit buses, which are excluded from ACT sales requirements but are included in EPA's projection of zero-emission vehicle sales and affect Phase 2 GHG standards. California's Innovative Clean Transit (ICT) standard, adopted in December 2018, is one such policy that EPA should consider. The ICT requires an increasing fraction of transit bus purchases to be zero-emission vehicles beginning at 25 percent in 2023 for large transit agencies and 25 percent in 2026 for small transit agencies. Under this policy, all transit bus purchases in the state must be zero-emission vehicles from 2029 and onward (CARB, 2019b). From purchase plans submitted to CARB by 19 large transit agencies across the state, an estimated 5,000 zero-emission buses (Class 4 and above) will be deployed in California through 2030 (Figure 6) (Paddon, 2021). Additional zero-emission transit buses will be deployed by small transit agencies. [EPA-HQ-OAR-2019-0055-1313-A1, pp.13-14]

Outside of state policies requiring the deployment of zero-emission vehicles, there are other important market drivers that EPA should consider in its projection of zero-emission vehicle sales, including vehicles deployed with known incentive funding and public commitments by fleets and vehicle manufacturers to produce and adopt zero-emission vehicles. [EPA-HQ-OAR-2019-0055-1313-A1, p.14]

Funding in the recently adopted Infrastructure Investment and Jobs Act (IIJA) will provide roughly $3.5 billion for zero-emission transit buses and up to $5 billion for zero-emission school buses. In a rough estimate that considers the price of a battery electric transit bus at $850,000 and a school bus at $375,000, the IIJA could fund approximately 4,000 transit buses and 13,000 school buses over the five-year life of these programs. While no targets have been set to date, incentives for the purchase of zero-emission trucks are also eligible expenditures under several, billion-dollar IIJA programs, including but not limited to the Carbon Reduction Program ($6.4 billion), the Congestion Mitigation and Air Quality Improvement Program ($13 billion), and the National Highway Freight Program ($7.1 billion). [EPA-HQ-OAR-2019-0055-1313-A1, pp.14-15]

Nationally, over 1,200 zero-emission trucks have been deployed across the US (Figure 7), with at least that many more expected to be deployed through existing vouchers awarded in

California's HVIP incentive program.9 Through 2021, an additional 1,700 zero-emission school buses and 3,500 zero-emission transit buses have been awarded, ordered, or delivered (see maps in Figure 8 below showing state distribution of these vehicles).10 [EPA-HQ-OAR-2019-0055-1313-A1, p.15]

> 9 Deployments of zero-emission trucks can be found at: https://calstart.org/zeroing-in-on-zero-emission- trucks/.Vehicles ordered through HVIP can be found at: https://californiahvip.org/impact

> 10 Adoption of zero-emission school buses and transit buses can be found at: https://calstart.org/zeroing-in-on-esbs-2022/ and https://calstart.org/zeroing-in-on-zebs/.

Fleets are committing to zero-emission vehicle transitions, ordering these vehicles, and deploying them. Nationwide, an estimated 81 fleets are currently operating zero-emission trucks. An additional 76 fleets have zero-emission vehicles on order. Twenty fleets have publicly set goals for adopting zero-emission vehicles.11 Last December, President Biden issued an Executive Order committing all Federal vehicle purchases to zero-emission technologies by 2035 (White House, 2021). [EPA-HQ-OAR-2019-0055-1313-A1, p.16]

> 11 EDF has catalogued fleets' deployments, orders, and commitments to zero-emission trucks, see: https://docs.google.com/spreadsheets/d/1l0m2Do1mjSemrb_DT40YNGou4o2m2Ee-KLSvHC- 5vAc/edit#gid=1021779951

Fleets in the US have "ordered" – inclusive of legally binding and non-binding commitments – 146,000 zero-emission trucks to be delivered over the next ten years. The largest order is from Amazon for 100,000 Rivian delivery vans. Rivian aims to have the first 10,000 delivery vans delivered to Amazon by 2022 and all 100,000 delivered by 2030. The United Parcel Service's order of 10,000 Arrival delivery vans is expected to be completed by 2024.12 [EPA-HQ-OAR-2019-0055-1313-A1, p.16]

> 12 See CALSTART's report "Zeroing in on Zero-Emission Trucks" for more information at: https://calstart.org/zeroing-in-on-zero-emission-trucks/

Twenty-one manufacturers of combustion cars, trucks, and equipment have made public commitments around zero-emission, electric, "carbon neutral," or "fossil free" vehicles (Table 6).13 Notable commitments include those by two large, legacy manufacturers of heavy-duty vehicles that have committed to 50 percent of their sales being electric or zero-emission vehicles by 2030, which match the Class 4-8 sales requirements and exceed the Class 7-8 tractor sales requirements under the ACT.14 [EPA-HQ-OAR-2019-0055-1313-A1, pp.16-17]

> 13 Information on vehicle manufacturers' commitments to clean technologies can be found in Table 2 at: https://globaldrivetozero.org/publication/country-policy-targets-briefing/

14 Information on Volvo Trucks and Scania's commitments can be found at: https://www.volvogroup.com/en/news-and-media/news/2022/jan/news-4158927.html and https://www.scania.com/group/en/home/newsroom/news/2021/Scanias-electrificationroadmap.html.

CALSTART's knowledge of the truck and bus industries indicates a rapid transition to zero-emission vehicles is achievable in many medium- and heavy-duty vehicle segments. CALSTART's "beachhead" strategy, summarized in Figure 9 below, envisions such deployments can be achieved through waves of investments, policies, and deployments that begin with vehicle segments most suited for zero-emission technology based on duty cycle, business case, and performance and progressively expand to additional applications as technology matures and manufacturing capacity increases.15 [EPA-HQ-OAR-2019-0055-1313-A1, pp.17-18]

15 More information on CALSTART's market-ready, "beachhead" strategy can be found at: https://globaldrivetozero.org/public/The_Beachhead_Model.pdf

BYD, a world leader in electric car, truck, and bus deployments, represents a company deploying vehicles across market-ready applications, including transit buses, coach buses, delivery trucks, regional haul tractors, yard trucks, and school buses (BYD, n.d.). Proterra also represents an example of the company deploying zero-emission technology in waves as it expands in scale. An early and current leader in zero-emission transit buses, Proterra now uses its battery technology in partnership with vehicle manufacturers that make school buses, coach buses, delivery vehicles, and construction equipment.16 [EPA-HQ-OAR-2019-0055-1313-A1, p.18]

16 Proterra's zero-emission product offerings can be found at: https://www.proterra.com/applications/

The state of zero-emission technologies for medium- and heavy-duty applications can be seen in CARB's assessment of Technology Readiness Levels in Figure 10 below (CARB, 2021). In all applications shown, covering nearly every use-case except long-haul, emergency, and construction, zero-emission technologies were determined to be in the commercial stage with early market entries. [EPA-HQ-OAR-2019-0055-1313-A1, p.18]

While further from maturation, the industry is progressing to zero-emission long-haul trucking, a transition once deemed impossible by some in the heavy-duty industry. In the Research Hub for Electric Technologies in Truck Applications (RHETTA) project funded by the California Energy Commission, CALSTART is working with industry partners to develop, test, and deploy megawatt charging systems for medium- and heavy-duty vehicles. This and similar pilot projects represent steps underway in the transition of long-haul trucking to zero-emission technologies. The Department of Energy's SuperTruck 3 program will fund two legacy vehicle manufacturers to develop megawatt charging systems for Class 8 trucks (DOE, 2021a). A $650 million private investment from a vehicle manufacturer, utility, and investment management firm will support charging and hydrogen refueling corridors for long-haul electric and fuel cell trucks along the West and East coasts of the US and across Texas, with construction expected to begin next year (Saul, 2022). This follows a similar announcement by three legacy vehicle manufacturers to jointly develop charging infrastructure for heavy-duty long-haul trucks in Europe (Mossalgue, 2021). Funding in the IIJA could also help build out these corridors, particularly the $2.5 billion "Discretionary Grants Program for Charging and Fueling infrastructure" in Section 11401 of this law. Standardization of a megawatt charging connector by SAE (J3271) is also enabling the development of charging infrastructure for long-haul trucks (SAE, 2021). [EPA-HQ-OAR-2019-0055-1313-A1, pp.19-20]

Demonstration and pilot projects involving fuel cell trucks and buses have also expanded in recent years. CARB and the California Energy Commission have supported a project in Oakland that will deploy 30 Hyundai fuel cell trucks for drayage operations starting in early 2023. As part of the Department of Energy's SuperTruck 3 program, three legacy vehicle manufacturers will develop fuel cell trucks, including a Class 8 tractor and Class 6 vehicle based on a popular chassis used for combustion vehicles (DOE, 2021a). A Nikola Fuel Cell truck delivered beer to the Superbowl, Hino and Toyota have announced fuel cell trucks, and Hyzon is working to bring their fuel cell truck to the US after deployments in China and Europe (Ericson, 2022). Fuel cell trucks are also being developed by Kenworth in partnership with Toyota and Navistar in partnership with GM. [EPA-HQ-OAR-2019-0055-1313-A1, p.20]

The range of current battery and fuel cell electric trucks can meet many fleets' operational demands. Based on the national Vehicle Inventory and Use Survey (VIUS), more than 80 percent of all Class 2b-8 trucks have a primary operating range (the farthest distance from the vehicle's home base) of less than 100 miles. More than 75 percent of Class 2b-8 trucks travel 30,000 miles or less each year, which corresponds to 120 miles per day for 250 operational days per year. Sixty five percent of Class 2b-8 vehicles travel less than 20,000 miles each year or 80 miles per day for 250 operational days per year (Figure 11).17 An updated survey of heavy-duty vehicles in California found similar vehicle miles traveled by truck class, suggesting results from the 2002 VIUS still reflect present day vehicle miles traveled by medium- and heavy-duty vehicles (Komanduri, 2019). [EPA-HQ-OAR-2019-0055-1313-A1, p.20]

> 17 Analysis of truck operating ranges and annual mileages by the Union of Concerned Scientists can be found at: https://www.ucsusa.org/resources/ready-work

In a study of Class 6-7 school bus operations in three states (Washington, New York, and Colorado) and of over 1,500 individual operating shifts found an average driving distance of 32 miles. A 99.7 percent confidence interval on route distance was found to be zero to 77 miles (route distances were doubled to determine an average daily driving distance of 64 miles, with a 99.7 percent cutoff of 154 miles) (Duran, 2013). [EPA-HQ-OAR-2019-0055-1313-A1, p.20]

As shown in the next section, these daily distances are well within the range of existing heavy-duty electric vehicles on a single charge or tank of hydrogen. [EPA-HQ-OAR-2019-0055-1313-A1, p.20]

An increasing number of battery and fuel cell electric trucks are being offered by legacy vehicle manufacturers and new vehicle manufacturers alike. Many new products are being offered by vehicle manufacturers and many more are moving from the demonstration and pilot stage and into mainstream production with significant manufacturing capacities being added to the market.

CALSTART's tracking of the industry, shown in Figure 12 below, indicates that by 2023, 56 manufacturers will offer 244 different models of zero-emission trucks and buses in the United States and Canada.18 Policies requiring the deployment of zero-emission vehicles are critical to ensuring these vehicles come to market in significant amounts. [EPA-HQ-OAR-2019-0055-1313-A1, p.21]

> 18 More information on CALSTART's Zero-Emission Technology Inventory Tool can be found at: https://globaldrivetozero.org/tools/zero-emission-technology-inventory/

The number of zero-emission models available provides an important indicator in the market, showing the breadth of manufacturers and suppliers investing in these technology platforms. The more manufacturers and suppliers producing zero-emission components and vehicles, costs will likely be lower, consumer choice will be expanded, and production times accelerated compared to a market with a limited number of commercial manufacturers. The presence of larger vehicle manufacturers in the marketplace will help bring prices down due to economies of scale and efficiencies in production processes. [EPA-HQ-OAR-2019-0055-1313-A1, p.21]

All major manufacturers and several new innovators are now in active sales and product development stages. In Class 7 and 8, applications include drayage and regional haul trucks. Eight manufacturers have Class 8 tractors available for sale in California. Longer range and lower, more competitively priced trucks are in the pipeline. Scania, for example, has recently announced longer range capable trucks in Europe by 2023. [EPA-HQ-OAR-2019-0055-1313-A1, p.21]

The last mile delivery market is also seeing significant transformation. With the huge increases in e-commerce and last mile delivery needs, EV-only startups as well as established OEMs have increased offerings. GM and their EV600, leveraging their Ultium battery and drive system, has begun delivering vans to some major customers and Ford has started delivery of their eTransit as well. Other manufacturers such as Envirotech, Green Power Motors, Lightning eMotors, Motiv, SEA Electric, Workhorse, and Xos all have delivery vans available for sale. Companies like Zeem, WattEV, and others are offering new 'transportation as a service' models to help speed the adoption of zero-emission trucks. [EPA-HQ-OAR-2019-0055-1313-A1, p.22]

Most zero-emission truck models available today serve lower-mileage applications, but manufacturers are increasingly bringing vehicles to market with longer ranges. CALSTART's chart in Figure 13 below shows zero-emission truck and bus offerings expected through 2022 by vehicle type and range. [EPA-HQ-OAR-2019-0055-1313-A1, p.22]

There is growing consensus that electric trucks and buses are becoming cost competitive with diesel technologies today and will offer measurable savings with continued decreases in battery and fuel cell costs over the next 10 years (Ledna, 2022; CARB, 2021b). Vehicle applications with higher annual mileages are expected to benefit from electrification the most due to the significant fuel and maintenance savings electrification can provide over diesel. Total cost of ownership studies by CARB, ICF, ICCT are shown in the Figures 14 and 15 below and illustrate the expected costs savings for Class 6 delivery vehicles and Class 8 drayage and short-haul tractors, without financial incentives or revenue from low carbon fuel standards (O'Dea, 2019). [EPA-HQ-OAR-2019-0055-1313-A1, p.23]

Based on a total cost of ownership analysis, NREL estimates that across all modes and travel distances of heavy-duty vehicles, zero-emission technologies will comprise 42 percent of vehicle sales by 2030, 98 percent by 2040, and 100 percent by 2046, with zero-emission vehicles achieving cost parity with combustion vehicles no later than 2035 for operations of all distances (Ledna, 2022). [EPA-HQ-OAR-2019-0055-1313-A1, p.23]

CALSTART's examination of truck vocations indicates the sales percentages in the ACT can be exceeded through deployments of zero-emission vehicles just in fleet segments that are ready for zero-emission technologies today, including urban and regional delivery vehicles (vans, box trucks, and tractors), school buses, transit buses, shuttle buses, heavy-duty short/regional haul (Al-Alawi, 2022b). These applications typically follow a return-to-base model, traveling to predictable destinations and with consistent daily mileage. [EPA-HQ-OAR-2019-0055-1313-A1, p.25]

These results reflect the timing for technology readiness of zero-emission technologies for different vehicle vocations, types and weights, and recognize that zero-emission technologies can be transferred across vehicle types as technologies evolve and costs decrease. Slower along the adoption timeline are more specialized vehicles like refuse and construction trucks (e.g., which represent a relatively small share of medium- and heavy-duty vehicles. [EPA-HQ-OAR-2019-0055-1313-A1, p.25]

Projections of zero-emission sales are based on CALSTART's quantitative and qualitative assessments of zero-emission feasibility based on technology readiness (i.e., availability and suitability of the technology to an application); fleet bias towards new technologies (i.e., preference towards technology risk and reliability, and time it takes for fleets to have confidence in a new technology), and scalability for different vehicle segments (i.e., how fast manufacturers can scale up production, accounting for different levels of supply scalability with OEM market share and financial position). [EPA-HQ-OAR-2019-0055-1313-A1, p.25]

Figure 16 below shows CALSTART's projections of zero-emission medium- and heavy duty vehicle sales in alignment with the Global MOU discussed above, which commits to 30 percent zero-emission truck and bus sales by 2030 and 100 percent sales by 2040 (Al- Alawi, 2022b).19 The figure below presents only the Class 4-8 sales targets associated with this analysis. The dashed black line represents the sales-weighted average across all categories of Class 4-8 vehicles. In model year 2027, sales of zero-emission Class 4-8 vehicles represent approximately 20 percent of total sales; 28 percent in model year 2028, 40 percent in model year 2029 and 50 percent in model year 2030. These sales levels exceed the sales weighted average requirements in the ACT standard. [EPA-HQ-OAR-2019-0055-1313-A1, p.25]

> 19 Buses and passenger shuttles include transit buses, school buses, coach buses, and shuttles used at locations such as airports and hotels. Urban and regional delivery vehicles include single unit trucks. Short-haul tractors include drayage, intracity, and

lower mileage intercity operations. Examples of construction vehicles include utility trucks and dump trucks.

The final rule should achieve zero-emission vehicle deployments of at least 18 percent, 26 percent, and 34 percent in model years 2027-2029, equivalent to those in states' Advanced Clean Trucks standard. [EPA-HQ-OAR-2019-0055-1313-A1, p.26]

Organization: *Center for Climate and Energy Solutions (C2ES)*

In short-haul medium- and heavy-duty applications, many vehicles' use cases make them particularly well-suited to early adoption of electrification technology. For example, slow speeds, frequent stops, and relatively predictable routes of last-mile delivery vehicles enable them to fully utilize the advantages of regenerative braking and the cost savings of depot charging. [EPA-HQ-OAR-2019-0055-1165-A1, p.2]

In the heavy-duty sector, transit and school buses are also favorable for early adoption of zero emission vehicle (ZEV) technologies, with their predictable routes and charging times. Because these vehicles are most often used by children and other vulnerable populations, the reduction of air pollution from these vehicles is particularly impactful in historically marginalized communities. [EPA-HQ-OAR-2019-0055-1165-A1, p.2]

Last year's passage of the Infrastructure Investment and Jobs Act (IIJA) marked a significant commitment to the development and deployment of low- and zero-emission bus technologies. The bill's more than $5 billion in funding for electric and alternative fuel school buses, alongside its $4 billion in funding for transit bus electrification, related infrastructure, and workforce development, will build on existing momentum in the field to accelerate the deployment of zero-emission technologies in the coming decade. [EPA-HQ-OAR-2019-0055-1165-A1, p.2]

The market is currently moving much more rapidly toward electrification than was expected at the time EPA initially finalized the Phase 2 standards in 2016. In considering whether and to what extent to make targeted adjustments to the Phase 2 standards, EPA cites two vastly different projections for 2030 market penetration of ZEV powertrains by total vehicle miles traveled: the U.S. Energy Information Administration's 2018 Annual Energy Outlook, which projects 0.08 percent, and the 2018 NREL Electrification Futures Study, which projects 29 percent. However, the more recent 2022 Annual Energy Outlook projects this share will be 13 percent by 2050.5 Given the developments in the market and the industry since then, C2ES believes more optimistic projections are more appropriate. [EPA-HQ-OAR-2019-0055-1165-A1, pp.2-3]

> 5 U.S. Energy Information Administration, *Annual Energy Outlook 2022* (Washington, DC: U.S. Department of Energy, 2022), https://www.eia.gov/outlooks/aeo/pdf/AEO2022_Narrative.pdf.

Based on recent progress in battery technology development extending range and reducing cost, in combination with increasing corporate ambition and federal procurement commitments, BloombergNEF's 2021 Electric Vehicle Outlook predicts that "battery electric trucks of any size become the cheapest option for several use cases in the 2020s."6 For example, Atlas Public

Policy finds that, as of February 2022, the total cost of ownership of the forthcoming electric Ford F-150 Lightning—one of the most popular pickup truck models in the U.S. market—is 17 percent lower than its gas-powered version.7 The Environmental Defense Fund and ROUSH Industries also project that electric versions of all class 3, 5, 7, and 8 vehicles will reach parity in total cost of ownership with their diesel counterparts by 2027, and all apart from shuttle buses will reach purchase price parity by the same year.8 [EPA-HQ-OAR-2019-0055-1165-A1, p.3]

8 Vishnu Nair et al., *Technical Review of Medium and Heavy-Duty Electrification Costs for MY 2027-2030* (Environmental Defense Fund and ROUSH Industries, 2022), http://blogs.edf.org/climate411/files/2022/02/EDF-MDHD-Electrification-v1.6_20220209.pdf.

Recent federal policy developments since the 2020 Advanced Notice of Proposed Rulemaking also lend additional funding and political support to the development of the nascent heavy-duty ZEV industry in the United States. The IIJA includes a transformative investment in capital funding to support battery technology development and targeted ZEV deployment. [EPA-HQ-OAR-2019-0055-1165-A1, p.3]

As EPA references throughout the proposed rule, momentum is also building at the state and local levels, as states move to adopt California's Advanced Clean Trucks standards. 15 states and the District of Columbia signed the Multi-state Medium- and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding setting a target of making 100 percent of new trucks zero-emission by 2050 and 30 percent zero-emission by 2030.9 Additionally, cities including Los Angeles and Boston have committed to fully electrifying their municipal fleets, including their heavy-duty transit vehicles. 10 [EPA-HQ-OAR-2019-0055-1165-A1, p.3]

9 Multi-State Zero Emission Vehicle Task Force, Multi-state Medium- and Heavy-duty Zero Emission Vehicle Memorandum of Understanding, (signed July 13, 2020), https://ww2.arb.ca.gov/sites/default/files/2020-07/Multistate- Truck-ZEV-Governors-MOU-20200714.pdf.

10 Steve Hanley, 'Electric Vehicle Master Plan–10,000 EVs for Los Angeles,' *CleanTechnica*, April 12, 2022, https://cleantechnica.com/2022/04/12/electric-vehicle-master-plan-10000-evs-for-los-angeles; 'Boston's Zero- Emission Vehicle Roadmap Summary,' Boston Transportation Department, Last modified October 2020, https://www.boston.gov/sites/default/files/file/2020/10/Executive%20Summary.pdf.

One successful example of heavy-duty fleet electrification can be found in Antelope Valley, California, which transitioned its entire transit fleet to electric in 2022, a full 18 years ahead of the state's 2040 electrification mandate.11 The fleet now includes 57 zero-emission buses, 10 EV microtransit vans, and 20 battery-electric commuter coaches, serving a community with more than 450,000 residents. The agency reported no disruptions to service and millions of dollars saved in avoided diesel fuel costs, as well as significant emissions reduction benefits. This successful example demonstrates not only that fleet electrification is possible, but it also sets a model for other transit authorities to follow. [EPA-HQ-OAR-2019-0055-1165-A1, p.3]

> 11 Antelope Valley Transit Authority, 'AVTA Becomes the First All-Electric Zero-Emission Transit Agency in North America,' press release, March 16, 2022, https://www.avta.com/avta-becomes-first-all-electric-zero-emission-transit-agency.

Given these developments in both technology advancement and policy support, EPA should adopt the most stringent emissions standards feasible with the earliest feasible target date. [EPA-HQ-OAR-2019-0055-1165-A1, p.3]

Organization: *ChargePoint, Inc. (ChargePoint)*

In 2020, 15 states and the District of Columbia signed a joint MOU pledging to achieve a 30% heavy duty electric vehicle (HDEV) market penetration by 2030 and 100% market penetration by 2050.5 Additionally, six of these MOU states have already adopted the Advance Clean Trucks (ACT) standard to set a minimum level of ZEV sales at nearly 20 percent of Class 4-8 sales in model year 2027, nearly 30 percent in model year 2028, and nearly 40 percent in model year 2029.6 Although, EPA concludes MDHVs will have 1.5% market penetration by 2027, ChargePoint strongly urges EPA to take the ACT standard market's impact into consideration moving forward in the Clean Trucks Plan. ChargePoint would strongly suggest federal deployment standards match those of the ACT in order to urge a swifter adoption of ZEV vehicles on our highways and aiding in the reduction of NOx, VOC, and GHG emissions from the MDHV sector. Based on the adoptions of the ACT plan, manufacturers will be required to sell between 40% and 75% ZEVs to the MHDV sector by 2035. [EPA-HQ-OAR-2019-0055-1294, p. 2]

> 5 https://calstart.org/wp-content/uploads/2022/02/ZIO-ZETs-Report_Updated-Final-II.pdf

> 6 Based on sales-weighted averages of zero-emission vehicle sales requirements in the Advanced Clean Trucks standard for Class 4-8 straight trucks and Class 7-8 tractors.

Organization: *Clean Air Task Force, Environmental Law & Policy Center, National Parks Conservation Association, and Sierra Club*

Zero-emission technologies can achieve significant pollutant reductions and are already being deployed within the heavy-duty fleet today. Despite the increasing growth of these technologies, EPA undermines its proposed criteria pollutant and GHG programs by greatly underestimating baseline (business-as-usual) heavy-duty zero-emission vehicle (HD ZEV) market penetration in MY 2027 and later. As a result of this underestimate, EPA proposes less stringent emissions standards than are warranted; overlooks the generation of a significant amount of credits that will allow vehicles to pollute at higher levels; and inadvertently exempts many vehicles from having to install any emissions controls to meet GHG standards. EPA's proposed HD ZEV baseline penetration rate of 1.5% for MY 2027 is based on outdated information and flawed methodology. It also fails to account for current market projections indicating significantly higher baseline sales; HD ZEV sales required by the Advanced Clean Trucks (ACT) rule and other state-level requirements; federal, state, local, and private sector commitments and incentives; and recent cost estimates supporting the viability of HD ZEVs across vehicle segments. Based on our analysis, EPA should revise its assessment of baseline HD ZEV penetration to at least 8–11% for MY 2027, and 19–27% by MY 2030. This correction is necessary for the standards to perform as EPA intends. In addition, we urge EPA to use this rulemaking to drive additional ZEV deployment in the heavy-duty sector in light of the current and rapidly increasing feasibility of zero-emission technologies across the range of HDV classes and applications. [EPA-HQ-OAR-2019-0055-1302-A1, pp.7-8]

Advancements in zero-emission technologies and the rapid growth of HD ZEV sales have created a critical need for EPA to update its Phase 2 GHG standards. But by dramatically underestimating baseline HD ZEV penetration and failing to include zero-emission technologies in its standard-setting analysis, EPA proposes unjustifiably weak standards that will effectively exempt many vehicles from installing any GHG emissions control technologies. [EPA-HQ-OAR-2019-0055-1302-A1, p.8]

EPA has the opportunity in this rulemaking to set a strong foundation for ambitious future rules that will achieve significant emissions reductions through widespread deployment of zero-emission technologies within the heavy-duty sector. Both now and in the future, EPA must fully analyze zero-emission technologies as feasible emissions control technologies, and it must set standards that reflect these technologies' deep emissions reductions capability. Electrification and fuel cell technologies are, or will soon be, feasible and cost-effective across the full range of HDVs, including long-haul applications. In order to achieve the United States' climate goals and carry out the Clean Air Act's mandate to protect public health and welfare, EPA must forge paths toward greater acceleration of zero-emission technology deployment in the entire heavy-duty sector. [EPA-HQ-OAR-2019-0055-1302-A1, pp.8-9]

EPA's goal of strengthening existing criteria pollutant and GHG standards for MY 2027 and later HDVs is appropriate considering the urgent need to address these air pollutants and the significant harms they cause to public health and welfare. However, the Agency's proposed standards are too lenient, in part because they rely on inaccurate estimates of future baseline HD ZEV market penetration levels, and because they fail to further drive the implementation of zero-emission technologies that can achieve deep emissions reductions. For the reasons explained in this section, instead of EPA's proposed 1.5% HD ZEV sales estimate for MY 2027, the Agency should—at a minimum—assume baseline HD ZEV sales will progress such that they reach between 8% and 11% by MY 2027, and between 19% and 27% by MY 2030.54 Moreover, because zero-emission technologies are already feasible and cost-competitive in many HD market segments, including those for which EPA proposes revisions, in order to fulfill its obligations under the Clean Air Act the Agency should adopt standards that would accelerate the deployment of these technologies above these baseline estimates. [EPA-HQ-OAR-2019-0055-1302-A1, p.20]

54 EPA’s 1.5% HD ZEV baseline penetration rate applies to Class 4–8 HDVs and omits vehicles in Classes 2b and 3. EPA also is not proposing adjusting standards for long-haul trucks. Accordingly, the 8–11% estimate for MY 2027 HD ZEV sales includes vehicles in Classes 4–8 and not Class 2b/3 vehicles and not long-haul tractors. For greater detail on the assumptions underlying this estimate, please see Appendix A. Including Class 2b and 3 vehicles would raise baseline ZEV penetration rates even higher, given the rapid market advancements in Class 2b and 3 ZEVs. Throughout this section, 'heavy-duty' vehicles only refer to Class 4–8 vehicles and not Class 2b and 3.

The Proposal’s underestimate of the baseline market penetration of HD ZEVs and its failure to propose standards that further drive adoption of zero-emission technologies ignores the Agency’s obligations under the Clean Air Act and weakens the proposed standards in several ways:

1. Considering more accurate (higher) baseline HD ZEV market penetration ‘could lead to a more stringent NOx emission standard,’ as EPA acknowledges. 87 Fed. Reg. at 17,561.
2. Underestimating the baseline market penetration of HD ZEVs will lead to the generation of a significant amount of credits that will dramatically undermine the goals of the NOx standards and fail to protect public health and welfare. 87 Fed. Reg. at 17,561.55 Allowing for ZEVs to generate NOx emissions credits is a significant departure from EPA’s prior rules,56 and a revised, more accurate baseline HD ZEV penetration estimate would require reconsideration of these credits to ensure that the rule reflects the greatest degree of emission reduction achievable, as is EPA’s statutory mandate.
3. Disregarding the feasibility of zero-emission technologies in establishing the stringency of the proposed criteria pollutant standards unjustifiably takes proven emission reduction technologies off the table. [EPA-HQ-OAR-2019-0055-1302-A1, pp.20-21]

55 EPA notes that it includes an FEL cap on NOx emissions to help limit the impact credits generated from BEVs or FCEVs could have in enabling vehicles to exceed the NOx standard. However, if HD ZEV market penetration is higher than EPA projects, 'there is the potential for a greater portion of CI engines to emit up to the level of the FEL cap,' 87 Fed. Reg. at 17,560, further undermining the goals of the regulatory program. EPA notes the importance of 'consider[ing] what impact NOx emissions credits generated from BEVs and FCEVs might have on the NOx emission reductions expected from the proposed rulemaking. Id. at 17,561. Further, as discussed in Section IV.D.2.c of these comments, EPA’s proposed FEL cap is unreasonably high.

56 See 87 Fed. Reg. at 17,556 ('However, under the current criteria pollutant program, manufacturers do not have a pathway to generate NOx emission credits for HEVs, BEVs, or FCEVs. For BEVs and FCEVs, current 40 CFR 86.016-1(d)(4) stipulates that these technologies may not generate NOx emission credits…'); id. at 17,561–62 (proposing to allow ZEVs to generate NOx emissions credits); 40 CFR 86.016-1(d)(4) ('Electric heavy-duty vehicles may not generate NOx or PM emission credits.').

4. Because the GHG standards apply as a fleet average, by underestimating the MY 2027 HD ZEV market penetration in the Proposal, EPA in turn underestimates the percentage of vehicles that would be able to meet the current Phase 2 standards without installing emission-reduction

technologies, undermining the program’s goal of requiring all conventional vehicles to install such controls.57

57 EPA explains in the Proposal that '[t]he intent of the existing HD GHG Phase 2 program was to set the stringency of the standards at a level that all conventional vehicles would need to install some level and combination of emission-reducing technologies or offset another conventional vehicle not installing such technology, since at that time we predicted very little market penetration of EVs.' 87 Fed. Reg. at 17,603.

5. Failing to revisit the GHG standards with an approach that would further drive adoption of zero-emission technologies—a regulatory path that is clearly feasible—results in standards that fall far short of achieving necessary climate and health benefits. [EPA-HQ-OAR-2019-0055-1302-A1, p.21]

The combination of applying an unreasonably low baseline HD ZEV market penetration estimate and failing to set criteria pollutant and GHG standards that further drive adoption of zero-emission technologies means that not only does EPA fail to set technology-forcing standards, as Congress directed it to do, but that the Agency actually limits itself to technologies that are inferior to what is available today. See NRDC v. EPA, 655 F.2d at 328 (emphasizing that EPA should ‘press for the development and application of improved technology rather than be limited by that which exists today’). [EPA-HQ-OAR-2019-0055-1302-A1, p.21]

The Proposal underestimates baseline HD ZEV market penetration in several ways. First, EPA bases its estimate on the number of HD ZEVs it expects as a result of California’s regulatory requirements for HDVs in 2027, extrapolated to a national level, but its methodology is flawed for several reasons. In particular, EPA relies on HD ZEV projections from California’s ACT58 rulemaking in 2019, which are based on projected 2027 HD sales that are significant underestimates—notably lower than EPA’s own projections in its MOtor Vehicle Emission Simulator (MOVES) model and when compared to historical HDV sales data, as discussed in more detail below. As a result, the Proposal’s baseline ZEV sales projections for California in 2027 are unreasonably low and out of line with other, more accurate data and information. In calculating its baseline HD ZEV penetration estimate, EPA should rely on its own up-to-date MOVES data (which is also more in line with historical sales data) rather than California’s 2019 projections. [EPA-HQ-OAR-2019-0055-1302-A1, pp.20-21]

58 CARB, Advanced Clean Trucks Regulation—Final Regulation Order (Mar. 15, 2021), https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/fro2.pdf.

Further, in extrapolating to the national level, EPA relies on a ratio from a 2021 report by ICCT on U.S. and Canada ZEV sales. But there is no reason to believe that this ratio will continue to hold in the future. Moreover, EPA ignores the HD ZEV sales that will result in other states that have already adopted the ACT rule, as well as those that have signed the Multi-State Medium- and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding (MOU),59 which targets ZEV sales and commits to ZEVs achieving 30% of all HDV sales by 2030 and 100% of all HDV sales by 2050. If EPA used MOVES data and looked at these existing state-level commitments, the baseline HD ZEV market penetration for 2027 would be significantly higher than that calculated in the Proposal. [EPA-HQ-OAR-2019-0055-1302-A1, p.21]

> 59 See NESCAUM, Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Memorandum of Understanding (NESCAUM MOU) (last accessed May 10, 2022), https://www.nescaum.org/documents/mhdv-zev-mou-20220329.pdf/.

In addition to the flaws in EPA's methodology, the Agency ignores other highly relevant information that shows that its approach in the Proposal is a significant underestimate of baseline ZEV penetration in the heavy-duty sector. This includes:

- Current market projections indicating significantly higher baseline HD ZEV sales;
- Federal, state, local, and private sector actions supporting a much higher baseline HD ZEV penetration rate; and
- Recent HD ZEV cost estimates supporting the viability of ZEVs across vehicle segments. [EPA-HQ-OAR-2019-0055-1302-A1, p.22]

EPA must consider the additional data available and presented in these comments to fulfill its obligations to engage in reasoned decision making and to set emissions standards that are supported by the record. In particular, EPA should update its assessment of baseline HD ZEV penetration in the range of at least 8–11% for MY 2027, significantly higher than EPA's proposed rate of just 1.5%.60 Assuming that all states that have signed the MOU also adopt the ACT, national HD ZEV market penetration will reach 8% in 2027. Assuming that additional state programs and private sector commitments drive some ZEV penetration in non-MOU states, national HD ZEV market penetration will reach 11% in 2027. By 2030, baseline HD ZEV penetration will reach 19–27%, accordingly. It is important for EPA to consider baseline market penetrations beyond MY 2027 since manufacturers have three model years to carry back ZEV credits; sales between MY 2028 and MY 2030 are, consequently, available for compliance in 2027. See 81 Fed. Reg. at 73,638 ('The agencies proposed and are adopting for Phase 2 the five year credit life and three year deficit carry-over provisions from Phase 1 (40 CFR 1037.740(c) and 1037.745).'). High baseline HD ZEV penetration in MYs 2028–2030 would allow manufacturers to accrue large numbers of credits that they could apply to prior years, diluting the standards. The carry-over provision effectively allows manufacturers to average sales across a multi-year period; having permitted compliance on a multi-year average basis, EPA is required to examine baseline market penetration across the same multi-year period. [EPA-HQ-OAR-2019-0055-1302-A1, pp.22-23]

> 60 See, e.g., 87 Fed. Reg. at 17,458 (noting that EPA 'may re-evaluate our approach, especially if we receive information showing higher BEV/FCEV market penetration in the MY 2027 or later timeframe'); id. at 17,471 (requesting comment on whether to include zero-emission technologies in the feasibility analysis for the final rule); id. at 17,599 (considering 'whether it would be appropriate in the final rule to increase the stringency of the standards more than what we have proposed'); id. (requesting information and data to support 'HD ZEV penetration rates of 5 or 10 percent (or higher)' in the MY 2027–2029 timeframe).

Moreover, to comply with its Clean Air Act obligations, EPA should go further than correcting its baseline HD ZEV penetration estimate by including zero-emission technologies in the technology packages underlying the criteria pollutant and GHG standards. EPA requested comment ‘on how the Agency can best consider the potential for ZEV technologies to significantly reduce air pollution from the heavy-duty vehicle sector.’ 87 Fed. Reg. at 17,420. As detailed below, zero-emission technologies are already available and cost-competitive in many HD market segments. Importantly, given technological advancements and substantial investments and commitments in the public and private sectors, greater adoption of zero-emission technologies is clearly feasible prior to MY 2030. In addition to these comments, EPA should consider the data presented in the comments on this Proposal submitted by the Moving Forward Network (MFN), Environmental Defense Fund (EDF), and ICCT, all of which further elaborate on the feasibility and importance of achieving significantly greater levels of ZEV penetration within the HD fleet.61 Doing so would fulfill EPA’s statutory mandate by delivering substantial climate and health benefits, as is detailed in the research supporting the MFN, EDF, and ICCT comments on this Proposal. [EPA-HQ-OAR-2019-0055-1302-A1, p.23]

> 61 When considering GHG standards that further drive adoption of zero-emission technologies, EPA should ensure that it preserves the original Phase 2 stringency for ICE vehicles. See, e.g., Sara Kelly et al, ICCT Comments on EPA’s Proposed Heavy-Duty Engine and Vehicle Standards 17–18, ICCT (May 10, 2022), https://theicct.org/wp-content/uploads/2022/04/public-webinar_10May2022.pdf (urging EPA to preserve the original Phase 2 stringency for internal combustion engine (ICE) vehicles by removing ZEV crediting and requiring all ICE vehicles to meet the original Phase 2 GHG standards).

Second, EPA wrongly assumes that California will continue to represent an oversized share of national HD ZEVs sales by failing to accurately capture the impact of other states’ policies on HD ZEV sales. The Proposal correctly points out that numerous states ‘have announced plans to shift the heavy-duty fleet toward zero-emission technology.’ 87 Fed. Reg. at 17,598.79 Yet when calculating baseline HD ZEV market penetration, EPA fails to discuss or account for the full range of state policies and commitments, particularly those from outside of California. Considering them would lead to substantially higher and more accurate baseline HD ZEV penetration rates. [EPA-HQ-OAR-2019-0055-1302-A1, p.26]

> 79 See, e.g., 87 Fed. Reg. at 17,595, n.813, n.814 (citing states’ and cities’ expansion of electric bus fleets); id. at 17,596–97 (noting that the 'BEV market for transit and school buses continues to grow,' and identifying several cities with ZEV transit bus programs); id. at 17,597 (listing several states with ZEV school bus programs); id. at 17,598 (explaining the ACT rule and states that have signed a related MOU).

EPA notes that ‘[o]utside California, several states have signaled interest in shifting to heavy-duty ZEV technologies and/or establishing specific goals to increase the heavy-duty electric vehicle market.’ 87 Fed. Reg. at 17,598. EPA further explains that 15 states and the District of Columbia have signed the MOU targeting ZEV sales equaling 30% of all HDV sales by 2030 and 100% of all HDV sales by 2050. 87 Fed. Reg. at 17,598. The Proposal fails to include both Virginia and Nevada as MOU signatories, and these two states bring the total MOU signatories to 17 states and the District of Columbia.80 HDV sales in MOU states, including California, make up a significant portion of national HDV sales—about 36.5%.81 In March 2022, Northeast States for Coordinated Air Use Management (NESCAUM) and the MOU states issued a comprehensive and detailed draft Action Plan to meet their goals.82 Despite mentioning the MOU, the Proposal does not factor into its baseline HD ZEV market penetration the fact that ZEVs will be added to the heavy-duty fleet more rapidly in these 17 states and D.C., which make up more than a third of national HDV sales.83 An analysis by ICCT estimates that 36% of HDV sales in MOU states (excluding California) would be ZEVs in 2030 if all states implement the goal set out in the MOU.84 ICCT estimates that this would translate to 153,820 HD ZEV sales in MOU states (excluding California) in 2030.85 [EPA-HQ-OAR-2019-0055-1302-A1, pp.26-27]

80 Electrification Coalition, Nevada Joins Multi-State Agreement to Electrify Trucks and Buses (Mar. 31, 2022), https://www.electrificationcoalition.org/nevada-joins-multi-state-agreement-to-electrify-trucks-and-buses/; Sierra Club, Governor Northam Signs Virginia onto Multi-State Agreement to Electrify Trucks and Buses (Dec. 9, 2021), https://www.sierraclub.org/press-releases/2021/12/governor-northam-signs-virginia-multi-state-agreement-electrify-trucks-and.

81 Claire Buysse, et al., Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the UnitedStates, ICCT (Apr. 8, 2022). This is consistent with MOVES3 projections for MY 2027, which show 219,092 heavy-duty sales in all the MOU states, as compared to 606,659 total heavy-duty sales nationally, or 36% of all sales. See Appendix A for the relevant MOVES3 sales projections.

82 NESCAUM, Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Action Plan: A Policy Framework to Eliminate Harmful Truck and Bus Emissions, Draft for Public Comment (NESCAUM Action Plan) (Mar. 10, 2022), https://www.nescaum.org/documents/mhd-zev-action-plan-public-draft-03-10-2022.pdf.

83 The MOU signatories are: California, Connecticut, Colorado, Hawaii, Maine, Maryland, Massachusetts, Nevada, New Jersey, New York, North Carolina, Oregon, Pennsylvania, Rhode Island, Vermont, Virginia, Washington, and the District of Columbia. See NESCAUM MOU.

84 Arijit Sen et al., Benefits of the 2020 Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Memorandum of Understanding 5, ICCT (Apr. 2022), https://theicct.org/wp-content/uploads/2022/04/md-hd-mou-benefits-apr22.pdf.

85 Id. at 5, Figure 1; id. at 15, Table A4, excluding 2b/3 vehicles.

In addition to the MOU, EPA cites the adoption of the ACT rule in three states—New York, New Jersey, and Washington, 87 Fed. Reg. at 17,598 nn.846–48—but in fact, five states in addition to California have adopted the ACT rule,86 which with California would comprise 20%87 of total HDV sales in 2027.88 Other states also have relevant legislation underway. In May 2022, Connecticut passed legislation authorizing the state's Department of Energy and Environmental Protection to adopt the ACT rule.89 Maine has also made progress toward adopting ZEV standards for the state's HDVs and is currently seeking additional public and stakeholder comment on its proposed ACT rule.90 The Proposal correctly notes the expectation that more states will follow,91 and Colorado, Illinois, and Vermont have 'signaled plans to weigh the new regulations' as well.92 HD ZEV sales in ACT-adopting states will need to reach between 30% (Class 7–8 tractors) and 50% (Class 4–8 trucks) by 2030, and 40% (Class 7–8 tractors) to 75% (Class 4–8 trucks) by 2035 in order to meet the ACT targets.93 But again, EPA fails to account for the fact that the states that have adopted the ACT rule have committed to ZEV adoption at a more rapid pace than EPA projects, even absent any additional federal regulation, and that others are already taking action to join them. [EPA-HQ-OAR-2019-0055-1302-A1, pp.27-28]

86 States that have adopted the ACT rule include New York, New Jersey, and Washington, as cited in the Proposal, along with Oregon and Massachusetts.

87 Calculated using EPA MOVES3, https://www.epa.gov/moves/latest-version-motor-vehicle-emission-simulator-moves. See Appendix A for the relevant MOVES3 sales projections.

93 CARB, Advanced Clean Trucks Regulation, Final Regulation Order, Table A-1 at 5 (Mar. 15, 2021), https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/fro2.pdf; Rachel MacIntosh et al., Electric Vehicle Market Update 15, EDF (Apr. 2022), http://blogs.edf.org/climate411/files/2022/04/electric_vehicle_market_report_v6_april2022.pdf.

Instead of factoring these state policies directly into its calculations, EPA takes an approach that leads to a significant underestimate of baseline HD ZEV market penetration by MY 2027. In the DRIA, EPA cites a 2021 analysis by ICCT that notes that 42% of cumulative HD ZEVs sold through 2020 in the U.S. and Canada have been in California.94 This leads EPA to conclude that 42% of annual national HD ZEV sales will be in California in MY 2027. But this will not be the case in 2027. While California represents 42% of cumulative HD ZEV sales in the United States and Canada, it only comprises 10% of U.S. HDV registrations.95 As noted above, states that have signed the MOU, including California and other ACT-adopting states, represent 36.5% of HDV registrations.96 As these policies take effect in these states, the relative share of HD ZEV sales in California will fall, even as national sales increase. California would only represent 28% of total HD ZEV sales nationally if all MOU states achieve the ACT targets (with the MOU states representing 72% of total HD ZEV sales).97 And these figures do not account for the high possibility that other states beyond the MOU states also see growth in HD ZEV sales, as detailed in Section III.C below. [EPA-HQ-OAR-2019-0055-1302-A1, p.28]

94 Ben Sharpe & Claire Buysse, Zero-Emission Bus and Truck Market in the United States and Canada: A 2020 Update 5, ICCT (May 21, 2021), https://theicct.org/publication/zero-emission-bus-and-truck-market-in-the-united-states-and-canada-a-2020-update/.

95 For MY 2020. See Appendix A for details on these calculations.

96 Claire Buysse et al., Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the United States, ICCT (Apr. 8, 2022). See also MOVES3 projections for MY 2027.

97 See Appendix A for details on these calculations. Calculated using EPA MOVES3, https://www.epa.gov/moves/latest-version-motor-vehicle-emission-simulator-moves.

There has been a similar trend of other states making up a larger share of light-duty ZEV sales. In 2015, a total of 64,175 light-duty ZEVs were sold in the United States, with 53% sold in California.98 However, as of 2021, California's relative share has fallen to 35% as light-duty ZEV sales have dramatically accelerated nationally, driven by other federal and state policies and significant consumer interest in ZEVs (Figure 2). As of 2021, new light-duty ZEV sales totaled 166,582 in California (nearly 5 times higher than in 2015) and 473,426 nationally (nearly 7 times higher than in 2015).99 These trends demonstrate not only how quickly ZEV sales have accelerated but also how they have grown in states beyond California. Over the long term, with other state policies and federal incentives taking effect, regional differences in ZEV sales will diminish for HDVs, just as they have for light-duty vehicles.

[EPA-HQ-OAR-2019-0055-1302-A1, pp.28-29] [Figure 2 has footnote 100]

99 Id.

100 Developed using data from the Electric Vehicle Sales Dashboard. See id.

In light of this data, EPA should not calculate forward-looking national HD ZEV sales using outdated HDV sales estimates and backward-looking sales shares. Instead, EPA should factor in the impact of policies in other states beyond California in the Agency's estimate of baseline HD ZEV market penetration. This should include states that 1) have adopted the ACT rule; 2) have committed to the MOU; and 3) are taking actions to deploy zero-emission transit and school buses (where it is possible to separately quantify those actions). This would result in a baseline HD ZEV market penetration estimate of at least 8% by 2027 and 19% by 2030.101 [EPA-HQ-OAR-2019-0055-1302-A1, p.29]

101 This assumes MOU states adopt ACT targets for 2027 and 2030. For detailed description of the methodology to develop these estimates, see Appendix A.

Still, even these more accurate baseline estimates would fail to reflect growing HD ZEV deployment in states that may adopt regulatory policies in the future or deployment that is driven by local government programs and private sector investments, as discussed below in Section III.C. As such, a baseline HD ZEV market penetration of 8% by 2027 and 19% by 2030 would be conservative. Accounting for modest additional state and private sector actions would bring baseline HD ZEV market penetration to at least 11% by 2027 and 27% by 2030.102 In addition, the faster-than-expected gains in the cost-competitiveness of HD ZEVs, as detailed below in Section III.D, offers additional evidence that HD ZEV uptake will continue to increase and that a MY 2027 HD ZEV penetration rate of between 8% and 11% by 2027 is a feasible and conservative baseline estimate.103 [EPA-HQ-OAR-2019-0055-1302-A1, pp.29-30]

102 This assumes MOU states adopt ACT targets for 2027 and 2030 and non-MOU states achieve 4% HD ZEV penetration by 2027 and 11% HD ZEV penetration by 2030. For a detailed description of the methodology to develop these estimates, see Appendix A.

103 For a detailed description of the methodology to develop these estimates, see Appendix A.

Current market analyses project rapid growth in HD ZEVs by the late 2020s, further illustrating that EPA's proposed baseline market penetration is a significant underestimate and that standards that further drive adoption of zero-emission technologies are clearly feasible. [EPA-HQ-OAR-2019-0055-1302-A1, p.30]

In discussing advances to the HD ZEV market, EPA cites two modeled projections: the Energy Information Administration's (EIA) Annual Energy Outlook 2021 ('AEO 2021') and the National Renewable Energy Laboratory's (NREL) Electrification Futures Study (2018). EPA also requests comment on sources for estimates and projections of the HD ZEV market. There are additional and up-to-date projections that demonstrate much higher baseline national HD ZEV penetration than the limited information that EPA considered in the Proposal, as shown in Table 2 below. These include:

- Boston Consulting Group discusses the fact that 'change is unfolding at electrifying speed in the commercial vehicle industry,' driven by economics and policies.104 The report predicts BEV sales in the range of 19–23% and FCEV sales in the range of 3–6%, with a central estimate of 25% ZEVs by 2030 (and 10% ZEVs by 2025). Even in its conservative scenario, zero-emission commercial vehicle sales would reach 6% in 2025 and 15% in 2030. [EPA-HQ-OAR-2019-0055-1302-A1, p.30]

  104 Peter Wiedenhoff et al., What the Shift to Zero-Emission Vehicle Means for Commercial Transportation, Boston Consulting Group (Mar. 22, 2022), https://www.bcg.com/en-us/publications/2022/what-the-shift-to-zero-emission-vehicles-means-for-commercial-transportation.

- NREL's 'Decarbonizing Medium- and Heavy-Duty On-Road Vehicles' report finds that 'zero-emission vehicles (ZEVs) can reach total-cost-of-driving parity with conventional diesel vehicles by 2035 for all medium- and heavy-duty (MD/HD) vehicle classes,' with smaller trucks and short-haul trucks achieving cost parity soon.105 The analysis concludes that 'demand for ZEV could rise rapidly...once cost parity is reached' and that ZEV sales could reach 42% by 2030.106 [EPA-HQ-OAR-2019-0055-1302-A1, p.30]

  105 Catherine Ledna et al., Decarbonizing Medium- & Heavy-Duty On-Road Vehicles: Zero-Emission Vehicles Cost Analysis 2, NREL (Mar. 2022), https://www.nrel.gov/docs/fy22osti/82081.pdf.

  106 Id. at 3.

- ACT Research's 'Charging Forward Update' report projects that BEVs will reach 21% of Class 4–8 sales by 2027.107

  107 Jennifer McNealy, ACT Research Releases Updated BEV and FCEV Study & Adoption Forecasts for NA CV Markets, ACT Research (Feb. 7, 2022), https://content.actresearch.net/blog/nacev-act-research-releases-updated-bev-and-fcev-study-adoption-forecasts-forna-cv-markets.

- The International Energy Agency's Global EV Outlook 2021 projects that due to federal and state policies incentivizing ZEVs and charging infrastructure, ZEV sales for buses and trucks will reach 20% and 8%, respectively, by 2030.108

  108 IEA, Prospects for Electric Vehicle Deployment (2021), https://www.iea.org/reports/global-ev-outlook-2021/prospects-for-electric-vehicle-deployment (IEA's definition appears to include Class 2b/3 categories).

- BNEF's Electric Vehicle Outlook 2021 states that 'in urban duty cycles, battery electric trucks of any size become the cheapest option for several use cases in the 2020s,' with 'battery electric trucks becoming a viable option for heavy-duty long-haul operations' by the late 2020s.109 BNEF's Economic Transition Scenario projects that U.S. HD ZEV sales will reach 5% in 2027 for commercial HDVs and 38% in 2027 for buses. [EPA-HQ-OAR-2019-0055-1302-A1, p.31]

109 BNEF, Electric Vehicle Outlook 2021 (2021), https://about.bnef.com/electric-vehicle-outlook/.

The AEO 2021 report that EPA cites in the Proposal projects that HD ZEVs will only make up 0.12% of new truck sales in 2027.110 This projection is substantially lower than other available market-based projections and should not be relied upon for the rulemaking. The model projects that only 485 electric medium- or heavy-duty vehicles will be sold in 2027, which is completely inconsistent with existing state policies and private sector commitments.111 Importantly, the National Energy Modeling System (NEMS), the model used for the AEO 2021 report, does not consider the impact of California and other states adopting the ACT rule or signing the MOU. NEMS also does not factor in total cost-of-ownership in calculating vehicle sales demand,112 does not appear to reflect the latest projected battery costs, and imposes exogenous maximum zero-emission technology penetration of 10%.113 [EPA-HQ-OAR-2019-0055-1302-A1, p.31]

110 87 Fed. Reg. at 17,596

112 EIA, Transportation Sector Demand Module of the National Energy Modeling System: Model Documentation (Dec. 2020), https://www.eia.gov/outlooks/aeo/nems/documentation/transportation/pdf/m070(2020).pdf.

113 National Energy Modeling System input file 'Max Share of Each Fuel Type' corresponding to parameter 'EFSHXG' for formula (199) as discussed in id. at 108. NEMS input files can be found at: https://www.eia.gov/outlooks/aeo/info_nems_archive.php

For its second source, EPA cites the NREL Electrification Futures Study (EFS).114 Compared to AEO 2021, NREL projects a greater market penetration of HD ZEVs, but the analysis is still dated compared to more recent analyses. NREL EFS projects 2027 HD ZEV sales shares of 5% for Class 3–6, 2% for Class 7–8, and 9% for buses in its Medium Scenario; and 10% for Class 3–6, 7% for Class 7–8, and 45% for buses in its High Scenario. As NREL’s analysis was completed in 2017, it does not account for all the significant advancements in the HD ZEV market that EPA proposes to take into account in this rulemaking. For instance, the NREL EFS assumes that battery costs decline such that they reach $135/kWh by 2050. This is a much slower pace than has been demonstrated in the real world. In fact, according to BNEF, the average lithium-ion battery pack cost was $137/kWh in 2020, down from $295/kWh in 2016.115 Projected battery costs have fallen significantly to such an extent that a report by Roush Industries notes that ‘battery cost projections made in 2017-2018 are already obsolete.’116 Analysis conducted by Roush finds that battery costs could reach $59–68/kWh by 2027. Other analyses have cited costs of $100/kWh by 2025.117 Furthermore, the NREL EFS pre-dates California's ACT program and the MOU signed by 17 states, so it does not consider the impact that these policies will have on market evolution. [EPA-HQ-OAR-2019-0055-1302-A1, pp.31-32]

Accordingly, EPA should place greater weight on recent studies that more accurately reflect a current assessment of the HD ZEV market, and which project more rapid market penetration of HD ZEVs in the coming years. [EPA-HQ-OAR-2019-0055-1302-A1, p.32]

122 BNEF, Electric Vehicle Outlook 2021 (2021).

EPA's proposed HD ZEV market penetration estimate also fails to account for plans by entities at all levels within the public and private spheres beyond state-adopted ACT rules and the MOU, which would significantly expand the HD ZEV market. This suggests that even a MY 2027 baseline HD ZEV penetration rate of 8% to 11% is a conservative estimate. The federal government, cities, and states across the country have implemented plans to transition their heavy-duty fleets to ZEVs. The private sector, too, has seen rapidly increasing commitments from both manufacturers and fleet managers. The Proposal notes a few of these public and private commitments, but it fails to capture the depth and breadth of the pace at which these commitments and goals are being announced. This section offers a non-exhaustive survey of some of the many goals and commitments already made; several sources are regularly updated and available to EPA to track the rapidly expanding HD ZEV market.123 A more accurate picture of the national HD ZEV landscape clearly indicates that EPA's estimate of only 9,376 HD ZEV sales nationally by MY 2027124 is a gross underestimate—especially given that fleets have already ordered or deployed at least 19,000 Class 4–8 ZEVs125—and supports a baseline HD ZEV market penetration of at least 8–11% in MY 2027. In addition, these goals and commitments further show the need for EPA to treat zero-emission technologies as feasible and to incorporate them into its standards-setting analysis. [EPA-HQ-OAR-2019-0055-1302-A1, p.33]

123 For updated information, EPA should consult the following resources: EDF, Electric Fleet Deployment & Commitment List (last accessed May 10, 2022), https://docs.google.com/spreadsheets/d/1l0m2Do1mjSemrb_DT40YNGou4o2m2Ee-KLSvHC-5vAc/edit#gid=2049 738669 (tracking fleet-level orders, vehicles in operation, and commitments); CALSTART, Zero-Emission Technology Inventory (2022), https://globaldrivetozero.org/tools/zero-emission-technology-inventory/ (tracking HDV ZEV models and commercial availability); DOE, Federal and State Laws and Incentives, Alternative Fuels Data Center (last accessed May 10, 2022), https://afdc.energy.gov/laws (tracking federal, state, and local laws and commitments within all ZEV sectors).

124 87 Fed. Reg. at 17,600.

125 This value was calculated by selecting the Class 4–8 trucks listed as deployed or ordered in EDF's Electric Fleet Deployment & Commitment List, as of May 10, 2022. The list is regularly updated to include additional new commitments. EDF, Electric Fleet Deployment & Commitment List.

On the state level, commitments and incentives extend beyond the ACT rule and the MOU. For example, CARB's Innovative Clean Transit regulation directs large transit agencies to make 25% of new bus purchases zero-emission in 2023, increasing to 50% by 2026 and 100% by 2029.126 More than 3,500 BEV and hydrogen FCEV transit buses are already in operation or on order nationwide.127 New York has also signed into law plans to electrify all school buses in the state by 2035—yielding 50,000 electric HDVs in that state alone.128 CARB is also developing the Advanced Clean Fleets (ACF) rule, which EPA did not analyze in the Proposal, to complement the ACT rule. The ACF rule will regulate public and private fleets, new mobility fleets, large employer fleets, rental fleets, and delivery fleets, with the 'goal of achieving a zero-emission public bus and truck fleet in California by 2045 and significantly earlier for certain market segments like last mile delivery and drayage trucks.'129 In addition, California's Low NOx Heavy-Duty Omnibus Regulation (the 'Omnibus'), adopted in 2020, 'will cut NOx emissions from heavy-duty trucks by roughly 75 percent below current standards beginning in 2024 and 90 percent in 2027.'130 These regulations are expected to be fully effective by 2024, likely increasing HD ZEV uptake in California even more than the ACT rule alone.131 [EPA-HQ-OAR-2019-0055-1302-A1, pp.33-34]

131 Id.

In addition, state-level commitments do not end with states that have enacted the ACT rule or signed the MOU. In fact, goals have been announced, commitments made, regulations passed, or financial incentives provided (such as rebates or funding) specific to the heavy-duty sector in at least 39 states plus the District of Columbia.132 These heavy-duty sector programs are in addition to many broader state and local programs targeted at ZEV adoption generally (across all vehicle sectors), which exist in all 50 states133 and include: medium- and heavy-duty or diesel emissions reduction funding, rebates, or HDV replacement grants in states such as Delaware, Idaho, Indiana, Iowa, Michigan, Montana, New Mexico, Ohio, South Dakota, Texas, and Wyoming;134 allowance for HD ZEVs to exceed weight limits in Arizona; ZEV school and/or transit bus programs and incentives in Illinois, Minnesota, Missouri, Oklahoma, Texas, West Virginia, and Wisconsin; and a diesel refuse truck replacement program in Nebraska.135 Other states beyond those that have adopted the ACT rule or signed the MOU have also been forming smaller regional-specific collaborations aimed at HD ZEV adoption. For example, Illinois, Indiana, Michigan, Minnesota, and Wisconsin recently signed an MOU establishing the Regional Electric Vehicle Midwest Coalition (REV Midwest), which 'aims to create [a] cohesive regional framework to accelerate the transition to electric vehicles.'136 One of REV Midwest's three key foundations is to accelerate medium- and heavy-duty fleet electrification.137 These state actions provide strong support for reducing emissions from the heavy-duty sector by transitioning to ZEVs, which will further enable HD ZEV market penetration in excess of that projected in the Proposal. [EPA-HQ-OAR-2019-0055-1302-A1, pp.34-35]

132 See DOE, Federal and State Laws and Incentives, Alternative Fuels Data Center (last accessed May 10, 2022), https://afdc.energy.gov/laws (tracking federal, state, and local laws and commitments within all ZEV sectors).

133 Information on regulations and programs in all states, including those that have signed the MOU or adopted ACT regulations, is available in id., and from the NC Clean Energy Technology Center, Database of State Incentives for Renewables and Efficiency (last accessed May 10, 2022), https://programs.dsireusa.org/system/program.

134 Many of these programs are funded as part of the Volkswagen Environmental Trust/Volkswagen settlement.

135 This list is compiled from information available at DOE, Federal and State Laws and Incentives, Alternative Fuels Data Center (last accessed May 10, 2022), https://afdc.energy.gov/laws (does not include the vast array of programs and incentives available in the MOU and ACT states).

The federal government's procurement goals and commitments will also lead to greater HD ZEV market penetration. President Biden recently signed Executive Order 14,057, directing the federal government to transition to 100% ZEV acquisitions for all federal fleets (including HDVs) by 2035.138 The federal fleet is large, and in 2020 included 39,246 heavy-duty trucks (Classes 5–8), 103,215 medium-duty trucks (Classes 2b–4), and 8,057 buses.139 As this large number of vehicles ages, the directive in the Executive Order will further drive HD ZEV penetration as federal agencies replace conventional vehicles with ZEVs. The ZEV transition within the federal fleet is already underway, with the General Services Administration (GSA) doubling the amount of ZEV medium- and heavy-duty models available to federal agencies.140 In accordance with Executive Order 14,057, individual agencies will develop and annually update their own ZEV fleet strategies to meet the ZEV target in the Executive Order, and already have been directed to 'maximiz[e] acquisition and deployment of zero-emission light-, medium-, and heavy-duty vehicles where the General Services Administration…offers one or more zero-emission vehicle options for that vehicle class.'141 [EPA-HQ-OAR-2019-0055-1302-A1, p.35]

The federal government has also committed significant funds toward achieving increased HD ZEV development and demand.142 The Infrastructure Investment and Jobs Act of 2021 (the 'Bipartisan Infrastructure Law') 'provides critical funding for states to accelerate MHD vehicle electrification.'143 Examples of programs that the law will fund include: EPA's Clean School Bus Program with $5 billion over the next five years (FY 2022–2026) to replace conventional school buses with ZEV models;144 the Department of Transportation's (DOT) Low-No Program with $5.5 billion toward purchases of low- or no-emission transit vehicles, 'more than 10 times greater than the previous five years of funding;'145 and DOT's Grants for Buses and Bus Facilities Program with $5.1 billion over the next five years to support modernizing and electrifying bus fleets.146 DOT's Federal Transit Administration also plans to award funding for ZEVs through the American Rescue Plan, including $7 million to replace diesel school buses with ZEV buses in underserved communities, and an additional $10 million for ZEV school buses through the Diesel Emissions Reduction Act School Bus Rebate Program.147 DOE has also increased funding for ZEV research, allocating $127 million in funding to industry through its SuperTruck 3 program, 'focused for the first time on reducing costs and improving durability in hydrogen and battery electric trucks.'148 EPA does not discuss or account for the Bipartisan Infrastructure Law funding or other recent federal funding in the Proposal, and these commitments will certainly accelerate the pace of growth in the HD ZEV market nationwide. When adopting the final rule, EPA must consider the impacts that this federal funding will have on HD ZEV development and uptake. [EPA-HQ-OAR-2019-0055-1302-A1, pp.35-36]

See also Rachel MacIntosh et al., Electric Vehicle Market Update 18, EDF (Apr. 2022).

148 The White House, Fact Sheet: Vice President Harris Announces Actions to Accelerate Clean Transit Buses, School Buses, and Trucks (Mar. 7, 2022), https://www.whitehouse.gov/briefing-room/statements-releases/2022/03/07/fact-sheet-vice-president-harris-announces-actions-to-accelerate-clean-transit-buses-school-buses-and-trucks/. Multiple other governmental and industry research projects are focused on ZEVs, including: Advanced Research on Integrated Energy Systems (providing a real-world environment for testing large battery and fuel cell electric trucks); Million Mile Fuel Cell Truck consortium (developing cost effective technology with industry for next generation fuel cells); and 21st Century Truck Partnership (launching a new electrification tech team focused on removing barriers to wide-scale truck electrification and deploying technology to improve freight efficiency).

Cities and other local governments are also committing to a shift to zero-emission technologies in the heavy-duty sector. EPA notes one specific commitment by the Los Angeles Department of Transportation (LADOT) to electrify its entire transit fleet by 2030 or sooner. 87 Fed. Reg. 17,597. The commitment from just this one municipal agency will yield approximately 501 ZEVs by 2030.149 But several other cities and states have announced commitments specifically aimed at electrifying local fleets. As EPA notes, numerous other cities and localities across the country have set ZEV transit and/or school bus commitments or piloted ZEV bus programs. 87 Fed. Reg. at 17,597. EPA lists ZEV transit bus programs in Chicago, Seattle, New York City, and Washington, D.C., and school bus programs in school districts in California, Virginia, Massachusetts, Michigan, Maryland, Illinois, New York, and Pennsylvania. 87 Fed. Reg. at 17,597. According to data from the World Resources Institute (WRI), in the six months prior to April 2022, ‘the number of committed electric school buses increased over 50 percent to a total of more than 1,800,’ and at least 37 states have either procured one or more electric school buses, or announced plans to do so, ‘with California, Maryland and Florida leading the way.’150 States and cities have also ordered other Class 4–8 ZEVs across the country, such as refuse and fire trucks, including in states beyond those that have signed the MOU or adopted the ACT rule, such as Wisconsin, Florida, Arizona, and Alaska. 151 Despite noting a few of these commitments, the Proposal fails to capture the speed and breadth of local government actions, and its projections fail to account for any significant HD ZEV penetration outside of California. All of these commitments provide further evidence that even baseline HD ZEV market penetrations within the range of 8–11% for MY 2027 and 19–27% for MY 2030 are conservative estimates. At least some modest level of HD ZEV uptake in states that have not adopted the ACT rule or signed the MOU is likely and would lead to baseline HD ZEV penetration of 11% or higher by MY 2027. [EPA-HQ-OAR-2019-0055-1302-A1, pp.37-38]

See also Leah Lazer and Lydia Freehafer, WRI, The State of Electric School Bus Adoption in the U.S. (Aug. 5, 2021), https://www.wri.org/insights/where-electric-school-buses-us; WRI, Dataset of Electric School Bus Adoption in the United States (last accessed May 10, 2022), https://datasets.wri.org/dataset/electric_school_bus_adoption; Hannah Hamilton et al., CALSTART, Zeroing in on ZEBs (Dec. 2021), https://calstart.org/wp-content/uploads/2022/01/2021-ZIO-ZEB-Final-Report_1.3.21.pdf. School buses have especially attractive potential for electrification, as districts have begun to look into using electric school bus fleets to provide vehicle-to-grid services, meaning that 'when electric school buses sit idle in the evenings and summer months, the batteries can be used to store and discharge electricity back to the grid during periods of peak demand when electricity is costlier,' which 'improves the economics of fleet electrification while reducing electricity distribution system costs for ratepayers.' NESCAUM Action Plan at 15–16; see also, e.g., The Lion Electric Co., Lion Electric Announces Successful Electric School Bus Vehicle-to-Grid Deployment with Con Edison in New York (Dec. 14, 2020), lion-electric-announces-successful-electric-school-bus-vehicle-to-grid-deployment-with-con-edison-in-new-york-301191980.html. 151 EDF, Electric Fleet Deployment & Commitment List (last accessed May 10, 2022), https://docs.google.com/spreadsheets/d/1l0m2Do1mjSemrb_DT40YNGou4o2m2Ee-KLSvHC-5vAc/edit#gid=2049738669 (listing 10,034 HD ZEVs already deployed or ordered by federal, state, and local governments).

As heavy-duty fleet managers establish their own environmental goals and recognize the increasingly favorable economics of ZEVs, both the speed of innovation and the demand for HD ZEVs are increasing at a rate that EPA’s proposed 1.5% market penetration does not reflect. A 2018 survey of fleet managers listed ‘sustainability and environmental goals’ as the primary motivator for transitioning to ZEVs, with ‘lower cost of ownership’ as the second most important factor.152 In fact, ‘[l]arge corporate fleets are responsible for much of the early momentum in commercial MHD fleet electrification…driven by corporate sustainability commitments and a desire to achieve operational savings.'153 These cost and sustainability motivations exist independent of regulatory requirements, and support the expectation that HD ZEV uptake will continue to grow in all states, including those that have not yet adopted more stringent regulations. While the Proposal mentions a few examples of fleet commitments to a zero-emission future, it again fails to capture the speed and breadth of these commitments that are driven not only by governmental policy but also by private industry interests, with commitments being made nationwide. [EPA-HQ-OAR-2019-0055-1302-A1, p.38]

152 See 87 Fed. Reg. at 17596; Steven Nadel & Peter Huether, Electrifying Trucks: From Delivery Vans to Buses to 18-Wheelers 10–11, American Council for an Energy-Efficient Economy (ACEE) (June 2021), https://www.aceee.org/research-report/t2102.

153 NESCAUM Action Plan at 16.

According to EDF's Electric Fleet Deployment & Commitment List (see Attachment 101 to these comments), commercial fleets have already ordered or deployed more than 164,000 medium- and heavy-duty electric vehicles, of which at least 19,000 are Class 4–8 electric vehicles.154 The Proposal cites a few examples of commercial fleets that have made efforts toward acquiring ZEVs, such as UPS, FedEx, DHL, Walmart, Anheuser-Busch, Amazon, and PepsiCo. 87 Fed. Reg. at 17,597. These orders cover the full range of heavy-duty applications—from last-mile delivery vehicles to trucks intended to cover longer distances—and include orders such as UPS's order of 10,000 Class 4 cargo vans155 and orders and/or deployments of over 2,500 Class 8 tractors by Amazon, UPS, PepsiCo, DHL, Walmart, and Anheuser-Busch.156 Walmart and PepsiCo have also both placed orders with Tesla for its upcoming electric Semi, for 130 and 100 trucks, respectively.157 Examples from just these six companies total 12,730 HD ZEVs already ordered or deployed, evidencing significant momentum toward greater deployment within private fleets. EPA should factor such commitments and deployments into its HD ZEV market penetration estimates. At the very least, these fleet commitments show significant momentum toward greater HD ZEV deployment within private fleets and offer further support for a MY 2027 baseline HD ZEV market penetration of 8–11%, as a conservative estimate. [EPA-HQ-OAR-2019-0055-1302-A1, pp.38-39]

154 These values were calculated from EDF's Electric Fleet Deployment & Commitment List as of May 10, 2022. The list is regularly updated to include additional new commitments. See id. See also NESCAUM Action Plan at 16.

Companies with heavy-duty fleets are also announcing their commitment to a zero-emissions future. Several of these commitments include aims to reduce carbon emissions by one-third to one-half by 2030.158 Amazon, PepsiCo, and Walmart all plan to reach net zero carbon emissions across their businesses by 2040, including their long-haul tractor operations.159 AT&T plans to be carbon neutral even earlier, by 2035.160 Anheuser-Busch plans to reduce carbon emissions by 25% by 2025, and FedEx is committed to 50% of its pickup and delivery fleet purchases being electric by 2025 and 100% by 2030.161 [EPA-HQ-OAR-2019-0055-1302-A1, p.39]

161 Id.

It is true that several large fleets such as those cited by EPA are some of the earliest adopters of HD ZEVs, but they are not alone. Interest in developing HD ZEV fleets is far-ranging, evidenced by the fact that over 135 different commercial fleets have either ordered or deployed HD ZEVs.162 Additionally, at least 59 commercial fleets, both large and small, have announced fleet-level commitments to increased ZEV penetration and/or reduced carbon emissions.163 In a recent survey of nearly 250 U.S.-based fleets that have used clean fuels and vehicles, nearly 85% said that their use of clean vehicle technologies would grow over the next five years.164 In considering what the heavy-duty sector will look like in MY 2027 and beyond, EPA must consider the breadth and scale of these announcements and the fact that these commitments are considered technologically and economically feasible by such a large range of fleet managers. [EPA-HQ-OAR-2019-0055-1302-A1, p.39]

Government and fleet commitments would not be possible if manufacturers were not producing HD ZEVs, and manufacturers are in fact rapidly increasing their HD ZEV production to meet the growing demand. For example, at May 2022's Advanced Clean Transportation Expo, manufacturers such as Cummins and Navistar made clear that they are committed to deploying zero-emission technologies at a rapid pace. Cummins CEO Tom Lineburger stressed the need 'to move faster for the sake of our kids and grandkids,'165 and Navistar CEO Mathias Carlbaum suggested that '[b]y 2030…50% of all trucks by volume will be BEVs.'166 Navistar's CEO reiterated to reporters that ‘[w]e believe 50% of our sales will be electric by 2030,’ and that 100% of sales would be ZEVs by 2040.167 EPA should consider manufacturers’ vehicle offerings, plans, and commitments when estimating baseline HD ZEV market penetration for the final rule, as well as when considering more stringent emissions standards that drive adoption of zero-emission technologies. According to ACEEE, ‘growing numbers of electric truck and bus models are reaching the market or are scheduled to be on the market soon, with models ranging from heavy-duty pickup trucks to 18-wheel tractor-trailers.’168 The pace of innovation in this sector has accelerated in recent years. In 2016, Oak Ridge National Laboratory identified just eight commercially available medium- and heavy-duty ZEV options.169 By 2019 this number had grown more than tenfold. EPA’s DRIA includes ‘a snapshot of BEVs in the heavy-duty truck and bus markets as of 2019,’ based on 2019 research by the Union of Concerned Scientists (UCS). According to this ‘snapshot,’ by 2019 there were already at least 82 different HD ZEV models: 34 trucks and 48 buses. See DRIA at 58–59.170 And by MY 2020, the market had grown even larger. EPA’s own research conducted for the Proposal and contained in EPA’s Memorandum to Docket reveals that by 2020, the number of ZEVs available for purchase climbed again to 177 unique makes and models from 52 producers in regulatory classes 3–8.171 [EPA-HQ-OAR-2019-0055-1302-A1, p.40]

Birky et al., Oak Ridge National Laboratory, Transportation Electrification Beyond Light Duty: Technology and Market Assessment (Sept. 2017), https://info.ornl.gov/sites/publications/Files/Pub72938.pdf).

170 See also UCS, Ready for Work: Now Is the Time for Heavy-Duty Electric Vehicles (2019), https://www.ucsusa.org/resources/ready-work.

171 See Angela Cullen, HD2027 Proposed Changes to Heavy-Duty Greenhouse Gas Emissions—Memorandum to Docket 2 (Docket No. EPA-HQ-OAR-2019-0055) (Nov. 2021), https://www.regulations.gov/document/EPA-HQ-OAR-2019-0055-0880; 87 Fed. Reg. at 17,595.

These numbers are certain to increase further, but EPA's grossly underestimated 1.5% baseline HD ZEV market penetration fails to reflect this anticipated growth. As EPA notes, 'given the dynamic nature of the BEV market, the number and types of vehicles available are changing fairly rapidly,' 87 Fed. Reg. at 17,595, as evidenced by the increasing frequency of new HD ZEV product announcements and commitments by manufacturers. Some of these are included below in Table 3. [EPA-HQ-OAR-2019-0055-1302-A1, p.40]

Table 3: Manufacturer Commitments for HD ZEV Production [EPA-HQ-OAR-2019-0055-1302-A1, pp.41-43]

- Daimler Trucks
  - Announced goals of selling carbon neutral commercial vehicles across all markets by 2039.172
  - Freightliner division currently taking orders for all-electric eCascadia and eM2 trucks.173
  - Freightliner division has developed electric versions of Cascadia Class 8 tractor, M2 Class 6 medium-duty chassis, and MT50 medium-duty step van.174
  - Freightliner Electric Innovation Fleet has been operating at customer sites, totaling over one-million miles of operation as of October 2021.175
  - Partnered with NextEra Energy Resources and BlackRock Renewable Power in January 2022 to invest approximately $650 million to design, develop, install, and operate a nationwide charging network for M/HD BEV and hydrogen fuel cell trucks.176
  - Full line of ZEV commercial vehicles could be ready by 2027.177
  - Daimler's Mercedes-Benz division unveiled a new electric model, the eActros LongHaul, expected to be ready for production by 2024, and an electric-fuel cell truck, the GenH2, which has potential to drive more than 600 miles before refueling and should be commercially available by 2025.178

While the above table includes a sample of relevant product announcements and commitments, CALSTART's Zero-Emission Technology Inventory (ZETI) offers information regarding HD ZEV commercial availability. According to the ZETI tool, the growth of zero-emission medium- and heavy-duty models in the United States and Canada has been rapid, with more manufacturers entering the market and the number of available ZEV models exceeding 200.201 The progress and potential in the manufacturing sector further underscores that EPA's proposed baseline HD ZEV market penetration of 1.5% in MY 2027 is an underestimate, and that much higher deployment is eminently feasible. [EPA-HQ-OAR-2019-0055-1302-A1, p.44]

201 CALSTART, Model Availability to Follow Upward Trajectory, ZETI Analytics, https://globaldrivetozero.org/tools/zeti-analytics/ (see table titled 'Growth of Models Available by Region and OEMS by Region Trending Upwards').

Declining costs for HD ZEVs also support a baseline market penetration rate much higher than 1.5%, as well as the feasibility of including HD ZEVs in EPA's standard-setting analysis. EPA notes that '[t]he lifetime total cost of ownership (TCO)...is likely a primary factor for heavy-duty fleets considering BEV purchases.' 87 Fed. Reg. at 17,596. Numerous cost studies—including those cited by EPA—estimate that at least some categories of HD ZEVs have already reached TCO parity with their diesel counterparts, and more categories will reach TCO parity prior to 2027. EPA should consider these favorable TCO projections in its estimates for baseline HD ZEV market penetration, which would support much higher penetration rates in MY 2027 and beyond. [EPA-HQ-OAR-2019-0055-1302-A1, p.44]

In addition to the ICCT (2019) estimate cited by EPA, which concluded that at least some HD ZEVs could reach cost parity in the 'early 2020s,' see 87 Fed. Reg. at 17,596, several other recent studies that EPA did not consider estimate when various classes of HD ZEVs will reach cost parity with their conventional counterparts. These studies generally show that transit buses, refuse trucks, school buses, and Class 4–7 short-haul rigid trucks such as delivery and utility vehicles—all of which are covered by the Proposal and make up approximately 47% of the entire HD market—either have already reached cost parity with their diesel counterparts for some vehicle categories, or will do so by 2027 for nearly all categories. Table 4 below [Table 4 includes footnotes 202 and 211] includes TCO parity estimates from the key recent literature. [EPA-HQ-OAR-2019-0055-1302-A1, p.44]

210 Catherine Ledna et al., Decarbonizing Medium- & Heavy-Duty On-Road Vehicles: Zero-Emission Vehicles Cost Analysis, NREL (Mar. 2022).

211 Id. at 21. NREL investigated different cost-parity situations. For most scenarios, medium-duty Class 4–6 trucks reached cost parity well before 2035, often before 2030.

Each of these cost studies contains slightly different parameters, leading to some variation in the projections based on factors such as the study's estimated battery pack price or the inclusion of infrastructure costs. However, the variation is small and the studies all indicate that TCO is not far from favoring HD ZEVs for the classes that have not yet already achieved TCO parity. ICCT considered many of these cost studies to develop a summary of literature that includes consensus estimates for when HD ZEVs will reach TCO parity, as shown in the table below:212 [EPA-HQ-OAR-2019-0055-1302-A1, p.46]

212 This table summarizing ZEV cost literature is from: Sara Kelly et al., ICCT Comments on EPA's Proposed Heavy-Duty Engine and Vehicle Standards at 23.

One reason for these favorable TCO projections is that upfront HD ZEV prices have been declining as '[b]attery prices have been consistently reducing more rapidly than projections,' and lower battery prices mean that HD ZEVs will reach cost parity sooner.213 As battery costs and HD ZEV prices decline, more fleet managers will seek to add ZEVs to their heavy-duty fleets. In 2010, battery pack costs were over $1,000/kWh, but have fallen dramatically to approximately $132/kWh in 2021.214 Costs are expected to continue this downward trajectory, 'reaching $100/kWh between 2023 and 2025 and $61–72/kWh by 2030. Auto manufacturers have endorsed these projections.'215 Other analysis has found battery costs in the range of $59-68/kWh by 2027.216 BNEF projects battery pack prices will drop to approximately $80/kWh in 2026 and $60/kWh in 2029, and Ford has targeted $80/kWh by 2030.217 [EPA-HQ-OAR-2019-0055-1302-A1, pp.46-47]

217 Rachel MacIntosh et al., Electric Vehicle Market Update 20, EDF (Apr. 2022); Colin McKerracher, Hyperdrive Daily: The EV Price Gap Narrows, Bloomberg (May 25, 2021), https://www.bloomberg.com/news/newsletters/2021-05-25/hyperdrive-daily-the-ev-price-gap-narrows; Todd Gillespie, Rising Battery Costs Hit Carmakers, Threaten Climate-Change Path, Bloomberg Green (Nov. 30, 2021), https://www.bloomberg.com/news/articles/2021-11-30/even-the-battery-boom-can-t-escape-world-s-supply-chain-woes.

Battery prices have fallen largely due to a rise in the search for and extraction of key raw materials, greater manufacturing scale, and technological improvements such as improved quality and material substitution. Because of significant commitments to the development of a domestic battery raw material and manufacturing industry, temporary changes in battery raw material prices or supply chain issues should not have a significant impact on these longer-term cost projections and trends.218 There are substantial industry and government investments in developing the battery manufacturing sector and lowering battery costs. Many manufacturers are making strides toward significant domestic battery production, with an expected 13 new battery cell gigafactories opening in the United States by 2025,219 further supporting this downward trend. Automakers have also announced research and production partnerships aimed at securing ready supplies of batteries and developing less expensive batteries.220 For example, Daimler recently announced a battery technology partnership through which the company will work with lithium-ion battery manufacturer and developer Contemporary Amperex Technology Co. Limited (CATL) for its supply of lithium-ion battery packs and to jointly work toward designing and developing next-generation battery cells and packs specifically for trucks.221 Additionally, in its Energy Storage Grand Challenge, DOE announced a goal to reduce battery cost to $80/kWh by 2030 for 300-mile range EVs.222 The Bipartisan Infrastructure Law also includes additional funds aimed at ‘expand[ing] the processing and manufacturing of advanced batteries, including for EVs and the electric grid.’223 These federal funds include: $3 billion for battery material processing; $3 billion for battery manufacturing and recycling; $10 million for the Lithium-Ion Battery Recycling Prize; $60 million for Battery Recycling RD&D; $50 million for state and local programs; and $15 million for Collection Systems for Batteries.224 The White House has also issued Executive Order 14,017, directing the Secretary of Energy and the relevant agencies to identify and address any risks to the battery supply chain.225 Advances in battery recycling technology are likely to lead to additional decreases in battery prices. A report by Roush Industries also details additional advancements in battery systems, such as lithium iron phosphate batteries, dry battery electrode coating processes, and tabless anodes, that will lead to greater efficiency and reduced costs for ZEVs.226 Finally, sustained high diesel and gasoline prices would likely make HD ZEVs more attractive and could allow for TCO parity even sooner. [EPA-HQ-OAR-2019-0055-1302-A1, pp.47-48]

226 Vishnu Nair & Gary Rogers, Reducing Medium- and Heavy-Duty Fuel Consumption and Criteria Pollutants, Roush Industries (Sept. 2021).

Moreover, charging infrastructure is developing alongside ZEV demand. The Biden Administration has already allocated $7.5 billion toward charging infrastructure,227 and manufacturers are investing as well. For example, Daimler Truck North America recently partnered with NextEra Energy Resources and BlackRock Renewable Power to invest approximately $650 million to design, develop, install, and operate a nationwide charging network for medium- and heavy-duty BEV and hydrogen fuel cell trucks.228 Cost studies such as Roush (2022) and ICCT (2019) have found that even if fleets bear high infrastructure costs, overall vehicle ownership cost parity is not far off, with ICCT (2019) concluding that overall fleet ownership costs will generally favor electric trucks over conventional trucks by 2030.229 [EPA-HQ-OAR-2019-0055-1302-A1, p.48]

227 Rachel MacIntosh et al., Electric Vehicle Market Update 25, EDF (Apr. 2022).

229 Dale Hall & Nic Lutsey, Estimating the Infrastructure Needs and Costs for the Launch of Zero-Emission Trucks
at i, ICCT (Aug. 2019); Vishnu Nair et al., Technical Review of: Medium and Heavy-Duty Electrification Costs for
MY 2027-2030, Roush Industries for EDF (Feb. 2, 2022).

We urge EPA to comprehensively consider these numerous relevant studies pointing to transformative cost projections for HD ZEVs in the classes and time periods covered by the Proposal. The cost studies show that many HD ZEVs are already both technologically feasible and cost effective, or will be so prior to MY 2027, meaning that they will be independently attractive to HD truck purchasers. As Daimler Truck AG's chief technology officer explained, 'In the very moment that the customer starts benefiting more from a zero-emission truck than from a diesel truck, there is no reason to buy the diesel truck anymore.'230 By failing to consider the full literature of cost projections, EPA assumes inappropriately low HD ZEV adoption and, as a result, proposes standards that are too lenient. These favorable cost projections provide additional support for EPA to reconsider its baseline HD ZEV market penetration rates for MY 2027 and beyond in the final rule. [EPA-HQ-OAR-2019-0055-1302-A1, p.48]

230 Cristina Commendatore, Daimler Truck to Ramp Down ICE Spending, Focus on ZEVs, Fleetowner (May 25, 2021),
https://www.fleetowner.com/technology/article/21165073/daimler-truck-to-ramp-down-ice-spending-focus-on-zevs.

In sum, EPA's proposed 1.5% baseline HD ZEV market penetration for MY 2027 vastly underestimates the number of HD ZEVs that will enter the market. EPA must reconsider its estimates to account for current market projections; federal, state, local, and private sector actions and commitments; and recent cost estimates, all of which point to baseline HD ZEV market penetrations in the range of 8–11% for MY 2027 and 19–27% for MY 2030. Failure to adjust the proposed emissions standards to account for these more accurate baseline figures will undermine the goals of the criteria pollutant and GHG programs. More accurate and reasonable baseline HD ZEV market penetration rates will support more stringent standards at levels that fulfills the Agency's duty to protect public health and welfare. Moreover, the recent cost studies outlined in Table 4 and in the separate comments on this Proposal submitted by MFN, EDF, and ICCT—along with the numerous public and private commitments detailed above—offer a strong record to support inclusion of zero-emission technologies in the technology packages underlying the criteria pollutant and GHG standards. EPA should revise the Proposal accordingly. [EPA-HQ-OAR-2019-0055-1302-A1, p.49]

The feasibility analysis underlying EPA's proposed NOx, PM, HC and CO emissions standards does not address the reductions achievable through zero-emission technologies, including hybrid electric vehicle (HEV), BEV, or FCEV technologies. 87 Fed. Reg. at 17,458. EPA bases that decision on 'current market penetration of BEVs (0.06 percent in MY 2019) or projected penetration rate in the MY 2027 timeframe (1.5 percent),' concluding that assessment of those technologies would not 'meaningfully impact [EPA's] analysis for developing the numerical level of the proposed Option 1 and 2 standards.' Id. But EPA recognizes that 'information showing higher BEV/FCEV market penetration in the MY 2027 or later timeframe' could require 'inclu[ding] HEV, BEV and/or FCEV technologies in [its] feasibility analysis,' and that it may have to 're-evaluate [its] approach' in the final rule. Id. (requesting comment on revising numeric standards to include HEV, BEV and FCEV technologies). [EPA-HQ-OAR-2019-0055-1302-A1, p.51]

EPA should revise its emissions standards to reflect both the feasibility and the baseline market penetration of zero-emission technologies. The Agency's reason for excluding those technologies—a projected market penetration rate of no more than 1.5% by MY 2027—is a gross underestimate. An updated, more accurate record indicates that by MY 2027, zero-emission technologies will be (and in many cases are already) cost-effective and feasible across the heavy-duty fleet, and are capable of providing deep reductions in NOx, PM, and HC emissions. See Section III, supra. The Clean Air Act's core command—that standards 'reflect the greatest degree of emission reduction achievable through the application of technology' which 'will be available for the model year to which the standards apply,' 42 U.S.C. 7521(a)(3)(A)(i)—therefore requires EPA to consider and include these technologies within its standard-setting analysis. That is especially so in light of the statute's technology-forcing nature. Nat'l Petrochemical & Refiners Ass'n, 287 F.3d at 1140 (noting that the statute does not require 'present availability'). EPA cannot consequently base its standards solely on 'currently available technologies'—and even if it could, zero-emission technologies are currently available. See 87 Fed. Reg. at 17,418, 17,458 (characterizing updated standards as reflecting 'technology improvements which have become available over the 20 years since' EPA's prior standards were promulgated). Rather, its standards must be based on a reasonable assessment of the technologies that 'will be available for the model years to which [the] standards apply.' 42 U.S.C. 7521(a)(3)(A)(i). [EPA-HQ-OAR-2019-0055-1302-A1, p.51]

Just as EPA must strengthen its criteria pollutant proposal to carry out its statutory mandate under the Clean Air Act, Commenters urge EPA to improve its proposed GHG standards. EPA proposes to make targeted adjustments to the existing HDV GHG Phase 2 standards and advanced technology incentives finalized in 2016 for certain vocational vehicles and combination tractors. 87 Fed. Reg. at 17,598–609. EPA predicated these existing standards and incentives on an assumption that it was unlikely that ZEV options would be available for HDVs during Phase 2's timeframe (MY 2021 through MY 2027 and later). Id. at 17,595. That assumption has been proven incorrect in the intervening years. Id. at 17,595–98. EPA notes the increasing number of manufacturers now producing electric HDVs along with state legislation and commitments for zero-emission trucks. Id. In light of these developments, EPA proposes to revise CO2 emissions standards for a subset of MY 2027 vehicles and adjust the advanced technology multipliers. 87 Fed. Reg. at 17,598–609. While these revisions are directionally necessary, the Agency continues to dramatically underestimate both baseline HD ZEV market penetration and the feasibility of zero-emission technologies to achieve increasingly stringent emissions standards. In doing so, it fails to 'utiliz[e] emission standards to prevent reasonably anticipated endangerment from maturing into concrete harm.' Coal. for Responsible Regulation, 684 F.3d at 122 (describing 'the job Congress gave [EPA] in 202(a)'). [EPA-HQ-OAR-2019-0055-1302-A1, p.64]

Significant improvements in zero-emission technologies and the rapid growth of HD ZEV sales have brought about a critical need for updates to the Phase 2 GHG standards. The Phase 2 standards were not based on hybrid, fuel cell, or battery electric vehicle technology. 87 Fed. Reg. at 17,594. Instead, EPA premised the vocational vehicle standards on controls including improvements in powertrain and driveline technology. Id. at 17,593. The standards for combination tractors were based on improvements in the tractor's powertrain, aerodynamics, tires, idle reduction, and other vehicle systems. Id. at 17,594. However, considering the improvements and growth in zero-emission technologies described above in Section III, EPA should in this rulemaking reconsider the technology package underlying the Phase 2 standards.246 [EPA-HQ-OAR-2019-0055-1302-A1, pp.64-65]

> 246 Comments on this Proposal submitted by MFN, EDF, and ICCT also detail the feasibility of achieving significantly greater deployment of zero-emission technologies within the HD fleet.

The Agency's mandate and stated intent was, and continues to be, to ensure that all regulated vehicles must install *some* combination of GHG emission reduction technology. 87 Fed. Reg. at 17,602–03. Because manufacturers comply with the standards on a fleetwide average basis, every additional ZEV (which is counted at a 0 g/mi CO2 emissions level) means that the remainder of the fleet can do less to reduce its GHG emissions. Id. at 17,601. In 2016, EPA dramatically underpredicted the level of future ZEV production, especially for school buses, transit buses, delivery trucks, and short haul tractors, which, according to EPA's estimates in the Proposal, now means that 'approximately five percent of conventional heavy-duty vehicles would be able to meet the current HD GHG Phase 2 standards without installing emission-reducing technologies because the standards apply as a fleet-average.' Id. (citing EPA, Memo to Docket, HD 2027 Proposed Changes to Heavy-Duty Greenhouse Gas Emissions (Nov. 2021)). While Commenters support EPA's plan to increase the stringency of 17 of the 33 MY 2027 vocational vehicle and tractor standards in line with updated baseline HD ZEV market penetration estimates, id. at 17,598, basing those updates on the Agency's proposed *underestimate* would result in standards that remain far too lenient—continuing the same problem EPA currently seeks to fix. Moreover, in light of Commenters' cost and market projections described in Section III, the record now supports including zero-emission technologies in the technology package underlying the GHG standards. [EPA-HQ-OAR-2019-0055-1302-A1, p.65]

EPA estimates that ZEVs will make up just 1.5% of HD sales in MY 2027. Id. at 17,601. At this level, the Agency estimates that 5% of the conventional HD fleet would not need to do anything to meet the fleet-average standards. Id. This calculation demonstrates how imperative it is to get the baseline ZEV penetration estimate right: without correction, for every 1.5% of additional ZEV penetration, roughly an additional 5% of the fleet will install no GHG emission controls, counter to the requirements of the Clean Air Act. See 42 U.S.C. 7521(a)(1) (requiring standards that 'prevent or control' pollution). To update the stringency of the proposed standards, EPA merely applied the technology packages finalized in Phase 2 to the 5% of the conventional fleet it predicts would otherwise not install any technology due to the increased ZEV penetration. 87 Fed. Reg. at 17,601. Therefore, an accurate baseline ZEV penetration estimate, at minimum, is imperative to properly strengthening the standards. [EPA-HQ-OAR-2019-0055-1302-A1, p.65]

As described in detail above in Section III, EPA's estimates are significantly and demonstrably incorrect. Its proposed 1.5% baseline ZEV penetration estimate is based on outdated data and a flawed methodology, and fails to consider recent, relevant studies and to take into account real-world ZEV sales commitments. Commenters' analysis provides support for at least 8–11% HD ZEV penetration by 2027 and 19–27% HD ZEV penetration by 2030. Failing to increase the stringency of the standards in line with this already conservative estimate would result in approximately 27–37% of the fleet installing *no* GHG emission controls in MY 2027, and 63–90% of the fleet installing *no* GHG emission controls in MY 2030.247 [EPA-HQ-OAR-2019-0055-1302-A1, pp.65-66]

247 8% ÷ 1.5% = 5.33 x 5% = 26.66%; 11% ÷ 1.5% = 7.33 x 5% = 36.66%; 19% ÷ 1.5% = 12.67 x 5% = 63.3%; 27% ÷ 1.5% = 18 x 5% = 90%

Given the data presented in Section III above, the Agency has a long way to go to 'provide a reasoned explanation of its basis for believing that its projection is reliable…[and] defen[d]…its methodology for arriving at numerical estimates.' Bluewater Network, 370 F.3d at 22 (internal citations omitted). Emissions standards must properly account for 'the rapid pace of progress…, and the industry's own forecasts,' NRDC v. EPA, 655 F.2d at 333—factors that here support a baseline HD ZEV penetration rate much higher than 1.5%, as well as incorporating zero-emission technologies into the standard-setting analysis. EPA must therefore update the record in accordance with these comments and examine the relevant data and demonstrate that the data is accurate and defensible. See Dist. Hosp. Partners v. Burwell, 786 F.3d 46, 57 (D.C. Cir. 2015). Courts require agencies to use 'the best information available,' Catawba County v. EPA, 571 F.3d 20, 45 (D.C. Cir. 2009), which the Agency failed to do in the Proposal. The market for ZEVs is accelerating rapidly with changes in technology, consumer demand, regulatory requirements, and fleet and manufacturer commitments, and '[a]gency reasoning…must adapt as the critical facts change.' Flyers Rights Educ. Fund, Inc. v. FAA, 864 F.3d 738, 745 (D.C. Cir. 2017). The Agency's baseline HD ZEV market penetration estimate must exhibit a 'sufficient linkage between theory, reality, and the result reached.' API v. EPA, 862 F.3d 50, 68 (D.C. Cir. 2017). Considering that even the *known* commitments for ZEV production—including state-level commitments related to the ACT rule—far outpace EPA's estimate, the linkage between reality and result must be corrected. [EPA-HQ-OAR-2019-0055-1302-A1, p.66]

EPA recognizes the gravity of the climate crisis and acknowledges that some sectors of the HD market are transitioning to zero-emission technologies at rates exceeding the Agency's original expectations. However, the Proposal continues EPA's history of significantly underestimating the future of ZEVs. This flawed forecast results in standards that do not comport with the requirements of the Clean Air Act and are not responsive to the dire effects of climate change, the transportation sector's outsized impact, or the available information indicating significantly higher baseline HD ZEV penetration and the further advancement of zero-emission technologies. [EPA-HQ-OAR-2019-0055-1302-A1, p.66]

In addition to fixing the insufficiencies in the Proposal, we urge EPA to consider zero-emission technologies in establishing its GHG emissions standards, both now and when the Agency sets Phase 3 standards for MY 2030 and later. Already, baseline HD ZEV market penetration will reach 19–27% by 2030.272 Analysis conducted by ICCT finds that new HD ZEV sales of 45% or higher by 2030 is necessary to avoid greater than 2â„ƒ of warming, and policies that allow greater than 2â„ƒ of warming will fail to protect health and welfare.273 EPA must set standards now with these goals and obligations in mind. [EPA-HQ-OAR-2019-0055-1302-A1, p.73]

272 See Appendix A.

State, ICCT (Apr. 8, 2022); Arijit Sen & Josh Miller, Emissions Reduction Benefits of a Faster, Global Transition to
Zero-Emission Vehicles, ICCT (Mar. 2022), https://theicct.org/wp-content/uploads/2022/03/Accelerated-ZEV-transition-wp-final.pdf.

Accelerating the deployment of zero-emission technologies is feasible, cost-effective, and necessary in order to achieve the United States' climate goals and protect public health and welfare. There are additional advancements in zero-emission technologies that EPA should consider, as detailed in a recent analysis by Roush Industries.274 Manufacturers have also acknowledged that regulations help provide the motivation needed to achieve goals. For example, Daimler's general manager for product strategy and market development explained that '[r]egulations provide motivation—and we all need some of that sometimes,' and that '[i]t's always easier to just do what you've always done. So we see the need for things like [California's Advanced Clean Trucks Rule] to help us along.'275 Moreover, considering zero-emission technologies in the standard-setting analysis fulfills Congress's expectations that '[w]hen a breakthrough occurs....standards can be toughened.' See 116 Cong. Rec. S20598 (daily ed. Dec. 18, 1970) (statement of Sen. Muskie); see also 116 Cong. Rec. H5348, H5358–59 (daily ed. June 10, 1970) (statement of Rep. Farbstein) (expressing the belief that the internal combustion engine was unsustainable and that alternative power sources were necessary and achievable). There has been such a 'breakthrough' in zero-emission technologies, across all HDV classes and applications. EPA must acknowledge these developments and set standards accordingly, now and in the future. [EPA-HQ-OAR-2019-0055-1302-A1, p.73]

In proposing updates to the GHG standards, EPA focuses on four vehicle types (school buses, transit buses, delivery trucks, and short-haul tractors) ‘because they will likely have the highest EV sales of all heavy-duty vehicle types between now and 2030.’ 87 Fed. Reg. at 17,598. While these sectors are likely to transition to zero-emission technologies the fastest, there is also increasing potential in long-haul sectors beyond MY 2027. Several long-haul ZEVs are currently in development, and cost studies find that TCO parity is not far off for even the largest HD ZEVs that travel long distances. As shown in Table 4 in Section III.C, several studies estimate that TCO parity will be achieved as early as 2030–2035 for long-haul rigid trucks and 2025–2030 for long-haul tractors.276 [EPA-HQ-OAR-2019-0055-1302-A1, p.74]

276 ICCT (2019), ZEV Alliance (2020), ANL (2021), EDF/MJB (2021), CARB (2021), and NREL (2022) all find
TCO parity reached for long-haul tractors at least by 2035. Only BEAN (2021) and NREL (2021) find TCO parity
for long-haul tractors to be achieved later than 2035 (between 2040 and 2050). For long-haul rigid trucks, both
studies that provide estimates find similar timelines for TCO parity—EDF/MJB (2021) estimates after 2030 and
NREL (2022) estimates between 2030–2035.

EPA believes ‘that it is not appropriate to propose updates to the sleeper cab tractor standards in this action because the typical usage and daily miles traveled by these vehicles is beyond the range available in current electric tractors under development.’ 87 Fed. Reg. at 17,600. In fact, however, ‘many manufacturers are now road-testing electric tractor prototypes for hauls significantly longer than 100 miles…Daimler, Peterbilt, Tesla, and Volvo seem to be furthest along, but several other companies are also developing products.’277 EPA should at least consider these developments for the Phase 3 standards, as reducing criteria pollutants and GHG emissions from these larger vehicles is necessary for protecting public health and welfare. [EPA-HQ-OAR-2019-0055-1302-A1, p.74]

277 Steven Nadel & Peter Huether, Electrifying Trucks: From Delivery Vans to Buses to 18-Wheelers 18, ACEEE
(June 2021).

The pattern of driving for many long-haul routes also supports a potential path to achieving zero emissions. ‘The estimated average distance traveled between 30-minute driver breaks is 150 miles and 190 miles for regional-haul and long-haul trucks respectively in the U.S. Thirty minutes of charging using 500 kW or mega-Watt scale fast-chargers would add sufficient range without impairing operations and economics of freight movement.’278 According to a recent report by the North American Council for Freight Efficiency, about half of all Class 8 tractors engaged in regional-haul applications (range of about 200 miles) could already switch to battery-electric technology ‘with minimal or no impact on operations, productivity, or efficiency.’279 The Federal Motor Carrier Safety Administration also has several restrictions on the driving hours for long-haul trucks. The maximum continuous driving allowed without a 30-minute mandatory break is 8 hours (approximately 450 miles), meaning that ‘a range of 500 miles will be sufficient to cover the maximum allowed continuous driving.’280 Long-range tractor models, including at least one with a range of up to 500 miles, are scheduled to enter the market soon.281 For example, Tesla's Semi, expected to hit the market next year, will have a range of 500 miles at highway speed, and will be powered by a new solar-powered high-speed DC charging system that will supply about 400 miles of electricity in 30 minutes.282 Moreover, nearly 80% of freight in the United States is transported less than 250 miles, meaning that 500-mile range is not necessary for all long-haul applications.283 Daimler's Mercedes-Benz brand has started customer testing a new long-haul truck, the Actros LongHaul, which has a 310-mile range and should be ready for production by 2024.284 [EPA-HQ-OAR-2019-0055-1302-A1, pp.74-75]

https://www.greenbiz.com/article/keep-your-eyes-these-9-electric-truck-and-van-companies-2021.

Long-haul fleet managers are likely to find zero-emission technologies advantageous for other reasons as well. 'Electric motors can deliver peak torque almost instantly, allowing them to do very well in towing large loads from a dead start or up a gradient.'285 While battery packs add additional weight to the truck, electric drivetrains are 'substantially lighter relative to a diesel drive train, which offsets a significant amount of battery pack weight.'286 And even the additional battery pack weight is unlikely to be an issue for trucks, 'since most truck trips tend to be limited by volumetric capacity of payload as opposed to payload weight,' meaning that any minor weight added by electrification 'is likely to be acceptable for most trucks.'287 [EPA-HQ-OAR-2019-0055-1302-A1, p.75]

287 Id.

Regardless of whether EPA considers more stringent emissions standards for long-haul trucks in this rulemaking, the Agency should consider these and future developments in this sector as promising evidence of the technological and economic feasibility of heavy-duty zero-emission technologies on a broad scale. In order to achieve the United States' climate goals and carry out the Clean Air Act's mandate to protect public health and welfare, EPA must consider paths toward greater deployment of zero-emission technologies in the entire heavy-duty sector, including long-haul trucks. [EPA-HQ-OAR-2019-0055-1302-A1, p.75]

The heavy-duty truck market is rapidly innovating, and EPA should consider all of these innovations in setting emissions standards, including developments in hydrogen fuel cell technology. For medium- and heavy-duty long-haul trucks, full transition to zero-emissions may require some use of hydrogen fuel cells. Hydrogen FCEVs are scheduled to enter the heavy-duty tractor market in 2022, and will provide an alternative to BEVs that may be attractive in long-haul applications.288 For long-haul trucks, a hydrogen tank can be fueled approximately 15 times faster than a battery can be charged, takes up significantly less cargo capacity, and has a longer range.289 [EPA-HQ-OAR-2019-0055-1302-A1, pp.75-76]

(June 15, 2021),
https://www.greenbiz.com/article/why-future-long-haul-heavy-trucking-probably-includes-lots-hydrogen.

EPA recognizes FCEV potential, stating that '[i]f additional data on FCEV sales is available when we are conducting analyses for the final rulemaking, then we would likely evaluate using those data.’ DRIA at 56. And manufacturers are currently developing FCEV models. Daimler’s Mercedes-Benz brand, for example, has recently announced the GenH2, an electric-fuel cell truck that promises to drive more than 600 miles before needing to refuel.290 [EPA-HQ-OAR-2019-0055-1302-A1, p.76]

290 Mike De Socio, Keep Your Eyes on These 9 Electric Truck and Van Companies in 2021, GreenBiz (Jan. 4, 2021).

Several recent studies have also considered the entry of FCEVs into the market, including NREL (2022) (projecting that FCEVs will make up 2% of heavy-duty sales by 2030 and 21% by 2040)291 and BNEF EV Outlook (2021) (projecting that FCEVs will comprise 3% of heavy-duty sales by 2040 in the Economic Transition Scenario and 10% of heavy-duty sales by 2050 in the Net Zero Scenario).292 DOE has explained that ‘[d]ue to advancements for fuel cells and clean hydrogen production, hydrogen fuel cell electric vehicles are expected to become cost-competitive for long-haul heavy-duty trucks with greater than 500-mile range by 2035.’293 EPA should consider all feasible zero-emission technologies, including both battery electric and fuel cell technologies, both now and when setting the upcoming Phase 3 standards. The Proposal underestimates baseline HD ZEV market penetration in several ways. First, EPA bases its estimate on the number of HD ZEVs it expects as a result of California’s regulatory requirements for HDVs in 2027, extrapolated to a national level, but its methodology is flawed for several reasons. In particular, EPA relies on HD ZEV projections from California’s ACT58 rulemaking in 2019, which are based on projected 2027 HD sales that are significant underestimates—notably lower than EPA’s own projections in its MOtor Vehicle Emission Simulator (MOVES) model and when compared to historical HDV sales data, as discussed in more detail below. As a result, the Proposal’s baseline ZEV sales projections for California in 2027 are unreasonably low and out of line with other, more accurate data and information. In calculating its baseline HD ZEV penetration estimate, EPA should rely on its own up-to-date MOVES data (which is also more in line with historical sales data) rather than California's 2019 projections. [EPA-HQ-OAR-2019-0055-1302-A1, pp.20-21]

58 CARB, Advanced Clean Trucks Regulation—Final Regulation Order (Mar. 15, 2021), https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/fro2.pdf.

Further, in extrapolating to the national level, EPA relies on a ratio from a 2021 report by ICCT on U.S. and Canada ZEV sales. But there is no reason to believe that this ratio will continue to hold in the future. Moreover, EPA ignores the HD ZEV sales that will result in other states that have already adopted the ACT rule, as well as those that have signed the Multi-State Medium- and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding (MOU),59 which targets ZEV sales and commits to ZEVs achieving 30% of all HDV sales by 2030 and 100% of all HDV sales by 2050. If EPA used MOVES data and looked at these existing state-level commitments, the baseline HD ZEV market penetration for 2027 would be significantly higher than that calculated in the Proposal. [EPA-HQ-OAR-2019-0055-1302-A1, p.21]

59 See NESCAUM, Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Memorandum of Understanding (NESCAUM MOU) (last accessed May 10, 2022), https://www.nescaum.org/documents/mhdv-zev-mou-20220329.pdf/.

EPA's approach to calculating national HD ZEV sales in 2027 is flawed because it relies on outdated data and fails to capture the impact of state policies driving additional HD ZEV sales. In its proposed approach, EPA begins by estimating MY 2027 HD ZEV sales in California. To do this, EPA takes into consideration the ACT rule passed by CARB in June 2020. 87 Fed. Reg. at 17,600.62 The ACT rule requires that HD ZEVs make up a certain percentage of a manufacturer's California sales. For example, in MY 2027, 20% of Class 4–8 vehicles and 15% of Class 7–8 tractors sold in California must be ZEVs. 87 Fed. Reg. at 17,597 Tbl.XI-2 & 17,600.63 EPA then scales to a national estimate of HD ZEV market penetration for MY 2027 using a static assumption that California will represent 42% of national HD ZEV sales. This approach is problematic for several reasons detailed below. [EPA-HQ-OAR-2019-0055-1302-A1, pp.23-24]

62 See also CARB, Notice of Decision: Advanced Clean Trucks Regulation (June 2020), https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/nod.pdf.

63 See also CARB, Appendix A – Proposed Regulation Order: Advanced Clean Trucks Regulation 5–6 (May 2020), https://ww3.arb.ca.gov/regact/2019/act2019/30dayatta.pdf.

First, EPA underestimates the number of vehicles impacted by California standards by relying on inaccurate sales projections used in the ACT rulemaking. EPA uses estimates from the ACT rulemaking of the total Class 4–8 on-road vocational vehicle and tractor sales in California in MY 2027 of 20,938 (15,945 Class 4–8 vehicles and 4,993 tractors).64 These sales estimates are well below the on-road Class 4–8 vocational vehicle and tractor sales in California derived from several other sources and are inconsistent with actual sales and registration data. [EPA-HQ-OAR-2019-0055-1302-A1, p.24]

64 87 Fed. Reg. at 17,600, Table XI-3 (citing CARB, Advanced Clean Trucks Regulation Standardized Regulatory Impact Analysis 25 (Aug. 8, 2019), https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/appc.pdf.).

According to the California DMV, 50,000 MY 2018 HDVs were registered as of October 2018; 52,688 MY 2019 HDVs were registered as of January 1, 2020; and 59,758 MY 2020 HDVs were registered as of January 1, 2021.65 These real-world new model year registrations are more than double those EPA estimated for MY 2027 in the Proposal. CARB's estimate of 20,938 HDV sales in MY 2027 is based on data from the EMFAC2017 modeling tool with an adjustment to 'remove out-of-state sales' as explained in the ACT Standardized Regulatory Impact Analysis (SRIA).66 In its documentation, CARB states that 84–90% of new registrations for Class 4–8 vehicles of model year age -1 or 0 were first sold in California.67 CARB states that it applied this factor to the EMFAC2017 projections to estimate new in-state sales of HDVs in MY 2027, but even applying this factor to EMFAC2017 projections still results in higher estimated MY 2027 sales than what CARB presents in the SRIA. Furthermore, if the out-of-state sales factor were applied to real-world California DMV registration data, new HDV sales would still be significantly higher than CARB's EMFAC2017-based estimates. [EPA-HQ-OAR-2019-0055-1302-A1, p.24]

65 California Department of Motor Vehicles (CA DMV), Vehicle Fuel Type Count by Zip Code (May 5, 2022), https://data.ca.gov/dataset/vehicle-fuel-type-count-by-zip-code.

Furthermore, a retrospective analysis by CARB has found that EMFAC2017 significantly underestimated future HDV sales compared to real-world sales.68 For instance, analysis by CARB found that EMFAC2017 projected sales for heavy-duty trucks and buses in 2018 underestimated real-world sales by 15,633 in calendar year 2018.69 CARB has updated its estimates of in-state HDV sales in its EMFAC2021, which projects higher sales for 2027.70 [EPA-HQ-OAR-2019-0055-1302-A1, p.24]

68 See CARB, EMFAC202x Updates 34, 68, 94 (July 30, 2020), https://ww2.arb.ca.gov/sites/default/files/2020-07/EMFAC202x_2nd_Workshop_07302020_ADA.pdf (showing EMFAC2017 projections underestimated HD sales in California).

In addition, EPA has developed its own sales projections using its MOVES3 modeling tool, which finds much higher sales for the relevant vehicles in California. The sales projections in MOVES3 are more consistent with California vehicle registration data. EPA's MOVES 'is a state-of-the-science emission modeling system'71 that 'undergoes major updates and review every few years,'72 including significant peer-reviewed updates for the most recent MOVES3 version. In MOVES3, EPA put substantial effort into estimating vehicle populations by source type and calendar year, acknowledging that vehicle population is 'a critical input' that is 'ever changing as new historical data becomes available and new projections are generated.'73 [EPA-HQ-OAR-2019-0055-1302-A1, pp.24-25]

71 EPA, Overview of EPA's MOtor Vehicle Emission Simulator (MOVES3) 3 (Mar. 2021), https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1011KV2.pdf.

73 Id. at 7–8.

In the Proposal, EPA relies on MOVES for all HDV sales and inventory projections, except those used in estimating the 2027 HD ZEV sales.74 However, even when using MOVES sales and inventory data in the Proposal, EPA is inconsistent with versions, mixing data from the most recent MOVES3 version with data from previous MOVES versions. See 87 Fed. Reg. at 17,600–01 (basing MY 2027 projections on vehicle population data from the 2016 HD GHG Phase 2 rulemaking, which used a previous version of MOVES, but basing short-haul tractor sales share on MOVES3 data). EPA should be consistent in the data source used for the sales and inventory projections. For these reasons, EPA should rely on its own and most current MOVES3 data rather than outdated MOVES versions or California's previous projections. Sales estimates by MOVES3 and other sources are significantly higher than what EPA assumes in the Proposal, as shown in Table 1 below. [EPA-HQ-OAR-2019-0055-1302-A1, p.25]

74 See, e.g., 87 Fed. Reg. at 17,492 (MOVES data used for inventory analysis when considering feasibility of standards); id. at 17,568 ('MOVES-projected sales volumes were used to determine first-year sales and cumulative sales' when calculating direct manufacturer costs); id. at 17,608 (MOVES data used to project sales in MY 2027 to model emissions impact and technology costs of GHG standard revisions); DRIA at 204 (MOVES was used to 'estimate emission inventories for air quality monitoring'); 87 Fed. Reg. at 17,600 (MOVES3 used to determine the fraction of short-haul tractors relative to overall tractor sales for MY 2027). EPA also used MOVES projections of total HD sales for MY 2027 but used EMFAC for California sales to extrapolate ZEV penetration rates, and then applied those to MOVES-based national sales numbers to arrive at a national percentage ZEV sales number). See 17 Fed. Reg. at 17,600–01 (noting that total national HDV sales numbers are based on sales split by vehicle category used in HD GHG Phase 2 rulemaking); EPA, Regulatory Impact Analysis: Greenhouse Gas Emission and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles–Phase 2 at 7-49, Tbl. 7-55 (Aug. 2016) (noting that sales estimates are based on MOVES).

Second, EPA wrongly assumes that California will continue to represent an oversized share of national HD ZEVs sales by failing to accurately capture the impact of other states' policies on HD ZEV sales. The Proposal correctly points out that numerous states 'have announced plans to shift the heavy-duty fleet toward zero-emission technology.' 87 Fed. Reg. at 17,598.79 Yet when calculating baseline HD ZEV market penetration, EPA fails to discuss or account for the full range of state policies and commitments, particularly those from outside of California. Considering them would lead to substantially higher and more accurate baseline HD ZEV penetration rates. [EPA-HQ-OAR-2019-0055-1302-A1, p.26]

> 79 See, e.g., 87 Fed. Reg. at 17,595, n.813, n.814 (citing states' and cities' expansion of electric bus fleets); id. at 17,596–97 (noting that the 'BEV market for transit and school buses continues to grow,' and identifying several
> cities with ZEV transit bus programs); id. at 17,597 (listing several states with ZEV school bus programs); id. at 17,598 (explaining the ACT rule and states that have signed a related MOU).

EPA notes that '[o]utside California, several states have signaled interest in shifting to heavy-duty ZEV technologies and/or establishing specific goals to increase the heavy-duty electric vehicle market.' 87 Fed. Reg. at 17,598. EPA further explains that 15 states and the District of Columbia have signed the MOU targeting ZEV sales equaling 30% of all HDV sales by 2030 and 100% of all HDV sales by 2050. 87 Fed. Reg. at 17,598. The Proposal fails to include both Virginia and Nevada as MOU signatories, and these two states bring the total MOU signatories to 17 states and the District of Columbia.80 HDV sales in MOU states, including California, make up a significant portion of national HDV sales—about 36.5%.81 In March 2022, Northeast States for Coordinated Air Use Management (NESCAUM) and the MOU states issued a comprehensive and detailed draft Action Plan to meet their goals.82 Despite mentioning the MOU, the Proposal does not factor into its baseline HD ZEV market penetration the fact that ZEVs will be added to the heavy-duty fleet more rapidly in these 17 states and D.C., which make up more than a third of national HDV sales.83 An analysis by ICCT estimates that 36% of HDV sales in MOU states (excluding California) would be ZEVs in 2030 if all states implement the goal set out in the MOU.84 ICCT estimates that this would translate to 153,820 HD ZEV sales in MOU states (excluding California) in 2030.85 [EPA-HQ-OAR-2019-0055-1302-A1, pp.26-27]

>
> 81 Claire Buysse, et al., Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the UnitedStates, ICCT (Apr. 8, 2022). This is consistent with MOVES3 projections for MY 2027, which show 219,092 heavy-duty sales in all the MOU states, as compared to 606,659 total heavy-duty sales nationally, or 36% of all sales. See Appendix A for the relevant MOVES3 sales projections.

82 NESCAUM, Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Action Plan: A Policy Framework to Eliminate Harmful Truck and Bus Emissions, Draft for Public Comment (NESCAUM Action Plan) (Mar. 10, 2022), https://www.nescaum.org/documents/mhd-zev-action-plan-public-draft-03-10-2022.pdf.

83 The MOU signatories are: California, Connecticut, Colorado, Hawaii, Maine, Maryland, Massachusetts, Nevada, New Jersey, New York, North Carolina, Oregon, Pennsylvania, Rhode Island, Vermont, Virginia, Washington, and the District of Columbia. See NESCAUM MOU.

84 Arijit Sen et al., Benefits of the 2020 Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Memorandum of Understanding 5, ICCT (Apr. 2022), https://theicct.org/wp-content/uploads/2022/04/md-hd-mou-benefits-apr22.pdf.

85 Id. at 5, Figure 1; id. at 15, Table A4, excluding 2b/3 vehicles.

In addition to the MOU, EPA cites the adoption of the ACT rule in three states—New York, New Jersey, and Washington, 87 Fed. Reg. at 17,598 nn.846–48—but in fact, five states in addition to California have adopted the ACT rule,86 which with California would comprise 20%87 of total HDV sales in 2027.88 Other states also have relevant legislation underway. In May 2022, Connecticut passed legislation authorizing the state's Department of Energy and Environmental Protection to adopt the ACT rule.89 Maine has also made progress toward adopting ZEV standards for the state's HDVs and is currently seeking additional public and stakeholder comment on its proposed ACT rule.90 The Proposal correctly notes the expectation that more states will follow,91 and Colorado, Illinois, and Vermont have 'signaled plans to weigh the new regulations' as well.92 HD ZEV sales in ACT-adopting states will need to reach between 30% (Class 7–8 tractors) and 50% (Class 4–8 trucks) by 2030, and 40% (Class 7–8 tractors) to 75% (Class 4–8 trucks) by 2035 in order to meet the ACT targets.93 But again, EPA fails to account for the fact that the states that have adopted the ACT rule have committed to ZEV adoption at a more rapid pace than EPA projects, even absent any additional federal regulation, and that others are already taking action to join them. [EPA-HQ-OAR-2019-0055-1302-A1, pp.27-28]

86 States that have adopted the ACT rule include New York, New Jersey, and Washington, as cited in the Proposal, along with Oregon and Massachusetts.

87 Calculated using EPA MOVES3, https://www.epa.gov/moves/latest-version-motor-vehicle-emission-simulator-moves. See Appendix A for the relevant MOVES3 sales projections.

93 CARB, Advanced Clean Trucks Regulation, Final Regulation Order, Table A-1 at 5 (Mar. 15, 2021), https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/fro2.pdf; Rachel MacIntosh et al., Electric Vehicle Market Update 15, EDF (Apr. 2022), http://blogs.edf.org/climate411/files/2022/04/electric_vehicle_market_report_v6_april2022.pdf.

Instead of factoring these state policies directly into its calculations, EPA takes an approach that leads to a significant underestimate of baseline HD ZEV market penetration by MY 2027. In the DRIA, EPA cites a 2021 analysis by ICCT that notes that 42% of cumulative HD ZEVs sold through 2020 in the U.S. and Canada have been in California.94 This leads EPA to conclude that 42% of annual national HD ZEV sales will be in California in MY 2027. But this will not be the case in 2027. While California represents 42% of cumulative HD ZEV sales in the United States and Canada, it only comprises 10% of U.S. HDV registrations.95 As noted above, states that have signed the MOU, including California and other ACT-adopting states, represent 36.5% of HDV registrations.96 As these policies take effect in these states, the relative share of HD ZEV sales in California will fall, even as national sales increase. California would only represent 28% of total HD ZEV sales nationally if all MOU states achieve the ACT targets (with the MOU states representing 72% of total HD ZEV sales).97 And these figures do not account for the high possibility that other states beyond the MOU states also see growth in HD ZEV sales, as detailed in Section III.C below. [EPA-HQ-OAR-2019-0055-1302-A1, p.28]

94 Ben Sharpe & Claire Buysse, Zero-Emission Bus and Truck Market in the United States and Canada: A 2020 Update 5, ICCT (May 21, 2021), https://theicct.org/publication/zero-emission-bus-and-truck-market-in-the-united-states-and-canada-a-2020-update/.

95 For MY 2020. See Appendix A for details on these calculations.

96 Claire Buysse et al., Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the United States, ICCT (Apr. 8, 2022). See also MOVES3 projections for MY 2027.

97 See Appendix A for details on these calculations. Calculated using EPA MOVES3, https://www.epa.gov/moves/latest-version-motor-vehicle-emission-simulator-moves.

There has been a similar trend of other states making up a larger share of light-duty ZEV sales. In 2015, a total of 64,175 light-duty ZEVs were sold in the United States, with 53% sold in California.98 However, as of 2021, California's relative share has fallen to 35% as light-duty ZEV sales have dramatically accelerated nationally, driven by other federal and state policies and significant consumer interest in ZEVs (Figure 2). As of 2021, new light-duty ZEV sales totaled 166,582 in California (nearly 5 times higher than in 2015) and 473,426 nationally (nearly 7 times higher than in 2015).99 These trends demonstrate not only how quickly ZEV sales have accelerated but also how they have grown in states beyond California. Over the long term, with other state policies and federal incentives taking effect, regional differences in ZEV sales will diminish for HDVs, just as they have for light-duty vehicles. [EPA-HQ-OAR-2019-0055-1302-A1, pp.28-29] [Figure 2 has footnote 100]

98 Alliance for Automotive Innovation, Electric Vehicle Sales Dashboard (last accessed May 10, 2022), https://www.autosinnovate.org/resources/electric-vehicle-sales-dashboard.

99 Id.

100 Developed using data from the Electric Vehicle Sales Dashboard. See id.

In light of this data, EPA should not calculate forward-looking national HD ZEV sales using outdated HDV sales estimates and backward-looking sales shares. Instead, EPA should factor in the impact of policies in other states beyond California in the Agency's estimate of baseline HD ZEV market penetration. This should include states that 1) have adopted the ACT rule; 2) have committed to the MOU; and 3) are taking actions to deploy zero-emission transit and school buses (where it is possible to separately quantify those actions). This would result in a baseline HD ZEV market penetration estimate of at least 8% by 2027 and 19% by 2030.101 [EPA-HQ-OAR-2019-0055-1302-A1, p.29]

101 This assumes MOU states adopt ACT targets for 2027 and 2030. For detailed description of the methodology to develop these estimates, see Appendix A.

Still, even these more accurate baseline estimates would fail to reflect growing HD ZEV deployment in states that may adopt regulatory policies in the future or deployment that is driven by local government programs and private sector investments, as discussed below in Section III.C. As such, a baseline HD ZEV market penetration of 8% by 2027 and 19% by 2030 would be conservative. Accounting for modest additional state and private sector actions would bring baseline HD ZEV market penetration to at least 11% by 2027 and 27% by 2030.102 In addition, the faster-than-expected gains in the cost-competitiveness of HD ZEVs, as detailed below in Section III.D, offers additional evidence that HD ZEV uptake will continue to increase and that a MY 2027 HD ZEV penetration rate of between 8% and 11% by 2027 is a feasible and conservative baseline estimate.103 [EPA-HQ-OAR-2019-0055-1302-A1, pp.29-30]

102 This assumes MOU states adopt ACT targets for 2027 and 2030 and non-MOU states achieve 4% HD ZEV penetration by 2027 and 11% HD ZEV penetration by 2030. For a detailed description of the methodology to develop these estimates, see Appendix A.

103 For a detailed description of the methodology to develop these estimates, see Appendix A.

Current market analyses project rapid growth in HD ZEVs by the late 2020s, further illustrating that EPA's proposed baseline market penetration is a significant underestimate and that standards that further drive adoption of zero-emission technologies are clearly feasible. [EPA-HQ-OAR-2019-0055-1302-A1, p.30]

In discussing advances to the HD ZEV market, EPA cites two modeled projections: the Energy Information Administration's (EIA) Annual Energy Outlook 2021 ('AEO 2021') and the National Renewable Energy Laboratory's (NREL) Electrification Futures Study (2018). EPA also requests comment on sources for estimates and projections of the HD ZEV market. There are additional and up-to-date projections that demonstrate much higher baseline national HD ZEV penetration than the limited information that EPA considered in the Proposal, as shown in Table 2 below. These include:

- Boston Consulting Group discusses the fact that 'change is unfolding at electrifying speed in the commercial vehicle industry,' driven by economics and policies.104 The report predicts BEV sales in the range of 19–23% and FCEV sales in the range of 3–6%, with a central estimate of 25% ZEVs by 2030 (and 10% ZEVs by 2025). Even in its conservative scenario, zero-emission commercial vehicle sales would reach 6% in 2025 and 15% in 2030 [EPA-HQ-OAR-2019-0055-1302-A1, p.30]

  104 Peter Wiedenhoff et al., What the Shift to Zero-Emission Vehicle Means for Commercial Transportation, Boston Consulting Group (Mar. 22, 2022), https://www.bcg.com/en-us/publications/2022/what-the-shift-to-zero-emission-vehicles-means-for-commercial-transportation.

- NREL's 'Decarbonizing Medium- and Heavy-Duty On-Road Vehicles' report finds that 'zero-emission vehicles (ZEVs) can reach total-cost-of-driving parity with conventional diesel vehicles by 2035 for all medium- and heavy-duty (MD/HD) vehicle classes,' with smaller trucks and short-haul trucks achieving cost parity soon.105 The analysis concludes that 'demand for ZEV could rise rapidly...once cost parity is reached' and that ZEV sales could reach 42% by 2030.106 [EPA-HQ-OAR-2019-0055-1302-A1, p.30]

  105 Catherine Ledna et al., Decarbonizing Medium- & Heavy-Duty On-Road Vehicles: Zero-Emission Vehicles Cost Analysis 2, NREL (Mar. 2022), https://www.nrel.gov/docs/fy22osti/82081.pdf.

106 Id. at 3.

- ACT Research's 'Charging Forward Update' report projects that BEVs will reach 21% of Class 4–8 sales by 2027.107

  107 Jennifer McNealy, ACT Research Releases Updated BEV and FCEV Study & Adoption Forecasts for NA CV Markets, ACT Research (Feb. 7, 2022), https://content.actresearch.net/blog/nacev-act-research-releases-updated-bev-and-fcev-study-adoption-forecasts-forna-cv-markets.

- The International Energy Agency's Global EV Outlook 2021 projects that due to federal and state policies incentivizing ZEVs and charging infrastructure, ZEV sales for buses and trucks will reach 20% and 8%, respectively, by 2030.108

  108 IEA, Prospects for Electric Vehicle Deployment (2021), https://www.iea.org/reports/global-ev-outlook-2021/prospects-for-electric-vehicle-deployment (IEA's definition appears to include Class 2b/3 categories).

- BNEF's Electric Vehicle Outlook 2021 states that 'in urban duty cycles, battery electric trucks of any size become the cheapest option for several use cases in the 2020s,' with 'battery electric trucks becoming a viable option for heavy-duty long-haul operations' by the late 2020s.109 BNEF's Economic Transition Scenario projects that U.S. HD ZEV sales will reach 5% in 2027 for commercial HDVs and 38% in 2027 for buses. [EPA-HQ-OAR-2019-0055-1302-A1, p.31]

  109 BNEF, Electric Vehicle Outlook 2021 (2021), https://about.bnef.com/electric-vehicle-outlook/.

The AEO 2021 report that EPA cites in the Proposal projects that HD ZEVs will only make up 0.12% of new truck sales in 2027.110 This projection is substantially lower than other available market-based projections and should not be relied upon for the rulemaking. The model projects that only 485 electric medium- or heavy-duty vehicles will be sold in 2027, which is completely inconsistent with existing state policies and private sector commitments.111 Importantly, the National Energy Modeling System (NEMS), the model used for the AEO 2021 report, does not consider the impact of California and other states adopting the ACT rule or signing the MOU. NEMS also does not factor in total cost-of-ownership in calculating vehicle sales demand,112 does not appear to reflect the latest projected battery costs, and imposes exogenous maximum zero-emission technology penetration of 10%.113 [EPA-HQ-OAR-2019-0055-1302-A1, p.31]

113 National Energy Modeling System input file 'Max Share of Each Fuel Type' corresponding to parameter 'EFSHXG' for formula (199) as discussed in id. at 108. NEMS input files can be found at: https://www.eia.gov/outlooks/aeo/info_nems_archive.php

For its second source, EPA cites the NREL Electrification Futures Study (EFS).114 Compared to AEO 2021, NREL projects a greater market penetration of HD ZEVs, but the analysis is still dated compared to more recent analyses. NREL EFS projects 2027 HD ZEV sales shares of 5% for Class 3–6, 2% for Class 7–8, and 9% for buses in its Medium Scenario; and 10% for Class 3–6, 7% for Class 7–8, and 45% for buses in its High Scenario. As NREL's analysis was completed in 2017, it does not account for all the significant advancements in the HD ZEV market that EPA proposes to take into account in this rulemaking. For instance, the NREL EFS assumes that battery costs decline such that they reach $135/kWh by 2050. This is a much slower pace than has been demonstrated in the real world. In fact, according to BNEF, the average lithium-ion battery pack cost was $137/kWh in 2020, down from $295/kWh in 2016.115 Projected battery costs have fallen significantly to such an extent that a report by Roush Industries notes that 'battery cost projections made in 2017-2018 are already obsolete.'116 Analysis conducted by Roush finds that battery costs could reach $59–68/kWh by 2027. Other analyses have cited costs of $100/kWh by 2025.117 Furthermore, the NREL EFS pre-dates California's ACT program and the MOU signed by 17 states, so it does not consider the impact that these policies will have on market evolution. [EPA-HQ-OAR-2019-0055-1302-A1, pp.31-32]

Accordingly, EPA should place greater weight on recent studies that more accurately reflect a current assessment of the HD ZEV market, and which project more rapid market penetration of HD ZEVs in the coming years. [EPA-HQ-OAR-2019-0055-1302-A1, p.32]

  122 BNEF, Electric Vehicle Outlook 2021 (2021).

Organization: *Colorado Energy Office, et al.*

Given the use of older ZEV heavy-duty sales projections in the proposed rule that don’t take into account more recent manufacturer commitments and state action, it is likely that heavy-duty

ZEV sales will be higher than EPA's projections (see more below on Colorado's estimated sales). [EPA-HQ-OAR-2019-0055-1297-A1, p.2]

EPA proposes to increase the stringency of GHG limits by 1.5% in MY 2027 based on sales-weighted average projections of electric school buses, transit buses, delivery trucks, and short-haul tractors. These projections are based on outdated data and significant market, technical, and policy developments that have occurred since, including reductions in battery costs, improvements in range, and the introduction of numerous new models for different vehicle classes. [EPA-HQ-OAR-2019-0055-1297-A1, p.2]

We recommend EPA update its estimates of heavy-duty ZEV sales based on more recent technology and market trends, as well as policy development and investments occurring at the state level. Colorado has developed a comprehensive Clean Truck Strategy that includes goals for 30% of medium- and heavy-duty vehicle sales to be ZEV by 2030, and to achieve 35,000 ZEV M/HD vehicles on the road by 2030.7 To achieve these goals, Colorado intends to pursue adoption of the Advanced Clean Trucks and Low NOx Omnibus rule, implement new vehicle incentive and replacement programs that have been funded by legislative action, invest in M/HD charging infrastructure, support workforce development, work with our utilities to invest in make-ready and other needed infrastructure investments, and numerous other strategies. Projected Class 4-8 Colorado ZEV sales for MY 2027-2029 based on adoption of the Advanced Clean Trucks rule, if no trading between classes occurs, are included below: [EPA-HQ-OAR-2019-0055-1297-A1, p.3] [See docket numberEPA-HQ-OAR-2019-0055-1297-A1, p.3 for table of CO ZEV Sales.]

7 This goal includes classes 2b and 3, and includes additional actions beyond adoption of the ACT and Low NOx rules.

Organization: *Consumer Reports (CR)*

The proposed rule significantly underestimates the future market penetration of ZEVs, and overlooks existing and reasonably foreseeable future ZEV technology. In doing so, the rule fails to set sufficiently stringent standards, and fails to encourage the adoption of ZEVs. As such, the EPA is not meeting its mandate under the Clean Air Act (CAA). [EPA-HQ-OAR-2019-0055-1285-A1, p.3]

Existing ZEV technology can meet the needs of most local and regional operations. Studies show that most straight trucks,22 in particular those used for local deliveries, do not travel more than 100 miles per day.23 There are a number of zero-emission trucks and buses commercially available today that already exceed 100 miles in range. Moreover, there are several battery and fuel cell models being demonstrated that can exceed 200 miles per day.24 With a number of companies such as Amazon, FedEx, and UPS committing to purchasing electric delivery vehicles, the possibility for a significant increase in adoption of ZEVs for this class is promising.25 The ZEV outlook for other classes of heavy-duty vehicles is also promising. [EPA-HQ-OAR-2019-0055-1285-A1, p.4]

Manufacturers are planning to commercialize regional-haul ZEV trucks in the coming years.26 Finally, as seen in CALStart’s 'Drive to Zero' zero-emission technology inventory, a number of class 8 models, including battery-electric vehicles (BEV) and fuel-cell-electric vehicles (FCEV) that can travel over 300 miles on a single charge will be available in the coming model years.27 [EPA-HQ-OAR-2019-0055-1285-A1, p.5]

26 Seth Clevenger. (2019, Dec. 6). The Dawn of Electric Trucks, Transport Topics. See https://www.ttnews.com/articles/dawn-electric-trucks

27 CALStart, Zero-Emission Technology Inventory. Available at: https://globaldrivetozero.org/tools/zero-emission-technology-inventory/

State policies such as California’s Advanced Clean Trucks (ACT) establish zero-emission sales requirements for heavy-duty vehicles.28 These regulations will further push the market and technology towards electrification as manufacturers work to comply with the regulation. [EPA-HQ-OAR-2019-0055-1285-A1, p.5]

28 13 C.C.R. 1963 et seq.

Heavy-duty vehicles account for 23% of transportation-related GHG emissions.56 The EPA is proposing to update existing heavy-duty GHG standards to better reflect the increase in electrification beyond what was anticipated when the GHG standards were initially set. Because the current standards do not accurately capture electrification, manufacturers are able to produce ICE vehicles without installing any GHG emission reducing technologies.57 [EPA-HQ-OAR-2019-0055-1285-A1, p.9]

56 EPA, Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2020, EPA–430–R–22–003 (April 14, 2022).

57 87 F.R. 17440.

Under the CAA, the Administrator is authorized to prescribe standards applicable to the 'emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines… which in his judgment cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare.'54 The EPA has issued numerous findings showing that GHGs are reasonably anticipated to both endanger public health and to endanger public welfare.55 [EPA-HQ-OAR-2019-0055-1285-A1, p.9]

54 42 U.S.C. 7251(a)(1).
55 Endangerment and Cause or Contribute Findings for Greenhouse Gasses Under Section 202(a) of the Clean Air Act; Final Rule 74 F.R. 66495 (January 14. 2010). Available at: https://www.govinfo.gov/content/pkg/FR-2009-12-15/pdf/E9-29537.pdf.

However, by continuing to underestimate the ZEV market, the proposed standards do little to address the issue, nor do they help set the U.S. on a path to achieve President Biden's goal of reducing greenhouse gas emissions by 50-52% compared to 2005 levels by 2030.58 [EPA-HQ-OAR-2019-0055-1285-A1, p.9]

58 White House, Fact Sheet: Vice President Harris Announces Actions to Accelerate Clean Transit, Buses, School Buses and Trucks,(March 07, 2022). Available at: https://www.whitehouse.gov/briefing-room/statements-releases/2022/03/07/fact-sheet-vice-president-harris-announces-actions-to-accelerate-clean-transit-buses-school-buses-and-trucks/

EPA should set GHG gas standards that more accurately reflect the current and future heavy-duty ZEV market, and that drive technology towards zero emission heavy-duty vehicles. [EPA-HQ-OAR-2019-0055-1285-A1, p.2]

As written, the proposed rule assumes a ZEV sales share of only 1.5% in key market segments in 2027.2 This is lower than the current requirements of state level policies, which would result in a market penetration of at least 3% by 20273, and underestimates current market trends. [EPA-HQ-OAR-2019-0055-1285-A1, pp.1-2]

2 87 F.R. 17414, 17458.

3 Claire Buysse, Sara Kelly Ray Minjares, Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the United States, International Council on Clean Transportation (April 8, 2022). Available at: https://theicct.org/racing-to-zero-hdv-us-apr22/

The EPA should establish standards that not only assume a higher market share of ZEVs, but that also push the market towards increased electrification. The Clean Air Act (CAA) is intended to be technology forcing 4 and the EPA should rely on this authority to encourage faster adoption of ZEV technology. [EPA-HQ-OAR-2019-0055-1285-A1, p.2]

4 42 U.S.C. 7521

As written, the proposed rule assumes a ZEV sales share of only 1.5% in key market segments in 2027.29 As discussed below, this assumption is lower than requirements in state level policies, and underestimates market trends. The EPA should establish standards that not only assume a higher market share of ZEVs, but that also push the market towards increased electrification. [EPA-HQ-OAR-2019-0055-1285-A1, p.5]

29 87 F.R. 17414, 17458.

On June 25, 2020, California adopted ACT which requires increasing percentages of heavy-duty trucks sales to be ZEVs starting in 2024. By 2035 the rule requires manufacturers to sell 55% Class 2b- 3 ZEV, 75% Class 4-8 ZEVs, and 40% class 7-8 ZEVs.30 Since California passed ACT, six additional states have adopted the regulation.31 In total these states represent around one-fifth of heavy-duty trucks nationwide.32 In addition, 17 states and the District of Columbia signed a memorandum of understanding (MOU) targeting 30% of all new trucks and buses by 2030.33 These states(and D.C.) represent 36.5% of heavy-duty vehicles nationwide.34 Combined, these state-level policies alone will result in a 3% market share of ZEVs by 2027 and an 8% market share by 2030.35 EPA's baseline calculations do not account for the passage of ACT in states outside California, and do not take into consideration the MOU. At the very least, EPA's baseline should reflect state regulations and policies that require the adoption of ZEV. However, even these percentages likely underestimate market trends. In fact, a study by the National Renewable Energy Lab (NREL), estimates that 42% of heavy-duty vehicle sales will be zero emission by 2030.36 [EPA-HQ-OAR-2019-0055-1285-A1, pp.5-6]

30 13 C.C.R. 1963.1.

31 Recently, Connecticut passed legislation that will allow the state to adopt ACT.

32 Claire Buysse, Sara Kelly Ray Minjares, Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the United States, International Council on Clean Transportation (April 8, 2022). Available at: https://theicct.org/racing-to-zero-hdv-us-apr22/; This number includes the projection that 2% of buses nationwide will be zero-emission by 2030 as a result of California's Innovative Clean Transit Rule.

33 Multistate medium and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding. Available at: https://www.nescaum.org/documents/mhdv-zev-mou-20220329.pdf/.

34 Claire Buysse, Sara Kelly Ray Minjares, Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the United States, International Council on Clean

Transportation (April 8, 2022). Available at: https://theicct.org/racing-to-zero-hdv-us-apr22/.

35 Id.

36 NREL, Decarbonizing Medium- and Heavy-Duty On-Road Vehicles: Zero-Emission Vehicles Cost Analysis, (March 2022). Available at: https://www.nrel.gov/docs/fy22osti/82081.pdf.

Standards for both NOx and GHG should reflect a higher ZEV market penetration, more than 3% in 2027 and increasing to more than 8% by 2030, and should work with state policies and regulations to push the heavy-duty market on a faster trajectory towards zero emissions. [EPA-HQ-OAR-2019-0055-1285-A1, p.6]

As the EPA notes, it is updating current GHG standards because the previous standards underestimated the impacts of the ZEV market.59 While the updates are needed, the current proposal simply repeats EPA's error of underestimating the ZEV market, and subsequently undermines the effectiveness of the GHG standards. [EPA-HQ-OAR-2019-0055-1285-A1, p.9]

59 87 F.R. 17594.

As discussed in detail in Section I, the EPA's baseline assumption of 1.5% ZEV market penetration underestimates market trends. As a result, more ZEVs will be on the road than predicted by the rule, and manufacturers will have to do less to reduce GHG emission from ICEs. Therefore, the proposed standards will do little to reduce GHG emissions. [EPA-HQ-OAR-2019-0055-1285-A1, p.10]

EPA should set GHG standards that accurately reflect ZEV market penetration as a result of state laws and policies. Furthermore, the EPA should do more, and set stringent standards that will drive further investment in clean vehicle technologies. Doing so is necessary to set the U.S. on track for achieving the President's goal of 50-52% net economy-wide greenhouse gas emission reductions below 2005 levels in 2030. [EPA-HQ-OAR-2019-0055-1285-A1, p.10]

Organization: *Eaton Vehicle Group (Eaton)*

Agency Request / Topic: We also are considering whether to establish more stringent standards beyond MY 2027, specifically in MY 2028 and MY 2029 using the methodology described in Section XI.C.1. We request comment on appropriate stringency and supporting data for each of those model years [EPA-HQ-OAR-2019-0055-1252-A1, p.11]

Eaton Comment Strategy / Materials: The approach to calculating new GHG standards is sound, but it is highly dependent on the market dynamics that are uncertain. Since the creation of the NPRM, more states finalized the NESCAUM MOU and the IIJA heavily subsidized the school bus market in 2023 – 2027. At a minimum, the EPA should assume ACT volumes across all NESCAUM MOU states, and separately, an approximate 20% EV market share in school and transit buses. However, the EPA should also consider the effect of simultaneous NOx and CO2 reduction on conventional powertrains that will also drive approximately 2% additional GHG improvement on the conventional fleet. [EPA-HQ-OAR-2019-0055-1252-A1, p.11]

Organization: *Edison Electric Institute (EEI)*

EPA includes a discussion in its preamble to this rule noting its long-term regulatory focus on driving the electrification of the transportation sector via future rulemakings. [EPA-HQ-OAR-2019-0055-1282-A1, p. 5]

> 87 Fed. Reg. 17,421. This discussion also builds on EPA's statements in its 2021 final rule on light duty vehicles, which included a significant discussion of the major announcements by every major automaker regarding new EV sales goals and cites the growing prevalence of EV penetration globally. Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 Fed. Reg. 74,434 (Dec. 30, 2021). [EPA-HQ-OAR-2019-0055-1282-A1, p. 6]

These discussions and acknowledgments provide important market and regulatory signals to all interested stakeholders—in particular, to the electric sector. States such as California, a leader in vehicle electrification, often include these kinds of discussions in their long-term planning documents, which have provided critical direction to California electric companies in building the infrastructure necessary to support increased electrification of the transportation sector. These types of broad market and regulatory signals will be helpful to all of EEI's members as they engage with their state commissions to move quickly to deploy EV infrastructure. Specific language regarding upcoming likely moves by EPA to set further regulatory standards to incentivize an increase in transportation electrification can send these signals effectively and should be included in any final rule. [EPA-HQ-OAR-2019-0055-1282-A1, p. 6]

EEI member companies are leading the charge to ready the market for widescale adoption of light-, medium- and heavy-duty EVs. EEI members are making investments and offering programs designed to help their customers overcome barriers to EV adoption, while also supporting existing EV users and year-over-year growth in the EV market. Many of these programs help to deploy and/or offset the cost of EV charging infrastructure in homes, workplaces, public locations, as well as for fleet operators. To date, more than 30 states and the District of Columbia have approved customer programs and investments totaling more than $3.4 billion.14 Furthermore, EEI members are leading by example with their own fleets by setting individual fleet electrification goals that put them on track to electrify more than a third of their fleet vehicles by 2030. [EPA-HQ-OAR-2019-0055-1282-A1, pp. 6 - 7]

> 14. See EEI, Electric Transportation Biannual State Regulatory Update, https://www.eei.org/-/media/Project/EEI/Documents/Issues-and-Policy/Electric-Transportation/ET-Biannual-State-Regulatory-Update.pdf.

Electric company investments coupled with those of other companies and stakeholders have dramatically increased access to charging in the U.S. Electric company investments have the potential (pending regulatory approval) to support more than 300,000 new charging stations.15 As of September 2021, there were more than 108,000 public charging ports, not including home chargers.16 This represents a more than 2000 percent increase in the number of public charging ports since 2011.17 The National Electric Highway Coalition, administered by EEI, is made up of more than 60 electric companies that are committed to fill in gaps in the public fast charging network needed to ensure long distance EV travel.18 While initially focused on light-duty passenger cars, this type of collaboration among electric companies is critical to lay the groundwork for EV charging infrastructure that can support other vehicle types that may have charging needs outside of fixed-route, return to base EV charging. [EPA-HQ-OAR-2019-0055-1282-A1, p. 7 - 8]

16. Department of Energy, Alternative Fuels Data Center, Alternative Fueling Station Counts by State, https://www.afdc.energy.gov/fuels/stations_counts.html (last visited September 21, 2021).

17. See Electric Vehicle Charing Association, State of the Charge: Report of the Northeast's Electric Vehicle Charging Industry at 3 (May 2018), http://www.evassociation.org/uploads/5/8/0/5/58052251/evca_stateofchargereport_2018.pdf.

18. EEI, https://www.eei.org/issues-and-policy/national-electric-highway-coalition.

Electric companies are also collaborating on infrastructure specific to medium- and heavy-duty electrifications. Efforts such as the West Coast Clean Transit Corridor Initiative and private partnerships like that between Daimler Truck North America and NextEra Energy Resources are laying the groundwork for dedicated medium- and heavy-duty EV charging infrastructure. In short, electric companies are preparing for a growing wave of fleet electrification and are eager to partner with both corporate and public fleet customers to ensure a seamless transition. [EPA-HQ-OAR-2019-0055-1282-A1, p. 8]

These investments are substantial and demonstrate that the industry—with the support of stakeholders necessary to authorize and enable these investments—are ready and willing to help facilitate America's shift towards EVs. The Agency should continue to be clear about its regulatory commitment to increased transportation electrification in this rule. As the electric sector continues its progress on and leadership on clean energy, EEI's members continue to make progress as they continue to propose and implement even more EV infrastructure projects across their service territories (to be augmented by the funds from the bipartisan infrastructure bill signed into law in 2021). EPA should look to leverage the progress the electric sector is making, and the investments being made, to choose electrification pathways in its regulatory regimes that match this progress. Agency comments regarding future electrification both acknowledges this progress while also laying out the roadmap on how future standards will provide a clear path for increasing electrification in the transportation sector—and send a strong signal about the need to build even greater EV infrastructure to meet an electrified future. [EPA-HQ-OAR-2019-0055-1282-A1, pp. 8 - 9]

EPA's role is consistent with both the Administration's and broad electrification stakeholder community's objectives and will be helpful to EEI's members as they continue to propose and implement even more EV infrastructure projects across their service territories. [EPA-HQ-OAR-2019-0055-1282-A1, p. 9]

Organization: *Elders Climate Action*

HDVs that are commercially available today with zero emission power trains obviously satisfy the available technology requirement for MY 2027. A large fraction of the CO2 comes from HD vehicle types that are NOW commercially available with zero emission power trains. These include transit and school buses, drayage vehicles linking ports and airports with distribution centers, delivery vans, service trucks, and shuttles serving airports, hotels and resorts. [EPA-HQ-OAR-2019-0055-1218-A1, p. 4]

EPA improperly estimates the zero emission HDVs that will likely be available in 2027 as a result of current incentive policies and state regulations. EPA does not estimate the potential availability of zero emission HDVs that could be produced and sold if EPA were to promulgate zero emission standards. [EPA-HQ-OAR-2019-0055-1218-A1, p. 4]

Instead EPA assumes that the rule will marginally improve the efficiency of IC engines and "induce" enough ZEV sales to reduce CO2 emissions less than 1% from new HDVs sold in 2027 and subsequent years. By failing to require the production and sale of zero emission HDVs along with a fleet averaging rule that allows engine manufacturers to sell "dirty" uncontrolled HDVs through the use of emission reduction credits obtained by selling zero emission vehicles in California and section 177 states, EPA is effectively allowing engine manufacturers to capture the benefits of clean zero emission vehicles for themselves while increasing the exposure of at risk communities to harmful pollutants in non-177 states. [EPA-HQ-OAR-2019-0055-1218-A1, p. 5]

By setting zero emission standards for NOx beginning in 2027 for the vehicle types currently available as zero emission vehicles (ZEVs), EPA could avoid an estimated 20,440 tons of NOx in South Coast and 22,630 tons in San Joaquin Valley. A zero emission standard for CO2 would avoid 54 million MT of CO2 from these three model years between now and 2050. The urgency of the public health and climate crises demands that the U.S. must not forego those reductions. [EPA-HQ-OAR-2019-0055-1218-A1, p. 5.]

EPA must start now with a zero emission standard for short haul vehicles in 2027 to put our nation's heavy duty vehicle fleet on a clear path to 100% zero-emissions sales by 2035. Allowing more vehicles that emit particulate and ozone precursor pollutants also fails to reflect the urgent need for ending particulate and ozone nonattainment within the Clean Air Act's statutory deadlines for attainment. [EPA-HQ-OAR-2019-0055-1218-A1, p. 5]

EPA has not answered the question Congress directed the agency to address with respect to the availability of zero emission technologies in MYs 2027-29 for most if not all HDV classes covered by the rule. [EPA-HQ-OAR-2019-0055-1218-A1, p. 10]

In the rule documents, EPA undertakes a detailed analysis of the technical feasibility of SCR technologies to control emissions from engines, the degree of reduction achievable, and an analysis of the cost to add such control technology. EPA concludes that we found that the fuel savings significantly exceed the costs associated with the technologies over the lifetime of the vehicles, with payback occurring in the fourth year of operation for vocational vehicle and in the second year for tractor-trailers.\870\ This same payback analysis would apply to the proposed revised standards, again as we are applying the same technology packages with the same costs and fuel saving to conventional vehicles that were originally intended to have these packages under the existing HD GHG Phase 2 program but would not with the current rise in electrification, absent these changes we are proposing in this action. 87 FR 17602. [EPA-HQ-OAR-2019-0055-1218-A1, pp. 10 - 11]

EPA does not perform a similar detailed updated analysis of the availability of zero emission power trains or the cost of deploying such technology. [EPA-HQ-OAR-2019-0055-1218-A1, p. 11]

EPA does not contend that zero emission power trains are not "available" within the statutory context of section 202(a)(3). On the contrary, EPA acknowledges in the NPR that – EPA's heavy-duty vehicle GHG certification data shows that EV products are being certified in most of the compression-ignition vocational vehicle subcategories, including the school buses and transit buses optional custom chassis subcategories, and the day cab tractor subcategories (about half of the total tractor subcategories). [EPA-HQ-OAR-2019-0055-1218-A1, p. 11]

> 87 FR 17601. EPA also cites "a report by international agency International Energy Agency (IEA) [that] provides a comprehensive accounting of recent announcements made by UPS, Fedex, DHL, Walmart, Anheuser-Busch, Amazon and PepsiCo for fleet electrification." EPA acknowledges that tens of thousands of zero emission vehicles are on order. Id., 17597. Based on these data, the Agency concludes that "the heavy-duty BEV market seems to be growing fastest in the areas of school buses, transit buses, delivery trucks, and short haul tractors." Id. [EPA-HQ-OAR-2019-0055-1218-A1, p. 11]

EPA discusses the availability of zero emission vehicles in MYs 2027-29 for the purpose of granting credits that allow manufacturers to sell more diesel and gasoline vehicles with higher NOx or CO2 emissions greater than the nominal standard. EPA discusses these credits as inducements to sell ZEV technologies, but does not explore in any significant degree the inducement that would be created by setting a zero emission standard for a share of new vehicle sales intended for duty cycles that are currently being served by vehicles certified as EVs. [EPA-HQ-OAR-2019-0055-1218-A1, p. 11]

EPA faulted the US Postal Service (USPS) for not evaluating the climate, air quality and public health benefits and the fleet total cost of ownership benefits that would flow from the purchase of battery electric vehicles for 75% of its delivery vehicle fleet as a "reasonable alternative" to the 90% ICE/10% BEV scenario evaluated in the EIS.10 But EPA has not proposed or even seriously analyzed the climate, public health and other environmental benefits that would flow from a regulatory strategy that requires fleet operators (such as the USPS) to purchase ZEVs for such service. [EPA-HQ-OAR-2019-0055-1218-A1, pp. 11 - 12]

10. EPA Comment Letter to U.S. Postal Service in re Final EIS for NGDV Acquisitions, downloaded 5/10/22 (available at Environmental Impact Statement (EIS) Database|USEPA).

Throughout the proposed rule EPA makes frequent references to the fact that HDVs with electric power trains have increased significantly in sales, and have become a larger portion of the on-road fleet than was expected in the projections made as part of the 2016 CO2 standards rulemaking. EPA identifies the CARB Advanced Clean Truck rule as the reason for this penetration of EVs into the HDV sector. [EPA-HQ-OAR-2019-0055-1218-A1, p. 12]

The necessary conclusion is that EPA has found zero emission HDVs to be "available technology" within the meaning of those terms as used in section 202(a)(3)(A). But EPA offers no detailed analysis to explain why, based on any of the relevant factors identified by Congress, zero emissions should not be the standard for some or all HDV classes or categories. The necessary conclusion is that EPA has found zero emission HDVs to be "available technology" within the meaning of those terms as used in section 202(a)(3)(A). The failure to propose and consider zero emission standards for significant portions of the HDV market is arbitrary and capricious, and not consistent with the statutory obligation to set standards that reflect greatest degree of emission reduction achievable. [EPA-HQ-OAR-2019-0055-1218-A1, p. 12]

For these reasons, Elders Climate Action asks that EPA adopt zero emission standards for NOx, PM and CO2 for HDVs that EPA has identified in short-haul duty cycles for which zero emission power trains are currently available, and for which zero emission power trains are expected to be available by 2027. At a minimum, zero emission standards should apply to the share of HDVs covered by the ZEV requirement in the CARB ACT rule. [EPA-HQ-OAR-2019-0055-1218-A1, p. 13.]

EPA acknowledges that under the fleet averaging rule, 5% of HDVs can meet the current CO2 standard without installing any emission reduction measures because they can take credit for the reductions achieved by replacing 1.5% of the HDV fleet with zero CO2 emission EVs. 87 FR 17601. In other words, EPA acknowledges that the CO2 reductions achieved by CARB's more aggressive regulatory approach have been used to allow manufacturers to sell dirty trucks without emission reduction technologies in other states. [EPA-HQ-OAR-2019-0055-1218-A1, p. 12]

In this admission, EPA acknowledges that engine manufacturers have aggregated to themselves the benefits of CARB's Clean Truck rule and stolen those benefits from the public they were intended to protect. EPA could remedy this inequitable impact on frontline communities most exposed to HDV emissions by requiring that CARB's ZEV mandates for trucks be applied nationally. But instead of accelerating the production of HDV ZEVs to deliver their climate and public health benefits to the remainder of the Nation, EPA is proposing only to modify the fleet averaging program to allow more dirty trucks to take credit for the CO2 reductions required by CARB and the other states that have, or will soon, are adopt the CARB clean truck rule. [EPA-HQ-OAR-2019-0055-1218-A1, p. 12]

This result has two outcomes that violate the Clean Air Act, Title VI of the Civil Rights Act and various Executive Orders: 1) it shifts the inequity experienced by frontline, BIPOC communities exposed to HDV pollutants in CA to similar communities in other parts of the country rather than reducing emissions to protect the public health; and 2) it fails to implement the CAA mandate to set "standards that reflect the greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply." [EPA-HQ-OAR-2019-0055-1218-A1, p. 12]

In addition, it defeats President Biden's promise to the American people in E.O. 14008 to address the Climate Crisis by transitioning the Nation to a zero emission economy by 2050 to ensure that the U.S. takes the actions needed to stabilize the global economy. [EPA-HQ-OAR-2019-0055-1218-A1, p. 13]

We ask EPA to revise the rule set a zero emission standard for all new HDVs by 2035, and establish a phase-in schedule for the standard that includes ZEV sales targets for MYs 2027-29 that are the same as the CARB ACT rule. [EPA-HQ-OAR-2019-0055-1218-A1, p. 18]

As discussed above in section II, the Clean Air Act requires EPA to set emission standards for HDVs that "reflect the greatest degree of emission reduction achievable…." [EPA-HQ-OAR-2019-0055-1218-A1, p. 19.]

Given the science informing the world that the climate cannot be stabilized short of achieving "net zero" GHG emissions, and the Presdient's commitment to achieving a net zero economy by 2050, we ask the Administrator to make the determination that emissions of both GHGs and precursors to the criteria pollutants PM and ozone emitted from light duty vehicles must be reduced to zero to protect the public health and welfare from the many adverse effects of climate warming. [EPA-HQ-OAR-2019-0055-1218-A1, p. 19.]

The Act provides that "[a]ny such [standard] under this subchapter may provide for a phase-in of the standard."13 We ask the Administrator to begin phasing in a zero emission standard by establishing a sales mandate that requires each manufacturer to achieve ZEV sales during the 2027 MY that are comparable to CARB's ACT rule with the goal of achieving 100% HDV ZEV sales by 2035 in order to achieve zero emissions from on-road vehicles by 2050. [EPA-HQ-OAR-2019-0055-1218-A1, p. 19.]

13. Id.

Commenters understand that additional rulemaking will be required to establish a zero emission standard and phase-in schedule for HDV classes not addressed by this rule. However, the current proposal can be revised to incorporate this approach for the HDV classes and categories addressed by this proposal. We ask that the Administrator not delay completion of the current proposed rule so that it can apply to 2027-29 MY vehicles. We ask that the Administrator open a rulemaking for the additional vehicle classes to promulgate a zero emission standard and a phase-in schedule that begins with the 2027 MY. [EPA-HQ-OAR-2019-0055-1218-A1, p. 19.]

ZEV sales targets are needed now –

- to establish benchmarks for all engine manufacturers to create a level playing field that promotes competitive market conditions for zero emission vehicles based on performance, reliability and cost;
- to ensure a market for ZEVs that will justify early investment by third parties in the development of supply chains needed for production of batteries and fuel cells;
- to ensure the capacity of the industry to ramp up to 100% of sales to ensure that ZEVs will be available in time to replace on-road ICE vehicles by 2050;
- for MY 2027 to give the industry enough lead time to develop supply chains, plan the conversion of production facilities and develop marketing campaigns designed to assure public acceptance of their products. [EPA-HQ-OAR-2019-0055-1218-A1, p. 18]

EPA does not investigate a ZEV sales mandate for the years 2027-2029 with respect to GHG emissions reductions, but the Rhodium Group estimates that light duty ZEV sales would need to reach 99% of total LDV sales by 2030 to achieve a zero emission fleet by 2045 (Fig. 2). Since HDVs have longer useful lives than LDVs, converting the HDV fleet to zero emission will require more aggressive regulatory approaches. Assuming the electric power sector achieves zero emissions by 2035 as President Biden has proposed, the HDV portion of the transport sector could achieve zero emissions by 2050 if a zero emission standard applies to all new HDVs by 2031. [EPA-HQ-OAR-2019-0055-1218-A1, pp. 26 - 27]

In its Regulatory Impact Assessment for the SAFE 2 rule, at 2-15, EPA acknowledges that -- … long-term GHG reduction goals will require a far greater penetration of ZEVs than this proposal would require through MY2026. The need for substantial increases in fleet penetration of ZEVs over the long term is supported by the recommendations of the National Academy of Sciences, which states in its 2021 Light-duty Vehicle Technology Assessment: "The agencies should use all their delegated authority to drive the development and deployment of ZEVs, because they represent the long-term future of energy efficiency, petroleum reduction, and greenhouse gas emissions reduction in the light-duty fleet". [EPA-HQ-OAR-2019-0055-1218-A1, p. 27]

But EPA does not disclose what its “long-term GHG reduction goals” are for either LDVs or HDVs, how it intends to achieve them, or whether and how the current rulemaking contributes to achieving those goals. The reasonableness of the current proposal turns on whether EPA 1) is committed to achieving the GHG reductions identified by the IPCC as necessary to avoid the dire public health and environmental consequences of warming greater than 1.5°C, 2) recognizes that zero emissions from on-road vehicles are a necessary component of the President’s national policy of transforming the U.S. into a zero emission economy by 2050, and 3) can establish how the current proposal contributes to a strategy designed to achieve those objectives. [EPA-HQ-OAR-2019-0055-1218-A1, p. 27]

In the absence of any consideration of these factors and an explanation by the Agency of how it has addressed those factors in developing its proposed decision in this rulemaking, the current proposal fails to consider relevant factors, fails to provide a rational basis for the proposal, and is arbitrary and capricious. [EPA-HQ-OAR-2019-0055-1218-A1, p. 27]

Based on these data and other available evidence, we petition the Administrator to find that –

1) climate warming already caused by GHG emissions harms the public health and is causing unacceptable adverse impacts on public welfare and the human environment, and

2) the expected increase in the severity and frequency of harms to health and the public welfare that will be caused by more extreme events that will occur as the global mean temperature advances toward and above the 1.5°C level resulting from growing GHG concentrations in the atmosphere, establish the need for a zero GHG emissions standard for HDVs pursuant to section 202(a)(1) and (3)(A) of the Clean Air Act. [EPA-HQ-OAR-2019-0055-1218-A1, p. 27.]

We petition the Administrator to make this finding as the predicate for re-opening this rulemaking for the purpose of promulgating a zero emission standard for HDVs, and a phase-in schedule that prescribes for each automaker a share of total HDV sales that must be ZEVs beginning with the 2027 MY. [EPA-HQ-OAR-2019-0055-1218-A1, pp. 27-28.]

Organization: *Energy Innovation, LLC*

Such trends are inconsistent with a climate stable future and must be reversed as quickly as possible. The EPA can and should promulgate more stringent GHG tailpipe standards that align with the U.S. Nationally Determined Contribution under the Paris Climate Agreement and achieve the emissions reductions in 2030 required for a 1.5°C trajectory. Strong tailpipe standards will also ensure compliance with Executive Order 14037, Strengthening American Leadership in Clean Cars and Trucks, aimed at making zero-emission vehicles (ZEVs), including EVs, 50 percent of all new cars sold in 2030.v They will help achieve the goals of Executive Order 14008, Tackling the Climate Crisis at Home and Abroad, as well, reducing economy-wide GHGs by 50 to 52 percent by 2030.vi [EPA-HQ-OAR-2019-0055-1310-A1, p.2]

February 1, 2021 https://www.federalregister.gov/documents/2021/02/01/2021-02177/tackling-the-climate-crisis-at-home-and-abroad

It has been six years since the EPA last updated Phase 2 GHG standards, yet the proposed rule falls far short of what is needed to meaningfully address the urgency of the climate crisis. Given the long life of vehicles and the lead time required for market transformation, the standards set for MY 2027-2029 should expedite the shift to zero-emission electric vehicles (EVs). Waiting until 2030 to meaningfully reduce the GHG emissions from heavyduty trucks (HDTs) will significantly hinder efforts to combat climate change. Fortunately, electrification is a known climate solution that can quickly cut emissions from the transportation sector. The standards for MY 2027- 2029 will either put the U.S. on a path to achieve rapid transportation decarbonization or will prevent the necessary market transformation. [EPA-HQ-OAR-2019-0055-1310-A1, p.2]

In response to the EPA's request for comment and data on higher penetration rates, which could serve as the basis for increasing stringency of the CO2 standards for specific Phase 2 vehicle subcategories,xi we offer the following additional supporting information: [EPA-HQ-OAR-2019-0055-1310-A1, p.4]

xi EPA Proposed Rules, 17419.

While the proposed rule does not aim to enact percentage sales requirements, the EPA should exercise its authority to set tailpipe GHG standards that reflect emissions reductions consistent with percentage sales standards that would put the U.S. on a climate stable path, such as those outlined in the previously mentioned studies. [EPA-HQ-OAR-2019-0055-1310-A1, p.4]

The EPA projects a zero-emission vehicle penetration rate of 1.5 percent in the MY 2027 timeframe, with nominal gains of market share before 2030.xii Yet several studies combined with current market trends suggest that HDEV growth could be much higher in that timeframe. For example: [EPA-HQ-OAR-2019-0055-1310-A1, p. 4]

xii EPA Proposed Rules, 17438

- According to CALSTART's Advanced Technology Truck Index, between 2019 and 2021, the U.S. market saw a 625 percent increase in Class 2b to Class 8 zero-emission trucks available for purchase, growing from 20 models in 2019 to 145 models in 2021. They anticipate 165 models available by 2023, and 30 of which will be heavy-duty models.xiii Notably, the CALSTART analysis shows available HDEV models span anywhere from 100 to 500 miles of range, which covers the vast majority of trucking operational ranges—research from the National Renewable Energy Laboratory (NREL) shows 70 percent of HDTs operate primarily within 100-mile ranges, and 80 percent operate primarily within the 200-mile range.xiv [EPA-HQ-OAR-2019-0055-1310-A1, p. 4]

- Energy Innovation, the University of California, Berkeley, and GridLab's 2035 2.0 Report illustrates the technoeconomic feasibility of 100 percent EV sales for passenger, medium- and heavy-duty vehicles by 2035 which, if achieved, would translate to around 40 percent HDEV sales by 2027, and around 80 percent HDEV sales in 2030. Notably, electrifying all new cars and trucks by 2035 would (by 2050) save consumers $2.7 trillion, prevent 150,000 premature deaths, avoid $1.3 trillion in environmental and health costs by reducing air pollution, and would support a net increase of over 2 million jobs in 2035.xv [EPA-HQ-OAR-2019-0055-1310-A1, p. 4]

Another factor very likely to shift the market to favor HDEVs in the near-term is the economic advantage HDEVs hold over their diesel counterparts (especially as gasoline and diesel prices remain high and subject to increasing volatility due to reliance on unstable international markets). Several analyses confer on the savings advantage of HDEVs over the vehicle’s lifetime:

- The 2035 2.0 Report found HDEVs are already cheaper than their diesel counterparts, on a total cost of ownership (TCO) basis (as shown in Figure 4), and this advantage grows to $0.22 per mile in 2030 and $0.25 by 2035. This translates to roughly $200,000 in savings across the vehicle lifetime. xxiv [EPA-HQ-OAR-2019-0055-1310-A1, p.5]

  xxiv Amol Phadke, et al., Plummeting Costs and Dramatic Improvements in Batteries Can Accelerate Our Clean Transportation Future.

- Lawrence Berkeley National Laboratory research shows a Class 8 electric truck, compared to a diesel truck, can offer about 13 percent lower TCO per mile when operating 300 miles per day with a 375-mile range.xxv Operating fewer miles per day further improves this cost advantage. [EPA-HQ-OAR-2019-0055-1310-A1, p.5]

Finally, the billions of dollars of federal investments in EVs and EV charging infrastructure supported by the Infrastructure Investment and Jobs Act (IIJA),xxxii combined with other federal efforts and existing state leadership on charging infrastructure, will provide further support for an expanded HDEV market in the near-term. Expanded charging will help prospective owners and operators gain confidence in their ability to charge their vehicles as they travel throughout the country. According to an NREL analysis, if charging infrastructure is deployed to support EV adoption, sales of medium- and heavy-duty EVs could reach 42 percent by 2030 and greater than 99 percent by 2045.xxxiii Numerous charging infrastructure efforts are underway that will likely transform the market in the next few years: [EPA-HQ-OAR-2019-0055-1310-A1, p.6]

- NREL is working in partnership with automotive industry group CharIn to develop new high-powered charging standards for medium- and heavy-duty vehicles, known as the Megawatt Charging System (MCS), which will allow for charging capacity seven times greater than current LDEV fast charging technology.xxxvii This effort will help address the current challenges of interoperability and inconsistent standards across the current network of over 100,000 public chargers. [EPA-HQ-OAR-2019-0055-1310-A1, p.6]

  xxxvii NREL, 'Industry Experts, Researchers Put Charging Systems for Electric Trucks to the Test,' August 30, 2021, https://www.nrel.gov/news/program/2021/industry-experts-researchers-put-charging-systems-for-electric-trucks-to-test.html.

In summary, current trends and compelling cost savings data suggest the HDT market segment is ripe for technology innovation and the introduction of more all-electric models in the next few years, along with a substantial expansion of charging infrastructure to meet demand for cleaner trucks. However, the standards set in this rulemaking have the potential to accelerate these developments and achieve the rapid GHG emissions reductions that are needed to avoid the worst impacts of climate change. A strong standard will incentivize greater private sector innovation and compel broader market changes that lead to faster uptake of clean, all electric trucks within this decade—which must occur to align with a 1.5°C to 2°C climate stable trajectory. [EPA-HQ-OAR-2019-0055-1310-A1, p.6]

Organization: *Environmental Protection Network (EPN)*

EPN recommends that the GHG proposal be significantly strengthened. The proposal lacks any ambition whatsoever and reinforces that EPA is now the laggard in reducing HD GHGs rather than the leader. The recent Intergovernmental Panel on Climate Change (IPCC) Report makes clear that now is the time for strong action to address the climate crisis. EPA's proposal fails to step up to this challenge and is an important lost opportunity. [EPA-HQ-OAR-2019-0055-1233-A1, p. 2]

There is a wealth of information available to EPA that supports this approach to the GHG standards. The recent government-funded National Renewable Energy Laboratory (NREL) report projects that ZEV sales could reach 42% of all medium-duty (MD)/HD trucks by 2030, reflecting lower combined vehicle purchase and operating costs (see Decarbonizing Medium- & HD On-Road Vehicles: Zero-Emission Vehicles Cost Analysis. The International Council on Clean Transportation is an important source of technical and other information on the transition to electrification in the HD and other sectors. For example, see Racing to zero: The ambition we need for zero-emission heavy-duty vehicles in the United States. These are just a few examples of the wealth of information available to EPA showing the potential for HD EVs to support a more aggressive regulatory approach to this sector. We expect many organizations and States will provide comprehensive sources of information to EPA in their comments. EPA's final decision needs to address the need for a much more aggressive but practical set of near-term GHG standards for this sector. [EPA-HQ-OAR-2019-0055-1233-A1, pp. 3 - 4]

Organization: *Environmental Defense Fund (EDF) (1265 and 2855)*

Momentum for electric vehicle development and production is accelerating rapidly, both globally and in the United States. Numerous recent studies highlight key automaker commitments and deployments, the dynamic and growing market for ZEVs, decreasing battery costs and the opportunity for new American jobs. States and business coalitions are taking the lead in supporting the industry in its transition to electrification. [EPA-HQ-OAR-2019-0055-1265-A1, pp.7-8]

ERM recently released its fifth Electric Vehicle Market Update, which tracks the current status and projected growth of the U.S. electric vehicle industry.31 The April 2022 report found robust growth indicators for the electric vehicle sector just since the last update was published one year prior. Medium- and heavy-duty vehicle manufacturers and fleets are making substantial commitments to zero-emitting vehicles. Daimler Trucks North America, the leading manufacturer of class 8 trucks in the U.S., has committed to offering only carbon-neutral trucks in the U.S. by 2039,32 and expects that by 2030, as much as 60 percent of its sales will be ZEVs.33 Volvo Group, owner of the Mack truck brand, has set a goal of having 100 percent of its truck and bus sales be zero-emission by 2040.34 Navistar recently announced its goal of having 50 percent sale of its sales volume be ZEVs by 2030, its commitment to achieve 100 percent zero emissions by 2040 across all operations and carbon-neutrality by 2050.35 Both FedEx and Walmart have committed to transition their entire global truck fleets to ZEVs by 2040.36 [EPA-HQ-OAR-2019-0055-1265-A1, p.8]

According to ERM, the labor market is also benefiting from the transition to electrification. Manufacturers have announced new investments in the United States of almost $2 billion in medium and heavy-duty assembly plants, investments that will support approximately 15,000 new direct U.S. jobs over the next decade.37 [EPA-HQ-OAR-2019-0055-1265-A1, p.8]

Electric Vehicle Market Update: Manufacturer Commitments and Public Policy Initiatives Supporting Electric Mobility in the U.S. and Worldwide, ERM for EDF, Version 6. http://blogs.edf.org/climate411/files/2022/04/electric_vehicle_market_report_v6_april2022.pdf

The numbers of electric trucks and buses already on the roads is growing, in part because of the increased selection of model availability. According to CALSTART, as of December 2021, 1,215 Class 2b through Class 8 ZEVs have been deployed in the United States across over 163 fleets.38 CALSTART has developed an interactive online tool that tracks available and soon-to-be-available medium- and heavy-duty zero-emission trucks (ZETs).39 In 2019, there were only 20 models of Class 2b-8 ZETs available for purchase in the United States. Today there are more than 400 models available across all classes and CALSTART estimates that could increase to 544 total models by the end of 2022. EPA also conducted an analysis of the manufacturer-supplied end-of-year production reports and found that out of the 380 BEVs certified in MY 2020, a total of 177 unique makes and models were available for purchase by 52 producers in classes 3-8.40 For example, General Motors launched a new business unit, BrightDrop, in January 2021 that focuses on electric first-to-last-mile delivery trucks. FedEx signed an agreement reserving 2,500 delivery vans and is working with BrightDrop to add up to 20,000 more vehicles in coming years.41 UPS and DHL ordered 950 electric trucks and 63 delivery vans, respectively, from Workhorse42 and Amazon has ordered 100,000 zero-emitting vehicles from Rivian.43 [EPA-HQ-OAR-2019-0055-1265-A1, pp.8-9]

Leading businesses have also recognized the importance of pollution standards and complementary policies in hastening ZEV deployment. The Zero Emission Transportation Association (ZETA) – a coalition of major businesses including electric vehicle manufacturers, power companies, and many others – has urged adoption of ambitious policies to support medium- and heavy-duty electrification, including multi pollutant standards under the Clean Air Act.44 The National Zero-Emission Truck (ZET) Coalition is a group of America's biggest truck equipment manufacturers, suppliers and key stakeholders, such as Cummins, Daimler, PACCAR, Eaton, Tesla and Rivian, advocating for federal charging and refueling infrastructure and increased federal investments and incentive programs to help drive the near-term production of ZEV trucks and buses in the United States.45 And the European Automobile Manufacturers Association – which includes Scania, Daimler Truck AG, Ford Trucks and Volvo Group, among others – together with the Potsdam Institute for Climate Impact Research, has pledged that by 2040 all new commercial vehicles sold must be fossil free.46 [EPA-HQ-OAR-2019-0055-1265-A1, pp.9-10]

Importantly, California also adopted more protective heavy-duty low NOx emissions standards to help the state meet national ambient air quality standards and vital state public health and environmental justice goals. In August 2020, California adopted the Heavy-Duty Engine and Vehicle Omnibus Regulation, which substantially tightens the NOx emission standard for on-road heavy-duty engines by 75 percent beginning in 2024 and ramping up to 90 percent in 2027.56 Once fully phased in by 2031, the rule is expected to reduce harmful NOx emissions in California by more than 23 tons per day – the equivalent of taking 16 million light-duty cars off the road in 2031. The emissions reductions will result in 3,900 avoided premature deaths and 3,150 avoided hospitalizations statewide over the life of the rule (2024 – 2050), and lead to estimated statewide health benefits of approximately $36.8 billion.57 [EPA-HQ-OAR-2019-0055-1265-A1, pp.12-13]

In November 2021, Oregon became the first state outside of California to adopt both the ACT rule and the Heavy-Duty Omnibus rule, which will apply to model years 2025 and beyond.58 Four other states – New Jersey, New York, Washington and Massachusetts – have all adopted the Advanced Clean Trucks rule.59 These states, together with California and Oregon are estimated to contain more than 20-percent of the national fleet of medium- and heavy-duty trucks.60 And many other states, including Connecticut,61 Colorado and Maine are currently contemplating adoption of the ACT rule. [EPA-HQ-OAR-2019-0055-1265-A1, p.13]

61 With passage of Connecticut Senate Bill 4 in May 2022, which authorizes the state’s Department of Energy and Environmental Protection to adopt California medium and heavy-duty motor vehicle standards, Connecticut is expected to join these states soon.

As part of its statewide strategy to reduce transportation emissions, California is also developing the Advanced Clean Fleets regulation, which aims to accelerate the market for zero-emission trucks and buses by requiring fleets that are well suited for electrification to transition to ZEVs.62 The regulation would set requirements for new ZEV sales as well as in-use fleet composition, and would apply to fleets performing drayage operations, public agencies, federal governments, and high-priority fleets. [EPA-HQ-OAR-2019-0055-1265-A1, p.13]

62 ARB fact sheet, 'Advanced Clean Fleets: Accelerating Zero-Emission Truck Markets,' (March 3, 2022). https://ww2.arb.ca.gov/sites/default/files/2022-03/ACF%20Fact%20Sheet_ADA.pdf

The draft regulation includes setting a requirement that all new medium- and heavy-duty vehicle sales be ZEVs starting in 2040 – a target that is faster than that finalized in the ACT rule – and proposed to help contribute to the state’s goal of carbon neutrality by 2045 and the Governor’s executive order that 100 percent of medium- and heavy-duty vehicles where feasible be ZEVs by 2045. Under the draft regulation, public fleets would be required to purchase 100 percent ZEVs by 2027; all new drayage trucks would be ZEVs beginning in 2024 and by 2035 every drayage truck on the road would be a ZEV; and high priority and federal fleets would be required to meet ZEV targets as a proportion of their total fleet. The Air Resources Board (ARB) will hold additional public workshops on the draft regulation in May 2022 and it is scheduled to go to the Board for final action in late Summer 2022.63 [EPA-HQ-OAR-2019-0055-1265-A1, pp.13-14]

63 ARB website, 'Advanced Clean Fleets – Meetings and Events,' (last accessed May 11, 2022). https://ww2.arb.ca.gov/our-work/programs/advanced-clean-fleets/advanced-clean-fleets-meetings-events

In addition to state rulemakings, a diverse collection of seventeen states and the District of Columbia joined a multi-state initiative to advance and accelerate the market for electric medium- and heavy-duty vehicles.64 Together, the signatories account for 35 percent of the nation's medium- and heavy-duty fleet.65 The voluntary initiative set a target of 30 percent of new truck and bus sales being ZEV by 2030 and 100 percent ZEV sales by 2050 with an emphasis on the need to accelerate and prioritize deployment in disadvantaged communities. The agreement could result in an estimated reduction of up to 740 million barrels of oil by 2045, which is equivalent to more than 300 million metric tons of CO_2 pollution.66 A more recent report from ICCT estimates a cumulative emissions reduction of 646 million metric tons of CO_2 from 2020-2050.67 [EPA-HQ-OAR-2019-0055-1265-A1, p.14]

64 The current signatories are California, Colorado, Connecticut, Hawaii, Maine, Maryland, Massachusetts, New Jersey, New York, Nevada, North Carolina, Oregon, Pennsylvania, Rhode Island, Vermont, Washington, and the District of Columbia. 'Multi-State Medium- and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding,' (July 14, 2020), https://www.nescaum.org/documents/mhdv-zev-mou-20220329.pdf/

67 Arijit Sen, Ray Minjares, Josh Miller, and Caleb Braun. April 2022. 'Benefits of the 2020 Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Memorandum of Understanding,' ICCT Briefing. https://theicct.org/wp-content/uploads/2022/04/md-hd-mou-benefits-apr22.pdf

Moreover, states have adopted policies and already made significant investments related to charging infrastructure to support their adoption of the Advanced Clean Truck (ACT) regulation and accelerate ZEV deployment. For instance, Massachusetts, New Jersey, New York, Oregon, and Washington have all developed, or are developing, complementary policies and investments to support the rule.68 In addition, charging infrastructure costs are rapidly declining and utilities and fleets are innovating to help further reduce charging costs and more immediately unlock the substantial fuel saving benefits of ZEVs. EDF has developed and plans to separately submit more detailed information on these solutions. [EPA-HQ-OAR-2019-0055-1265-A1, p.14]

68 With passage of Connecticut Senate Bill 4 in May, which authorizes the state's Department of Energy and Environmental Protection to adopt California medium and heavy-duty motor vehicle standards, Connecticut is expected to join these states soon.

All of these state initiatives are critical drivers for the adoption of ZEV technology and help alleviate statewide pollution burdens. However, heavy-duty vehicles and their pollution do not always stay within state borders. For example, over half of the heavy-duty vehicle miles traveled in California are by federally certified vehicles that are not required to meet California's more protective standards.69 A durable EPA medium- and heavy-duty greenhouse gas and NOx rule will further encourage the investments needed to transition to a fully zero-emitting medium- and heavy-duty fleet. [EPA-HQ-OAR-2019-0055-1265-A1, pp.14-15]

> 69 Letter from Richard W. Corey, ARB Executive Officer to Liane Randolph, ARB Board Chair, 'Accelerating California's Transition to Zero-Emission Trucks,' (January 10, 2022). https://ww2.arb.ca.gov/sites/default/files/2022-02/ZE%20Trucks%20Board%20Memo_ADA.pdf

EPA has clear authority to set an emission standard at a level that ensures greater deployment of ZEVs. Doing so in this rule is critically important to ensure we are making needed progress prior to 2030, and accordingly, we urge EPA to ensure performance-based pollution standards help to achieve 80 percent sales for new school and transit buses by MY 2029 and 40 percent sale of new class 4-7 vehicles and class 8 short haul vehicles by that year. New analysis from ERM evaluated aspects of the ZEV sales baseline EPA failed to consider, including a range of scenarios, from very conservative to more optimistic, with midpoint scenarios projecting medium- and heavy-duty ZEV deployment in excess of 20 percent in 2029 and more optimistic scenarios projecting M/HD ZEV sales of over 33 percent of all class 4-8 single unit trucks, short-haul tractor trailers and school and transit buses in 2029.72 These estimates far exceed EPA's assumption in the proposal, and underscore that standards achieving these levels of ZEV deployment are both feasible and reasonable. However, they also make clear that it is absolutely critical for EPA to establish protective, pollution standards in this rulemaking to achieve this level of pollution reductions. [EPA-HQ-OAR-2019-0055-1265-A1, pp.16-17]

> 72 Ellen Robo and Dave Seamonds, 'Analysis of Alternative Medium- and Heavy-duty Zero-Emission Vehicle Baseline Scenarios,' Technical memo by ERM for EDF (May 12, 2022).

Developing a robust charging infrastructure for medium and heavy-duty zero-emission vehicles (ZEVs) is important to support wide-spread electrification. The vehicles that are most ready for electrification in the 2027-2029 timeframe are those that rely on depot charging, a technology that is widely available today. These vehicles include delivery vans, transit buses, box trucks, refuse haulers and last-mile-delivery trucks among other market segments.2 [EPA-HQ-OAR-2019-0055-2855-A2, p. 1]

> 2. M.J. Bradley & Associates, Medium- & Heavy-Duty Vehicles Market structure, Environmental Impact, and EV Readiness, July 2021.

EPA has manifest legal authority to adopt greenhouse gas emission standards for new medium and heavy-duty vehicles. Additionally, the authority established under Section 202(a)(1) and 202(a)(3) of the Clean Air Act (CAA) authorizes EPA to set protective standards that secure deep pollution reductions based on the increased deployment of available zero-emission technologies. [EPA-HQ-OAR-2019-0055-1265-A1, p.17]

As demonstrated above, EPA has clear authority under Section 202(a)(1) to establish standards that drive the uptake of technology that currently exists, or can feasibly be developed. It follows that EPA has authority under 202(a)(1) to promulgate standards that ensure the increased uptake and development of ZEV technology. As established above, EPA may set technology-forcing standards under 202(a)(1) driving the uptake of a particular existing technology; and zero-emission technologies are not only clearly established but are increasing in popularity and development across the vehicle market.88 Consistent with the technology-forcing history of Section 202, EPA can and should establish protective performance standards requiring GHG emissions reductions sufficient to drive increased development of ZEVs. [EPA-HQ-OAR-2019-0055-1265-A1, p.19]

88 See supra Section I.B

Charging costs are declining, and numerous technologies and approaches are continuing to lower those costs. Fleets have a range of options to consider when designing a depot charging infrastructure, including different kilowatt (kW) capacities for electric vehicle supply equipment (EVSE). Fleets also have access to detailed guidance on how to optimize their charging set-up to meet their operational needs.3 Fleets can maximize the economic benefit of this transition through managed charging software, on-site battery storage and on-site electricity generation, which enable fleets to minimize peak-power demand for their depot.4 There are also a variety of state and utility infrastructure programs emerging that are driving down the total cost of charging for fleets and providing technical support to achieve mass deployment. [EPA-HQ-OAR-2019-0055-2855-A2, pp. 1 - 2]

3. See, e.g., San Diego Gas & Electric, Electric Vehicles Charging Guidebook for Medium and Heavy-Duty Fleets, 2020.

4. Gladstein, Neandross & Associates, California Heavy-Duty Fleet Electrification Summary Report, March 2020.

By finalizing strong multi-pollutant standards that reflect the increasing availability and desirability of zero-emission medium and heavy-duty vehicles, EPA can send a powerful signal to help support and accelerate the many infrastructure investments and programs already under development. [EPA-HQ-OAR-2019-0055-2855-A2, p. 2]

A number of studies have found that current depot charging technology can cover the needs of fleets that return their trucks to a hub each night. For example, a study by Gladstein Neandross and Associates (GNA) evaluated the driving needs of two drayage fleets in California. They found that most of the trips performed by the two companies could have been completed with todays' electric truck models and charging equipment, without having to modify any fleet operations.5 Another similar study evaluated five Class 3 through 7 fleets based in New Jersey, finding that electric trucks could serve over 88% of their needed routes when only charging a single time, and 95% when including time for an additional charging session, either at the depot or en route.6 A report by M.J. Bradley & Associates looked at all Class 2b-8 vehicles to assess the readiness of zero-emitting technologies based on usage patterns and market status. The analysis found that 60% of all vehicles in the medium- and heavy-duty fleet will generally be able to use depot charging, and of these vehicles, more than 80% can meet their charging requirements with an inexpensive Level 2 charger. These examples indicate that the technology available on the market today can already cover a majority of the charging needed to electrify. [EPA-HQ-OAR-2019-0055-2855-A2, p. 2]

5. Gladstein, Neandross & Associates, California Heavy-Duty Fleet Electrification Summary Report, March 2021.

6. Emerging Futures, New Jersey Medium Duty Fleet Electrification Infrastructure Summary Report, May 2022.

Further significant work has been done to demonstrate that charging technology is capable of covering industry needs to transition to electric. Here are a few examples of the various utility and industry activities supporting charging infrastructure and underscoring its current capabilities to meet operational constraints:

- In New Jersey, 8 BYD refuse trucks are operational with a 280+ kWh battery pack and "a range of 600 pick-up plus 60 miles." They can be recharged in two and a half hours with DC fast charging.7 [EPA-HQ-OAR-2019-0055-2855-A2, p. 2]

  7. https://cleantechnica.com/2021/12/07/jersey-city-receives-its-5-byd-battery-electric-refuse-trucks/

- Volvo Lights project in California demonstrated the ability for 53 heavy-duty, battery electric trucks and equipment to reliably move freight between the city's two major ports and warehouses throughout the region with less noise and zero emissions. Key charging innovations demonstrated in this project were: networked chargers integrated with vehicle telematics to balance the needs of the vehicle, facility, and utility grid; the integration of onsite solar panels to mitigate grid impacts and energy costs; and use of second-life batteries to improve grid and facility resiliency, provide load management, and offset total cost of ownership.8 [EPA-HQ-OAR-2019-0055-2855-A2, p. 3]

  8. VolvoLights, About Volvo Lights Project, accessed May 2022.

- The South Coast Air Quality Management District, California Air Resources Board and the California Energy Commission are leading an effort to deploy 100 battery-electric regional haul and drayage trucks across California. The battery-electric trucks will be deployed through a partnership with NFI Industries and Schneider as part of a project known as the Joint Electric Truck Scaling Initiative that aims to demonstrate scaling fleet electrification of class 8 trucks. NFI and Schneider are collectively installing 50 electric vehicle chargers, warehouse upgrades, on-site energy storage and rooftop solar. 9 [EPA-HQ-OAR-2019-0055-2855-A2, p. 3]

  9. Heavy Duty Trucking, Electric Truck Project Deploys 100 Trucks in California, August 31, 2021.

- FedEx is installing 500+ charging stations to service their electric delivery truck fleets across California. These stations alone have the potential to support more than 1,000 electric vehicles. 10 [EPA-HQ-OAR-2019-0055-2855-A2, p. 3]

  10. FedEx, Charged Up About Electric Vehicles, accessed May 2022.

- Manhattan Beer Distributors has installed three Level 3 DC fast chargers at its Bronx facility that can fully recharge its 8 Volvo VNR Electric trucks up to 80 percent in 70 minutes. Lessons learned from this demonstration project will help the company build charging plans to accommodate its more than 400 delivery trucks to service customers throughout New York City, Long Island, and the surrounding counties.11 [EPA-HQ-OAR-2019-0055-2855-A2, p. 3]

  11. VolvoTrucks, Volvo Trucks delivers the first of five VNR Electrics to New York customer Manhattan Beer Distributors, August 13, 2021.

The market for fleet charging solutions is highly dynamic with new innovations and technologies coming to the market rapidly. Just this month, over two dozen companies exhibited charging solutions at the ACT Expo.12 Charging solutions are available for companies that want to provide depot charging for their own fleet of trucks solely, while other solutions are being installed at facilities where depot charging can be shared across numerous fleets. For example, WattEV and the Port of Long Beach just announced development of a charging plaza13 while Penske and Shell Recharge announced a collaboration to expand fleet charging to six states.14 [EPA-HQ-OAR-2019-0055-2855-A2, pp. 3 - 4]

13. Heavy-Duty Trucking, WattEV and the Port of Long Beach announced plans to build a charging plaza for heavy-duty electric trucks inside the port complex, May 11, 2022.

14. Fisher, Joel, Shell to install vehicle chargers at 33 Penske locations in 6 states, Fleet Owner, May 10, 2022.

Fleets have hundreds of charging station options currently available. As noted above, most fleets will likely meet their charging needs through a Level 2 charger, while others may want or need a faster charger. EnergIIZE Commercial Vehicles (Energy Infrastructure Incentives for Zero-Emission Commercial Vehicles), a fleet infrastructure incentive project funded by the California Energy Commission’s Clean Transportation Program and implemented by CALSTART, released a list of over 140 makes and models of EVSE designed for charging commercial vehicles and available today.15 Most chargers range in max power output from 1.4kW to 1,200 kW with the majority being around 7kW to 100kW. [EPA-HQ-OAR-2019-0055-2855-A2, p. 4]

15. Calstart Energiize Commercial EV Eligible Technology, Technology Catalogue, accessed May 16, 2022.

Some of the choices currently available include:

- Nuvve EVSE-B-P1-H1, 19.2 kW charger16

- Tellus Power TP5 30-480, 30 kW charger17
- ABB Terra 54, 50 kW DC Fast charger18
- Tellus Power TP3 60-480, 60 Kk DC fast charger19
- ChargePoint Express 250, 62.5 kW DC charger20
- Tritium RTM75, 75 kW DC charger21
- BTC Power L3R-100-480, 100 KW DC fast charger22
- Power Electronics NBD180, 180 KW DC fast charger23 [EPA-HQ-OAR-2019-0055-2855-A2, p. 4]

23. https://power-electronics.com/wp-content/uploads/2021/10/DATASHEET_NBI180.pdf

There are also high-powered charging depots of 350 kW per port with new higher powered charging stations coming to the market soon.24 While the vast majority of fleets do not require this level of power, a few examples of the highest-powered choices that fleets currently have available are:

- Proterra 1.5 MW charging system.25
- Tesla 1 MW charging station. 26
- ABB High Power enclosures27
- Heliox 600 kW ultra-fast charger28
- Signet 350 kW DC fast charger29 [EPA-HQ-OAR-2019-0055-2855-A2, p. 5]

24. Calstart Energiize Commercial EV Eligible Technology, Technology Catalogue, accessed May 16, 2022.

25. Proterra, 1.5 MW Charging System spec sheet, accessed May 16 2022.

26. Lambert, Fred, Tesla is deploying the first Megacharger to charge its Tesla Semi electric truck, electrek, October 12, 2021.

27. ABB, E-Mobility high-power enclosure, accessed May 16, 2022.

28. Heliox, Ultra Fast Charging Station, accessed May 16, 2022.

29. Signet, 350 KW DC fast charging cabinet, accessed May 16, 2022.

Fleet choices will further expand between now and 2027. There are many projects advancing new, more powerful charging options. These include:

- NREL developing and testing a 3.75 MW charging station, intended to enable extremely fast charging of a single vehicle, in partnership with CharIN and evaluation from four original equipment manufacturers.30
- Roadway Wireless charging being tested in Detroit to see if charging while driving is feasible. Currently also tested in Europe and Asia. 31
- Research and piloting of using box truck roofs to solar charge trucks while driving. 32 [EPA-HQ-OAR-2019-0055-2855-A2, p. 5]

30. Greencar Congress, NREL researchers, industry partners testing Megawatt Charging Systems; up to 3.75MW, September 2021.

31. Lambert, Fred, Tesla is deploying the first Megacharger to charge its Tesla Semi electric truck, electrek, October 12, 2021.

32. Sono Motors, Sono Motors and MAN Truck & Bus Want to Jointly Analyze Applications of Solar Technology in Commercial Vehicles, May 7, 2021.

The technologies, solutions, and approaches fleets are employing today underscore the availability of charging solutions and create a strong foundation for deeper electrification, particularly in those segments that will rely on depot charging and so are most ready for near term electrification. [EPA-HQ-OAR-2019-0055-2855-A2, p. 5]

Much attention has been given to the current cost of installing charging equipment. Current projections likely overstate the costs fleets will face when installing equipment between 2027 and 2029. [EPA-HQ-OAR-2019-0055-2855-A2, p. 6]

In a study of light-duty vehicle charging infrastructure, ICCT recently found that average charging costs decline per electric vehicle sold. number of factors lead to the decreasing costs. Higher utilization of chargers, in terms of hours of active charging per day per charger, results in fewer chargers needed per electric vehicle. And installation costs decline as the number of chargers per site increases with growing market penetration. ICCT also found a modeled 3% decline in per-charge hardware cost occurs per year. The figure below shows that while installation and hardware costs increase from approximately $110 million to $165 million dollars in 2025, the average cost per electric vehicle (blue line), calculated by dividing public and workplace charging costs in each year by the number of electric vehicles sold in that year, declines from $480 in 2019 to $300 in 2025.33 This study evaluated cost of L1, L2, and DC fast charging stations for public and workplace charging rated up to and including 350kW. Given fleets will similarly be charged with L2 and similarly rated DC fast chargers, this downward trend of cost as utilization increases for the light duty vehicle sector can be translated to the heavy duty sector and similar cost reductions would be expected as medium and heavy duty ZEV sales increase. [EPA-HQ-OAR-2019-0055-2855-A2, p. 6]

33. Nicholas, Michael, Estimating electric vehicle charging infrastructure costs across major U.S. metropolitan areas, August 2019.

It is also important to recognize that in the 2027-2029 timeframe, fleets will benefit from nearly a decade of experience in how to minimize charging costs through operations and system design. In the few years that fleets have been operating electric trucks and buses, many best practices have already been developed to maximize the economic benefit fleets gain from operating these vehicles. While difficult to precisely project, we should expect fleets will continue to improve charging costs as they become more familiar with operating electric fleets. [EPA-HQ-OAR-2019-0055-2855-A2, p. 7]

As fleets have begun to electrify, more insights into the solutions for charging infrastructure are being gleaned. One area that is evolving is shared charging hubs for commercial vehicles located in key corridors. This allows fleets to share the upfront cost of charging infrastructure, reducing the cost of charging, especially for smaller fleets. For example, Portland General Electric and Daimler Trucks North America (DTNA) are co-developing a large public charging site for medium- and heavy-duty electric trucks, known as Electric Island. The island will host up to nine charging stations with charging levels of up to 5 MW.34 [EPA-HQ-OAR-2019-0055-2855-A2, p. 7]

34. Lewis, Michelle, Portland and Daimler team up for 5MW electric semi public charging ‘Island’, electrek, December 1, 2020.

New ownership models such as Transportation-as-a-Service (TaaS) are allowing fleet operators to use battery electric vehicles without being responsible for the full upfront cost of the vehicles and charging equipment. Instead, under a TaaS model, an operator pays a recurring fee to the service provider, who in exchange provides zero-emitting trucks (ZETs), vehicle maintenance, installation and management of charging infrastructure, and vehicle charging management. For example, Zeem Solutions provides leasing, servicing, parking, charging, and energy storage for small- and medium-sized fleets looking to adopt Class 3-8 ZEVs but avoid their upfront costs.35 As one example, Highland Fleets is utilizing the TaaS model with their electric school buses. Montgomery County Public Schools in Maryland has contracted with Highland Fleets to use 326electric buses over the next four years.36 Forum Mobility aims to provide similar services for drayage trucks and has broken ground on an electric truck charging station in California.37 [EPA-HQ-OAR-2019-0055-2855-A2, p. 7]

35. Zeem Solutions, Zeem Solutions, accessed May 16, 2022.

36. Green Tech Media, Highland Electric Raises $235M, Lands Biggest Electric School Bus Contract in the US, https://www.greentechmedia.com/articles/read/on-heels-of-253m-raise-highland-electric-landsbiggest-electric-school-bus-contract-in-the-u.s.

37. Forum Mobility, Forum Mobility, accessed May 16, 2022.

A variation of the TaaS business model also coming to market is Charging as a Service (CaaS), being pioneered by companies like AMPLY Power and Electrada, which provide fleet charging infrastructure installation and management in exchange for a recurring fee. AMPLY Power is demonstrating its CaaS approach for an all-electric school bus fleet of 5 in New York City together with Logan Bus Company and Black and Veatch.38 Similar to TaaS providers, CaaS providers can lower the upfront capital costs and provide the expertise needed to transition to a BEV fleet. [EPA-HQ-OAR-2019-0055-2855-A2, pp. 7 - 8]

38. Amply Power, AMPLY Power & Logan Bus Announce Demonstration Project to Simplify Electric Transportation for Fleets, February 4, 2020.

Alongside industry trends, there are a number of technology developments and industry practices available today that can significantly lower the cost of charging, including managed charging, use of on-site distributed energy resources, and open-source communication standards. [EPA-HQ-OAR-2019-0055-2855-A2, p. 8]

One of the most significant technologies lowering the cost of charging, both in terms of infrastructure and electricity costs, is managed charging. Managed charging allows fleets to use real-time utility data like grid load or electricity cost to optimize charging schedules, lower the cost of charging, reduce stress on the grid and reduce emissions. The study that evaluated the cost of charging fleets in New Jersey showed significant savings for both upfront capital costs and electricity cost when fleets managed their charging. The figure below shows the difference in capital cost for one of the evaluated fleets, a food service fleet. The study found upfront capital cost savings of over $50,000 per vehicle, largely due to spreading the charge overnight when vehicles are parked, lowering maximum charger requirements and minimizing equipment costs. By utilizing the same charging hardware for multiple vehicles or lowering the peak power requirements, the cost of infrastructure can be significantly lowered.39 [EPA-HQ-OAR-2019-0055-2855-A2, p. 8]

39. Emerging Futures, New Jersey Medium Duty Fleet Electrification Infrastructure Summary Report, May 2022.

The study also assessed the impact of managed charging on five different fleet market segments covering Class 3 through 7 trucks. The figure below shows that regardless of the electricity rate to which the fleet subscribed, significant electricity cost savings are seen, with net present value per vehicle electricity cost savings ranging from ~$15,000 to ~$175,000 depending on the rate structure. [EPA-HQ-OAR-2019-0055-2855-A2, p. 9]

A similar study in California from GNA showed managed charging can increase affordability of charging for fleets and reduce grid needs. In some of the cases evaluated, managed charging resulted in annual savings of upwards of $130,000 compared to unmanaged charging, where trucks charge at any time that is convenient for the owner or business, often immediately upon return to the depot site. Not only can managed charging improve the economics of electrifying fleets, but the analysis suggests that optimized managed charging programs could be much more powerful than they are today.40 [EPA-HQ-OAR-2019-0055-2855-A2, p. 9]

40. Gladstein, Neandross & Associates, California Heavy-Duty Fleet Electrification Summary Report, March 2021.

Onsite distributed energy resources (DERs) such as solar and battery storage are another important solution to reducing charging costs for medium and heavy-duty fleets, which often experience short but high energy demand events that significantly increase their impact on the grid and energy bills. The California GNA study examined two types of clean DERs: on-site solar panels and on-site energy storage, or batteries. When added to the managed charging scenarios, DERs produced additional annual electric savings of $625,000 (Schneider) and $835,000 (NFI). Moreover, managed charging and DERs reduced annual on-peak load by 611 kW for the Schneider fleet and 4 MW for the NFI fleet. This would not only reduce costs for the truck companies, but the utility, as well.41 If scaled to all trucks in a utility's territory, these load reductions could drastically decrease the amount of grid upgrades needed to accommodate electric fleets. If leveraged for resiliency, DERs also offer the possibility for fleets to have power security in moments when the grid power is down. [EPA-HQ-OAR-2019-0055-2855-A2, pp. 9 - 10]

41. Gladstein, Neandross & Associates, California Heavy-Duty Fleet Electrification Summary Report, March 2021.

States and utilities offer a number of programs and policies to support truck and bus electrification. For example, EnergIIZE Commercial Vehicles (Energy Infrastructure Incentives for Zero-Emission Commercial Vehicles) is a commercial vehicle fleet infrastructure incentive project funded by the California Energy Commission's Clean Transportation Program and implemented by CALSTART.42 EnergIIZE provides incentives for ZEV infrastructure equipment for medium- and heavy-duty battery electric and hydrogen fuel cell vehicles in California. The project provides a user-friendly and streamlined process for participation by breaking down infrastructure deployment barriers through targeted incentives and specialized assistance. [EPA-HQ-OAR-2019-0055-2855-A2, p. 10]

42. Calstart Energiize Commercial Vehicles. https://www.energiize.org/

Below is a selection of other programs and policies that support electrification infrastructure. [EPA-HQ-OAR-2019-0055-2855-A2, p. 11]

Make-Ready Support:

Under make-ready programs, some of the infrastructure costs are paid for by the utility, reducing the cost of electrification to customers and fleets. Utilities typically recover the cost by adding it to the rate base or through another recovery mechanism. Make-ready costs can be divided into two components: the utility-side make-ready costs associated with upgrading grid components such as the power lines, transformer, and meter to accommodate new load; and the customer side make-ready or "behind the meter" upgrades, such as trenching to upgrade or extend a line, electric panels, conduits, and switch gear. Programs and policies that reduce these costs can help fleets transition to electrification. [EPA-HQ-OAR-2019-0055-2855-A2, p. 11]

In California, the Public Utility Commission released new rules requiring utilities to provide make-ready infrastructure, up to the meter and including trenching, to support electric vehicles charging at no cost to the typical customer.43 Utilities in New York launched a make-ready pilot program for commercial trucks and buses that participate in the New York Truck Voucher Incentive Program or the New York City Clean Trucks Program, to cover up to 90 percent of the utility side make-ready costs for L2 and fast chargers.44 Programs such as these reduce the costs of installing charging stations, fundamentally improving the economics of electrifying the transportation sector. [EPA-HQ-OAR-2019-0055-2855-A2, p. 11]

43. California Public Utilities Commissions, Resolution E-5167, October 7, 2021.

44. Joint Utilities of New York, Medium and Heavy Duty Make Ready Pilot, accessed May 20th, 2022.

Electricity Rates:

Electricity rates and their structure have a large impact on the cost of charging. Compared to passenger vehicles, commercial trucks and buses are a tremendously diverse segment that varies by vehicle type, duty cycle, fleet size, business model and experience with complex electric pricing. As such, there are a number of rate structure developments occurring that are helping lower the cost of charging for fleets. [EPA-HQ-OAR-2019-0055-2855-A2, pp. 11 - 12]

One of the largest portions of a fleet's bill, in particular in its early transition stage when utilization of charging equipment is low, is the demand and capacity ($/kw) portion. New rate structures are available to fleets to help alleviate this cost:

Demand Holidays: This approach eliminates the demand charge component for commercial EV rates for a specified amount of time (recovering delivery costs through volumetric pricing in the meantime), and phases them back in over time. Some utilities are exploring this approach to help ease transition until fleets reach a higher utilization. For example, Southern California Edison offers a seven-year demand holiday rate after which a demand charge is slowly reintroduced.45 [EPA-HQ-OAR-2019-0055-2855-A2, p. 12]

45. California Public Utilities Commissions, Application of San Diego Gas & Electric Company (U 902E) for Approval of SB 350 Transportation Electrification Proposals, June 6, 2018.

Subscription Rate: Customers subscribe in advance for a particular level of demand and pay a fixed monthly amount for service. The actual subscription rates now coming online are based on a pre-subscribed coincident peak demand maximum. This is often complemented with a grace period: if a customer exceeds their "allotted" demand, they will have a set amount of time to adjust their usage before their bill rises to a higher level and stays there.46 [EPA-HQ-OAR-2019-0055-2855-A2, p. 12]

46. See, e.g. California Public Utilities Commissions, Application for Approval of Pacific Gas and Electric Company's Commercial Electric Vehicle Rate. (U39E). October 28, 2019.

Time of Use (TOU) Rate: Customers are charged based on their highest demand level that coincides with system peak conditions. For the energy or dollar per kWh portion of the bill, offering a variety of TOU and real time prices will enable fleets to lower their charging costs by allowing them to charge when generation costs are lowest. Many utilities already offer TOU-based prices for demand and energy - and when coupled with managed charging, it can result in significant fuel cost savings for fleets. [EPA-HQ-OAR-2019-0055-2855-A2, p. 12]

Rate Reduction: Fixed rate reductions also ease the upfront cost when utilization is low. For example, Con Edison offers an electric rate reduction ranging from 34% to 39% for businesses in New York City and Westchester County that install a publicly accessible direct current (DC) fast electric vehicle supply equipment (EVSE).47 [EPA-HQ-OAR-2019-0055-2855-A2, p. 12]

47. Con Edison, Business Incentive Rate, accessed May 16, 2022.

Technical and Planning Support: As fleets enter the BEV space, it is important to understand the needs for charging, how to build a charging infrastructure plan and the types of financial support programs available. A number of utilities and states offer programs tailored to address technical and feasibility concerns for fleets. For example, National Grid in New York and Portland Gas and Electric currently offer fleet charging site feasibility analysis, technical support for charging, and electricity rate advice.48,49 Financial support for a charging site feasibility study and design is also part of SB 372 in California.50 [EPA-HQ-OAR-2019-0055-2855-A2, p. 13]

48. National Grid, Electric Vehicle Charging Station Programs, accessed May 16, 2022.

49. Portland General Electric, PGE Fleet Partner, Fleet Charging, accessed May 16, 2022.

50. Leyva, Connie, SB-372 Medium- and heavy-duty fleet purchasing assistance program: zero-emissionvehicles.(2021-2022), October 8, 2021.

Transit agencies are also getting support from utilities and states to electrify their fleets and build necessary charging networks. Southern California Edison's Charge Ready program provides fleets with technical knowledge and significantly reduces the upfront cost of infrastructure, making electrification more feasible for transit agencies.51 New York's Metropolitan Transit Authority finalized a $39 million agreement with the New York Power Authority to install more than 50 overhead chargers to power new electric buses as part of their goal of transitioning to a zero-emitting bus fleet by 2040.52 [EPA-HQ-OAR-2019-0055-2855-A2, p. 13]

51. Southern California Edison, Charge Ready Transport Program: Case Studies, accessed May 2022.

52. Metropolitan Transportation Authority , MTA Announces Plans to Increase Number of Electric Buses Purchased in 2021, May 25, 2021.

On Bill Financing and Tariffs: Some utilities offer Pay As You Save (PAYS) programs for certain market segments that allow utilities to invest in the charger and some of the additional costs needed to procure an electric vehicle. The utility's investment is recovered through a charge on their monthly electricity bill, and when the cost of the equipment is paid off, the fleet owns the vehicle and charging infrastructure. An example of this is the Duke Energy school bus program, which offers a PAYS program for school districts.53 [EPA-HQ-OAR-2019-0055-2855-A2, p. 13]

53. DSIRE, Duke Energy - EV School Bus Program, October 9, 2021.

While many PAYS programs are being developed in support of school bus fleets, there are also loan and financing programs being offered to help assist small businesses develop their charging infrastructure. For example, the Capital Access Program (CalCAP) helps small fleets design, develop, purchase and install electric charging stations at small business locations in California.54 These kinds of programs not only help overcome financial barriers of small businesses but also aid in developing the industry knowledge for expanding broader charging infrastructure coverage to support mass fleet electrification. [EPA-HQ-OAR-2019-0055-2855-A2, p. 13]

54. California Pollution Control Financing Authority, California Capital Access Program (CalCAP) Electric Vehicle Charging Station (EVCS) Financing Program, accessed May 16, 2022.

Rebate Programs:

Fleets can benefit from rebate programs offered by utilities and local governments, among others. These programs can significantly reduce the upfront costs of installing charging infrastructure, particularly for small businesses. Depending on the region, there are currently a variety of charging infrastructure rebate programs, including rebates for make-ready, charging stations, smart chargers, and onsite renewables. [EPA-HQ-OAR-2019-0055-2855-A2, p. 14]

Between now and 2027, it is reasonable to expect a significant expansion in the number of rebate programs available to fleets while also increasing the effectiveness of these programs for addressing fleet needs – as utilities and others benefit from several years of further learning and exploration that will enable them to sharpen these programs. Below is an illustrative list of current rebate programs. [EPA-HQ-OAR-2019-0055-2855-A2, p. 14]

Charging Infrastructure and Make Ready: Rebates offset the cost of installation and associated service upgrades needed to meet a fleet's growing need for electricity.

- Saratoga county offers rebates for charging infrastructure and tax incentives.55
- Massachusetts covers up to 60 percent of the cost for L1 and L2 chargers.56
- PG&E's EV Fleet program offers infrastructure incentives up to $9,000 per vehicle and charger rebates up to 50 percent of the cost of level 2 and DC fast chargers.57
- SDGE offers a rebate of up to 80 percent of the cost of "customer-side infrastructure".58

- Atlantic City, New Jersey offers commercial customers rebates covering up to 50 percent of eligible installation costs up to $2,500 per port, for a maximum of 10 ports.59 [EPA-HQ-OAR-2019-0055-2855-A2, p. 14]

55. Sarasota County, Electric Vehicles, accessed May 16, 2022.

59. Atlantic City Electric, EVsmart Residential, Multi-family, Public, Workplace & Fleet Rebates, May 2021.

Smart Charging: Fleets can be incentivized to utilize software that guides them when to charge. This can help fleets minimize increases in peak-load while also enabling utilities to manage their generation.

- PGE Long Island offers a $300 rebate for installing a smart charger.60 [EPA-HQ-OAR-2019-0055-2855-A2, p. 14]

60. PSEG Long Island, Smart Charger Rebate, accessed May 16, 2022.

Disadvantaged Communities: Reflecting the significant health benefits of replacing diesel and other combustion vehicles with ZEVs, some agencies provide fleets with incentives for replacing or operating ZEV in frontline communities.

- Colorado offers grants for EVSE in disadvantaged communities61
- New Jersey Department of Environment offers incremental cost rebates, including charging equipment, to shuttle bus, school bus, garbage truck, and transit bus fleets operating in disadvantaged communities.62
- In California, transit agencies can apply to a voucher program to relieve costs for buses, charging equipment and design. 63 [EPA-HQ-OAR-2019-0055-2855-A2, pp. 14 - 15]

61. Clean Air Fleets, ALT Fuels Colorado, accessed May 16, 2022.

62. The New Jersey Department of Environmental Protection, RGGI Funding for Transportation Electrification, accessed May 16, 2022.

63. Clean Mobility Options, Providing funding for zero-emission carsharing, carpooling/vanpooling, bikesharing/scooter-sharing, innovative transit services, and ride-on-demand services in underserved communities, accessed May 16, 2022.

Solar and Storage: Leveraging distributed energy resources, such as on-site solar and battery storage, can lower peak electricity demand at fleet depots. This can have significant cost savings, especially when it helps fleets avoid or reduce demand charges.

- Commercial property owners in Asheville, North Carolina, can receive a rebate on their building permit by installing solar.64
- Pacific Gas and Electric (PGE) offers rebates to businesses to install behind the meter generation and storage. 65
- New York State Energy Research and Development (NYSERDA) is offering financing and upfront rebates to businesses to install solar.66 [EPA-HQ-OAR-2019-0055-2855-A2, p. 15]

64. Energy Sage, North Carolina solar incentives, accessed May 16, 2022.

65. Pacific Gas & Electric, Clean energy incentives and programs, accessed May 16, 2022.

Utility Charging Station Ownership: Some utilities are exploring owning and operating charging infrastructure in certain demographic areas and market segments. In North Carolina, Duke Energy will install and own the charging equipment, provide funding to offset 30 electric school bus purchases, gather operational data, and explore vehicle-to-grid technology's technical capabilities.67 [EPA-HQ-OAR-2019-0055-2855-A2, p. 15]

67. North Carolina Utilities Commission, Application by Duke Energy Carolinas, LLC, and Duke Energy Progress, LLC, for Approval of Proposed Electric Transportation Pilot, November 24, 2020.

Bring Your Own Device (BYOD) program: In these programs, a rebate is offered for participation in programs that require advanced technology, such as smart charging. For example, Baltimore offers a BYOD rebate of $300 to entities that use a smart charger and enroll in a TOU rate.68 [EPA-HQ-OAR-2019-0055-2855-A2, p. 15]

68. Baltimore Gas and Electric, EVsmart® Vehicle Charging Time of Use Rate, accessed May 16, 2022.

Other BYOD programs are performance based and continually reimburse owners of the advanced technology for providing a grid service such as critical peak load reduction. Currently this is only offered for onsite solar and storage, often co-located with MHDV charging infrastructure, but programs like these could also be expanded to include smart charging services. Green Mountain Power's BYOD program offers a performance-based incentive for utilizing customers' behind-the-meter storage for grid services.69 Similarly, National Grid offers a BYOD device program for solar and storage.70 [EPA-HQ-OAR-2019-0055-2855-A2, pp. 15 - 16]

69. Green Mountain Power, Rebate Program: Bring Your Own Device, accessed May 16, 2022.

70. National Grid, ConnectedSolutions Program, accessed May 16, 2022.

Another report developed by M.J. Bradley & Associates for Environmental Defense Fund shows a large and growing opportunity to expand America's zero-emission freight trucks and buses. The report evaluates four factors in assessing the readiness of zero-emitting medium and heavy-duty vehicles in different applications – the availability of electric models from manufacturers, the requirements for charging, the ability of electric models to meet operating requirements, and the business case for zero-emitting vehicles. It finds that a large number of market segments have favorable ratings across at least three of these categories, which indicates strong potential for near-term zero-emitting vehicle deployment. These market segments, which represent about 66% of the current in-use fleet, include heavy-duty pickups and vans, local delivery and service trucks and vans, transit and school buses, class 3 to 5 box trucks, class 3 to 7 stake trucks, dump trucks and garbage trucks. [EPA-HQ-OAR-2019-0055-1265-A1, p.12]

Market sources clearly show that the medium- and heavy-duty industry has embraced zero-emitting vehicle technology and momentum is growing. Strong and durable federal emissions standards are needed to signal our nation's steadfast commitment to reducing truck emissions and support the industry in its transition to ZEVs. [EPA-HQ-OAR-2019-0055-1265-A1, p.12]

In June 2020, California adopted the world's first zero-emission truck rule. The Advanced Clean Truck (ACT) rule will require manufacturers to start selling new heavy-duty ZEVs by 2024 and require 55 percent of class 2b – 3 truck sales, 75 percent of class 4 – 8 straight truck sales, and 40 percent of truck tractor sales to be zero-emission by 2035 at the latest.54 This landmark rule is expected to prevent more than 900 premature deaths, save the state economy up to $12 billion over the next 20 years and create thousands of new jobs by 2035.55 [EPA-HQ-OAR-2019-0055-1265-A1, p.12]

54 ARB press release, "California takes bold step to reduce truck pollution," (June 25, 2020). https://ww2.arb.ca.gov/news/california-takes-bold-step-reduce-truck-pollution

55 Jamie Fine, 'Report: California's clean truck rule will save the economy billions, eliminate vast amounts of pollution,' EDF blog (June 17, 2020). http://blogs.edf.org/energyexchange/2020/06/17/report-californias-clean-truck-rule-will-save-the-economy-billions-eliminate-vast-amounts-of-pollution/#more-20253

EDF supports substantially strengthening the Phase 2 GHG standards. However, EPA's proposed adjustment to the standards not only dramatically underestimates the likely market penetration of ZEVs in the coming years; it fails to achieve any additional deployment of zero emission technologies. We urge the agency to set protective, performance-based GHG standards that more accurately reflect the likely baseline levels of ZEVs in the 2027 to 2029 time frame, and that also ensure greater deployment of zero-emissions technologies well beyond that baseline. [EPA-HQ-OAR-2019-0055-1265-A1, p.16]

Organization: *Environmental Protection Network (EPN)*

Electric vehicles (EVs) play an important role in achieving major NOx reductions in our country. EVs are a critically important component of a multi-pollutant emissions control strategy. The HD sector is already transitioning to EVs, with new announcements almost every day of plans to build and buy EVs for the HD sector. Progress is sure to accelerate given the immense public and private investments taking place. This includes support at the federal level, such as the recently passed Infrastructure Investment and Jobs Act, as well as many states providing financial and other support for this transition. [EPA-HQ-OAR-2019-0055-1233-A1, p. 1]

EPA properly includes EVs in its technology basis for setting the level of the revised GHG standards. EPA properly recognizes that many important circumstances have changed since the Phase 2 GHG standards were adopted—the quickening pace of EV development and use, adoption of regulations by California and other states, actions by countries across the world, and the immense investments being made and planned by industry and governments for the transition to EVs in the US and elsewhere. [EPA-HQ-OAR-2019-0055-1233-A1, p. 3]

EPN agrees and supports that now is the time to use this technology as part of the basis for setting the level of the GHG emissions standards. The problem is EPA appears to aim at a level that does no more than codify business as usual and, in fact, likely underestimates near-term EV sales in the HD sector. EPA's traditional approach to standard-setting analyzes the need for emissions reductions and the kinds of technologies that could achieve reductions, including the history of prior use, advances to date, cost, feasibility, lead time considerations, and other factors. EPA then sets the standard at a level that reflects a projection of technology penetration that could occur and reasonably balances the various factors. This projected rate of penetration is almost always more than what industry and the market already plan to do. EPA's proposal does not take this approach. It is a missed opportunity to promote the degree of near-term EV penetration necessary to begin to address the climate crisis. [EPA-HQ-OAR-2019-0055-1233-A1, p. 3]

EPN recommends that EPA set standards that aim for very high ZEV penetration for school buses and urban transit buses by MY 2029. For delivery vans and short-haul tractors, EPN recommends EPA aim for a much more aggressive, but practical, penetration rate by MY 2029 than proposed. More ambitious GHG standards will accelerate the introduction of zero-emissions technologies for all pollutants and set the stage for the standard setting in the next, longer-term rulemaking. The country can't rely on business as usual, whether for MYs 2027-29 or for MYs 2030 and later. [EPA-HQ-OAR-2019-0055-1233-A1, p. 3]

Organization: *Evangelical Environmental Network (EEN)*

While the proposed rules are a good start, they must be strengthened. Specifically

o On GHG part of rule, the agency's minor adjustments to existing Phase 2 greenhouse gas standards are weak and reflect neither the urgency of the climate crisis nor the rapid advancement in zero-emission truck technology. These adjustments must be strengthened. [EPA-HQ-OAR-2019-0055-1134-A1, p.2]

Organization: *Evolving Electric Motor Company*

The optimum reduction in GHG emissions from all vehicles, smallest to largest, is via electric vehicles charging at electric power stations using electricity generated solely via renewable methods. [EPA-HQ-OAR-2019-0055-2488,p.1]

That optimal advance will require many trillions of dollars in infrastructure to generate and distribute said renewable electricity. [EPA-HQ-OAR-2019-0055-2488, p.1]

Full Series Hybrid Electric Vehicles (FSHEV)...

This technology has been demonstrated by: the RST-V (a.k.a., Shadow) from General Dynamics Land Systems; the Ultra AP from Georgia Tech's Research Institute; the Nissan Note, E-Power, available only in Japan. [EPA-HQ-OAR-2019-0055-2488, p.1]

Large reductions in GHG emissions, accomplished by the vehicles listed above, have been possible for more than two decades. It will take more than a bit of insistence by the EPA, and other regulatory agencies, or nothing will continue to be done. [EPA-HQ-OAR-2019-0055-2488, p.1]

As was the case with seat belts... Little, to nothing, happens without significant regulatory pressure. In this case the EPA must take the lead as the agent of enforced progress. [EPA-HQ-OAR-2019-0055-2488, p.1]

Organization: *Ford Motor Company (Ford)*

Ford supports Greenhouse Gas Emissions Model (GEM)-based stringency changes. The GEM-based standards need to account for ZEVs that are expected to enter the heavy-duty fleet in the future. We believe that the targeted GEM-based standard reductions in 2027 model year and later reflect a reasonable assumption of the fraction of ZEVs that are expected in the heavy-duty fleet in that timeframe. [EPA-HQ-OAR-2019-0055-1300-A1, p. 4]

Organization: *Fuel Cell and Hydrogen Energy Association (FCHEA)*

However, regulatory efforts by the federal government to increase deployment of heavy-duty zero-emission vehicle transportation are only one piece of the puzzle needed to unlock greater investment and adoption in this sector. The hydrogen truck industry also needs sustained federal investment in developing a national hydrogen refueling infrastructure network, as well as incentives to encourage station development, vehicle adoption, and reductions in the cost of hydrogen fuel. The federal government can work to build adoption by encouraging government agencies to switch to zero-emission vehicle alternatives for their own operations. [EPA-HQ-OAR-2019-0055-1187-A2, p. 2]

Organization: *International Council on Clean Transportation (ICCT)*

ICCT research shows that the U.S. must achieve at least 45% zero-emission truck sales in 2030 and 100% no later than 2040 to meet domestic and global climate goals to limit warming to below 2 degrees Celsius. Limiting global warming to below 2°C would require the U.S. HDV sector to mitigate its projected cumulative CO2 emissions through 2050 by roughly 4 billion metric tons. Our analysis of EPA's proposal finds it is inadequate to meet domestic and global climate goals. EPA risks not meeting these goals if the agency waits until 2030 to require zero-emission HDV sales. Our modeling shows that EPA has the opportunity in this rulemaking to accelerate ZEV uptake in high priority vehicle segments to remain on a pathway consistent with 2°C. [EPA-HQ-OAR-2019-0055-1211-A1, p. 4]

RECOMMENDATION: We recommend EPA adopt GHG standards for MY2027, MY2028 and MY2029 consistent with achieving the following market shares of zero-emission vehicles—and to do so by the end of this year. This level of ZEV deployment falls between the ambition of the targets set by the Advanced Clean Trucks rule adopted by several U.S. states and those set out in a draft Advanced Clean Fleets rule also under discussion at the state level. This level of ambition is necessary, based on our analysis, to maintain an emissions pathway consistent with limiting warming to 2°C. Even higher ZEV deployment would be needed to reduce the gap with 1.5°C. [EPA-HQ-OAR-2019-0055-1211-A1, p. 4. See Table 1.]

RECOMMENDATION: We recommend EPA achieve these targets by requiring vehicle manufacturers to meet a zero-emission standard for CO2 for a minimum percentage of production in each segment. A zero emission CO2 standard would apply only to zero-emission vehicles only and would be in addition to current GHG standards. Such an approach represents a 'dual-averaging' set. If EPA chooses not to adopt this approach, we recommend EPA revise its GHG standards to reflect the combination of projected internal combustion engine and zero-emission vehicle technology needed to meet climate goals. [EPA-HQ-OAR-2019-0055-1211-A1, p. 4]

The EPA proposal includes baseline ZEV uptake assumptions that do not currently reflect the benefits of adopted state policies that require zero-emission truck sales. A more accurate reflection of baseline ZEV uptake resulting from already adopted state-level policies, based on ICCT estimates, is 3.8% in MY 2027 and 7.2% in MY 2029 in the 17 early-adopting segments for which EPA proposed revisions. ICCT estimates that implementation of the Advanced Clean Trucks regulation among all U.S. signatories to the Multi-State Memorandum of Understanding would increase this baseline to 6.7% in MY 2027 and 12.7% in MY 2029 in the same 17 segments. At the federal level, the Infrastructure Investment and Jobs Act allocates up to $5 billion in funding for zero-emission school buses.1 In addition, the Biden administration has directed the federal government to transition to 100% ZEV acquisition by 2035.2 Both of these federal actions are expected to supplement state-level actions and lead to higher heavy-duty ZEV uptake than considered in EPA's baseline. [EPA-HQ-OAR-2019-0055-1211-A1, p. 5]

1. The White House, "Fact Sheet: Competitive Infrastructure Funding Opportunities for Local Governments," accessed 13 May 2022, https://www.whitehouse.gov/wp-content/uploads/2022/01/BIL-Factsheet-Local-Competitive-Funding.pdf

2. The White House, “Fact Sheet: President Biden Signs Executive Order Catalyzing America’s Clean Energy Economy Through Federal Sustainability THE WHITE HOUSE, accessed 13 May 2022, https://www.whitehouse.gov/briefingroom/statements-releases/2021/12/08/fact-sheet-president-biden-signs-executive-order-catalyzing-americas-cleanenergy-economy-through-federal-sustainability/

RECOMMENDATION: We recommend EPA accurately reflect business-as-usual projections of ZEV sales, taking into consideration the requirements adopted in at least six U.S. states (as of this writing) who have adopted the Advanced Clean Trucks regulation and providing for further evolution of the baseline as more states take similar actions in coming years and as federal actions further accelerate deployment of heavy-duty ZEVs. [EPA-HQ-OAR-2019-0055-1211-A1, p. 6]

EPA has the opportunity in this rulemaking to accelerate zero-emission uptake in high priority vehicle segments to remain on a pathway consistent with 2°C.37 [EPA-HQ-OAR-2019-0055-1211-A1, p. 26]

37. Buysse, Kelly, and Minjares, “Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the United States.”

Achieving at least 45% heavy-duty ZEV sales by 2030 will require setting progressively stringent regulations beginning as soon as model year 2027 to ensure nationwide ZEV model availability for all HDV segments at production volumes consistent with achieving this ambition. HDV electrification is moving fastest in the most market-ready segments—transit buses, short-haul rigid trucks, and short-haul tractors—which are characterized by favorable total costs of ownership, dedicated parking facilities, and predictable low-cost overnight charging. [EPA-HQ-OAR-2019-0055-1211-A1, p. 26]

Long-haul tractors are the single largest contributor of HDV CO2 emissions (Table 9) and will rely upon a national publicly accessible network of charging and refueling infrastructure necessary to support zero emissions operation. Ensuring adequate density and distribution of infrastructure to support its flexible long distance operational profile requires a nationwide effort, which the Biden administration has initiated with the 2021 Infrastructure Investment and Jobs Act.38 Previous ICCT research has identified a need for $6 billion in cumulative public charging infrastructure investments by 2030 and $52 billion by 2040 to support a transition to 100% zero-emission long-haul tractor sales by 2040.39 [EPA-HQ-OAR-2019-0055-1211-A1, p. 26]

38. Infrastructure Investment and Jobs Act..

39. Minjares et al., “Infrastructure to Support a 100% Zero-Emission Tractor-Trailer Fleet in the United States by 2040.”

To understand how EPA could strengthen its proposal, we developed scenarios for CO2 emissions from Class 4–8 vehicles that explore a combination of ZEV pathways, GHG standards, and ZEV crediting schemes. [EPA-HQ-OAR-2019-0055-1211-A1, p. 27]

We developed several ZEV sales pathways to represent how we expect OEMs may choose to comply with future sales requirements. These pathways are shown below in Figure 9. See Attachment 1 – Appendix A for a detailed description of these scenarios. [EPA-HQ-OAR-2019-0055-1211-A1, p. 27. See Docket Number EPA-HQ-OAR-2019-0055-1211-A2 for Appendix A.]

We also modeled three policy scenarios for GHG standards:

• Current represents the original Phase II rulemaking, which includes ZEV super credits through MY 2027 (advanced technology credit multiplier of 4.5 for battery-electric vehicles);

• Proposal tightens MY 2027 GHG standards by 1.5% and retains ZEV super credits through MY 2027;

• ICCT assumes EPA adoption of minimum production requirements of zero-emission vehicles as explained in a previous ICCT paper.40 Under such an approach, minimum production percentage requirements are established for vehicles that meet a zero-emission CO2 standard, average GHG limits apply to other vehicles, and ZEVs cannot generate super credits. More detailed modeling methodology and scenario descriptions can be found in Attachment 1-Appendix A. [EPA-HQ-OAR-2019-0055-1211-A1, pp. 27 - 28. See Docket Number EPA-HQ-OAR-2019-0055-1211-A2 for Appendix A.]

> 40. https://theicct.org/wp-content/uploads/2022/02/HDV-US-adapting-vehicle-emission-stds-zero-emissioncommercial-truck-bus-fleet-feb22.pdf

We recommend EPA revise its proposal to accelerate heavy-duty ZEV uptake before 2030 in order to meet the goals of the Paris Climate Agreement. [EPA-HQ-OAR-2019-0055-1211-A1, p. 28]

Shown in Figure 11, our most ambitious scenario would reduce cumulative 2027–2050 well-to-wheel CO2 emissions by 6.4 Gt from current policies, well in line with the 4 Gt reduction compatible with a 2°C global climate target. These emission benefits result from ZEV deployment in our Alternative 3 pathway as well as alignment with our recommended GHG policy scenario, ICCT, which assumes the stringency of Phase II standards would be preserved for ICE vehicles regardless of ZEV deployment. Harmonizing federal ZEV sales targets with those set out in the ACT regulation, represented by our Alternative 2 pathway, also achieves this target with a 4.8 Gt reduction in cumulative emissions. A 3-year lag in harmonizing with the ACT regulation, represented in our Alternative 1 pathway, only achieves a 3.5 Gt reduction in cumulative emissions. Such a delay in accelerating heavy-duty ZEV deployment would reduce cumulative emissions benefits by 1.2 Gt compared to federal harmonization with the targets set out in the ACT regulation and would not be aligned with a 2°C-compatible future—steeper emissions reductions would be needed to maintain a chance of limiting warming to 1.5°C. [EPA-HQ-OAR-2019-0055-1211-A1, p. 29]

3. We recommend EPA revise its proposal to reflect at least 20% zero-emission HDV sales in MY 2027, 30% in MY 2028, and 40% in MY 2029 [EPA-HQ-OAR-2019-0055-1211-A1, p. 30]

To align with domestic and global climate targets, we recommend that EPA adopt annual MY 2027–2029 GHG standards that put the U.S. heavy-duty vehicle fleet on pace to achieve at least a 45% ZEV sales share in 2030.41 [EPA-HQ-OAR-2019-0055-1211-A1, p. 30]

41. Buysse, C., Kelly, S., and Minjares, R. (2022). Racing to zero: The ambition we need for zero-emission heavy-duty vehicles in the United States. Washington, D.C.: International Council on Clean Transportation. 8 April. https://theicct.org/racing-to-zero-hdv-us-apr22/

We recommend that EPA adopt MY 2027 GHG standards that reflect an average emission level for the combination of 20% production of zero-emission vehicles and 80% production of vehicles using internal combustion engines. We further recommend that EPA also adopt MY 2028 GHG standards that reflect an average emission level for the combination of 30% production of zero-emission vehicles and 70% of vehicles using internal combustion engines, as well as a set of MY 2029 GHG standards that reflect an average emission level for the combination of 40% production of zero-emission vehicles and 60% of vehicles using internal combustion engines. Manufacturers can take advantage of averaging, banking, and trading (ABT) crediting flexibility to comply with annual targets. [EPA-HQ-OAR-2019-0055-1211-A1, p. 31]

We recommend EPA establish minimum production requirements for heavy-duty ZEVs in the form of 'dual averaging sets' to provide certainty the ZEV transition will occur at the pace required to meet climate goals. [EPA-HQ-OAR-2019-0055-1211-A1, p. 31]

In his August 2021 Executive Order, President Biden called upon the EPA Administrator to consider establishing new NOx standards for heavy-duty engines and vehicles ‘‘in consideration of the role that zero emission heavy-duty vehicles might have in reducing emissions from certain market segments”; and to consider new greenhouse gas emission standards beginning as soon as MY 2030. 42 If designed appropriately, these actions by EPA could jump-start the national transition to zero-emission heavy-duty vehicles and take advantage of the infrastructure investments and fiscal policies the president is pursuing through legislation. [EPA-HQ-OAR-2019-0055-1211-A1, p. 31]

42. The White House, “Executive Order on Strengthening American Leadership in Clean Cars and Trucks,” (August 5, 2021), https://www.whitehouse.gov/briefing-room/presidential- actions/2021/08/05/executive-order-on- strengthening-american-leadership-in-clean-carsand-trucks/.

For decades, EPA set new vehicle emission standards under Section 202 of the Clean Air Act, focusing on the incremental improvement of internal combustion engine-powered vehicles. Standards for nitrogen oxides and particulate matter have encouraged the widespread adoption of diesel oxidation catalysts, diesel particulate filters, and selective catalytic reduction. Standards on greenhouse gases have encouraged the adoption of more efficient engines and transmissions, low rolling-resistance tires, improved vehicle aerodynamics, and low-GWP refrigerants. These emission standards have increased in stringency, generating fleet-wide emission reductions over time. The result has been steadily cleaner ambient air and significant public health and welfare benefits. [EPA-HQ-OAR-2019-0055-1211-A1, p. 31]

But the urgency of the climate crisis requires deeper, more rapid, and more sustained emission reductions than those delivered by incremental vehicle and engine standards. This need points to the role of zero emission powertrains as a leapfrog solution over continued incremental improvements. Transitioning to zero emission powertrains in the commercial truck and bus fleet requires an effective adaptation of the existing U.S. regulatory framework for internal combustion engines vehicles. [EPA-HQ-OAR-2019-0055-1211-A1, p. 31]

We recommend that EPA require vehicle manufacturers to meet a zero-emission standard for CO2 for a minimum percentage of production in each segment.43 This new zero-emission CO2 standard would be in addition to current GHG standards; for example, limits on emissions of refrigerants would still apply to these vehicles. For the purposes of this discussion, the vehicles subject to this minimum percentage requirement are called “transition” vehicles. This standard would require a vehicle to be powered by an electric motor and not have an internal combustion engine, resulting in no tailpipe emissions of GHGs. The multi-pollutant coverage of this control technology also means the transition vehicles would produce no emissions of NOx or PM. [EPA-HQ-OAR-2019-0055-1211-A1, p. 32]

> 43. Minjares, Ray, and John Hannon. 2022. “Adapting US Heavy-Duty Vehicle Emission Standards to Support a Zero-Emission Commercial Truck and Bus Fleet.” Washington, D.C.: International Council on Clean Transportation. https://theicct.org/publication/us-hvs-standards-ze-fleet-feb22/.

As part of the vehicle certification and production process, manufacturers would designate their vehicles as either transition vehicles, subject to the percentage requirements, or non-transition vehicles. A manufacturer would need to show that the transition vehicles were zero-emission vehicles and met the applicable percentage of production, as well as other applicable requirements. [EPA-HQ-OAR-2019-0055-1211-A1, p. 32]

The emissions standards for each group would be distinct and separate, and the requirements for each group would be based on the nature of their projected emissions control technology. For transition vehicles, this would reflect technology that produces zero tailpipe emissions for multiple pollutants. Non-transition vehicles would be subject to standards based on technology to control emissions from vehicles powered by internal combustion engines. [EPA-HQ-OAR-2019-0055-1211-A1, p. 32]

The engines used in non-transition vehicles would be subject to the new, more stringent NOx standard finalize by EPA in this rulemaking and would remain subject to current GHG and PM standards. The current provisions for categorization and averaging, banking, and trading would apply to non-transition vehicles and engines. [EPA-HQ-OAR-2019-0055-1211-A1, p. 32]

Credits generated by producing more zero-emission transition vehicles than required could be banked to meet that segment's percentage requirement in future MYs or used to show compliance with the percentage requirement for transition vehicles in another segment. For example, a manufacturer that produces more than the minimum zero-emission vehicles in Segment A in MY 2027 could bank those credits for use in that segment in future MYs, or could use the credits to show compliance with the percentage requirement for Segment B in MY 2027. EPA could establish appropriate adjustments for the transfer of these transition credits from one segment to another to account for differences in emissions and other variables. [EPA-HQ-OAR-2019-0055-1211-A1, p. 32]

Transition vehicles and non-transition vehicles would be distinct and separate averaging sets. Credits from producing more zero-emission transition vehicles than the required percentage could not be used to show compliance with the standards for non-transition vehicles, and vice versa. This would best ensure that the overall emissions reduction and zero-emission vehicle production goals are achieved. [EPA-HQ-OAR-2019-0055-1211-A1, p. 32]

However, manufacturers would retain flexibility in designating vehicles as either transition or non-transition vehicles. A manufacturer that produces greater zero- emission vehicles than the required percentage could certify some or all those extra zero-emission vehicles as non-transition vehicles and include them to demonstrate compliance with the standards for non-transition vehicles. This provides manufacturers flexibility while preserving the goals of overall emission reductions and production of zero-emission vehicles. [EPA-HQ-OAR-2019-0055-1211-A1, p. 32]

EPA could consider treating PHEVs as non-transition vehicles that do not meet the zero-emission vehicle percentage requirements. Designating PHEVs as non-transition vehicles would provide manufacturers with significant flexibility in achieving the more stringent engine and vehicle standards. This approach would avoid undercutting the critical goal of transitioning the vehicles in each segment to the desired percentage production of zero-emission vehicles. [EPA-HQ-OAR-2019-0055-1211-A1, pp. 32 - 33]

EPA could consider how vehicles subject to standards set by California and Section 177 States are addressed. If the standards adopted by California and Section 177 states for internal combustion vehicles are more stringent or require a greater percentage of zero-emission vehicles compared to EPA's corresponding standards, then EPA may consider not including vehicles certified to the California and Section 177 state standards in demonstrating compliance with EPA's corresponding standards. For example, assume California and Section 177 states require a greater percentage requirement of zero-emission vehicles for Segment A than EPA. In that case EPA's percentage requirement would only apply to vehicles that are not certified to the California and Section 177 state standards. If the California and Section 177 state standards are the same as EPA's or provide that compliance with the federal standards is deemed to be compliance with the state standards, then EPA could apply its standards to the entire national fleet. In any case, we recommend the federal standard ensure that the appropriate percentage of ZEVs are produced above and beyond any production called for by California and the Section 177 states. [EPA-HQ-OAR-2019-0055-1211-A1, p. 33]

It is critical that we achieve the long-term goal of broadly transitioning to zero- emission vehicles with their elimination of tailpipe criteria pollutant, air toxic, and greenhouse gas emissions over the full life of the vehicle. Treating zero-emission vehicles as a separate group, with standards set to reflect the use of zero emissions technology, provides high certainty that the projected transition to a percentage of zero-emission vehicles will occur. It also provides high certainty that the overall level of projected GHG, NOx, and PM reductions would be achieved. [EPA-HQ-OAR-2019-0055-1211-A1, p. 33]

If EPA chooses not to establish a zero-emission standard for CO2 for a specified percentage of production in each segment, we recommend EPA retain the current program structure of GHG regulation and revise standards to reflect the combination of projected internal combustion engine and zero-emission vehicle technology needed to meet climate goals. Under this approach, EPA would set MY2027 GHG standards that reflect an average emission level for the combination of zero-emission vehicle targets given in Table 11. There would be no requirement under this approach that manufacturers produce zero-emission vehicles. Credits from any segment would be banked or transferred to another segment, subject to the appropriate adjustments set by EPA to account for differences among segments and usage patterns. [EPA-HQ-OAR-2019-0055-1211-A1, p. 33]

EPA could adopt a bin structure that sets standards achievable by zero-emissions technology; a near-zero emissions standard, achievable by long-range plug-in hybrid-electric vehicles; and a stringent NOx bin achievable by engines in internal combustion-powered vehicles. Hybrid vehicles could be certified using a test procedure that appropriately reflects usage. [EPA-HQ-OAR-2019-0055-1211-A1, p. 33]

To ensure additionality, we recommend EPA consider only allowing ZEV credits for ZEV sales in excess of state or federal requirements. In the absence of federal action to require a minimum share of ZEV sales, this approach would effectively incentivize ZEVs only in non-ACT states. [EPA-HQ-OAR-2019-0055-1211-A1, p. 35]

Under EPA's proposal, if MOU states continue to adopt the ACT regulation, ICE vehicles would not need to attain any of the reductions originally envisioned by Phase II in model year 2027. To ensure that these ICE efficiency improvements are achieved, we recommend EPA minimize the impact of ZEV crediting on the stringency of the Phase II standard for ICE vehicles by establishing separate averaging sets, as detailed in section 3. [EPA-HQ-OAR-2019-0055-1211-A1, p. 35]

We estimate that tightening the Phase II standards to reflect expected state action on ZEVs (MOU ZEV pathway) could reduce cumulative well-to-wheel CO2 emissions from model year 2027 and later vehicles through 2050 by 372 Mt. If federal action drives additional ZEV deployment, represented in our Alternative 1–3 ZEV pathways, and ZEV crediting is limited to ZEV sales in excess of production requirements, cumulative emissions would be further reduced by 2.8 Gt (Alternative 1) to 5.2 Gt (Alternative 3). Failing to maintain the stringency of the original Phase II rule for ICE vehicles would result in a 143–194 Mt loss of these emissions reductions. [EPA-HQ-OAR-2019-0055-1211-A1, p. 35]

The EPA's baseline ZEV uptake assumptions are too low to account for currently adopted and likely state action, as well as support at a federal level. [EPA-HQ-OAR-2019-0055-1211-A1, p. 35]

The EPA proposal currently assumes roughly 1.5% ZEV penetration among 17 early adopting market segments in model year 2027. With six states having adopted the ACT regulation and with the ICT regulation in California, we estimate that minimum ZEV sales requirements in these same 17 market segments would drive national ZEV sales shares of 3.8% in model year 2027, 5.5% in model year 2028, and 7.2% in model year 2029. Further adoption of the ACT regulation by MOU signatories would increase national ZEV sales shares in those market segments to 6.7%, 9.7%, and 12.7% for model years 2027–2029, respectively. Further, federal actions to fund zero-emission school buses and transition the federal fleet to 100% zero-emission vehicle acquisitions by 2035 would supplement state-level action to accelerate deployment of heavy-duty ZEVs.44 [EPA-HQ-OAR-2019-0055-1211-A1, p. 35]

> 44. The White House, "Fact Sheet: Competitive Infrastructure Funding Opportunities for Local Governments"; The White House, "Fact Sheet: President Biden Signs Executive Order Catalyzing America's Clean Energy Economy Through Federal Sustainability."

We recommend EPA accurately reflect business-as-usual projections of ZEV sales, taking into consideration the requirements adopted in at least six U.S. states (as of this writing) who have adopted the Advanced Clean Trucks regulation and providing for further evolution of the baseline as more states take similar actions in 2023 and 2024 and with federal action to accelerate deployment of heavy-duty ZEVs. [EPA-HQ-OAR-2019-0055-1211-A1, p. 35]

We hold the view that market trends support the rapid electrification of most on-road medium- and heavyduty vehicle applications during the period covered by this rule. We attempt to summarize here the research and data that inform our views. [EPA-HQ-OAR-2019-0055-1211-A1, p. 36]

Technology readiness
California Air Resources Board staff undertake an annual review of battery-electric and hydrogen fuel cell readiness. This exercise informs the Long-Term Heavy-Duty Investment Strategy staff use to guide decisions on targeted technologies and project categories that merit funding to help the state reach its air quality and climate goals. [EPA-HQ-OAR-2019-0055-1211-A1, p. 36]

The most recent strategy was made available to the public on 19 November 2021.45 A summary of technology status for on-road battery electric vehicles is found in Figure 6 on page D-42. The figure shows that heavyduty delivery, medium-duty delivery (cargo van), drayage, shuttle bus, school bus, transit bus, refuse truck, and medium-duty delivery truck categories have all reached a technology readiness level of nine out of nine. This level reflects readiness to transition to commercial market entry. [EPA-HQ-OAR-2019-0055-1211-A1, p. 36]

> 45. California Air Resources Board (2022). Appendix D: Long-term heavy-duty investment strategy," Sacramento, CA: California Air Resources Board, accessed 12 May

2022, https://ww2.arb.ca.gov/sites/default/files/2021-10/fy21-22_fundingplan_appendix_d.pdf

The technology readiness of on-road fuel cell technology is behind that of battery-electric technology. Technology readiness of on-road fuel cell electric vehicles is visible in Figure 7 found on page D-46. Among the five use cases evaluated, transit buses are the only one to achieve a technology readiness level of 9. The other evaluated use cases, including heavy-duty delivery, medium-duty delivery, drayage, and shuttle bus are undergoing advanced technology demonstrations and pilots, reflecting a technology readiness level between 7 and 8. [EPA-HQ-OAR-2019-0055-1211-A1, p. 36]

Product availability

The ICCT most recently surveyed available zero-emission heavy-duty products in 2020.46 At that time, zero emission transit buses were available from every major legacy OEM, including Volvo, NFI Group, and Gillig as well as from zero-emission OEMs including Proterra, BYD, GreenPower, and Lion Electric. Volvo, NFI Group and Gillig represent nearly 90% of the transit bus market in the United States. [EPA-HQ-OAR-2019-0055-1211-A1, p. 36]

46. Sharpe, B., Buysse, C., Mathers, J., and Poudelet, V. (2020) How manufacturers are positioned for zero emission commercial trucks and buses in North America. Washington, DC: International Council on Clean Transportation, https://theicct.org/publication/race-to-zero-how-manufacturers-are-positioned-for-zero-emission-commercial-trucksand-buses-in-north-america/

School bus models were also well represented, including products from Thomas Built (Daimler Trucks), Navistar, Blue Bird, GreenPower and Lion Electric. We find that Thomas Built, Navistar, and Blue Bird control nearly 100% of the school bus market in the United States. [EPA-HQ-OAR-2019-0055-1211-A1, p. 36]

Electric coach buses, which travel longer average distances than school or transit buses, were represented in our 2020 survey by products from NFI Group, Van Hool, and BYD. These companies represent more than 90% of the coach bus fleet in the United States. [EPA-HQ-OAR-2019-0055-1211-A1, p. 36]

The Class 4-6 rigid truck category in our survey contains the greatest number of models and market players. Ninety percent of the market is dominated by Ford, Daimler, Isuzu, Navistar and Toyota. Ford products are developed in partnership with powertrain suppliers, including Lightning Systems, Motiv, Phoenix Motors, and SEA Electric. SEA Electric also partners with Isuzu and Toyota. Daimler also offers products in this category. Navistar is the one major market player not to announce a product. In the Class 6-8 refuse trucks category, PACCAR and Volvo Group through their MACK brand have introduced electric products, as have BYD and Lion Electric. [EPA-HQ-OAR-2019-0055-1211-A1, pp. 36 - 37]

The Class 7-8 tractor truck category is dominated almost entirely by four manufacturers – Daimler, PACCAR, Volvo, and Navistar. At the time of publication, all companies except for Navistar had announced product plans. Since that time, we are aware of orders and deliveries that all companies who announced product plans have made. This segment faces competition from new market entrants with electric products, including Hyundai, Hino (Toyota), Xos, Tesla, and Nikola. [EPA-HQ-OAR-2019-0055-1211-A1, p. 37]

A more recent update of model availability was published by CalStart in January 2022.47 Across Class 2b-8 categories, they estimate total models have grown to 145 in 2021 (Class 2b-8). They anticipate a further increase to 165 models by 2023. Manufacturers who produce the entire vehicle and only produce EVs account for 22 percent of models. Legacy manufactures, such as Daimler, Volvo, and Paccar, accounted for 13% of zero-emission models. The remainder are models produced by manufacturers who may repower an existing chassis or produce their own chassis for an existing vehicle frame. Medium-duty trucks were the largest share of available models, accounting for 43%. [EPA-HQ-OAR-2019-0055-1211-A1, p. 37]

47. Al-Alawi, B.M., Macdonnell, O., McLane, R., and Walkowicz, K. (2022) Zeroing in on zero-emission trucks. Pasadena, CA: CalStart, https://calstart.org/zeroing-in-on-zero-emission-trucks/

A representation of truck models available as of the time of this writing can be found on the website of the2022 Advanced Clean Trucks Expo.48 [EPA-HQ-OAR-2019-0055-1211-A1, p. 37]

48. “2022 Display Vehicles,” ACT EXPO, accessed 12 May 2022, https://www.actexpo.com/vehicles

To put the US market in context, consider the market in Europe.49 Battery-electric buses were more than 97% of new electric HDV registrations in 2020. While three companies – Daimler, CNH Industrial and Traton – were responsible for 70% of bus registrations in 2020, seven companies compete in the electric bus space. The market leader is BYD with their K9 model, followed by Volvo Group with their 7900 E. [EPA-HQ-OAR-2019-0055-1211-A1, p. 37]

49. Basma, H., and Rodriguez, F. (2021) Race toz ero: How manufacturers are positioned for zero-emission commercial trucks and buses in Europe.” Berlin, Germany: International Council on Clean Transportation, https://theicct.org/publication/race-to-zero-ze-hdv-eu-dec21/

The state of the Chinese market provides additional context.50 China is the world’s largest electric vehicle market and home to more than ninety percent of all electric buses and trucks on the road today. Eight manufacturers are responsible for 70 percent of all ICE vehicle sales while more than ten manufacturers control less than 70 percent of all zero-emission truck and bus sales. The Chinese market is unique in having more than 900 OEMs in the ICE truck and bus market. More than 200 of these were capable of offering an electric model in 2019. The only Chinese OEM listed in the top five for ICE vehicles and zero-emission vehicles is Foton. Foton also has a joint venture with both Daimler and Cummins, who have a strong presence in the US market. [EPA-HQ-OAR-2019-0055-1211-A1, p. 37]

50. Mao, S., and Rodriguez, F. (2021) Race to zero: How manufacturers are positioned for zero-emission commercial trucks and buses in China. Beijing, China: International Council on Clean Transportation, https://theicct.org/publication/race-to-zero-how-manufacturers-are-positioned-for-zero-emission-commercial-trucksand-buses-in-china/

Total cost of ownership

The potential for zero-emission sales growth is affected by the cost to purchase and own the vehicle. These costs are captured in estimates of upfront cost parity and total-cost-of-ownership parity with ICE vehicles. Table 14 summarizes the results of recently published total-cost-of-ownership studies.51 Additional information can be found in Attachment 1 - Appendix B included with these comments. [EPA-HQ-OAR-2019-0055-1211-A1, p. 38. See Docket Number EPA-HQ-OAR-2019-0055-1211-A3 for Appendix B.]

51. Argonne National Laboratory, “BEAN Techno-Economic Impact of Individual Technologies”; Hunter et al., “Spatial and Temporal Analysis of the Total Cost of Ownership for Class 8 Tractors and Class 4 Parcel Delivery Trucks”; Ledna et al., “Decarbonizing Medium- & Heavy-Duty On-Road Vehicles”; Lowell and Culkin, “Medium- & Heavy-Duty Vehicles Market Structure, Environmental Impact, and EV Readiness”; Burnham et al., “Comprehensive Total Cost of Ownership Quantification for Vehicles with Different Size Classes and Powertrains”; Welch et al., “Moving Zero-Emission Freight toward Commercialization”; CARB, “Draft Advanced Clean Trucks Total Cost of Ownership Discussion Document”; Nair et al., “Medium and Heavy-Duty Electrification Costs for MY 2027- 2030.”

ICCT has sorted the data reflected in these studies into 9 different use cases, aligned with regulatory source categories defined in MOVES.52 We then grouped use cases according to three broad groupings of cost and market readiness, as shown in Table 15. [EPA-HQ-OAR-2019-0055-1211-A1, p. 41]

52. MOVES is the U.S. EPA Motor Vehicle Emission Simulator, a state-of-the-science emissions modeling system that estimates emissions for mobile sources at the national, county, and project level for criteria air pollutants, greenhouse gases, and air toxics. For more visit https://www.epa.gov/moves.

This organization of cost and market readiness of each use case leads to several conclusions. The segments in the 'fast' group are expected to reach TCO parity before MY 2027 and will all see an upfront cost ratio under 1.5 by the same year. Combined, these segments make up over 40% of annual Class 4–8 vehicle sales. School buses share these characteristics with the fast group, and, along with transit busses, are one of only two segments where the EV market is already mature. However, we place them in the 'medium' group as a reflection of the financing challenges school bus programs can face and the additional time they may need to secure appropriate funds for ebus purchases. The 2021 Infrastructure Investment and Jobs Act provides up to $5 billion to finance the electrification of school buses.53 Vehicles in the 'slow' category currently include long-haul rigid and tractor trucks, which will require publicly accessible infrastructure to enable diesel equivalent performance. Navistar CEO Mathias Carlbaum has taken the view that battery-electric long-haul tractors will achieve cost parity without subsidies between 2025 and 2030, while fuel cell variants will achieve this by 2030.54 ICCT has conducted a meta-study of upfront cost parity of tractor-trailers, including a bottom up virtual tear-down of component cost for day cabs and sleeper cabs using a battery-electric or a fuel cell powertrain.55 Despite large reductions in powertrain costs expected this decade, the ICCT understands public infrastructure availability will dictate the pace of market penetration in this segment. [EPA-HQ-OAR-2019-0055-1211-A1, pp. 41 - 42]

Private sector commitments

Large global engine and vehicle manufacturers have adopted ambitious plans for producing new zero emission bus and truck models. In 2021 Daimler announced its goal to "phase down" the internal combustion engine from its product line within 10 to 15 years. The TRATON Group, the parent company of brands including MAN, Scania, and Navistar, aims to reduce conventional engines to just one-fifth of all product development by 2025. These commitments do not include the sizable number of all-electric products to be produced by new manufacturers. These commitments are also complemented by those of large customers of HDVs and fleet owners who are shaping the demand for ZEVs. Table 16 highlights a few such commitments to provide a sense of the expected pace of private sector activity in the ZE HDV market. [EPA-HQ-OAR-2019-0055-1211-A1, p. 44]

Public sector commitments

Governments around the world are committing to transition sales of new trucks and buses towards zero emission powertrains.65,66 President Biden signed an executive order on 8 December 2021 directing the federal government to acquire only zero-emission vehicles, including medium- and heavy-duty vehicles, from 2035.67 The United Kingdom is among fourteen countries to endorse the goal of 30% zero-emission truck sales in 2030 and 100% in 2040.68 On 12 May 2022 the national government became the first to translate this into an enforceable national policy.69 The Chilean Ministry of Economy has endorsed a non-binding goal to achieve 100% zero-emission new medium- and heavy-duty truck sales in the same year.70 Sub-national governments are also making commitments. New York State Governor Kathy Hochul has signed Senate Bill 2758 setting this goal into law, and has reached an agreement to electrify all school bus sales in 2027 and school bus operations in 2035.71,72 The State of California has begun a public consultation on a requirement to end ICE truck sales in 2040.73 This policy would deliver on Governor Newsom's executive order to achieve 100%

zero-emission drayage operations by 2035 and heavy-duty vehicles, where feasible, by 2045.74 The California Air Resources Board adopted a 100% zero-emission bus purchase requirement in 2018 to be fully implemented in 2029.75 Large volume transit bus purchases are becoming common, particularly in emerging economies. Convergence Energy Services Limited (CESL), a joint venture with the Indian Ministry of Power, recently closed a tender for 5,450 zero-emission buses to be leased within one year to five Indian cities at a cost of 43.49 INR per km (~0.35 USD per mile).76 The Metropolitan Transport Department of Santiago, Chile currently operates the largest electric bus fleet outside of China, including 776 buses with 991 ordered, 10 electric bus depots in operation, and 11 under development.77 Figure 13 and Figure 14 illustrate these political commitments recently announced as of December 2021.

Infrastructure

Vehicles and fuels are a single system, and so the electrification of medium- and heavy-duty on-road vehicles requires investments in the enabling power delivery infrastructure to support their operation. Our view is that infrastructure needs differ across vehicle use cases, and that first-mover segments benefit from less demanding infrastructure requirements. Table 15 represents our view of the pace of electrification of each segment and is informed by our understanding of infrastructure needs and availability. [EPA-HQ-OAR-2019-0055-1211-A1, p. 48]

In our view, certain enabling characteristics define first-mover segments:

Duty Cycle: Buses, refuse trucks, urban delivery trucks and other first-mover segments have predictable return-to-base operations, featuring predefined routes and schedules that change infrequently. Relatively narrow distribution of vehicle range and route variability translates to high predictability of energy needs and battery size requirements. These characteristics allow manufacturers to design products with diesel equivalent performance for a wide range of use cases, and they allow fleets to accelerate electrification on the basis of battery-electric powertrains. Local and regional-haul tractor-trailers, such as daycabs performing drayage operations near ports, share these characteristics. [EPA-HQ-OAR-2019-0055-1211-A1, p. 48]

Long overnight dwell time: Fleets whose vehicles operate on a single daytime shift will have a long overnight dwell time in which to re-charge the vehicle. This period allows fleets to take advantage of lower charging costs typical over nighttime periods. Fleets without long periods in which to re-charge would need to utilize fast or ultra-fast charging that can deliver power in a far shorter period of time but at higher cost to the fleet and to the utility sector. The utility sector will be a key partner, designing of electricity rates, building physical infrastructure, and balancing the utility system's own reliability, performance, and costs.78 In the interim, battery-electric HDVs whose recharging needs can be met without additional upgrades to the electric power system will be able to deploy even faster. [EPA-HQ-OAR-2019-0055-1211-A1, pp. 48 - 49]

78. Yihao Xie and Felipe Rodríguez, "Zero-Emission Integration in Heavy-Duty Vehicle Regulations: A Global Review and Lessons for China," (ICCT: Washington, DC, August 31, 2021) https://theicct.org/publication/zero-emissionintegration-in-heavy-duty-vehicle-regulations-a-global-review-and-lessons-for-china/.

Dedicated parking: Fleets with a reliable location to park their vehicles will have a clear advantage. Such locations allow fleets to be certain that opportunities to re-charge or re-fuel their vehicle will exist at the end of each day. Fleets that own or lease a yard or depot facility have greater freedom to establish charging or refueling equipment at the pace they require. [EPA-HQ-OAR-2019-0055-1211-A1, p. 49]

Investments in publicly accessible charging infrastructure will enable electrification of those segments who are not first-movers. Currently more than 7,400 publicly accessible DC fast chargers exist in the United States and Canada, equal to around 35 percent of the total we expect will be needed by 2030 to support overnight public charging up to 350 kW for tractor-trailers alone. This number does not take into consideration the challenges such vehicles may have accessing chargers – which may be designed exclusively for private vehicle access – nor does it account for higher power needs up to 1 MW to enable the shortest dwell times. [EPA-HQ-OAR-2019-0055-1211-A1, p. 49]

In September 2021, ICCT estimated the number of charging points and hydrogen refueling stations needed to enable the transition to 100 percent sales of zero-emission Class 7 and Class 8 tractor-trailers by 2040 in the United States.79 We found that by 2030, approximately 127,000 charging points and 220 hydrogen refueling stations will be necessary to support a fleet of 103,000 zero-emission tractor-trailers. The cumulative investment needed to install publicly available infrastructure is $6.4 billion, beginning in 2021. Of 32,000 publicly accessible chargers, 14,000 will require a charging speed of 350 kW or greater. [EPA-HQ-OAR-2019-0055-1211-A1, p. 49]

79. Minjares, R., Rodriguez, F., Sen, A., and Braun, C. (2022) Infrastructure to support a 100% zero-emission tractor-trailer fleet in the United States by 2040. Washington, DC: International Council on Clean Transportation, https://theicct.org/publication/infrastructure-to-support-a-100-zero-emission-tractor-trailer-fleet-in-the-united-statesby-2040/

We found that by 2050, the network of national charging points will need to support a fleet of 2.4 million zero-emission tractor-trailers. This will require 2.5 million charging points and 6,900 hydrogen fueling stations, while the cumulative investment in publicly accessible infrastructure will need to equal approximately $122 billion. Most of the investments required will need to satisfy overnight charging needs. Most of these chargers will be installed in privately owned and operated depots, meaning public access to these chargers will be limited. The cumulative private investment in this depot charging infrastructure will amount to approximately $116 billion through 2050. Overnight chargers at publicly accessible truck stops by 2050 would require a cumulative investment of approximately $20 billion. [EPA-HQ-OAR-2019-0055-1211-A1, p. 49]

But due to the nature of long-distance operations of Class 7 and Class 8 tractor-trailers, overnight chargers alone will not be sufficient to satisfy the charging needs of this fleet. Publicly accessible fast chargers at trucks stops with power levels of up to 1 MW will be required. The cumulative infrastructure investment to 2050 on these 350 kW and 1MW chargers represents $76 billion. For the longest-range tractor-trailers, that is those traveling more than 650 miles per day, a network of hydrogen refueling stations at a cumulative cost of $26 billion, or 21% of the total, may be necessary, although we project just 12% of the fleet would utilize them. [EPA-HQ-OAR-2019-0055-1211-A1, p. 49]

Public investment in this infrastructure will accelerate its deployment. Most of the estimated investment cost, particularly after 2030, can come from the private sector. However, government incentives for the purchase and installation of infrastructure, as well as public guarantees along critical corridors, will jump start the deployment of this infrastructure before 2030. [EPA-HQ-OAR-2019-0055-1211-A1, p. 50]

In 2021 President Biden signed into law the Infrastructure Investment and Jobs Act, which provides for $7.5 billion in funding towards the National Electric Vehicle Formula Program administered by the Joint Office of
Energy and Transportation. This office has issued guidance to states to apply for funding, including the stipulations that (1) all EV charging infrastructure be installed along a designated Alternative Fuel Corridor (b) infrastructure along Alternative Fuel Corridors must be complete before states can install infrastructure along other corridors (c) and each corridor is considered fully constructed when charging infrastructure is installed every 50 miles, each station includes at least four 150 kW DC fast chargers, and the minimum installed capacity at each station is 600 kW. A concern we have with these guidelines is they do not require that stations accommodate medium- and heavy-duty truck charging needs. [EPA-HQ-OAR-2019-0055-1211-A1, p. 50]

For context, the European Commission proposed an Alternative Fuels Infrastructure Regulation (AFIR) in July 2021. The regulation would set mandatory targets for the deployment of infrastructure for charging and hydrogen refueling for both light- and heavy-duty vehicles. The provisions concerning heavy-duty vehicles would set minimum requirements for the roll out of infrastructure serving zero-emission HDVs across the Trans-European Network for Transport (TEN-T), as well as related urban nodes and overnight truck parking areas. The proposed regulation sets targets for the minimum capacity and maximum distance between charging and hydrogen refueling points to be met by member states. The proposal has not been adopted by the

European Parliament or Council and the timeline of adoption is uncertain.80 [EPA-HQ-OAR-2019-0055-1211-A1, pp. 50 - 51]

> 80. Ragon, P, Mulholland, E., Basma, H., and Rodriguez, F. (2022). A review of the AFIR proposal: Public infrastructure needs to support the transition to a zero-emission truck fleet in the European Union. Washington, DC: International Council on Clean Transportation, https://theicct.org/publication/afir-eu-hdv-infrastructure-mar22/

Whatever the future direction of public investment in the United States, private sector investment is emerging to complement these public investments. On January 31, 2022, Daimler Truck North America announced it signed an MoU with NextEra Energy Resources and BlackRock Renewable Power to start a joint venture to develop a nationwide charging network for both battery-electric and hydrogen fuel cell vehicles. The first charging sites are expected in 2023 with funding of approximately 650 million dollars.81 Similarly, Volvo Group has established a new division called Volvo Energy, which will provide energy services. Volvo Group has formed a joint venture in Europe with Traton and Daimler with funding of 500 million Euros to install and operate at least 1,700 charging points along highways and at other key points in the road network.82 No similar announcement has been made for the U.S. [EPA-HQ-OAR-2019-0055-1211-A1, p. 51]

Organization: *Lion Electric Co. USA Inc. (Lion)*

We support the EPA’s focus on school buses, transit buses, delivery trucks, and short-haul tractors as being the four major vehicle categories that will experience the most EV growth during the outlined time frame starting in model year (MY) 2027. However, it is also important to consider that fleets that utilize these vehicles may be smaller, operating in underserved communities, have minimal time and resources, or a any new emission standards to accommodate disadvantaged fleets that may not be able to comply as quickly as a larger fleet with more resources. This can take the form of a longer compliance timeframe or larger incentives for smaller fleets, which are often underrepresented in funding considerations. While expediting the transition to zero-emission technology is an exciting and important goal, it is crucial that we consider options for these fleets for whom the transition is currently less accessible. Prioritizing small fleets and disadvantaged communities in current and future EPA grant programs is a great way to ensure that these diverse industries are not lost or left behind as we strive to protect the environment. [EPA-HQ-OAR-2019-0055-1151-A2, pp. 1 - 2]

We support the EPA's consideration of incorporating the Advanced Clean Truck (ACT) regulation into the final rule. To meet the proposed Option 1 goal of reducing NOx emissions by over 50 percent by 2040, existing manufacturers will need to focus more of their operations on zero-emission vehicle (ZEV) production. While a variety of zero-emission vehicles are already available to the public, Lion believes that implementing this regulation on a federal level will provide further direction to this growing industry. [EPA-HQ-OAR-2019-0055-1151-A2, p. 2]

Organization: *Loren Marz*

I also support EPA declining to establish a "ZEV" mandate at this time (Page 25). HD EVs may reduce NOx emissions in most cases, but that comes at the expense of significantly higher PM10, PM2.5, and SOx emissions, even in urban locations, from a complete vehicle life-cycle (LCA) perspective in long- haul operations, and even short-haul operations in some regions of the U.S., per Argonne National Laboratory's latest version of its GREET model (GREET_2021). That's more or less reflected in the peer- reviewed paper - Lui et al., "Well-to-Wheels Analysis of Zero-Emission Plug-In Battery Electric Vehicle Technology for Medium- and Heavy-Duty Trucks" Environ. Sci. Technol. 2021, 55, 538-546 (Figure 4). Even GHG emissions are roughly the same for long-haul diesel ICEV and BEV in that study, and even higher for BEV on a freight ton-mile basis when taking into account the lower payload capacity of BEVs (Figure 7). That study considers only well-to-wheels (WTW) emissions, not full LCA as GREET_2021 does. Projections for 2045 do not change this trade-off per GREET_2021 even if this proposed rule is not implemented (LCA PM2.5 emissions are still ~2 times higher in long-haul BEV operations in both total and urban shares under the assumptions in GREET).

Mandates, or even incentives, for "ZEVs" are dubious proposals at this time, and may be for the foreseeable future. [EPA-HQ-OAR-2019-0055-1394]

Organization: *Mass Comment Campaign sponsored by Climate Action Campaign (22,659)*

- Cleaner trucks are not only available and ready now, they also are projected to deliver critical cost savings for operators and drivers. [EPA-HQ-OAR-2019-0055-1193, p.1]

- Across nearly every vehicle class, zero-emission electric trucks and buses are projected to be cheaper to own and operate than their combustion engine counterparts within five years. [EPA-HQ-OAR-2019-0055-1193, p.1]

Organization: *Mass Comment Campaign sponsored by Moms Clean Air Force and Arizona Climate Action Coalition (198)*

On the greenhouse gas portion of the rule, the proposed adjustments to existing Phase 2 greenhouse gas standards are weak and reflect neither the urgency of the climate crisis nor the rapid advancement in zero-emission truck technology. EPA should put our nation's heavy duty vehicle fleet on a clear path to 100% zero-emissions sales by 2035. [EPA-HQ-OAR-2019-0055-1192-A1, p.3]

Organization: *Mass Comment Campaign sponsored by Neighbors for Clean Air and Elders Climate Action (43)*

Thank you for proposing to reduce nitrogen oxide (NOx) pollution from medium and heavy-duty trucks and buses. However, we are concerned that the proposal fails to prevent the worst impacts of the climate crisis and is not adequate to protect our children and communities from the diseases of air pollution. [EPA-HQ-OAR-2019-0055-1619-A1,p .1]

We, the undersigned Oregon community organizations, elected officials and community members are joining together to request that you withdraw your proposal that allows millions more new diesel trucks and buses in 2027-29, that reduces CO2 from these vehicles by less than 1% and will lock-in over the next 20 years 1.7 billion tons of additional CO2 and thousands of tons of harmful particulate, NOx and toxic air emissions that could be avoided by requiring manufacturers to transition to commercially available zero emission technologies. [EPA-HQ-OAR-2019-0055-1619-A1, p.1]

The transportation sector is the leading source of climate pollution in the US, but the proposal fails to make any progress toward ending CO2 emissions from the transport sector to avoid the worst consequences of a warming climate. The proposed rule also fails to achieve the public health benefits that will flow from requiring trucks and buses to emit zero particles, NOx and toxic pollutants that cause urban smog, childhood asthma, respiratory and cardiovascular diseases, and premature deaths. [EPA-HQ-OAR-2019-0055-1619-A1, p.1]

We ask that you withdraw the proposed CO2 standards that will allow millions more diesel vehicles during model years 2027-29. These vehicles will remain on the road for at least 20 years, add to CO2 in the atmosphere and prevent the U.S. from achieving the CO2 reductions identified by the Intergovernmental Panel on Climate Change (IPCC) as necessary to keep within the 1.5 C target to avoid a climate catastrophe. Instead we ask you to propose zero emission standards for medium and heavy duty vehicles in short-haul applications that would require manufacturers to sell zero emission vehicles that are already commercially available with zero emission power trains. [EPA-HQ-OAR-2019-0055-1619-A1, p.1]

To protect our children's health, their future on a livable planet, our large Senior citizen population, and to address environmental injustice, EPA needs to immediately take urgent and bolder action. Please strengthen the proposed rule for heavy duty vehicle pollution by –

1) revising the NOx portion of the rule to match California's Heavy Duty Omnibus rule for vehicles not subject to a zero emission standard, which should be the baseline for smog and particulate matter reduction goals.
2) withdrawing both the NOx and greenhouse gas (CO2) portion of the rule for vehicles intended for short haul applications, and proposing zero emission standards for those vehicles beginning in 2027. A zero emission standard will eliminate all pollutants, including deadly particulates and air toxics as well as NOx and CO2. [EPA-HQ-OAR-2019-0055-1619-A1, pp.2-3]

Zero emission vehicles satisfy the Clean Air Act's directive that emission standards for heavy duty vehicles must provide "the greatest emission reduction achievable with [available] technology. [EPA-HQ-OAR-2019-0055-1619-A1, p.3]

School and transit buses, delivery vans, passenger vans, utility service vehicles, garbage trucks and cargo trucks conveying goods from ports and airports to local distribution centers are all available now with zero emission power trains. Proposed adjustments to existing Phase 2 greenhouse gas (CO2) standards and proposed NOx standards are not acceptable for vehicles that are now commercially available with zero emission power trains. [EPA-HQ-OAR-2019-0055-1619-A1, p.3]

Standards that allow, rather than prevent, more vehicles that burn fossil fuels fail to reflect the urgency of the climate crisis and the need to promote the rapid transformation of the transport sector to zero emission technology. Allowing more vehicles that emit particulate and ozone precursor pollutants also fails to reflect the urgent need for ending particulate and ozone nonattainment within the Clean Air Act's statutory deadlines for attainment. EPA must start now with a zero emission standard for short haul vehicles in 2027 to put our nation's heavy duty vehicle fleet on a clear path to 100% zero-emissions sales by 2035. [EPA-HQ-OAR-2019-0055-1619-A1, p.3]

We urge these changes to demonstrate EPA's dedication to protecting public health, achieving a zero emission economy by 2050 to stabilize the climate, and to advancing environmental justice and equity for communities at risk.[EPA-HQ-OAR-2019-0055-1619-A1, p.3]

Organization: *Mid-America Regional Council (MARC) Air Quality Forum*

The trucks included under this rule will be around for decades; therefore, heavy duty trucks must be cleaned up as soon as possible. Zero-emissions technology for heavy- and medium-duty trucks is already available. Additionally, a new study from the Department of Energy shows that within the timeframe of this rule, "nearly half of medium- and heavy-duty trucks will be cheaper to buy, operate, and maintain as zero emissions vehicles than traditional diesel-powered combustion engine vehicles." 1 [EPA-HQ-OAR-2019-0055-1131-A1, p. 1]

Organization: *Motor & Equipment Manufacturers Association (MEMA)*

> Per EPA's request for information on heavy-duty electric vehicle sales projections, including for what HD vehicle types, to help inform their HD electric vehicle sales projections in the MY 2024 through MY 2029 timeframe, MEMA urges the EPA to avoid regulations that allow backsliding on ICE technologies to make sure that ICE vehicles are as clean as current technology will allow. [EPA-HQ-OAR-2019-0055-1322-A1, p. 9]

Organization: *Minnesota Pollution Control Agency (MPCA)*

Minnesota supports the goals of the Greenhouse Gas (GHG) portion of the program and encourages the EPA to adopt these standards as quickly as possible. Minnesota has supported heavy-duty electrification through Volkswagen settlement funds and other programs and believes accelerating heavy-duty electrification can help the state meet its climate and air pollution goals. [EPA-HQ-OAR-2019-0055-1044-A1, p. 2]

Organization: *Moving Forward Network (MFN)*

Zero Emission Solutions Are Widely Available Today, Making These Health Consequences Even More Unconscionable. The electric vehicle landscape has changed dramatically since EPA adopted its Phase 2 GHG rule in 2016, and in astounding ways since EPA last updated its Heavy-Duty NOx standards some twenty years ago. Today, there are already a staggering number of zero-emission heavy-duty models available. In fact, there are over 100 models of battery-electric heavy-duty vehicles available for purchase – nearly twice the amount EPA cited in its Draft Regulatory Impact Assessment (RIA) for this rulemaking.41,42 Moreover, the EPA's current Notice of Proposed Rulemaking (NPRM) and DRIA fail to cite critical technology developments beyond 2019, even though the battery-electric truck market has seen significant growth since then. A recent market assessment of the medium- and heavy-duty market by analysts at MJ Bradley & Associates examines the in-use truck fleet to assess readiness for adoption of zero-emission trucks.43 The analysis factors in charging patterns, operating requirements, market status, and the business case. It relies on conservative assumptions (from a 2019 ICF study), but nevertheless, finds that 66% of the truck fleet has "strong potential for near-term [pre-2025] uptake."44 [EPA-HQ-OAR-2019-0055-1277-A1, p. 12]

According to the US Census Bureau's Vehicle In-Use Survey, 70 percent of HD vehicles travel less than 50 miles daily, meaning that range is not the concern it once was.45 EPA correctly notes in the DRIA that urban delivery vehicles are fully primed for electrification, but fails to recognize that the potential to employ zero emissions regional haul tractors and vocational trucks also exists today as a result of advances in battery technology and new availability of suitable models.46 [EPA-HQ-OAR-2019-0055-1277-A1, p. 13]

45. US Census: https://www2.census.gov/library/publications/economic-census/2002/vehicle-inventory-and-use-survey/ec02tvus. pdf

46. Draft Regulatory Impact Analysis p. 54-55

Many heavy-duty trucks operate within 100-mile ranges (left), and many vehicle miles traveled (VMT) are attributable to trucks with operating ranges less than 100 miles (right). These trucks are particularly well suited to early electrification efforts. [EPA-HQ-OAR-2019-0055-1277-A1, p. 13]

Fleet operators and truck manufacturers themselves are already transitioning to zero-emissions trucks. Indeed, industry is well ahead of most states, and especially the federal government, in terms of zero emission heavy-duty truck adoption. This transition is significant, and speaks to the technical feasibility and availability of zero-emission trucks today—yet this reality is not reflected in EPA's current proposal. Well established truck manufacturers like Daimler Trucks48 and Volvo49 are preparing for a clean transportation future by shifting to a fully zero-emissions product line by 2040 and models from newcomers like Nikola, Rivian, and Tesla are beginning to hit the roads. Amazon made headlines with its order for some 100,000 Rivian electric delivery vans and several of the nation's largest fleet owners including PepsiCo, Walmart, and JB Hunt have piloted and placed orders for electric tractor and delivery trucks.50,51,52 Sysco, one of the largest food distribution companies in the world, has pledged to electrify 35 percent of its tractor fleet by 2030.53 [EPA-HQ-OAR-2019-0055-1277-A1, pp. 13 - 14]

To be sure, these companies are not transitioning to electric vehicles out of a sense of altruistic social and environmental responsibility – electric heavy-duty vehicles offer significant economic upsides for fleets. While the initial purchase cost for most zero-emissions models is currently higher than their combustion counterparts, their total lifetime costs can be lower in many use cases today. "The industry is moving quickly to deploy new technologies and the lifetime cost parity of HDEVs are rapidly approaching that of their combustion counterparts."54 [EPA-HQ-OAR-2019-0055-1277-A1, p. 14]

54. NRDC blog: https://www.nrdc.org/experts/patricio-portillo/epa-its-time-act-we-need-clean-trucks-now

As battery prices continue to decline, so will the upfront cost of electric trucks, furthering the cost parity for zero-emissions models. A February 2022 study from Roush Industries shows that electric class 5 delivery trucks will have the most favorable total cost of ownership (TCO) in the next two years, well before the first compliance period under the proposed regulation. Similarly, a total cost of ownership study by CARB, found that by 2030, ZEVs would be cheaper than diesel across every vehicle type examined, including Class 8 Sleeper Cabs, even while accounting for the costs associated with infrastructure and excluding rebates and incentives. The Department of Energy's own cost analysis (released the same day as EPA's draft rule) concluded that ZEVs can reach TCO parity with conventional diesel vehicles "by 2035 for all medium and heavy-duty (MD/HD) vehicle classes (without incentives)."55 DOE concluded that if economics alone drove adoption, ZEVs could reach 42% of all MD/HD trucks by 2030. [EPA-HQ-OAR-2019-0055-1277-A1, p. 14]

55. Catherine Ledna et al., Decarbonizing Medium & Heavy-Duty On-Road Vehicles Cost Analysis (Mar. 2022) https://www.nrel.gov/docs/fy22osti/82081.pdf at 2.

Electric trucks have significantly reduced operating and maintenance costs compared to diesel trucks – over 50 percent in some cases.56 Furthermore, the cost of electricity is far more stable than that of oil, which gives fleet operators more certainty in planning their business. Instead of worrying about the volatility of fossil fuels from geopolitics, our nation's trucks can do what they do best – deliver goods and services. [EPA-HQ-OAR-2019-0055-1277-A1, p. 14]

56. Roush Industries Inc., Table 67: https://blogs.edf.org/climate411/files/2022/02/EDF-MDHD-Electrification-v1.6_20220209.pdf

Advancements in zero-emission truck technology are being propelled by state-level ambition to tackle freight-related pollution. Six states that make up at least 17 percent of the U.S. medium- and heavy-duty vehicle market share have already adopted California's Advanced Clean Trucks (ACT) rule – a manufacturer requirement to increase ZEV sales to between 30-50 percent by 2030 and 40-75 percent by 2035, depending on vehicle class. In addition, 17 states and the District of Columbia (D.C.) – which make up 30 percent of the U.S. medium- and heavy-duty vehicle market share – signed a memorandum of understanding to achieve 100 percent zero-emission truck and bus sales by 2050, with an interim target of 30 percent ZEV sales by 2030.57 According to a recent analysis by ERM, if all the MOU states adopted the ACT rule, 27 percent of the Class 4-8 U.S. fleet would transition to ZEV by midcentury.58 While state ACT rule adoption is important, complementary federal action is critical to help address the remaining threequarters of the fleet that must transition to ZEVs. These state actions demonstrate the feasibility of requiring zero-emission trucks but cannot move the nation forward on electrification alone – an analysis completed by the Union of Concerned Scientists (UCS) estimates that ZEVs will account for roughly 1 in 8 of national heavy-duty sales in 2030 if all California ZEV Standard states adopt the ACT. Other projections, like that from IEA's Global EV Data Explorer, confirm this insufficient sales share, with HD ZE trucks at around 7 percent in 2030 without federal intervention.59 The same analysis completed by UCS shows that, if EPA adopted modest sales requirements like the ACT, it would more than double the anticipated market share for electric heavy-duty trucks (Figure 2). [EPA-HQ-OAR-2019-0055-1277-A1, pp. 14 - 15]

Federal Clean Trucks Program: An analysis of the impacts of low-NOx and zero-emission medium- and heavy-duty trucks on the environment, public health, industry, and the economy. Report developed by ERM for the Natural Resources Defense Council and the Union of Concerned Scientists. (“ERM report”)

59. IEA Global EV Data Explorer: https://www.iea.org/articles/global-ev-data-explore

Estimate of the share of new truck sales driven under different state and federal ZEV policy requirements under a conservative assessment of status quo market adoption.60 While state commitments are helping to drive the HDZEV market, even a nationwide adoption of the ACT would fall short of the level of sales needed to meet climate, health, and equity goals. [EPA-HQ-OAR-2019-0055-1277-A1, p. 15]

60. IEA World Outlook 2021: https://www.iea.org/reports/world-energy-outlook-2021

Throughout EPA’s technological and market assessments in the NPRM and DRIA, the Agency notes the varying outlooks for HDZEV adoption in the coming years. What it does not do, however, is recognize that federal regulations, including mandates and incentives, are key to accelerating the national HDZEV market.61,62 This is despite some of the key literature relied upon in the DRIA pointing towards the inclusion of government actions in rapid technology and adoption scenarios.63 EPA cannot afford to waste this consequential opportunity to accelerate the market for HDZEVs within this rulemaking. It is beyond time for EPA to be part of the solution. [EPA-HQ-OAR-2019-0055-1277-A1, pp. 15 - 16]

61. Ibid.

62. Resources for the Future, An Analysis of US Subsidies for Electric Buses and Freight Trucks - https://www.rff.org/publications/issue-briefs/an-analysis-of-us-subsidies-for-electric-buses-and-freight-trucks/

63. National Renewable Energy Laboratory, Electrification Futures Study, p. 3: https://www.nrel.gov/docs/fy18osti/70485.pdf

EPA requested how to best consider the potential for ZEV technologies to significantly reduce air pollution from the heavy-duty vehicle sector.64 Put simply, vehicle electrification is the best method for controlling nitrogen oxide pollution from heavy-duty vehicles over the long term. Compliance for this rulemaking begins in MY 2027, roughly four years from its anticipated promulgation. HDZEVs have seen rapid technological growth and significant cost reductions over the past four years, and these are likely to accelerate even further in the near term. By excluding HDZEVs as the centerpiece of this regulation, EPA is all but guaranteeing that the regulation will be outdated before the first compliance period even begins. [EPA-HQ-OAR-2019-0055-1277-A1, p. 16]

64. 87 FR 17420

As noted above, there is ample evidence to expect that by model year 2027, 20 percent of new truck sales could be ZE trucks, and that number could increase year-over-year by roughly 10 percent to reach 100 percent by 2035. EPA's truck-wide standard therefore should be reduced to account for this feasible growth in ZE truck sales. Using 0.02 g/hp-hr as the conservative starting point for the emissions achievable by combustion engines (as noted, MFN believes even lower emissions are feasible), the combined standard for MY2027 should be no higher than 0.016 g/hp-hr to reflect that 20 percent of sales could feasibly be met with ZE trucks. To address stability requirements, EPA should set three-year standards that reflect the three-year average of projected ZE sales. Thus, for model years 2027 through 2029, EPA should assume an average of 30 percent ZE sales and set the three-year average standard at 0.014 g/hp-hr. [EPA-HQ-OAR-2019-0055-1277-A1, p. 20]

To project forward growth in the Class 4-8 ZEV market, we have conservatively assumed a rate of adoption consistent with the International Energy Agency's baseline policy case for 2030 in the United States,189 the majority of sales which are the result of California adopting the Advanced Clean Truck rule. We have then further adjusted the sales of EVs upward to reflect the additional adoption of the Advanced Clean Truck rule by Massachusetts, New Jersey, New York, Oregon, and Washington, which the IEA baseline did not account for, using the regulatory requirements and registration data. [EPA-HQ-OAR-2019-0055-1277-A1, p. 52]

189. https://www.iea.org/reports/global-ev-outlook-2021

This baseline scenario is meant to represent a conservative but reasonable assessment of adoption of zero emission trucks in order to better assess the impacts of the crediting provisions on conventional internal combustion engine trucks (Figure 9). As noted elsewhere in our comments, the actual future adoption of zero-emission trucks is likely to be much higher, owing to incentives, the cost-effectiveness of the technology, and additional state action like the MOU. [EPA-HQ-OAR-2019-0055-1277-A1, p. 52]

For all these reasons, this analysis is likely an underestimate of the impact of the ZEV crediting program. Furthermore, we have not considered in the below analysis any attempt by the agency to actually drive sales of zero-emission vehicles, because the agency did not do so in its proposal. [EPA-HQ-OAR-2019-0055-1277-A1, p. 52]

A conservative estimate of status quo deployment finds that electric trucks would achieve an 11 percent marketshare by 2030, with just over 6 percent of that market coming from conventional vehicles powered by engines (HDO, LHDD, MHDD, or HHDD) transitioning to zero-emission powertrains in states that have adopted the Advanced Clean Trucks rule (ACT), representing 15 percent of total vehicle sales. [EPA-HQ-OAR-2019-0055-1277-A1, p. 52]

“EPA requests comment on whether and how to consider including specific sales requirements for ZE trucks.” (87 FR 17420) [EPA-HQ-OAR-2019-0055-1277-A1, p. 17]

MFN urges EPA to finalize standards that include a separate standard for ZE trucks and require an increasing annual minimum number of ZE truck sales.66 Studies have consistently found that clear regulatory market signals are necessary to spur investment in the manufacturing, supply chains, and supporting infrastructure necessary to support the transition to ZE vehicles. A study of California’s transportation policies points to the ZEV sales requirement as sending a strong “signal, effectively channeling innovation activities towards ZEV development and increasing the availability of ZEVs for sale, where supply constraints have proven to be a major barrier to widespread uptake.”67 Multiple forward-looking models confirm that stringent ZEV mandates can play a large role in reducing emissions in the U.S.68 Noting the clear evidence of ZEV mandates’ effectiveness in the passenger vehicle space in California, researchers advised: “ZEV mandates should also be more actively considered for freight, drawing inspiration from California’s recent [Advanced Clean Trucks] policy.”69 [EPA-HQ-OAR-2019-0055-1277-A1, pp. 17 - 18]

66. The preamble explains that EPA is not proposing this sort of sales mandate but EPA's invitation for comment on sales requirements, and the overwhelming public testimony on such sales requirements suggest such requirements are well understood to be within the ambit of options for the final rule. See, e.g., Nat'l Mining Ass'n v. Mine Safety & Health Admin, 512 F.3d 696, 699 (D.C. Cir. 2008); City of Portland v. EPA, 507 F.3d 706, 715 (D.C. Cir. 2007); Ariz. Pub. Serv. Co. v. EPA, 211 F.3d 1280, 1299 (D.C. Cir. 2000).

69. John Axsen et al., Crafting strong, integrated policy mixes for deep CO2 mitigation in road transport Nature Climate Change (Aug 24, 2020) https://doi.org/10.1038/s41558-020-0877-y.

Clear regulatory requirements prime the investment pump and can bring ZE truck production to scale, which in turn will advance technologies and drive down prices in a virtuous feedback loop.70 California's experience just in developing the sales requirements of the Advanced Clean Truck rule was to see a rapid increase in the commercialization of ZE trucks, reinforced with strong fleet commitments to purchase the required ZE trucks and improved planning for the buildout of supporting charging infrastructure. Within the course of the CARB’s rulemaking for the Advanced Clean Trucks rule, new manufacturer announcements enabled CARB staff to revise upward their ZEV targets for manufacturers.71 In their updated analysis on increasing sales requirements, Staff noted that “the large number of ZEVs launched before the regulation begins [and] the more established ZEV marketplace…support higher ZEV sales requirements in the earlier years and is consistent with Board direction and many public comments seeking to increase the number of ZEVs deployed.”72 Having a separate requirement for the deployment of ZE trucks also ensures that the transition to ZE trucks does not undermine the stringency of combustion standards. [EPA-HQ-OAR-2019-0055-1277-A1, p. 18]

70. “[A ZEV mandate] sends the strongest transformational signal of all the policies examined, receiving a score of 5/5. As a regulatory policy, it is likely to be reasonably durable and it also provides clear directionality with respect to investment in PEVs” Noel Melton et al., Which plug-in electric vehicle policies are best? A multi-criteria evaluation framework applied to Canada (Dec. 2019) https://doi.org/10.1016/j.erss.2019.101411.

72. CARB, Updated Analysis Regarding Increased Manufacturer Zero-Emission Vehicles Sales Requirements – Attachment B (2019) https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/30dayattb.pdf

Manufacturers have acknowledged that the transition to ZE trucks is underway (press release pages for major truck manufacturers are dominated by news and stories about their electric trucks73). Industry experts testing ZEV trucks in real-world demonstrations concluded that “four market segments – vans and step vans, medium-duty box trucks, terminal tractors, and heavy-duty regional haul tractors – are ready to go electric,” and specifically, that “half of heavy-duty regional haul tractors are electrifiable now.” 74 As documented extensively in the previous section, there is widespread agreement, confirmed across multiple independent analyses, that these trucks already represent lower total costs of ownership in a large share of use cases.75 [EPA-HQ-OAR-2019-0055-1277-A1, p. 18]

But the transition to ZE trucks is not happening at the pace necessary to address the public health crises created by truck pollution. As the Department of Energy’s study highlights, "it is possible that demand for ZEVs could rise rapidly in MD/HD trucks once cost parity is reached" but "manufacturing capacity…will need to increase commensurately to support vehicle adoption."76 Conventional manufacturers are incentivized to extend production of combustion trucks on existing manufacturing lines as long as possible to maximize the return on those old investments.77 Their current business model also relies on selling diesel trucks at a low cost with lucrative service and maintenance agreements.78 Setting a strong, feasible sales target in the final rule is critical to accelerate the transition to ZE trucks. The aforementioned ERM report found that a national ZEV sales requirement–with a schedule commensurate with the ACT rule–would result in 45 percent of the Class 4-8 fleet turning over to ZEV by 2040 and 73 percent by 2050.79 [EPA-HQ-OAR-2019-0055-1277-A1, pp. 18 - 19]

78. See, e.g. McKinsey&Company, Route 2030 – A Regional View of Truck Industry Profit Pools (Dec. 2018) at 7 ("[o]ur research reveals that advanced markets already exhibit greater profitability in aftersales than in new truck sales.") https://www.mckinsey.com/~/media/mckinsey/industries/automotive%20and%20assembly/our%20insights/a%20regional%20view %20of%20truck%20industry%20profit%20pools/a-regional-view-of-truck-industry-profit-pools-web-final.pdf .

79. Robo et al. 2022.

In terms of how to include a sales requirement, MFN recommends setting a separate ZE truck standard and phasing that standard in over time.80 This proposal is separate and additive to EPA's heavy-duty combustion engine requirements to ensure maximum emission reductions are achieved from new combustion engines. This structure is the preferred pathway to getting to zero-emissions, as it guarantees emission reductions from both the combustion engines and deployment of ZEVs. It also provides certainty to the market by identifying a clear schedule for the percentage of ZEVs that must be sold nationally. This market signal can help unlock additional resources from the public and private sector, such as charging infrastructure investments. By separating ZEV requirements from combustion engine requirements, this structure also avoids promoting "false solution fuels" such as natural gas vehicles. [EPA-HQ-OAR-2019-0055-1277-A1, p. 19]

80. For another example of a similar regulatory design, see Ray Minjares and John Hannon, ICCT, "Briefing: Adapting US heavyduty vehicle emission standards to support a zero-emission commercial truck and bus fleet" at 6-7 (Feb. 2020) (describing Dual Averaging Sets option) (available at: https://theicct.org/wp-

content/uploads/2022/02/HDV-US-adapting-vehicle-emission-stds-zeroemission-commercial-truck-bus-fleet-feb22.pdf). The key to whatever design option EPA chooses is to ensure that the standard provides a clear signal to manufacturers that they must begin ramping up production of ZE trucks, and that by 2035 the expectation is that all trucks can and will be zero-emissions.

The proposal currently sets standards for all trucks, including ZE trucks, see NPRM at 17458 (noting proposed 40 CFR 1036.104), but does not set the ZE standards based on what is achievable by ZE technology. The proposed standards are indefensible under the CAA because they fail to set standards that reflect the greatest degree of emission reductions achievable by ZE trucks and allow ZE trucks to undermine the greatest degree of emission reductions achievable by combustion engine vehicles. The appropriate criteria pollutant standard for ZE trucks is 0 g/hp-hr. EPA should set a ZEV standard and phase that standard in, over time. similar to EPA's approach for phasing in the Tier 2 standards for small volume manufacturers of light duty vehicles and trucks. See 40 C.F.R. § 86.1811–04(k). [EPA-HQ-OAR-2019-0055-1277-A1, p. 19]

MFN believes 20 percent of new sales in model year 2027 being ZEV is a feasible target, and that those targets can reasonably increase 10 percent each year, such that 50 percent of sales would need to meet the ZEV standard in model year 2030, and 100 percent by model year 2035. To comply with the stability requirements of Clean Air Act section 202(a)(3)(C), EPA could finalize a phase-in schedule using the three-year average sales target, and increase that target every three years in line with a 100% target beginning model year 2035. Thus, the first round of the ZEV standard would apply to 30% of sales for MY 2027- 2029. [EPA-HQ-OAR-2019-0055-1277-A1, pp. 19 - 20]

This initial round is consistent with the targets adopted by California, New York, New Jersey, Massachusetts, Washington and Oregon in the Advanced Clean Truck Rule, which requires between 15 and 30% of truck sales to be ZEVs between MY 2027-2029.81 It is in line with deployment rates projected in Europe82 and truckmakers' own voluntary commitments there to sell 100% zero-emission vehicles by 2040.83 Moreover, the fleet operators that are members of the Corporate Electric Vehicle Alliance have already made commitments to purchase 330,000 commercial ZEVs, which would represent roughly 9 percent of truck sales over the first three-year compliance period of MY27-MY29.84 [EPA-HQ-OAR-2019-0055-1277-A1, p. 20]

81. Claire Buysse et al., California's Advanced Clean Trucks regulation: Sales requirements for zero-emission heavy-duty trucks (July 2020) at 9 https://theicct.org/sites/default/files/publications/CA-HDV-EV-policy-update-jul212020.pdf.

82. "If Europe can deliver on its green Deal, with emission-cut targets rising to around 50% in 2030, the demand for green trucks will rise to as much as 50% of all the new ones sold." Peter Wiedenhoff et al., "What the Shift to Zero-Emission Vehicles Means for Commercial Transportation" (Mar. 22, 2022) https://www.bcg.com/en-us/publications/2022/what-the-shift-to-zero-emissionvehicles- means-for-commercial-transportation.

83. ACEA – PIK, Joint Statement – The Transition to Zero-Emission Road Freight Transport (Dec. 2020) https://www.acea.auto/files/acea-pik-joint-statement-the-transition-to-zero-emission-road-freight-trans.pdf.

84. CERES, "Major companies with large fleets release new electric vehicle 'blueprint' for car and truck manufacturers" (Jan 20, 2022) https://www.ceres.org/news-center/press-releases/major-companies-large-fleets-release-new-electric-vehicle-blueprint-car.

In the proposed rule, EPA requests comment on how the agency can best consider the potential for ZEV technology to significantly reduce air pollution from the heavy-duty vehicle sector, including but not limited to whether and how to consider including specific sales requirements for [heavy-duty] ZEVs. [EPA-HQ-OAR-2019-0055-1277-A1, p. 58]

While incentivizing zero-emission vehicle sales would be best incorporated into the NOx portion the EPA's final rule, it is possible to incentivize this transition through targeted revisions to the GHG Phase 2 program, as well, especially since these targeted updates are being crafted to reflect the "outlook for heavy-duty electric vehicles." [EPA-HQ-OAR-2019-0055-1277-A1, pp. 58 - 59]

Similar to our proposal above, in which a fleet averaging requirement that goes to zero g/bhp-hr emissions for spark ignition, light-, medium- and heavy heavy-duty engines through intermediate useful life and full useful life no later than 2035 proposed in the NOx section of our comments, EPA could make use of a fleet averaging requirement that increases in stringency and eventually goes to zero g of CO_2/ton-mile. This structure would allow ZEVs to play a larger role in "enabling stringent emission standards" and "balance further incentivizing zero and near-zero emissions vehicle development [while] ensuring that the standards achieve an appropriate fleet-wide level of CO_2 emissions reductions," both of which are stated considerations of EPA's, per the proposed rule. [EPA-HQ-OAR-2019-0055-1277-A1, p. 59]

Additionally, the EPA should further explore the relationship between the proposed rule and its Phase 2 stringency updates and the rapid electrification of the vehicle sectors the proposed updates intend to target. Ideally, EPA should set GHG stringency targets based on what the ICE engines are capable of meeting on their own, without averaging in zero-emission vehicles for compliance. Without taking this into account, the agency will be setting up many of the ICE vehicles in these sectors to backslide and avoid real-world emission improvements by allowing manufacturers to use ZEVs that were already expected to come to market for compliance – especially since EPA's proposal currently undercounts the ZEV market in MY 2027. [EPA-HQ-OAR-2019-0055-1277-A1, p. 59]

Organization: *National Association of Clean Air Agencies (NACAA)*

In addition to the NOx portion of this NPRM, EPA includes proposed "targeted updates" to the existing Heavy-Duty Greenhouse Gas Emissions Phase 2 program. The agency proposes to adjust the HD Phase 2 vehicle greenhouse gas (GHG) emission standards by sales-weighting the projected heavy-duty electric vehicle (EV) production levels of school buses, transit buses, commercial delivery trucks and short-haul tractors – four vehicle types EPA expects will have the highest EV sales of all HD vehicle types between now and 2030 – and by lowering the applicable emission standards in MY 2027 accordingly. EPA says that these updates are appropriate given the growing HD EV market and, considering other factors, including lead time and cost, would not fundamentally change the HD GHG Phase 2 program as a whole. [EPA-HQ-OAR-2019-0055-1232-A1, p. 16]

In addition to the NOx portion of this NPRM, EPA includes proposed "targeted updates" to the existing Heavy-Duty Greenhouse Gas Emissions Phase 2 program. The agency proposes to adjust the HD Phase 2 vehicle greenhouse gas (GHG) emission standards by sales-weighting the projected heavy-duty electric vehicle (EV) production levels of school buses, transit buses, commercial delivery trucks and short-haul tractors – four vehicle types EPA expects will have the highest EV sales of all HD vehicle types between now and 2030 – and by lowering the applicable emission standards in MY 2027 accordingly. EPA says that these updates are appropriate given the growing HD EV market and, considering other factors, including lead time and cost, would not fundamentally change the HD GHG Phase 2 program as a whole. [EPA-HQ-OAR-2019-0055-1232-A1, p. 16]

For the past seven years, NACAA has urged EPA to develop and adopt a strong, technology-forcing rule to reduce NOx emissions from HD trucks. We welcomed President Biden's August 5, 2021, EO calling upon EPA to propose in January 2022 and finalize in December 2022 NOx standards for HD trucks for MYs 2027 through at least MY 2030 and begin work on a rule under the CAA, to be finalized by July 2024, to establish new GHG emission standards for HD engines to take effect as soon as MY 2030. In that same EO, the President called on EPA to consider the role zero-emission heavy-duty vehicles might have in reducing emissions from certain market segments and consider updating the existing GHG emissions standards for heavy-duty engines and vehicles beginning with model year 2027 and extending through and including at least model year 2029. [EPA-HQ-OAR-2019-0055-1232-A1, pp. 16 - 17]

NACAA's expressed preference was for EPA to reserve action on reducing GHG emissions from HD trucks for the July 2024 final rule so that EPA could focus on the immediate need for overdue HD NOx reductions and a final rule by not later than December 2022. While we support reducing HD truck GHG emissions, we do not want anything to impede the timely adoption of a final HD truck NOx rule. [EPA-HQ-OAR-2019-0055-1232-A1, p. 17]

Although NACAA's highest priority with this rule continues to be NOx reductions, we recognize that EPA's proposed updates can provide benefits in the form of increased fuel efficiency and reduced fuel consumption and pave the way for a more ambitious rule to be implemented as soon as MY 2030. Provided adopting EPA's proposed "targeted updates" to the Phase 2 truck provisions in no way slows the finalization of the NOx portion of the rule, impedes adoption of the NOx portion of the rule this year or undermines the rigor of the NOx program that NACAA recommends, NACAA supports the proposed targeted GHG updates. [EPA-HQ-OAR-2019-0055-1232-A1, p. 17]

Organization: *National Association of Clean Water Agencies (NACWA)*

NACWA also supports EPA's approach to allow both ZEVs and NZEVs. POTWs must use certain types of heavy-duty vehicles to repair and maintain their critical infrastructure. These vehicles must be able to cover long distances and operate for many hours, and often must be outfitted with specialized equipment or be capable of towing additional equipment. Heavy duty vehicles are also used to transport the biosolids produced by the wastewater treatment process for beneficial reuse as fertilizer or soil amendments, or for disposal in landfills. Since there are currently no ZEV options that can provide the necessary level of service for utilities, some NACWA members have already started purchasing NZEVs that are immediately available and emit 90 percent less NOx that current standards for heavy duty vehicles. EPA's approach to balance ZEV and NZEV development, while ensuring that vehicle options are available that can meet the needs of communities and the functions of POTWs, is both practical and environmentally protective. [EPA-HQ-OAR-2019-0055-1343-A1, pp.1-2]

Organization: *National Coalition for Advanced Transportation (NCAT)*

EPA's GHG emissions standards incentivize and support investment in the development and deployment of electric vehicles, other advanced low-emission and zero-emission vehicles and the infrastructure to support them. Federal vehicle standards have helped drive investment in electric vehicle manufacturing and technology because performance standards incentivize manufacturing vehicles with lower GHG and criteria pollutant emissions. Federal standards also play a key role in catalyzing major infrastructure and economic development plans. EPA's longer term GHG emissions standards for heavy-duty vehicles will play an important role by providing benchmarks to give manufacturers, state air agencies, public utility commissions and consumers a sense of long-term clarity. [EPA-HQ-OAR-2019-0055-1290-A1, p. 2]

NCAT's members collectively have invested, or are in the process of investing, billions of dollars in manufacturing electric vehicles and deploying charging-related infrastructure. NCAT members are making those significant investments and implementing long-term business strategies, in large part, to support the implementation of vehicle GHG emissions regulations. The regulations and resulting investments will stimulate technology innovation and market competition, enable consumer choice, attract private capital investments, and create high quality jobs. [EPA-HQ-OAR-2019-0055-1290-A1, p. 3]

Electric vehicles and other advanced technology vehicles and supporting infrastructure play a critical role in supporting U.S. global competitiveness, economic growth, energy security, and cost-effective protection of public health and environmental quality. To remain a leader in the global automotive market, the U.S. must continue to support policies that encourage adoption of electric and other advanced technology vehicles and related infrastructure to serve the needs of American consumers. Charging infrastructure providers continue to expand charging networks across the country and utilities are investing in the grid and transportation electrification infrastructure programs to support and complement those efforts. NCAT supports EPA adopting strong standards that continue to advance electric vehicle deployment and infrastructure investment. [EPA-HQ-OAR-2019-0055-1290-A1, p. 3]

The number of public and private electric vehicle chargers has increased dramatically. There are now more than 44,000 public charging stations across the U.S. with over 108,000 ports.4 Notably, this includes nearly 20,000 DC fast chargers nationwide.5 On average, the number of public chargers increased 30% from 2015 to 2019 in the top 50 most populous metropolitan areas.6 This trend of charging infrastructure build out is only accelerating. For example, Shell announced plans to build 500,000 charge points globally by 2025.7 Tesla's global network has grown to include over 3,000 Supercharger Stations with more than 27,000 individual connectors, as of August 1, 2021.8 In 2020, Tesla opened 743 new Supercharger locations around the world, which is an average of two new locations every day. Tesla's charging network also includes over 14,000 Destination Charging locations and over 28,000 Destination Charging connectors.9 Electrify America plans to invest $2 billion in charging infrastructure through 2026.10 [EPA-HQ-OAR-2019-0055-1290-A1, pp. 3- 4]

Utilities are investing significantly in the build out of infrastructure related to electric vehicle charging. 'Throughout 2020, approved utility investment in transportation electrification increased three times over the amount approved in 2019' and almost $3 billion in utility electric vehicles programs have been approved through February 2021.11 Utilities have long-term planning horizons for considering investments in improvements to the electricity grid to support transportation electrification. In addition to preparing the grid to support increased electric vehicle adoption, utilities across the country have been planning and implementing significant transportation electrification infrastructure programs. As an example, in August of 2020, the California Public Utilities Commission (CPUC) approved NCAT member Southern California Edison's Charge Ready 2 program, a $437 million program that will fund the installation of approximately 38,000 charging ports.12 This program builds upon Southern California Edison's initial $22 million Charge Ready pilot in 2016, supporting the installation of 1,300 light-duty electric vehicle charge ports. NCAT member Exelon is part of the Electric Highway Coalition, a partnership among 14 U.S. utilities to create a seamless network of rapid electric vehicle charging stations connecting major highway systems, across the country from the Atlantic Coast through the Midwest, South and into the Gulf and Central Plains regions. Through approved programs at its utilities, Exelon will enable the installation of more than 7,000 residential, commercial and/or utility-owned charging ports across Maryland, D.C., Delaware and New Jersey.13 [EPA-HQ-OAR-2019-0055-1290-A1, p. 4]

Organization: *National Parks Conservation Association (NPCA)*

EPA’s proposed revisions to the Phase II GHG Standards to tighten existing standards in 2027 by 1.5% for school and transit buses, delivery vans, and short-haul tractors would result in only a .4% reduction in CO2 emissions for class 4-8 vehicles between 2027-2050.37 This level of reduction is drastically inadequate and falls far short of what is needed to limit global temperatures below the 2° C, which in itself is .5° C above the IPCC’s stated goal of limiting warming to 1.5° C. NPCA thus requests that EPA make additional improvements to the Phase II GHG standards for HD vehicles to drastically reduce GHG emissions and expand ZEV penetration in the coming years. [EPA-HQ-OAR-2019-0055-1314-A1, p.7]

37 Sara Kelly, et. al, ICCT comments on EPA’s proposed heavy-duty engine and vehicle standards, at slide 14, available at public-webinar_10May2022.pdf (theicct.org).

Analysis conducted by the International Council on Clean Transportation (ICCT) found that new heavy-duty ZEV sales of 46% or higher by 2030 are necessary to avoid a greater than 2° C increase in warming.38 To achieve this vital target of 46% or higher HD vehicle sales by 2030, we suggest EPA take a phased in approach to require sale mandates of 20% HD ZEV sales 2027, 30% in 2028, 40% in 2029, and 46% or greater in 2030, with an ultimate goal of achieving 100% HD ZEV sales in 2035. We believe this strategy is not only necessary to meet our climate goals but is also technologically achievable given recent advances in both short and long-haul HD vehicle technologies. Waiting until Phase III GHG standards will be too late. [EPA-HQ-OAR-2019-0055-1314-A1, p.7]

38 C. Buysse et al., Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the United States, International Council on Clean Transportation (Apr. 8, 2022), https://theicct.org/racing-to-zero-hdv-us-apr22/.

The approach taken by EPA in the in this rulemaking is far too conservative, and severely underestimates potential HD ZEV sales that will take place starting in 2027. For instance, EPA's analysis looks only at outdated projections conducted by CARB regarding HD ZEV adoption in California and fails to take into consideration additional factors such as dropping costs, improving technology, and growing public interest in HD ZEVs. Moreover, EPA's California focused analysis of HD ZEV potential fails to account for the growing list states that have adopted ACT, Omnibus, or HD Memorandum of Understanding (MOU), nor does it consider additional commitments at the federal, state, local, and private level. This underestimation of ZEV potential not only diminishes justifications for the feasibility of stringent ZEV advancements in the coming years, but when mixed with EPA's proposed ZEV credit scheme will incentivize industry to trade ZEVs that likely would already be purchased for additional NOx pollution harming localized communities. [EPA-HQ-OAR-2019-0055-1314-A1, p.7]

Organization: *National Waste & Recycling Association (NWRA)*

With the projected adoption of ZEVs in the waste industry, we ask that EPA work with U.S. Department of Transportation (USDOT) to resolve the issue of heavier battery vehicles needing to reduce the amount of mass they can haul to comply with truck weight restrictions. EPA and USDOT should work together to minimize pollution without sacrificing cargo carrying capacity of vehicles. This potential reduction of cargo capacity should also be included in EPA's economic analysis of the rule. [EPA-HQ-OAR-2019-0055-1242-A1, p. 2]

NWRA also asks that EPA work with the Department of Energy to understand the electrical load that would be needed to electrify the heavy-duty truck fleet. NWRA members are concerned that the electrical infrastructure is not expanding fast enough to support an electrified fleet. [EPA-HQ-OAR-2019-0055-1242-A1, p. 2]

Organization: *Natural Gas Vehicles for America (NGVAmerica)*

In its notice, EPA addresses the historic opportunity related to electric vehicles. However, we believe some caution should be exercised when it comes to evaluating the potential for electric vehicles to deliver significant emission reductions or to rapidly overtake the transportation sector. The successes to date have not been entirely a result of technology break-through and economics, but rather in our view have arisen in large part from the benefits of regulatory mandates, generous regulatory credits, and significant subsidies. [EPA-HQ-OAR-2019-0055-1330-A1, p.7]

There are many concerns related to the expectations surrounding battery electric vehicles. One concern, when it comes to plans to electrify everything, is the fact that the U.S. is a long way from being self-sufficient when it comes to sourcing and supply of the metals needed to support batteries. The New York Times and other media outlets have highlighted the concerns over becoming reliant on China and others for rare earth minerals and other critical components for batteries.13 Not only are these materials largely not available in the U.S. but the extraction and processing of these materials produces significant greenhouse gas emissions. Before moving further to increase reliance on battery electric vehicles it is important to understand how these negative consequences will be addressed. [EPA-HQ-OAR-2019-0055-1330-A1, p.7]

13 'A Power Struggle Over Cobalt Rattles the Clean Energy Revolution,' New York Times, November 20, 2021. This article highlights that China dominates the production and processing of clean energy metals.

Another issue of concern is the recent increase in costs of battery components, which like almost everything else are going up.17 But there is a difference with respect to battery costs. [EPA-HQ-OAR-2019-0055-1330-A1, p.7]

17 Precious Metal Values are Raising Battery Prices and Slowing EV Uptake, Newsweek April 4, 2022; Rising Battery Costs Hit Carmakers, Threaten Climate-Change Push, Bloomberg Nov. 30, 2021; https://www.bloomberg.com/news/articles/2021-11-30/even-the-battery-boom-can-t-escape-world-s-supply-chain-woes; Rising Battery Prices Add Uncertainty to Electric-Vehicle Costs: Demand for lithium outstrips supply, ending yearslong price declines, WSJ Feb 5, 2022.

The significant increase in demand at some point was always going to impact supply and costs. With mandates for light duty vehicles and now also heavy-duty vehicles, and with increased efforts to install battery storage as a means of storing and then supplying renewable energy, there was going to be an impact on pricing. It has long been presumed that battery prices would keep falling but few appear to really be looking at whether that is truly a reasonable assumption. [EPA-HQ-OAR-2019-0055-1330-A1, p.8]

Another concern with the push for electric vehicles in trucking is that that this technology is largely unproven from the standpoint of deployability, scalability, dependability, and cost-effectiveness. Many of the companies touting the ready availability of electric trucks are new market entrants with no track record of manufacturing, servicing, or supporting motor vehicles in actual use. Regarding their claims that the technology will be less costly to operate, there is insufficient data to support the argument because the vehicles are only now starting to be deployed. Another claim is that over time these trucks will cost less to purchase as the cost of batteries comes down, despite the significant increase in demand for battery materials and batteries. Consider the views expressed recently by Daimler Truck, a company that has many years of experience in manufacturing and supporting trucks. Daimler Truck CEO, Martin Daum stated, 'The first truth is, in heavy-duty commercial vehicles you need such a huge amount of energy, meaning you need such large batteries, that such a truck always will cost significantly more than a combustion engine powered truck.'18 [EPA-HQ-OAR-2019-0055-1330-A1, p.8]

18 Meghana Kandra, 'Daimler CEO Talks About Advancements in Heavy Electric Duty Truck', https://www.cnbc.com/2021/11/12/too-risky-to-not-use-battery-and-hydrogen-tech-daimler-truck-ceo.html, November 13th, 2021.

Claims regarding cost-effectiveness almost always overlook factors such as range, utility, and fleet turnover. In many cases, it appears that fleets deploying shorter-range electric vehicles will need to deploy more trucks to move the same amount of freight. The implications of this are huge (especially in case of upstream emissions associated with vehicle and battery production) as trucking fleets will need more trucks and more drivers in some cases if they deploy electric trucks. These factors appear to be ignored in cost-comparisons and emission comparisons, but they have significant implications. For shorter range trips and vehicles that do not accumulate significant daily mileage, electric trucks may be an excellent option, but it is also true that in these applications there is less opportunity to reduce fuel consumption and offset pollution. Few assessments acknowledge the additional monetary investments required and enormous challenges associated with the establishment of statewide heavy-duty vehicle charging infrastructure – including the build out of charge points, mandatory grid upgrades, and the expansion of transmission capacity – that must complement these new battery electric vehicle purchases once they are market ready and deployable. [EPA-HQ-OAR-2019-0055-1330-A1, p.8]

A number of recent reports have highlighted concerns regarding whether the electricity grid is ready for electric vehicles. One recent review of this issue by the Washington Post focused on the issues specific to New York state.19 Based on that report it appears that there are some very serious challenges to preparing the grid so that it can transport renewable electricity to the locations it will be needed to serve electric vehicles, and additional challenges installing necessary charging equipment. [EPA-HQ-OAR-2019-0055-1330-A1, pp.8-9]

19 https://www.washingtonpost.com/business/2021/10/13/electric-vehicles-grid-upgrade/

The infrastructure issue and challenges of getting electricity to where it is most needed goes to the issue of scalability and deployability which could significantly frustrate electrification plans even if vehicles become readily available and are lower in cost. An article published recently by Oregon Public Broadcasting highlights the very real concerns expressed by representatives of the trucking industry. Here are excerpts from that article: Oregon Trucking Associations President Jana Jarvis said there are opportunities for new technologies for the trucking industry but she's not sure if electric trucks are the fuel for the future, especially for medium- to heavy-duty trucks…it's unclear what the future holds when it comes to batteries and charging stations along transportation routes to ensure that trucks can deliver freight efficiently. 'Then you think about having to stop and recharge — if there was a charging infrastructure and if there was enough grid capacity. And both of those are questions today,' she said. 'You start thinking about doing that every couple hundred miles and you realize the inefficiencies the trucking industry would be subject to by conversion to electric vehicles.' Jarvis said some of her association's larger companies are trying to use electric trucks but getting the charging infrastructure installed in their terminals has been difficult, depending on their location. 'In many parts of the state there just isn't the grid capacity to accommodate that,' she said.20 [EPA-HQ-OAR-2019-0055-1330-A1, p.9]

20 M. Samayoa, OPB.org, Zero emissions trucks could be soon be required in Oregon (Nov. 15, 2021); https://www.opb.org/article/2021/11/15/zero-emissions-trucks-could-soon-be-required-in-oregon/

Even if electric vehicles become the dominate technology in coming years, there will continue to be applications and uses that are not a good fit for electric vehicles. For example, commercial pickup trucks operated in rural and remote parts of the country requiring extended range could continue to be an excellent niche market for natural gas. It also is unlikely that electric trucks will satisfy the needs of longer-range, medium- and heavy-duty trucks operating in challenging conditions or operating with a full load. [EPA-HQ-OAR-2019-0055-1330-A1, p.12]

Organization: Nikola Corporation

[*From Hearing Testimony, April 14, 2022, Alana Langdon, Nikola Corporation*] I am the head of government affairs and global policy at Nikola Corporation. On behalf of Nikola, we appreciate the opportunity to express our support for reducing pollution and the carbon emissions footprint from heavy-duty trucks through this EPA rulemaking process. Founded in 2015, Nikola has now grown over to 1,000 employees headquartered in Phoenix, Arizona, with manufacturing operations in Coolidge, Arizona. Nikola is a leading manufacturer of heavy-duty zero-emission commercial battery-electric and fuel cell electric vehicles and energy solutions. Nikola's mission is to transform the transportation industry while improving our employees' lives and leaving the world a better place. This includes doing our part to increase the health and well-being of communities impacted by heavy trucking. Our products and services are built to deliver on those core commitments by manufacturing BEV and fuel cell electric vehicle trucks plus working with strategic business partners and suppliers to build a complete infrastructure ecosystem that will support the transition to zero-emissions trucking. Operating as both a zero-emissions OEM and an energy company, Nikola is a game changer in the marketplace, transforming the future of the heavy-duty transportation sector, focused on addressing the entire value chain to deliver an economic total cost of ownership to fleets, which includes access to trucks, fuel, service, and maintenance for our customers. Nikola's truck portfolio of BEV and fuel cell offerings aims to address the short-, medium-, and long-haul applications of heavy trucking. Our current manufacturing capacity in Coolidge is up to 2,400 trucks per year and we are in the process of expanding our manufacturing facilities to be capable of manufacturing up to 20,000 trucks per year in late 2023. We delivered the first of several pre-series battery electric Tre BEV class eight trucks to our launch customer, Total Transportation Services, in December 2021 at the Port of Los Angeles, and started production of the Tre BEVs at our manufacturing facility on March 21st, 2022. Nikola has begun delivering the Tre BEV to customers in our dealer network across the country, anticipating between 300 to 500 Tre BEVs to be completed this year. The battery electric vehicle has a 753-kilowatt battery onboard with a 350-mile range. The battery pack is modular and can be reduced for shorter distances and to maximize payloads customized for our customers' operational needs and use cases. The next vehicle to market, the Nikola Tre fuel cell vehicle, has 70 kilograms of hydrogen on board with a 500-mile range. The Nikola fuel cell vehicle will enter production in 2023, and earlier this year, we delivered two of these alpha fuel cell vehicles to our launch customer, Anheuser-Busch, just in time for delivery of their first zero-carb beer for the Super Bowl. These vehicles were fueled at our headquarters facility in Phoenix and made the over 350-mile trek to Ontario, California, with hydrogen fuel to spare, showing that hydrogen fuel cell heavy-duty trucks are just around the corner. And finally, the Nikola Two sleeper cab fuel cell will arrive in 2025, addressing the long-haul commercial needs supported by a national hydrogen network of production and fueling facilities being developed by Nikola and our partners. In closing, we look forward to providing more details in our written comments in response to the proposed rule. However, we did want to take the opportunity to convey our support during these public hearings. As an American company, Nikola is excited about the role our innovative vehicle truck technology is and will play to advance cleaner transportation and energy technologies that will yield a healthier tomorrow while also creating jobs that will contribute to our nation's economic prosperity for generations to come. [EPA-HQ-OAR-2019-0055-2867]

Organization: *Northeast States for Coordinated Air Use Management (NESCAUM)*

Should EPA instead promulgate Option 1, we urge the Agency to make the following changes to the proposed standards: EPA estimated the percent sales of HD ZEVs in the baseline to be 1.5 percent ZEV sales in 2027. We urge EPA to update this estimation in the final rule to reflect recent substantial changes in heavy-duty ZEV technology, the regulatory landscape, and the market for heavy-duty ZEVs. EPA relied on the "medium" projection case from the NREL Electrification Futures study and EIA's 2018 Annual Energy Outlook for its heavy-duty ZEV sales estimate for 2027. Since the 2018 EIA Outlook and the Electrification Futures study have been published, CARB finalized the Advanced Clean Trucks regulation and five states outside of California have adopted the regulation as of April 2022 – Massachusetts, New Jersey, New York, Oregon, and Washington. Taken together, registered trucks and buses in these six states comprise over 20 percent of registered trucks and buses in the U.S.39 In addition, CARB has proposed the Advanced Clean Fleets rule40 that will increase the percent requirement for heavy-duty ZEVs above and beyond the ACT requirement in California. As a result of these regulatory actions, NESCAUM estimates a minimum of 30,000 class 4 to 8 heavy-duty ZEVs will be required to be sold in 2027 in California and states that have finalized the ACT regulation combined. In 2028, the number of class 4 to 8 heavy-duty ZEVs that will be required to be sold in the states that have adopted the ACT regulation will exceed 45,000 vehicles. This estimate likely underestimates the number of ZEVs that will be introduced as it does not account for heavy-duty ZEV sales in states outside of Section 177 states that have adopted ACT. It also does not account for the adoption of ACT in states that are currently proceeding with ACT adoption but have not yet finalized the regulation. Nor does it account for state specific heavy-duty zero emission sales requirements and goals above and beyond ACT requirements.41 As noted above, heavy-duty ZEV sales in years subsequent to 2027 will increase significantly as required by the ACT regulation. These requirements should be taken into consideration in EPA's baseline assessment. [EPA-HQ-OAR-2019-0055-1249-A1, pp. 12 - 13]

>
> 40. California Air Resources Board, "Advanced Clean Fleets" Regulation." Available at Advanced Clean Fleets | California Air Resources Board.
>
> 41 An example is New York State Education Law §3628 that requires no later than July 1, 2027, every school district shall only purchase or lease zero-emission school buses when purchasing or leasing new buses.

In addition to changes in the regulatory landscape, much has changed from a cost and technology standpoint since the studies EPA relied on in its analysis were published. The Electrification Futures study was published in 2017 and relied on studies published in 2016 for battery cost information. Since that time, significant improvements in battery technology have occurred. Rapid advances in battery chemistries, increased energy density, and more efficient pack design have driven sharp reductions in battery costs, which are the single largest factor influencing ZEV purchase prices. During the last decade, battery prices declined by nearly 90 percent and a steady decline in battery prices is forecasted through 2030. Declining battery costs and technology advances will be reflected in lower prices and longer ranges for vehicles, leading to an improved business case for electrification and making zero-emission trucks and buses more affordable. [EPA-HQ-OAR-2019-0055-1249-A1, p. 13]

EPA asks for comment on whether or not the “medium” NREL Electrification Future study assumptions should be used in the Agency’s assessment of heavy-duty ZEV sales in 2027. For the above reasons, NESCAUM recommends EPA not rely on the NREL “medium” scenario. We urge EPA to conduct a more up-to-date analysis to estimate heavy-duty ZEV sales in model years 2027 and later. An up-to-date analysis would estimate heavy-duty ZEV sales resulting from ACT regulation adoption in California and Section 177 states, quantify sales resulting from additional state heavy-duty ZEV requirements, and use more recent projections of heavy-duty ZEV sales, such as NREL’s March 2022 study and ACT Research’s 2021 analysis.42,43 [EPA-HQ-OAR-2019-0055-1249-A1, p. 13]

Organization: *Our Children's Trust*

Decarbonization of the transportation sector and other combustion engines is critical to achieving greenhouse gas emission reduction goals. Experts have opined that '[t]ransportation electrification is the most critical sector to achieve these electrification goals in due to the volume of liquid fuels it currently consumes.'6 [EPA-HQ-OAR-2019-0055-1317-A1, p.3]

> 6 Ben Haley et al., Evolved Energy Research, 350 PPM Pathways for the United States 38 (2019).

EPA must increase the stringency of its Phase 2 MYs 2027-2029 and beyond standards. These should be as stringent as possible and strive for electrification of the heavy-duty truck industry by 2030 and no later than 2035. It is EPA’s job to do as much as it can to push the transition to zero emissions to protect the air and climate for children and future generations. These standards need to go further faster so that the entire transportation sector, and supporting industrial sectors, can plan and respond as quickly as feasible. The technology is there to expedite the transition away from the internal combustion engine and eliminate their sales by 2030 for heavy duty vehicles. [EPA-HQ-OAR-2019-0055-1317-A1, pp.3-4]

Organization: *Public Citizen and Healthy Port Communities Coalition (HPCC)*

EPA should support an accelerated transition of the trucking industry toward zero emissions vehicles. [EPA-HQ-OAR-2019-0055-1417-A2, p. 4]

Heavy Duty vehicle manufacturers need to eliminate tailpipe emissions. The only way that we see this achieved is through the widespread adoption of zero emissions vehicles. Zero-emission, battery electric technology will address public health and the climate crisis without the risk of emissions cheating or SCR failure. [EPA-HQ-OAR-2019-0055-1417-A2, p. 4]

This EPA Proposal changes standards for school buses, transit buses, delivery trucks, and short haul tractors because EPA believes that the battery electric vehicle market is changing most rapidly in these areas. We believe that EPA should take a more proactive stance in moving forward zero emission heavy duty vehicles across the board. [EPA-HQ-OAR-2019-0055-1417-A2, p. 4]

While the market penetration of zero emission heavy-duty vehicles is still quite low, deployment is expected to ramp up quickly, according to Calstart13. The report states, “A complete transition to ZET technology would not only help mitigate the impacts of climate change and poor air quality but could eventually lower total cost of ownership (TCO) for fleets and create job growth in the United States.” [EPA-HQ-OAR-2019-0055-1417-A2, p. 4]

13. https://calstart.org/wp-content/uploads/2022/02/ZIO-ZETs-Report_Updated-Final-II.pdf

A recent Department of Energy14 study echoed these findings and showed that costs of zero emissions vehicles are decreasing. According to the study, by 2030, about half of the market-ready zero emissions medium- and heavy-duty trucks will cost less to purchase, maintain, and operate than medium- and heavy-duty diesel trucks. The study further states that zero emissions vehicles can be a boon to the US economy. US Secretary of Energy Jennifer Granholm states:

DOE is showing a clear pathway for trucking companies to make the switch from diesel to electric that will help them cut costs and pollution for their customers, while combating climate change. The Biden Administration’s comprehensive approach is working to make clean transportation a reality—by reducing exposure to volatile fuel prices, investing in American manufacturing and creating a national charging network to support more electric vehicles on the road.15 [EPA-HQ-OAR-2019-0055-1417-A2, p. 4]

14. https://www.nrel.gov/docs/fy22osti/82081.pdf

15. https://www.energy.gov/articles/doe-projects-zero-emissions-medium-and-heavy-duty-electric-trucks-will-be-cheaper-diesel

Because battery prices are dropping swiftly and the energy intensity of batteries is improving, zero emission battery electric trucks are primed to accelerate in adoption–if they can acquire the strong policy support needed to overcome higher upfront costs16. This is why it is necessary for the EPA to lay out a strong foundation for the adoption and implementation of zero emission battery electric trucks. [EPA-HQ-OAR-2019-0055-1417-A2, p. 4]

16. https://eta-publications.lbl.gov/publications/why-regional-and-long-haul-trucks-are

Some states are moving forward with their own policies to reduce harmful NOx emissions, like California, which set a goal for engines to cut NOx by 75% below current standards starting in 2024 and by 90% in 2027.17 This rule sets progressive electrification targets to help achieve these reductions.18 Because all components of the new rule will be phased in, engine manufacturers will have time to prepare for compliance. [EPA-HQ-OAR-2019-0055-1417-A2, pp. 4 - 5]

17. https://www.greencarcongress.com/2020/08/20200829-carb.html

18. https://www.scientificamerican.com/article/california-passes-historic-clean-truck-rule/

Several states and the District of Columbia have set targets to advance zero emission trucks and buses, aiming for 100% of sales to be zero emission by 2050. The interim goal is for 30% of vehicle sales to be zero emission by 2030.19 [EPA-HQ-OAR-2019-0055-1417-A2, p. 5]

19. Ibid 12.

However, given both the contribution of the greenhouse gas emissions from the trucking industry and the urgency of the climate crisis, we call on the EPA to reach 100% zero emission truck sales by 2035. [EPA-HQ-OAR-2019-0055-1417-A2, p. 5]

Organization: *Retail Industry Leaders Association (RILA)*

As EPA discusses in its proposed rule, the previously unanticipated acceleration towards electrification for heavy-duty (HD) zero-emission vehicles (ZEVs) will inherently reduce the aggregate GHG emissions from HD vehicles, even if the HD non-ZEVs do not exhibit emission reductions. EPA's proposed shift to more stringent heavy-duty 'phase 2' GHG emissions standards can therefore be viewed positively, as it responds to the quickened pace for the emergence of HD ZEVs. [EPA-HQ-OAR-2019-0055-1189-A2, pp.6-7]

As a supplement to these standards comments, EPA is encouraged to also review RILA's February comments submitted to FHWA/DOT in response to their Request for Information: Development of Guidance for Electric Vehicle Charging Infrastructure Deployment for more information about the RILA's views and suggestions concerning:

- accelerating fleet operational efficiency,
- enabling the role of fleet transition fuels and technologies,
- adapting regulatory processes to meet the needs of a widescale charging infrastructure rollout,
- pursuing public-private partnerships,
- investing in infrastructure designed to surpass the design and performance of current transportation refueling networks and facilitate the collaboration necessary for their success, and
- expeditiing adoption and availability of medium- and heavy-duty low and zero emission vehicles (ZEVs) by lowering upfront costs. [EPA-HQ-OAR-2019-0055-1189-A2, p.6]

One of the factors expected to drive adoption of HD ZEVs is California's development and adoption of Advanced Clean Truck (ACT) rules, that require manufacturers to increase the promotion of HD ZEVs sold within the state as a share of their overall HD vehicle sales annually over an annual implementation schedule. These ACT rules have also been adopted by five other states and been proposed for adoption in several others. The states that have adopted ACT rules account of over 20 percent of medium-duty and heavy-duty3 (MDHD) 2019 vehicle stock,4 while states that have proposed ACT rules account for nearly three percent more. Additionally, a total of 17 states and the District of Columbia have signed a joint memorandum of understanding (MOU) to join a Multi-State Medium- and Heavy-Duty Zero-Emissions Vehicle (MHD ZEV) initiative to develop a MHD ZEV Action Plan for rapid electrification of trucks and buses. Jurisdictions within the United States that are signatory to this MOU account for more than 36 percent of MDHD 2019 stock 4. This multi-jurisdictional MOU is anticipated to further accelerate the adoption of electrified heavy-duty trucks.[EPA-HQ-OAR-2019-0055-1189-A2, p.7]

3 Vehicles with gross vehicle weight rating (GVWR) class 2b-8

4 IHS Markit, 2019 United States stock data

Although the anticipated effectiveness or success of ACT rules and the MHD ZEV Action Plan against their stated objectives will not be known for at least several years to come and that enticing a rule in of itself does guarantee future market feasibility, their presence is expected to induce an increased presence of HD ZEVs across the United States. EPA's proposed rule mentions California's adoption of ACT rules. Similarly, the count of states having signed the MOU to join the MHD ZEV initiative has increased by three since EPA drafted the proposed rule. This signals both that the acceleration of HD ZEV adoption is likely to increase, and that EPA's proposed rule changes for HD GHG emissions still underestimates the full extent of the actual HD ZEV market penetration by 2027. EPA is therefore encouraged to review its estimates against these recent developments to identify if a more stringent GHG emissions standard is warranted. [EPA-HQ-OAR-2019-0055-1189-A2, p.7]

Organization: *Rivian Automotive, LLC (Rivian)*

EPA could likely adopt an even more stringent standard than Option 1, which should serve as a floor in agency deliberations on a final rule. This is because EPA has “not relied on the use of” hybrid or ZEV technologies in the development of the co-proposals offered in the NPRM. Seemingly, this was justified by the agency’s assessment that ZEV uptake will remain low enough through the MY2027 timeframe as to not “meaningfully impact” the analysis or proposal development.9 Rivian believes this fails to account for existing trends in the MHD ZEV market and underestimates the likely ZEV penetration rate in the second half of the decade. EPA currently predicts that just 1.5 percent of truck and bus sales will be battery-electric vehicles (“BEVs”) in MY2027. However, six states, representing 20 percent of national MHD vehicle registrations, have already adopted the Advanced Clean Trucks (“ACT”) standard, which sets a minimum level of zero-emission vehicle sales in these states. Additional states are likely to follow suit in the coming months and years. The ACT rule requires that ZEVs comprise 20 percent of Class 4-8 sales in MY2027 and 15 percent in other truck classes.10 This regulation alone appears highly likely to drive ZEV uptake well above 1.5 percent nationally by that time. Wider deployment of ZEVs than EPA currently anticipates could support a standard stronger than Option 1 and we encourage the agency to analyze that possibliity. [EPA-HQ-OAR-2019-0055-1229-A1, pp.3-4]

9 Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, 87 Fed. Reg. 59, 17,458 (Mar. 28, 2022) (revising 40 C.F.R. Parts 2, 59, 60, 80, 85, 86, 87, 600, 1027, 1030, 1033, 1036, 1037, 1039, 1042, 1043, 1045, 1048, 1051, 1054, 1060, 1065, 1066, 1068, and 1090).

10 13 C.C.R. §1963.

EPA rightly notes major progress in electrifying MHD vehicles and describes the current moment as an "historic opportunity" to achieve even greater emissions reductions from the sector. It is also important that the agency capitalize on the progress already seen to position the industry for what will necessarily be even more ambitious rulemakings later in the decade. To do so, Rivian encourages EPA to more fully account for the expected rate of truck and bus electrification in a BAU scenario. Stated industry commitments and strong state-level policy all suggest that this proposal has underestimated where the MHD ZEV market will be by MY2027.[EPA-HQ-OAR-2019-0055-1229-A1, p.7]

Organization: *Sierra Club, NJ Chapter*

EPA's proposed rule has requirements that do not come into effect until 2031 in order for technology to be fully available. Plenty of data shows, however, that this technology is already here and ready for use. Currently, there are over 100 models of zero emissions trucks and buses available and more coming in the future. The technology is here, now we just need the policy and standards to match it. As further evidence of this, there are already 6 States in the country that have adopted clean truck policies that go above and beyond the EPA's proposal. [EPA-HQ-OAR-2019-0055-2558, p. 1]

These states, my State being one of them, to name them: California; Oregon; Washington; New York; New Jersey; and Massachusetts, account for 20% of the truck market. However, the proposed EPA rule would only yield 1.5% of zero-emission new truck sales by 2027. To be specific, these 6 State policies will yield 40 to 75% of new zero-emissions truck sales by 2035. [EPA-HQ-OAR-2019-0055-2558, p. 1]

The US EPA can and must do more, because of three main reasons: 1) the technology is available; 2) other States are already doing it; and 3) most importantly, so all communities in the country, not just the ones from States with adequate clean truck policies, and especially those communities that are overburdened with pollution and economically disadvantaged, benefit from the same targets towards cleaner air. It is what is fair, equal clean air. [EPA-HQ-OAR-2019-0055-2558, pp. 1 - 2]

New Jersey's transportation sector accounts for 42% of greenhouse gas emissions, the largest contributor, to which medium duty and heavy duty vehicles, aka buses and trucks, account for a significant portion. Of course, that equally means a huge contribution of co-pollutants: NOx, Particulate Matter (PM), black carbon, a subset of PM, and other air toxics like benzene. The latest available data by NJ's State Department of Environmental Protection indicates that the highest carcinogenic risk driver in our State is diesel PM with a maximum predicted risk of 1,447 in a million, and a range of 100 to 300 in a million risk in the heavily trafficked areas like those surrounding I-95. These risk estimates are based on EPA's NATA or National Air Toxics Assessment data, your data. [EPA-HQ-OAR-2019-0055-2558, p. 2]

Although New Jersey will benefit from the clean truck rule recently adopted, federal action is absolutely necessary in order to move the manufacturers into a zero-emissions market. When we holistically move the market, everything else follows. Climate action cannot wait, and this proposed rule, if done correctly, will significantly deliver to the effort. [EPA-HQ-OAR-2019-0055-2558, p. 2]

Organization: *Southern Environmental Law Center (SELC)*

EPA's proposal underestimates ZEV penetration rates in light of declining costs and state requirements and initiatives, which results in less-stringent standards that do little to accelerate ZEV adoption in medium- and heavy-duty vehicles. [EPA-HQ-OAR-2019-0055-1247-A1, p.1]

As discussed further below, proposed Option 1 for the criteria pollutant emissions standards and the revised Phase 2 greenhouse gas (GHG) emissions standards do not go far enough. [EPA-HQ-OAR-2019-0055-1247-A1, p.1]

The standards should also be fully aligned with the California Heavy-Duty Omnibus Regulation in 2027, establish minimum ZEV production requirements, and preserve the stringency of GHG emissions requirements for internal combustion engine vehicles. [EPA-HQ-OAR-2019-0055-1247-A1, p.1]

At a minimum, EPA should fully align its criteria pollutant emissions standards with the California Heavy-Duty Omnibus Regulation in in 2027, establish minimum ZEV production requirements, and preserve the stringency of GHG emissions requirements for internal combustion engine vehicles. [EPA-HQ-OAR-2019-0055-1247-A1, p.8]

The stringency of both the proposed criteria pollutant emissions standards and the revised Phase 2 GHG emissions standards is undermined because EPA underestimates ZEV market penetration. When analyzing the feasibility of the proposed standards, EPA projects that only approximately 1.5 percent of medium- and heavy-duty vehicles will be ZEVs in model year 2027.20 Based on this estimate, EPA did not consider ZEV technologies when developing the criteria pollutant standards since the low ZEV market penetration would not 'meaningfully impact [the] analysis of the proposed [standards].'21 Similarly, this low projection influenced the stringency of the revised GHG Phase 2 emissions standards because the proposed reduction in the numeric standards is equal to 'the projected percentage of electric vehicles' in certain vehicle subcategories.22 [EPA-HQ-OAR-2019-0055-1247-A1, p.4]

20 Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, 87 Fed. Reg. 17414, 17458, 17601 (proposed Mar. 28, 2022).

21 Id. at 17458.

22 Id. at 17599.

In developing its ZEV market penetration rate, EPA failed to consider the full scope of regulations and policies adopted by states related to medium- and heavy-duty ZEV deployment. EPA included data from the California Air Resources Board's (CARB's) Advanced Clean Trucks (ACT) rulemaking in its projections,23 but the estimate does not seem to account for the six other states—Oregon, Washington, New York, New Jersey, Massachusetts, and Connecticut—that have also adopted the ACT regulations. The ACT regulations establish binding requirements that progressively increase the percentage of medium- and heavy-duty ZEVs that must be sold in these states starting in model year 2025.24 By model year 2035, ZEVs will be required to make up approximately 55 percent of Class 2b-3 vehicle sales, 75 percent of Class 4-8 Group sales, and 40 percent of Class 7-8 tractor sales in these states,25 which make up over 20 percent of the national fleet of medium- and heavy-duty vehicles.26 [EPA-HQ-OAR-2019-0055-1247-A1, p.4]

26 Press Release, Earth Justice, New York State Advances Clean Trucks Rule to Electrify Vehicles (Dec. 30, 2021), https://earthjustice.org/news/press/2022/new-york-state-advances-clean-trucks-rule-to-electrify-vehicles.

EPA also does not seem to consider the impact of commitments made in the Multi-State Medium- and Heavy-Duty Vehicle Memorandum of Understanding (MOU) when calculating national ZEV market penetration. In addition to the states that have adopted the ACT regulations, Colorado, Hawaii, Maine, Maryland, Nevada, North Carolina, Pennsylvania, Rhode Island, Vermont, Virginia, and Washington D.C. have signed the MOU.27 These 18 jurisdictions have committed to a goal of having at least 30 percent of all new medium- and heavy-duty vehicle sales be ZEVs by no later than 2030, and 100 percent of sales being ZEVs by no later than 2050.28 [EPA-HQ-OAR-2019-0055-1247-A1, pp.4-5]

28 Multi-State Medium- and Heavy-Duty Zero Emission Vehicle Memorandum of Understanding, https://www.nescaum.org/documents/mhdv-zev-mou-20220329.pdf/ (last updated Mar. 29, 2022).

Finally, declining costs and other economic forces are also likely to drive higher deployment of medium- and heavy-duty ZEVs in coming years. A study by the National Renewable Energy Laboratory found that ZEVs in all medium- and heavy-duty vehicle classes could reach cost parity with diesel vehicles by 2035, even without incentives.29 Coupled with the deployment of charging and refueling infrastructure, this could result in ZEVs accounting for 42 percent of medium- and heavy-duty sales by 2030, and over 99 percent of sales by 2045.30 [EPA-HQ-OAR-2019-0055-1247-A1, p.5]

30 Id.

These factors will have significant impacts on the medium- and heavy-duty vehicle market and will likely drive national ZEV market penetration rates higher than EPA's projected 1.5 percent. EPA should therefore re-evaluate the stringency of its proposed standards after accounting for a higher ZEV market penetration rate. [EPA-HQ-OAR-2019-0055-1247-A1, p.5]

Although EPA characterizes the current rulemaking as a minor revision of the Phase 2 GHG emissions standards, bold action is needed to put the medium- and heavy-duty vehicle fleet on the path to eliminating GHG tailpipe emissions and to set the stage for increasingly stringent standards in model year 2030. Establishing minimum ZEV production requirements—similar to requirements in the ACT regulations—is one of the best ways to accelerate the transition to ZEVs. EPA should therefore consider setting fleetwide minimum ZEV production requirements to achieve 20 percent ZEV sales by model year 2027, 30 percent ZEV sales by model year 2028, and 40 percent ZEV sales by model year 2029. [EPA-HQ-OAR-2019-0055-1247-A1, pp.6-7]

As manufacturers increasingly rely on ZEVs to meet the Phase 2 GHG emissions standards, manufacturers may continue to produce more-GHG-polluting internal combustion engines. Modeling shows that the currently proposed revisions to the GHG standards could result in internal combustion engine vehicles emitting more GHGs in model year 2027 than they did in model year 2017.40 For this reason, any revisions to the Phase 2 GHG emissions standards should preserve the original standard's stringency for internal combustion engine vehicles. Introducing ZEV production requirements could help to separate the regulation of ZEVs and internal combustion engines and allow EPA to better ensure that gains in ZEVs deployment do not erode the stringency of the requirements intended for internal combustion engine vehicle. [EPA-HQ-OAR-2019-0055-1247-A1, p.7]

40 Sara Kelly et al., INT'L COUNCIL ON CLEAN TRANSP., ICCT Comments on EPA's Proposed Heavy-Duty Engine and Vehicle Standards17 (May 10, 2022),

https://theicct.org/wp-content/uploads/2022/04/publicwebinar_10May2022.pdf.

Strong tailpipe emissions standards are one of the best ways to address the harmful impacts of vehicle pollution. Ultimately, EPA's current proposals fail to accelerate the transition of medium- and heavy-duty vehicles to ZEVs—readily available technology that eliminates tailpipe pollution altogether. EPA should therefore reassess its ZEV penetration rates in light of economic factors and state requirements and initiatives. [EPA-HQ-OAR-2019-0055-1247-A1, p.8]

Organization: *States of California, et al. (The States)*

The Proposed Rule would also further tighten the Phase 2 GHG standards for model year 2027 in certain segments of the heavy-duty vehicles sector based on the better-than-anticipated deployment of zero-emitting vehicles (ZEVs) in certain heavy-duty vehicle classes, especially buses and delivery vans. The States support EPA's general methodology for updating the Phase 2 GHG standards, which preserves their environmental integrity and comports with EPA's legal duties of rational decision-making. However, the States urge EPA to base its update on a more robust projection of ZEVs in the heavy-duty sector that reflects multiple States' ZEV mandates and market conditions that increasingly favor heavy-duty ZEVs. The States also encourage EPA to prioritize new GHG standards for the heavy-duty sector based on proven, cost-effective ZEV technology. [EPA-HQ-OAR-2019-0055-1255-A1, p. 3]

The States support the Proposed Rule's revisions to the HD Phase 2 GHG standards as an important step in ensuring the heavy-duty vehicles sector continues to reduce its GHG emissions. Our comments concentrate on the following three observations: (1) EPA's approach to updating to the Phase 2 standards is consistent with legal requirements and comparable agency practice for fleetwide average standards where ZEVs make up an increasing share of the real-world fleet; (2) EPA can improve the accuracy of its update by ensuring the estimated HD ZEV penetration rate reflects other States' adoption of the California Advance Clean Trucks (ACT) rule and favorable market conditions for HD ZEVs; and (3) EPA should take prompt action to develop "Phase 3" GHG standards for the heavy-duty sector based on the enormous emission-reducing potential of HD ZEVs. [EPA-HQ-OAR-2019-0055-1255-A1, p. 24]

1. Even as EPA takes initial steps to develop next-generation GHG standards based on ZEV technology, it is rational and consistent with the Clean Air Act to update Phase 2 GHG standards to ensure they remain binding on the conventional heavy-duty fleet. Indeed, it is "patently unreasonable" for agencies to ignore "dramatic[]" changes in their regulated industries. NRDC v. Herrington, 768 F.2d 1355, 1408 (D.C. Cir. 1985). The Clean Air Act, in particular, is designed so that EPA may respond to "changing circumstances and scientific developments" and "forestall . . . obsolescence." Massachusetts v. EPA, 549 U.S. 497, 532 (2007). The projections that HD ZEVs will reach cost parity with, and then achieve cost advantage over, conventional heavy-duty engines within the next three to eight years is surely one such change. It is therefore appropriate for EPA to forestall obsolescence here by adjusting the Phase 2 GHG standards to respond to increasing ZEV deployment in the heavy-duty sector. [EPA-HQ-OAR-2019-0055-1255-A1, pp. 24 - 25]

EPA's general methodology in updating the Phase 2 GHG standards is also consistent with NHTSA's recent approach in developing new fleetwide fuel economy standards for light-duty vehicles—a sector that is likewise seeing dramatic increases in ZEV sales.109 There, NHTSA projected automakers would comply with California's ZEV mandate in estimating the number of ZEVs in the baseline light-duty fleet (i.e., in the absence of new fuel economy standards).110 Doing so, NHTSA stated, "is consistent with guidance in OMB Circular A-4 directing agencies to develop analytical baselines that are as accurate as possible regarding the state of the world in the absence of the regulatory action being evaluated," in particular because baselines should "reflect other legal obligations that automakers will be meeting during this time period."111 In a similar fashion, if EPA grants California's requested waiver for its ACT rule, then EPA's baseline fleet should include at least the vehicles the heavy-duty sector will produce to comply with ACT. [EPA-HQ-OAR-2019-0055-1255-A1, p. 25]

109. See Corporate Average Fuel Economy Standards for Model Years 2024-2026 Passenger Cars and Light Trucks, 87 Fed. Reg. 25,710, 25,721 (May 2, 2022).

110. Id. at 25,744.

111. Id. Courts have upheld the inclusion of such obligations in regulatory baselines in a variety of contexts. E.g., NRDC v. Thomas, 838 F.2d 1224, 1238 (D.C. Cir. 1988) (holding, in part, that using "[State-Implementation-Plan]-required emission rates as the baseline" was "a quite reasonable interpretation" of relevant provision of Clean Air Act); Cooling Water Intake Structure Coal. v. EPA, 905 F.3d 49, 81 (2d Cir. 2018) (quoting "environmental baseline" requirements for Endangered Species Act consultations as including "the past and present impacts of all Federal, State, or private actions" and distinguishing those from impacts resulting from agencies exercising discretion); Am. Rivers v. FERC, 201 F.3d 1186, 1192 (9th Cir. 1999) (upholding agency use of facility's operations pursuant to terms and conditions of existing license as no action baseline).

2. However, the States take issue with EPA's estimated 1.5 percent penetration rate for HD ZEVs in model year 2027, which likely underestimates HD ZEV deployment. EPA derives this estimate by extrapolating the HD ZEV requirement for model year 2027 in the ACT rule to national numbers based on California's 2020 share of the heavy-duty electric vehicle market.112 This methodology omits two important factors. [EPA-HQ-OAR-2019-0055-1255-A1, p. 25]

112. 87 Fed. Reg. at 17,600 & n.858.

First, several other States have adopted or will likely adopt ACT under section 177 of the Clean Air Act. Currently, Massachusetts, New Jersey, New York, Oregon, and Washington, in addition to California, have finalized adoption of the ACT requirements.113 These States as well as the District of Columbia, Connecticut, Colorado, Hawaii, Maine, Maryland, Nevada, North Carolina, Pennsylvania, Rhode Island, Vermont, and Virginia (and the Province of Quebec) have signed a memorandum of understanding (MOU) to promote the adoption of HD ZEVs.114 A more robust and realistic estimate would determine the heavy-duty market share of at least those States that have formally adopted ACT and use this, in combination with the ACT schedule, to determine the minimum national fleet of HD ZEVs required by state law in model year 2027. This methodology would also avoid the inconsistency of modeling the heavy-duty sector to comply with one State's legal obligations, but not with other States' equally binding regulations. [EPA-HQ-OAR-2019-0055-1255-A1, p. 26]

113. 310 Code Mass. Regs. 7:40 (2021); N.J. Admin. Code §§ 7:27-31 and 33 (2021); N.Y. Comp. Codes R. & Regs., tit. 6, §§ 218-1.1, 218-2.1, 218-4.1, 218-4.2 (2021); Or. Admin. R. 340-257-0050(3) (2021); Wash. Admin. Code § 173-423-010 et seq. (2021).

114. Multi-State Medium- and Heavy-Duty Zero Emission Vehicle Mem. of Understanding (July 13, 2020; amended March 29, 2022), available at https://www.nescaum.org/documents/mhdv-zev-mou-20220329.pdf/ and attached as Exhibit 16.

Second, favorable market factors—especially fuel cost savings—are projected to make HD ZEVs increasingly attractive to buyers, with several classes achieving cost parity by 2025 or earlier.115 Indeed, these market factors are even more significant the longer historically high and volatile diesel prices continue.116 Thus, EPA should base the updated GHG standards on projected overcompliance with ACT in model year 2027. Indeed, the NREL's recent Cost Analysis projects 42 percent of heavy-duty sales will be HD ZEVs in 2030, suggesting a 2027 penetration rate significantly higher than 1.5 percent.117 EPA's preference for conservative estimates is understandable, but given the importance of preserving the Phase 2 GHG standards' integrity, EPA should base its revisions on the most accurate deployment estimates available. [EPA-HQ-OAR-2019-0055-1255-A1, p. 26]

3. While the States support EPA's choice to focus on the integrity of Phase 2 GHG standards in this rulemaking, EPA should initiate a new rulemaking with a full record on HD ZEVs' potential to reduce GHG emissions even further. As CARB's ACT rule shows,118 and as the Proposed Rule recognizes,119 HD ZEVs are an available and cost-effective technology with enormous GHG reduction potential. In California alone, these GHG reductions translate to $1.01 billion in avoided climate-related costs from 2020 to 2040, in addition to $5.5 billion in health benefits from NOx and PM2.5 co-reductions.120 High rates of HD ZEV deployment are a critical component of States' individual plans for reaching midcentury decarbonization targets set by state law, with significant co-benefits for attaining and maintaining criteria pollutant NAAQS.121 These state decarbonization plans further support a national program for HD ZEV adoption as part of the United States' path to achieving its Paris Agreement commitments.122

Given the imperative to prevent the worst effects of climate change, and to secure GHG reductions as fast as possible, EPA should make GHG standards based on HD ZEV technology a high regulatory priority. [EPA-HQ-OAR-2019-0055-1255-A1, pp. 26 - 27]

Organization: *Tesla, Inc. (Tesla)*

In general, EPA’s proposal fails to consider the depth and pace of electrification technology deployment that has already occurred and will be accelerated through market forces and numerous other state and federal policies. In its proposal, EPA assumes a zero-emission vehicle (ZEV) sales share of only 1.5% in key market segments in 2027.61 This assumed baseline is woefully low and cuts against many projections. Indeed, as EPA indicates, the BEV market is dynamic and changing rapidly.62 For example, NREL has found economics will drive must faster adoption with ZEV sales possibly reaching 42% of all medium- and heavy-duty trucks by 2030.63 It even projects out a scenario where ZEV sales reach >99% by 2045, and 80% of the sector transitions to ZEVs by 2050, reducing CO2 emissions by 69% from 2019.64 A new analysis views the heavy-duty haul market as 50% electrifiable right now.65 The firm ACT Research forecasted a 26% sales share of heavy-duty ZEVs nationwide in 2030.66 Yet, another found that by 2030 25% of the global fleet will be electric.67 Still other analyses have found that most 'market segments have the potential to be fully mature by 2025, with EV models available from multiple companies, including the majority of major OEMs that currently have 90% market share of the in-use fleet.'68 Further, it is predicted the paced of electrification will increase rapidly over the next decade.69 Recent sales suggest this pace of adoption is already occurring.70 [EPA-HQ-OAR-2019-0055-1219-A1, p.9]

72 See, Trucknews.com, Standalone Daimler Truck business gives corporate update as it prepares for public listing (Nov. 11, 2021) (Daimler estimating BEVs will achieve total cost of operation parity with diesel by 2025, and fuel cells by 2027.)

73 Sennder, European truck manufacturers aiming for 100% electric by 2040 (July 6, 2021).

While EPA points to a handful of manufacturer statements (and there are many more) on near term electrification plans,74 the agency did not account for the California's Advance Clean Truck (ACT) regulation and the adoption of forward-looking heavy-duty electrification policies in numerous other states.75 As EPA develops its final rule, the agency's analysis of the levels of fleet electrification and its baseline for addressing NOx emissions must take these programs into account.76 In doing so, the agency has the basis for finalizing more ambitious and protective standards than those proposed in Option 1. [EPA-HQ-OAR-2019-0055-1219-A1, pp.9-10]

74 See HDT Truckinginfo, DTNA's O'Leary on Fast-Changing Trucking Technology (Mar. 9, 2022)(Daimler North American Truck ambition is to produce 'exclusively CO2-neutral products in the U.S. by 2039' starting with the medium-duty battery electric eM2 in 2022 and the eCascadia early 2023); Inside EVs, GM to Launch All-Electric Heavy-Duty Trucks In 2035 Instead of 2040 (Jan. 10, 2022); Fleet Owner, Volvo details electric truck strategy (Oct. 13, 2021) (wants 50% of its truck sales to be electric vehicles by 2030—and 100% by 2040); See also, Iveco, Electric; MAN, Battery-electric trucks are our future (Nov. 11, 2021); Electrek, Kenworth says electric truck orders have tripled the past three months, quoting customers in 44 states (Jan.14, 2022); Navistar, Battery Electric Vehicles; Scania, Scania's commitment to battery electric vehicles (Jan. 19, 2021); See generally, Green Car Congress – Heavy Duty (highlighting many recent announcements); HDT Truckinginfo, Volta Trucks to Enter U.S. Market with Electric Class 7 (May 6, 2022); HDT Truckinginfo, Xos Unveils Two New Commercial Electric Trucks (May 10, 2022).

75 87 Fed. Reg. at 17581.

76 Id.

In addition to the marketplace announcements, regulatory environment, and federal fleet adoption driving significant electrification, cost-related issues will ensure that electrification of the heavy-duty sector occurs rapidly. To that end, EPA's proposed rule points to one 2017 report suggesting that battery costs may be a barrier to heavy duty fleet adoption.97 Further, the agency assumes costs for the Phase 2 GHG regulations still hold that per vehicle cost for BEVs represent approximately a 12% increase in tractor costs.98 Contrary to this assertion, as one analysis sums up, 'Electrification is also making inroads into heavier vehicles. In urban duty cycles, battery electric trucks of any size become the cheapest option for several use cases in the 2020s.'99 Similarly, other studies find that when considering upfront purchase price alone, by 2027 electric freight trucks and buses will be less expensive than their combustion engine counterparts in almost all categories.100 [EPA-HQ-OAR-2019-0055-1219-A1, p.12]

97 87 Fed. Reg. at 17596.

98 87 Fed. Reg. at 17602.

99 BNEF, Electric Vehicle Outlook 2021,

100 EDF, New Study Finds Rapidly Declining Costs for Zero-Emitting Freight Trucks and Buses (Feb. 10, 2022).

In assessing the pace of electrification, the agency should consider the documented and projected rapid decline in battery cell and pack costs. As DOE has recently documented, the energy density of lithium-ion batteries Increased by more than eight times between 2008 and 2020 allowing for BEVs to travel the same distance with a smaller battery pack, thus saving space, weight, and manufacturing costs.101 [EPA-HQ-OAR-2019-0055-1219-A1, p.12]

101 DOE VTO, FOTW #1234, April 18, 2022: Volumetric Energy Density of Lithium-ion Batteries Increased by More than Eight Times Between 2008 and 2020 (Apr. 18, 2022).

To the extent reductions seen in the light duty sector, the similarity in battery chemistries will carry over to the medium and heavy-duty sectors. For example, UBS reports that leading manufacturers are estimated to reach battery pack costs as low as $67/kWh between 2022 and 2024.102 Recently, others have also projected costs significantly lower than EPA's past projections. BNEF's recent estimate is that pack prices go below $100/kWh on a volume-weighted average basis by 2024, hit $58/kWH in 2030,103 and could achieve a volume-weighted average price of $45/kWh in 2035.104 The National Academies of Sciences found high-volume battery pack production would be at costs of $65-80/kWh by 2030105 and DNV-GL has predicted costs declining to $80/kWh in 2025.106 The IPCC recently concluded similarly.107 Reductions in battery costs are projected to lead to cost parity in many vehicle segments by 2025.108 Continued and expansive R&D in this sector can be expected to further drive down costs.109 Consistent with these declines, other key subsystems of BEV technology will continue see cost reductions as manufacturers scale production.110 [EPA-HQ-OAR-2019-0055-1219-A1, pp.12-13]

107 IPCC, AR 6, Working Group III, Climate Change 2022: Mitigation of Climate Change (date) at 10-32 (For example, according to IEA, battery pack costs could be as low as 80 USD per kWh by 2030 (IEA 2019a). In addition, there are clear trends that now vehicle manufacturers are offering vehicles with bigger batteries, greater driving ranges, higher top speeds, faster acceleration, and all size categories (Nykvist et al. 2019). In 2020 there were over 600,000 11 battery-electric buses and over 31,000 battery-electric trucks operating globally (IEA 2021a).)

108 MJ Bradley, Medium- & Heavy-Duty Vehicles: Market Structure, Environmental Impact, and EV Readiness (Aug. 11, 2022) at 7. (EVs in most market segments have the potential to achieve life-cycle cost parity with internal combustion engine vehicles by model year 2025 or earlier if M/HD battery costs follow a similar trajectory as battery costs for light-duty EVs).

109 See generally, Energy & Environment Sciences, Determinants of lithium-ion battery technology cost decline (Jan. 3, 2022).

110 See generally, ICCT, A Meta-Study of Purchase Costs for Zero-Emission Trucks (Feb. 17, 2022) (Finding, inter alia, by 2030 key subsystems can achieve up to 40% to 60% cost reduction driven by technology and manufacturing scalability).

Indeed, a recent LBNL study found that recent reductions in battery prices and improvement in energy density have made long haul electric trucking viable in the near term.111 More directly, the study concluded: ‘At the current global average battery pack price of $135 per kilowatt-hour (kWh) (realizable when procured at scale), a Class 8 electric truck with 375-mile range and operated 300 miles per day when compared to a diesel truck offers about 13% lower total cost of ownership (TCO) per mile, about 3-year payback and net present savings of about US $200,000 over a 15-year lifetime. This is achieved with only a 3% reduction in payload capacity.’112 [EPA-HQ-OAR-2019-0055-1219-A1, p.13]

111 LBNL, Why Regional and Long-Haul Trucks are Primed for Electrification Now (Mar. 15, 2021).

112 Id.

Further numerous studies have found that heavy duty BEVs outperform conventional trucks on a total cost of ownership basis.113 Tesla projects that its Semi will have energy costs that are half those of diesel, provide over $200,000 in fuel savings, and have a two-year payback period.114 Another manufacturer has found that BEVs could save fleets up to 80% on energy costs and 60% on repair.115 Yet another found that the benefits of electrifying heavy-duty truck fleets are significant with recent studies showing that operating costs for electric trucks can be between 14 and 52 percent lower and repair costs around 40 percent lower than their combustion-powered counterparts.116 CARB has found that battery-electric vehicles appear cost competitive with the established combustion technologies by 2025 in many use cases.117 Real world demonstrations have also proven this out.118 [EPA-HQ-OAR-2019-0055-1219-A1, p.13]

113 See e.g., UC Berkley, 2035 Report: Transportation: Plummeting Costs and Dramatic Improvements in Batteries Can Accelerate Our Clean Transportation Future (April 2021) at 15 (finding BEV heavy-duty trucks already hold a TCO advantage today and, for heavy-duty trucks, an EV advantage of $0.05/mi in 2020 that increases to $0.22/mi in 2030—magnified by the large number of miles traveled by this class of vehicles. In absolute terms, in 2020 this translates to a $42,800 TCO advantage of electric heavy-duty trucks, which increases to $200,000 in 2030. The TCO advantage of EVs continues to grow through 2050).

114 See Tesla, Semi.

118 North American Council for Freight Efficiency, Electric Trucks Have Arrived: Documenting A Real-World Electric Trucking Demonstration (Feb. 2, 2022).

In short, BEVs will offer the best compliance technology near term and dramatically decreasing costs battery costs further support that BEV deployment support a much more stringent final rule. [EPA-HQ-OAR-2019-0055-1219-A1, p.13]

Finally, the agency should be prepared to consider the role new state and federal incentives may play in deployment of heavy-duty electric vehicles. Federally, numerous heavy duty electrification grants, demonstration programs, incentives, and infrastructure incentives were included in the Infrastructure Investment and Jobs Act of 2021.119 Moreover, Congress is actively considering significant (up to 30%) purchasing incentives for heavy-duty ZEV vehicles.120 If adopted, such an incentive could also substantially increase the cadence of electrification in the trucking sector. For example, Rhodium has modeled that by 2030, a modest 10% investment tax credit for medium- and heavy-duty BEVs and an excise tax exemption for such vehicles would drive BEVs to or below TCO parity with conventional vehicles in some smaller vehicle classes and reduce the gap in others.121 [EPA-HQ-OAR-2019-0055-1219-A1, p.14]

119See, DOE, Alternative Fuel Data Center, Bipartisan Infrastructure Law (Infrastructure Investment and Jobs Act of 2021).

120 See e.g., S.1791 (117th Cong.), Fueling America's Security and Transportation with Electricity Act of 2021 (expands the tax credit for plug-in electric drive motor vehicles to include a 30% credit for additional electric transportation options capable of moving

passengers, cargo, or property and powered by an integrated, on-board electric propulsion system.); H.R. 848 (117th Cong.), Growing Renewable Energy and Efficiency Now Act of 2021, at 403.

121 Rhodium, Pathways to Build Back Better: Investing in Transportation Decarbonization (May 13, 2021).

EPA should also recognize that state incentives will create additional uptake of BEVs in the medium- and heavy-duty sector. These incentives already exist in California122, Colorado123, Connecticut124, Massachusetts125, New York126, Utah127, and Washington.128 [EPA-HQ-OAR-2019-0055-1219-A1, p.14]

122 California, HVIP, Carl Moyer, LCFS, and additional CARB programs not listed.

126 New York, New York Truck Voucher Incentive Program; New York City Clean Truck Program.

127 Utah, Utah Code 59-7-618.1. Tax credit related to alternative fuel heavy duty vehicles.

128 Washington, Clean Alternative Commercial Vehicle and Infrastructure Tax Credit..

Accordingly, as supported by this growing raft of data, Tesla recommends that the agency's final rule do a far better job of recognizing the expected pace and deployment of BEVs and finalize a standard that maximizes and accelerates this transition. [EPA-HQ-OAR-2019-0055-1219-A1, p.14]

Organization: *WE ACT for Environmental Justice*

The greenhouse gas segment of the rule does not reflect the urgency of the climate crisis and the disproportionate impacts it has on environmental justice communities. Moreover, it underestimates advancements in electric truck and bus technology and state policies that are already accelerating zero-emission vehicles. In particular, the California's Advanced Clean Truck (ACT) rule,21 which has been adopted by 6 other states22, including most recently Connecticut,23 and has additional states such as Maine and Maryland24 on a clear pathway to adopting the ambitious rule. This would achieve at least 50% percent of zero-emission sales in the U.S. by 2030, putting us on a pathway to 100% zero-emission medium- and heavy-duty truck sales by 2035. [EPA-HQ-OAR-2019-0055-1347-A1, pp.3-4]

21 https://ww2.arb.ca.gov/our-work/programs/advanced-clean-trucks

23 https://www.ctpublic.org/news/2022-05-03/connecticut-clean-air-bill-will-adopt-stricter-standards-for-certain-trucks-and-buses

24 https://www.electrictrucksnow.com/states

The EPA should utilize its authority and seize the opportunity to **strengthen and increase the stringency of the greenhouse gas standard** and spur the rapid transition to medium- and heavy-duty vehicle electrification. An analysis by ICCT shows that EPA can do so by setting minimum zero-emission production requirements for model years 2027 through 2029, utilizing an approach that would ensure the transition occurs across all vehicle segments while also prioritizing categories, such as transit and school buses that operate in areas of non-attainment and environmental justice communities (See Table 1 [footnote 27 is listed in Table 1 too). This would minimize greenhouse gasses in addition to bringing significant emissions reductions and health benefits to vulnerable children and low-income communities of color overburdened by harmful truck pollution. [EPA-HQ-OAR-2019-0055-1347-A1, p.4]

27 https://theicct.org/wp-content/uploads/2022/02/HDV-US-adapting-vehicle-emission-stds-zero-emission-commercial-truck-bus-fleet-feb22.pdf

We appreciate that the EPA has sought to revisit and tighten the Phase 2 greenhouse gas standard for model year 2027 for several subsectors, including school and transit buses, delivery trucks and short-haul tractors. However, as it stands, the proposed rule would only yield 1.5% zero-emission sales by 2027 and these market segments are already relatively mature and are expected to rapidly grow.25,26 The ACT rule would have delivered three times the zero-emission vehicles that this proposal calls for nationally by 2027. [EPA-HQ-OAR-2019-0055-1347-A1, p.4]

25 https://rmi.org/insight/high-potential-regions-for-electric-truck-deployments/

26https://www.mjbradley.com/sites/default/files/EDFMHDVEVFeasibilityReport22jul21.pdf

Organization: *World Resources Institute (WRI)*

Rapid advances in zero-emissions technology for medium- and heavy-duty vehicles have led to an array of commercially available makes and models, including for electric school buses and transit buses. This means that transforming these fleets through electrification is both possible and practical. In fact, electric school and transit buses in operation today could already meet the strongest standards proposed. Momentum on electrification has been building across these sectors, and billions of federal investment dollars soon to be available through a successfully implemented Bipartisan Infrastructure Law will further accelerate the pace. [EPA-HQ-OAR-2019-0055-1298-A1, p.2]

Adoption of electric school buses has grown considerably since the first generation of these vehicles were first deployed in 2014. While electric school buses were once limited to a handful of pilot programs, WRI’s analysis and dataset indicate that as of April 2022 more than 300 school districts around the country have been awarded, ordered or are committed to nearly 12,000 electric school buses (this total includes newly manufactured as well as repowered buses). According to this same dataset, nearly 600 buses have already been delivered or are in operation around the country today. Responding to this increased demand, manufacturers now offer more than 20 models of electric school buses, including newly manufactured and repowered options, with more expected to enter the market in the near future (to be detailed in WRI’s forthcoming U.S. electric school bus market report). The performance and reliability of these buses are also continuing to improve, as each generation of buses is more advanced than the previous. Many manufacturers are on their second or third iteration, some even further along, and the newest models have battery ranges that can serve more than 90% of school bus routes in the U.S. [EPA-HQ-OAR-2019-0055-1298-A1, pp.2-3]

Increased federal support is helping accelerate school bus electrification: funding from the American Rescue Plan awarded nearly $7 million and 23 buses to schools around the country, and $5 billion in funding from the Bipartisan Infrastructure Law will be awarded to school districts through the forthcoming Clean School Bus Program. These successes at the federal level are helping to drive positive outcomes in many states, as well. For example, New York State’s recent mandate requires all new school buses to be zero-emission by 2027 (with limited exemptions until 2029) and will provide up to $500 million to facilitate this transition through a bond act to be considered by voters later this year. At close to 50,000 vehicles, New York’s fleet is the largest of any state and represents more than 10 percent of the US school bus fleet. Adding to past investments, Governor Newsom’s budget proposal, currently being considered by the California state legislature, would allocate $1.5 billion in one-time funding available over three years to support school transportation programs with a focus on greening school bus fleets. In Colorado, the legislature has approved the allocation of $65 million to fund electric school buses across the state. [EPA-HQ-OAR-2019-0055-1298-A1, p.3]

We expect high rates of electric school bus penetration by the end of the decade. Blue Bird has seen 'unprecedented' interest in ESBs, causing a backlog of over 380 bus orders. In 2021, Navistar/IC Bus stated that they believe 30-50% of new school bus purchases will be electric by 2030. Moreover, market experts anticipate that electric buses will achieve cost parity with diesels on a lifetime total cost of ownership basis by the middle to end of this decade. [EPA-HQ-OAR-2019-0055-1298-A1, p.3]

School bus fleets aren’t the only ones transitioning to electric: as transit operators take advantage of zero-emission technology advances and available funding sources, electric transit buses continue to increase in cities and municipalities around the country as well. In the United States, more than 3,500 electric transit buses are currently in operation, representing 24% growth since the 2020 count. With up to $10 billion from the Bipartisan Infrastructure Law being made available to states and transit agencies to replace, rehabilitate, and purchase cleaner and or electric buses and related equipment and to construct bus-related facilities, the number of electric transit buses may increase rapidly. [EPA-HQ-OAR-2019-0055-1298-A1, p.3]

In short, the market is already moving; the regulatory framework should reflect and accelerate, not hinder, this progress. [EPA-HQ-OAR-2019-0055-1298-A1, p.3]

A further consideration for setting the strongest possible rule for medium- and heavy-duty vehicles is to encourage investments in electric vehicle manufacturing and charging infrastructure, creating jobs and building a more resilient and cleaner economy. Recent electric school bus investment announcements in Illinois, West Virginia, Ohio, Colorado, and the Carolinas will result in increased production capacity of electric school buses specifically, joining states like California, Michigan, and New York which are already home to a wide range of medium- and heavy-duty electric vehicle manufacturing facilities. [EPA-HQ-OAR-2019-0055-1298-A1, p.3]

Organization: *Zero Emission Transportation Association (ZETA)*

There are profound benefits to advancing heavy-duty electric vehicles (HDEVs), which EPA defines as electric vehicles in Classes 2b–8. With an average lifespan of 33 years, most heavy-duty vehicles (HDVs) spend more time and miles on the road before retirement than light-duty vehicles.2 As a result, failing to electrify these HDVs now means that fossil fuel-powered HDVs rolling off the assembly line during this rulemaking will remain on the road well beyond 2050, adding hundreds of thousands of vehicle miles and associated deadly emissions over the coming decades. [EPA-HQ-OAR-2019-0055-1283-A1, p.2]

> 2 https://energyoffice.colorado.gov/press-releases/polis-administration-releases-new-colorado-medium-and-heavy-duty-vehicle-study

Electrifying this vehicle segment represents a prime and outsized opportunity to improve public health, minimize GHG emissions, and reduce the country’s fossil fuel reliance and net energy consumption. As ZETA detailed in our white paper, 'Medium- and Heavy-Duty Electrification: Weighing the Opportunities and Barriers to Zero-Emission Fleets,'3 HDVs comprise a mere 4% of vehicles on the road, yet they disproportionately contribute to U.S. fuel consumption and resulting air pollution and climate repercussions. Buses and freight trucks alone represent 10% of all vehicle miles traveled (VMT), but they are responsible for 22% of all fuel used.4 Likewise, HDVs produce 24.4% of all emissions across the transportation sector, making them the single largest contributors to U.S. emissions of particulate matter (PM2.5), NOx, volatile organic compounds (VOC), and carbon dioxide (CO2). All of these elements are linked to long-term respiratory, cognitive, and autoimmune impairment, and HDVs’ emissions are getting worse: between 1990 and 2019, GHG emissions from heavy-duty trucks and buses grew by 93% and 162%, respectively.5 [EPA-HQ-OAR-2019-0055-1283-A1, p.2]

>
> 5 https://www.epa.gov/greenvehicles/ archives-fast-facts-us-transportation-sector-greenhouse-gas-emissions

In its own analysis, EPA also found that HDEVs will own a 1.5% market share by 2027, which is based on a ‘business-as-usual’ scenario rather than one in which regulations and incentives push the market further towards zero-emission technologies. Using publicly available information on available HDEVs, ZETA believes that assuming business-as-usual causes a severe underestimate in adoption. Based on cutting-edge market research, our member companies’ public announcements, and other regulatory regimes, we assess that HDEV market penetration will greatly exceed 1.5%. In our fleet electrification white paper, we found that HDEVs will bring substantial economic advantages to fleet operators through total cost of ownership savings,17 in addition to HDEVs’ environmental and public health benefits.18 Batteries are the most expensive component in HDEVs, but their prices are dropping. Battery prices have already dropped 89% in real terms from $1,200 per kilowatt-hour in 2010 to $132 per kilowatt-hour in 2021.19 A continued decline in battery costs would help further reduce HDEV purchase costs in the coming years. The evidence suggests that the lower TCO of HDEVs is driving fleet electrification, and it stands to reason that further HDEV price drops will accelerate electrification. In a survey of fleet managers conducted by the Department of Energy’s National Renewable Energy Laboratory (NREL), 64% cited lower TCO as a motivation for electrifying their fleets.20 For this reason and others, NREL predicts that 42% of all MHDV sales will be MHDEV models by 2030.21 [EPA-HQ-OAR-2019-0055-1283-A1, pp.3-4]

17 https://fs.hubspotusercontent00.net/hubfs/8829857/ZETA-WP-MHDV-Electrification_Opportunities-and-Barriers_Final3.pdf

20 https://www.aceee.org/sites/default/files/pdfs/t2102. pdf

21 https://www.nrel.gov/docs/fy22osti/82081.pdf

Likewise, a CALSTART report, ‘Zeroing in on Zero-Emission Trucks,’ assesses that HDEV sales will skyrocket in the next few years.22 According to the report, while only 20 HDEV models were on the market in 2019, 145 models are now available as of December 2021, and more models are being announced and entering production each year, as highlighted in Figure 1. CALSTART also notes that the more than 1,200 HDEVs deployed as of December 2021 are merely the beginning of a large wave of HDEV deployments: active orders show that 146,102 HDEVs will be deployed in the next few years. The diversification of HDEV models goes to show that manufacturers are recognizing and responding to market demands and that electrification is financially possible in a broad variety of HDV applications, rather than just in the ‘easy-to-electrify’ applications of just a few years ago. [EPA-HQ-OAR-2019-0055-1283-A1, p.4]

22 https://calstart.org/wp-content/uploads/2022/02/ZIO-ZETs-Report_Updated-Final-II.pdf

It is worth noting that fears about range anxiety are outsized. The average HDV travels approximately 101 miles per day;23 long-haul trucks generally have the longest routes of all HDVs, maxing out at 600 miles per day and often averaging closer to 300 miles per day, as noted in Figure 2. Considering that many HDEVs today have similar ranges, the electric models currently available can meet up to 60% of the HDV sectors' needs.24 HDEVs capable of traveling greater than the average distance of long-haul trucks are expected by the end of 2022, and HDEVs with ranges exceeding 620 miles are expected after 2023.25 [EPA-HQ-OAR-2019-0055-1283-A1, pp.4-5]

23 https://
www.edf.org/sites/default/files/documents/EDFMHDVEVFeasibilityReport22jul21.pdf

24 Ibid

25 https://calstart.org/wpcontent/uploads/2021/05/How-Zero-Emission-Heavy-Duty-Trucks-Can-Be-Part-of-theClimate-Solution.pdf

This exponential growth of the HDEV market is occurring before the timeframe in which EPA's proposed standards are finalized. CALSTART's research shows that HDEVs will achieve price parity with traditional fossil fuel-powered HDVs. In California, even in the absence of state subsidies, HDEVs will be cheaper to own and operate than fossil fuel-powered HDVs by 2030. [EPA-HQ-OAR-2019-0055-1283-A1, p.5]

That corroborates research from NREL, which found that HDEVs will be cheaper to purchase, operate, and maintain than fossil fuel-powered HDVs by 2035.26 50% of HDEVs will be cheaper by 2030—within the timeframe of EPA's rulemaking. Continuing improvements to ZEV technologies will allow HDEVs to become even cheaper and more accessible over the next decade.27 [EPA-HQ-OAR-2019-0055-1283-A1, p.5]

26
https://www.google.com/url?q=https://www.nrel.gov/docs/fy22osti/82081.pdf&sa=D&source=docs&ust=1651682526583368&usg=AOvVaw2fO_IyMdhtnFT-l4P6iJeD

27 https://www.energy.gov/articles/doe-projects-zero-emissions-medium-and-heavy-duty-electric-trucks-will-be-cheaper-diesel#:~:text=WASHINGTON%2C%20D.C.%20%E2%80%94%20The%20U.S.%20Department,diesel%2Dpowered%20combustion%20engine%20vehicles

Additionally, EPA's assessment is at odds with current fleet electrification announcements, including the projections of ZETA member companies. While these companies will submit confidential business information in their own comments, even from publicly available information, it is clear that HDEVs will surpass a 1.5% market share by 2027. [EPA-HQ-OAR-2019-0055-1283-A1, p.5]

ZETA member companies like Arrival, GreenPower Motor Company, Lion Electric, Proterra, and Tesla are all working to manufacture sufficient HDEVs to meet demand. These companies are capable of producing tens of thousands of HDEVs annually. These production capacities are proven in part by these companies' investments in new manufacturing plants like Tesla's Gigafactory in Texas, Rivian's plant in Georgia, Lion Electric's plant in Illinois, Proterra's heavy-duty battery manufacturing facility in California and South Carolina, and GreenPower Motor Company's plant in West Virginia. [EPA-HQ-OAR-2019-0055-1283-A1, p.6]

While some of these companies are just initiating production, their pending orders from customers help illustrate what the HDEV market landscape will look like in the next few years. ZETA member company Rivian's partnership with Amazon is a noteworthy example: Amazon plans to purchase 100,000 Rivian delivery vehicles produced in Rivian's manufacturing plant in Normal, Illinois.28 In addition to reducing Amazon's GHG emissions by 4 million metric tons per year by 2030, Amazon expects that these electric vehicles' fuel savings will significantly cut down the company's last-mile delivery costs. Below, you will find several examples of ZETA member companies developing, manufacturing, and delivering HDEVs across the country: [EPA-HQ-OAR-2019-0055-1283-A1, p.6]

28 https://www.forbes.com/sites/alanohnsman/2019/09/19/amazons-multibillion-dollar-bet-on-electric-delivery-vans-is-game-changer-for-startup-rivian/?sh=da6f73ed0138

- Arrival will provide up to 10,000 delivery vehicles to UPS, which includes the Large Van and XL Van. UPS also has the option to purchase up to 10,000 more delivery vehicles from Arrival. UPS is one of the world's largest fleet operators, with 125,000 delivery vehicles around the globe. 29 Arrival's delivery van is made of ultra-lightweight composite materials that reduce the vehicle's weight, contribute to lower fueling and maintenance costs, and can significantly lower the total cost of ownership when compared to internal combustion engine vehicles. In addition, UPS now drives more than 1 million miles each business day using alternative fuel vehicles, which has saved more than 60 million gallons of conventional fossil fuels since 2000. [EPA-HQ-OAR-2019-0055-1283-A1, p.6]

29 https://electrek.co/2020/01/30/ups-orders-10000-electric-delivery-vans-arrival/

- GreenPower Motor Company developed the 'battery electric automotive school transportation,' vehicle or the BEAST. The BEAST's 194-kWh battery provides a range of up to 150 miles. The vehicle is also equipped with a Thermal Management System and anticorrosive E-coating, which can operate in the harshest climates, and has a turning radius of 37.7 +/- 1.6 ft—the best out of all school bus types in the industry. [EPA-HQ-OAR-2019-0055-1283-A1, p.6]
- Lion Electric will be providing electric school buses to school districts across the country, and more than 600 are already operating throughout North America.30 Lion Electric has seven purpose-built electric models with their own chassis, bus body and truck cabin, and proprietary battery system technology. It has five new models coming out by the end of this year. [EPA-HQ-OAR-2019-0055-1283-A1, p.6]

30 https://www.prnewswire.com/news-releases/lion-electric-celebrates-10-million-miles-driven-at-act-expo-301542386.html

- Proterra's electric transit buses offer the longest drive range of any 40-foot electric bus on the market at 329 miles per charge. Proterra's offerings include transit buses, as well as technology powering school buses, delivery trucks, port equipment, construction equipment and shuttles. As a result, transit agencies across the U.S. and Canada have purchased over 850 Proterra vehicles that have driven more than 25 million miles in heavy-duty applications.31 Recently, Proterra also announced a multi-year agreement partnership with Nikola Corporation to power Nikola's Class 8 semi-trucks with Proterra's battery systems. [EPA-HQ-OAR-2019-0055-1283-A1, pp.6-7]

  31 https://www.proterra.com/about/

- Tesla will begin delivering its 'Semi' short-haul truck within the time frame of the rule, which will transform the surface shipping industry. The Semi is projected to offer a 300-mile and 500-mile range version. By lowering operating costs on high-mileage vehicles, these Semis will deliver cost savings to their fleet operators and significantly reduce pollution along interstate shipping corridors. [EPA-HQ-OAR-2019-0055-1283-A1, p.7]

A variety of other companies outside of ZETA's membership are also electrifying their HDV fleets, and a host of companies are partnering with local governments to electrify their fleets:

- FedEx is electrifying its fleet of 87,000 vehicles. It plans to buy only EVs after 2025, and its fleet will be 100% electric by 2040. FedEx says an electric fleet will cut maintenance costs in half.32 Fedex's BrightDrop models will decrease the cost of fueling by 75% compared to a fossil fuel-powered truck.33

  32 https://www.fleetequipmentmag.com/fed-ex-largest-electric-truck-purchase-zero-emission/.

  33 https://www.cnbc.com/2021/12/17/fedex-gets-first-of-500-electric-trucks-from-gms-ev-unit-in-move-to-green-logistics.html

- Walmart also plans to buy 5,000 electric vans from BrightDrop, which are expected in 2023.34 Similar to FedEx, Walmart's BrightDrop vehicles will save dramatically on operating costs.

  34 https://media.gm.com/media/us/en/gm/home.detail.html/content/Pages/news/us/en/2022/jan/ces/0105-brightdrop.html

- DHL has already electrified 20% of its fleet, and it plans to decarbonize 70% of its first- and last-mile delivery services by 2025.35

  35 https://www.dhl.com/discover/en-global/business/business-ethics/future-of-electric-vehicles

- IKEA is also electrifying all of its customer deliveries in thirty markets by 2025, and 25% of its deliveries are already electric today. IKEA believes electrifying its delivery fleet will create a competitive advantage and generate cost savings.36

  36 https://evreporter.com/gati-and-ikea/

- Finally, EV100 brings together 121 companies around the world that have committed to electrifying their fleets. By 2030, EV100's members will have electrified 5.5 million vehicles, avoiding nearly 86 million metric tons of pollution.37 In its annual report, EV100 stated that 'The business case for a transition to EVs is now stronger than ever, and the associated running costs are considerably lower than traditional internal combustion engine vehicles.' [EPA-HQ-OAR-2019-0055-1283-A1, p.7]

  37 https://www.theclimategroup.org/ev100-publications

Finally, EPA's assessment that HDEVs will achieve 1.5% market penetration by 2027 also ignores the regulatory impacts of the Advanced Clean Trucks (ACT) rule on technology advancement and adoption, which will require a 40–75% HDEV market penetration by 2035.38 17 states and the District of Columbia have signed a Joint Memorandum of Understanding that pledges to achieve a 30% HDEV market penetration by 2030 in each state, scaling toward a 100% HDEV market penetration by 2050.39 Five of these MOU states (in addition to the ACT rule's home state of California) have also adopted the ACT rule, and many more of the MOU states are expected to enact the ACT rule in the next few years.40 These MOU states represent 34% of all national HDV sales; if they all enacted the ACT rule, approximately 756,000 HDEVs would be deployed between 2024 and 2035.41 That number corresponds to more than 6% of all HDVs currently driving on America's roads, with a far higher market penetration.42 [EPA-HQ-OAR-2019-0055-1283-A1, pp.7-8]

38 https://calstart.org/wp-content/uploads/2022/02/ZIO-ZETs-Report_Updated-Final-II.pdf

40 https://calstart.org/wp-content/uploads/2022/02/ZIO-ZETs-Report_Updated-Final-II.pdf

41 Ibid

42 https://fs.hubspotusercontent00.net/hubfs/8829857/ZETA-WP-MHDV-Electrification_Opportunities-and-Barriers_Final3.pdf

EPA's assessment similarly underestimates the impact of President Biden's executive order.43 If the HDEV market penetration is 1.5% in 2027, then the United States will drastically undershoot President Biden's transportation electrification goal. And we have already seen the introductory impacts of President Biden's executive order on electrifying the federal fleet. The General

Services Administration (GSA) is increasingly electrifying its fleet, the Department of Defense (DOD) is working to electrify some of its non-tactical vehicles, and the U.S. Postal Service (USPS) just ordered 10,019 electric delivery vehicles. These government HDEV investments will help build economies of scale for HDEV manufacturing to drive down their purchase prices, and will send clear market signals that will facilitate greater HDEV uptake in the private market. [EPA-HQ-OAR-2019-0055-1283-A1, p.8]

> 43 https://www.whitehouse.gov/briefing-room/presidential-actions/2021/08/05/executive-order-on-strengthening-american-leadership-in-clean-cars-and-trucks/

Based on market research, ZETA member companies' publicly available projections, and the current regulatory landscape, it is evident that HDEVs will achieve a much higher market share in 2027 than just 1.5%. For that reason, EPA should reconsider its analysis and enact more stringent NOx and GHG standards for the MY2027–30 period than it has proposed in Option 1. [EPA-HQ-OAR-2019-0055-1283-A1, p.8]

ZETA and our member companies stand ready to facilitate the transition to a fully electrified heavy-duty vehicle market. The HDEV market is primed to accelerate in the coming years—hundreds of thousands of vehicles have been ordered, the diversity of models available is growing exponentially, and battery prices are falling rapidly. Regulatory certainty will ensure that manufacturers continue to invest in HDEVs, which deliver marked environmental and public health benefits in addition to their reduced cost of operation and, in many cases, ownership. EPA should provide this regulatory certainty by adopting Option 1 at a minimum to reduce NOx emissions from HDVs, and EPA should increase the stringency of the MY2027–2030 GHG standards (including by eliminating the Phase 2 GHG standard's multipliers by MY2024). EPA should make this rule even more stringent than it has already proposed because it should consider the aforementioned expansion of the HDEV market and the other regulatory regimes already in place, including, most notably, the ACT rule. Issuing a stringent standard in this rulemaking will enable EPA to create strong—and environmentally and economically necessary—Phase 3 HDV rules in the coming years. [EPA-HQ-OAR-2019-0055-1283-A1, pp.9-10]

EPA Response

EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider the comments in this section of this document in the development of that future rulemaking.

28.1.2 Proposed Standards are too Stringent and/or Should not Reopen HD GHG Phase 2

<u>Comments by Organizations</u>

Organization: *Alliance for Vehicle Efficiency (AVE)*

AVE opposes technology mandates, including Zero Emission Vehicle (ZEV) mandates. [EPA-HQ-OAR-2019-0055-1280-A1, p. 4]

AVE consistently urges regulators develop technology neutral standards. Standards based on performance are more likely to encourage broader investments into innovative technologies. A ZEV mandate signals to manufacturers that there is little incentive to invest in new engine technologies to meet future standards. [EPA-HQ-OAR-2019-0055-1280-A1, p. 4]

Organization: *Allison Transmission, Inc. (Allison)*

In proposing targeted updates to the Phase 2 Heavy-Duty GHG program, EPA has requested comment on ZEV sales projections to inform the level of GHG reductions that should be considered for MY 2027 and later year vehicles.51 EPA has also requested comment on different approaches that might be used to scale down the Advanced Technology Credit multiplier program after MY 2024. [EPA-HQ-OAR-2019-0055-1231-A1, p.23]

51 87 Fed. Reg. at 17,599.

As a component supplier, EPA's GHG standards do not directly apply to Allison. However, we hear our OEM customers' concerns about the importance of regulatory certainty to product development and share similar concerns about the precedent and disruption that re-opening the GHG Phase 2 Rule, finalized in 2016, can have to the industry. The commercial vehicle industry benefits from advanced awareness of and certainty in regulations to guide research and development and integration projects, and this foundation is important for reliable deployment of emissions reducing technology.[EPA-HQ-OAR-2019-0055-1231-A1, p.23]

Allison appreciates EPA acknowledgement of the importance to maintain four years of lead time to meet standards and appreciates the challenge EPA faces in developing GHG fleet standards based on projections of ZEV sales at this point in history where this is plenty reason for optimism, as well as a great deal of uncertainty. In this regard, however, Allison would note that EPA's analysis showed that the percentage of battery electric vehicles ("BEVs") certified for MY 2019 was 0.06 percent of the total heavy-duty vehicle market. While EPA did not supply a similar percentage for sales in MY 2020, with only 380 BEVs certified in that year versus 350 BEVs in the year prior, it would be clear that such vehicles are still a very small part of the overall heavy-duty vehicle market. Elsewhere in the proposed rule, EPA cites additional information concerning pronouncements by vehicle manufacturers and fleet operators, additional studies and economic rationale (lower total cost of ownership) to support projecting increased BEV sales in future years.52 California's various ZEV mandates are also cited. [EPA-HQ-OAR-2019-0055-1231-A1, p.23]

52 87 Fed. Reg. 17,595-7.

Based on such information, EPA is proposing an increase in vehicle (not engine-based) CO_2 emission standards which do not directly correspond to the vehicle categories used in the Phase 2 rule, resulting in an adjustment to 17 of the 33 vehicle categories defined in EPA regulations. Based on several analytical steps, EPA estimated that approximately 1.5% of heavy-duty vehicles in MY 2027 would be electric, and since these would theoretically "net out" vehicles without technology that would otherwise reduce CO_2 emissions, an overall increase in stringency of for certain vehicle categories was calculated.[EPA-HQ-OAR-2019-0055-1231-A1, p.23]

Allison believes that the Agency should consider several factors in arriving at any final increase in the stringency of Phase 2 standards. First, EPA must recognize that its methodology is not a "ground up" analysis that is of the same empirical quality as that contained in other rulemakings. The nascent nature of the BEV market does not allow for such quantification and there remain a range of uncertainties that cannot be fully quantified. In such a case, EPA should err on the side of more conservative estimates of the level of BEV market penetration that will occur five years from now.[EPA-HQ-OAR-2019-0055-1231-A1, pp.23-24]

Allison supports OEM Vehicle GHG certification by providing components, software features, and efficiency data for OEMs to use in the GEM model. Thus, a concern we hold regarding an overly aggressive ZEV sales prediction is that, should the BEV market not develop in the manner that some of the more optimistic projections indicate, OEMs would be placed in the position of seeking non-ZEV alternatives to meet more aggressive emission requirements. This situation would inevitably "trickle down" to component suppliers, increasing the pressure to quickly develop alternative CO_2 reduction technology based on conventional engines/powertrains. Concurrent elimination of Advanced Technology Credit Multipliers would only compound the difficulties OEMs and suppliers would face if ZEV adoption rates do not materialize as quickly as projected. [EPA-HQ-OAR-2019-0055-1231-A1, p.24]

In the NPRM, EPA did not propose to establish a heavy-duty ZEV mandate. At the same time, the Agency recognized the important role that ZEVs may assume in the heavy-duty sector. EPA based both the revision of Phase 2 stringencies on presumed ZEV uptake in the market as well as accounted for ZEVs with regard to the control of heavy-duty criteria pollutants, e.g., through proposing to allow the generation of NO_x emission credits by ZEVs. Therefore, under all of EPA's proposed options and alternatives, ZEVs will assume a more important place in EPA's regulation of the heavy-duty sector. ZEVS will affect the stringency of GHG and criteria pollutant standards and become an element of compliance flexibility for OEMs and indirectly, component suppliers. [EPA-HQ-OAR-2019-0055-1231-A1, p.32]

As noted in the introduction to our comments, Allison has invested in and continues to develop several lines of products for the electrification of HDVs, including Allison's emerging eGen Power® series which will be compatible with full battery electric vehicles and fuel cell vehicles as well as hybrid applications. Allison is currently engaged with OEM vehicle development programs and is supporting integration activities around it's e-Axle systems. Additionally, Allison is investing in a range of other technologies and product architectures to support the nationwide shift to electrification. Our insight into numerous OEM programs helps ensure that our program timing and pace of investments are aligned with OEM and end user requirements. [EPA-HQ-OAR-2019-0055-1231-A1, p.32]

To date, as a component supplier, Allison has not been directly regulated by CARB ZEV mandates nor would Allison be directly regulated at the federal level. But clearly any rule that is promulgated may serve as a reference point or the foundation for additional rulemakings, particularly where such are contemplated pursuant to Executive Order 14037: Strengthening American Leadership in Clean Cars and Trucks. [EPA-HQ-OAR-2019-0055-1231-A1, p.32]

Depending on how the final rules are structured at the federal and state level, even if Allison is not mandated to produce or sell ZEVs, components for ZEVs, BEVs and HEVs that Allison produces for other manufacturers may be affected by testing, certification and durability requirements and its commercial relationships with other manufacturers may be implicated. This, in turn, produces questions with regard to both compliance and regulatory flexibility (e.g., credits) that may be generated or available. Commercial issues also arise with respect to funding necessary research and development as ZEV mandates and/or other regulatory requirements or incentives are implemented and inevitably revised over time. In general, Allison favors performance-based standards that do not dictate particular technological outcomes. Emission standards should not be de facto mandates for specific technologies; rather they should be designed in a manner and within a timeframe that different technological approaches to reducing emissions can be pursued. [EPA-HQ-OAR-2019-0055-1231-A1, p.32]

Allison, as a long-time leading manufacturer of hybrid vehicle systems and like many of our competitors, is moving into components that will allow for greater electrification of the vocational vehicle fleet. But development of these systems requires substantial investment and verification of their performance, including evaluation of their durability. This necessary process means that EPA should not project broad adoption of ZEV technology across the medium- and heavy-duty fleet. And, while the Proposed Rule does not mandate the sale of any ZEV vehicles, EPA should not impose stringencies and other regulatory requirements which would result in a de facto requirement for ZEV vehicles. The vocational vehicle sector responds to the demands of its customers and Allison and other vendors are working to meet anticipated demand for ZEV and other alternatively-fueled vehicles with favorable GHG performance. EPA should be wary of producing counter-productive results by favoring one technology (ZEV) over other potential health and environmental solutions.[EPA-HQ-OAR-2019-0055-1231-A1, pp.37-38]

Organization: *American Fuel & Petrochemical Manufacturers (AFPM)*

EPA sets a relatively modest penetration rate for BETs in this rule but is taking comments on higher target levels. Higher BET penetration rates will result in a significant environmental impact that must be fully considered. Processing commodities is an energy and environmentally intensive activity and results in emissions that the agency cannot ignore, as indicated by the chart from the IEA below.10 [EPA-HQ-OAR-2019-0055-1262-A1, p.3]

10 See IEA’s Critical Minerals Report, at 17.

Increased use of BETs also creates security concerns. China has a dominant position in the global supply chain for battery production as detailed in a recent report noting '[w]idespread commercialization of EVs will only make the United States more susceptible to China's threats.' 11 Motor vehicle electrification can make the United States beholden to China and other nations that control the minerals required to manufacture EV batteries, chips, and other components.12 [EPA-HQ-OAR-2019-0055-1262-A1, p.4]

11 See Securing America's Future Energy, The Commanding Heights of Global Transportation, at 46, https://secureenergy.org/wp-content/uploads/2020/09/The-Commanding-Heights-of-Global-Transportation.pdf, last visited May. 16, 2022.

12 See https://www.visualcapitalist.com/chinas-dominance-in-clean-energy-metals/, based on data from the International Energy Administration, Executive Summary, https://www.iea.org/reports/the-role-of-critical-minerals-in-clean-energy-transitions/executive-summary

EPA must not ignore increased battery degradation (and earlier disposal and replacement) associated with the 'fast-charging' that is most frequently utilized to minimize the hours of charging time that would otherwise be required to place a commercial truck in service.13 Studies have shown that fast-charging a battery causes lithium plating and dendrite formation around the anode, permanently reducing its capacity. At a pack level, it can cause cells to age at different rates and pack overheating.14 Further studies of light-duty vehicles reveal that vehicle hardware improvements to enable these increased fast-charging speeds could cost approximately $1,000, assuming no change in battery size.15 [EPA-HQ-OAR-2019-0055-1262-A1, pp.4-5]

13 See Fast-charging damages electric car batteries, Univ. Calif. Riverside News (March 11, 2020), https://news.ucr.edu/articles/2020/03/11/fast-charging-damages-electric-car-batteries, last visited, May16, 2022.

14 See The International Council on Clean Transportation, Lessons Learned on Early Electric Vehicle Fast-Charging Deployments, White Paper (July 2018), at 6, https://theicct.org/sites/default/files/publications/ZEV_fast_charging_white_paper_final.pdf.

15 Id.

EPA must fully quantify the costs associated with fast-charging, including the adjustments to battery replacement schedules, for heavy-duty vehicles and seek public comment on that analysis before finalizing this proposal. [EPA-HQ-OAR-2019-0055-1262-A1, p.5]

The trucking industry's driver shortage and its impact on supply chains and the price of consumer goods has made national news. The trucking industry cannot afford to idle drivers for long periods of recharging.16 Most medium- and heavy-duty vehicles take less than 10 minutes to fuel with petroleum-based liquid fuels, but even using a supercharging rate of 350 kW,17 a BET would take over an hour. If the operator avoids supercharging to avoid degrading the battery, charging would take even longer. Long charging times adversely impact trucking productivity. The Federal Motor Carrier Safety Administration's Hours of Service regulations limit a driver's time on-duty, and increased charging time reduces the amount of time that a driver can legally operate the vehicle.18 [EPA-HQ-OAR-2019-0055-1262-A1, p.5]

16 See, e.g., Truckers are getting big pay hikes, but there's still a shortage of drivers, CNN.com (May 29, 2021), https://www.cnn.com/2021/05/29/economy/truck-driver-shortage-pay-hikes/index.html.

17 See How Does Electric Vehicle (EV) Public Charging Work?, Electrify America, https://www.electrifyamerica.com/how-ev-charging-works/., last visited, May 16, 2022.

18 See 49 CFR Part 395.

EPA must account for and seek public comment on these real-world increased labor costs and the impact on the cost of consumer goods before finalizing this proposal. [EPA-HQ-OAR-2019-0055-1262-A1, p.5]

The installation of charging stations will also require significant investment in additional transformers, distribution circuits, conductors, substations, transmission lines, dependable generating capacity, and other necessary grid upgrades. These costs can be staggering and EPA must provide an analysis of the impacts of these electricity upgrades as truck electrification increases. As an example, for modest light-duty EV penetration, the city of Sacramento determined that approximately 12,000 transformers needed to be replaced at an average cost of $7,400 each. The total investment would almost total $90 million.19 [EPA-HQ-OAR-2019-0055-1262-A1, p.5]

19 See Smart Electric Power Alliance, Utilities and Electric Vehicles: The Case for Managed Charging, 13, available at http://emotorwerks.com/images/PR/Articles/sepa-managed-charging-ev-report.pdf. last visited, May 16, 2022.

These infrastructure costs will increase ratepayer's costs if the utilities seek to include these costs in their rate-base and, separately, will require businesses and government entities that rely on BETs to make massive investments in onsite power distribution grid upgrades and charging equipment. EPA must estimate these costs and seek public comment before finalizing this proposal. [EPA-HQ-OAR-2019-0055-1262-A1, p.5]

Similarly, battery-powered trucks and buses may be uncompetitive and impractical for weight-sensitive and many mid-range or long-haul routes.20 Weight limitations would require more BETs to move an equivalent amount of cargo (as the vehicles weigh-out). Moreover, increasing truck trips would only exacerbate existing congestion at the ports. [EPA-HQ-OAR-2019-0055-1262-A1, p.6]

20 California Air Resources Board, Public Hearing to Consider the Proposed Advanced Clean Trucks Regulation, Staff Report: Initial Statement of Reasons at I-9 (Oct. 22, 2019), https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/isor.pdf ('ZEVs may not be suitable for periodic towing of heavy loads which could be a problem for a vehicle with limited range capability.'), last visited, May 16, 2022.

Additionally, temperature significantly impacts battery performance and vehicle range. EPA should consider the significant and deleterious impacts that both hot and cold weather have on EV battery performance and associated charging requirements and emissions, as these issues would have a significant impact on the cost-benefit analysis supporting this proposal and a consumer's vehicle selection choice.21 [EPA-HQ-OAR-2019-0055-1262-A1, p.6]

21 See American Automobile Association (AAA), Electric Vehicle Range Testing at fig. 68 (Feb. 2019), https://www.aaa.com/AAA/common/AAR/files/AAA-Electric-Vehicle-Range-Testing-Report.pdf (Percent change in cost for 1000 miles of combined urban/highway driving relative to 75°F), last visited, May 16, 2022.

Medium-duty and heavy-duty electric trucks will increase tire wear and associated particulate matter emissions in the areas where they operate. EPA's analysis does not evaluate these emissions.22,23 [EPA-HQ-OAR-2019-0055-1262-A1, p.6]

> 22 See Jim Park, Equipment: What Will Electrification Mean for Truck Tires?, Trucking Info (Sept. 9, 2021), https://www.truckinginfo.com/10151115/what-will-electrification-mean-for-truck-tires ('Torque loads on drive tires will increase not only thanks to the higher output of electric motors compared to internal combustion engines, but also because regenerative braking will impart torsional forces on tires in the opposite direction. This will affect tire tread wear as well as sidewalls.'), last visited, May 16, 2022.
>
> 23 See International Council for Clean Transportation, Benefits of adopting California medium- and heavy-duty vehicle regulations in New York State at 6, Working Paper 2021-23 (May 2021), at 6, https://theicct.org/publications/nys-hdv-regulation-benefits-may2021 ('STI did not apply any adjustment to particulate matter tire-wear emissions.'), last visited, May 16, 2022.

EPA May Not Consider California's Advanced Clean Trucks Program

EPA relies on California's adoption of its Advanced Clean Trucks Program as evidence of a trend toward truck electrification and a substantial basis of EPA's proposal. However, these rules lack federal preemption approval39 and have not been implemented. EPA states 'these developments have demonstrated that further CO_2 emission reductions in the MY 2027 timeframe are feasible,' although no such demonstration has occurred because, again, the rules are yet to be implemented. EPA further states '[w]e also may incorporate the CARB Advanced Clean Truck (ACT) Regulation into our final rule analyses.' Footnote 90 in the Proposal states that 'EPA has received waiver requests under CAA section 209(b) from California for the Omnibus or ACT rules; EPA is currently reviewing the waiver requests for the CA Omnibus and ACT rules and may consider including these rules in our analyses for the final rule.' To do so, EPA must first satisfy its obligations under 209(b), which provides '[t]he Administrator shall, after notice and opportunity for public hearing, waive application of this section' if a list of conditions is met by the State. EPA cannot consider the implications of fully implemented California rules in its rulemaking until it approves California's waiver request and demonstrates it as 'feasible.' [EPA-HQ-OAR-2019-0055-1262-A1, p.10]

39 42 U.S.C. 7543(b)

Organization: *American Truck Dealers (ATD)*

New GHG Standards: ATD categorically opposes increases to the stringency of the Phase 2 HDE/CMV fuel economy/GHG standards applicable through MY 2027 as they would undermine the regulatory certainty that is critical to compliance. The technology-forcing Phase 2 standards resulted from a carefully coordinated joint rulemaking with the National Highway Traffic Safety Administration (NHTSA), which is primarily responsible for administering the Energy Policy and Conservation Act (EPCA), as amended by the Energy Independence and Security Act (EISA).5 Indeed, NADA suggests that it would be contrary to the intent of Congress for EPA to, on its own, revise the Phase 2 HDE/CMV fuel economy/GHG standards. Moreover, EPA's suggestion that the Phase 2 mandates should be tightened given potential HDE and CMV OEM ZEV product plans is an arbitrary and unjustified "no good deed goes unpunished" policy strategy. [EPA-HQ-OAR-2019-0055-1321-A1, p. 3]

5. Section 102 of EISA specifically mandated that NHTSA coordinate with EPA to establish fuel economy/GHG standards for medium- and heavy-duty trucks. 49 U.S.C. §32902(b)(1)(C).

In addition, while ATD does not oppose work by EPA on a new (Phase 3) fuel economy/GHG rulemaking for MYs 2030 and later, such rulemaking also must be conducted jointly with the NHTSA, consistent with the statutory authority spelled out in EPCA, as amended by EISA. [EPA-HQ-OAR-2019-0055-1321-A1, p. 3]

As discussed above, ATD urges EPA to move forward with a single set of technologically achievable and customer acceptable national HDE NOx standards for MY 2027 and later, while relegating any consideration of new HDE GHG mandates to a separate "Phase 3" rulemaking. [EPA-HQ-OAR-2019-0055-1321-A1, p. 8]

Organization: *American Trucking Associations (ATA)*

ATA has established 12 fleet Guiding Principles that should be considered in the development of HD2027 including:

• HD2027 should not serve as a mechanism to amend the Phase 2 rule that was finalized in 2016 and supported by industry stakeholders. [EPA-HQ-OAR-2019-0055-1326-A1, p. 5]

While ATA cannot address every aspect of HD2027, we are supportive of the underlying environmental objectives and several of the elements being proposed. ATA's areas of support include: Recognition that NOx reductions should align with both EPA's Phase 2 and Phase 3 greenhouse gas ("GHG") implementation milestones to afford manufacturers the necessary lead-time and ability to conduct thorough research and development to align competing regulatory objectives. [EPA-HQ-OAR-2019-0055-1326-A1, p. 3]

ATA does not support the reopening of the EPA 2016 Phase 2 rule. Reopening any final rule that was the culmination of years' worth of stakeholder discussions, input, data sharing, and negotiation is simply not good public policy. After having worked with EPA in good faith, changing a final rule mid-stream sets a bad precedent and upends the lead-time, planning, and resources necessary for manufacturers to design technologies for the future. [EPA-HQ-OAR-2019-0055-1326-A1, p. 18]

Testimony presented on Phase 2 by several stakeholders during the April 12-14 EPA public hearing encouraged the agency to not only tighten truck GHG standards in 2027, but also in years 2028 and 2029 as well. Testimony called for Phase 2 revisions to mandate zero-emission trucks. What became abundantly clear during the hearing was that none of the parties testifying in support of accelerated decarbonization efforts purchased or operated trucks nor did they run trucking companies. No testimony presented solutions as to how to pay for an accelerated "green transportation" transition. With the cost of new Class 8 electric trucks costing over $400,000 per vehicle, and fuel cell vehicles estimated to cost even more, trucking fleets simply cannot afford the up-front costs to buy new trucks that are 3-4 times more expensive than their clean diesel counterparts. [EPA-HQ-OAR-2019-0055-1326-A1, p. 18]

While it is understood that HD2027 was a convenient mechanism to modify requirements under a totally separate rulemaking, changes in circumstances not originally anticipated by the agency under Phase 2 should not warrant more stringent standards. From a purely equitable standpoint, the agency should also change the implementation of mobile source final rules that adversely impact fleet operations due to changes in circumstances as well – such as pandemics, labor and technician shortages, excessive inflationary rates, economic downturns, parts shortages, or technological inability to comply. In other words, good public policy necessitates the door swinging both ways. [EPA-HQ-OAR-2019-0055-1326-A1, p. 19]

President Biden's August 2021 Executive Order already requires the agency complete its Phase 3 rule by the summer of 2024. With initial discussions about to begin, there will be abundant opportunities for stakeholder input on further tightening truck GHG standards in 2030 and beyond. The trucking industry continues to support the pursuit of one nationwide zero-emission vehicle plan that is reasonable, logical, affordable, and the least-disruptive to not impede the nation's supply chains. [EPA-HQ-OAR-2019-0055-1326-A1, p. 19]

Organization: *Autocar, LLC (Autocar)*

In supporting the spirit of the Proposed Rule, Autocar proposes the following modifications:

1. Maintain emission standards for 2027 and beyond at current levels for small manufacturers, and provide credit opportunities for small manufacturers that are able to produce and sell trucks that meet the more stringent standards. [EPA-HQ-OAR-2019-0055-1292-A1, p. 1]

Autocar produces specialized heavy-duty vocational trucks and yard tractors used across the United States to collect and dump solid waste and recycling, sweep streets, mix and pump concrete and shunt freight at warehouses, railroads and ports. Autocar has been a leader in refuse truck industry adoption of environmentally-supportive vehicles and technologies. In recent years, at least 40% of Autocar's refuse trucks sold for use in the U.S. were built with compressed natural gas ("CNG") engines. Autocar has built and sold more than 8,000 CNG trucks. These trucks reach the country's most disadvantaged and polluted communities, and lead to lower daily emissions from mobile sources. CNG-fueled vehicles now comprise the largest portion of Autocar's refuse truck production. No other refuse truck maker's product mix reflects a higher concentration of clean-fuel burning vehicles. And while less viable in the marketplace, Autocar also produced and sold hybrid refuse vehicles, from which the Company gained additional experience in development of lower emission vehicles. [EPA-HQ-OAR-2019-0055-1292-A1, p. 2]

Over the last three years, Autocar accelerated and made great progress in its commitment to environmentally-supportive vehicles through development of an all-electric, zero-emission ("ZEV") yard tractor. The time line for bringing to market heavy-duty ZEV refuse trucks and other severe-duty applications is largely dependent on progress in heavy-duty battery development, integration with body companies and installation of charging infrastructure. Autocar is working hard to be ready with its own pieces of the puzzle so that it can incorporate those other pieces when available. Nevertheless, as further described below, Autocar faces unique challenges. [EPA-HQ-OAR-2019-0055-1292-A1, p. 2]

Those unique challenges were recognized by EPA during GHG Phase 1 and Phase 2 rulemaking. Small manufacturers were completely exempt from Phase 1. For Phase 2, Autocar worked closely with the Heavy-Duty Diesel Standards team in Ann Arbor to provide flexibilities for small manufacturers, including delayed imposition of Phase 2 standards (with incentives for early Phase 1 opt-in) and opportunities for small manufacturers to generate emissions credits during Phase 1 for use in Phase 2. When it became clear that large manufacturers would generate emissions credits across their diverse, high-volume heavy duty vehicle lines, including over-the-road trucks, and use those credits to certify their vocational trucks, the risk that small manufacturers would not be able to certify and stay in business became very real. [EPA-HQ-OAR-2019-0055-1292-A1, p. 2]

The Notice of Proposed Rulemaking (NPRM) recognizes that small business vehicle manufacturers will be disproportionately impacted by the imposition of more stringent emission standards. In general, the justification for increasing the stringency of the GHG standards for heavy-duty vehicles in 2027 is the proliferation of certain heavy duty ZEV's, which EPA anticipates will be accelerated by California's Advance Clean Trucks and Advance Clean Fleet regulations (the "California ZEV Regulations"). [EPA-HQ-OAR-2019-0055-1292-A1, p. 3]

The Proposed Rule as well as the California ZEV Regulations will impose disproportionately high burdens on a small business like Autocar, which produces small volumes of a select few product lines. The lack of product mix denies Autocar the benefit of averaging and aggregating credits. The low overall volume denies Autocar the benefit of banking credits and prevents it from spreading development and compliance costs across many vehicles. Specifically, Autocar's development and compliance costs will be concentrated within its current volume of approximately 3,000 vehicles annually. In contrast, Autocar's competitors will spread such costs across tens of thousands of vehicles and multiple product lines, and with vertical integration and robust purchasing power, the competition will gain a competitive advantage over its "small town" competitor. [EPA-HQ-OAR-2019-0055-1292-A1, p. 3]

Small manufacturers have less diverse product lines than large manufacturers. Autocar's main product lines are refuse vehicles, yard tractors, street sweepers, dump trucks and a few other severe-service applications. Unlike its large competitors, Autocar does not build chassis for any of the "targeted subcategories" (school buses, transit buses, delivery trucks and short-haul tractors) that are providing the perceived boost in ZEV demand and production. Therefore, although the GHG standards for Autocar's trucks will be more stringent under the Proposed Rule, Autocar will not benefit from any early industry shift to ZEV's. [EPA-HQ-OAR-2019-0055-1292-A1, p. 3]

Pandemic-related shortages of supply of parts and components for vehicles are challenging all manufacturers, and it is unclear how or when those problems will be resolved. However, the impact on small manufacturers is multiplied by their lower cash flows, lack of diversity of product and lower relative purchasing power. In fact, when shortages occur, suppliers allocate based on volume, which puts small manufacturers at the back of the line. [EPA-HQ-OAR-2019-0055-1292-A1, p. 3]

In particular, small manufacturers have experienced sourcing issues during ZEV development. ZEV technology suppliers are demanding large capital investments that exceed what small businesses can commit. And Autocar is not in a position to build a battery production plant or acquire whole existing ZEV technology producers, like their large competitors are. [EPA-HQ-OAR-2019-0055-1292-A1, p. 3]

Although California will compel fleets to purchase ZEV's, other states will not. And although California is attempting to develop ZEV charging infrastructure, other states are not. Therefore, small manufacturers who are compelled by the regulations to produce ZEVs may not be able to sell those vehicles, thus increasing the risk of falling short of meeting the standards. [EPA-HQ-OAR-2019-0055-1292-A1, p. 3]

Autocar does not design or manufacture its own conventional engines or transmissions. Unlike its vertically-integrated competitors, Autocar is entirely dependent on outside suppliers for these major vehicle components. [EPA-HQ-OAR-2019-0055-1292-A1, p. 4]

The same is true for batteries and many other ZEV powertrain components. Therefore, it will be more difficult for small businesses like Autocar to build trucks that meet the more stringent standards. For example, because Autocar's product lines are limited, the supply base options for ZEV components are limited, requiring more global shipments; specifically, battery cores for Autocar applications are only available from China. [EPA-HQ-OAR-2019-0055-1292-A1, p. 4]

Autocar has strong relationships with its suppliers; however, they have compliance requirements of their own, and they have much larger customers than Autocar. The market and order volumes obviously drive their decision making on investment in development. [EPA-HQ-OAR-2019-0055-1292-A1, p. 4]

Recognizing that EPA may ultimately impose emission standards even more stringent than as currently set forth in the Proposed Rule, Autocar offers a few simple modifications to the

Proposed Rule to alleviate the competitive advantage that more stringent GHG emission standards bestow upon large manufacturers. [EPA-HQ-OAR-2019-0055-1292-A1, p. 5]

First, EPA should maintain emission standards for 2027 and beyond at current levels for small manufacturers, and provide credit opportunities for small manufacturers that are able to produce and sell trucks that meet the more stringent standards. That way, small manufacturers that do not share the benefit of the ZEV development and sales that are prompting the changes to the standards will meet the original 2027 standards and be incentivized to continue development to earn credits. [EPA-HQ-OAR-2019-0055-1292-A1, p. 5]

Small manufacturers are uniquely impacted by emission standards and changes to emission standards. Autocar requests that EPA maintain emission standards for 2027 and beyond at current levels for small manufacturers, and provide credit opportunities for small manufacturers that are able to produce and sell trucks that meet the more stringent standards. An extension of the interim provisions for credit generation for CNG trucks will help small business keep up with credit generation by their large competitors. [EPA-HQ-OAR-2019-0055-1292-A1, p. 6]

As set forth in the NPRM, EPA set the existing heavy-duty GHG Phase 2 standards at levels that would require all conventional vehicles to install varying combinations of emission-reducing technologies (the degree and types of technology can differ, with some vehicles that have less being offset by others with more), leading to emissions reductions. In Autocar's experience, no large manufacturers are offering these "Phase 2 technologies" on their vocational vehicles other than neutral-idle, and the other technologies are not viable or not available for purchase in the vocational market. For example:

- Vehicle Speed Limiter – Most of Autocar's trucks run in the Urban cycle. Vehicle speed limiting has little to no effect in these duty cycles. [EPA-HQ-OAR-2019-0055-1292-A1, pp. 4 - 5]

- Start-Stop – Autocar's engine supplier does not currently offer this technology and does not intend to offer it with Autocar's engines in the future. As such, this technology is not currently available to use in compliance. [EPA-HQ-OAR-2019-0055-1292-A1, p. 5]

- Automatic Engine Shutdown – Autocar's engine supplier currently offers this technology only for tractor engines and specifically excludes vocational engines. They do not plan to extend to vocational applications, in part due to Autocar being the only manufacturer requesting this option. [EPA-HQ-OAR-2019-0055-1292-A1, p. 5]

- Tire Pressure Monitoring – During our launch of tire pressure monitoring, customers experienced various challenges with implementation of this technology, so TPMS has not been launched successfully to date. Autocar's development of solutions to make this successful in the vocational market is ongoing, but currently there is not path to solve the customer implementation issues. It is unclear whether this technology will be available for Phase 2 certification. Further, tire pressure technologies have little impact on reducing GHG emissions, so the return on investment for manufacturers and customers is hard to justify. [EPA-HQ-OAR-2019-0055-1292-A1, p. 5]

Based on Autocar's observations in the market, large manufacturers are using credits earned on non-vocational vehicles to meet Phase 2 standards on their vocational vehicles, rather than installing Phase 2 technologies, which makes it unlikely that engine manufacturers will bring them to market. It is unclear whether Autocar and other small manufacturers will have earned enough credits on vocational vehicles in Phase 1 to get them through Phase 2. But it is clear that fleet owners are not interested in purchasing the added cost and weight of many of the Phase 2 technologies. [EPA-HQ-OAR-2019-0055-1292-A1, p. 5]

Organization: *Clean Energy (CE)*

<u>Near-Zero Trucks are the Only Alternative Deployable on a Large-Scale</u> [EPA-HQ-OAR-2019-0055-1350-A1, p.2]

Heavy-duty near-zero trucks are capable of ranges exceeding 600 miles and refuel in about 5 to 7 minutes. Electric trucks are significantly constrained by their limited range of roughly 150 miles or less2. This significant barrier to viability is further compounded by recharging times that can exceed three hours3. Oregon Trucking Association President Jana Jarvis recently stated, *'Then you think about having to stop and recharge — if there was a charging infrastructure and if there was enough grid capacity. And both of those are questions today. You start thinking about doing that every couple hundred miles and you realize the inefficiencies the trucking industry would be subject to by conversion to electric vehicles.4'* [EPA-HQ-OAR-2019-0055-1350-A1, p.2]

2 https://www.electrive.com/2022/01/07/kenworth-presents-first-class-8-electric-truck/#:~:text=The%20vehicle%20is%20equipped%20with,at%20up%20to%20120%20kW.

3 https://www.fleetequipmentmag.com/kenworth-class-8-battery-electric-t680e-available-order/

4 M. Samayoa, OPB.org, Zero emissions trucks could be soon be required in Oregon (Nov. 15, 2021); https://www.opb.org/article/2021/11/15/zero-emissions-trucks-could-soon-be-required-in-oregon/

These significant performance restrictions in turn require, in most cases, two electric trucks to replace the work of one diesel. This key factor appears to be ignored in cost-comparisons and emission comparisons, but they have significant implications. This reality makes the cost of replacing a single diesel truck with electric power at around $1 million whereas a near-zero truck can be purchased for approximately $170,000 depending on its configuration. [EPA-HQ-OAR-2019-0055-1350-A1, p.2]

In a November 2021 interview, Daimler Truck CEO, Martin Daum stated, *'The first truth is, in heavy duty commercial vehicles you need such a huge amount of energy, meaning you need such large batteries, that such a truck always will cost significantly more than a combustion engine powered truck.'*5 This problem is further compounded by the rising costs of the batteries themselves. The chief executive of Benchmark Mineral Intelligence in October of 2021 told Reuters, 'The market may have to reposition itself for a period of rising battery cell prices, a new phenomenon for an industry conditioned to expect year-on-year falls.'6 While we have been hearing about heavy-duty EV trucks for years, the reason you do not see them being deployed, outside of demonstration projects, is they face a triple layered barrier to adoption consisting of severely limited range, long recharging times and the need, in most cases, of purchasing two EV trucks for every diesel replaced. [EPA-HQ-OAR-2019-0055-1350-A1, p.2]

5 Meghana Kandra, 'Diamler CEO Talks About Advancements in Heavy Electric Duty Truck', https://www.cnbc.com/2021/11/12/too-risky-to-not-use-battery-and-hydrogen-tech-daimler-truck-ceo.html, November 13th, 2021.

California's HVIP program is a great illustration of the real-world effects of this massive barrier. The HVIP program has provided over half a billion dollars of vouchers specifically for electric powered trucks, but 97 percent of those vouchers have not been redeemed.7 As the EV industry works to navigate significant hurdles, near-zero engines are being deployed. UPS is in the process of purchasing 6,000 new natural gas trucks and has signed an agreement to purchase 250 million gallon equivalents of RNG.8 New regulatory support for large-scale deployments of near-zero trucks is in-line with the Biden Administrations 'Long Term Strategy' for achieving net-zero emissions. The plan states that the Administration will 'prioritize clean fuels like carbon-free hydrogen and sustainable biofuels where electrification is challenged.'9 [EPA-HQ-OAR-2019-0055-1350-A1, p.3]

The Southern California air basin is the most challenged attainment zone in the United States in terms of air quality. Wayne Nastri, Executive Director of the Southern California Air Quality Management District stated in an August 2021 letter, *'There are multiple reasons why, despite manufacturer promises to the contrary, as a practical matter ZE heavy-duty trucks are not available today. First, while there appear to be multiple heavy-duty ZE truck models available for order, getting these vehicles delivered in a timely manner is an entirely different matter. Second, there are ongoing concerns regarding whether ZE trucks can meet needed duty-cycles.*

*Third, there is currently a dearth of charging infrastructure and concerns regarding sufficient power supply needed to support widespread electrification.'*11 [EPA-HQ-OAR-2019-0055-1350-A1, p.3]

11 August 3, 2021 Letter From Wayne Nastri to Environmental Justice and Environmental Health Partners.

Organization: *ClearFlame Engine Technologies (ClearFlame), Remora, and SixWheel*

With respect to reducing greenhouse gas (GHG) emissions from heavy-duty vehicles and engines, we strongly believe that EPA should establish fuel-neutral, technology-neutral, performance-based standards and incentives that allow all effective technologies to be recognized for their contributions. Further, we urge the Agency to avoid prescribing specific fuels, power sources, or technologies that engine and vehicle companies must use to meet the Proposal's emissions standards or take advantage of its incentives. [EPA-HQ-OAR-2019-0055-1329-A2, p. 2]

We must work to reduce emissions from vehicles that are on the road now and until we reach this goal. Furthermore, the urgency of the climate crisis demands that all solutions are pursued. Any technology that can deliver near-zero emission transportation at scale in the coming decade should have a pathway in EPA regulations. [EPA-HQ-OAR-2019-0055-1329-A2, p. 3]

100% zero-emission vehicles are always the ideal solution. However, given the urgency to decarbonize the entire transportation sector to net-zero levels by mid-century and to reduce GHGs as much as possible this decade, near-zero emission vehicles must be a necessary part of the solution. The EPA acknowledges the difficulty of extended-range battery electric vehicles (BEVs) and fuel cell electric vehicles (FCEVs) (Federal Register, p. 17562). Industry members are keenly aware of these difficulties. Innovation will be necessary to achieve long-term HDV emissions goals. The EPA, thus, must design regulations with room for near-zero emissions solutions. [EPA-HQ-OAR-2019-0055-1329-A2, p. 3]

We object to any sales mandate that is only for BEVs or FCEVs. Such mandates will stifle innovation. They will also reduce the overall GHG emissions reductions that will result from finalizing this Proposal by limiting the future market to only a limited set of technology solutions. Instead, EPA should encourage innovators to pursue all viable solutions in case any one solution does not work out. Thus, we strongly urge EPA to avoid mandates of specific technologies, whether in the Advanced Technology Incentive Program, in federal versions of the Advanced Clean Truck and Advanced Clean Fleet rules, and otherwise. [EPA-HQ-OAR-2019-0055-1329-A2, p. 3]

The included three (3) technologies offer pathways to carbon negative transportation. In other words, we may be able to turn vehicles into carbon removal devices — through a bioenergy with carbon capture & storage (BECCS) pathway. These offer perhaps the most feasible path to the Administration's Department of Energy EarthShot Initiative for carbon removal under $100/ton. We must ensure all transformative solutions are given the opportunity to develop. [EPA-HQ-OAR-2019-0055-1329-A2, p. 3]

ClearFlame, Remora, and SixWheel are developing effective emissions-reduction technologies for one of the hardest-to-decarbonize sectors. These developers must be supported and given a pathway in regulations – not shut out. [EPA-HQ-OAR-2019-0055-1329-A2, p. 3]

The EPA's own history shows the risk of prematurely "picking winners." In the early 2000s, EPA tried to drive the market place towards using NOx adsorbers to meet the 2007 and 2010 NOx standards. The market ultimately determined that Selective Catalytic Reduction (SCR) was a more cost-effective and vastly preferred strategy. [EPA-HQ-OAR-2019-0055-1329-A2, p.. 3 - 4]

As you update the Agency's Phase 2 GHG standards for certain heavy-duty vehicles and as you develop EPA's expected proposal for new Phase 3 GHG standards that will apply to all heavy-duty engines and vehicles, we strongly urge you to adapt EPA's successful fuel-neutral, technology-neutral "systems approach" to reducing greenhouse gas (GHG) emissions from all of the nation's heavy-duty engines and vehicles. [EPA-HQ-OAR-2019-0055-1261-A1, p. 3]

An innovation-driven, all-of-the-above approach will lead to more rapid carbon mitigation than pre-selecting particular technologies. The current Proposal includes provisions that reward BEVs and FCEVs that are not available to other technologies, including but not limited to ours. This approach will delay –and ultimately reduce – the overall GHG benefits of the program, an unintended consequence with real-world climate impacts. [EPA-HQ-OAR-2019-0055-1261-A1, p. 3]

We strongly urge EPA to revise these provisions in its final rule to enable all technologies to qualify under these provisions, thereby sending a market signal that encourages all innovations that may achieve the same – or even greater – emissions benefits when upstream and other indirect emissions are considered, at greater speed, scale, and/or cost-effectiveness. [EPA-HQ-OAR-2019-0055-1261-A1, p. 3]

We strongly urge EPA to revise its definition of "Fuel" and other provisions that will be necessary to ensure that a ClearFlame engine can be certified and operate using any high-blend ethanol or biofuel, including E85 and E98. [EPA-HQ-OAR-2019-0055-1261-A1, p. 3]

The Proposal lists ethanol only as a blend option for gasoline. It is critical that EPA sends the right market signal here – that an ethanol-fueled compression-ignition engine can receive the appropriate EPA certification and any incentives that it qualifies for, by virtue of its emissions performance. [EPA-HQ-OAR-2019-0055-1261-A1, p. 3]

EPA Should Maintain its Historic Fuel-Neutral, Technology-Agnostic Performance-Based Approach in the Proposal's Final Rule and Next Year's Expected Phase 3 GHG Proposal.

For the reasons outlined above, a fuel-neutral, technology-neutral, "systems approach" is still critically necessary – both for this Proposal and for next year's expected proposal to reduce GHGs from all heavy-duty engines and vehicles. [EPA-HQ-OAR-2019-0055-1261-A1, p. 4]

Here are just a few reasons why: [EPA-HQ-OAR-2019-0055-1261-A1, p. 4]

First, diesel engines will continue to emit a significant portion of the transportation sector's NOx and GHG emissions inventories in 2050. Even in states that have adopted California's Advanced Clean Truck Rule, up to 60% of the truck tractor sales market will still be diesel in 2035.5 These engines are likely to remain on the roads for decades thereafter. In other words, diesel engines that are sold in 2035 will still be in use deep into mid-century. [EPA-HQ-OAR-2019-0055-1261-A1, p. 4]

5. California's Advanced Clean Truck Rule, which has been adopted by New York and other states, requires 55% of Class 2b-3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales to be zero-emission by 2035.

Second, EPA's Heavy-Duty Highway Engine and Vehicle Rule of 20016 (the "2001 Diesel Rule") showed that a fuel-neutral, technology-neutral, performance-based "systems approach" reduced emissions and related health harms at scale, faster and most cost-effectively that any approach that picked specific technology winners. Indeed, when the 2001 Diesel Rule was finalized, it was widely anticipated that NOx adsorbers would be the "technology winner" that would enable diesel engines to meet the NOx standard in that rule. A competing technology, Selective Catalytic Reduction (SCR), was considered impractical and unlikely to succeed, due to the logistical hurdles posed by the need for SCR-equipped engines to use urea to operate cleanly. By 2010, SCR had become the industry standard, and NOx adsorbers never reached widespread use in the heavy-duty truck market. The lesson from that rule is clear: despite pressure to anoint NOx adsorbers as the technology "winner," the final Rule was drafted in a fuel-neutral, technology-neutral, performance-based manner, which enabled the market to innovate and then shift quickly to a technology solution that enabled implementation at scale, in the most cost-effective and fastest way possible, within a decade. [EPA-HQ-OAR-2019-0055-1261-A1, p. 5]

6. EPA, Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements, Regulatory Announcement, accessed on May 15, 2002 at https://nepis.epa.gov/Exe/ZyPDF.cgi/P1001CXZ.PDF?Dockey=P1001CXZ.PDF.

We encourage the EPA to establish objective and transparent emissions-based criteria that qualify a technology as zero or near-zero emissions. Any and all technologies that demonstrate proper emissions reductions should be able to qualify. It is essential for market fairness and to send the appropriate market signal to technology developers. [EPA-HQ-OAR-2019-0055-1329-A2, p. 4]

In sum, we strongly urge EPA to adopt a final NOx and GHG program that is open to all demonstrated, cost-effective emissions-reduction solutions. Doing so is critical to achieve near-term and long-term goals. [EPA-HQ-OAR-2019-0055-1329-A2, p. 4]

It is important to avoid unnecessarily limiting innovation at this stage of decarbonization. Encouraging and rewarding innovation will be necessary to reduce emissions in hard-to-decarbonize sectors like heavy-duty transportation. Such an open approach should also yield technology development benefits that pay dividends later when EPA seeks to decarbonize the non-road diesel sector. [EPA-HQ-OAR-2019-0055-1329-A2, p. 4]

Ever since the first federal vehicle emission standards for heavy-duty engines were adopted, EPA has correctly assumed that compression-ignition engines would be fueled by diesel fuel. This assumption predates those first emission standards, and has been appropriate for more than a century. Indeed, most people simply call these engines “diesel engines,” and most people probably have never even heard the phrase “compression-ignition.” For most engines over this time, the diesel fuel powering these engines was a petroleum product; in recent years, biodiesel and renewable diesel has entered the fuel market, and those fuels have been integrated into EPA’s fuel and vehicle emissions regulatory architecture. [EPA-HQ-OAR-2019-0055-1261-A1, p. 8]

Similarly, EPA has historically assumed that ethanol would only be used in spark-ignition engines. Again, this has been the correct assumption for decades. Even within this Proposal, EPA considers the impacts of ethanol blends on the cost of emission control aftertreatment devices used in spark-ignition engines10 and discusses ethanol only in the context of current and proposed test procedures for spark-ignition engines.11 [EPA-HQ-OAR-2019-0055-1261-A1, p. 8]

10 See Proposal, at 17488.

11 See, e.g., Proposal at 17490, 17491, 17631, 17703, 17849, and 17866.

It is now time to update these assumptions, and to integrate the use of ethanol in a compression-ignition engine into the policy architecture that will govern future heavy-duty engines and vehicles. Thus, ClearFlame strongly urges EPA to finalize this Proposal in a way that explicitly anticipates that future compression-ignition engines may operate on high-blend ethanol fuels (e.g., E85 or E98). [EPA-HQ-OAR-2019-0055-1261-A1, p. 9]

As we have stated above, ethanol can play a major role in decarbonizing the hard-to-electrify segments of the highway and nonroad diesel engine and vehicle markets. In order for this to happen, EPA must remove any uncertainty surrounding whether or not ethanol can be used to certify future compression-ignition engines or whether this fuel must be used thereafter throughout the useful life of such future engines. [EPA-HQ-OAR-2019-0055-1261-A1, p. 9]

In addition, we ask EPA to add “ethanol” to the general categories of fuels that are included in the agency’s definition of “Fuel Type.”12 Currently, the Proposal lists gasoline blended with 10 percent ethanol as merely one example of a fuel grade with the gasoline fuel type, just as premium and regular gasoline are listed. Instead, we request that EPA adds an Ethanol fuel type to list of general categories of fuels, alongside diesel fuel, gasoline, and natural gas. Within this fuel type, we request that EPA include both E85 and E98 as fuel grades that can be used for certification and other purposes. 13 [EPA-HQ-OAR-2019-0055-1261-A1, p. 9]

12 See Proposal, at 17724.

13 See Table 1 to Paragraph (b)(4) of Section 1036.530 – Reference Fuel Properties and related discussion. This table and discussion does list high-blend ethanol, but does not specify whether E98 can be used. This should be corrected in the final rule. See Proposal, pp. 17703-17704.

Organization: *Daimler Truck North America LLC (DTNA) (1045 and 1168)*

In this and all emissions-related rulemaking efforts, EPA should seek to provide certainty and stability for manufacturers, who must invest billions of dollars in developing product and market strategies that comply with the Agency's rules. Further, EPA's vehicle emissions regulations should seek to smooth and incentivize the transition to ZEVs wherever possible. EPA's proposed updates to the Phase 2 GHG program are, however, contrary to both of these principles. [EPA-HQ-OAR-2019-0055-1168-A1, p.112]

Daimler Trucks supported EPA's existing Phase 2 GHG standards during all phases of their development and implementation to date. We believe that the current Phase 2 standards incentivize manufacturers to develop more fuel-efficient vehicles across a broad variety of applications, while allowing broad flexibility to choose the best combination of technologies to reach these strict standards. [EPA-HQ-OAR-2019-0055-1168-A1, p.112]

Manufacturers have been developing strategies and technologies to reach the Phase 2 GHG targets since at least 2016, when the EPA first adopted the rule. Manufacturers develop a roadmap of product offerings to comply with these rules well ahead of time. In fact, Daimler Truck has strategies in place today to target compliance with the GHG Phase 2 rule beyond 2027, and has already made significant investment in the necessary development paths to achieve this goal. [EPA-HQ-OAR-2019-0055-1168-A1, p.112]

During the previous administration, Daimler Truck, EMA, and other industry stakeholders voiced their support to leave the existing GHG Phase 2 standards in place. When presented with an opportunity to consider revising these standards for less stringency, industry continued to express their support for the standards as written. We argued that we were committed to reaching the fuel economy targets we had agreed to, and that we believed we were doing our part to address climate change. [EPA-HQ-OAR-2019-0055-1168-A1, p.112]

We believed then—and we believe now—that the environment and the industry are best served by predictable, achievable standards. To reach our eventual goal of carbon-neutral heavy duty transportation, we will have to invest billions of dollars, collectively, in new technology. We cannot do that effectively without predictable rules and stability on the scale that EPA and industry originally envisioned in the Phase 2 rule. [EPA-HQ-OAR-2019-0055-1168-A1, p.112]

Industry and the environment, together, will suffer in an atmosphere of political influence on climate regulation. If regulations change with the political winds, and the rules are rewritten every four to eight years under different presidential administrations, industry will not be able to predict market conditions to invest the massive amount of money necessary to reach these ambitious goals. [EPA-HQ-OAR-2019-0055-1168-A1, pp.112-113]

While industry supported maintaining the existing standards during the previous administration, rather than advocating for relaxed standards, EPA, under the current administration, is proposing to revise these standards to increase their stringency further than originally set. This threatens to upend the cooperative nature of the rulemaking process and risks encouraging stakeholders to push for whatever ground they can gain when the political situation allows. [EPA-HQ-OAR-2019-0055-1168-A1, p.113]

Unexpected changes now to the Phase 2 regulatory program will also threaten to undermine the investments that manufacturers have made in reliance on the standards that EPA set years ago.126 Daimler Truck has invested very significantly in developing ZEVs, in part, to comply with the GHG Phase 2 rules. EPA threatens to undercut that investment by changing the rule and devaluing those ZEVs for the purpose of GHG compliance. [EPA-HQ-OAR-2019-0055-1168-A1, p.113]

126 As the Supreme Court has explained, when an agency changes course, it must be 'cognizant that longstanding policies may have ‘engendered serious reliance interests that must be taken into account,' as it would be 'arbitrary and capricious to ignore such matters.' Department of Homeland Security v. Regents of the University of California, 140 S.Ct. 1891, 1913 (2020) (citations omitted).

In addition to proposing to increase the stringency of certain CO_2 emission standards promulgated in the 2016 Phase 2 GHG Final Rule starting in MY 2027, EPA notes that it is also considering whether to establish more stringent standards beyond MY 2027, specifically in MY 2028 and MY 2029, using the sales-weighed projection methodology discussed in Section XI.C.1 of the Proposed Rule.127 The Agency requests comment on the appropriate stringency and supporting data for ‘each of those model years’ and ‘whether to finalize such an increase in stringency for those model years’ standards in a one-step (single MY) or multi-step (multiple MY approach.’128 EPA appears to be requesting comment on future incremental changes to applicable CO_2 standards, potentially on a year-by-year basis. If EPA were to finalize such changes, it would undermine the notion of stability in emission standard-setting that is enshrined in CAA Section 202(a)(3)(C). While perhaps not technically required for CO_2 standards, the three year standard applicability requirement in Section 202(a)(3)(C) is informed by considerations of predictability and stability, and recognizes the minimum amount of time it takes for industry to develop, validate, and fine-tune their products to ensure EPA’s standards can be met over a number of years. Daimler Truck urges EPA to keep this principle of stability in mind as it looks ahead to setting CO_2 standards for future model years. Just as rapid increases in criteria pollutant stringency can disrupt technological development, changes in CO_2 stringency that are close in time would undermine the progress of incremental advances that are needed to produce ZEVs of the future. [EPA-HQ-OAR-2019-0055-1168-A1, pp.113-114]

127 See Proposed Rule, 87 Fed. Reg. at 17,599.

128 Id.

EPA proposes to tighten CO_2 standards for certain vocational vehicle and tractor subcategories on the basis that ZEV penetration is expected to be higher than the EPA accounted for during the original Phase 2 rulemaking. EPA bases this assumption on marketing materials from various OEMs, the existence of small, initial fleets, and on other state level rulemaking efforts—such as California's Advanced Clean Trucks (ACT) program and potential state opt-in efforts. [EPA-HQ-OAR-2019-0055-1168-A1, p.114]

The mass adoption of ZEVs is by no means certain, thus any assumptions about ZEV penetration rates are purely speculative. Today, in 2022, very few commercial ZEVs are in operation—and while we expect significant adoption in certain applications, rates in all of the categories that EPA considers are less certain. While California's ACT rule forces manufacturers to sell ZEVs, and other states consider following suit, these rules do not ensure successful adoption on the scale that EPA appears to assume. Sufficient charging facilities and grid infrastructure to support these projections do not exist, and it is not clear when they will. Daimler Truck has significant concerns with the ACT rule, and believes it will not result in as many ZEV sales as projected - especially since many fleets do not purchase or register their vehicles in California. [EPA-HQ-OAR-2019-0055-1168-A1, p.114]

EPA is considering increased CO2 stringency for certain applications before manufacturers have even completed reporting on their first model year's CO2 credit accumulation. In other words, bases its projections are speculative, and the Agency has not, in fact, evaluated whether manufacturers are on track to comply with the Phase 2 program in its current state, as it has only just come into effect. Further, EPA's proposal to increase CO2 stringency is made in tandem with proposals that will limit manufacturers' ability to improve CO2 emissions performance—namely, the proposed new, stringent NOx standards will require less fuel-efficient engines to comply (or, at least, will limit fuel efficiency improvements that could otherwise be made). EPA must evaluate the actual landscape and feasibility of manufacturers complying with new, tighter CO2 standards, before making any adjustments. [EPA-HQ-OAR-2019-0055-1168-A1, p.114]

Further, EPA fails to evaluate whether the other technologies that were projected during the original Phase 2 rulemaking have reached the penetration targets the Agency expected—and if, accordingly, Phase 2 standard stringency should, in fact, be *decreased*. For example, Daimler Truck does not believe that market adoption of technologies such as automatic shutdown, neutral idle, low rolling resistance tires, or stop-start have kept pace with EPA's projected penetration rates at the time of the Phase 2 rulemaking. Arguably, this means that lower-than-expected penetration rates for EPA's expected GHG reduction technologies should result in a relaxation of the standards. The Agency is unlikely, however, to take such an approach. EPA made rules that allowed manufacturers to comply through a variety of strategies, and it would upend those reliance interests for EPA to change the rules now that manufacturers have deployed those strategies. [EPA-HQ-OAR-2019-0055-1168-A1, p.114]

The commercial ZEV market is at a critical tipping point; the next decade will determine whether ZEVs are a niche product, or whether they revolutionize the commercial truck market. Increased ZEV sales now offer the opportunity to increase market acceptance, spur the development of infrastructure, and trigger a cascade effect that will dramatically increase ZEV penetration. Such a shift is not, however, guaranteed; it is dependent on adequate infrastructure to make the vehicles functional, sufficient financial incentives to make the vehicles affordable, and adequate investment from OEMs to ensure broad, successful product availability. [EPA-HQ-OAR-2019-0055-1168-A1, p.115]

To that end, we believe that all regulatory proposals that impact vehicle emissions or fuel economy should be considered in the light of their effect on ZEV adoption rate. All rules must seek to incentivize ZEVs, or risk slowing their adoption. Instead, EPA's proposal forces OEMs to invest in further improvements to conventional vehicles, redirecting development funding that would otherwise be spent on ZEV programs—developing new zero-emissions platforms and applications. [EPA-HQ-OAR-2019-0055-1168-A1, p.115]

To avoid the disincentives described above and the threats to regulatory stability that would have adverse effects on ZEV penetration, we recommend the following: 1. EPA should not change the GHG Phase 2 standards in MY 2027. 2. EPA should not adjust credit multipliers, or otherwise limit, the value of ZEVs under the GHG Phase 2 program. 3. EPA should evaluate ZEV penetration rates, the adoption rates of various GHG-reducing technologies, and the actual feasibility of further improvements, and work towards a strong GHG Phase 3 rule that prioritizes a smooth transition to ZEVs, while minimizing the diminishing returns of further investments in conventional vehicles. [EPA-HQ-OAR-2019-0055-1168-A1, p.115]

Daimler Truck has very aggressive ZEV penetration targets, and we are investing dramatically in trucks, batteries, fuel cells, chargers, infrastructure, and more. We are clearly committed to the GHG emission reduction goals of the Paris Climate Agreement, and—as noted by EPA in the Proposed Rule—aim for all of our new vehicles in North America, Europe, and Japan to be CO2-neutral ('tank-to-wheel') by 2039.129 [EPA-HQ-OAR-2019-0055-1168-A1, p.116]

129 See 'Daimler Trucks & Buses targets completely CO2-neutral fleet of new vehicles by 2039 in key regions' https://media.daimlertruck.com/marsMediaSite/ko/en/44764260.

Mass adoption of ZEVs in the commercial truck space is not, however, certain. ZEV technology is in a nascent state and is rapidly developing. Commercial trucks are a tool for businesses to do work with—and businesses will not invest in these capital-intensive vehicles if their investment is not cost-effective. We believe that the following three factors are key to ZEV adoption:

1. ***Vehicle Products.*** The vehicles must have sufficient technical capabilities to meet duty cycle demands in a variety of applications and must be readily available for purchase.
2. ***Infrastructure.*** There must be adequate charging and fueling stations.
3. ***Cost Parity.*** There must be a favorable total cost of ownership for ZEVs as compared to conventional vehicles. [EPA-HQ-OAR-2019-0055-1168-A1, pp.116-117]

If any of these three factors is not in place, ZEV transition will be unsuccessful. Daimler Truck is investing to improve the capability of our ZEV products, is partnering to develop infrastructure, and is working to make our products more affordable every day. However, we cannot do this alone. We believe the regulatory climate must actively support ZEVs. Unfortunately, the Proposed Rule does not advance these factors, and in the case of the 'Vehicle Products' and 'Cost Parity' factors, actively detracts from them. [EPA-HQ-OAR-2019-0055-1168-A1, p.117]

EPA’s proposal serves to add significant cost and uncertainty to ZEVs: the proposed durability, useful life, and warranty requirements will add significant direct and indirect costs to ZEVs, which will hurt their cost position as compared to diesel vehicles. To meet the proposed requirements, manufacturers will be forced to take regulatory risk for vehicles that emit no NOx or CO2 at all. This risk will need to be accounted for in the price of the vehicle, and will discourage manufacturers from pursuing aggressive deployment strategies. [EPA-HQ-OAR-2019-0055-1168-A1, p.117]

EPA’s ZEV proposals must also be read against the backdrop of its questionable legal authority to regulate ZEVs at all, given that they do not emit air pollutants and thus, by definition, have no emission-related components subject to EPA’s CAA Title II jurisdiction.130 [EPA-HQ-OAR-2019-0055-1168-A1, p.117]

130 See 42 U.S.C. 7521(a) (authorizing EPA to prescribe standards 'applicable to the emission of any air pollutant' from new motor vehicles or engines which 'cause, or contribute to, air pollution,' and providing no regulatory authority with respect to vehicles that do not emit air pollutants).

Organization: *Eaton Vehicle Group (Eaton)*

We are not advocating for additional CO2 reductions based on certain categories to reflect penetration of battery electric vehicles, as this amounts to predicting technology winners. However, should the Agency adopt such an approach, given the significant funding for school and transit buses, we recommend that the CO2 standards for those categories should reflect at least the volumes driven by the Infrastructure and Jobs Investment Act. For example, in our estimates, Federal funding will drive approximately 5,000 school buses per year which is equivalent to roughly 20% of the school bus production. 20% zero emissions buses would be equivalent to an average of 217 g/ton-mile in that category, significantly lower than the proposed reduction from 271 to 267 g/ton-mile. [EPA-HQ-OAR-2019-0055-1252-A1, p.5]

We recommend instead that the EPA calculates the national fleet impact of both electrical trucks and the simultaneous lower CO2 and NOx of internal combustion powertrains, and perhaps adjust the 2027 GHG standards to reflect the then-current state of technology. The assumption that only California ACT will account for electrical vehicles is undercounting the realistic expected market dynamics, as illustrated by the school bus federal funding program above [EPA-HQ-OAR-2019-0055-1252-A1, p.6]

Agency Request / Topic: In Section XI, we request comment in a number of areas related to the proposed updates to the HD GHG Phase 2 program for certain heavy-duty vehicles that are shifting to zero-emission vehicles. We are considering whether it would be appropriate in the final rule to increase the stringency of the standards even more than what we propose. Therefore, we request information on heavy-duty electric vehicle sales projections, including for what HD vehicle types, to help inform our HD electric vehicle sales projections in the MY 2024 through MY 2029 timeframe [EPA-HQ-OAR-2019-0055-1252-A1, p.10]

Eaton Comment Strategy / Materials: While Eaton is not opposed to realistically adjust the Phase II GHG standards in 2027 to account for electrification, we are not strong advocates either. We believe that electrification rates are hard to predict because of uncertainties in the adoption of ACT in California, the adoption of the NESCAUM MOU states, any other states or localities adopting similar mandates and the dynamics induced by significant federal aid in some sectors (e.g., school and transit buses through IIJA). We would advise the EPA to also calculate the simultaneous NOx and CO2 reductions for conventional powertrains affected by the NOx rule, as well as potential HD Hybrids in the vocational space. However, we also recognize that revising the GHG standards for 2027 is overly complex. As an example, the calculation methodology in the NPRM has already been invalidated for school buses by the IIJA $5B funding of EV school buses drives a 20% market share, that would in effect reduce the proposed standard to 217 g/ton-mile rather than the proposed 267 g/ton-mile under an approximately 2% EV market share assumption. [EPA-HQ-OAR-2019-0055-1252-A1, pp.10-11]

Agency Request / Topic: In addition, we request comment under this proposal on how EPA can best consider the potential for ZEV technology to significantly reduce air pollution from the heavy-duty vehicle sector, including whether and how to consider including specific sales requirements for HD ZEVs. [EPA-HQ-OAR-2019-0055-1252-A1, p.11]

Eaton Comment Strategy / Materials: Eaton does not have a position on this topic, especially as the EPA authority to impose ZEV quotas seems fragile, and in general, Eaton believes in technology neutral regulations that let the market find the best solutions [EPA-HQ-OAR-2019-0055-1252-A1, p.11]

Organization: *International Union, United Automobile, Aerospace & International Union, United Automobile, Aerospace & Agricultural Implement Workers of America - UAW Region 1A*

We are also concerned about the proposed rules attempts to add new certification, warranty and useful life requirements to zero emission vehicles. This will add cost to ZEV and delay their deployment. All of these have the potential to adversely impact Redford Township, Michigan. [EPA-HQ-OAR-2019-0055-1062-A1, p.1]

To that end, we are concerned by the precedent of re-opening the GHG Phase 2 final rule to increase the stringency for 17 out of 33 subcategories of vehicles. Stability and regulatory certainty are crucial to encouraging investment in domestic manufacturing that creates quality union jobs. Reopening finalized rules, whether it is to make rules more stringent or less stringent, undermines that certainty and could create a cycle of constantly changing regulations depending on who is in power and changes in our economy. [EPA-HQ-OAR-2019-0055-1138-A1, p.3]

Organization: *Maine Department of Environmental Protection (Department)*

EPA’s proposal, which increases GHG stringency requirements for certain vehicle classes by 1.5%, will reduce cumulative class 4-8 heavy-duty vehicle emissions by only 0.4% from 2027-205022 and could paradoxically result in greater GHG emissions if ZEV crediting provisions are retained. The Department recommends revising the proposal to preserve the original Phase II

GHG stringency requirements for internal combustion engine vehicles and phasing out ZEV crediting towards GHGs as soon as feasible. [EPA-HQ-OAR-2019-0055-1288-A1, pp.8-9]

Organization: *Mayer Automotive LLC*

The Biden administration has lost touch with what is good for OUR country. We need someone who REALLY cares about this country to lead us forward ! The new green deal is a farce ! I know that at this point we cannot make it without fossil fuels. [EPA-HQ-OAR-2019-0055-1018, p.1]

Organization: *Motor & Equipment Manufacturers Association (MEMA)*

In Section XI, EPA requests comments in a number of areas related to the proposed updates to the HD GHG Phase 2 program for certain heavy-duty vehicles that are shifting to zero-emission vehicles. EPA is considering whether it would be appropriate in the final rule to increase the stringency of the standards even more than what EPA proposes. [EPA-HQ-OAR-2019-0055-1322-A1, p. 9]

MEMA opposes a national ZEV mandate and recommends continuing with a technology neutral, performance-based HD GHG standards approach as we have today. BEV penetration levels may reach higher levels faster or slower than expected. Therefore, MEMA recommends separate GHG requirements for ICE vehicles rather than the entire fleet (including BEVs and FCEVs) to avoid unintended backsliding and lowering of technology deployment on internal combustion engine heavy-duty vehicles. In addition, if BEVs and ICEs are combined in the fleet averages and BEV forecasts are off the mark, the result will lead to significant regulatory uncertainty. [EPA-HQ-OAR-2019-0055-1322-A1, p. 9]

Regarding more stringent standards beyond MY 2027 - specifically in MY 2028 and MY 2029 using the methodology described in Section XI.C.1, MEMA believes that these forecasts will be quite volatile and uncertain. Therefore, we don’t want an optimistic or incorrect ZEV forecast to distort the market in the future. Establishing regulatory certainty is very important to the supply base that is developing the necessary advanced emissions technologies. [EPA-HQ-OAR-2019-0055-1322-A1, p. 9]

Organization: *National Association of Chemical Distributors (NACD)*

This rule also revisits EPA’s final rule on GHG emissions published October 25, 2016, proposing to impose more stringent GHG emissions on MY2027 than what was originally established. This shift would set a dangerous precedent, disincentivizing manufacturers and others in the industry to plan farther into the future, as there would be no certainty that set EPA standards will not be changed before they are eventually implemented. [EPA-HQ-OAR-2019-0055-1279-A1, p. 5]

The current Phase 2 GHG standards have gone through a full comment process and their implementation has already begun. Moving the goalposts midway through Phase 2’s execution to change what is required of MY2027 would disregard the input and careful considerations that went into the 2016 rule. NACD recommends that the EPA continue with the current Phase 2 GHG standards. [EPA-HQ-OAR-2019-0055-1279-A1, p. 5]

Organization: *Navistar, Inc. (Navistar)*

Changes to the Phase 2 GHG standards are disruptive, unnecessary, and premature. Navistar has relied on the certainty of the existing GHG standards in product planning, engineering, and manufacturing compliant diesel and ZEV trucks and buses. Navistar joined the industry is protecting the GHG 2 framework from the previous Administration to keep in place the regulatory lead time for product planning. EPA’s assumption that manufacturers’ sales of ZEVs due in part to California’s Advanced Clean Truck rule fails to properly consider the charging and refueling infrastructure necessary to enable the continued development of the ZEV truck market, necessary purchase incentives to encourage early adoption, and technology costs. A transition of the trucking industry to ZEVs requires regulatory consistency and certainty. EPA’s proposal to change the Phase 2 GHG standards at this time will undermine manufacturers’ product decisions made years ago and pick winners and loser amongst vehicle manufacturers based off of their market vehicle classifications. **A criteria emissions change in the same year as a long planned-for change in GHG emissions standards is challenging enough, but when uncertainty is introduced into the 2027 requirements in both the criteria and GHG emissions standards, it becomes untenable.** Navistar urges EPA not to reopen the previously approved Phase 2 GHG regulation as part this proposed low-NOx rule, but rather to address such changes in the forthcoming Phase 3 GHG rulemaking. [EPA-HQ-OAR-2019-0055-1318-A1, p. 6]

Organization: *NTEA - The Association for the Work Truck Industry*

In addition to the proposed NOx changes, the EPA is also proposing to re-open the GHG (greenhouse gas) Phase 2 rule. [EPA-HQ-OAR-2019-0055-1164-A1, p. 2]

Re-opening the finalized GHG Phase 2 rules would undermine the regulatory stability manufacturers need in order to develop their products. It would effectively penalize engine manufacturers for their ongoing efforts to assure compliance with the existing 2024 and 2027 GHG standards. Additionally, changing the GHG rules would put manufacturers in the position of trying to develop technologies to reduce NOx and meet increased GHG standards simultaneously – while also trying to introduce ZEV’s to the market. [EPA-HQ-OAR-2019-0055-1164-A1, p. 3]

Organization: *PACCAR, Inc (PACCAR)*

However, PACCAR does not support re-opening the GHG Phase 2 rule, specifically with respect to the standards set to take effect in MY 2027. [EPA-HQ-OAR-2019-0055-1346-A1, p.3]

PACCAR has relied on the certainty of the Phase 2 rule’s progressively more stringent GHG standards to design our Zero-Emission Vehicles (‘ZEVs’) and accelerate their deployment. EPA sought to incentivize that accelerated deployment of ZEV trucks by providing enhanced emission credits, and EPA should not reopen the Phase 2 rule to change the ZEV credit framework simply because the incentives worked. PACCAR therefore supports the single step low-NOx standard in MY 2027 that would enable OEMs to comply with the next generation of compression ignition engine NOx standards, while at the same time focusing on ensuring a zero emission future for 2030 and beyond. [EPA-HQ-OAR-2019-0055-1346-A1, p.3]

PACCAR summarizes below the major issues that EPA should take into account as it moves forward with this rulemaking: PACCAR does not support the re-opening of the GHG Phase 2 rule, specifically because the standards are set to take effect in MY2027. [EPA-HQ-OAR-2019-0055-1346-A1, p.61]

Organization: *Port of Seattle, Port of Tacoma, and Northwest Seaport Alliance (NWSA)*

However, transitioning the fleet of more than 4,000 mostly diesel-powered drayage trucks that serves the NWSA gateway to zero-emission vehicles will be as challenging as it is urgent. As noted in the proposed rule, zero-emission Class 8 trucks – battery electric and hydrogen fuel cell vehicles – are being produced, but in this region, they remain limited in number and prohibitively expensive – roughly 8 to 10 times what the average drayage truck driver serving our gateway currently pays for a used diesel truck on the second- or third-hand market. In addition, charging and fueling infrastructure for zero-emission trucks is virtually nonexistent here. This large gap between the current situation and our zero-emission vision is daunting, especially for our network of drayage service providers, which consists mostly of independent owner-operators and small trucking companies, including many minority-owned businesses and drivers-of-color. About 20 percent of the trucking companies with which we partner have fewer than five trucks, nearly 40 percent have fewer than 20, and about 60 percent have fewer than 30. These companies are highly sensitive to significant changes in the cost and convenience of doing business, and the risks associated with adopting new technologies. [EPA-HQ-OAR-2019-0055-1312-A1, pp.1-2]

Currently, zero-emission trucks are much more expensive than new diesel trucks, in terms of both purchase price and total cost-of-ownership (TCO). According to an analysis by the California Air Resources Board (CARB), battery electric trucks could have a lower TCO than new diesel trucks by 2030, and hydrogen fuel cell trucks could be approaching cost parity as well. However, as noted earlier, a significant percentage of the drayage trucks serving the NWSA's terminals are purchased on the second- or third-hand markets, and there is considerable uncertainty as to when used zero-emission trucks will be available and cost-competitive for our drayage truckers and fleet operators. [EPA-HQ-OAR-2019-0055-1312-A1, p.2]

Financial incentives to purchase newer trucks: As noted, many of our drayage truck owner/operators are new Americans and people of color, and many of the trucks serving our terminals are purchased on second- or third-hand markets. To ensure that emission reductions are realized, EPA should consider direct financial incentives such as rebates, no-cost or low-cost loans, and a national scrapping program like those the NWSA and other ports around the country have implemented. [EPA-HQ-OAR-2019-0055-1312-A1, p.3]

Grants for electric charging and alternative fueling infrastructure: We are pleased the Biden Administration and Congress approved historic funding for creating a nationwide network of electric charging and alternative fueling stations as well as dedicated funding to study reducing truck emissions at port facilities. The EPA should continue to work with the departments of Energy and Transportation and others to offer grants and technical assistance focused on developing this charging and fueling infrastructure in and around industrial areas and along freight corridors where heavy-duty trucks operate. This will facilitate the uptake of zero- and near-zero emission heavy duty trucks. [EPA-HQ-OAR-2019-0055-1312-A1, p.3]

Temporary waivers to the Buy America(n) requirements: The requirement that projects seeking federal transportation funding must meet Buy America(n) rules is proving to be a significant barrier to accelerating the deployment of zero-emission heavy duty vehicles and equipment in our region. None of the manufacturers of heavy-duty trucks and cargo-handling equipment with whom we have spoken meet the Buy America(n) requirements—including Us manufacturers. This means that zero-emission technology demonstrations are not eligible for federal transportation funding without a waiver and in our experience to date, such waivers are difficult and time-consuming to apply for and secure. We encourage the Biden Administration to adopt a position of flexibility with regard to limited-duration waivers over the next few years to help meet emissions reduction goals and to provide time for US manufacturers to achieve the scale needed to meet the demand for zero- and near-zero emissions cargo handling equipment and make their production lines compliant with Buy America requirements. [EPA-HQ-OAR-2019-0055-1312-A1, p.3]

Organization: *Retail Industry Leaders Association (RILA)*

- RILA notes that the HD ZEVs can weigh substantially more than otherwise equivalent non-ZEVs, due to the weight of high-capacity battery packs. This increased weight, along with the anticipated increase in market share for HD ZEVs may lead to a notable increase in average weight for the average HD vehicle which might reduce vehicle payload capacity due to maximum vehicle weight limits. RILA suggests that EPA and other departments or agencies consider conducting a study to identify the anticipated increase in total weight of the HD ZEVs and the potential resulting impact on highway performance standards. [EPA-HQ-OAR-2019-0055-1189-A2, p.8]

Organization: *SEAM Group*

However, it has concerns regarding the amount of time needed to deploy the charging infrastructure support the electrification of small to large commercial fleets at the levels required under the proposed rule. As an installer of EV charging stations, SEAM Group has experience with lead times for the EV charging station (EVSE) hardware, permitting, installation, and utility energization. The aggressive timeline proposed here may not be realistic or possible based on the current market conditions. Most sites for heavy duty chargers will require that DC Fast Chargers be installed, which then necessitates the purchase of a transformer as well as switchgear in most instances. The lead time on each of these pieces is currently around 52 weeks (1 year). As both light duty and heavy duty vehicles will be electrifying at a high rate in the coming years, we can anticipate that even longer timelines may result. This is not likely to let up in the coming years, meaning that a key component to deploying electricity to a site to support the aggressive fleet electrification goals at EPA may not be readily available. Utility engagement will also be key to this process, as utilities will need to be alerted as soon as possible to the potential demand for electricity within their service territories required to service heavy duty fleets. Depending on the utility and the number of vehicles that need to be electrified, there could be significant upgrades required (e.g., new substations, new power lines), which could also cause significant delays. Again, we support fleet electrification; however, the deployment of these vehicles must go hand in hand with the deployment of charging infrastructure. [EPA-HQ-OAR-2019-0055-2574, p.1]

Organization: *State Soybean Associations*

With this Proposal, EPA plans to increase the stringency of the Phase 2 GHG emissions standards for heavy-duty vehicles through MY 2027, making revisions to the standards initially issued in 2016. The Agency explains in the Proposed Rule that the move toward increased stringency is premised on the projected increase in the penetration rate of EVs into the heavy-duty vehicle market. [EPA-HQ-OAR-2019-0055-2035-A1, p.1]

The Proposed Rule specifically seeks comment on the projected EV heavy-duty vehicle penetration rate for MY 2027. While the project penetration rate in the proposed rule is 1.5%, the agency seeks 'comment and additional supporting information and data on higher penetration rates, which could serve as the basis for the increase in the stringency of the CO2 standards for specific Phase 2 vehicle subcategories.'1 Without commenting on what the appropriate EV projected penetration rate should be, we urge EPA to stick to standards that can be met by considering only tailpipe vehicles. [EPA-HQ-OAR-2019-0055-2035-A1, p.2]

1 87 Fed. Reg. 17414, 17419 (Mar. 28, 2022)

EPA also lists several indicators as support for this projection, such as an agreement between a number of states ‘establishing goals to increase the heavy-duty electric vehicle market,’ along with multiple actions taken by the California, including the state’s Zero Emission Vehicle (‘ZEV’) sales mandate and the California Air Resources Board’s (‘CARB’s’) Advanced Clean Trucks analysis projecting future heavy-duty EV sales in California. [EPA-HQ-OAR-2019-0055-2035-A1, pp.1-2]

The State Soybean Associations do not object to an increase in EVs in the heavy-duty market, and certainly do not object to increasing the stringency of EPA’s Phase 2 GHG emissions standards. We do take issue, however, with EPA’s over-reliance on electrification as a means to meet the administration’s decarbonization goals, and its misuse of Clean Air Act authorities to set emission standards that are unachievable with internal combustion engines. Although Clean Air Act ('CAA') Section 202(a) authorizes EPA to issue tailpipe emissions standards for the transportation sector, EVs are not tailpipe vehicles; accordingly, they are not contemplated under 202(a) and therefore should not be considered in a 202(a) standards rulemaking. Moreover, the Proposal requires either EVs or credits trading in order for fleets to maintain compliance, which is impermissibly preferential one kind of technology over others. [EPA-HQ-OAR-2019-0055-2035-A1, p.2]

Organization: *Toyota Motor North America, Inc. (Toyota)*

EPA has indicated that it is not considering a HD ZEV mandate at this time. Toyota supports this approach. A ZEV mandate for light-duty vehicles exists in California and other states that have adopted California's regulations. In addition, other federal regulations such as EPA's light-duty greenhouse gas (GHG) regulations and NHTSA's related Corporate Average Fuel Economy (CAFE) regulations are compelling a greater need for light-duty zero-emission technologies. Achieving these existing regulations requires complementary market-development and sustainment measures, including infrastructure investments for electric vehicle charging and hydrogen refueling, critical mineral supply chain development, and a robust system to recycle end-of-life vehicle batteries. Adding a Federal HD vehicle mandate on top of existing light-duty mandates will exacerbate each of these challenges and could put successful compliance with ZEV mandates in both sectors in jeopardy [EPA-HQ-OAR-2019-0055-1224-A1, pp. 1-2]

Organization: *Truck and Engine Manufacturers Association (EMA)*

In order to ensure the adoption of fully achievable and cost-effective HDOH low-NOx regulations, and notwithstanding our broader agreement, the Agency should revise the proposed standards in the following manner: The current Phase 2 GHG standards should not be revised. The Phase 2 standards appropriately incentivized manufacturers to accelerate the deployment of ZEV trucks. Now, the Agency is proposing to tighten the Phase 2 standards solely because manufacturers deployed ZEVs as they were incentivized to do. That is fundamentally unfair. Manufacturers have relied on the stability of the Phase 2 provisions to formulate their product plans out to 2027 and beyond. When other stakeholders sought to undo the Agency's GHG standards, EMA and its members defended them. If, as the Agency is indicating, final rules really are not final, but are instead subject to unilateral revision by the Agency (in this instance because the rule's incentives worked!), the resulting precedent for undermining the regulatory certainty of "final rules" will yield very adverse consequences each time a new Administration takes office. The Agency should not open this type of Pandora's Box. No federal agency should feel unilaterally empowered to move the regulatory finish line well after the regulated industry's march toward compliance has begun. [EPA-HQ-OAR-2019-0055-1203-A1, pp. 7 - 8]

With respect to the proposed "reopening" of the current Phase 2 GHG standards, specifically the standards set to take effect in MY 2027, the Agency simply should not do that. OEMs have relied on the certainty of those progressively more stringent GHG standards in designing their engine platforms and vehicle upgrades, and in accelerating their deployment of ZEV trucks where feasible. Indeed, the Agency sought to incentivize that accelerated deployment of ZEV trucks by providing for enhanced emission credits. [EPA-HQ-OAR-2019-0055-1203-A1, p. 14]

But now, really for no other reason than the incentives worked to encourage the manufacture and sale of ZEV trucks in certain applications, the Agency is proposing to tighten the Phase 2 GHG standards by 1.5% in 2027, to, in effect, take back the credits that led to the intended increased deployment of ZEV trucks in the first place. It is the type of blatant renege that would never be allowed in commerce, and it should not be a practice of the federal government. [EPA-HQ-OAR-2019-0055-1203-A1, p. 14]

The Agency's proposed undoing of its prior regulatory commitments is even more egregious in this case since, unlike other stakeholders in other regulated sectors, EMA and its members defended and sought to preserve the Phase 2 standards when the prior Administration was looking to reduce those standards across the board. Yet now the Agency is poised to engage in the same type of activity — re-trading previously-adopted emission standards — that environmental advocates bemoaned only a few years ago. [EPA-HQ-OAR-2019-0055-1203-A1, p. 14]

If the Agency persists in moving the regulatory goalposts after the underlying rules were set and OEMs' compliance efforts were well underway, the precedent will not be lost on anyone. Henceforth, all "final" regulations will be deemed open to fresh debate and revision anytime a new Administration is sworn-in. Not all of those revisions will trend in the same direction. Stated differently, if the Agency insists on eliminating the assurances that heretofore accompanied final rules, that same lack of assurance is just as likely to burden the Agency in the future. The Agency should not include Phase 2 revisions in this low-NOx rule, but instead should leave the development of enhanced GHG requirements to the imminent "Phase 3" rulemaking that is earmarked for that specific purpose. [EPA-HQ-OAR-2019-0055-1203-A1, p. 14]

EMA's earlier comments discuss why the Agency should not unilaterally reopen the Phase 2 GHG standards, and how the proposed low-NOx standards will negatively impact CO2 emissions and will increase the technical challenges of meeting the Phase 2 GHG standards in 2027. In short, there is no sound policy or technical basis for the Agency to re-trade the terms of the final Phase 2 regulations at this juncture. To do so would jeopardize all future "final rules." Beyond this critical issue impacting what "final" rules will mean going forward, other more detailed aspects of the Agency's proposed "reopening" nonetheless warrant additional comment. [EPA-HQ-OAR-2019-0055-1203-A1, pp. 104 - 105]

The August 2016 Regulatory Announcement that accompanied the release of the Phase 2 GHG rule proclaimed that the "technology-advancing Phase 2 program goes beyond the successful Phase 1 program, with standards based not only on currently available technologies but emerging technologies that are not yet in widespread use." (See, EPA-420-F-16-044.) The preamble to the final rule similarly stated that "Phase 2 will include technology-advancing standards that will phase in over the long-term (through model year 2027) to result in an ambitious, yet achievable program that will allow manufacturers to meet the standards through a mix of different technologies at reasonable cost." (See, 81 FR 73481.) Nowhere in the Phase 2 final rule did the Agency indicate that the technology-forcing standards were subject to change if the Agency later felt so inclined. [EPA-HQ-OAR-2019-0055-1203-A1, p. 105]

Since 2016, manufacturers have been preparing to implement the stringent 2027 standards, and the interim standards for model years 2021 and 2024. Manufacturers have developed the necessary engine and vehicle technologies, and they have established production and sales plans to achieve compliance with the increasingly stringent regulatory steps in the Phase 2 GHG program. As the Agency predicted, the Phase 2 program has spurred innovation, and manufacturers have met that challenge by developing and deploying the technologies needed to implement the first step of the Phase 2 rule last year. And with the second step of Phase 2 less than twenty months away, manufacturers are working to deploy the additional technologies necessary to meet those more stringent second-step standards, and then to meet the third and most stringent step of the program less than four years from now. It is clear, then, that manufactures are working diligently to implement the Phase 2 program in a successful and cost-effective manner, just as they committed to do. [EPA-HQ-OAR-2019-0055-1203-A1, p. 105]

In addition, EPA has already begun work on a Phase 3 GHG program, planning to release a proposed rule next year, and a final rule in 2024 that will be effective with model year 2030. The Phase 3 GHG rule will provide the minimally reasonable three years of regulatory stability after implementation of the final step of the Phase 2 GHG program in 2027, and will adopt even more stringent GHG requirements to help transition the industry to ZEVs. Thus, it is also clear that manufacturers face additional technology-forcing challenges to further reduce GHG emissions. [EPA-HQ-OAR-2019-0055-1203-A1, p. 105]

Notwithstanding the aggressive pace and cadence of the HDOH GHG rulemakings, and the corollary technology developments and deployments, the Agency has included in this low-NOx rulemaking a proposal to “reopen” the Phase 2 GHG program midstream. That reopening proposal is being made in spite of the fact that the new NOx standards that are the focus of the rulemaking will greatly impact manufacturers’ ability to comply with the existing GHG standards, and seemingly ignores the Phase 3 GHG rulemaking that already is underway. Such regulatory destabilization, undermining manufacturers’ ability to comply with the requirements, should not be the practice of EPA. If final rules are, in fact, no longer final, the regulatory landscape will be changed in ways that will have very serious repercussions. [EPA-HQ-OAR-2019-0055-1203-A1, p. 105]

To justify the proposed re-trading of the Phase 2 GHG program, the Agency broadly speculates about where the diverse and complicated market for medium- and heavy-duty ZEVs is headed. But in that speculation, the Agency fails to take into account the three separate challenges that must be addressed simultaneously to successfully grow the market for medium- and heavy-duty ZEVs. First, manufacturers must develop diverse ZEV products that will meet their customers’ needs. Second, those customers must be prepared to purchase and deploy the ZEVs, and they must be able to do so in a profitable manner. And third, the most expensive and complex aspect of growing a commercial ZEV market is ensuring that robust electricity-charging and hydrogen-fueling infrastructures are in place before the ZEVs are deployed. A three-legged stool is an apt metaphor for the medium- and heavy-duty ZEV market, where available ZEV products, fleets able to profitably deploy the ZEVs, and a robust infrastructure are all three simultaneously needed to support the ZEV market. [EPA-HQ-OAR-2019-0055-1203-A1, pp. 105 - 106]

Looking only at ZEV product development plans or marketing targets, as the Agency seems to be doing, is a myopic view of a much larger and more complex picture. Stated differently, pointing to a manufacturers’ aspiration ZEV marketing plans — something the Agency should be applauding — is not a basis for the Agency to unilaterally undermine the established regulatory structure under which this industry operates. Changing the rules halfway through the game should not be a practice of the federal government. If it becomes such, there will be no reason restraining the industry from encouraging more of the same each time a new Administration takes control. [EPA-HQ-OAR-2019-0055-1203-A1, p. 106]

Undeterred by its proposed breach of regulatory commitments, EPA points to the Advanced Clean Trucks ("ACT") rule that CARB finalized last year as conclusive evidence of significant future growth in the deployment of the medium- and heavy-duty. However, the ACT rule only includes ZEV sales targets, ignoring the other two legs of the stool. When CARB approved the ACT rule, it acknowledged that to be successful, CARB must enact regulations to mandate the purchase of ZEVs and that the State needed to build out a robust infrastructure to charge/fuel the ZEVs. (See, CARB Resolution 20-19.) Since the ACT rule will not begin mandating the sale of ZEVs in California until 2024, and the State is still working on the other two legs needed to support the ZEV sales targets, the rule remains far from a proven success. While California leads the nation is developing its medium- and heavy-duty ZEV market, additional expensive and challenging steps must be taken before anyone can honestly say that the transition of California's trucking industry to ZEVs has actually begun. [EPA-HQ-OAR-2019-0055-1203-A1, p. 106]

EPA also points to the Multi-State Zero Emission Medium and Heavy-Duty Vehicle Initiative as evidence of the growth in medium- and heavy-duty ZEVs, and as support for its newfound belief that "final rules" remain such only for industry. However, that initiative is simply a memorandum of understanding ("MOU"), by and among seventeen states and the District of Columbia, declaring that thirty percent of the sales of medium- and heavy-duty trucks in each jurisdiction should be ZEVs by 2030, and 100 percent by 2050. Similar to CARB's ACT rule (but without any regulatory teeth), the MOU ignores the need for fleets to purchase ZEVs or the more challenging and expensive, but absolutely necessary, build-out of electricity-charging and hydrogen-fueling infrastructures to support the ZEVs. Without wholistically addressing the development of the medium- and heavy-duty ZEV market, the MOU is merely an unsupported aspirational proclamation. [EPA-HQ-OAR-2019-0055-1203-A1, p. 106]

The Agency further points to ZEV prototype and demonstration projects as establishing the "feasibility and durability of the technology for specific applications." (See, 87 FR 17595.) But what is left unsaid is whether the projects demonstrate that the ZEVs complete the work demanded by each trucking business with a competitive total cost of ownership. Commercial vehicles are purchased by businesses for the sole purpose of providing a financial return on the investment in the new vehicle. To invest in a ZEV, the fleet must be able to predict that the vehicle will have a competitive total cost of ownership over other available technologies. Right now, ZEVs have much higher acquisition costs than other technologies, they have lower utility (i.e., the ability to get the job done), and they have lower resale values. Additionally, fleets must invest in new maintenance facilities and parts inventories to support ZEVs, and they must make substantial investments to build out and maintain the necessary charging/fueling infrastructure. Until ZEVs are proven to provide a competitive total cost of ownership for trucking businesses on all of those fronts, they will remain nothing more than a niche market. To be sure, manufacturers are working hard and investing billions to overcome those obstacles, but those efforts do not warrant new interim GHG standards just because EPA feels the need for a new "win." The Phase 3 rule — not this rulemaking — is the regulatory mechanism for helping to deliver on all parties' aspirational ZEV targets. [EPA-HQ-OAR-2019-0055-1203-A1, pp. 106 - 107]

The NPRM acknowledges the diverse nature of commercial vehicle applications by pointing to the high adoption rates for zero-emission transit buses and school buses. Those narrow applications are highly suitable for ZEVs deployments for various reasons, including that they are operated by government entities instead of for-profit businesses. However, those two applications cannot be used to prove that the diverse private commercial vehicle market is on the cusp of a wholesale transition to ZEVs. Long-haul tractor-semitrailer combination vehicles, concrete mixers, and snowplows are just a few examples of applications that present much greater challenges to the successful deployment of ZEVs. Any realistic assessment of the thousands of unique commercial vehicle applications would conclude that a tremendous amount of effort and resources still remains to be applied to successfully initiate a broad-based transition of the nation's commercial trucking industry to ZEVs. [EPA-HQ-OAR-2019-0055-1203-A1, p. 107]

Nonetheless, EPA highlights the high numbers of ZEV deployments in school and transit bus applications as supposed evidence that when the Phase 2 GHG rule was finalized it underestimated the growth of ZEVs. But again, successful ZEV adoption in those two highly suitable but narrow applications should not be used as evidence that the Phase 2 GHG rule underestimated the growth of ZEV across the board. Certainly, it should not be used to justify increasing the stringency of the "final" GHG standards for more than half of the vehicle subcategories in the Phase 2 GHG rule, nor should those narrow examples be used to reduce the Advanced Technology Credits in the rule. [EPA-HQ-OAR-2019-0055-1203-A1, p. 107]

The Agency's speculation that it underestimated the growth of ZEVs is not well-founded. Even if it were, it does not justify changing the final Phase 2 rule after manufacturers have established their technology and product plans to meet the rule. Furthermore, regulations as complex and the Phase 2 GHG rule are never perfect. For example, the rule assumes significant GHG reduction benefits from manufacturers deploying electric accessories, a benefit that can only be achieved by increasing the voltage of the electrical system. However, that cannot be cost-effectively accomplished unless a significant portion of the industry also converts to the higher voltage, so accessories can be sold in high volumes. While there has been a great deal of discussion about converting medium- and heavy-duty trucks from 12 V to 48 V, that upgrade is not expected to be realized this decade. As such, manufacturers cannot expect to see any penetration of electric accessories, even though the rule assumed significant adoption by 2027. Because the industry is converting to 48 V slower than EPA assumed when it finalized the Phase 2 GHG rule, manufacturers must deploy other technologies to meet the standards. [EPA-HQ-OAR-2019-0055-1203-A1, p. 108]

The Phase 2 GHG rule also assumed that manufacturers would deploy advanced transmission shift strategies and show those benefits with powertrain certification testing. While manufacturers indeed are deploying advanced shift strategies to make their trucks operate more efficiently (i.e., with lower GHG emissions), they are unable to get credit for that technology when certifying trucks to the Phase 2 GHG regulations. The powertrain certification test procedures are extremely complicated and so far unvalidated. Manufacturers are working with EPA to clarify the procedures so they can conduct powertrain testing consistently and with confidence, but that process is likely to take months or years to complete, and in the meantime, manufacturers have no way of earning GHG credits for the advanced shift strategies they are deploying. [EPA-HQ-OAR-2019-0055-1203-A1, p. 108]

The Phase 2 GHG rule also overestimated the willingness of trucking fleets to accept tamper-resistant automatic engine shutdown systems. The rule assumes that a vast majority of trucks would be built with that technology by 2027, yet even though all manufacturers have the technology available, almost no fleets are willing to accept it. Similar to the other situations where the Phase 2 rule over-estimated the adoption of a technology, in order to meet the current Phase 2 standards, manufacturers must deploy technologies other than tamper-resistant automatic engine shutdown systems. Thus, notwithstanding the other clear examples of the Agency's overestimations of available GHG-reducing options, EPA is pointing to one potential under-estimation in the Phase 2 rulemaking as supposed justification for recasting what final rules really mean. There is no good faith justification for that. [EPA-HQ-OAR-2019-0055-1203-A1, p. 108]

In sum, EPA incorrectly points to speculative ZEV adoption rates to support the assertion that the Phase 2 GHG rule underestimated the growth of medium- and heavy-duty ZEVs, and that such an assumed underestimation justifies reopening the Phase 2 GHG standards. The actual deployment of ZEVs (not predictions or aspirations) simply does not support increasing the stringency of the Phase 2 GHG rule. To the contrary, verifiable sales data would support deceasing the stringency due to the rule's overestimation of the adoption of conventional vehicle technologies. [EPA-HQ-OAR-2019-0055-1203-A1, p. 108]

More important than estimation errors in a complex rulemaking, manufacturers need regulatory stability and predictability – now and with future Administrations – to be able to develop the needed technologies and establish the necessary productions and sales plans to comply with the rule. Accordingly, EPA should not reopen the Phase 2 GHG rule; it is a misguided proposal that is wholly unsupported by the relevant facts and the dictates of good government policy. [EPA-HQ-OAR-2019-0055-1203-A1, pp. 108 - 109]

As discussed above, ZEVs are beginning to emerge in the medium- and heavy-duty trucking industry, yet many significant challenges remain for manufacturers, fleets, utilities, governments, and other stakeholders before we can point to the beginning of a broad-based transition of the industry to ZEVs. While aspirations are quite high right now, a great deal of work remains before trucking fleets will be willing to make the significant and long-term investments needed to begin transitioning to ZEVs in a meaningful way. At this time, most medium- and heavy-duty ZEVs in service are prototypes or demonstration units that are a long way from providing trucking businesses with the competitive total cost of ownership that they need to justify beginning the process of converting to ZEVs. [EPA-HQ-OAR-2019-0055-1203-A1, p. 109]

EPA has developed the proposed new ZEV certification, durability, useful life, and warranty provisions without any consultation with the manufacturers that are expected to implement them. History has shown that such unilateral development of complex vehicle certification procedures rarely leads to implementable and successful regulatory requirements. Although it is unfortunate that industry would be starting with the unilateral proposal included in the NPRM, we request that EPA commit to collaborating with manufacturers to identify a workable path forward for the certification and compliance requirements for credit-generating ZEVs. Considering the limited time before a final rule, and the complexity and novelty of ZEV certification and compliance requirements, we believe an interim approach may be the only realistic path forward. An interim solution could be fashioned to meet EPA's needs while not burdening ZEVs with excessive costs and regulatory requirements. If we can identify an appropriate interim approach, a long-term solution could then be developed as part of the Phase 3 GHG rulemaking. That rulemaking is a more appropriate forum for the in-depth data analyses and technical discussions needed to establish workable and effective long-term ZEV certification and compliance requirements. [EPA-HQ-OAR-2019-0055-1203-A1, p. 109]

EMA is evaluating the role that low-carbon fuels can play to reduce GHG emissions impacts from the multiple engine product sectors. Low-carbon fuels provide the opportunity to effect very significant near-term CO2 reductions because, to the extent that they are available as "drop-in" fuels, they can improve emissions from existing fleets without the need for additional technological advancements or the time for market adoption and phase-in. This opportunity can be scaled quickly, limited only by the fuel supply and the fuels' compatibility with the engine and aftertreatment systems in which they would be used. EMA is very interested in the potential for the widespread use of low carbon fuels. Steps will have to be taken, however, to improve and enforce the quality of those fuels to ensure market success. [EPA-HQ-OAR-2019-0055-1203-A1, p. 137]

Organization: *U.S. Chamber of Commerce*

We have concerns about provisions proposed in the rule that would modify the current Phase 2 GHG requirements, which have been in place since 2016. Such changes, if made final, would increase investment uncertainty and erode confidence in private-public partnerships that have helped successfully implement this program. While each business may view the particular impacts of these proposed changes through different lenses, changing provisions that were agreed to years ago would create a moving regulatory target and send mixed signals to the market. The proposed rule does not adequately account for such impacts. [EPA-HQ-OAR-2019-0055-1245-A1, p. 10]

Although significant changes to regulatory programs have occurred across a range of EPA and other federal agency programs during the last few administrations, EPA's medium- and heavy-duty GHG requirements have remained constant following the issuance of the 2016 final rulemaking.16 This is in no large part due to the commitment by companies to invest and meet the 2016 standards. [EPA-HQ-OAR-2019-0055-1245-A1, p. 10]

> 16. Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles— Phase 2, 81 Fed. Reg. 73478, October 25, 2016.

Companies are continuing to innovate and bring GHG-reducing technologies, fuels, and other solutions to the medium- and heavy-duty marketplace. EPA may be able to achieve additional GHG emissions reductions through incentives for advanced biofuels, such as biodiesel or renewable diesel, under the Renewable Fuel Standard program. As renewable diesel is a drop-in diesel fuel substitute, it has the potential to reduce GHGs from this mobile source sector without adding significant costs. Aside from this type of incentive, making unanticipated changes to the previously settled phase 2 GHG standards—ahead of EPA's next phase of GHG standards updates— would remove some of the stability needed by businesses to invest in this market segment. [EPA-HQ-OAR-2019-0055-1245-A1, pp. 10 - 11]

Organization: *Valero Energy Corporation*

The American Transportation Research Institute ('ATRI') made similar findings in a report issued this month:2 the trucking industry can decrease GHG emissions through a variety of vehicle types. Among other findings, the report concludes that based on a lifecycle analysis, Class 8 BEV production results in more than six times the carbon dioxide ('CO2') emissions as compared with a Class 8 ICEV due to the size and replacement cycle of the lithium-ion battery required to power a long-haul BEV. The analysis concludes with the following figure and the statement that there are three truck types (ICEV, BEV, and fuel cell electric vehicle ('FCEV')) that have a pathway for lowering CO2 emissions. Indeed, ICEVs with renewable diesel have a better emissions profile than the electric vehicles. [EPA-HQ-OAR-2019-0055-1328-A2, pp.3-4]

2 'Understanding the CO2 Impacts of Zero-Emissions Trucks: A Comparative Life-Cycle Analysis of Battery Electric, Hydrogen Fuel Cell and Traditional Diesel Trucks,' prepared by the American Transportation Research Institute (May 2022).

EPA acknowledges in the Notice of Proposed Rulemaking (NPRM) that 'projecting the production levels of conventional and electric HD vehicles in MY 2027 and beyond is challenging'.3 However, EPA should not move forward on the basis of an inadequate analysis and questionable data. EPA is proposing new Model Year ('MY') 2027 standards based on the premise that something has changed since the original rulemaking, yet EPA does not document or quantify any change in the proposal other than the issuance of Executive Orders directing EPA to reconsider its previously established standards in favor of electrification. If EPA does not have the data to establish a sound basis for estimating MY 2027 HDV and electric vehicle ('EV') production, then EPA is not ready to proceed with this rulemaking and should not try to use the estimate to justify the lowering of emission standards. [EPA-HQ-OAR-2019-0055-1328-A2 ,p.4]

3 87 FR 17600

As the basis for its estimate of the total number of HD vehicle sales in MY 2027, EPA relies on:

- Analysis performed by CARB under the Advanced Clean Trucks ('ACT') rulemaking to project future HD vehicle sales in California,
- ZEV sales mandate established by CARB as projection of future EV sales in California,
- Data published by International Council on Clean Transportation ('ICCT') to establish a ratio between EV sales in California and EV sales in the remainder of the U.S., and
- HD vehicle sales projections from previous EPA rulemaking to project future sales in the remainder of the U.S. [EPA-HQ-OAR-2019-0055-1328-A2, pp.4-5]

Concerns relating to EPA's projection include the following:

1. EPA's projection of HD engine and vehicle sales relies on data from 2017 and earlier and does not account for significant changes that could impact sales. EPA uses outdated

forecasts of future HD vehicle sales, relying on analyses performed by CARB in the ACT rulemaking and by EPA in the HD GHG Phase 2 rulemaking. 4' 5 The COVID-19 pandemic alone has significantly impacted the way the U.S. lives, works and moves as well as how goods are bought, sold, and delivered, rendering any pre-pandemic forecasts of MY 2027 sales obsolete. [EPA-HQ-OAR-2019-0055-1328-A2, p.5]

4 CARB, 'Advanced Clean Trucks Regulation Standardized Regulatory Impact Assessment', August 2019. The CARB analysis was based on sales projections in CARB's EMFAC2017 emission inventory model.

5 U.S. EPA. 'Regulatory Impact Analysis: Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium and Heavy-Duty Engines and Vehicles -Phase 2.' Table 7-55. Page 7-49. April 2016.

2. EPA relies on ZEV mandates in California to project EV growth in the rest of the U.S., assuming that HD EV sales in the U.S. will experience the same rate of growth as has been mandated by law in California. It should be noted that California's ZEV sales targets are highly aspirational mandates and not projections based on actual sales performance. It should further be noted that the California mandates have been adjusted several times over the life of the program to reflect a reality that could not keep up with the aggressive targets. In the midst of record inflation, unprecedented supply chain disruptions and critical concerns about the availability, cost and foreign dependence of minerals needed for EV batteries, it is irresponsible of EPA to assume the U.S. will experience growth in FID EV sales based on expectations regarding mandated growth in California. [EPA-HQ-OAR-2019-0055-1328-A2, p.5]

3. EPA misinterprets and misrepresents data by CARB and ICCT

- a. EPA estimates that 20% of Class 4-8 and 15% of Class 7-8 Tractor sales in California will be ZEV in MY 2027, based on ACT sales requirements. The ACT sales requirements are more nuanced than EPA interprets or applies them. The incorporation of weight class modifiers means that one auto manufacturer might be able to comply with fewer ZEV sales, and another might need more. EPA has not demonstrated, nor is it reasonable to assume that compliance with California's ACT sales requirements will translate to 20% of Class 4-8 and 15% of Class 7-8 Tractor sales in California being ZEV in MY 2027.
- b. Based on a fact sheet published by the ICCT, EPA estimates that new HD EV sales in California in MY 2027 will represent 42% of new HD EV sales in the U.S.6 Data presented in the ICCT fact sheet refer to total ZEVs sold to-date (through 2020), not to new ZEV sales in 2020. It is not reasonable to assume that the ratio of HD EV stock (as of 2020) in CA to the remaining 49 states would be the same as the ratio of HD EV MY 2027 sales in CA to the remaining 49 states. Further, EPA concludes from the ICCT fact sheet that 'approximately 42 percent of the heavy-duty electric vehicle sales in the U.S. are in California.' Thus, EPA's ratio of sales is incorrect. EPA cannot assume that 42 percent of sales will occur in California. The ICCT fact sheet actually states 'to date, 42% of zero emission commercial vehicles sold in the United States and Canada have gone to fleets in California.' [EPA-HQ-OAR-2019-0055-1328-A2, pp.5-6]

6 ICCT, 'Fact Sheet North America: Zero-emission bus and truck market in the United States and Canada: A 2020 Update', May 2021

Valero has independently conducted lifecycle analysis that shows the differences in GHG emissions resulting from use of renewable fuels as well as how different sources of electricity can reduce the benefits from EV adoption. The carbon intensity of electricity generation can vary dramatically depending on the fuel source. In setting national standards, EPA should not naively assume that increased electrical demand will be satisfied with low-carbon sources; EPA must account for variable sources of electrical generation, and should avoid setting a vehicle standard that may paradoxically increase electricity generation from energy sources of high carbon intensity. For Class 8 trucks, for example, Valero's analysis shows that an ICEV fueled with renewable diesel reduces lifecycle GHG emissions by almost 70 percent and a renewable diesel fueled FLEV achieves even greater lifecycle emission reductions, achieving emission reductions comparable to the cleanest BEV and FCEV. Note that BEVs powered by Wyoming power stations, which are over 80 percent coal-fired, have lifecycle GHG emissions more than 30 percent higher than ULSD fueled ICEVs. [EPA-HQ-OAR-2019-0055-1328-A2, p.7]

Furthermore, EPA has not accounted for how increasing incentives or mandates for electrification of HD engines and vehicles will exacerbate the supply chain problems identified in comments on the LD GHG rule and the environmental and national security problems associated with the supply issues related to battery production. EPA projected that the LD GHG rule finalized at the end of 2021 will result in doubling the electric vehicle fleet in a four-year period. EPA has not addressed in this proposal how such increased demand for electricity for LD vehicles and increased infrastructure demand for LD vehicles could affect the supply and reliability of electricity and infrastructure for HD engines and vehicles. [EPA-HQ-OAR-2019-0055-1328-A2, p.7]

As in the LD GHG rule, EPA has not accounted for the findings in a recent IEA report that 'today's mineral supply and investment plans fall short of what is needed to transform the energy sector, raising the risk of delayed or more expensive energy transitions.'10 EPA should evaluate the impact of limited supplies of raw materials needed to support increased electrical generation and battery manufacture, as well as the current chip shortage, will have on the HD EV market. In assessing mineral availability issues related to HD vehicle batteries, it should be noted that the quantity of minerals necessary to manufacture a HD vehicle battery is orders of magnitude greater than LD vehicle batteries (as noted above, the ATRI report assesses carbon emissions resulting from production of a 8.5 ton lithium-ion Class 8 vehicle battery). As noted above, EPA's EV market evaluation is wholly inadequate because it is outdated and relies on assumptions derived from state mandates rather than factual data. [EPA-HQ-OAR-2019-0055-1328-A2 ,p.7]

10 lEA (2021), The Role of Critical Minerals in Clean Energy Transitions, https://www.iea.org/reports/the-role-ofcritical- minerals-in-clean-energy-transitions.

Organization: *Volvo Group*

The Volvo Group is fully aligned with EMA's comments opposing the reopening of the Phase 2 regulation. As EMA noted, the Volvo Group has relied on the expected regulatory certainty to balance our investments in engine and vehicle technologies to provide GHG improvements, while also meeting the need for electrification of key vehicle models. We were able to perform this balancing act based on the stringency steps as finalized in 2016, along with the Advanced Technology credit multiplier used to incentivize development and sales of heavy-duty "all-electric" vehicles, otherwise known as battery electric vehicles, or BEVs. The Volvo Group and EMA cited this same need for regulatory certainty in opposing a review of the Phase 2 regulation during the previous administration, a review that likely would have had the effect of weakening the regulation, as was attempted with the light-duty regulation. [EPA-HQ-OAR-2019-0055-1324-A1, p. 7]

Globally, Volvo Trucks, Renault Trucks, Mack Trucks, Volvo Bus and Nova Bus offer heavy-duty on-road commercial ZEVs in regional short haul, urban pick-up and delivery, light construction (on-road short haul), and transit bus applications. In the United States, Volvo Trucks offers the VNR Electric BEV in regional short haul and local delivery tractor and box truck applications with a range up to 275 miles, Mack Trucks offers the LR Electric low-entry cab-over refuse truck with a range up to 100 on-the-job miles, and Nova Bus offers its LFSe and LFSe+ with a range up to 290 miles. All these models are available for purchase and delivery today; these are not just prototypes or preorder opportunities. [EPA-HQ-OAR-2019-0055-1324-A1, p. 7]

The Volvo Group is committed to transitioning to a carbon-neutral future as rapidly as possible. We foresee that future primarily relying on zero-emission BEV and fuel-cell electric vehicles (FCEV) and have set aggressive targets of 35% of global vehicles sales to be zero-emissions by 2030, and 100% fossil free by 2040. However, there are factors outside of our control that must be in place for us to meet these very lofty, yet achievable, goals, including: grid readiness, sufficient charging and refueling infrastructure, purchase incentives to address cost competitiveness in the early days of the market, and customer acceptance. [EPA-HQ-OAR-2019-0055-1324-A1, p. 7]

If any revision must be made, the agency should make that revision in the transition to the Phase 3 heavy-duty greenhouse gas regulation. [EPA-HQ-OAR-2019-0055-1324-A1, p. 8]

In conclusion, the Volvo Group believes the following principles must be reflected in the final regulation: a respect for completeness of data, economic consequences of the regulation (including increased technology costs and workforce implications), and the many factors outside of OEM control affecting the speed of ZEV penetrations in the marketplace. [EPA-HQ-OAR-2019-0055-1324-A1, p. 10]

Organization: *Walmart*

EPA should take a full and robust market view in revising Phase 2 GHG standards and potential Phase 3 standards based on market conditions, cost-effectiveness, diverse stakeholder input and infrastructure needs. [EPA-HQ-OAR-2019-0055-1191-A2, p. 2]

In the proposed rule, EPA seeks to increase the stringency of the current Phase 2 GHG standard for select vehicle types for MY2027 and after. This adjustment is based on analysis that indicates that these specific vehicle types, which include delivery vans, are more quickly transitioning to electric-based power due to market and public policy factors.5 [EPA-HQ-OAR-2019-0055-1191-A2, p. 2]

5. https://www.govinfo.gov/content/pkg/FR-2022-03-28/pdf/2022-04934.pdf

We encourage EPA to take a full and robust view of the market demand and policy developments incentivizing growing demand for these vehicle types in MY2027 and after, and to set an appropriate regulatory signal that reflects realistic technology and infrastructure conditions, motivating action by manufacturers to meet the compliance and demand-side needs, while further driving down purchase costs. [EPA-HQ-OAR-2019-0055-1191-A2, p. 2]

Robust inter-agency collaboration is critical to ensuring that incentives are aligned across the government and deliver a smooth transition to lower- and zero-emissions technologies for heavy duty vehicles. [EPA-HQ-OAR-2019-0055-1191-A2, p. 3]

For example, there is a concern that the weight of batteries in MHDVs will trigger weight limits that can affect payload efficiency and route optimization, which is an important short- and medium-term tool for reducing GHG and NOx emissions. Walmart encourages consideration of additional weight allowances to account for the difference between near-zero and zero-emission vehicles and diesel engines. [EPA-HQ-OAR-2019-0055-1191-A2, p. 3]

It will be valuable for EPA to consult and coordinate with other key federal agencies that regulate heavy duty vehicles to identify a full range of complementary actions that can accelerate adoption of these technologies. [EPA-HQ-OAR-2019-0055-1191-A2, p. 3]

Organization: *Westport Fuels Systems (WFS)*

Conversely, H2 ICEs are much less sensitive to purity. This not only decreases risks for fleet operators, and potentially leads to lower costs, it also eases the expansion of refueling infrastructure. This is especially true where interstate hubs are working to enable the development of an interconnected hydrogen network. As such, H2 ICEs would be able to offtake hydrogen from diverse sources, including through repurposed natural gas infrastructure, which FCEVs would not. [EPA-HQ-OAR-2019-0055-1278-A1, p.5]

There is a clear case for hydrogen fueled ICEs in road freight, and while many industry players are considering pure hydrogen with spark ignition (SI) combustion technology, the application of

Westport Fuel Systems HPDI technology overcomes some of the limitations of SI H2 ICEs. [EPA-HQ-OAR-2019-0055-1278-A1, p.5]

Despite their varying stages of development, the pathway for H2 ICEs is well understood, being based on existing ICE manufacturing routes. Hydrogen refueling infrastructure deployment is far more likely to be the critical timing path to commercialization.[EPA-HQ-OAR-2019-0055-1278-A1, p.5]

22 International Council on Clean Transportation

EPA Response

EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider the comments in this section of this document in the development of that future rulemaking.

28.2 Advanced Technology Credit Adjustments

Comments by Organizations

Organization: *Advanced Engine Systems Institute (AESI)*

The existing ZEV credit multipliers contained in the Phase II GHG rule are far too generous and should be phased out quickly. These multipliers will diminish real CO2 reductions from diesel trucks and hurt the sale of electric trucks. [EPA-HQ-OAR-2019-0055-1281-A1, p. 3]

Organization: *Allison Transmission, Inc. (Allison)*

Allison has invested in fuel efficiency solutions for conventional vehicles that are already in production. These systems could assist OEMs in need of fleet average GHG improvements apart from credits generated through ZEVs. [EPA-HQ-OAR-2019-0055-1231-A1, p.24]

- For example, Fuel Sense 2.0 is a software package that can reduce conventional engines CO2 up to 6% with more impact in urban and multi-purpose applications. [EPA-HQ-OAR-2019-0055-1231-A1, p.24]

- Also, the Allison on-highway transmission portfolio is currently compatible with lower carbon-intensity alternative fuels like natural gas or propane; Allison is also planning for integration of more alternative fuel options in the future. [EPA-HQ-OAR-2019-0055-1231-A1, p.24]

- Allison's eGen Flex™ hybrid systems reduce CO2 in transit bus up to 25%.53 While EPA's proposal focuses on BEVs, hybrid systems can serve as a bridge solution for transit agencies that do not yet have charging infrastructure or workforce readiness established to support full ZEV transition. Among other benefits, these systems result in reduced CO2 emissions while helping to familiarize transit agencies with high voltage systems. [EPA-HQ-OAR-2019-0055-1231-A1, p.24]

We would suggest that, in principle, if EPA seeks to bring ZEV closer to its real-world CO2 impact by reducing multipliers, EPA should also review opportunities to bring non-ZEV CO2 reduction technologies to closer to real-world emissions credit, so that OEM and end-user customers have a variety of ZEV and non-ZEV pathways to achieve CO2 fleet compliance. Consistent with EPA's rationale (wherein it believes that retaining current multipliers could have counter-productive results, allowing continual production of higher-emitting vehicles) EPA could alternatively review how non-ZEV technology paths can receive appropriate credit mirroring real-world CO2 reduction across commercial vehicle.[EPA-HQ-OAR-2019-0055-1231-A1, p.24]

EPA can do this by better integrating non-ZEV CO2 reduction technology and considering a way to include real world customer drive cycles into the GEM model. Some fuel-savings technologies are not best represented on certification cycles (steady state 55-65 mph and ARB transient). A singular focus on quantifying potential market uptake of ZEVs does not represent the whole picture regarding how OEMs will lower GHG emissions fleetwide and an overemphasis on reductions achievable through ZEV technology risks private sector investment (and gains) that can be made across various non-ZEV platforms. In fact, the direction of EPA's Phase 2 analysis risks overreliance on ZEVs and could result in at least implicit pressure for OEMs to pursue ZEVs as the sole methodology for meeting more stringent standards with respect to this rulemaking and other rules that are part of the Biden Administration's articulated agenda.54 [EPA-HQ-OAR-2019-0055-1231-A1, pp.24-25]

54 Executive Order 14037.

EPA should place greater emphasis on fuel savings technologies are already in production to reduce CO2 emissions. In the context of this rulemaking, it should not be presumed that better integration of "conventional" technologies would detract from the longer-term development of ZEV technology, resulting in less overall emission reductions. To the contrary, EPA has already projected that the TCO for ZEV technologies will soon reach parity with compression ignition ("CI") and spark ignition ("SI") technologies.55 All other things being equal, the commercial heavy-duty market will invariably select lower-cost options. But an over emphasis on ZEV acquisition as the primary means to reduce fleetwide CO2 emissions could leave near-term reductions in CO2 emissions effectively "on the table" or result in an inefficient allocation of resources if the cost-per-ton of emission reduction from ZEV vehicles remains higher longer than EPA projections. In short, EPA should not promulgate a regulatory structure and presumption that would serve to detract from multiple technologies that are able to efficiently reduce CO2 emissions. [EPA-HQ-OAR-2019-0055-1231-A1, p.25]

55 87 Fed. Reg. at 17,562.

Commercial vehicles differ from passenger cars because components and features are used across a wide range of vehicles and vocations. Often, the perception of fuel savings value varies greatly depending on the end vehicle being produced. In the commercial context, end users of vocational vehicles are often reluctant to accept efficiency features if they perceive that there is a risk that the feature will reduce productivity of the vehicle. While vocational vehicle purchasers are highly motivated to reduce operating costs through fuel savings, an overriding concern for most commercial buyers is that the vehicle they are buying will be reliable and able to perform the work required of it. This results in a continuing challenge for OEMs to make new, more efficient configurations widely accepted in the market. [EPA-HQ-OAR-2019-0055-1231-A1, p.25]

EPA should therefore consider crediting methodologies that would make it easier for OEMs to apply CO2 technology for GHG credits across a wide range of vehicle configurations. And this effort should be accompanied by additional review of the duty cycles used for the certification of different vehicle types. [EPA-HQ-OAR-2019-0055-1231-A1, p.25]

- Vocational applications like transit bus with lower average speed, more frequent stops, and technology advancements such as hybrid with all-electric-range can realize greater CO2 benefits than reflected in GEM model. This results in an underestimation resulting CO2 emissions. [EPA-HQ-OAR-2019-0055-1231-A1, p.25]
    - Specifically, eGen Flex™ hybrid systems can realize up to a 25 reduction in CO2 emissions, yet this performance is not recognized in GEM. Hybrid drive cycles include engine-off run time which is entirely out of scope of the current certification cycles. Transit agencies can use of geofencing, green EV zones, and Engine Start Stop features to increase percentage of operating time where vehicle is moving, but engine is off. [EPA-HQ-OAR-2019-0055-1231-A1, p.26]
    - GEM model does not capture such effects when modeling CO2 reduction because GEM model instead reflects a mix of high speed 55-65 mph steady state cycles and ARB transient, compared with Manhattan cycle with top speeds of 25 mph. Neither custom chassis certification nor powertrain testing certification include certification cycles that reflect the real-world operation of transit buses or other unique drive cycles [EPA-HQ-OAR-2019-0055-1231-A1, p.26]

- Allison's Neutral at Stop Standard feature is another example of a fuel efficiency feature that reduces conventional CO2 emissions but does not have this benefit reflected in OEM GEM score. [EPA-HQ-OAR-2019-0055-1231-A1, p.26]
    - GEM's neutral idle capability recognizes only torque reduction at idle that is equivalent to true neutral, and thus, Neutral Idle is incorporated in GEM with a binary yes-no selection. It is unfair to allow no benefit in the GEM logic to OEMs utilizing such features as Neutral at Stop Standard which utilizes approximately 70% torque reduction at idle to show efficiency gains at a partial credit of the GEM Neutral-Idle feature, while optimizing vocational productivity and therefore increasing adoption rates by end users. [EPA-HQ-OAR-2019-0055-1231-A1, p.26]
    - EPA could change Neutral-idle technology within GEM to recognize this CO2 reduction with a high-medium-no setting, or it would be possible to use off-cycle technology credit, however, clear requirements and definitions are needed to assign an approved partial credit. EPA could address this crediting issue within

the context of this rulemaking and the broad request for comments that EPA has solicited. [EPA-HQ-OAR-2019-0055-1231-A1, p.26]

- A third example exists with respect to DynActive™ Shifting
  - This feature is specified by end-users desiring fuel savings. But advanced shifting strategies are currently not a technology improvement option for vocational customers in the GEM model. EPA should therefore consider this technology for inclusion in GEM with a high-regular-no setting of efficiency bias input to reflect the different levels vocational customers set to balance their productivity needs with reduced fuel usage.
  - This feature utilizes an algorithm to learn the engine's torque curve, allowing shifting decisions to be made to maximize performance when performance is needed, all while delivering fuel economy benefit when there is opportunity (part throttle, light weight, downhill operation, etc.). [EPA-HQ-OAR-2019-0055-1231-A1, p.26]

Other vendors to OEMs may have additional technologies that are similarly-situated. But the main argument is that EPA should not ignore technological innovations for conventional powertrains during the period of many years that it will take to transition to ZEV technology. While some of these technologies will be adopted through market forces and stricter GHG requirements, non-engine GHG technology cannot benefit under regulatory protocols that rely on measured reductions in engine-out CO2 emissions. Rather, even if the technology provides an actual reduction in CO2 emissions, the technology can only be properly incentivized if it is credited within GEM itself. That crucial difference dictates a different approach in the heavy-duty sector versus the light-duty sector where treadmill tailpipe testing of exhaust emissions explicitly recognizes multiple vehicle technologies that result in lower CO2 emissions. In effect, the GEM model, while necessary for the Phase 2 program given limited chassis-testing, also acts as final arbiter of whether a specific technology will be favored in the marketplace. Whether through GEM or a different mechanism, EPA should expand the ability to measure and credit GHG reductions apart from the zero g/mile credit given to ZEVs.56 [EPA-HQ-OAR-2019-0055-1231-A1, p.27]

56 87 Fed. Reg. at 17,557.

Organization: *American Council for an Energy Efficient Economy (ACEEE)*

The Advanced Vehicle Technology Credit endangers the emissions reductions from the standards, even with proposed stringency increases, and should be eliminated as quickly as possible. This credit was planned for a much less mature EV market than we have now. Based on currently expected EV sales, the credits would allow substantially worse fleetwide GHG performance than the nominal stringency of the Phase 2 standards would indicate. [EPA-HQ-OAR-2019-0055-2852-A1, p.7]

Table 3 shows the effects of the existing credit on the current and proposed rule stringencies for class 4-5 light heavy-duty vocational vehicles3, which saw their effective stringency changed the least as a result of increased rates of electrification, and therefore represent a conservative estimate of the potential loss in stringency resulting from the credits. The methodology ACEEE used to arrive at these estimates is explained in Appendix B. As the table shows, even with the lowest plausible EV sales shares in 2027, the existing advanced technology credits would lead to effective standards far weaker than the nominal Phase 2 standards for MY 2027, with effective emissions limits for ICEs lower than even the MY 2021 standards. Figure XI-1 of the NPRM quantifies this in terms of emissions and shows that the minimum expected nationwide EV sales would result in an increase of over 30,000,000 Mg of GHG emissions. [EPA-HQ-OAR-2019-0055-2852-A1, p.8]

3 The division between light heavy-duty vocation vehicles is different in the ACT sale requirements and federal emission rules. This table ignores any averaging between Light Heavy-Duty vehicles which have different ACT sale requirements.

EPA requested comment on three options to limit these adverse effects of this credit. ACEEE believes option 3, the complete phase-out of the credit by MY 2027, is the best of the options offered to mitigate the harm of the credit and ensure continued improvement in ICVs, as shown in Table 4. However, option 3 alone would be insufficient to address the problem. We suggest that EPA also exclude any vehicle certified for ACT compliance and sold in any ACT adopting state, from eligibility for this credit, effectively combining proposed options 1 and 3. This will ensure that manufacturers' compliance with state regulations does not result in reduced emissions benefits of the federal rule. [EPA-HQ-OAR-2019-0055-2852-A1, p.9]

EPA should both phase out the Advanced Vehicle Technology Credit program, by MY 2027, and also immediately exclude any vehicle certified for compliance with the Advanced Clean Truck Act, and sold in an adopting state, from eligibility for this credit. [EPA-HQ-OAR-2019-0055-2852-A1, p.10]

Organization: *American Fuel & Petrochemical Manufacturers (AFPM)*

EPA's Heavy-Duty GHG Phase 2 program currently provides multipliers of 3.5, 4.5, and 5.5 for Hybrid Electric Vehicles, Battery Electric Vehicles, and Fuel Cell Electric Vehicles, respectively. These multipliers further misrepresent the actual emissions, arbitrarily distort the benefits analysis, and are not authorized by the Clean Air Act or any other federal statute. In discussing the technology credit multipliers, EPA admits the program is not technologically neutral and that the technologies receiving the multiplier credits are not cost-effective. The agency states, '[t]he HD GHG Phase 2 advanced technology credit multipliers represent a tradeoff between encouraging a new technology that could have significant benefits well beyond what is required under the standards and providing credits that do not reflect real world reductions in emissions which in effect allow for emissions increases by other engines and vehicles.'31 EPA has offered for comment several options in the rule to either reduce, cap or phase out the multipliers through 2027 and the Agency includes no multipliers beginning in 2028. These Agency efforts to reduce, cap or phase out these multipliers acknowledges that the policy is unlawful, not necessary anymore, and not good policy to cost-effectively reduce emissions. [EPA-HQ-OAR-2019-0055-1262-A1, p.8]

31 87 Fed Reg. 17603 (March 28, 2022)

The use of 'EV Multipliers' is arbitrary and capricious because it reduces the effectiveness of the Proposal's greenhouse gas limits and increases costs to regulated parties and consumers without any corresponding benefit to health, safety, or public welfare. EV multipliers increase the net amount of greenhouse gas emitted both in the short term, by diluting the standards, and in the long term, because they discourage innovations in ICE technology. [EPA-HQ-OAR-2019-0055-1262-A1, p.9]

The use of the multiplier simply creates a financial windfall for a specific mobile source technology, by granting credits that are not a logical outgrowth from the actions taken by the regulated entities. EPA continues picking technology winners and losers through this process. The market and consumer choices should drive decision making. EPA states in the Proposal that there is a much larger effort by manufacturers in the most recent years to produce BETs. If that is the case as EPA outlines, then there is no additional economic incentive for multipliers that continue to distort the market. [EPA-HQ-OAR-2019-0055-1262-A1, p.9]

Organization: *California Air Resources Board (CARB)*

The NPRM requested comment for how to revise the Phase 2 ATC multiplier used by a manufacturer for BEV in 2024 through 2027 MYs and proposed three different approaches. CARB staff supports U.S. EPA in reducing the number of incentive credits produced by electric vehicles in the 2024 through 2027 MYs. CARB staff agrees and supports U.S. EPA's proposed first approach of not allowing ATC multipliers for 2024 through 2027 MY electric vehicles that are certified to ACT regulations (including California and any other section 177 states that adopt CARB's ACT regulation). Starting in the 2024 MY, CARB's ACT regulation will require 5 to 9 percent of total HD vehicles sales to be ZEVs. These HD ZEVs would continue to be considered zero grams CO2 per ton-mile emissions and receive significant credits reflective of the difference between the applicable CO2 emission standard and zero grams emissions. Hence, there would be no need for the ATC multiplier incentive on those ACT-certified vehicles. [EPA-HQ-OAR-2019-0055-1186-A2, p.83]

CARB staff agrees with U.S. EPA that HD electric vehicles certified to the federal program for new vehicles sold outside of California, and not subject to California standards in other states under Section 177, would continue receiving some type of ATC multipliers for the federal program. However, CARB staff urges U.S. EPA to reduce and phase-out the magnitude of the ATC multipliers over a period of MYs following the U.S. EPA's calculation approach in their third proposed approach, in combination with the first proposed approach to not allow the ATC multiplier for HD ZEVs certified to CARB's ACT regulation. As discussed in the NPRM, electric vehicle costs have been decreasing substantially since the federal Phase 2 adoption in 2016 due to the increase in battery electric learning and production levels. It is appropriate to adjust the ACT multipliers to account for the decreased electric vehicle costs as shown in Table XI-14 in the NPRM, where the proposed multipliers are 4.5, 3.5, 3.0, 2.0, and 1.5 in the 2023, 2024, 2025, 2026, and 2027 MYs, respectively, instead of the current multiplier of 4.5 for the 2024 through 2027 MYs. [EPA-HQ-OAR-2019-0055-1186-A2, pp.83-84]

Organization: *Ceres BICEP (Business for Innovative Climate and Energy Policy) Network*

In addition, in order to prevent increased emissions, EPA should preserve the Phase 2 stringency requirements for ICE vehicles and phase out advanced technology credit multipliers as soon as feasible. Finally, a recent Ceres analysis [https://www.ceres.org/resources/reports/electrifying-american-trucking-promise-and-challenges] concluded that, while shifting to electric vehicles increasingly makes economic sense for manufacturers and suppliers, as well as fleet owners and shippers, a federal ZEV mandate and fleet purchasing requirements, similar to California's Advanced Clean Truck (ACT)1 and Advanced Clean Fleet (ACF) standards, will be necessary to accelerate this transition at the rate and scale necessary to meet climate goals, and to ensure the global competitiveness of the U.S. truck industry. Accordingly, we urge you to adopt a ZEV mandate consistent with the targets outlined above. [EPA-HQ-OAR-2019-0055-2714-A1, pp.1-2]

> 1 The ACT has drawn significant business and investor support. Importantly, given that MHDVs are the largest source of nitrogen oxides (NOx) in the transportation sector, it is critical to strengthen the proposed NOx standards.

Organization*: Clean Air Task Force, Environmental Law & Policy Center, National Parks Conservation Association, and Sierra Club*

EPA must also revise its proposal to provide credit multipliers to plug-in hybrid, all-electric, and FCEVs. Because credit multipliers erode emissions reductions, they are not warranted for ZEVs that will already be produced as a result of state-level and other requirements and commitments (and thus need no incentive). [EPA-HQ-OAR-2019-0055-1302-A1, p.8]

EPA must reconsider its proposal on advanced technology credit multipliers to avoid diluting the GHG standards by providing unnecessary incentives to HD ZEVs that will be built even under a business-as-usual scenario. The 2016 Phase 2 GHG rule provides credit multipliers to plug-in hybrid (3.5X), all-electric vehicles (4.5X), and fuel cell vehicles (5.5X) to incentivize the deployment of advanced technologies. 87 Fed. Reg. at 17,594. When Phase 2 was finalized, EPA concluded that these technologies were important to achieving significant future emissions reductions in the HD sector, but were unlikely to be adopted in the market without additional incentives. Id. at 17,603. However, as described above in Section III.A, EPA's pessimism was mistaken. In 2016, EPA found that there was only one manufacturer that had certified an all-electric HDV, 87 Fed. Reg. at 17,603, but that number ballooned to 52 in MY 2020.248 Commenters agree with the Agency's conclusion that 'credit multipliers…may no longer be appropriate' and could 'reduc[e] the effective stringency of the existing MY 2024 through 2027 standards.' 87 Fed. Reg. at 17,603. In fact, EPA warns that at 8.5% ZEV penetration, *all* of the projected reductions from Phase 2 would be lost due to the credits. Id. at 17,604. [EPA-HQ-OAR-2019-0055-1302-A1, pp.66-67]

248 EPA, Memo to Docket, HD 2027 Proposed Changes to Heavy-Duty Greenhouse Gas Emissions 2 (Nov. 2021).

EPA proposes three options to reduce the impact of the credit multipliers on the stringency of the standards. Id. at 17,605–07. The first, precluding the multipliers from being utilized by ZEVs certified in California, inappropriately omits ZEVs that are required to be sold in other states that have adopted the ACT rule or other binding requirements. If a state already requires a certain percentage of HD sales to be ZEVs, those vehicles should be reflected in the baseline and should not accrue credit multipliers. [EPA-HQ-OAR-2019-0055-1302-A1, p.67]

The second option would cap the number of credits a manufacturer could receive, precluding credit multipliers to ZEVs sold *above* a certain threshold. This seems to turn EPA's original balancing on its head. EPA describes its rationale for credits: The HD GHG Phase 2 advanced technology credit multipliers represent a tradeoff between encouraging a new technology that could have significant benefits well beyond what is required under the standards and providing credits that do not reflect real world reductions in emissions which in effect allow for emissions increases by other engines and vehicles. [EPA-HQ-OAR-2019-0055-1302-A1, p.67]

Id. at 17,603. The intention of the credit multipliers is to encourage technology deployment and emissions reductions that would not occur without the incentive; therefore, it should be those additional ZEVs that receive a credit multiplier, not the ones that would be produced under a business-as-usual scenario. Every credit multiplier will lessen the emissions reductions required of conventional vehicles, and therefore should only be available for HD ZEVs that are actually incentivized. This approach, however, would require an accurate assessment of the baseline. As noted above, Commenters' assessment indicates that HD ZEV penetration will be at least 8–11% by 2027 and 19–27% by 2030. If a manufacturer is incentivized by the credits to produce more ZEVs than business-as-usual, only then should credits be available in the 2024–2027 timeframe. [EPA-HQ-OAR-2019-0055-1302-A1, p.67]

The final proposed option provides no rationale based on incentivizing additional ZEVs, but merely attempts to phase out the credit multipliers in an orderly fashion. HD ZEVs that would be built anyway—as the analysis in Section III indicates—should not be eligible for credit multipliers. Commenters recommend phasing out multipliers for these vehicles as expeditiously as possible. [EPA-HQ-OAR-2019-0055-1302-A1, p.67]

Organization: *Coalition for Clean Air*

The greenhouse gas credit multipliers for ZEVs proposed in the rule are overly generous, reducing the effectiveness of existing EPA regulations to reduce GHGs in the heavy-duty sector. [EPA-HQ-OAR-2019-0055-1139-A1, p.2]

Organization: *Consumer Reports (CR)*

EPA should eliminate credit multipliers for ZEVs to ensure incentives do not limit the effectiveness of the rule. [EPA-HQ-OAR-2019-0055-1285-A1, p.2]

EPA is proposing to adjust its credit system for heavy-duty vehicles to reduce the number of incentive credits produced by electric vehicle manufacturers in MY 2024-2027. We agree with the need to reduce these credits. Currently manufacturers can earn large advanced technology credit multipliers for CO2 emissions.60 Such multipliers were intended to encourage early action and technological innovation but have ultimately reduced the stringency of the existing GHG standards, largely due to the unforeseen growth in the HDV ZEV market.61 Any adjustments to this program should eliminate credits to prevent this outcome. A credit program should not result in backsliding of emissions reductions expected from ICEs. [EPA-HQ-OAR-2019-0055-1285-A1, p.10]

60 87 F.R. 17603.

61 Id.

EPA is proposing three approaches to reduce the number of incentive credits: (1) excluding EVs certified to meet California's ACT Rule from earning federal credits; (2) establishing an advanced technology cap; and (3) establishing a transitional credit cap. We agree with EPA's proposal to exclude EVs built to satisfy California's ACT requirement from the federal advanced technology credit incentive program. However, this cannot be the only adjustment to the program as it would still leave in place significant multipliers that could lead to backsliding. EPA's advanced technology cap proposal does little to address the issue of backsliding: It leaves in place multipliers that are too high, and, when the cap is reached, still allows for the accrual of credits. As with the current programs, this will lead to too many credits and hamper the effectiveness of the GHG standard. EPA's transitional credit cap proposal at least reduces the multipliers over time, and ultimately phases out multipliers. CR agrees that phasing out these multipliers is important. EPA should phase out these multipliers by 2024 or as soon as possible. While multipliers can be seen as a trade-off for encouraging early innovation and adoption of new technologies, this trade-off cannot come at the cost of an ineffective rule. [EPA-HQ-OAR-2019-0055-1285-A1, p.10]

Organization: *Daimler Truck North America LLC (DTNA) (1045 and 1168)*

EPA developed the Phase 2 program with flexibilities in mind, making it apparent that manufacturers could choose many paths to comply, including meeting their requirements in part by adopting ZEVs. Now that manufacturers are doing so, EPA proposes to remove this compliance path. Rather than create disincentives for ZEV adoption, EPA should continue to allow the flexibilities that rewarded such adoption in its original Phase 2 program. [EPA-HQ-OAR-2019-0055-1168-A1, p.113]

EPA also considers reducing the effect of ZEVs on manufactures' ability to achieve GHG compliance—either by reducing the ZEV multipliers for GHG credits, or by capping their overall effect. This directly reduces the value of ZEV programs to OEMs. If manufacturers no longer have the option of meeting their compliance obligations, in part, with ZEVs, they will be forced to direct resources towards further development of conventional vehicles. If one ZEV today has a credit multiplier of 4.5x, and EPA's rulemaking eliminates that multiplier, or reduces its value, this will directly dis-incentivize production of that ZEV. [EPA-HQ-OAR-2019-0055-1168-A1, p.115]

EPA's proposed regulatory approach risks the ZEV future that we all support. The Proposed Rule seeks to encourage investment in conventional technologies, which have limited returns at increasing costs—instead of focusing on the future technologies that will enable our transition to carbon-neutral transportation. [EPA-HQ-OAR-2019-0055-1168-A1, p.115]

Organization: *Eaton Vehicle Group (Eaton)*

However, continued multipliers for electric trucks may in fact dilute the progress in conventional technology while also dampening high penetration rates of electric trucks. [EPA-HQ-OAR-2019-0055-1252-A1, p.5]

5. **Regulations should be technology-neutral with flexibilities built in, but the EPA should also recognize the local nature of NOx and PM emissions versus the global impact of GHG.** Electrical vehicles have unclear upstream emissions, but zero tailpipe NOx. Including electrical vehicles in averaging engine NOx emissions may significantly dilute the local NOx benefits in non-attainment zones, while increasing emissions elsewhere. [EPA-HQ-OAR-2019-0055-1252-A1, p.6]

Fundamentally, we believe that GHG emissions ought to be averaged over both Diesel and electrical vehicles for two reasons: GHG is a global pollutant and thus only the fleet-level emissions are significant, and GHG emissions are in fact vehicle attributes. Thus, we agree a vehicle manufacturer should be able to average GHG emissions across its vehicle fleets, which is already allowed by the GHG rule. We agree that the actual penetration of electric vehicles, further spurred by both market demand and the proposed CARB ACT rule do not warrant multipliers going forward. The Agency has proposed three means to sunset the multipliers, but all three have disadvantages. [EPA-HQ-OAR-2019-0055-1252-A1, p.6]

• Excepting vehicles covered by California ACT certification but allowing multipliers above runs counter to the intent of multipliers – to stimulate a non-exiting technology. Furthermore, there is uncertainty in the ACT rule implementation in California, as well as how many of the NESCAUM MOU states would adopt that rule and what other zero-emissions mandates other states might adopt. This approach is in fact a state-by-state approach that has unpredictable consequences and will in fact hinder planning and deployment. [EPA-HQ-OAR-2019-0055-1252-A1, p.6]

• In a market with increasing pull for electrical vehicles, both due to economic drivers, as well as a patchwork of local and state regulations, it is not clear what a credit cap for multipliers achieves. Again, a cap can have unpredicted consequences, such as providing an incentive to reach the cap, and then a disincentive to electrification after the cap is reached. [EPA-HQ-OAR-2019-0055-1252-A1, p.6]

• Finally, the annual reduction of the multipliers seems to be slow and will produce a very high number of credits in the early years, that could in fact slow progress towards electrification in that timeframe or can slow progress on diesel powertrains, ending up with a higher-than-expected number of high CO2 emissions trucks. There is a significant risk that this approach will also slow down the real GHG reductions under the current Phase II program. [EPA-HQ-OAR-2019-0055-1252-A1, p.6]

Given the fast uptake of electrical vehicles driven by market dynamics, a patchwork of local and state restrictions and incentives, and the significant federal funding programs, we believe that the multipliers ought to be sunset significantly faster, so that they do not end up distorting both the market and the real GHG emissions. We would recommend decreasing the 4.0 multiplier in decrements of 1.0 units over the next 3 years, or faster. [EPA-HQ-OAR-2019-0055-1252-A1, p.6]

Agency Request / Topic: We are also interested in stakeholder input that supports changes to the advanced technology credit multiplier approach under consideration [EPA-HQ-OAR-2019-0055-1252-A1, p.11]

Eaton Comment Strategy / Materials: At this point in the EV adoption cycle, as well as all the market forces accelerating the adoption, the credit multipliers are on path to distort the market and the real GHG. We recommend a rapid reduction of the multipliers from 4.0 to 1.0 over the span of 2-3 years. [EPA-HQ-OAR-2019-0055-1252-A1, p.11]

Organization: *Elders Climate Action*

We urge the Agency to scrap the credit scheme as the primary strategy for inducing the sale of zero emission HDVs, and instead adopt the schedule for the sale of HDVs contained in the CARB ACT rule. The effect of such an approach would not “induce” production and sale of BEV HDVs, but require their production and sale. With such a requirement in place, manufacturers would no longer need credits to serve as an incentive for producing and selling zero emission HDVs. [EPA-HQ-OAR-2019-0055-1218-A1, p. 13]

Organization: *Environmental Defense Fund (EDF)*

In the Proposal, EPA sought comment on how to treat Advanced Technology Credits produced by EVs for the Phase 2 standards.94 While EDF supports programs that incentivize increased ZEV deployment, EPA should not allow credit multipliers in the vehicle segments targeted for increased ZEV deployment. As the agency correctly notes in the Proposal, multiplier credits allow for 'backsliding of emission reductions expected from internal combustion engine vehicles.'95 In the Proposal, EPA notes that at 8.5 percent ZEV penetration credits would result in the loss of all of the projected reductions from Phase 2.96 The path to ZEV deployment levels of 80 percent ZEV sales of school and transit buses by 2029 and 40 percent ZEV sales by 2029 for new Classes 4-7 vehicles and Class 8 short-haul tractors in 2029 will result in high levels of ZEV deployment in MY 2024-2027 – indeed, even in its most conservative scenario, ERM projects over 6 percent ZEVs in 2024. [EPA-HQ-OAR-2019-0055-1265-A1, p.21]

94 87 Fed. Reg 17,603.

95 Id. at 17,604.

96 Id.

EPA should not allow credit multipliers for these segments, Classes 4-7 vehicles, and Class 8 short-haul tractors, that are targeted for increased ZEV deployment. ZEVs will continue to have 0 grams CO2 per ton-mile emissions, but additional multiplier credits are not necessary and will undermine the emissions reductions required to meet the standards. Additionally, there will be significant deployment of ZEVs as a result of the Advanced Clean Truck rule. California, Oregon, Washington, New York, New Jersey, and Massachusetts have adopted the rule and several other states are in the process or committed to adopting the rule.97 ACT will require 9%, 11% and 13% ZEV sales of Class 4-8 vehicles for MYs 2024-2027 respectively.98 Accordingly, it is critical that EPA not provide credit multipliers to ensure that the contemplated ZEV targets are actually achieved and the reductions from their deployment are assured. [EPA-HQ-OAR-2019-0055-1265-A1, p.21]

98 CARB, Advanced Clean Trucks Regulation Final Regulation Order: ZEV Sales Percentage Schedule at 5, Table A-1 (March 15, 2021), https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/fro2.pdf.

Organization: *Environmental Protection Network (EPN)*

With respect to multipliers for EVs in the GHG program, EPN agrees that the current approach is no longer appropriate. The transition to EVs is already underway and is expected to increase. In the near-term, the increase in production will continue to reduce the “cost differential between EVs and conventional vehicles,” and the emissions effects of the multipliers reduces “the effective stringency of the existing MY 2024 through 2027 standards.” See 59 Fed. Reg. at 17603. [EPA-HQ-OAR-2019-0055-1233-A1, p. 3]

EPN believes multipliers for EVs should not be allowed after MY 2026. The stringency of the standard in MY 2027 already accounts for the use of EVs, and multipliers are no longer appropriate as incentives. The standard is the incentive in this case. Prior to MY 2027, any EPA projections of EV penetration rate will more than likely be lower than what the industry and market will produce. That is the nature of the fluid situation in these near-term years, where positive but currently unexpected progress is likely to result from an industry that is investing its expertise and large resources towards this goal. Given this, EPA should err on the side of larger, not smaller, reductions in the level of the multipliers. [EPA-HQ-OAR-2019-0055-1233-A1, p. 3]

Organization: *Ford Motor Company (Ford)*

To ensure an equitable phase-out of the Battery-Electric Vehicle (BEV) Advanced Technology credits after 2024 model year, we recommend that EPA adopt the proposal which gradually phases-out the Advanced Technology multipliers between the 2025 and 2028 model years. The proposed option to disallow BEVs certified in California from receiving the Advanced Technology multipliers would potentially be applied unequally across manufacturers. Manufacturer with greater percentages of sales in California would be impacted more. Similarly, the option to apply an absolute Advanced Technology credit cap could create an un-level playing field. Manufacturers that sell more BEVs would be eligible for the Advanced Technology credits for a smaller percentage of their fleet. [EPA-HQ-OAR-2019-0055-1300-A1, p. 4]

Organization: *General Motors LLC (GM)*

EPA proposes to incorporate by reference regulations and test procedures in many cases that are unclear, duplicative, or are not yet final. [EPA-HQ-OAR-2019-0055-1246-A1, p.5]

For instance, EPA proposes to incorporate the CARB Advanced Clean Trucks (ACT)10 by reference, and to account for vehicles qualifying for ZEV credits under the ACT differently than other ZEVs. The Advanced Clean Trucks regulation says that manufacturers earn a ZEV credit when the zero emissions vehicle is "sold to the ultimate purchaser" in the state, which is currently understood to be different than when a vehicle is "produced and delivered for sale". Many questions remain about how to practically count vehicles and transactions that qualify for the ACT ZEV credit, especially considering common business practices in the medium-duty and heavy-duty markets. It is unclear what accounting and reporting practices EPA would interpret as correct, and if this would or would not be aligned with CARB now, or in the future. The acceptable accounting and reporting practices to earn ZEV credits under the ACT program remain unclear at the time of this letter. [EPA-HQ-OAR-2019-0055-1246-A1, pp.5-6]

10 https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2019/act2019/fro2.pdf

Incorporating standards by reference that are not finalized, unclear, or duplicative adds uncertainty to what is expected in a finalized regulation, and often increases the burden to industry to comply with standards. GM encourages EPA to not incorporate by reference regulations and test procedures that are unclear, potentially duplicative, or not finalized. [EPA-HQ-OAR-2019-0055-1246-A1, p.6]

Organization: *International Council on Clean Transportation (ICCT)*

The EPA proposal does not preserve the original stringency of the Phase II GHG rule. For example, the proposal makes no change to existing Advanced Technology Credit multipliers, which originally were intended to stimulate the production of zero-emission vehicles and achieve a 15% overall improvement in efficiency of internal combustion engine vehicles. Since the adoption of the original Phase II rule, six states have adopted requirements for the sale of zero-emission trucks, which would generate Advanced Technology Credits. These credits no longer serve as an incentive when states require manufacturers to produce zero emission vehicles. A total of 17 states and the District of Columbia have signed a multi-state memorandum of understanding pledging to secure at least 30% zero-emission truck sales in 2030, creating the likelihood of additional Advanced Technology Credits. In their current form, the credits are poised to seriously undermine any originally intended improvements in the efficiency of internal combustion engine vehicles as more states adopt zero-emission sales requirements, and as the federal government works to stimulate or require the purchase of zero-emission vehicles. We estimate that even under scenarios with moderate ZEV deployment, ICE vehicles would not need to attain any of the reductions originally envisioned by Phase II in model year 2027. [EPA-HQ-OAR-2019-0055-1211-A1, p. 5]

RECOMMENDATION: We recommend EPA not permit manufacturers to generate Advanced Technology Credits from sales of ZEVs in states where they are subject to zero-emission truck and bus sales or purchase requirements, which currently include California, New York, New Jersey, Massachusetts, Oregon, and Washington state. Additional states who have joined together under a Multi-state Memorandum of Understanding are expected to adopt similar requirements, and we recommend their ZEV sales also not be permitted to generate ZEV credits. [EPA-HQ-OAR-2019-0055-1211-A1, p. 5] RECOMMENDATION: We recommend EPA eliminate Advanced Technology Credit multipliers in model year 2024, or as soon as feasible. [EPA-HQ-OAR-2019-0055-1211-A1, p. 5]

Under the EPA's proposal, retaining Advanced Technology Credits until model year 2028 poses a serious risk of delaying improvements in ICE efficiency and allowing the future production of less efficient and higher emitting ICE vehicles than those sold today. [EPA-HQ-OAR-2019-0055-1211-A1, p. 33]

Even under a conservative scenario in which MOU states adopt the ACT but ZEV deployment does not increase in the rest of the country, Advanced Technology Credits would allow MY 2027 ICE vehicles to emit 17% more under the EPA's proposed standards than without these super credits. Shown in Table 12, ACT adoption in MOU states under the EPA's proposed standards would allow model year 2027 emissions that are on average 3% higher than in model year 2017 if emissions are allowed to increase or backslide. Our analysis is optimistic in that it assumes that average ICE efficiency does not backslide, as shown in Table 13. Even so, under this assumption, removing Advanced Technology Credits would reduce cumulative well-to-wheel 2024–2050 CO_2 emissions by 195 Mt, or 1.4%, with moderate ZEV deployment under the MOU ZEV pathway. Because of state policies requiring the sale of heavy-duty ZEVs, these additional CO_2 emissions would be permitted without necessarily incentivizing additional ZEV deployment beyond state requirements. [EPA-HQ-OAR-2019-0055-1211-A1, pp. 33 - 34]

We recommend EPA remove Advanced Technology Credit multipliers starting in model year 2024 or as early as feasible. [EPA-HQ-OAR-2019-0055-1211-A1, p. 34]

We encourage EPA to consider whether additional CO_2 emissions allowed by these super credits under the current proposal would serve to incentivize ZEV deployment beyond what is already required by state or federal policies. We caution that if EPA were to set a cap on Advanced Technology Credits per manufacturer, which could retain incentives for small manufacturers and heavy-duty vehicles with low ZEV penetration, EPA still consider not allowing manufacturers to generate Advanced Technology Credits where they are subject to state or federal ZEV sales requirements. Since currently adopted state policies are technology-neutral, not strictly requiring either battery-electric or fuel-cell vehicle sales, we recommend EPA remove all Advanced Technology Credit multipliers. [EPA-HQ-OAR-2019-0055-1211-A1, p. 34]

Organization: *International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)*

Additionally, regulatory credits play an important role in incentivizing the deployment of new and otherwise cost-prohibitive technologies, particularly when the industry is working to meet ambitious new regulations and provide industry with multiple technology pathways for reducing emissions. Maintaining technological flexibility can also guard against barriers to ZEV deployment that are out of the control of manufacturers, such as consumer willingness to purchase ZEVs or supply chain issues that limit manufacturers' ability to produce the required number of ZEVs. Finally, we have concerns that reducing regulatory credits for advanced technologies would reduce the incentive to produce battery electric or fuel cell vehicles and fail to reward companies for deploying more costly technologies in the heavy-duty sector. [EPA-HQ-OAR-2019-0055-1138-A1, p.3]

Organization: *Maine Department of Environmental Protection (Department)*

EPA's proposal, which increases GHG stringency requirements for certain vehicle classes by 1.5%, will reduce cumulative class 4-8 heavy-duty vehicle emissions by only 0.4% from 2027-205022 and could paradoxically result in greater GHG emissions if ZEV crediting provisions are retained. The Department recommends revising the proposal to preserve the original Phase II GHG stringency requirements for internal combustion engine vehicles and phasing out ZEV crediting towards GHGs as soon as feasible. [EPA-HQ-OAR-2019-0055-1288-A1, pp.8-9]

22 International Council on Clean Transportation

Organization: *Manufacturers of Emission Controls Association (MECA)*

EPA is proposing to revise the HD Phase 2 GHG standards for MY 2027 vehicles in order to take into account the larger proportion of electric vehicles that are projected to be sold out to MY 2030. The original Phase 2 regulation did not take electric vehicle penetration into account when setting the standards, so many proponents of this revision cite the ability to meet lower GHG targets than originally proposed. MECA agrees with the change to vehicle standards proposed by EPA based on projected electric vehicle sales. For the same reason, we support EPA's decision to phase out GHG credit multipliers for battery electric vehicles. CARB's Advanced Clean Trucks (ACT) Regulation is expected to lead to significant penetration of electric and fuel cell vehicles in California as well as several Section 177 states. [EPA-HQ-OAR-2019-0055-1320-A1, p.29]

The early introductory use of incentives can promote innovative technologies that can be disadvantaged by lack of customer exposure and experience. However, in order for a technology to be a sustainable and durable solution, it must demonstrate the ability to compete on the same basis with other technologies to allow consumers the choice that meets their needs while meeting performance based standards. Analyses by ICCT and researchers at Carnegie Mellon have shown that extended use of super credits in the light-duty sector has resulted in the unintended consequence of increased emissions from the non-ZEV fleet as it is allowed to emit more under a fleet average regulatory structure that includes averaging, banking and trading provisions [46]

[47]. Given the current number of heavy-duty electric vehicle model offerings, declining costs of these vehicles and projected sales, large credits to OEMs are not needed to incentivize production. Similar to the light-duty sector, an over-incentivized credit scheme for heavy-duty ZEVs will instead result in erosion of ZEV sales and thus the benefits anticipated by the standards, especially when the upstream emissions from electricity generation are considered [48]. [EPA-HQ-OAR-2019-0055-1320-A1, p.29]

[46] N. Lutsey, 'Integrating electric vehicles within U.S. and European efficiency regulations,' 2017.

[47] A. Jenn, I. L. Azevedo and J. J. Michalek, 'Alternative-fuel-vehicle policy interactions increase U.S. greenhouse gas emissions,' Transportation Research Part A: Policy and Practice, vol. 124, pp. 396-407, 2019.

[48] R. Minjares and J. Hannon, 'Adapting US heavy-duty vehicle emission standards to support a zero-emission commercial truck and bus fleet,' 2022.

MECA supports two changes to ZEV advanced technology multiplier credits that will help to strengthen the proposal. First, EPA should eliminate advanced technology multiplier credits for ZEVs sold into California and all states that have adopted California's Advanced Clean Trucks Regulation, which requires year-over-year increasing sales requirements of advanced technology vehicles subject to the credits. Second, EPA should phase out the current advanced technology multiplier credits such that no multiplier exists as soon as practicable and no later than from MY 2027. [EPA-HQ-OAR-2019-0055-1320-A1, p.30]

Finally, we support continued progress in reducing the GHG footprint from HD vehicles by considering the combination of technologies and fuels to enable stringent GHG standards. EPA staff should reconsider the generous credit provisions with respect to NOx credits and ZEV credit multipliers in light of the numerous OEM announcements of market introductions of EV trucks. Furthermore, stringent CO2 standards being adopted in other global markets, such as Europe, will drive electric truck technology in the US into the market. All of these factors should be considered when revising the Phase 2 vehicle GHG limits and credit considerations. An underestimation of the EV penetration in light of generous credits could significantly increase emissions of NOx and CO2 from combustion powered trucks. Our industry is prepared to do its part and deliver cost-effective and durable advanced emission control and efficiency technologies to the heavy-duty sector to assist in simultaneously achieving lower GHG and NOx emissions, while also meeting other criterial pollutant standards. [EPA-HQ-OAR-2019-0055-1320-A1, p.34]

Organization: *Mass Comment Campaign sponsored by Environment America (11,390)*

The greenhouse gas (GHG) emissions performance standard should be designed to push truck manufacturers to accelerate the transition to zero-emission electric trucks and buses. As written, EPA's proposal is far too weak and will allow truck manufacturers to keep producing dirty diesel trucks. [EPA-HQ-OAR-2019-0055-1611-A1, p.1]

Electric trucks and buses are already available today and vehicle manufacturers have the technology to meet stronger standards. Many recent analyses have shown that fully zero-emission trucks will be cheaper to purchase and operate than diesel trucks within the timeframe of these standards. Environment America supports eliminating credits and multipliers, and implementing a GHG standard that will put the truck and bus market on a path to 100% zero-emission sales by 2035. [EPA-HQ-OAR-2019-0055-1611-A1, p.2]

Organization: *Moving Forward Network (MFN)*

Finally, EPA notes that "advanced technology credit multipliers for CO2 emissions in HD GHG Phase 2 may no longer be appropriate based on [the agency's] current understanding of the [heavy-duty] market." We agree and urge EPA to under no circumstances extend multipliers beyond their currently expected MY 2027 phaseout and would even recommend an earlier than MY 2027 phaseout, since industry has shown that the technology needed to meet the proposed MY 2031 standards already exists today. For example, Eaton – a power management company – has already demonstrated that diesel emission reduction technologies for NOx emissions are already showing compliance with MY 2031 standards and is doing so at minimal cost and with GHG reduction benefits too.197 In addition, EPA should exclude any vehicles certified under the Advanced Clean Trucks (ACT) program and sold in an ACT state (California and any other state that has adopted the ACT or in the future adopts the ACT) from eligibility for the multiplier program. [EPA-HQ-OAR-2019-0055-1277-A1, p. 59]

197. In a series of private meetings, Eaton Technology gave a presentation titled 'Eaton Technology and Test Results for Future Regulations,' where they shared test results that demonstrated that diesel emission reduction technologies for NOx emissions are already showing compliance with the proposed standards for MY 2031. The private meeting that we took part in that is referenced in these comments occurred on April 26, 2022.

Organization: *Navistar, Inc. (Navistar)*

In the proposed rule, EPA is requesting comment on the following three approaches that would reduce the number of incentive credits produced by ZEVs in the MY 2024 through MY 2027 timeframe: (1) credit multiplier approach for ZEVs certified to meet California's ACT Rule; (2) advance technology credit cap approach; and (3) a transitional credit cap approach. 87 Fed. Reg. at 17603. California's ACT rule was adopted in 2020, and requires manufacturers to sell a certain percentage of zero emission heavy-duty vehicles for each model year, starting in MY 2024. Several states have followed suit and issued proposals to adopt California's ACT rule under CAA section 177, and it is anticipated more states may follow with similar proposals. [EPA-HQ-OAR-2019-0055-1318-A1, p. 6]

Under the first proposed approach, EPA would treat all ZEVs certified in California in the MY 2024 through MY 2027 timeframe differently than the vehicles certified outside of California. Under this approach, the MY 2024 through MY 2027 ZEVs certified in California would not receive the advanced technology credit multiplier that currently exists. 87 Fed. Reg. at 17605. EPA's proposed approach is unclear in that it does not address a scenario where a manufacturer sells more ZEVs than required under the California ACT rule. Navistar urges EPA to allow manufacturers to receive the advanced technology credit multiplier for ZEVs sold in excess of the applicable ACT rule requirements. [EPA-HQ-OAR-2019-0055-1318-A1, pp. 6 - 7]

As noted above, several states have issued proposals to adopt California's ACT rule under CAA section 177. EPA's proposed rule would seek to eliminate advanced technology credit multipliers for ZEVs sold in states that adopt California's ACT rule. The significance of EPA's proposal cannot be properly evaluated, because the proposal rests on future uncertain actions of states. This uncertainty undermines the continued development of the ZEV truck market. [EPA-HQ-OAR-2019-0055-1318-A1, p. 7]

Organization: *Natural Gas Vehicles for America (NGVAmerica)*

It is also clear that regulatory incentives for electric vehicles have been disproportionately favorable to that technology (e.g., ignoring upstream emissions, providing sales multipliers, allowing credit trading from low-mileage vehicles to high-mileage vehicles, providing credits for fueling station capacity - not actual fuel use or emission reductions). [EPA-HQ-OAR-2019-0055-1330-A1, p.11]

Organization: *Retail Industry Leaders Association (RILA)*

While MDHD ZEV technology is accelerating, RILA recommends a market-oriented approach to GHG credit multipliers, extending these multipliers past the MY2027 timeframe to encourage further maturation of EV vehicle technology. RILA also recommends a ramp down of credits instead of a hard cut off, in order to prevent potential 'pre-buy' spikes in demand at the end of MY2027. Extending and ramping down these multipliers will further ensure removal of market barriers to their further adoption. [EPA-HQ-OAR-2019-0055-1189-A2, p.7]

Looking forward, RILA additionally welcomes working with EPA on the MY2030 plan for GHG reductions from all types of MHD vehicles. [EPA-HQ-OAR-2019-0055-1189-A2, p.8]

Organization: *Rivian Automotive, LLC (Rivian)*

We also urge EPA to strengthen any GHG standard by phasing out multipliers for advanced technology vehicles. According to the agency, when originally designed the HD GHG Phase 2 multipliers represented a "tradeoff"—a needed economic inducement to develop new technologies but at the cost of effectively allowing for emissions increases by other engines and vehicles.15 EPA now rightly notes that the market has changed considerably since 2012 with levels of innovation and state policy leadership the federal government did not foresee. Rivian agrees that the multipliers "may no longer be appropriate."16 In fact, it would be imprudent for EPA to sustain the advanced technology vehicle multipliers in any form to avoid back-sliding. This standard should phase out all GHG multipliers for advanced technology vehicles. [EPA-HQ-OAR-2019-0055-1229-A1, p.5]

15 Id. at 17,603.

16 Id. at 17,604.

The agency proposes three potential approaches to reforming the GHG program's credit multipliers. These include eliminating multipliers for ZEV trucks and buses certified specifically in California in MY2024-2027, pursuant to its ACT requirement; a multiplier cap; and stepping down the multiplier value until its eventual sunset in MY2027. These alternatives all move in the right direction and of the three the latter option—phasing out the multiplier—appears most appropriate. [EPA-HQ-OAR-2019-0055-1229-A1, pp.5-6]

However, even this option fails to reflect the state of ZEV truck and bus development, as well as the degree of incentivization already built into the state-level regulatory landscape. Between the diversity of ZEV truck and bus offerings slated for launch in the near future and the ACT, we question whether the additional incentive a multiplier creates is still worth the environmental costs. Moreover, EPA determined the feasibility of the GHG standard "through the evaluation of conventional technologies" alone, indicating that the multipliers could erode overall GHG reductions if they remain in place to any extent.17 Eliminating the multiplier would also be administratively simplest. Rivian encourages EPA to sunset all truck advanced technology GHG multipliers in MY2024. [EPA-HQ-OAR-2019-0055-1229-A1, p.6]

17 Id. at 17,606.

Organization: *Southern Environmental Law Center (SELC)*

Moreover, to advance these goals, the credit systems used in the nitrogen oxides (NOx) and GHG emissions standards must be properly tailored to ensure the regulations result in cleaner internal combustion engines and meaningful deployment of ZEV technology beyond the forecasted baseline. [EPA-HQ-OAR-2019-0055-1247-A1, pp.1-2]

Under the revised Phase 2 GHG emissions standards, EPA should phase out super crediting of ZEVs in 2024 or as soon as feasible. EPA currently proposes to apply advanced technology credit multipliers until model year 2028,43 but this type of incentive is not needed given the growth of the ZEV market. Additionally, EPA should review its treatment of CO2 emissions credits for ZEVs that are required as part of manufacturers' compliance with the ACT regulation. As noted by EPA, these vehicles 'would still receive significant credits reflective of the difference between the applicable CO2 emission standard and zero grams' CO2 per ton-mile emissions.44 Allowing these vehicles to generate federal CO2 emissions credits would serve as a compliance giveaway to manufacturers since they will be required to provide these ZEVs under the ACT regulations. This makes no sense. At a minimum, these vehicles should not receive an advanced technology credit incentive under the Phase 2 GHG standards. [EPA-HQ-OAR-2019-0055-1247-A1, p.8]

43 Id. at 17607.

44 Id. at 17605.

EPA should also adjust the NOx and CO2 emissions credit systems to ensure that these compliance flexibilities do not unnecessarily dilute the stringency of the standards. [EPA-HQ-OAR-2019-0055-1247-A1, p.8]

Organization: *Tesla, Inc. (Tesla)*

Tesla, even though being the largest light-duty BEV manufacturer, supports eliminating advanced technology multipliers to ensure overall program integrity and supports firmly establishing a one-for-one credit ratio that is a more rational and transparent compliance mechanism and creates actual BEV vehicle deployment, thereby enabling deeper emission reduction targets. [EPA-HQ-OAR-2019-0055-1219-A1, p.18]

Furthermore, each of the options for reforming the existing credit multipliers presented by EPA all have substantial weakness. The first option would provide multipliers to those BEV sales in non-ACT states.146 This creates a disincentive for states to adopt ACT and move more aggressively with a regulatory framework that will yield greater GHG reductions. [EPA-HQ-OAR-2019-0055-1219-A1, p.18]

146 87 Fed. Reg. at 17605.

Similarly, the option to use multipliers and then cap credit use is equally flawed. Under this architecture, manufacturers will likely deploy ZEVs to maximize generation of multiplier credits up to the 1% cap limit but move no further.147 In the E.U, a similar 'Super Credit' multiplier exists for light duty vehicles which emit <50g CO_2/km, which can be earned from 2020-2022 inclusive. In the *first year* of the Super Credit eligibility, eight out of ten manufacturers reached the cap.148 This was achieved by aggressive sales practices (pricing and preregistrations) to capture the maximum value of the credits up to the cap, and then halting further sales once the cap was reached. [EPA-HQ-OAR-2019-0055-1219-A1, pp.18-19]

147 Id.

148 ICCT, CO2 emissions from new passenger cars in Europe: Car manufacturers' performance in 2020 (August 2021) at 4, Table 1.

The final option is the transitional credit approach proposing an extended phase down of the multiplier.149 This would delay actual deployment and incent less delivery of real vehicles for more credits. [EPA-HQ-OAR-2019-0055-1219-A1, p.19]

149 87 Fed. Reg. at 17606

As the technology has been now commercialized at scale, each BEV manufactured already contributes to achieving the GHG targets by making each manufacturers' fleet more efficient. All the enhanced multiplier does is weaken the stringency of the standard with no further delivery of an actual ZEV and little further technology development benefit will arise from this new incentive.150 [EPA-HQ-OAR-2019-0055-1219-A1, p.19]

150 See e.g., ICCT, Fixing the Broken Super Credits Scheme of the Proposed HDV Co2 Standards (Dec. 3, 2018) (Although super credits help make fleet electrification more cost-effective, they erode the intended environmental benefits of the CO2 standards, and their use amounts to poor environmental policy.)

Organization: *Truck and Engine Manufacturers Association (EMA)*

It is important to note that EPA included the advanced technology incentives at the urging of CARB. CARB advocated to EPA that the "credits are still needed to promote the wide-spread adoption of advanced technologies in the medium- and heavy-duty sectors, which CARB believes is essential to meeting our GHG and criteria pollutant goals." (See, Letter from CARB to EPA and NHTSA, June 16, 2016.) Based on a detailed analysis of the costs of BEVs and FCEVs, the letter also stated that credits alone will not be enough to incentivize production of the technologies, concluding that the costs exceed the benefits of the credits even before factoring in the ZEV infrastructure costs. CARB's analysis remains accurate; to spur ZEV production, the credit incentives must be part of a broader suite of incentive and infrastructure funding. EPA should continue to follow that advice, as the Agency did during the "finalization" of the Phase 2 GHG rulemaking. [EPA-HQ-OAR-2019-0055-1203-A1, p. 107]

Organization: *U.S. Partnership for Education for Sustainable Development and National Clean Energy Workforce Alliance*

[*From Hearing Testimony*, *April 13, 2022*, *Debra Rowe*] So because low NOx and electric trucks are already available and cost-effective, the proposed credits and multipliers, these are giveaways. They just allow for the dirtiest trucks to continue to be sold, and that really should be eliminated. The benefits are obvious. I suggest you make these changes because they are so logical and smart. [EPA-HQ-OAR-2019-0055-2867]

Organization: *Volvo Group*

Given that these enabling factors are outside of EPA's control as well, we foresee the need for continued regulatory incentives, such as the advanced technology credit multipliers, to allow manufacturers to continue to develop and sell zero-emission vehicles into existing and new market segments. [EPA-HQ-OAR-2019-0055-1324-A1, p . 8]

Organization: *Walmart*

We also recommend a ramp down of credits instead of hard cut off to prevent a 'pre-buy' spike in demand at the end of CY2027. [EPA-HQ-OAR-2019-0055-1191-A2, p. 2]

We recommend extending GHG credit multipliers past the CY2027 timeframe to encourage further maturation of EV vehicle technology. [EPA-HQ-OAR-2019-0055-1191-A2, p. 2]

Organization: *WE ACT for Environmental Justice*

Moreover, we also recommend phasing out the zero-emission credit multipliers in 2024 or eliminating them as soon as possible. As with the NOx emission credits, these multipliers erode the greenhouse gas standard as electric trucks are currently ready, available, and cost-effective. These credit multipliers are fundamentally giveaways for the highest-polluters in the engine manufacturing industry and will continue to allow the dirtiest medium- and heavy-duty vehicles to pollute for decades. [EPA-HQ-OAR-2019-0055-1347-A1, p.5]

Organization: *Zero Emission Transportation Association (ZETA)*

Similarly, ZETA recommends that EPA also phase out the Phase 2 GHG standard's multipliers for advanced technology vehicles by MY2027 at the latest, as proposed**.** We encourage EPA to remove these multipliers by MY2024. HDEV technology has progressed rapidly since 2012, and HDEVs will soon penetrate the market to a much greater degree than was previously anticipated. EPA has recognized that multipliers present a tradeoff between driving emissions reduction and incentivizing new technology. Based on the technology available today, multipliers are no longer required to incentivize HDEV technology investments, and a more stringent GHG standard would most effectively drive HDEV adoption and, in turn, emissions reduction. [EPA-HQ-OAR-2019-0055-1283-A1, p.9]

EPA Response

EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider the comments in this section of this document in the development of that future rulemaking.

28.3 Costs of proposed HD GHG program

Comments by Organizations

Organization: *Environmental Defense Fund (EDF) (1265 and 2855)*

Many commercial truck and bus segments are primed for a near term transition to electrification – the technology has been proven and the benefits outweigh the costs now or in the very near term. A recent study conducted by Roush Industries for Environmental Defense Fund evaluated both the upfront and ongoing costs of electrifying several types of medium and heavy-duty vehicles that are commonly used in urban areas, including transit buses, school buses, garbage trucks, shuttle buses and delivery trucks.47 These vehicles tend to be concentrated in urban areas where average trip distances are shorter and health and pollution impacts are of most concern, making them particularly important opportunities for early electrification deployment. The study found that, when considering upfront purchase price alone, by 2027 electric freight trucks and buses will be less expensive than their combustion engine counterparts in nearly all categories. Electric vehicles will also be less expensive on a total cost of ownership basis in all categories in the same timeframe. [EPA-HQ-OAR-2019-0055-1265-A1, p.10]

> 47 Vishnu Nair, Sawyer Stone, Gary Rogers, Sajit Pillai. 2022. Medium and Heavy-Duty Electrification Costs for MY 2027- 2030, Roush Industries for Environmental Defense Fund. See http://blogs.edf.org/climate411/files/2022/02/EDF-MDHD-Electrification-v1.6_20220209.pdf

The Roush study developed projections for upfront costs and total cost of ownership for electric vehicles in years 2027 to 2030 and compared those costs to equivalent internal combustion vehicles that meet EPA Greenhouse Gas Phase 1 and 2 rules, as well as California Low NOx regulations. The study determined the total cost of ownership for all financial aspects of ownership, including vehicle purchase cost of either an internal combustion engine or electric freight truck or bus, fuel or energy costs, charging or fueling infrastructure costs, maintenance costs, and vehicle mid-life refresh if applicable. It focused exclusively on the direct financial costs and savings related to vehicle ownership and did not include the substantial health and welfare benefits associated with switching to electric trucks. [EPA-HQ-OAR-2019-0055-1265-A1, p.10]

The study found decreasing upfront costs for electric freight trucks and buses, driven largely by steeply decreasing battery costs. It also concluded that in 2027, electric vehicle costs will be less than internal combustion vehicles costs over the life of the vehicle, largely because maintenance and energy costs will be lower. Total cost of ownership parity will occur immediately for some segments evaluated and very quickly for the rest. [EPA-HQ-OAR-2019-0055-1265-A1, p.10]

Roush's findings have been confirmed in other recently released reports. The National Renewable Energy Lab (NREL) looked at all classes and segments of medium- and heavy-duty vehicles and concluded that with continued improvements in vehicle and fuel technologies, ZEVs can reach TCO parity with diesel vehicles as early as 2026 for some applications and no later than 2035 for all segments, including long-haul trucks.48 The study also concludes that 42 percent of all medium- and heavy-duty truck sales and 100 percent of bus sales will be ZEVs by 2030. [EPA-HQ-OAR-2019-0055-1265-A1, p.11]

48 Muratori, Matteo et al. 'Decarbonizing Medium- and Heavy-Duty On-Road Vehicles: Zero-Emission Vehicles Cost Analysis.' NREL Transforming Energy. March 2022. https://www.nrel.gov/docs/fy22osti/82081.pdf.

While Roush did not study Class 8 short haul (day cab) tractors, this segment is also ripe for near-term electrification. These tractors pull trailers and typically drive less than 250 miles per day, returning to a hub each night where they could charge. NREL estimates that these tractors will reach TCO parity with their diesel counterparts by 2025.49 And a recent study by the North American Council for Freight Efficiency (NACFE) concluded that a BEV short haul tractor purchased today will save more than $9,000 annually on fuel costs compared to a diesel truck.50 [EPA-HQ-OAR-2019-0055-1265-A1, p.11]

49 Chad Hunter, Michael Penev, Evan Reznicek, Jason Lustbader, Alicia Birky, and Chen Zhang. 2021. Spatial and Temporal Analysis of the Total Cost of Ownership for Class 8 Tractors and Class 4 Parcel Delivery Trucks, Nation Renewable Energy Lab, Technical Report. https://www.nrel.gov/docs/fy21osti/71796.pdf

50 North American Council for Freight Efficiency. 2022. Electric Trucks Have Arrived: The Use Case for Heavy-Duty Regional Haul Tractors. https://nacfe.org/heavy-duty-regional-haul-tractors/

Cost parity projections are also being confirmed by leading heavy-duty truck and bus manufacturers. Navistar noted recently that long haul trucks will reach cost parity with diesel by

2027 with all other heavy-duty vehicles reaching cost parity before 2025.51 Daimler anticipates total cost of ownership of its BEVs to reach parity with traditional diesel vehicles by 2025.52 [EPA-HQ-OAR-2019-0055-1265-A1, p.11]

EPA Response

EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider the comments in this section of this document in the development of that future rulemaking.

28.4 Benefits of proposed HD GHG Phase 2

Comments by Organizations

Organization: Brooke S.

These new standards are not enough.

We have the technology and political leadership now to pass more aggressive policies on the transportation industry to stop climate change. We cannot afford to wait. We cannot afford to move slowly. [EPA-HQ-OAR-2019-1033]

Why must we stop producing high emitting heavy-duty vehicles?

Heavy-duty trucks stay on the road much longer than cars. While cars might stay on the road until they reach 200,000 miles, trucks keep driving until around 750,000 miles. This means that heavy-duty trucks are on the roads for an average of 15 years. Right now in the United States, medium and heavy duty trucks account for only 5 percent of vehicles on the road but 24 percent of transportation emissions. The emissions produced by trucks put on the roads now will continue long after policy changes eventually mandate low emitting trucks. With the effects of truck production decisions today still being felt 15 years from now, we cannot afford to move slowly when creating regulations to keep new high emitting trucks from joining fleets. [EPA-HQ-OAR-2019-1033]

Are heavy-duty electric vehicles economically feasible?

A major obstacle in the adoption of heavy-duty electric vehicles is sticker shock. We cannot generally expect purchasers to choose more expensive options just because they are better for the environment. We have the technology to produce heavy-duty electric vehicles, but they are expensive. With the current cost of production and materials, the cost of a new electric truck can be two or three times that of a conventional truck. However, this cost comparison does not tell the whole story.

Fleet managers and individual truck drivers consider Total Cost of Ownership (TCO). Overtime, the decrease in maintenance and fuel costs will effectively decrease the cost the truck. Today, medium-duty electric trucks have achieved TCO numbers that match those of conventional medium-duty trucks. Therefore, for local delivery trucks and buses, electric vehicles are already economically feasible. They are perfect for urban and regional uses due to their smaller batteries and the benefits they get from regenerative braking technology with frequent stops. Electric heavy-duty trucks, however, are expected to reach TCO parity in 2030. As developments in technology and production scale decrease costs, electric heavy-duty trucks will become the most economic option. Initially, though, governments must provide subsidies to incentivize more immediate adoption of electric heavy-duty trucks for the sake of our planet. These initial subsidies would increase investment into electric heavy-duty trucks and move them towards TCO parity more rapidly. [EPA-HQ-OAR-2019-1033]

Do we have the infrastructure to support electric big rigs?

Policies promoting the adoption of electric heavy-duty vehicles will be ineffective if we do not have the infrastructure for long-haul truckers to recharge their vehicles. The charging infrastructure and electric vehicle production must be developed in unison with one another. Policies aiding in the development of one goal will make the other easier to achieve. Many grants, loans, and incentive programs have already been implemented to develop the charging infrastructure needed to make electric big rigs a reality. These include the California Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project (HVIP), the Diesel Emission Reduction Act (DERA) Program, Electric Vehicle Charging incentives provided by governments and utilities, and Federal and State Laws and Incentives. These programs, joined with policies that mandate more electric heavy-duty vehicles, push investment in charging infrastructure. [EPA-HQ-OAR-2019-1033]

Why the urgency?

Climate change is happening and it’s too late to reverse some of the damage we have already done to our planet. It is not too late, however, to mitigate the worst effects of climate changing by limiting our emissions and preventing further global warming. We must act now. Years spent putting off significant climate change policies will result in increasingly devastating effects of global warming.

We might never be able to pass the necessarily aggressive climate change policies without at least some political opposition. However, actions addressing climate change are possible under the current administration. We have a president and leadership interested in addressing climate change. We must act quickly to pass important policies like stricter emissions standards in the transportation sector and increased investment in the infrastructure needed to make electric vehicles of all sizes economically feasible. We don’t know what the future political climate will look like. We cannot afford to make minimal progress towards emissions reductions goals and hope the next administration will take more aggressive action. This proposed rule is a small step in the right direction, but it’s not enough. I urge the EPA to propose a new rule with more substantial regulations to push us towards a decarbonized future. [EPA-HQ-OAR-2019-1033]

Organization: *CALSTART*

Several studies demonstrate the expected benefits of deploying zero-emission trucks and buses (Busch, 2020). CARB estimated that the ACT would reduce NOx emissions by 5,301 tons per year, PM2.5 by 144 tons per year, and GHG emissions by 2.9 million metric tons per year in California in 2040 (CARB, 2019a). From 2020-2040, CARB estimated these emission reductions would avoid 943 premature deaths and 778 hospitalizations and emergency room visits at a valuation of $8.9 billion in health benefits. Avoided GHG emissions provide an additional $1.7 billion in savings related to the social costs of global warming emissions at a 2.5 percent discount rate. CARB estimated the ACT will provide additional savings of $5.9 billion in California related to vehicle purchases and operation (higher vehicle purchase costs offset by significant savings in fuel and maintenance). [EPA-HQ-OAR-2019-0055-1313-A1, pp.5-6]

In addition to zero tailpipe emissions, battery and fuel cell electric vehicles offer significant reductions in global warming emissions compared to combustion vehicles. As shown in Figure 2 below, with the average sources of electricity in the US, heavy-duty electric vehicles reduce global warming emissions by approximately 50 to 80 percent depending on a vehicle's average speed over the course of its trip (O'Dea, 2019). Emissions associated with charging electric vehicles will continue to decline as lowercarbon sources of electricity are required to be deployed through state laws. Heavy-duty fuel cell electric vehicles also offer emission reductions compared to vehicles fueled with diesel. For hydrogen generated from steam-reforming of methane, a fuel cell transit bus, for example, has life cycle GHG emissions 40 percent lower than a comparable diesel transit bus (Union of Concerned Scientists, 2016). Using hydrogen generated from electrolysis of water using renewable electricity will provide significantly lower life cycle GHG emissions. [EPA-HQ-OAR-2019-0055-1313-A1, p.6]

Organization: *Ceres BICEP (Business for Innovative Climate and Energy Policy) Network*

Strong truck standards are also necessary to ensure that we meet climate goals. A recent [ICCT analysis](https://theicct.org/publication/zevs-global-transition-benefits-mar22/) (https://theicct.org/publication/zevs-global-transition-benefits-mar22/) found that a target of 100% zero-emission sales of medium- and heavy-duty trucks (MHDVs) by 2040 would be consistent with limiting warming to less than 2°C (although higher sales would be necessary to limit warning to 1.5°C). The GHG standards should ensure a trajectory consistent with 100% ZEV MHDV sales by 2040 at the latest, and 50% ZEV MHDV sales by 2030. [EPA-HQ-OAR-2019-0055-2714-A1, p.1]

The urgency of taking action on climate has never been so clear; upon release of the most recent April 2022 IPCC report, working group co-chair Jim Skea warned that "It's now or never, if we want to limit global warming to 1.5°C."1 Global HDV GHG emissions, which are second only to passenger vehicles in the transportation sector, are projected to exceed light-duty vehicle emissions by 2025 based on current trajectories.2 A rapid transition to ZEVs is necessary to meet climate goals. A recent ICCT analysis found that a goal of 45% zero-emission sales in 2030 in the U.S. heavy-duty vehicle sector would be consistent with limiting warming to less than 2°C, although higher sales would be necessary to limit warning to 1.5°C. However, EPA projects a zero-emission vehicle (ZEV) sales share of 1.5% in key market segments in 2027, which falls far short of what is needed to meet climate goals as well as current state regulatory requirements. [EPA-HQ-OAR-2019-0055-2714-A3, p.1]

Organization: *Clean Air Task Force, Environmental Law & Policy Center, National Parks Conservation Association, and Sierra Club*

EPA's cost-benefit analysis should include a quantification of the rule's climate benefits based on the social cost of greenhouse gases (SC-GHG). Commenters' proposed improvements to EPA's criteria pollutant and GHG proposals would deliver increased climate benefits by incorporating and driving zero-emission technologies across the heavy-duty sector, and EPA must consider these additional benefits in finalizing the standards. [EPA-HQ-OAR-2019-0055-1302-A1, pp.67-68]

EPA has previously found that sales impacts from heavy-duty standards were too uncertain to quantify, and Commenters believe that continued uncertainty cautions against attempting to quantify them as part of this rulemaking's Regulatory Impact Analysis. Despite this continued uncertainty, Commenters agree with EPA that the adverse sales impacts, if any, from Option 1 (including pre-buy and low-buy effects) are likely to be minimal and short lived. [EPA-HQ-OAR-2019-0055-1302-A1, p.68]

The federal government has quantified the climate impacts of proposed regulations for more than a decade, since the Ninth Circuit Court of Appeals held in 2008 that the National Highway Traffic Safety Administration (NHTSA) had acted arbitrarily and capriciously by failing to do so when assessing the costs and benefits of various alternative fuel-economy standards. See Center for Biological Diversity v. NHTSA, 538 F.3d 1172, 1201 (9th Cir. 2008) (finding 'no evidence to support NHTSA's conclusion that the appropriate course was not to monetize or quantify the value of carbon emissions reduction at all'). [EPA-HQ-OAR-2019-0055-1302-A1, p.68]

As Commenters and others have previously explained,249 and as EPA and NHTSA both recently determined,250 the best available and most appropriate values for estimating monetized climate impacts are the interim estimates published in February 2021 by the federal government's Interagency Working Group on the Social Cost of Greenhouse Gases (IWG).251 Although the IWG's interim estimates are widely acknowledged to be significant underestimates,252 they remain appropriate representations of the lower bound of potential climate impacts and have been applied in dozens of previous rulemakings253 and their use has been upheld by federal courts.254 [EPA-HQ-OAR-2019-0055-1302-A1, p.68]

249 See Comments of Center for Climate and Energy Solutions et al. on Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 Fed. Reg. 43,736

(Aug. 10, 2021) (Docket No.
EPA-HQ-OAR-2021-0208-0268).

250 See EPA, Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 Fed. Reg. 74,434, 74,504 (Dec. 30, 2021) (determining that the interim estimates, 'while likely an underestimate, are the best currently available SC-GHG estimates,' and that they remained 'appropriate for use in estimating the global social benefits of [GHG] emission reductions expected from this final rule'); NHTSA, Corporate Average Fuel Economy Standards for Model Years 2024–2026 Passenger Cars and Light Trucks, 84 Fed. Reg. 25,710, 25,724 (May 2, 2022) (determining that the IWG values 'are based on the best available science and economics and are the most appropriate values to focus on in the analysis of this rule,' even though they 'likely significantly underestimate the full benefits to social welfare of reducing greenhouse gas pollution').

251 See IWG, Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide—Interim Estimates Under Executive Order 13,990 (2021), https://www.whitehouse.gov/wp-content/uploads/2021/02/TechnicalSupportDocument_SocialCostofCarbonMethaneNitrousOxide.pdf.

252 See, e.g., id. at 4 (acknowledging that current social cost valuations 'likely underestimate societal damages from [greenhouse gas] emissions'); Richard L. Revesz et al., Improve Economic Models of Climate Change, 508 Nature 173 (2014) (explaining that the IWG's values, though methodically rigorous and highly useful, are very likely underestimates).

253 Peter Howard & Jason Schwartz, Think Global: International Reciprocity as Justification for a Global Social Cost of Carbon, 42 Colum. J. Envt'l L. 203, 270–84 (2017) (listing all uses through mid-2016).

254 Zero Zone v. Dept. of Energy, 832 F.3d 654, 679 (7th Cir. 2016)

In the Proposal, EPA requested comment on 'how to address the climate benefits' of the proposed rule, noting that a federal district court had issued an injunction against the use of the IWG's interim estimates by EPA and other defendants. 86 Fed. Reg. at 17,608 & n.888. See Louisiana v. Biden, Order, No. 2:21-CV-01074, ECF No. 99 (W.D. La. Feb. 11, 2022). However, the Fifth Circuit Court of Appeals has since stayed that injunction, Louisiana v. Biden, Order, No. 22-30087, Doc. No. 00516242341 (5th Cir. Mar. 16, 2022), meaning there is currently no reason for EPA to depart from its historical and preferred approach of monetizing climate impacts using the IWG's interim estimates. Indeed, NHTSA has already returned to using the interim estimates, finding them to be 'more accurate and reasonable' than other values. NHTSA, Corporate Average Fuel Economy Standards for Model Years 2024–2026 Passenger Cars and Light Trucks, 87 Fed. Reg. 25,710, 25,724 (May 2, 2022). [EPA-HQ-OAR-2019-0055-1302-A1, p.69]

Commenters encourage EPA to follow the approach that NHTSA recently took in finalizing its Light-Duty Vehicle Corporate Average Fuel Economy Standards for Model Years 2024–2026. In that rulemaking, NHTSA explicitly stated its independent determination that although the IWG interim estimates significantly underestimate the full benefits of GHG emissions reductions, they remain the best available values. Id. at 25,724–25. Critically, NHTSA provided additional justification for adopting a global damages valuation and for combining climate effects discounted at an appropriate consumption-based rate with other costs and benefits discounted at a capital-based rate. Id. at 25,879–80. NHTSA then used the IWG's interim estimates and recommended discount rates in the agency's main cost-benefit analysis. Id. at 25,724. However, NHTSA also conducted sensitivity analyses using additional discount rates, as well as the SC-GHG estimates it used in 2020 (which attempted to exclude global climate impacts), while cautioning that the 2020 values 'do not reflect the best available science and economics for estimating climate effects.' Id. NHTSA then determined that 'even if NHTSA's cost-benefit analysis applied the misleadingly low SC-GHG estimates from the 2020 rule, which severely underestimate the impacts of climate effects on U.S. citizens,' the results would not change the agency's determination that the final standards were 'the maximum feasible under its statutory authority.' Id. By taking a similar approach in this rulemaking, EPA can protect against challenges to the Agency's application of the SC-GHG, as well as confirm that strengthening the standards as Commenters propose will deliver meaningful net benefits to society under a range of analytical assumptions. [EPA-HQ-OAR-2019-0055-1302-A1, p.69]

Organization: *ClearFlame Engine Technologies (ClearFlame)*

Third, it should not be a given that a BEV or FCEV will always be the lowest-GHG option or the lowest cost option to reach a particular GHG goal. Upstream grid emissions vary widely in the United States, and we are decades away from a grid that is 100% renewable. While we are impressed by the progress being made to electrify transit and school buses and other urban truck niches that operate on short routes and rely on a home base to recharge, significant questions about the ability of BEVs and FCEVs to meet the operating needs of long-haul fleets remain unanswered and are likely to remain so for years to come. [EPA-HQ-OAR-2019-0055-1261-A1, p. 5]

By opening the proposed BEV and FCEV provisions (e.g., sales-weighted averages of projected emissions) to all vehicles or vehicle/fuel systems that meet fuel-neutral, technology-neutral performance criteria, EPA will accelerate innovation, and the result will be deeper, more cost-effective GHG reductions across the entire heavy-duty vehicle market. Certainly, EPA should not pick technology "winners" by adopting any form of sales mandate when finalizing this Proposal or proposing next year's expected Phase 3 GHG standards. [EPA-HQ-OAR-2019-0055-1261-A1, p. 5]

Recently, Gladstein, Neandross & Associates (GNA) published a white paper that found that the ClearFlame system could provide lower GHG emissions, lower total cost of ownership (TCO), and lower cost per mile than comparable BEV, FCEV, and other systems.7 Findings of the GNA study include: [EPA-HQ-OAR-2019-0055-1261-A1, p. 5]

7. Gladstein, Neandross & Associates, ClearFlame TCO and Emissions Study, May 2022, summarized and accessed on May 15, 2022 at https://www.clearflameengines.com/press-release/independent-study-confirms-cost-savings-emissions-advantages-for-heavy-duty-trucks-

running-clearflames-engine-modification-technology/. To download the full study, visit https://www.clearflameengines.com/white-paper/tco-study/.

Findings of the GNA study include: ClearFlame-enabled trucks are expected to have the lowest TCO when compared with diesel, natural gas, electric, and hydrogen platforms. [EPA-HQ-OAR-2019-0055-1261-A1, p. 6]

Findings of the GNA study include: ClearFlame's cost per mile is expected to be substantially lower than electric and hydrogen platforms—40% less than electric and 30% less than hydrogen. [EPA-HQ-OAR-2019-0055-1261-A1, p. 6]

Findings of the GNA study include: ClearFlame engines can provide a quick and cost-effective path to substantial reductions of GHG and other tailpipe emissions compared to other sustainable fuels and technologies, whose practical challenges, such as cost, range, infrastructure, and fuel availability, have slowed adoption. [EPA-HQ-OAR-2019-0055-1261-A1, p. 6]

Findings of the GNA study include: ClearFlame engines are estimated to provide a 42% lifecycle carbon reduction compared with diesel, as well as approximately 22% lower GHG than BEVs, based on the national average grid mix. [EPA-HQ-OAR-2019-0055-1261-A1, p. 6]

This TCO analysis was conducted when diesel fuel's national average was $3.48 per gallon in October 2021 (i.e., it predates our currently escalated fuel prices). The analysis found that ClearFlame-enabled trucks would have a lower TCO than diesel by $0.08 per mile, lower than natural gas by $0.09 per mile, lower than electric by $0.97 per mile, and lower than hydrogen platforms by $0.61 per mile. [EPA-HQ-OAR-2019-0055-1261-A1, p. 6]

The report also highlights the potential for even greater GHG reductions using other feed sources developed by the ethanol industry with lower carbon intensities. For instance, further improvement to ethanol production processes—such as utilizing more corn fiber and stover, or adding carbon capture to production facilities—would result in GHG emissions reductions of 69-83% compared with diesel, depending on the region. [EPA-HQ-OAR-2019-0055-1261-A1, p. 6]

Considering these findings, we urge EPA to take a systems approach to certifying ClearFlame engines (or any other engine that can guarantee that a non-petroleum biofuel will be used throughout useful life). When an OEM seeks to certify a ClearFlame-equipped engine as a ZEV or near-ZEV, EPA should treat the engine and the fuel as a single system, thereby granting credit for that engine's overall emissions performance, rather than just considering the engine's tailpipe emissions. Similarly, EPA should consider the upstream grid or other emissions impacts on any BEV or FCEV systems. Doing this across the board will better reflect the real-world emissions benefit of all vehicle/fuel/power systems. Equally important, it will provide a market signal and incentive to the biofuels community to find ways to reduce the direct and indirect GHG impacts of their fuels in order to compete successfully with BEVs, FCEVs, and any other technologies that emerge. [EPA-HQ-OAR-2019-0055-1261-A1, p. 6]

We acknowledge that today's systems approach may be more complicated than simply removing sulfur or choosing among a small number of competing emission control technologies. However, this approach is even more important now, given the wide range of potential upstream or indirect GHG emissions from all types of vehicles, whether fueled by electricity, hydrogen, biofuels, or diesel. Indeed, as we evolve towards a market that includes vehicles powered by all of these options, evaluating and integrating the full upstream, indirect, and other lifecycle emissions impacts of our full vehicle/fuel/power systems will become even more important to ensuring that real world emissions meet our environmental goals. [EPA-HQ-OAR-2019-0055-1261-A1, p. 7]

The Biden Administration's Net Zero Plan Will Require Increased Use of Renewable Biofuels to Replace Petroleum Diesel—and this Proposal Can Help Achieve that Goal. [EPA-HQ-OAR-2019-0055-1261-A1, p. 7]

The Biden administration's bold plan to reach net zero GHG emissions by 2050 will require many strategies to succeed.8 [EPA-HQ-OAR-2019-0055-1261-A1, p. 7]

8. The Long-Term Strategy of the United States: Pathways to Net Zero Greenhouse Gas Emissions by 2050, November 2021. Accessed on May 15, 2022 at https://www.whitehouse.gov/wp-content/uploads/2021/10/US-Long-Term-Strategy.pdf

Given that diesel engines will be in widespread use until at least midcentury, it is clear that the Biden administration's Net Zero plan cannot succeed without a significant shift from petroleum diesel to renewable liquid biofuels. Such a strategy is necessary as a critical complement to the Biden administration's electrification strategies. [EPA-HQ-OAR-2019-0055-1261-A1, p. 7]

The White House recognizes the importance of a strong, comprehensive GHG strategy that includes aggressive action to replace petroleum diesel fuel with low-carbon, renewable biofuels. Indeed, the White House's Net Zero plan assumes that we will need roughly a gigaton of GHG reductions by decarbonizing the liquid fuels that will still be used in 2050 as a complementary strategy to its ambitious electrification goal. [EPA-HQ-OAR-2019-0055-1261-A1, p. 7]

We estimate that this gigaton of GHG reductions is equivalent to approximately 90 billion gallons of diesel fuel or its equivalent. This is more than twice our annual highway diesel consumption. In other words, the Biden administration's Net Zero plan anticipates that overall use of diesel fuel (or its renewable substitutes) will continue to grow for years to come, even as parts of the heavy-duty sector increasingly move towards electrification. Meeting this goal will require a tenfold increase in our use of renewable biofuels. Perhaps for this reason, President Biden recently said, "You simply can't get to net zero by 2050 without biofuels."9 [EPA-HQ-OAR-2019-0055-1261-A1, p. 7]

9. Statement of President Joseph R. Biden, April 12, 2022. Accessed on May 15, 2022 at: https://www.whitehouse.gov/briefing-room/speeches-remarks/2022/04/12/remarks-by-president-biden-on-lowering-energy-costs-for-working-families/

By aiming to reduce the GHG emissions of the entire fuel/power/vehicle "system," EPA's Clean Trucks Plan can help ensure that the White House's Net Zero plan will be successful. Such an approach will incentivize accelerated scaling of all low-carbon-fuel based solutions by sending the right market signal, rather than sending the signal that a future of targeted electrification in certain vehicle niches, combined with millions of diesel trucks and buses continuing to operate on petroleum diesel fuel, will somehow be sufficient to reach Net Zero. [EPA-HQ-OAR-2019-0055-1261-A1, pp. 7 - 8]

To be clear, ClearFlame is committed to supporting all contributions to meeting our Net Zero goals. Thus, we share the administration's excitement about the many promising developments in the electric vehicle industry recently, including in the light-duty vehicle sector and those segments of the heavy-duty sector that are the best candidates for electrification at scale, such as school and transit buses, urban delivery vehicles, and short-haul tractors. [EPA-HQ-OAR-2019-0055-1261-A1, p. 8]

But electric school buses, transit buses, grocery delivery vans, and package delivery trucks will not get us to the Net Zero goal. EPA's GHG rules should contribute to the Net Zero goal by encouraging innovation that can decarbonize all heavy-duty vehicles and engines, not just those that are most appropriate for battery or fuel cell electrification. [EPA-HQ-OAR-2019-0055-1261-A1, p. 8]

In sum, EPA has had more than 50 years of success using a fuel-neutral, technology-neutral approach that rewards innovation, cost-effectiveness, and the ability to scale quickly. This approach has led to deeper emissions reductions, faster and more cost-effectively and at greater scale than any technology-specific federal or state program that has "picked winners." [EPA-HQ-OAR-2019-0055-1261-A1, p. 8]

Organization: *Energy Innovation, LLC*

Modeling from numerous studies concur strong tailpipe standards can effectively reduce GHG emissions from the transportation sector and put the U.S. on a climate-stable path. For example, modeling from Energy Innovation's Energy Policy Simulator, as shown in Figure 1, demonstrates widespread deployment of ZEVs for light- medium and heavy-duty vehicles, powered by a clean grid and in conjunction with other policies, would reduce U.S. GHG emissions to net zero by 2050, limiting warming to 1.5°C. [EPA-HQ-OAR-2019-0055-1310-A1, p.2]

The dark purple wedge, 'Passenger EV Sales Standard + Clean Trucks,' reflects a 100 percent EV new sales target for light-duty vehicles by 2035 and a 100 percent EV new sales target for heavy-duty vehicles by 2045.vii [EPA-HQ-OAR-2019-0055-1310-A1, p.3]

vii Robbie Orvis and Megan Mahajan, A 1.5°C NDC for Climate Leadership for the United States, Energy Innovation, April 2021, 4, https://energyinnovation.org/wp-content/uploads/2021/04/A-1.5-C-Pathway-to-Climate-Leadership-for-The-United-States_NDC-update-2.pdf.

An analysis conducted by the Lawrence Berkeley National Laboratory supports similar findings, as shown in Figure 2.viii [EPA-HQ-OAR-2019-0055-1310-A1, p.3] viii Illustrative Strategies for the United States to Achieve 50% Emissions Reduction by 2030, Lawrence Berkeley National Laboratory, April 2021, 11, https://eta-publications.lbl.gov/sites/default/files/us_50_percent_ndc_memo_finalap.pdf.

A recent study by the International Council on Clean Transportation (ICCT) also shows a 2030 target of 45 percent zero-emissions sales would put the U.S. heavy-duty sector on a path to limit warming to 2°C (more ambitious sales targets would be needed to align with a 1.5°C warming limit). That would translate to a 50 percent zero emission sales target for rigid trucks in model year 2030, combined with a 30 percent target for tractor-trailers and a 100 percent target for buses, as shown in Figure 3.ix [EPA-HQ-OAR-2019-0055-1310-A1, p.3]

ix Claire Buysse, Sara Kelly, and Ray Minjares, Racing to Zero: The Ambition We Need for Zero-Emission Heavy-Duty Vehicles in the United States, The International Council on Clean Transportation, April 8, 2022, https://theicct.org/racing-to-zero-hdv-us-apr22/.

Although the heavy-duty sector lags behind the light-duty sector in terms of EV availability and cost declines, the adoption of a stronger GHG tailpipe standard could stimulate more investment and innovation to jumpstart transformation in the HDT sector. Well-designed performance standards can leverage the pace of technology advancement and send clear market signals that spur the private sector to accelerate HDEVs sales. This relationship between regulatory standards and market advancements is explained in Energy Innovation’s book, Designing Climate Solutions: Demand signals, stimulated by performance standards, provide investment opportunities for private companies to fund research and development in new technologies. With strong performance standards and a clear timeline over which they will become more stringent, companies have a strong incentive to invest in innovation. The best example of this is electric vehicles, widely recognized as critical to global efforts to decarbonize transportation. Effective performance standards push EV deployment forward…[and] create the short-term conditions necessary for lower-cost options to emerge.x [EPA-HQ-OAR-2019-0055-1310-A1, p.4]

Organization: *Institute for Policy Integrity at New York University School of Law (Policy Integrity)*

EPA should quantify the benefits of reducing greenhouse gases. EPA should quantify any expected reductions in greenhouse gas emissions from the Proposed Rule and monetize the benefits of such reduction using the social cost of greenhouse gases. [EPA-HQ-OAR-2019-0055-1256-A1, p. 2]

While the Proposed Rule is focused on reducing the emissions of particulate matter and nitrogen oxides from the heavy-duty trucks, the necessary vehicle improvements may also reduce greenhouse gas emissions. However, EPA does not quantify greenhouse gas emission reductions for any of the alternatives considered. EPA has expertise in estimating greenhouse gas emissions from changes in vehicle standards and should apply that expertise here. If EPA believes the greenhouse gas effects are too small to warrant quantification, it should explain that. [EPA-HQ-OAR-2019-0055-1256-A1, p. 26]

EPA should not only quantify greenhouse gas emissions (or emission reductions) in the Proposed Rule, but also monetize the climate effects of those changes in greenhouse gases. EPA has used the social cost of greenhouse gases many times in the past to monetize the climate effects of its proposed regulations, and so should have no problem applying the tool here.142 The social cost of greenhouse gases can be applied to any volume of emissions and is useful for comparing climate impacts to other monetized costs and benefits.143 [EPA-HQ-OAR-2019-0055-1256-A1, p. 26]

142. See, e.g., 86 Fed. Reg. 74,434, 74,444 tbl.4, n.b (Dec. 30, 2021) (explaining how the agency monetized the benefits of reducing greenhouse gas emissions in its final light-duty vehicle greenhouse gas emission standards for MY 2023-26).

143. See generally Inst. for Pol'y Integrity et al., Joint Comments on the Consideration of the Social Cost of Greenhouse Gases in Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards (Sept. 27, 2021), https://policyintegrity.org/documents/Joint_SCC_Comments_on_EPA_Cars_Rule.pdf.

Policy Integrity and several other groups submitted joint comments to EPA on its light- and medium-duty vehicle emissions that focus on the social cost of greenhouse gases.144 These comments (attached) highlight the appropriate methodology and rationale that EPA should use in the Final Rule. [EPA-HQ-OAR-2019-0055-1256-A1, p. 26]

Organization: *International Council on Clean Transportation (ICCT)*

Human-induced climate change has already caused widespread damages to humans and ecosystems, globally and in North America.22 At the current rate of CO2 emissions, the remaining carbon budget for a 67% chance of limiting warming to 1.5 degrees Celsius will be exhausted as early as 2030.23 Yet under currently adopted policies, global CO2 emissions from on-road vehicles are projected to continue growing through 2050.24 [EPA-HQ-OAR-2019-0055-1211-A1, p. 25]

The U.S. has a responsibility to lead—not lag—in GHG mitigation efforts. The U.S. is the second largest emitter of CO2 presently and accounts for 23% of cumulative CO2 emitted since

1850.25 Yet under currently adopted policies, CO_2 emissions from on-road vehicles in the U.S. are projected to decline only one-third by 2050—far short of the 40%–60% reduction by 2030 and near-zero emissions by 2050 that are required for compatibility with 1.5°C.26 [EPA-HQ-OAR-2019-0055-1211-A1, p. 25]

26. https://theicct.org/wp-content/uploads/2022/03/Accelerated-ZEV-transition-wp-final.pdf

The current trajectory of the U.S. HDV sector is not sustainable for other reasons: continued reliance on oil poses a risk to national security and exposes consumers and freight operators to high energy price volatility. In 2021, the U.S. was a net exporter of petroleum but still imported 8.47 million barrels per day, including 11% from OPEC countries and 8% from Russia.27 The transport sector accounts for two-thirds of U.S. end use petroleum consumption,28 and within transport, HDVs are the second largest source of oil demand.29 If EPA sets stringent GHG standards for HDVs that significantly accelerate ZEV uptake, these standards will have a co-benefit of insulating the U.S. HDV sector from oil price volatility. [EPA-HQ-OAR-2019-0055-1211-A1, p. 25]

28. https://www.eia.gov/energyexplained/oil-and-petroleum-products/use-of-oil.php

29. https://www.bts.gov/content/fuel-consumption-mode-transportation-1

ICCT modeling has found that accelerating the transition to zero-emission vehicles could put the U.S. onroad vehicle fleet on a pathway consistent with limiting warming to below 2°C.30 We have not yet identified a pathway consistent with limiting warming to 1.5°C, indicating that even the most ambitious actions under consideration would need to be augmented to maintain a chance of limiting warming to 1.5°C. Accelerating ZEV uptake in the HDV sector would also produce significant air quality and public health co-benefits,31 especially in communities that are disproportionately impacted by HDV pollution. Combined, a strategy to reduce HDV tailpipe NOx emissions by at least 90% (through the NOx standards) and increase ZEV uptake in line with reaching 100% zero-emission HDV sales as soon as 2035 (through the GHG standards) could avoid $5.7 million in health damages annually in 2035, including 46% in overburdened and underserved communities that meet select environmental justice criteria. [EPA-HQ-OAR-2019-0055-1211-A1, p. 25]

30. https://theicct.org/wp-content/uploads/2022/03/Accelerated-ZEV-transition-wp-final.pdf

31. https://www.2035report.com/transportation/

Substantial reductions in heavy-duty vehicle GHG emissions are needed before 2030 to align with domestic climate goals. [EPA-HQ-OAR-2019-0055-1211-A1, p. 26]

The Biden administration has set a goal of reducing economy-wide greenhouse gas emissions by 50%–52% from 2005 levels in 2030.32 Transportation represented 29% of U.S. greenhouse gas emissions in 2019, a quarter of which are attributable to on-road HDVs.33 Achieving the Biden administration's climate target within the U.S. HDV sector in 2030 would mean reducing emissions by roughly 54% from 2019 levels.34 [EPA-HQ-OAR-2019-0055-1211-A1, p. 26]

32. The White House, "Fact Sheet: President Biden Sets 2030 Greenhouse Gas Pollution Reduction Target Aimed at Creating Good-Paying Union Jobs and Securing U.S. Leadership on Clean Energy Technologies."

33. US EPA, "U.S. Transportation Sector Greenhouse Gas Emissions: 1990–2019."

34. US EPA, "Inventory of U.S. Greenhouse Gas Emissions and Sinks."

Limiting global warming to below 2°C would require the U.S. HDV sector to mitigate its projected cumulative CO2 emissions through 2050 by roughly 4 Gt.35 [EPA-HQ-OAR-2019-0055-1211-A1, p. 26]

35. Sen and Miller, "Emissions Reduction Benefits of a Faster, Global Transition to Zero-Emission Vehicles."

Previous ICCT modeling has found that the U.S. could achieve this level of mitigation by accelerating ZEV uptake to account for at least 45% of HDV sales by 2030 and 100% no later than 2040. Compatibility with a 1.5°C target would require greater ambition.36 [EPA-HQ-OAR-2019-0055-1211-A1, p. 26]

36. Sen and Miller.

We find EPA's current proposal is inadequate to reduce HDV emissions in line with the Biden administration's economy-wide 2030 target, resulting in annual well-to-wheel CO2 emissions that are 7.5% above 2005 levels. [EPA-HQ-OAR-2019-0055-1211-A1, p. 28]

We evaluated EPA's proposed revisions to Phase II GHG standards in combination with currently adopted state policies that require the purchase or sale of zero-emission heavy-duty vehicles. Our analysis finds that, under this scenario, annual well-to-wheel CO2 emissions in 2030 would be just 2.0% below 2019 levels and 7.5% above 2005 levels. By 2050, we estimate that annual emissions will rebound to 2.1% above 2019 levels (Figure 10). When compared to the most ambitious scenario we considered for ZEV uptake, we find U.S. HDV CO2 emissions would decrease 17.6% from 2019 levels by 2030, or 9.6% from 2005 levels. This scenario would achieve a 50% decrease from 2005 levels by 2042. This would reduce the need for other sectors to decrease emissions by more than 50% to make up for the shortfall in the HDV sector. [EPA-HQ-OAR-2019-0055-1211-A1, p. 28]

EPA's proposal will reduce CO2 emissions very little compared to current policies, with lifetime CO2 emissions of model years 2027–2030 just 0.5% lower and model years 2027–2050 just 0.6% lower. [EPA-HQ-OAR-2019-0055-1211-A1, p. 29]

Our analysis demonstrates that the EPA's proposed updates to the Phase II GHG standards lead to an emissions scenario nearly indistinguishable from the original rule. We estimate EPA's proposed revisions to existing Phase II GHG standards would lead MY2027 vehicles to emit 0.1% less CO2 cumulatively over their lifetimes. In 2030, we estimate that annual well-to-wheel CO2 emissions from Class 4–8 U.S. HDVs would be 525 Mt under both the original rule and EPA's proposed revisions, with a less than 0.2% difference between the original rule and the proposed updates. Cumulatively through 2050 under the original Phase II standards, all MY 2027 and later vehicles would emit 8.6 Gt of CO2, with only a 53 Mt reduction under EPA's proposed revisions (Table 10). [EPA-HQ-OAR-2019-0055-1211-A1, p. 29]

Failing to preserve Phase II stringency for ICE vehicles would reduce CO2 benefits by 0.2–0.5 Gt of CO2 emissions from model year 2027 and later vehicles, depending on the level of ZEV ambition. [EPA-HQ-OAR-2019-0055-1211-A1, p. 29]

If ICE vehicles are instead subject to EPA's proposed updates to the Phase II standards, represented in our Proposal policy scenario, cumulative emissions benefits of the Alternative 1 ZEV pathway would be reduced by 0.3 Gt, achieving only a 3.3 Gt reduction from current policies. For Alternatives 1 and 2, cumulative emissions benefits would similarly be 0.2–0.3 Gt lower. If national ZEV deployment were to be driven only by MOU state adoption of the ACT regulation, 0.5 Gt cumulative emissions benefits would be lost due to reduced ICE standard stringency under the EPA's Proposal relative to the ICCT policy scenario. (Figure 12) [EPA-HQ-OAR-2019-0055-1211-A1, p. 29]

Organization: *Metropolitan Washington Air Quality Committee (MWAQC) et al.*

Finally, GHG emissions from the transportation sector are one of the major contributors of GHGs in the metropolitan Washington region. Tightening of the "Phase 2" GHG emissions standards for several heavy-duty categories would facilitate progress towards our long-term climate goals, which include a 50 percent greenhouse gas emission reduction below 2005 levels by 2030 and an 80 percent reduction below 2005 levels by 2050. It would also accelerate the adoption of zero emission vehicles in the region's heavy-duty fleet, which is one of COG's legislative priorities. [EPA-HQ-OAR-2019-0055-0996-A1, p. 2]

Organization: *National Coalition for Advanced Transportation (NCAT)*

The benefits of zero emissions vehicles are important in the medium and heavy-duty vehicle space because diesel truck and bus emissions disproportionately harm low-income communities and communities of color.26 And a number of states are requiring that electric vehicle infrastructure be deployed in disadvantaged communities to ensure that those communities can reap the environmental and public health benefits of these technologies.27 [[EPA-HQ-OAR-2019-0055-1290-A1, p. 6]

26. M.A. Demetillo, et al., 'Space-Based Observational Constraints on NO2 Air Pollution Inequality From Diesel Traffic in Major US Cities,' Geophysical Research Letters (2021), available at https://agupubs.onlinelibrary.wiley.com/doi/10.1029/2021GL094333.

27. Matthew Goetz, Ryan Levandowski, James Bradbury, & Grace Van Horn, M.J. Bradley & Associates & Georgetown Climate Center, Towards Equitable and Transformative Investments in Electric Vehicle Charging Infrastructure (Mar. 2021) at 22-23, available at https://www.georgetownclimate.org/files/report/Towards%20Equitable%20and%20Transformative%20Investments%20in%20EV%20Charging%20Infrastructure.pdf.

Electric vehicles will provide substantial benefits for the management of the electric grid. By improving utilization of the existing power grid and spreading fixed costs over a larger base of sales, electric vehicle use can benefit not just electric vehicle owners, but other electricity consumers as well. For instance, transportation electrification can benefit all customers by putting downward pressure on electricity rates, as fixed costs are spread over a larger base of kWh sold. [EPA-HQ-OAR-2019-0055-1290-A1, p. 6]

Although electric vehicles are expected to increase the demand for electricity,28 they are also a valuable grid resource that can be used to help manage the time and intensity of energy consumption, which helps lower electricity bills and helps avoid otherwise necessary upgrades to the electric grid, and will likely—in the future—facilitate storing energy and transferring it back to buildings or the grid.29 Many utilities are switching to time of use (TOU) rates that price energy based on the day, time, and season.30 As of March 2020, about half of U.S. investor-owned utilities had optional TOU rates.31 These can be used separately or in addition to residential TOU rates to incentivize electric vehicle customers to charge at off-peak times when it is cheaper and also beneficial for the grid.32 Another form of smart charging involves vehicles being plugged in but not charging until they receive a signal from the grid indicating that demand has declined.33 These technologies have benefits for electric vehicle fleet owners and grid managers, but also for all customers whose rates could decline as electric vehicles help to shift demand.34 California recently undertook a major study of vehicle-to-grid integration—encompassing TOU rates and using electric vehicle batteries as distributed energy resources—and is now working to implement the report's 92 policy recommendations in order to realize the benefits of electric vehicle integration.35 [EPA-HQ-OAR-2019-0055-1290-A1, p. 7]

28. Demand is expected to increase 60% in California by 2045. Southern California Edison, Reimagining the Grid (Dec. 2020) at 1, available at https://download.newsroom.edison.com/create_memory_file/?f_id=5fcfb5f62cfac23b06eb7d39&content_verified=True. Rocky Mountain Institute estimates that there would be a 25% increase in annual electricity demand if all light duty vehicles were electrified. Robert Walton, UtilityDive, '2021 Outlook: The Future of Electric Vehicle Charging Is Bidirectional — But the Future Isn't Here Yet,' https://www.utilitydive.com/news/2021-outlook-the-future-of-electric-vehicle-charging-is-bidirectionalbu/592957/ (Jan. 12, 2021).

35. CPUC, Final Report of the California Joint Agencies Vehicle-Grid Integration Working Group (June 30, 2020), https://gridworks.org/wp-content/uploads/2020/07/VGI-Working-Group-Final-Report-6.30.20.pdf. Consistent with the study's recommendations, utilities in California – including NCAT members Southern California Edison and Pacific Gas & Electric – have proposed a number of large-scale pilots to accelerate technologies and business models that will, among other things, promote the use of electric vehicle charging for load modifying demand response and resource adequacy efforts and the advance opportunities to use bidirectional flow from electric vehicles for buildings, microgrids, and the grid. SCE Advice Letter Filing AK 4542-E, https://library.sce.com/content/dam/scedoclib/public/regulatory/filings/pending/electric/ELECTRIC_4542-E.pdf (July 15, 2021); PG&E Advice Letter 6259-E, https://www.pge.com/tariffs/assets/pdf/adviceletter/ELEC_6259-E.pdf (July 15, 2021).

Electric vehicle charging is also increasingly connected to and supported by renewable energy. TOU rates can be coordinated with renewable energy availability, like in Charge Forward, NCAT member PG&E and BMW's pilot program that helped consumer to delay charging to align with renewable energy.36 NCAT member Southern California Edison also introduced a TOU rate connected to renewable energy availability,37 and has implemented demand response programs through its Charge Ready infrastructure programs that demonstrate how electric vehicle charging load can be shifted to absorb midday excess renewable generation that may otherwise be curtailed.38 NCAT member EVgo, a fast-charging network, powers its 800-charger network using 100% renewable energy.39 [EPA-HQ-OAR-2019-0055-1290-A1, p. 8]

Several utilities including the Sacramento Municipal Utility District (SMUD) have active Vehicle-to-Grid (V2G) research and development projects planned or in progress including both electric school buses and light duty electric vehicles. V2G figures prominently in SMUD's 2030 Zero Carbon Plan pursuant to which SMUD is planning to eliminate its fossil fuel based generation assets by 2030 and could expect over 250 MW/400 MWh of energy storage from V2G. [EPA-HQ-OAR-2019-0055-1290-A1, p. 8]

Organization: *States of California, et al. (The States)*

The States agree that HD ZEVs are rapidly becoming an important presence within the heavy-duty vehicles sector, especially in those vocational categories identified by EPA.97 EPA's proposed initial response to this transition—to tighten the Phase 2 GHG standards to ensure they remain binding on the conventional diesel fleet—is sound and consistent with good rulemaking.98 The proposed approach, in itself, does nothing to accelerate or promote HD ZEV deployment, but only preserves the environmental integrity of EPA's existing Phase 2 standards, which were premised on emission-reduction technologies other than ZEV technology.99 Nevertheless, EPA has invited comment on "the potential for ZEV technology to significantly reduce air pollution from the heavy-duty vehicle sector" as it prepares for future GHG standards for light-duty and heavy-duty vehicles.100 [EPA-HQ-OAR-2019-0055-1255-A1, pp. 22 - 23]

98. Id.

99. Id. at 17,594.

100. Id. at 17,593.

The States welcome EPA's proactive consideration of ZEV technology for future GHG standards. The current Phase 2 GHG standards are an important element of the United States' strategy to stave off the worst effects of climate change, which are caused by anthropogenic emissions of GHGs.101 "Elevated concentrations of GHGs have been warming the planet, leading to changes in the Earth's climate including changes in the frequency and intensity of heat waves, precipitation, and extreme weather events, rising seas, and retreating snow and ice. The changes taking place in the atmosphere as a result of the well-documented buildup of GHGs due to human activities are changing the climate at a pace and in a way that threatens human health, society, and the natural environment."102 As EPA recognizes, the transportation sector is now the largest U.S. source of GHG emissions, with heavy-duty vehicles contributing 23 percent of the United States' transportation emissions.103 [EPA-HQ-OAR-2019-0055-1255-A1, p. 23]

101. See, e.g., Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 Fed. Reg. 74,434, 74,489 (Dec. 30, 2021).

102. Id.; see also Intergovernmental Panel on Climate Change (IPCC), Climate Change 2022: Impacts, Adaption and Vulnerability, Summary for Policymakers, at 11 (H.-O. Portner & D. Roberts, eds. 2022) ("Impacts, Adaptation, and Vulnerability") (surveying medium-to-high confidence attributions of extreme weather, wildfires, heat-related deaths, and ecosystem loss to greenhouse gas emissions from human activities), attached as Exhibit 13.

103. 87 Fed. Reg. at 17,592.

The States are already experiencing grievous effects from climate change, which, as described above, are expected to escalate without sharp reductions in GHG emissions.104 Our residents have lost property, been displaced from homes, endured respiratory illness and other health impacts, and even been killed as a result of severe weather events exacerbated by climate change.105 Often these impacts are disproportionately borne by communities with high poverty rates, communities of color, and indigenous peoples.106 Rising average temperatures, shrinking mountain snowpack, warmer storms, wildfires, and higher sea levels also harm our economies, infrastructure, and public services.107 These impacts require long-term, resource-intensive adaptation planning and costly disaster response by all levels of government and the private sector. The U.S. Global Change Research Program's 2017-2018 Fourth National Climate Assessment projects more extreme-weather impacts for every region of the United States, including major damage to agriculture, coastal industries, utility grids, transportation networks, air quality, and human health, from coastal flooding, heat waves, drought, and wildfires, as well as from the spread of tree-killing and disease-carrying pests.108 Action to reduce GHGs from all major-emitting sectors, including the heavy-duty vehicles sector, is imperative. [EPA-HQ-OAR-2019-0055-1255-A1, pp. 23 - 24]

Organization: *Tesla, Inc. (Tesla)*

For the U.S. to meet its decarbonization goals and to mitigate the public health and welfare impacts from climate change, EPA’s proposal should be amended to meet increasingly more stringent regulatory requirements that incentivize all vehicle manufacturers to rapidly scale up delivery of high-quality BEVs. As previously described, BEV technology in the medium- and heavy-duty vehicle classes is increasing at a rapid pace. Indeed, under Phase 1 of the GHG regulations advanced conventional and BEV heavy duty technology have already established a sizeable manufacturer GHG credit bank.145 The presence of a large bank of credits can dampen the uptake of best emission control technology and delay broader deployment of BEVs. Accordingly, in amending the current Phase 2 GHG regulations, EPA should ensure the changes eliminate this possibility. [EPA-HQ-OAR-2019-0055-1219-A1, p.18]

145 See EPA, Phase 1 EPA Heavy-Duty Vehicle and Engine Greenhouse Gas Emissions Compliance Report (Model Years 2014- 18) (Oct. 2021). See also, Union of Concerned Scientists, Verdict on First US Fuel Economy and Emissions Program for Trucks: Success? (Nov. 5. 2021).

Organization: *University of California, Berkeley, The Goldman School, Center for Environmental Policy*

We have reviewed EPA’s proposed NOx and GHG Tailpipe Emission Standards for Heavy Duty Vehicles for MY 2027-2029. We have conducted a high level modeling exercise to contrast the EPA proposed standard with an alternative proposal (hypothesized for modeling purposes) that would be in line with President Biden’s goal (announced at the Glasgow Climate Summit) of reaching economy-wide net-zero GHG emissions by 2050 (hereinafter referred to as the “President’s climate commitment” scenario). We find that the difference between the two proposals is significant: The President’s climate commitment scenario is found to save $1 trillion more than EPA’s proposed standard by 2050. With this substantial difference in mind, we urge EPA to set more stringent, climate-consistent HDV GHG emission standards, including at least 20% zero emission requirement in new truck sales by 2027 and 50% by 2030. These requirements would credibly put us on the path to meet the President’s climate commitment. [EPA-HQ-OAR-2019-0055-1327-A1, p. 1]

Our work shows that electrifying trucking can have substantial economic benefits over diesel trucking, particularly when electricity tariffs are structured to facilitate off-peak charging. Given these recent findings, and President Biden's commitment to achieve deep decarbonization, we conducted this preliminary analysis to investigate the impact of a climate-consistent HDV emissions standard. [EPA-HQ-OAR-2019-0055-1327-A1, pp. 1 - 2]

We find the differences between the President's climate commitment scenario and the current EPA proposal to be notable across many elements of analysis:

Cost: While EPA proposed standard would save money compared to business-as-usual diesel scenarios, the net present cost of the EPA proposed standard is $1.5 trillion more by 2050 than that of the President's climate commitment scenario. This figure includes carbon pollution costs reflecting the social cost of carbon as well as air pollution damages; however, even when omitting pollution costs, the proposed EPA standard still costs $1 trillion more than the alternative. [EPA-HQ-OAR-2019-0055-1327-A1, p. 2]

ICE trucks on the road: The proposed EPA standard will leave a significant portion of today's internal combustion engine (ICE; gas- and diesel-powered) trucks on the road through 2050 and will fall to meet the President's climate commitment. With the EPA Proposed rules, because of the slow stock turnover of trucks (average life of ~12-15 years or so), nearly 57% of the on-road truck stock would still be diesel powered by 2050. In contrast, in the President's Climate Commitment consistent case, which models all new truck sales to be electric by 2035, only about 7% of the truck stock in 2050 would be diesel powered, while ~93% would be electric. [EPA-HQ-OAR-2019-0055-1327-A1, p .2]

Carbon emissions: The EPA proposed rules would reduce the CO_2 emissions from trucks only by 10% by 2035 and 33% by 2050, relative to the 2020 levels. By contrast, the President's Climate Commitment scenario slashes CO_2 emissions from trucks (including electricity used by trucks for charging) by 50% in 2035—putting this sector on a path to meet its share of the net-zero emissions (a90% reduction in 2050, relative to 2020 levels). [EPA-HQ-OAR-2019-0055-1327-A1, p. 2]

In light of these preliminary results, we urge EPA to rigorously evaluate and consider adopting a more stringent, climate-consistent truck emission standard, including at least 20% zero emission requirement in new truck sales by 2027 and 50% by 2030. This would credibly put us on the path to meet the President's climate commitment. Such regulations are critical to provide a clear signal to the private sector and utilities to rapidly build out production capabilities and charging infrastructure. [EPA-HQ-OAR-2019-0055-1327-A1, p. 4]

Organization: *Wisconsin Department of Natural Resources (WDNR)*

In addition to the necessary NOx reductions, EPA's rule also advances Wisconsin's efforts to reduce GHG emissions and address climate change. Onroad heavy-duty vehicles were responsible for about 10.2 million metric tons of CO_2 equivalent (MMCO2E), or 7% of the state's total GHG emissions inventory in 2018.2 Given the state lacks the authority to address GHG emissions from vehicles and other mobile sources, EPA's action to update the Phase 2

GHG program to ensure it remains representative of the current market conditions in the heavy-duty sector and achieves the most emission reductions possible needed to make progress on this goal. [EPA-HQ-OAR-2019-0055-1162-A1, p. 2]

2. Wisconsin 2021 Greenhouse Gas Emissions Inventory Report, https://widnr.widen.net/view/pdf/o9xmpot5x7/AM610.pdf?t_download=true

***Organization**: World Resources Institute*

EPA studies confirm that medium- and heavy-duty vehicles also generate 23 percent of the transportation sector's greenhouse gas emissions (GHG), contributing to the severity of climate change impacts, including heat waves, drought, sea level rise, extreme climate and weather events, coastal flooding, and wildfires. Some populations may be especially vulnerable to these and other climate change impacts, including low-income communities, people with disabilities, people of color, and Indigenous populations. Furthermore, studies (such as the recent 'Zeroing in on Healthy Air' from the American Lung Association) show that regulations and policies designed to reduce GHG emissions, such as through accelerating electric transportation, will have the added benefit of reducing other forms of pollution, such as air toxics and particular matter, that impact public health and disproportionately impact overburdened communities. [EPA-HQ-OAR-2019-0055-1298-A1, p.2]

EPA Response

EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider the comments in this section of this document in the development of that future rulemaking.

28.5 Other comments on proposed changes to HD Phase 2 GHG program

Comments by Organizations

***Organization:** Allison Transmission, Inc. (Allison)*

Allison would suggest that for the four vehicle types that EPA expects to electrify rapidly (i.e., school bus, transit bus, short-haul tractor, and delivery truck) EPA consider options that would simplify the GHG certification process as noted in previous section regarding better GEM integration of non-ZEV CO2 features, rather than add additional testing burdens associated with powertrain certification. [EPA-HQ-OAR-2019-0055-1231-A1, p.27]

Allison recognizes that powertrain certification can be used to measure CO2 reductions associated with a variety of different features. At the same time, Allison's experience is that it has been challenging to broadly undertake powertrain testing/certification at a reasonable cost given the number of different systems that may be supplied to OEMs. Apart from the capital and recurring costs stemming from obtaining and operating powertrain testing equipment, other elements of EPA regulations, like selective enforcement audits, impose additional indirect costs that may be experienced over multiple years. See Appendix 1. There are additional complications to sharing costs and commercializing powertrain certification for non-vertically integrated manufacturers. [EPA-HQ-OAR-2019-0055-1231-A1, p.27]

In the vocational vehicle sector, this challenge becomes even greater given the wide range of customer needs which drive a variety of vehicle configurations. Lower volumes for some applications make it challenging to address the overhead associated with such testing. Allison recommends that simpler methods be explored, including those involving the testing of standalone components and/or a further build-out of the GEM model to incorporate incremental CO2 reductions. [EPA-HQ-OAR-2019-0055-1231-A1, p.27]

Additionally, it is clear that EPA and CARB will increasingly need to consider not only tailpipe and avoided GHG emissions, but also upstream components to the GHG profile of heavy-duty ZEVs. As EPA is well aware, the overall emissions impact of a ZEV is tied to the carbon content of the electricity used to charge its batteries; such content will vary across different areas of the country, resulting in very real differences in net climate benefits. These differences can be very substantial, varying from 12 grams of CO2 per kilowatt hour (“kWh")to 2.23 lbs. per kWh.69 While this rulemaking does not address this issue and the relative effect of upstream emissions from electricity generation is not a current, major concern given the relatively low penetration of ZEVs in the heavy-duty sector, by EPA’s own estimates this effect will increase over time. EPA should therefore more proactively discuss this issue going-forward during the series of rulemakings that are currently part of its agenda in the HDV sector. [EPA-HQ-OAR-2019-0055-1231-A1, p.33]

> 69 Nationwide, CO2 emissions per kilowatt-hour (“kWh”) averaged 0.85 lbs./kWh in 2020. But the rate varied from near-zero for certain forms of energy (e.g., from 48 gCO2eq/kWh for solar, 24gCO2eq/kWh for hydropower and 12gCO2eq/kWh for nuclear) as compared with 2.23 lbs./kWh for coal-fired power plants. See, e.g., eia.gov/tools/faqs; www.hydropower.org.

Beyond scope of Clean Air Act, ZEVs also face numerous other environmental issues, including the extent of recovery of battery materials, recyclability, and closed loop systems. Battery material reclamation is a very important consideration for the long-term sustainability of ZEV. [EPA-HQ-OAR-2019-0055-1231-A1, p.33]

While all of these issues may not be able to be addressed pursuant to the Agency’s Clean Air Act authority, these impacts have associated costs and cannot be ignored over the long-term. Proactively discussing such issues would aid the vehicle manufacturing sector in planning for future design and sourcing agreements early within vehicle development cycles. Such an assessment should be performed prior to adoption of any explicit or implicit ZEV targets; EPA should not in this rulemaking attempt to align final regulations with the measures and timing contained in the CARB HD Omnibus regulation or the CARB Advanced Clean Trucks regulation. [EPA-HQ-OAR-2019-0055-1231-A1, p.33]

- These include the need for reasonable access to energy and fueling infrastructure where a transition to different systems to power commercial vehicles is contemplated. Either explicit or implicit mandates for certain vehicle types cannot be reasonably achieved unless there is corresponding availability of the necessary fueling infrastructure. [EPA-HQ-OAR-2019-0055-1231-A1, p.34]

In the comments above, Allison has referenced several areas where EPA's Proposed Rule could be improved. Specifically, with respect to the interrelationship of EPA and CARB standards, Allison would offer several additional comments and perspectives: [EPA-HQ-OAR-2019-0055-1231-A1, p.35]

- CARB's Omnibus NOx standards post MY 2027 are based on assumptions concerning certain alternative fuels and the electric grid; but these assumptions may or may not prove out over the next few years and choosing one technology pathway like ZEVs could realistically constrain participation by other technologies and emerging alternative fuels in the heavy-duty sector. Again, Allison would urge EPA to continue promulgating standards that may be achieved by a variety of different technological approaches and, consistent with its CAA authority, only promulgate standards that appropriately consider costs as well as allow for a sufficient timeframe for necessary research, development and demonstration. [EPA-HQ-OAR-2019-0055-1231-A1, pp.35-36]
- The CARB HD Omnibus Rule utilizes standards and measures that are meant to address regional air quality concerns. The standards also require coordination with supporting infrastructure. Such coordination is inherently more feasible to take in a regional context, which is more capable of supporting and targeting infrastructure development for ZEV deployments, necessary alternative fuels and fueling capacity. Such efforts are likely impracticable and potentially unattainable at the federal level within the same timeframes. Several factors distinguish California's efforts from EPA capability in this area:
    - From a practical standpoint, California has exhibited unwavering support for statewide greenhouse gas reductions and electrification goals and incentives for the transportation sector. Starting with approval of the Global Warming Solutions Act of 2006, California has developed a legal and regulatory framework to enable a noteworthy push to accelerate ZEV technology. In more recent rulemakings, ZEV technology has become a primary focus for efforts in the mobile source sector.
    - In this effort, CARB has conducted multiple workshops and engaged in extensive coordination with the California Energy Commission to plan the infrastructure development necessary to support ZEVs at an accelerated pace. While there are currently some federal efforts in this area, including through passage of the 2021 infrastructure package,72 similar efforts do not exist throughout the United States at the same level of legal/regulatory commitment or public funding. [EPA-HQ-OAR-2019-0055-1231-A1, p.36]

72 Infrastructure Investment and Jobs Act, Pub. L. 117-58.

- CARB HD Omnibus NOx standards post 2027 are based on certain alternative fuels and grid assumptions considered at the time of rulemaking. As a result, these standards may not consider the benefits of other emerging alternative fuels that could be applied to heavy duty internal combustion engines as a tool to achieve near-term criteria air pollutant and long-term CO2 reduction goals in vehicle applications that resist electrification. They also may not fully consider the need to leverage existing infrastructure when transitioning to stricter standards. Given these limitations, variation from the structure of CARB regulatory requirements is both justified and necessary. [EPA-HQ-OAR-2019-0055-1231-A1, p.36]

- Otherwise, one of the reasons that the CARB HD Omnibus Rule may be able to achieve its aggressive standards and implementation schedule is by leveraging federally certified engines through allowable exemptions that serve to mitigate impacts to end-user productivity (e,g., numerous exemptions were included by CARB in the final rule because transit, motorcoach, refuse, and heavy haul end-users provided information that justified additional flexibility. Again, the state's ability to take particular regulatory approach to reducing emissions does not mean that similar approaches are justified or workable at a federal level. [EPA-HQ-OAR-2019-0055-1231-A1, pp.36-37]

Organization: *American Automotive Policy Council (AAPC)*

The EPA HD Engine notice of proposed rulemaking includes provisions for using credits to meet fleet requirements. Averaging Banking and Trading (ABT) credits are an important flexibility for manufacturers to meet stringent emissions standards. [EPA-HQ-OAR-2019-0055-1293-A1, p. 1]

Flexibilities to earn credits and to move credits between years and product applications are helpful for manufacturers. Quick changes to production and product plans often result in stranded capital and disruptions to the supply chain and manufacturing workforce. Depending on the product lineup and lifecycle position of their product portfolio, a manufacturer may not have the ability to respond to large changes in stringency immediately, with limited lead time. Alternatively, a manufacturer may be able to transition quickly in one part of its business, but not immediately in another. Manufacturers are more likely to be able to respond to stringent regulations with adjustments to their portfolios over time, and an ABT program with sufficient flexibilities can help manufacturers smoothly transition to stringent regulations. EPA should consider adding flexibilities to trade credits between certification classes, such as light-heavy and medium-heavy, for criteria emissions and GHG. [Also in Section 13. EPA-HQ-OAR-2019-0055-1293-A1, p. 1]

Organization: *American Fuel & Petrochemical Manufacturers (AFPM)*

Although AFPM supports emissions reductions and efficiency, its members believe there is a better way to do it than an indirect mandate of battery electric trucks (BETs). A recent technical assessment confirms that trucks powered with advanced internal combustion technology, coupled with the growing production of renewable diesel and biodiesel that meets the ASTM D-6751 standard, delivers earlier and more cost-effective air quality and GHG reduction benefits than a battery electric truck-centric approach.2 [EPA-HQ-OAR-2019-0055-1262-A1, p.1]

2 See Ramboll US Consulting, Inc., Multi-Technology Pathways to Achieve California's Air Quality and Greenhouse Gas Goals: Heavy-Heavy-Duty Truck Case Study (Feb. 1, 2021), prepared for Western States Petroleum Association and appended to WSPA, Comments on Advanced Clean Fleets (ACF) Regulation March Workshops (April 17, 2021), https://www.arb.ca.gov/lists/com-attach/36-acf-comments-ws-UCdTJlUkAzFVDFMy.pdf

First, EPA must apply a thorough life-cycle analysis when considering GHG tailpipe emissions. [EPA-HQ-OAR-2019-0055-1262-A1, p.2]

A metric ton of carbon has the same impact on climate change regardless of where it is emitted in a vehicle's lifecycle. Some vehicles incur a significant upfront carbon penalty during the manufacturing process and utilize carbon emitted by the power sector. Others have smaller upfront carbon impact but emit at the tailpipe. Only through a lifecycle analysis (LCA) can EPA properly evaluate the tradeoffs and ensure it is achieving its objective of cost-effective carbon emissions reductions from HD trucks. A proper LCA should be based on sound science, account for each vehicle's lifetime emissions regardless of powertrain, including emissions associated with its production, recharging/refueling, drivetrain/battery replacements, required infrastructure modifications, and end of life disposal options. Emphasizing only tailpipe emissions results in a distorted view of the actual environmental impacts of vehicle technologies that generate emissions elsewhere in the production of the vehicle or the generation the energy used for vehicle operation. If EPA intends to reduce motor vehicle emissions in a cost-effective and transparent manner, it should evaluate emissions on a lifecycle basis. [EPA-HQ-OAR-2019-0055-1262-A1, p.2]

Although, tailpipe emissions are the most obvious emissions from new motor vehicles or their engines, a rule that effectively mandates BETs will cause additional emissions from electricity generation. Similarly, EPA must recognize that requiring BETs causes additional GHG emissions relating to battery mining, production, and disposal or recycling. Without LCA, the Agency cannot reasonably assess the stringency or GHG reduction benefits of its proposed standards, nor can it reasonably assess the costs and benefits; thus, EPA cannot assure that its standards appropriately and justifiably protect public health or welfare without LCA. The absence of LCA of BETs in this context amounts to EPA ignoring an issue of central relevance to the problem it is trying to solve and is therefore arbitrary and capricious. [EPA-HQ-OAR-2019-0055-1262-A1, p.2]

Second, EPA must remain technology neutral when setting NOx and GHG emissions standards for heavy-duty trucks. [EPA-HQ-OAR-2019-0055-1262-A1, p.2]

Third, the agency has no authority to set standards that can only be achieved through fleet averaging and emissions trading. [EPA-HQ-OAR-2019-0055-1262-A1, p.2]

Finally, the Proposal's GHG provisions are reliant upon California's Advanced Clean Truck rule for significant BET sales even though there is no California waiver in place for Heavy Duty (HD) trucks. EPA is acting arbitrarily in depending on a preempted California standard to demonstrate regulatory achievability. [EPA-HQ-OAR-2019-0055-1262-A1, p.2]

Heavy duty trucks can be used for more than a million miles, and this will mean that for BETs, there will be several battery replacements during their lifetime. The battery is the energy storage media on the vehicle, just as the fuel is on a diesel ICE (internal combustion engine) vehicle. [EPA-HQ-OAR-2019-0055-1262-A1, p.2]

The analysis included in the Proposal does not assume battery replacements and essentially ignores an issue of key importance to the problem EPA is working to resolve. Lithium-ion batteries are made from critical minerals including cobalt, graphite, lithium, nickel, and manganese. Electric vehicles (EVs) require six times the mineral inputs of traditional internal combustion engines.3 One study suggests that the extraction and processing of critical minerals are responsible for approximately 20 percent of the GHG emissions associated with battery production.4 A typical light-duty lithium EV battery weighs about 1,000 pounds. While there are dozens of variations, a typical battery contains around 25 pounds of lithium, 30 pounds of cobalt, 60 pounds of nickel, 110 pounds of graphite, and 90 pounds of copper. Since ore grades vary, acquiring these five elements to produce a single battery requires mining about 90,000 pounds of ore.5 Roughly 90,000 pounds of ore requires digging and moving between 200,000 and over 1,500,000 pounds of earth, a rough average of more than 500,000 pounds per battery.6 These numbers are significantly higher for heavy-duty EV batteries. Further, the International Energy Agency (IEA) pins the average GHG intensity for production of lithium carbonate at around 5 metric tons of Carbon Dioxide Equivalent (CO_2e) emitted per ton of metal, and approximately 15 CO_2e metric tons per ton of cobalt sulfate.7 The mining of minerals for BETs typically occurs in countries where environmental, health, and safety precautions are significantly less stringent than those in the U.S.8,9 [EPA-HQ-OAR-2019-0055-1262-A1, p.3]

9 In addition to GHG emissions, such mining activities are also responsible for PM emissions, NOx emissions, and other air pollutant emissions.

Finally, EPA's proposal does not consider whether there are any safety concerns with adopting standards that force a shift toward BETs. Section 202 of the Clean Air Act requires the Administrator to consider whether any 'device, system, or element of design will cause or contribute to an unreasonable risk to public health, welfare, or safety in its operation or function.' EPA's failure to include this analysis on these issues as they relate to heavy-duty BETs is arbitrary and capricious. EPA must conduct such an assessment and seek comment from the public. [EPA-HQ-OAR-2019-0055-1262-A1, p.6]

Policies that allow various technologies24 to compete in the marketplace can and should be developed to achieve the goal of cost-effective GHG emissions reductions. Mandating the use of a particular technology stifles innovation, for example the benefits of renewable diesel in not only new engines but the on-road fleet. Renewable diesel is promising because it is chemically identical to petroleum diesel and can deliver GHG reductions of 50 to 90 percent depending upon feedstock.25 On a lifecycle basis, a new diesel truck running on renewable diesel emits fewer GHGs than a battery powered truck, while retaining refueling convenience and infrastructure.26,27 Renewable diesel is becoming more widely available as new production facilities are built.28 Subject to renewable feedstock availability, this advanced fuel will build on past successes29 in improving air quality and lowering carbon emissions at a much lower cost than electrification. In addition, research studies30 have also shown that paraffinic fuels such as renewable diesel reduce criteria pollutants emitted from the engines. These reductions are measurable and significant but diminish after gases pass through vehicle aftertreatment systems typically found on post-2010 MY vehicles. However, there are still benefits to the existing fleet of pre-2010 vehicles. [EPA-HQ-OAR-2019-0055-1262-A1, p.7]

24 E.g., battery electric vehicles, hybrids and efficient gasoline and diesel vehicles, biofuels, natural gas, and hydrogen.

25 See Reduced emissions, Neste.com https://www.neste.com/products/all-products/renewable-road-transport/reduced-emissions#fe233267, last visited, May 16, 2022.

26 Id. Renewable diesel is produced through various thermochemical processes such as hydrotreating, gasification, and pyrolysis. Because it is made from waste and biobased materials, using renewable diesel does not release any new carbon dioxide (CO_2) into the atmosphere.

27 See discussion Section II.A.2. infra.

28 The U.S. Environmental Protection Agency (EPA) Electronic Moderated Transaction System for renewable fuel indicates that the United States consumed over 900 million gallons in 2019. Renewable diesel output in the United States has increased nearly 15 percent over the last year and close to 20 renewable diesel projects at refineries are underway, including one that will be the world's largest renewable fuel plant.

29 Diesel engines using compression-ignition (CI) combustion are presently the most efficient engines for MHDVs, with progress evident for further reductions in CO2 and fuel consumption, and NOx emissions. Supported by the U.S. Department of Energy's SuperTruck initiative, demonstration of 55 percent peak engine efficiency in a research vehicle environment may occur in the next few years. Spark-ignition (SI) engines continue to evolve and improve, with potential to reach more than 40 percent peak brake thermal efficiency while still achieving stringent criteria emissions with relatively low-cost aftertreatment. See 'Summary,' National Academies of Sciences, Engineering, and Medicine, Reducing Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty Vehicles, Phase Two: Final Report (2020), https://doi.org/10.17226/25542.

30 CARB Assessment of the Emissions from the Use of Biodiesel as a Motor Vehicle Fuel in California 'Biodiesel Characterization and NOx Mitigation Study.'

EPA must utilize technological neutrality in setting engine warranty requirements. In this rule, EPA proposes to significantly expand the regulatory useful life and emission warranty requirements for diesel truck engines, along with associated costs, but does not treat EV truck powertrains similarly, creating unequal regulatory treatment for different technologies, and ultimately shifting the significant hidden cost of battery replacement to the truck operator. It is unreasonable for EPA to ignore similar expansions of the regulatory useful life and emission warranties for EVs. EPA bases its proposed tightening of GHG emission limits on a transition to EVs despite EV batteries being dependent on large cross-subsidies from buyers of gasoline and diesel vehicles. EPA cites no authority to adopt standards that force buyers of specific drivetrains (e.g., diesel engines) to fund large cross-subsidies to buyers of other drivetrains (e.g., electric motors), without any notice to the public of these transfers, nor any requirement for these payments to be disclosed by auto or truck manufacturers and retailers. EPA must cite such authority and seek public comment before buyers of diesel trucks in West Virginia, for example, unknowingly are forced to subsidize buyers of electric trucks in California. EPA also fails to account for a significant cross-subsidy from utility ratepayers to pay for electric infrastructure upgrades for EV infrastructure and a large subsidy from federal and state taxpayers through EV tax incentives. EPA must estimate these costs and seek public comment. [EPA-HQ-OAR-2019-0055-1262-A1, pp.7-8]

Simply put, production multipliers for BETs are not authorized under the CAA. By including multipliers, the use of the multiplier provides manufacturers with compliance credits that exceed the emissions reduced. EPA originally proposed these changes under Section 202(a) of the CAA.32 Nothing in Section 202(a) of the CAA provides EPA with the authority to utilize factually inaccurate multipliers to assure compliance with the standards. In fact, Section 202(a) of the CAA contains language that is inconsistent with the use of multipliers. The statute instructs the Administrator to prescribe, by regulation, 'standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.’33 [EPA-HQ-OAR-2019-0055-1262-A1, p.8]

32 42 U.S.C. 7521(a).

33 Id.

The statute also states the regulations 'shall contain standards which reflect the greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply, giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology.'34 The reliance on multipliers is a de facto concession that it has set a standard that is not achievable [EPA-HQ-OAR-2019-0055-1262-A1, pp.8-9]

34 Id.

Rather than continuing the use of unlawful multipliers, EPA should promulgate standards that are achievable and cost-effective as required by the CAA. [EPA-HQ-OAR-2019-0055-1262-A1, p.9]

Although emissions trading can be a valuable tool in reducing cost through a market-based mechanism, EPA lacks the statutory authority here to utilize fleetwide emissions trading as the basis to set underlying emission standards and to force an economy-wide transition from the internal combustion engine to the electric powertrain.35,36 Liquid fuels and the internal combustion engine are the centerpieces of Title II of the CAA. Surely, if Congress contemplated giving EPA the authority to set standards that could not be achieved without averaging emissions from electric vehicles whose primary emissions occur upstream, it would have provided EPA with that specific authority. This is a major policy shift that Congress must directly address. To this point Congress has not authorized this authority. To the contrary, the terms of Section 202(a), which require emission standards to be 'applicable to' vehicles and engines for their useful lives, and numerous other provisions of Title II make clear that emission standards under Section 202 must be vehicle-specific, and not fleetwide standards achievable only through emissions averaging and trading.37 When Congress wants to create an average standard applicable to manufacturers, or to authorize emissions trading, it says so.38 [EPA-HQ-OAR-2019-0055-1262-A1, pp.9-10]

35 AFPM does not take a position in these comments on any other emissions trading program.

36 AFPM notes that EPA is requesting comment on expanding the embedded BET percentage as part of this rulemaking, which is undoubtedly a major question that Congress should speak to.

37 See, e.g., 7522, 7524, 7525, 7541.

> 38 See 49 U.S.C. 32902(a) (requiring DOT to 'prescribe by regulation average fuel economy standards for automobiles manufactured by a manufacturer' in a given model year and directing that '[e]ach standard shall be the maximum feasible average fuel economy level that the Secretary decides the manufacturers can achieve in that model year'). See also e.g., 7545(k)(7); 7545(o)(2)(A)(ii)(II)(cc), 7545(o)(5)(A) (credits for renewable fuels); 7586(f) (credits for centrally fueled fleets); 7589(d) (California pilot test program).

EPA cannot include electric trucks in establishing motor vehicle tailpipe standards especially within the same vehicle classes as heavy-duty ICE engines. BETs do not have engines, therefore if EPA is required to establish emission standards for BETs, the Agency must do so as part of a separate classification. This can be achieved by weight rating within that separate BET classification, as heavier BETs have different emissions profiles than lighter BETs. [EPA-HQ-OAR-2019-0055-1262-A1, p.10]

Although Congress has not authorized emissions trading between ICEVs and BETs as a basis for setting emissions standards, if EPA finalizes this aspect of the proposal, it must adopt a scientifically-sound approach to such emissions trading. The current approach is arbitrary and capricious in that it turns its back on EPA's own understanding of real-world emissions. To remedy this, there must be a full accounting of the lifecycle of each vehicle that is part of the trading program emissions (see Battery Components (section IA) above regarding the inclusion of GHG emissions from BET battery production and replacements). Sound science also requires that EPA eliminate all multipliers that distort the calculation of each vehicle's emissions. [EPA-HQ-OAR-2019-0055-1262-A1, p.10]

Organization: *American Petroleum Institute (API)*

All technologies should be compared on an equal footing when developing transportation policies.

API and its members commit to delivering solutions that improve air quality and reduce the risks of climate change while meeting society's energy needs. We support global action that drives greenhouse gas (GHG) emissions reductions and economic development. Market-based policies are an effective means to drive competition and innovation to address current and future energy needs. Based on this principle, we encourage EPA to adopt technology-neutral regulatory policies that facilitate a level playing field for all vehicle, fuel and related infrastructure technologies where innovation, competitive markets and consumer choice will drive emissions reductions and also meet policy objectives. [EPA-HQ-OAR-2019-0055-1171-A1, p.2]

A holistic federal transportation policy that utilizes technology neutral, carbon intensity-based fuel and vehicle standards will enable improvements in air quality and drive immediate reductions in GHG emissions for the entire vehicle fleet.

Liquid fuels can provide near-term, significant emission reductions from the on-road vehicle fleet in a policy framework that includes technology neutral, performance-based and complementary standards for fuels, vehicles, and infrastructure. Utilizing a well-to-wheels vehicle approach for GHG emissions accounting across all fuel-vehicle pathways allows direct comparisons of internal combustion engines (i.e., gasoline, diesel, or natural gas), battery electric, hydrogen, and hybrid technologies. [EPA-HQ-OAR-2019-0055-1171-A1, p.2]

API supports federal policy that establishes 1) a technology neutral, carbon intensity-based fuel standard in gCO2/MJ for the motor fuel pool that declines over time and 2) a well-to-wheels vehicle standard in gCO2/mile that incorporates the GHG benefits brought about by the fuel standard as it continues to encourage efficiency improvements in the certification of new vehicles. [EPA-HQ-OAR-2019-0055-1171-A1, p.2]

Instead of making 'targeted' adjustments for specific, end-use applications designed to incentivize future adoption of a specific technology, EPA should focus on strategies to broadly encourage increased deployment of commercially available technologies to meet near-term air quality goals and greenhouse gas reduction. A recent Guidehouse Insights study notes that '*20% of the [medium/heavy-duty vehicle] market is poorly positioned for decarbonization*' because of operational, performance and technology adoption constraints that pose challenges for policy focused on a single technology.5 In addition, a technical assessment prepared by Ramboll US Consulting Inc. suggests that the expanded penetration of vehicles equipped with low NOx technologies, coupled with increased usage of renewable liquid and gaseous fuels (e.g., renewable diesel and renewable natural gas), offers significantly lower carbon intensity pathways that could deliver earlier and more cost-effective air quality and GHG reduction benefits than that possible via a single technology focus.6 [EPA-HQ-OAR-2019-0055-1171-A1, pp.2-3]

5 See Guidehouse Insights, 'The Easiest and Hardest Commercial Vehicles to Decarbonize,' prepared for The Fuels Institute, April 2022, https://www.fuelsinstitute.org/Research/Reports/Decarbonizing-Medium-and-Heavy-Duty-Vehicles/Med-Heavy-Duty.pdf

6 See Ramboll US Consulting, Inc., 'Multi-Technology Pathways to Achieve California's Air Quality and Greenhouse Gas Goals: Heavy-Heavy-Duty Truck Case Study,' February 1, 2021, prepared for Western States Petroleum Association and appended to WSPA, 'Comments on Advanced Clean Fleets (ACF) Regulation March Workshops,' April 17, 2021 https://www.arb.ca.gov/lists/com-attach/36-acf-comments-ws-UCdTJlUkAzFVDFMy.pdf

Only providing incentives for the electrification of future heavy-duty vehicles distorts the market and ignores the 'near-zero' technology options that: (a) are currently commercially available; (b) offer significant emission reductions; (c) are cost-effective; and (d) are feasible across a broad spectrum of end-uses. [EPA-HQ-OAR-2019-0055-1171-A1, p.3]

Renewable diesel (RD), which is chemically identical to petroleum diesel, is one such low carbon intensity fuel technology option that is readily available and has seen increasing usage, especially in California.7 Renewable diesel fuels have the potential to offer significant emission reductions when compared to petroleum-based diesel, particularly for one of its largest end-use applications: heavy-duty vehicles and engines. Data from the California Air Resources Board (CARB) suggests we could see reductions in lifecycle GHG emissions in the range of 40% to 80%.8 9 EPA also recently estimated that the production of renewable diesel from canola oil using a hydrotreating process could reduce lifecycle GHG emissions by 63 – 69% on average relative to a petroleum diesel baseline.10 These emission reductions for the on-road heavy-duty fleet could be further accelerated through action by EPA and other government agencies (e.g., the Federal Trade Commission) to revise and update the language in existing labeling, certification, and recordkeeping requirements for renewable diesel that currently acts as a disincentive for its use. This is consistent with the Renewable Diesel and Sustainable Aviation Fuel Parity Act of 2022 which seeks to remove labeling requirements for renewable diesel that meet or exceed ASTM D975.11 Maintaining the current labeling requirements to disclose the percentage, within one percent, of renewable diesel is not informative to end- users from a vehicle performance or emissions perceptive and only serves to restrict efficient distribution. [EPA-HQ-OAR-2019-0055-1171-A1, p.3]

8 California Air Resources Board, Petroleum Diesel Carbon Intensity: Low Carbon Fuel Standard Regulation, Table 7-1

10 See EPA Proposed Rule -Renewable Fuel Standard Program: Canola Oil Pathways to Renewable Diesel, Jet Fuel, Naphtha, Liquefied Petroleum Gas and Heating Oil, Table II.C.12-1 in 87 Federal Register 22839 (April 18, 2022)

11 See S.3038, Renewable Diesel and Sustainable Aviation Fuel Parity Act of 2022, introduced in the US Senate, April 7, 2022

Organization: *Autocar, LLC (Autocar)*

In supporting the spirit of the Proposed Rule, Autocar proposes the following modifications: Ensure the extension of provisions for generation of emission credits for natural gas-fueled vocational vehicles in §1037.150(y)(3), and extend the life of such credits indefinitely. [EPA-HQ-OAR-2019-0055-1292-A1, p. 1]

Second, EPA should extend the provisions for generation of emission credits for natural gas-fueled vocational vehicles in §1037.150(y)(3), and extend the life of such credits indefinitely. Autocar and other small manufacturers should continue to earn extra credits for selling market-ready environmentally-friendly CNG trucks while they continue to develop ZEV's. The credits earned may put them on a more even playing field with regard to meeting Phase 2 standards and beyond. [EPA-HQ-OAR-2019-0055-1292-A1, pp. 5 - 6]

Organization: *California Air Resources Board (CARB)*

CARB's Draft 2022 State Strategy for the State Implementation Plan (SIP)148 describes the need for federal action to expand use of HD ZEVs. The Strategy includes a draft SIP commitment for CARB staff to advocate for U.S. EPA to promulgate HD ZEV requirements in order to reduce NOx emissions in the South Coast in 2037. The Strategy envisions U.S. EPA adopting new more stringent GHG standards for medium- and HD vehicles that would apply to new heavy-duty trucks sold nationwide. [EPA-HQ-OAR-2019-0055-1186-A2, p.84]

148 https://ww2.arb.ca.gov/sites/default/files/2022-01/Draft_2022_State_SIP_Strategy.pdf

Based on discussions with U.S. EPA staff, CARB staff believes U.S. EPA is planning on a revision to the Phase 2 GHG standards, i.e., the Phase 3 GHG standards, with an anticipated proposal date of Spring 2023. CARB staff is supportive of U.S. EPA adopting stringent Phase 3 GHG standards. HD vehicles are an important contributor to GHG emissions. In order to meet the urgent need to address climate change and achieve carbon neutrality, CARB staff encourages U.S. EPA to propose Phase 3 GHG standards that aggressively drive HD ZEV penetration. HD ZEV uptake rates and timelines required by U.S. EPA standards should match those in CARB's ACT and the upcoming Advanced Clean Fleets regulations.149 CARB supports any efforts U.S. EPA can take as part of the current proposed rule to advance HD ZEV adoption. [EPA-HQ-OAR-2019-0055-1186-A2, p.84]

Organization: Edwin J. Ward

The proposed standards are incentivizing manufacturers to develop technology that will be useless with coming state ZEV requirements

The final issue I must address is the looming elephant in the room of widespread vehicle electrification. Although light-duty vehicles currently constitute almost the entirety of the zero-emissions vehicle market, a ZEV future is very much on the near horizon for heavy-duty vehicles as well. Nevertheless, EPA's proposed rulemaking for updated heavy-duty vehicle emissions standards focuses primarily on impacts to local air pollution instead of impacts on climate change. This is a mistake. The 2015 Paris Agreement, of which the United States is a signatory, binds our country to taking steps to reduce greenhouse gas emissions and limit global average temperature increases to below at least 2°C and preferably 1.5°C.17 In advancement of the Paris Agreement, President Biden signed Executive Order 14008 in 2021 which directs each department and agency, including EPA, to take part in a government-wide approach to solving the climate crisis.[18] Reducing and eliminating greenhouse gas emissions from heavy-duty vehicles is of utmost importance as transportation now accounts for a plurality of U.S. greenhouse gas emissions.[19] [EPA-HQ-OAR-2019-0055-1050]

Furthermore, the impacts of climate change will not be borne equally by all Americans. Researchers have found that communities of color, which are already disproportionately impacted by air pollution, are the most vulnerable to heatwaves and extreme weather events.[20] EPA's concerns with the effects of criteria pollutants from heavy-duty vehicles on environmental justice communities are admirable, but EPA also has a duty to protect those same communities from climate change, which itself is also exacerbated by heavy-duty vehicle emissions. Executive Order 12898 directs all federal agencies to incorporate environmental justice into their decision-making, and failing to address the effects of emissions on climate change (and thus environmental justice communities) is a dereliction of EPA's duty under EO 12898.[21] EPA should move forward with a rule that all heavy-duty vehicles sold after 2045 must be zero emissions vehicles. [EPA-HQ-OAR-2019-0055-1050]

Beyond the effects of vehicle emissions on climate change and environmental justice, the rationale for moving forward with a ban on heavy-duty non-ZEVs by 2045 is also simply practical. The eulogy for the internal combustion engine has already been written, and countries around the world have adopted cut-off dates for light, medium, and heavy-duty vehicles. In the United States, California and New York have both moved to mandate that no new heavy-duty non-ZEVs can be sold after 2045.[22] Manufacturers have already responded by racing to design and deploy ZEV versions of their heavy-duty vehicles, including Tesla,[23] Volvo,[24] and Mack Trucks.[25] [EPA-HQ-OAR-2019-0055-1050]

For many manufacturers, the writing for ZEVs is on the wall. Rapid technology improvements and cost reductions in both battery and hydrogen fuel cell technologies make a gradual phaseout of internal combustion engines over the next two decades the most prudent way forward for our climate and for manufacturers' bottom lines. EPA's proposed rules would require a 60% reduction in NOx emissions by 2045. That's an impressive reduction in a potent air pollutant, but by that date, any internal combustion engine vehicle meeting those rules wouldn't even be eligible for sale in California, New York, and countless other countries. It is likely that even more state governments will adopt the 2045 cutoff date in the coming years. [EPA-HQ-OAR-2019-0055-1050]

EPA's proposed rules require manufacturers to invest heavily in a technology that will be essentially worthless for a huge chunk of potential buyers. Perhaps EPA is hoping that the opportunity cost of developing new diesel engines will persuade manufacturers to develop ZEVs instead? If that is the agency's hope, then why still allow manufacturers to invest in and sell non-ZEV vehicles at all? EPA can and should propose rules to wean vehicle manufacturers off of climate-polluting engines and incentivize them to invest in ZEV technologies like batteries, hydrogen fuel cells, and even trolleytrucks. [EPA-HQ-OAR-2019-0055-1050]

[Conclusion] For the long term, EPA should establish a hard cut-off date of 2045 for the sale of any heavy-duty non-zero emissions vehicle. This date will give manufacturers time to adjust, will bring the federal government in line with New York and California, and will help environmental justice communities already suffering from the effects of air pollution from being more at risk from climate change. Organization: *Ford Motor Company (Ford)*

The Greenhouse Gas regulations do not currently allow trading of engine-based CO2 credits between averaging sets (e.g., between Light Heavy-Duty and Medium Heavy-Duty Diesel engines). This restriction is unnecessary and can drive costly investments for manufacturers who would otherwise be looking to invest in the advanced technology powertrains of the future (electric, fuel cell, etc.). A manufacturer with a single engine (which could be used to meet both the newly proposed NOx standards as well as the more stringent proposed GEM-based vehicle CO2 standards) could be forced to develop or purchase separate light-heavy-duty and medium-heavy-duty diesel engines simply to meet the “normalized to work” engine CO2 standards of both segments. This would not yield any additional GHG or NOx emission benefits. Ford recommends that EPA remove the restriction on trading of engine-based GHG credits between service classes or, at a minimum, allow trading in cases where engines and emission systems are substantially the same (e.g., displacement, combustion system design, emissions controls including aftertreatment chemistry and loading, etc.). This change would have no negative impact on fleet NOx or CO2 emissions and would enable manufacturers to more efficiently invest in the powertrains of the future. [EPA-HQ-OAR-2019-0055-1300-A1, p. 5]

Organization: *Manufacturers of Emission Controls Association (MECA)*

EPA recognized the GHG reduction benefits of auxiliary power units (APUs) during the promulgation of the heavy-duty Phase II regulation. APUs utilize a small diesel engine to operate driver comfort systems rather than overnight idling of the main engine on Class 8 sleeper trucks. One APU manufacturer advertises savings of $428 per month when using a diesel fueled APU to supply auxiliary power compared to idling class 8 engine (2000 hr./yr. at $3/gallon fuel). Due to the quick return on investment from the fuel savings, APUs are quite popular with production volumes in the 25K to 40K units per year. [EPA-HQ-OAR-2019-0055-1320-A1, p.30]

At the same time, EPA also understood that APU engine standards are less stringent than those for on-highway trucks. Permitting trucks with the latest engine and aftertreatment technology to employ APUs to reduce GHGs during idling would result in increased PM emissions unless DPFs were installed on the APUs. CARB has verified at least three diesel particulate filter models for APUs at the Level 3 designation (> 85% reduction) since 2008. These DPFs can be installed on Carrier, Proventia and Thermo King APUs, resulting in the production of more than 10,000 DPF equipped APUs for the California market. Therefore, EPA finalized stringent PM emission limits in the Phase II Heavy Duty GHG Rule for all Auxiliary Power Units (APUs) installed on new model year 2024 or later tractors. The agency noted that DPFs are viewed as the likely 'emission control hardware' necessary to meet the standard. [EPA-HQ-OAR-2019-0055-1320-A1, p.30]

MECA has learned that EPA has agreed with an interpretation of the Phase 2 requirements that an APU would not need to include a DPF if an OEM did not install the APU on a new tractor at the factory. The vast majority of APUs are installed at the dealer/distributor after the truck is sold when the vehicle owner requests an APU option. This presents a 'loophole' in the Phase 2 regulation by allowing an APU manufacturer to claim that the tractors are no longer 'new' and thus avoid installation of a DPF. Given the incremental cost of approximately $1800 as referenced in the heavy-duty Phase 2 RIA, the tractor's owner has a strong incentive to install an APU without the DPF at the dealer rather than having the DPF equipped APU installed at the truck assembly plant. [EPA-HQ-OAR-2019-0055-1320-A1, p.30]

The current practice in the market of circumventing the intent of the rule will have significant consequences for both human health and GHG emissions, resulting in more than 75 metric tons (MT) of excess PM emissions with serious public health consequences, particularly for frontline communities. It is reasonable to assume that the APU will operate on average for 2000 hours per year. EPA's MOVES model estimates that APUs without DPFs emit 0.96 grams PM per hour while APUs with DPFs emit 0.02 grams PM per hour. The difference in emissions of 0.94 g/hr results in approximately 1880 grams of PM per year per APU. If 40,000 new APUs are sold each year, this would result in an additional 75.2 MT/yr of PM. This difference in PM emissions will have a significant negative impact on human health and air quality. [EPA-HQ-OAR-2019-0055-1320-A1, pp.30-31]

When CARB promulgated their rules for requiring DPFs on APUs, they applied it to 2007 and later trucks. Their intent was clear – with DPFs being installed as the latest technology to reduce PM on the tractor drive engine, it would be counter-productive to allow APUs on the same vehicle to operate without a DPF since this would emit more PM than the main engine with a DPF. It is our view that EPA clearly intended in 40CFR 1039.699 to follow the same logic, requiring DPFs to be installed on all APUs starting in MY 2024, and that this interpretation by the APU certificate holders creates an unintended 'loophole' with significant public health, environmental equity and climate change impacts. We ask EPA to include language in the Phase 2 provisions in the Clean Trucks Regulation that would remediate this issue and ensure all APUs are equipped with DPFs when installed on MY 2024 and later on-highway HD trucks. [EPA-HQ-OAR-2019-0055-1320-A1, p.31]

Organization: *Natural Gas Vehicles for America (NGVAmerica)*

The emissions impact of battery materials and battery production are not inconsequential. An ATRI study released this month 'found that while electric trucks have no direct tailpipe emissions, CO_2 production associated with vehicle, battery and electricity production would only result in a 30 percent decrease in CO_2 emissions when compared to a standard diesel truck.'14 According to ATRI, 'the marginal environmental benefits of electric trucks are due, in large part, to lithium-ion battery production – which generates more than six times the carbon of diesel truck production.' A story published by Politico included this significant datapoint: 'a thousand-pound electric car battery requires the moving of 500,000 pounds of earth in the course of mining.'15 The Financial Times has reported that 'between 5 and 15 tonnes of CO_2 are produced per tonne of lithium extracted. This is equal to the total electric usage of between 1 and 2 U.S. homes for a whole year.'16 [EPA-HQ-OAR-2019-0055-1330-A1, p.7]

Organization: *Neste US, Inc*

The Rule Over-Emphasizes the Importance of Electric Vehicles

The Proposed Rule would increase the stringency of the 2016 Phase 2 GHG emissions standards for certain categories of heavy-duty trucks for MY 2027. The rule cites 'a number of manufacturers producing fully electric heavy-duty vehicles in a number of applications,' California's adoption of an 'Advanced Clean Trucks program that includes a manufacturers sales requirement for zero-emission truck sales,' and 'a Memorandum of Understanding establishing goals to increase the heavy-duty electric vehicle market' between a number of states as support for the premise that the outlook is improving for heavy-duty EVs and that GHG emissions standards therefore should increase in stringency.1 Neste supports the increased stringency of GHG emissions standards, but questions EPA's assessment of the benefits and limitations of EVs and cautions against full reliance on the increased prevalence of EVs. [EPA-HQ-OAR-2019-0055-1225-A1, p.1]

1 87 Fed. Reg. 17414, 17419 (Mar. 28, 2022)

Emissions standards should not favor one technology over others when regulating tailpipe emissions, and should ensure the standards are achievable by internal combustion engines as well [EPA-HQ-OAR-2019-0055-1225-A1, p.3]

The Proposed Rule projects an EV heavy-duty vehicle penetration rate of 1.5% for MY 2027, but requests 'comment and additional supporting information and data on higher penetration rates, which could serve as the basis for the increase in the stringency of the CO2 standards for specific Phase 2 vehicle subcategories.'2 Neste has no comment on whether the projected EV penetration rate should be higher (or lower). Rather, Neste objects to EPA's decision to increase the stringency of standards in such a way that depends on the existence of EVs and therefore impermissibly prefers one technology over others. [EPA-HQ-OAR-2019-0055-1225-A1, p.3]

2 Id.

Moreover, EPA's heavy-duty vehicle rules are intended to regulate tailpipe emissions. EVs are not tailpipe vehicles and are therefore not contemplated by the regulatory scheme and should not be included when calculating the appropriate stringency of tailpipe emissions reduction standards. [EPA-HQ-OAR-2019-0055-1225-A1, p.3]

Increased prevalence of EVs is not required for the reduction of GHG and NOx emissions. As demonstrated by the recent CARB scoping plan, EPA's goals can still be met by using the existing fleet and deploying multiple strategies and technologies, most notably replacing fossil diesel with renewable diesel. [EPA-HQ-OAR-2019-0055-1225-A1, p.3]

Organization: *Oshkosh Corporation*

EPA requests comments on multiple aspects of the Proposed Rule related to the emission credit ABT programs for heavy duty trucks. Oshkosh generally supports the ABT provisions and views them as this as an important tool for incentivizing the introduction of EV and other advanced technologies. In past rulemakings, EPA has significantly limited the ability of manufacturers to carry over legacy credits for vocational trucks certified under the Phase 2 GHG custom chassis provisions. As a result, in the move from Phase 1 to Phase 2 GHG programs, Oshkosh's CO2 credit bank was effectively eliminated, thus constraining the Company's ability to use earned emission credits. The current rulemaking presents an opportunity to obtain a different result. To this end, Oshkosh is pleased to provide these comments regarding EPA's ABT proposals: [EPA-HQ-OAR-2019-0055-1226-A1, p. 5]

To provide further incentives for EV development, Oshkosh also requests that EPA ensure harmonization of NOx and CO2 credit programs for heavy-duty vehicles. In general, we request that EPA modify existing credit ABT programs to (1) allow credit transport across all heavy-duty engine/vehicle families; (2) allow a credit life of 10 years for credits generated by EV, FCEV and hybrid technologies; and (3) guard existing credit banks to enable carry over of legacy credits to future programs. [EPA-HQ-OAR-2019-0055-1226-A1, p. 6] [Also appears in Section 13.1 and 13.5.1 of this document]

Organization: Ray Pingle

[*From Hearing Testimony*, *April 12*, *2022*, *Ray Pingle*] The transition from combustion engine, heavy-duty vehicles to 100-percent zero-emission vehicles is the ultimate end goal to reducing toxic air pollution and GHGs. The EPA must do everything it can now to achieve this objective. A fundamental assumption that EPA will use in crafting its final rule is the forecast number of ZEVs feasible in the coming years. It must increase dramatically from its current outdated forecast with only 1.5 percent of medium heavy-duty vehicle sales being ZEVs by 2027. Five additional states have adopted California's act rule, representing 20 percent of medium-, heavy-duty vehicles nationally. This rule requires 15 to 20 percent of sales to be ZEVs in 2027. This will have a dramatic impact nationally, and momentum is growing in additional states as they adopt policies, incentives, and support structures to promote increasing medium-, heavy-duty vehicles. A March 2022 NREL study entitled, "Decarbonizing Medium-, Heavy-Duty On-Road Vehicles Cost Analysis," states, "Assuming economics drive adoption, ZEV sales could reach 42 percent of all medium-, heavy-duty trucks by 2030, reflecting lower combined vehicle purchase and operating costs." We would encourage the EPA also to consider the recommendations from the International Council for Clean Transportation in its February 2022 briefing paper, entitled: "Adapting U.S. Heavy-Duty Vehicle Emission Standards to Support a Zero-Emission Commercial Truck and Bus Fleet." Zero-emission vehicles are technically and economically ready today in the use cases where the majority of vehicles are currently deployed. In California, the HVIP Financial Incentive Program has approved over 160 zero-emission vehicles with multiple vendors in each class, from Class 2b to Class 8 semi-tractors. ZEV truck demand is significant and growing. Many companies have announced commitments to transition their fleets to zero-emission vehicles, including Amazon, American Airlines, Best Buy, DHL, IKEA, Walmart, and many, many more. We cannot wait for the Phase 3 GHG rulemaking until 2030 to seriously address how to increase the ZEV fleet. We need to begin now in the Phase 2 GHG part of the rule to boldly drive the necessary and feasible significant transition possess. [EPA-HQ-OAR-2019-0055-2867]

Organization: *State Soybean Associations*

Additionally, the proposal overemphasizes the benefits of EVs while overlooking their negative impacts. Specifically, EPA fails to adequately account for the lifecycle emissions associated with EVs, including the significant upstream emissions resulting from charging batteries. [EPA-HQ-OAR-2019-0055-2035-A1, p.3] [Also included in Section 19.2 of this document]

Moreover, EPA fails to acknowledge that electrification is not the most economically or technologically feasible option for achieving its desired emission reductions. As CARB has recognized in its 2022 Draft Scoping Plan Update, which recognizes the importance of continued use of liquid fuels, the 'transition to complete ZEV technology will not happen overnight. ICE vehicles from legacy fleets will remain on the road for some time, even after all new vehicle sales have transitioned to ZEV technology.'3 For that reason, CARB concluded that, '[i]n addition to building the production and distribution infrastructure for zero-carbon fuels, the state must continue to support low-carbon liquid fuels during this period of transition….'4 [EPA-HQ-OAR-2019-0055-2035-A1, p.3] [Also included in Section 3.10 of this document]

3 Cal. Air Resources Bd., '2022 Draft Scoping Plan Update' (May 10, 2022), at 152.

4 Id.

Given the significant benefits associated with renewable fuels and the uncertainties regarding the benefits of EVs, EPA should not favor EVs over other vehicles that can run on renewable fuels in planning for the decarbonization of the U.S. transportation sector. [EPA-HQ-OAR-2019-0055-2035-A1, p.3] [Also included in Section 3.10 of this document]

Vehicles and Advocate for Electrification through Market Incentives

EPA’s authority under the Clean Air Act and Executive Order No 14037 delegates the responsibility of regulating air pollutants emitted from mobile sources and directs the agency to consider setting new NOx standards as well as updating existing GHG emissions standards for HDV17. The reduction of GHG emissions in new HDV MY 2027 under the proposed rule, the EPA should consider all market information on zero-emissions HDV technologies as well as the potential benefits of an accelerated transition through the electrification of HDV sector. [EPA-HQ-OAR-2019-0055-1223]

17 87 FR 17414

Heavy-duty vehicles are significant source of local air pollution and GHG emissions. According to Chandler et al. and the California Air Resources Board (CARB), HDV accounts for 7% of total global warming emissions in California and estimates that this figure will likely increase over the next 30 years18. HDV are the single largest source of NOx in California estimated at 33% and produces more PM than all the state’s power plants combined estimated at 23 tons per day and 7 tons per day respectively19. Likewise, according to the Colorado Department of Transportation medium-and heavy-duty vehicles represents the second-largest source of GHG emissions in the transportation sector, contributing 22% of on-road GHG emissions despite being less than 10% of all Colorado vehicles20. [EPA-HQ-OAR-2019-0055-1223]

In response to the EPA's request to comment in States' interest in shifting to zero emissions HDV. Colorado under the Polis administration released a multi-agency state strategy draft on March 4, 2022, to encourage the adoption of clean trucks21. The clean truck strategy is composed of initiatives to improve air quality, reduce emissions, provide financial savings for businesses, and alleviate environmental justice concerns22. Medium- and Heavy-Duty Vehicle Study found that an accelerated transition to zero-emission vehicles could reduce GHG emissions of MHDV by 45% to 59%, reduce NOx emissions 54% to 93%, and reduce particulate matter emissions 53% to 68% below 2005 levels by 205023. These initiatives provide evidence that the market for ZEV in the HDV sector is likely to rapidly develop as a response to an increase in demand for these vehicles which will result in a decrease in the price of ZE-HDV and increase is cost-effectiveness. [EPA-HQ-OAR-2019-0055-1223]

23 "Polis Administration's Clean Truck Strategy Would Reduce Pollution, Save Money", News, March 4, 2022, accessed May 16, 2022, https://www.codot.gov/news/2022/march/polis-clean-truck-strategy-reduces-pollution.

Tesla announced that it intends to offer a fully electric, Class 8 HD semi by late 2020s equipped with top-of-the-line performance and safety features24. Tesla estimates that the electric costs are half of those of diesel, promising fewer systems to maintain and providing owners with $200,000+ fuel savings and a two-year payback period25. The Tesla semi is available for reservation at tesla.com/semi which provides more evidence on ZE HDV market readiness and its cost-effectiveness against traditional diesel and gasoline substitutes. Low variable cost of driving on electricity will likely outweigh the slightly higher upfront cost of its competitors. Thus, stronger GHG emission standards for traditional HDVs will serve as an economic incentive for corporations to adopt more environmentally friendly and cost-effective alternatives which aligns with the goal of CO2 emission reductions, NOX reductions, and PM reductions as well as improve air quality yielding human health and environmental welfare benefits. [EPA-HQ-OAR-2019-0055-1223]

24 “Semi”, Tesla, accessed May 16, 2022, https://www.tesla.com/semi.
25 “Semi”, Tesla, accessed May 16, 2022, https://www.tesla.com/semi.

Purchasing decisions are solely based on costs, incentives provided by the CTI program directly lowers the costs of transition and drives adoption. Early action credits proposed in CTI drives deployment and sales directly influencing the reduction of NOx emissions from this sector prior to 2027. [EPA-HQ-OAR-2019-0055-1223]

[I] advocate for the use of market incentives to accelerate the adoption of ZE technologies in the HDV sector. Public health and welfare benefits in terms of improved air quality and the transition to ZE infrastructure far outweigh the costs of the proposed regulatory rule. [EPA-HQ-OAR-2019-0055-1223]

Organization: *Valero Energy Corporation****:*** *Valero Energy Corporation*

Clean Air Act (CAA) 202(a)(3)(A) requires EPA to set vehicle emission standards that are ‘achievable through the application of technology which the Administrator determines will be available ..., giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology.’ EPA's proposal establishes GHG emission standards that are not achievable through application of technology that will be available, and EPA has not conducted a rational analysis to determine otherwise. Instead, EPA postulates a ‘significant transition’ within the nationwide heavy-duty (‘HD’) engine and vehicle fleet, in which internal combustion engine vehicles (‘ICEV’) will be replaced by battery electric vehicles (‘BEV’). EPA proposes standards that move toward electrifying the HD fleet by establishing a program that relies on credits and multipliers to incentivize development of BEV, then allowing manufacturers to employ various averaging, banking and trading ‘flexibilities’ to comply. Furthermore, the proposed standards together with the final rule in place for light-duty (‘LD’) vehicles impair the statutory mandates in the Clean Air Act for renewable fuels. [EPA-HQ-OAR-2019-0055-1328-A2, p.1]

EPA purports to act in furtherance of Executive Order 14037, but the order itself limits EPA to action that is ‘appropriate and consistent with applicable law’ (emphasis added below):

Sec. 3. Heavy-Duty Engines and Vehicles Multi-Pollutant Standards for 2027 and Later.

(a) The Administrator of the EPA shall, *as appropriate and consistent with applicable law, consider beginning work* on a rulemaking under the Clean Air Act to establish new oxides of nitrogen standards for heavy duty engines and vehicles beginning with model year 2027 and extending through and including at least model year 2030.

(b) The Administrator of the EPA shall, *as appropriate and consistent with applicable law,* and in consideration of the role that zero-emission heavy-duty vehicles might have in reducing emissions from certain market segments, *consider updating* the existing greenhouse gas emissions standards [EPA-HQ-OAR-2019-0055-1328-A2, p.2]

For the first time, EPA's proposed standards move the HD engine and vehicle sector toward standards that could be met by the sector only through emissions trading. In embarking on a path that imposes monumental costs, huge societal changes, an intractable dependence on foreign adversaries, and a myriad of environmental hazards, EPA ignores or disadvantages competing technology enhancements that are far more likely to produce emissions reductions at less cost and with far less disruption and risk to national security and energy independence, such as carbon sequestration, on-board emissions capture, and increased use of low-carbon biofuels, as expressly mandated by the Renewable Fuel Standard. [EPA-HQ-OAR-2019-0055-1328-A2, p.2]

EPA's proposal exceeds its statutory authority. EPA's declarations that this is an ‘historic opportunity,’ ‘the early stages of a significant transition in the history of the heavy-duty on highway sector,’ underscore the aspirational policy underlying the proposed rulemaking. Meanwhile, EPA fails to provide data regarding technology that will be available to achieve the proposed standards, considering the statutory factors of cost, energy, and safety. Absent reasonable and fair consideration and inclusion of all available technologies and fuels, EPA's proposal and the more stringent requirements on which EPA seeks comment are not achievable or available on a commercial scale. EPA arbitrarily relies on the credit and multiplier system to advantage one technology despite evidence of higher lifecycle emissions for that technology. [EPA-HQ-OAR-2019-0055-1328-A2, p.2]

The ‘historic transition’ is not one by manufacturers or consumers but by EPA's significant (but silent) re-interpretation of statutory authority to grant the Agency power to engineer the nation's HD fleet. Historically, to the extent manufacturers were allowed to comply with tailpipe standards using averaging, banking and trading (‘ABT’) emission credits, the effect on overall emissions and other environmental impacts was little to none, because the vehicles producing the credits and debits largely used similar technology and had similar lifecycle emissions profiles. Yet now EPA's emissions ABT system for vehicle standards goes beyond merely facilitating compliance flexibility; it is designed to force adoption of a single technology by rendering a shift to a single technology the only realistic means to achieve compliance. EPA has not demonstrated that the standards that EPA intends to move toward are achievable or available by the average vehicles and engines in this category. EPA appears to be relying on compliance through ABT, particularly since EPA seeks comment on whether market availability of zero-emission vehicles (‘ZEV’) would support more stringent standards. With these standards, EPA is changing the ABT from a compliance tool that allowed manufacturers some flexibility in meeting demand to be a tool that allows EPA to engineer a significant transition of the HD vehicle fleet to electric vehicles. [EPA-HQ-OAR-2019-0055-1328-A2, p.2]

EPA notes that in 2016, EPA projected no market penetration for electric vehicles in this sector. EPA now assumes the power to impose standards that can be met only by dramatically enhancing the credit value of BEVs and presumes that doing so will result in significantly increased market share for these vehicles. Even if EPA had statutory authority to do this, it would be arbitrary to ignore the impact of the resulting increase in overall emissions and the environmental, health, and security impacts from this 'historic' proposal. [EPA-HQ-OAR-2019-0055-1328-A2, pp.2-3]

Whether EPA may or should leverage a compliance flexibility tool to begin forcing electrification of the United States HD vehicle fleet is a major policy question with enormous potential economic and emissions consequences. Neither Section 202 nor any other provision of the Clean Air Act provides EPA that authority. Congress did not authorize EPA or any other agency in the Executive Branch to force electrification of the HD vehicle fleet. On the contrary, CAA 202 provides for EPA to promulgate vehicle emission standards that are achievable and available. Under any interpretation of the CAA, EPA lacks authority to enact standards that force electrification of the heavy-duty vehicle fleet. Because the standards EPA proposes would significantly alter the national economy, industry, environment, society, and national security, the changes present a major question on which express and clear Congressional delegation is required. Congress has not made such a determination, and the EPA is not the proper or authorized forum for making a decision with such widespread ramifications on areas outside EPA's control or expertise. [EPA-HQ-OAR-2019-0055-1328-A2, p.3]

EPA not only lacks authority to force the Executive Branch's preferred policy outcome by setting vehicle emission standards that clearly are neither achievable nor available, it also has a direct and conflicting mandate under the Renewable Fuel Standard to achieve greenhouse gas emissions from the transportation fleet by promoting increased production of renewable fuels. [EPA-HQ-OAR-2019-0055-1328-A2, p.3]

As provided by the Energy Independence and Security Act of 2007 (EISA), which was adopted with the express purpose of promoting domestic renewable fuel production in order to enhance domestic energy security while reducing emissions of greenhouse gases in the transportation sector, the Clean Air Act mandates increasing volumes of renewable fuel to be used in the transportation sector. EPA's final LD GHG standards and the proposed HD standards undermine these express Congressional mandates. EPA's failure to give fair and full consideration for technologies that use liquid fuels is inconsistent with Congressional directives to achieve reductions in mobile source GHG emissions by increasing volumes of renewable fuel used in the domestic transportation fleet. [EPA-HQ-OAR-2019-0055-1328-A2, p.3]

Finally, by making a policy choice to favor electric vehicles, EPA discourages innovation and investment in alternative technologies that would reduce GHG emissions associated with liquid fuels, such as on-board CO2 capture and blue hydrogen. Instead, EPA's proposal inappropriately favors a technology that may result in higher GHG emissions as well as higher costs for operation and other negative consequences. Incentives for electric vehicles, coupled with the absence of incentives or fair treatment for vehicles using lower-carbon fuels, arbitrarily subsidizes the electric vehicle industry and unfairly disadvantages potential opportunities for greater GHG emissions reductions in the liquid fuel market. [EPA-HQ-OAR-2019-0055-1328-A2, p.7]

EPA is required to consider impacts on endangered species of any action that may affect a listed species or any critical habitat for a listed species. In the proposal, however, EPA does not mention consideration of impacts on endangered species or any consultation required by the Endangered Species Act. EPA's proposal to shift the heavy-duty engine/vehicle market to electric vehicles should account for the emissions expected from production of electric vehicles, batteries, and the electricity for the vehicles, including the harm to endangered species from mines, windmills, and solar fields as well as the environmental impacts from any new mineral extraction facilities, including open-pit and subsea mining, as well as mineral processing and battery manufacturing facilities. [EPA-HQ-OAR-2019-0055-1328-A2, p.8]

EPA's cost-benefit analysis understates the costs of electric vehicles and grossly overstates the benefits by failing to account for the true emissions from electric vehicles. EPA's analysis does not account for the increased costs of electric reliability, increased costs to the electricity infrastructure, the loss of valuable fuel infrastructure already in place, the cost increase to consumers in not only vehicle costs that will be passed on in the prices of goods and services but also the cost increases from the increased demand on minerals that are also needed for other industrial and consumer goods. EPA's analysis of cost and market readiness for EVs does not consider the chip shortage that has been evident for at least a year, nor does it account for short term mitigation of minerals availability and battery costs. [EPA-HQ-OAR-2019-0055-1328-A2, p.8]

In conclusion, EPA's authority under the Clean Air Act to set standards for heavy-duty engines and vehicles does not allow EPA to set standards to engineer a transition in the sector to adopt one technology. EPA has overlooked the opportunity to recognize and encourage development of liquid fuels that have inherently lower carbon intensities as well as opportunities to encourage offsets of GHG emissions. Emerging technologies involving carbon capture, efficiency, and blends of low carbon fuel components could result in substantially lower overall GHG emissions and could be implemented sooner than electric vehicles for this category of vehicles. EPA's design of a GHG standard in a way that fails to properly identify the actual emissions associated with all vehicles (upstream energy emissions and pollution from production) passes up the opportunity to maximize emission reductions and will arbitrarily limit innovation and discourage investment in important developing technologies. Finally, by focusing only on tailpipe emissions and by putting its thumb on the scale in favor of electric vehicle development, EPA has failed to properly consider the full costs and benefits of its rulemaking such as the environmental, social, and economic impacts associated with increased electricity demand and increased mineral mining and processing. EPA's approach may very well lead to higher overall GHG emissions at almost certainly the highest cost for GHG reductions. [EPA-HQ-OAR-2019-0055-1328-A2, p.9]

Organization: *Walmart*

We believe EPA’s regulatory actions provide a valuable signal to the market that can accelerate the innovation and supply of zero and near-zero emissions vehicles to meet the demand for zero emissions vehicles from companies like Walmart.6 We have previously expressed high-level support for EPA's Phase 2 GHG standards and believe a Phase 3 standard for MY2030 and after can function as a critical national standard. [EPA-HQ-OAR-2019-0055-1191-A2, p. 2]

6. https://www.linkedin.com/pulse/heres-how-policy-can-design-reliable-resilient-zero-emissions-cortes/?trackingId=dYIkXNwhfe21D0RIT5Avrw%3D%3D

It is essential to design a Phase 3 standard that aligns climate outcomes with market and operational realities. A standard should unlock viable, emissions-reducing technology at a pace that is cost-effective and based on an independent analysis of market supply and demand conditions and projections, necessary grid and fueling infrastructure needs, and the operational realities of medium- and heavy-duty vehicle (MHDV) fleets. [EPA-HQ-OAR-2019-0055-1191-A2, p. 3]

Additionally, it will be important for EPA to consider how a Phase 3 standard can align and build consistency across the various states that have initiated zero emissions sales standards. One national standard is ideal for national operators to help mitigate the complexity of competing policy requirements while leveraging economies of scale. [EPA-HQ-OAR-2019-0055-1191-A2, p. 3]

Organization: *Westport Fuels Systems (WFS)*

Key WFS commentary/observation highlights include:

- The lowest cost of CO2 abatement is through ICE options, powered by HPDI fuel system technology, representing the most cost-effective pathway to deep decarbonization of road freight. Incentive programs should include high-efficiency, low-cost, low-carbon ICE solutions such as that offered by the HPDI fuel system. [EPA-HQ-OAR-2019-0055-1278-A1, p.6]

EPA Response

EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider the comments in this section of this document in the development of that future rulemaking.

A commenter claimed that EPA failed to consider this rule's impacts on endangered species or any consultation required by the Endangered Species Act (ESA). The commenter focused on the impacts associated with electric vehicles, including the upstream impacts associated with producing and using such vehicles.

EPA disagrees that the agency must consider the rule's impacts on endangered species and, to the extent the commenter asserts ESA consultation is required, disagrees that EPA must conduct ESA consultation for multiple independent reasons. First, the commenter failed to raise this issue with reasonable specificity as required by the Clean Air Act. See CAA section 307(d)(7)(B). The commenter failed to articulate which portion of the proposal the commenter is concerned about, how that portion of the proposal may affect listed species or critical habitat, or why EPA has discretion to consider impacts to listed species or critical habitat.

Second, to the extent that the commenter's ESA concern was specific to GHG standards, this comment is beyond the scope of this final rule. As noted above, we are not taking final action at this time on the proposed GHG standards. *See also WildEarth Guardians v. EPA*, 759 F.3d 1196, 1207-08 (10th Cir. 2014) (holding that the scope of ESA consultation is limited to the scope of EPA's final action).

Third, Section 7(a)(2) of the ESA requires federal agencies, in consultation with the U.S. Fish and Wildlife Service and/or the National Marine Fisheries Service (collectively, "the Services"), to ensure that actions agencies authorize, fund, or carry out are not likely to jeopardize the continued existence of federally listed endangered or threatened species or result in the destruction or adverse modification of designated critical habitat of such species. Contrary to the commenter's suggestion, the final rule does not authorize, fund, or carry out the production or use of electric vehicles, or *a fortiori*, upstream activities like mining, mineral processing, wind and solar energy production, and battery production. As we explain in preamble Section and section 3 of this document, the final criteria pollutant standards do not mandate and are not premised on increasing the production or use of electric vehicles. Therefore, the potential species-related impacts referenced by the commenter are not caused by this final action, and there is no need for EPA to assess any such impacts.

Fourth, the ESA's consultation requirement applies only to actions where there is discretionary federal involvement or control. 50 CFR 402.03; *see also Nat'l Ass'n of Home Builders v. Defs. of Wildlife*, 551 U.S. 644, 669 (2007); *Sierra Club v. EPA*, 353 F.3d 976, 992 (D.C. Cir. 2004). As we explain in preamble Sections I and III, the final standards are justified by EPA's assessment of the relevant statutory factors in CAA section 202(a)(3)(A), which directs EPA to set certain emission standards that reflect the greatest degree of emission reduction achievable through the application of technology that will be available for the model year to which such standards apply, giving appropriate consideration to cost, energy, and safety factors associated with the application of the technology. This provision does not grant EPA authority to weaken the standard, based on impacts to listed species or their critical habitats. Since EPA lacks discretion to modify the standard based on species-related impacts, the consultation requirement does not apply.

29 Other amendments HD highway engines and vehicles

29.1 Alternate standards for specialty vehicles

Comments by Organizations

Organization: *Oshkosh Corporation*

Oshkosh also requests that EPA enhance OBD flexibility for heavy-duty BEV, Fuel Cell Electric Vehicle (FCEV), hybrid, and range-extending configurations by codifying a volume-based OBD exemption for engines to be used in such applications. Such an exemption would apply once the current alternate standards for specialty vehicles (40 C.F.R. § 1037.605) sunset in MY 2027 and could allow a limited number of vehicles (e.g., up to 750 in a given model year) to meet simplified diagnostic control requirements upon making an engineering demonstration of the sufficiency of the diagnostic system. This demonstration could include vehicle sensor-based and monitoring system data to reflect the functionality of the control system. The Company submits that such a process would allow for streamlined certification of hybrid, range-extending, and potentially other specialty vehicles, thus fully capitalizing on the emission benefits of these vehicles as a substitute for conventional ICE vehicles. The requested volume-based OBD exemption could potentially align with the categories of vehicles allowed to certify under the custom-chassis provisions of the Phase 2 GHG rule, given that the latter provisions are intended to facilitate the deployment of similar low-emission technologies. [EPA-HQ-OAR-2019-0055-1226-A1, p. 4]

EPA Summary and Response

Comment Summary	EPA Response
Oshkosh requests that, once the current alternate standards for specialty vehicles sunset in MY 2027, EPA could allow a limited number of vehicles (e.g., up to 750 in a given model year) to meet simplified diagnostic control requirements upon making an engineering demonstration of the sufficiency of the diagnostic system. This streamlined certification demonstration could include vehicle sensor-based and monitoring system data to reflect the functionality of the control system. The requested volume-based OBD exemption could potentially align with the categories of vehicles allowed to certify under the custom-chassis provisions of the Phase 2 GHG rule, given that the latter provisions are intended to facilitate the deployment of similar low-emission technologies.	We appreciate the interest in developing provisions that are specifically tailored to address compliance concerns for these advanced-technology vehicles. We would need to explore these ideas further to determine whether to propose such provisions in a future rulemaking. It is not clear how the suggested provisions would apply for electric vehicles or fuel-cell vehicles.

29.2 Scope and timing for amending applications for certification

Comments by Organizations

Organization: *California Air Resources Board (CARB)*

CARB staff proposes to allow manufacturers to submit the amending applications for certification up to 30 days before the end of the model year. [EPA-HQ-OAR-2019-0055-1186-A2, p.84]

CARB generally does not issue the Executive Order (EO) after the model year ends. If manufacturers submit the amending applications too late, there is not enough time to issue the running change EO if a running change EO is needed. [EPA-HQ-OAR-2019-0055-1186-A2, p.84]

EPA Summary and Response

Comment Summary	EPA Response
CARB staff proposes to allow manufacturers to submit the amending applications for certification up to 30 days before the end of the model year. CARB generally does not issue the Executive Order (EO) after the model year ends. If manufacturers submit the amending applications too late, there is not enough time to issue a running change EO.	The comment largely affirms EPA's proposed approach to disallow amending certificates after the end of the manufacturer's model year. We did not propose to include a separate deadline before the end of the model year for submitting amendment requests. We recommend that manufacturers submit their requests well before the end of the model year to ensure a smooth process.

29.3 Miscellaneous HD highway amendments

Comments by Organizations

Organization: *Allison Transmission, Inc. (Allison)*

- Allison appreciates that EPA defines technology in a way that gives industry greater flexibility to design architecture for OEM and end-user requirements. For example, EPA's definition of hybrids and HEVs offers the industry greater flexibility than the California PHEV definition which constrains hybrid technology down a narrow path to achieve increasing all-electric range, rather than considering other potential hybrid architectures that may be a better fit for customer and regulatory requirements. [EPA-HQ-OAR-2019-0055-1231-A1, p.35]

Organization: *American Reliance Industries Co. (ARI)*

Although not specific to ARI, ARI recognizes that other exemptions exist in 40 C.F.R. Part 1037. For example, 40 C.F.R. 1037.605 "allows vehicle manufacturers to introduce into U.S.

commerce certain new motor vehicles using engines certified to alternate emission standards specified in 40 CFR part 86 for motor vehicle engines used in specialty vehicles." In fact, 40 CFR 1037.605(d) provides an exemption that requires the following label: "THIS VEHICLE IS EXEMPT FROM GREENHOUSE GAS STANDARDS UNDER 40 CFR 1037.605." [EPA-HQ-OAR-2019-0055-1182-A1, p. 2]

As a part of the Proposed Rule, the EPA continues to acknowledge the importance of the existing exemptions by maintaining them in the rule. ARI appreciates the EPA's focus on their top priority of obtaining real world emission reductions and recognition that regulating such small manufacturing niche markets in addition to the regulations placed upon the OEM would not provide such results. Although ARI believes it is the EPA's intent not to limit the existing exemptions in Part 1037, we believe that certain modifications to 40 C.F.R. § 1037.601, which describes how 40 C.F.R. Part 1068 applies to heavy-duty vehicles, fail to account for the existence of these exemptions. After reviewing the redline edits ARI understands how this element could have been overlooked. [EPA-HQ-OAR-2019-0055-1182-A1, p. 2]

Redline changes to 1037.601:

> Subpart G - Special Compliance Provisions
> § 1037.601 - General compliance provisions.
> (a) Engine and vehicle manufacturers, as well as owners and operators of vehicles subject to the requirements of this part, and all other persons, must observe the provisions of this part, the applicable provisions of 40 CFR part 1068, and the applicable provisions of the Clean Air Act. The provisions of 40 CFR part 1068 apply for heavy-duty vehicles as specified in this part, subject to the provisions:
> (1) Except as specifically allowed by this part or 40 CFR part 1068, it is a violation of ~~§~~40 CFR 1068.101(a)(1) to introduce into U.S. commerce a tractor or vocational vehicle that is not certified to the applicable requirements of this part. Similarly, it is a violation of 40 CFR 1068.101(a)(1) to introduce into U.S. commerce a tractor or vocational vehicle containing an engine that is not certified to the applicable requirements of ~~this part and~~ 40 CFR part 86 or ~~part~~ 1036. Further, it is a violation to introduce into U.S. commerce a Phase 1 tractor containing an engine not certified for use in tractors; or to introduce into U.S. commerce a vocational vehicle containing a Light HDE or Medium HDE not certified for use in vocational vehicles. These prohibitions apply especially to the vehicle manufacturer. Note that this paragraph (a)(1) allows the use of Heavy heavy-duty tractor engines in vocational vehicles. [EPA-HQ-OAR-2019-0055-1182-A1, p. 3]

ARI Comment: ARI believes that the changes to this subsection as reflected in the first two sentences, may inadvertently confuse the scope of applicability of the existing exemptions detailed in Part 1037. We believe "similarly" was added to the beginning of the second sentence in the above excerpt in order to extend the introductory clause of the first sentence to the second sentence. However, because there is no affirmative statement that said introductory clause applies, ARI believes that it could be misinterpreted to not apply or at least create unnecessary ambiguity. We also understand why "this part and" was deleted in the second sentence as it relates to meeting certain requirements and does not relate to the existing exemptions. Nonetheless, this deletion, combined with the absense of clear application of the first sentences introductory clause, could be interpreted to limit the applicability of the exemptions of this Part. ARI believes that the EPA should consider alternative wording to avoid such a misinterpretation and maintain the original applicability of the exemptions as established by the existing rule. [EPA-HQ-OAR-2019-0055-1182-A1, p. 3]

ARI believes that two simple alternatives could be applied to amend this section to resolve the above-described concern. Below are two "redlined" versions which ARI believes would both enact the EPA's intent and prevent future misinterpretations. [EPA-HQ-OAR-2019-0055-1182-A1, p. 3]

First alternative:

> § 1037.601 - General compliance provisions.
> (a) ***
> (1) Except as specifically allowed by this part of 40 CFR part 1068, it is a violation of 40 CFR 1068.101(a)(1) to introduce into U.S. commerce a tractor or vocational vehicle that is not certified to the applicable requirements of this part. Similarly, except as specifically allowed by this part or 40 CFR part 1068, it is a violation of 40 CFR 1068.101(a)(1) to introduce into U.S. commerce a tractor or vocational vehicle containing an engine that is not certified to the applicable requirements of 40 CFR part 86 or 1036. Further, it is a violation to introduce into U.S. commerce a Phase 1 tractor containing an engine not certified for use in tractors; or to introduce into U.S. commerce a vocational vehicle containing a Light HDE or Medium HDE not certified for use in vocational vehicles. These prohibitions apply especially to the vehicle manufacturer. Note that this paragraph (a)(1) allows the use of Heavy heavy-duty tractor engines in vocational vehicles. [EPA-HQ-OAR-2019-0055-1182-A1, p. 4]

Second alternative:

> § 1037.601 - General compliance provisions.
> (a) ***
> (1) Except as specifically allowed by this part of 40 CFR part 1068, it is a violation of 40 CFR 1068.101(a)(1) to: (1) introduce into U.S. commerce a tractor or vocational vehicle that is not certified to the applicable requirements of this part; or (2) ~~Similarly, it is a violation of 40 CFR 1068.101(a)(1) to~~ introduce into U.S. commerce a tractor or vocational vehicle containing an engine that is not certified to the applicable requirements of 40 CFR part 86 or 1036. Further, it is a violation to introduce into U.S. commerce a Phase 1 tractor containing an engine not certified for use in tractors; or to introduce into U.S. commerce a vocational vehicle containing a Light HDE or Medium HDE not certified for use in vocational vehicles. These prohibitions apply especially to the vehicle manufacturer. Note that this paragraph (a)(1) allows the use of Heavy heavy-duty tractor engines in vocational vehicles. [EPA-HQ-OAR-2019-0055-1182-A1, p. 4]

Thank you for your continued recognition of the need for the existing exemptions, specifically those available to certain small manufacturers. ARI requests that the agencies adopt one of the two above alternatives to preserve the existing exemptions described under 40 C.F.R. Part 1037.

Otherwise, ARI requests that the agencies engage in additional discussions to evaluate what alternative changes would need to be made to maintain the applicability of these exemptions. [EPA-HQ-OAR-2019-0055-1182-A1, p. 4]

Organization: *California Air Resources Board (CARB)*

For the labeling requirements, consolidate the location for all the labeling requirements in one central place. This is already done for the requirements manufacturers must meet to qualify as a small business, and there are citations to applicable sections throughout. It would be beneficial to have a singular location for labeling requirements. Consolidating the regulations would make it simpler to edit language, find where labels are not meeting the requirements, and also make it clear where all labeling requirements are located. CARB staff suggests that U.S. EPA consider moving all the requirements added to 1037.135 or creating 1037.136 as 'Additional Labeling' where all the consolidated labeling requirements are posted. Please reference the below examples:

- 1037.150(c)(3)
    - Original: Manufacturers must label excluded vehicles with the following statement: 'THIS VEHICLE IS EXCLUDED UNDER 40 CFR 1037.150(c).'
    - Change: Manufacturers must label excluded vehicles as discussed in 1037.135(f)
- 1037.150(r)(3)
    - Original: Add a permanent supplemental label to the vehicle near the original manufacturer's emission control information label. On the label identify your full corporate name and include the following statement: 'THIS VEHICLE WAS MODIFIED AS ALLOWED UNDER 40 CFR 1037.150.'
    - Change: Add a permanent supplemental label to the vehicle near the original manufacturer's emission control information label. On the label put the statement from 1037.135(g)(1)
- 1037.105(h)
    - Original: Vehicles certified to these standards must include the following statement on the emission control label: 'THIS VEHICLE WAS CERTIFIED AS A [identify vehicle type as identified in Table 5 of this section] UNDER 40 CFR 1037.105(h)].' These custom-chassis standards apply as follows:
    - Change: Vehicles certified to these standards must include statement on their emission control label as outlined in 1037.135(h). These custom-chassis standards apply as follows:
- 1037.631(d)
    - Original: You must include the following additional statement on the vehicle's emission control information label under 1037.135: 'THIS VEHICLE WAS EXEMPTED UNDER 40 CFR 1037.631.'
    - Change: You must include the following additional statement on the vehicle's emission control information label under 1037.135 as described in 1037.135(i)
- 1037.622(d)(3)
    - Original: The secondary vehicle manufacturer must add a permanent supplemental label to the vehicle near the original manufacturer's emission

control information label. On the label identify your corporate name and include the statement: ‘THIS TRACTOR WAS MODIFIED UNDER 40 CFR 1037.622.’
    - Change: The secondary vehicle manufacturer must add a permanent supplemental label to the vehicle near the original manufacturer's emission control information label. That has the language found in 1037.135(j)
- 1037.630(b)(3)
    - Original: You must include the following additional statement on the vehicle's emission control information label under
      1037.135: ‘THIS VEHICLE WAS CERTIFIED AS A VOCATIONAL TRACTOR UNDER 40 CFR 1037.630.’
    - Change: You must include the statement from 1037.135(k) on the vehicle’s emission control information label under 1037.135 [EPA-HQ-OAR-2019-0055-1186-A2, pp.85-87]

List of 1037.135 Additions

- (f) - For those vehicles that are using the small business provisions as outlined in 1037.150(c), manufactures must label vehicles with the following statement: ‘THIS VEHICLE IS EXCLUDED UNDER 40 CFR 1037.150(c).’
- (g) - Secondary vehicle manufacturers that qualify as small manufacturers may convert low- and mid-roof tractors to mid- and high-roof configurations without recertification for the purpose of building a custom sleeper tractor or converting it to run on natural gas, must permanent supplemental label to the vehicle near the original manufacturer's emission control information label with the following requirements on the label:
    - (1) On the label identify your full corporate name
    - (2) Include the following statement: ‘THIS VEHICLE WAS MODIFIED AS ALLOWED UNDER 40 CFR 1037.150.’
- (h) - For Vehicles that are certifying to custom chassis the following statement on the emission control label: ‘THIS VEHICLE WAS CERTIFIED AS A [identify vehicle type as identified in 1037.105 Table 5 of this section] UNDER 40 CFR 1037.105(h)].’
- (i) - ’THIS VEHICLE WAS EXEMPTED UNDER 40 CFR 1037.631.’
- (j) - For secondary vehicle manufacturers supplemental label, follow the location requirements of 1037.622(d)(3). On the label identify your corporate name and include the statement: ‘THIS TRACTOR WAS MODIFIED UNDER 40 CFR 1037.622.’
- (k) - If your vehicle meets the requirements as set forth in 1037.630. Meet requirements of 1037.135 add the following statement to your emissions control information label: ‘THIS VEHICLE WAS CERTIFIED AS A VOCATIONAL TRACTOR UNDER 40 CFR 1037.630.’

Alternative Suggestion: Leverage the use of 1037.136 as a centralized location for all the ‘Additional Label Requirements’. [EPA-HQ-OAR-2019-0055-1186-A2, pp.87-88]

The NPRM requests comment regarding whether U.S. EPA should decrease the warranty period for medium HD vehicles in 40 CFR 1037.120 from 5 years or 100,000 miles, to five years or 50,000 miles. U.S. EPA states this amendment would ensure consistency between the warranty coverage periods between the affected vehicles and the engines powering such vehicles. [EPA-HQ-OAR-2019-0055-1186-A2, p.119]

CARB staff strongly opposes the proposed decrease in warranty coverage. As an initial matter, CARB staff notes that U.S. EPA first established the subject warranty periods in the federal Phase 1 GHG Emissions Standards and Fuel Efficiency Standards for Medium- and HDE and Vehicles (hereinafter 'Phase 1 GHG regulation'), 76 Fed. Reg. 57106 (Sep. 15, 2011). In NPRM for the Phase 1 GHG regulation, U.S. EPA stated that CAA section 207 requires vehicle manufacturers to warrant that their vehicles do not have defects that would cause such vehicles to not comply with applicable emission standards.179 CAA section 207 also imposes the requirements on engine manufacturers.180 U.S. EPA further stated that the emissions warranty requirements would, in conjunction with the proposed defects reporting requirements, serve manufacturers' interests in producing quality products and U.S. EPA's interests in ensuring quality control concerns necessitating need to repair in-use engines and vehicles would be addressed,181 and determined that the current warranty period and warranty obligations of vehicle manufacturers were consistent with the directives of CAA section 207.182 [EPA-HQ-OAR-2019-0055-1186-A2, pp.119-120]

179 75 Fed. Reg. 74152, 74273 (Nov. 30, 2010).

180 Id. at 74268.

181 Id. at 74278.

182 U.S. EPA, Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles – EPA Response to Comments for Joint Rulemaking (2011) at p. 17-104.

The NPRM provides no information or reasoning that supports a determination that decreasing the length of warranty coverage is consistent with the directives of CAA section 207. Indeed, elsewhere in this NPRM U.S. EPA acknowledges that lengthening the emissions warranty coverage for HDE will both incentivize owners to perform emissions maintenance and deter owners from tampering with emissions controls, which will collectively help maintain the benefits of the emission controls. In addition, lengthened emissions warranty periods could cause manufacturers to simplify their repair processes and better inform them of system defects.183 These considerations and justifications equally apply to the HD vehicles powered by such HDEs and therefore the proposal to reduce the warranty coverage for medium HD vehicles by 50,000 miles should be rejected. [EPA-HQ-OAR-2019-0055-1186-A2, p.120]

183 NPRM at 17505-17506.

The proposal overlooks the obvious loss of important emissions benefits resulting from the proposal, and has not set forth a rational connection between the facts found and the choice made, State Farm, 463 U.S. at 43. Moreover, in light of CARB staff's concerns, it is additionally clear U.S. EPA has failed to demonstrate that the reduction of warranty coverage is permissible under the statute, or that that there are good reasons for a shorter vehicle warranty. FCC v. Fox Television Stations, Inc., 556 U.S. 502, 515 [EPA-HQ-OAR-2019-0055-1186-A2, p.120]

The NPRM also requests comment whether U.S. EPA should 'align all warranty periods that apply for engine technologies, irrespective of the emissions they are designed to control, with the warranty periods that we finalize for criteria pollutant emission control.'184 [EPA-HQ-OAR-2019-0055-1186-A2, p.120]

184 NPRM at p. 17628.

The proposed rulemaking is primarily directed towards emissions standards and other emissions-related requirements regarding criteria pollutants emitted from new and in-use HD vehicles and the engines powering such vehicles. Although the testing and developmental data indicates that the compliance technologies that manufacturers will likely use to comply with the proposed criteria emissions standards will not adversely increase emissions of GHGs, CARB staff believes the data does not, at this time, indicate a pressing need to extend the emissions warranty periods for GHG pollutants to match the emissions warranty periods for criteria pollutants. However, CARB staff would be interested in considering this issue in more detail in the future, hopefully in conjunction with U.S. EPA. [EPA-HQ-OAR-2019-0055-1186-A2, pp.120-121]

The NPRM requests comment on whether the proposed 'misalignment' of emissions warranty periods between affected HDE and HD vehicles may present issues with respect to certification or implementation. [EPA-HQ-OAR-2019-0055-1186-A2, p.121]

CARB staff is not aware of any issues presented from the different warranty periods. The HD vehicle industry is predominately non-integrated, with a small number of engine manufacturers and a significantly larger number of vehicle manufacturers. The proposed warranty provisions appropriately require engine manufacturers to warrant components and systems installed on their engines are free from defects and workmanship that would cause such engines to not comply with applicable emissions standards for the proposed emissions warranty periods, and require vehicle manufacturers to warrant that emissions-related components they install on the vehicle are free from defects and workmanship that would cause such vehicles to not comply with applicable emissions standards for the proposed emissions warranty periods. [EPA-HQ-OAR-2019-0055-1186-A2, p.121]

HD vehicle manufacturers rely on the engine manufacturers to supply them with compliant engines, and the proposed warranty provisions appropriately acknowledge and reflect the non-integrated nature of the industry by only requiring vehicle manufacturers to warrant that the components and systems installed in vehicles are free from defects and workmanship that would cause such vehicles not to comply with applicable emissions standards for the proposed emissions warranty periods. [EPA-HQ-OAR-2019-0055-1186-A2, p.121]

No issues are presented regarding certification, because both engine and vehicle manufacturers must apply for and obtain certificates of conformance each model year, and no issues are presented with respect to implementation, as the proposed regulations clearly set forth the in-use obligations of both engine and vehicle manufacturers. Moreover, the longer emissions warranty periods for HDE, as compared to the emissions warranty periods for HD vehicles is warranted, given the extended operational lives of HDE, and given that most HDE are designed to be rebuilt after specified periods of operation.185 [EPA-HQ-OAR-2019-0055-1186-A2, p.121]

185 NPRM at pp. 17341, 17495, 17496-17499.

Organization: *Cummins Inc. (Cummins)*

EPA's new proposed provision in §1036.240(c) allows small manufacturers to use assigned DFs but does not mention small-volume families certified by other manufacturers. EPA should retain the existing provisions of §86.096-24(e)(2) allowing any manufacturer to utilize the procedures of §86.094-14 for certifying small-volume families, including the use of assigned DFs. Those provisions are used today and will continue to be needed for some families, for example, those containing alternative fuel engines. [EPA-HQ-OAR-2019-0055-1325-A1, p. 12]

Organization: *PACCAR, Inc (PACCAR)*

PACCAR respectfully requests that EPA clarify its expectations regarding off-cycle data demonstrations. Specifically, proposed 1036.240(b) provides: 'Your engine family is deemed not to comply if any emission-data engine representing that family has test results showing an official emission result or a deteriorated emission level for any pollutant that is above an applicable emission standard (including all corrections and adjustments). Similarly, your engine family is deemed not to comply if any emission-data engine representing that family has test results showing any emission level above the applicable off-cycle emission standard for any pollutant. This also applies for all test points for emission data-engines within the family used to establish deterioration factors.' [EPA-HQ-OAR-2019-0055-1346-A1, p.45]

This section of the regulation discusses DF. The emissions-data engine is only operated in a test cell, and is not intended for installation in a vehicle. This open- ended provision does not provide stakeholders with the regulatory certainty that is needed to allow them to ensure compliance and therefore should be revised. For example, the regulation should further clarify the contours of what is contemplated by 'off-cycle emission standard.' And the statement that '[y]our engine family is deemed not to comply if any emission-data engine representing that family has test results showing an official emission result or a deteriorated emission level for any pollutant that is above an applicable emission standard' could be read to suggest that DF engines would be installed and tested in on-road vehicles, which of course would be inconsistent with industry practice. PACCAR therefore requests that EPA remove this proposed provision. [EPA-HQ-OAR-2019-0055-1346-A1, pp. 45-46]

Proposed section 1036.240(c) also needs to be revised. As proposed, OEMs would be required to take into account in-use testing in calculating DF. This is not possible. DF is an aging exercise on a single emission data engine with a prescribed DF method that measures low-hour performance and deteriorated performance, from which a curve is determined. Although accepted methods are listed in 1036.240(c)(1)-(4), in-use data is not mentioned and the proposed regulation does not describe how to incorporate in-use data into DF. [EPA-HQ-OAR-2019-0055-1346-A1, p.46]

Organization: *Truck Trailers Manufacturers Association (TTMA)*

The proposed rule would make updates to EPA's Heavy-Duty Greenhouse Gas Emissions Phase 2 program. EPA relied primarily on Section 202(a) of the Clean Air Act for authority to promulgate the regulations that implement that program. See 42 U.S.C. §§ 7521, 7550. TTMA has previously challenged EPA's authority to regulate trailers and trailer manufacturers under Section 202 of the Clean Air Act, and the United States Court of Appeals for the District of Columbia recently held that EPA does not have such authority. The decision was issued in Truck Trailer Manufacturers Association, Inc., v. Environmental Protection Agency, et al., No. 16-1430 (November 12, 2021). The proposed rule updating the Phase 2 program similarly rests on Section 202 of the Clean Air Act as authority for EPA's rulemaking. See 87 Fed. Reg at 17436. However, for the reasons set forth in the D.C. Circuit's recent decision, EPA does not have authority to update Phase 2 in ways that extend to the regulation of trailers or trailer manufacturers. [EPA-HQ-OAR-2019-0055-1024-A1, p. 1]

Specifically, in the General Information section, in response to the question "Does this action apply to me?," the reference to truck trailer manufacturing (NAICS code 336212) as a regulated category lacks statutory authority. See 87 Fed Reg. at 17415. Therefore, in Section 1037.1(a) of the proposed rule, titled "Applicability," the statement that "[t]his also includes certain trailers as described in §§1037.5, 1037.150, and 1037.801" should be deleted. See 87 Fed. Reg. at 17813. Similarly, Section 1037.101(b)(2)(ii) of the proposed rule should be deleted, as it specifies that "[t]railers" comprise a group of "regulated heavy-duty vehicles." See 87 Fed. Reg. at 17814. And in Section 1068.1(a)(2) of the proposed rule, the statement that "[t]his includes trailers" should also be deleted, as the agency lacks authority to apply these regulations to trailers. See 87 Fed. Reg. at 17882. [EPA-HQ-OAR-2019-0055-1024-A1, pp. 1 - 2]

And finally, the agency should delete (1) the reference to emission-related warranty requirements for trailers found in Section 1037.120(b)(iii)&(iv), see 87 Fed. Reg. at 17816; (2) the reference to a useful life (250,000 miles) for trailers found in Section 1037.705(b), see 87 Fed. Reg. at 17837; and (3) the references to tires on non-box and box van trailers found in the definition of "low rolling resistance tire" in Section 1037.801, see 87 Fed. Reg. at 17838. [EPA-HQ-OAR-2019-0055-1024-A1, p. 2]

Organization: *Truck and Engine Manufacturers Association (EMA)*

EMA also has concerns related to the proposed requirement under §1036.240(c) that, "Your deterioration factors must take into account any available data from in-use testing with similar engines." That requirement is at the same time too vague and overly broad, and is therefore unworkable. It is entirely unclear how manufacturers, having completed a comprehensive, very costly and controlled full useful life DF determination according to the proposed provisions, would "take into account" other "available" in-use data to adjust those results. There is no clarity as to what types of "available" data should be drawn into this analysis, or would be drawn into this analysis by the Agency, under this language. For example, would data acquired by NGOs unskilled in emissions measurement have to be taken into account? Will manufacturers be compelled to review data from field test engines that have undergone numerous component and emissions control software upgrades and incorporate NOx sensor data from these engines into the DF determination? As stated, this requirement is utterly unworkable, and should be eliminated in the final rule. [EPA-HQ-OAR-2019-0055-1203-A1, p. 112]

EPA's proposed requirements under §1036.235(a)(1) provide that a manufacturer must select an engine configuration for criteria pollutant certification testing that is "most likely to exceed (or have emissions nearer to) an applicable emission standard or FEL…" That requirement could lead to significant ambiguity in determining the selected test engine's configuration, as it is unlikely that one engine configuration would have the highest emissions for all certification cycles and all criteria pollutants. Further, EPA's proposal could result in a different configuration identification, such as a child rating, compared to existing requirements in §86.096-24(b)(3)(ii) which allow selecting "the engine that features the highest fuel feed per stroke, primarily at the speed of maximum rated torque and secondarily at rated speed." EPA should retain the existing criteria based on highest fueling in §86.096-24(b)(3)(ii) (and similarly retain the existing criteria in §86.096-24(b)(2) for Otto-cycle engines) for selecting an engine configuration for criteria pollutant certification testing. [EPA-HQ-OAR-2019-0055-1203-A1, p. 117]

Today, the test engine configuration requirements have led to a situation where some manufacturers use a different test engine configuration for criteria emissions demonstrations than the one used for GHG emissions demonstrations. Proposed §1036.235(a) requires that the data engine for GHG emissions be the same as the data engine configuration for criteria pollutants. This new requirement, as proposed, will have unintended consequences on engine GHG stringency. The engine configuration with the highest NOx, for example, on an SCR-equipped engine will likely be a lower power rating within the family, and will likely, therefore, have relatively high CO2 emissions relative to the other ratings in the family. The requirements of proposed §1036.235(a) will thereby have the effect of increasing the stringency of the GHG standards. This is the most serious consequence of the language as proposed. There could also be corollary complications with other aspects of emissions control regulations, such as DF carry-across, where factors such as highest fueling and exhaust flow (catalyst residence time) are deemed relevant. [EPA-HQ-OAR-2019-0055-1203-A1, p. 117 - 118]

EPA proposes in §1036.205(t) to include a design requirement that engine manufacturers would have to include in their installation instructions to a vehicle manufacturer (§1036.130) that would facilitate in-use testing. More specifically, the engine manufacturer would be required in those instructions to "specify how to ensure that sampling of exhaust emissions will be possible after engines are installed in equipment and placed in service. If this cannot be done by simply adding a 20-centimeter extension to the exhaust pipe, show how to sample exhaust emissions in a way that prevents diluting the exhaust sample with ambient air." [EPA-HQ-OAR-2019-0055-1203-A1, p. 133]

As an initial matter, imposing requirements on the vehicle design that go beyond those required to ensure compliance, and that instead are imposed solely to enable the rare instances that someone would want to conduct PEMS testing on a vehicle, is an unnecessary and unwarranted requirement. Compelling less than optimal designs, that could take precedence over practical installation considerations and limitations, and potentially impose higher costs, is unreasonable solely to make exhaust sampling easier than it otherwise might be. [EPA-HQ-OAR-2019-0055-1203-A1, p. 133]

EMA recommends that the provisions regarding installation instructions at §1036.130 be finalized to include a "recommended practice" with respect to vehicle design, to be followed "whenever practical." Those instructions should recommend physical characteristics of the installed design, without reference to extension dimensions or ambient air dilution, which would not be meaningful to the vehicle design and installation personnel. The resulting design recommendations should be established in a way that would facilitate PEMS testing. EMA further recommends that EPA simplify the proposed §1036.205(t) accordingly, referencing §1036.130. Finally, both provisions should refer to installation instructions, since they concern vehicles rather than equipment. [EPA-HQ-OAR-2019-0055-1203-A1, p. 134]

EMA offers the following comments on the specific OBD-related elements of the proposed regulatory text. §1036.115: "(d) Torque broadcasting. Electronically controlled engines must broadcast their speed and output shaft torque (in newton-meters). Engines may alternatively broadcast a surrogate value for determining torque. Engines must broadcast engine parameters such that they can be read with a remote device or broadcast them directly to their controller area networks. This information is necessary for testing engines in the field (see §1036.515)." EMA is confident that the engine torque and speed parameters currently used to support PEMS today should suffice for this purpose, and asks EPA to confirm this expectation. [EPA-HQ-OAR-2019-0055-1203-A1, p. 103]

In another related matter, EMA supports the Agency's tank-sizing requirements detailed in §1036.115(i). [EPA-HQ-OAR-2019-0055-1203-A1, p. 125]

EPA Summary and Response

Comment Summary	EPA Response
Allison appreciates that EPA defines technology in a way that gives industry greater flexibility to design architecture for OEM and end-user requirements. For example, EPA's definition of hybrids and HEVs offers the industry greater flexibility than the California PHEV definition which constrains hybrid technology down a narrow path to achieve increasing all-electric range.	EPA acknowledges the comment supporting the proposed rule.
ARI suggested adjusted wording for proposed changes in §1037.601(a)(1) to avoid the possibility that someone would interpret the regulation to recognize exemption provisions only for the first of two given scenarios. The comment suggested two alternative approaches to address the concern.	EPA agrees that proposed wording should be revised to more clearly recognize that the exemption provisions apply for both of the given scenarios. We have revised the paragraph in the final rule in a way that is similar to the ARI's second suggested approach.

CARB recommends consolidating labeling requirements in one central place in the regulation to make it simpler to edit language, find where labels are not meeting the requirements, and make it clear where all labeling requirements are located.	We believe the recommended approach would serve the interest of regulators at the expense of making it more difficult for companies to comply with labeling requirements. We favor the approach of describing labeling requirements in the context of the related regulatory provisions. This is particularly true where consolidated labeling specifications would include interim provisions that may apply only for a limited time. Electronic searching also makes it very easy to find all the different labeling requirements.
CARB strongly opposes EPA's consideration of decreasing the warranty period for Medium HD vehicles from 100,000 miles to 50,000 miles, which would ensure consistency between the warranty coverage periods between the affected vehicles and the engines powering such vehicles. CARB staff is not aware of any issues presented from applying different warranty periods for criteria and greenhouse gas emission standards.	We are not taking final action at this time regarding warranty periods for Medium HDV under 40 CFR 1037.120.
Cummins stated that EPA should retain the existing provision of §86.096-24(e)(2) to allow any manufacturer to certify small-volume families with an assigned deterioration factor.	We are not including in the final rule a provision for assigned deterioration factors for small families. Manufacturers have made very limited use of the existing provisions in §86.096-24(e)(2). The proposed rule included a new approach for testing to establish deterioration factors that includes a combination of engine testing and bench aging of aftertreatment components. This new approach is intended to substantially lower the cost of developing new deterioration factors. Existing provisions allowing flexibility will continue to apply—carry-across of deterioration factors for similar families in the same model year, and carry-over of deterioration factors for later model years. We expect to consider the production volumes of the families selected for in-use verification testing, both to allow for a reasonable application of testing burden and to achieve the intended verification relative to the emission impact of different engine families.

PACCAR requests that EPA remove the proposed provision in §1036.240(b) specifying that an "engine family is deemed not to comply if any emission-data engine representing that family has test results showing any emission level above the applicable off-cycle emission standard for any pollutant. PACCAR suggested that this provision is too open-ended, and could subject manufacturers to unreasonable compliance liability if an emission-data engine were installed in an in-use vehicle. PACCAR also suggested clarifying the contours of what is contemplated for demonstrating compliance with the off-cycle emission standard.	As PACCAR notes, the statement in §1036.240(b) applies for an "emission-data engine," which is defined as an engine that is tested for certification. Such an engine must comply with all applicable duty-cycle standards and off-cycle standards to be eligible for certification. We are not aware that an emission-data engine has ever been installed in an in-use vehicle. However, if that would occur, manufacturers could only perform such an installation after the certificate was issued. If measured in-use emissions exceed emission standards, EPA would generally be able to pursue a recall based on a pattern of noncompliance.
PACCAR suggested clarifying the contours of what is contemplated for demonstrating compliance with the off-cycle emission standard.	We have implemented off-cycle standards for many years in the form of Not-to-Exceed standards. We would expect to implement the new off-cycle emission standards in a similar way. In particular, EPA's Compliance Division will expect to meet regularly with manufacturers to clarify plans to demonstrate compliance with off-cycle standards. This might involve testing over some number of steady-state test points, or operation of some defined transient test segments. We have added a sentence to §1036.205 clarifying that EPA may direct manufacturers to include emission measurements representing typical engine in-use operation at a range of ambient conditions.

EMA suggested that we remove the provision in §1036.240(c) requiring manufacturers to take into account the results of in-use testing when they establish a deterioration factor for certification. That requirement is at the same time too vague and overly broad, and is therefore unworkable. It is entirely unclear how manufacturers, having completed a comprehensive, very costly and controlled full useful life DF determination according to the proposed provisions, would "take into account" other "available" in-use data to adjust those results. There is no clarity as to what types of "available" data should be drawn into this analysis, or would be drawn into this analysis by the Agency, under this language. PACCAR also suggested that we remove the provision in §1036.240(c) requiring manufacturers to take into account the results of in-use testing when they establish a deterioration factor for certification. PACCAR pointed out that they determine the deterioration factor from testing a single emission-data engine with a prescribed method, which does not reference in-use testing.	The proposed §1036.240(c) specifically directs manufacturers to "take into account any available data from in-use testing with similar engines" when the establish deterioration factors for certification. This is not necessarily intended to come into play when the manufacturer first establishes deterioration factors for certifying an engine family. As manufacturers continue to perform in-use testing throughout an engine family's useful life, it may become apparent that the original deterioration factors under-represent emissions throughout the useful life for one or more pollutants. In that case, we would expect manufacturers to use good engineering judgment to adjust deterioration factors as appropriate for future model years to ensure that the manufacturer can properly demonstrate for certification that in-use engines will meet emission standards throughout the useful life. We have adopted this same provision for several types of nonroad engines, such as those subject to standards under 40 CFR parts 1039, 1042, and 1048. We have modified the final regulation at §1036.240(c) to clarify that DF verification testing applies as specified, and that manufacturers must additionally consider in-use testing results separate from that DF verification testing.
TTMA has previously challenged EPA's authority to regulate trailers and trailer manufacturers under Section 202 of the Clean Air Act, and the United States Court of Appeals for the District of Columbia recently held that EPA does not have such authority. TTMA states that EPA should therefore remove trailers from the list of sectors affected in the preamble, and remove reference to trailers in 40 CFR parts 1037 and 1068.	We recognize the court decision vacating the Phase 2 regulations as they applied to trailers as motor vehicles. We intend to address this in a future rulemaking where we can comprehensively review the regulations to identify all the appropriate changes to remove provisions, terminology, and descriptions stating or presuming that trailers are motor vehicles. We inadvertently included trailers in the list of regulated categories and have removed trailers from this list for the final rule.

Cummins commented that EPA should revise §1036.235(a) to retain the existing criteria for selecting a test engine for demonstrating compliance with criteria emission standards based on highest fueling rate (§86.096-24(b)(2) and (b)(3)(ii)). The proposed approach instructing manufacturers to select the configuration most likely to exceed a standard could lead to significant ambiguity.	We agree with the comment and have revised the regulation accordingly.
EMA observed that the proposed §1036.235(a) would require manufacturers to perform testing for criteria and greenhouse gas standards using the same engine. EMA stated that this would be inappropriate for complying with greenhouse gas standards, with the expectation that the proposed approach would lead them to select engines with higher CO2 emissions, which would increase the stringency of the greenhouse gas standards.	We agree with the comment and have revised the regulation to more clearly allow manufacturers to select different test engines for demonstrating compliance with criteria and greenhouse gas emission standards.
EMA objected to the proposed provision in §1036.205(t) for manufacturers to confirm that their installation instructions specify how to sample exhaust emissions from an in-use configuration without diluting the exhaust sample with ambient air. EMA argued that it is unnecessary and unwarranted to impose requirements on the vehicle design that go beyond those required to ensure compliance, and that instead are imposed solely to enable the rare instances that someone would want to conduct PEMS testing on a vehicle. EMA recommended instead specifying installation instructions at §1036.130 to include a "recommended practice" with respect to vehicle design, to be followed "whenever practical." Those instructions should recommend physical characteristics of the installed design, without reference to extension dimensions or ambient air dilution, which would not be meaningful to the vehicle design and installation personnel. Design recommendations should facilitate PEMS testing. EMA recommends that EPA simplify the proposed §1036.205(t) accordingly, referencing §1036.130.	We agree with the comment. In the final rule we have changed the proposed provision in §1036.205 to remove this requirement and added a simpler requirement to include a recommended practice to the engine manufacturer's installation instructions.

EMA is confident that the engine torque and speed parameters currently used to support PEMS suffice for meeting proposed specifications for torque broadcasting in §1036.115(d).	We are retaining the requirement for torque broadcasting because it may be needed to support powertrain testing.
EMA supports the Agency's tank-sizing requirements detailed in §1036.115(i).	EPA acknowledges the comment affirming that we properly captured the substantive content from part 86 regarding the tank-sizing provisions migrated into part 1036.

30 Cross-sector issues

30.1 Confidentiality determinations

Comments by Organizations

Organization: *Alliance for Automotive Innovation (Auto Innovators)*

40 C.F.R. 1068.10 Practices for handling confidential business information.

Auto Innovators recommends that various data submitted either during certification, greenhouse gas reporting, defect reporting, or in-use testing continue to be processed through EPA's existing confidential business information (CBI) process. The existing process balances the agency's Freedom of Information Act obligations while ensuring that highly valuable competitively sensitive and trade secret information is not released. Further, that practice remains consistent with the Supreme Court's decision that, 'where commercial or financial information is both customarily and actually treated as private by its owner and provided to the government under an assurance of privacy, the information is 'confidential'' under 5 U.S.C. 552(b)(4). Food Marketing Institute v. Argus Leader Media, 139 S. Ct. 2356, 2366 (2019). [EPA-HQ-OAR-2019-0055-1303-A1, p.7]

Troublingly, EPA's proposal seeks to deprive broad and vague classes of information of confidential treatment. The proposal considers those classes of data in isolation, and disregards the fact that the structure, groupings, relationship, and organization of data can also reveal CBI. Moreover, the structure of EPA's proposal would default the agency to releasing this information without any visibility into how the agency applies its vague and broad classes, especially in instances where a document might contain a mixture of information fitting with EPA's proposed classes of remission data and information in 40 C.F.R. 1068.11(c) that would still be subject to the processes of 40 C.F.R. Part 2. [EPA-HQ-OAR-2019-0055-1303-A1, p.7]

Such regulatory change would depart from the long-standing definition of ‘emission data’ in 40 C.F.R. 2.301(a)(2) which, among other limitations, encompasses only information about the past (e.g., ‘emission which has been emitted’). [EPA-HQ-OAR-2019-0055-1303-A1, p.7]

For example, the proposal would prevent confidential treatment of ‘[c]ertification and compliance information, including information submitted in an application for a certificate of conformity that is used to assess compliance.’ This could arguably encompass the entirety of the information submitted by automakers to the EPA, given that it appears to be coterminous with the agency’s authority to obtain information from the industry. 42 U.S.C. 7525, 7541, and 7542. In other words, it is not clear what information automakers provide EPA except certification and compliance information. Next, the proposal would prevent confidential treatment of ‘[t]est information and results, including emission test results and other data from . . . any other testing to demonstrate emissions.’ While the results of a test to measure regulated pollutants may be exempt from confidential treatment once the subject vehicle was introduced into commerce, there is abundant ‘other data’ related to the emissions test that would reveal specific aspects of the vehicle design and construction, including proprietary information like software and calibrations. Yet another example is found in the proposal to prevent confidential treatment of ‘ABT credit information, including information submitted for current and future compliance demonstrations using credits under an ABT program.’ This plainly disregards the temporal limitation in 2.302(a)(2) and would be fairly understood to encompass forecasted sales volumes and product mix, which are inseparable from emissions performance in any discussion of ABT credits and compliance. [EPA-HQ-OAR-2019-0055-1303-A1, p.7]

While creating public-facing documents remains an option for regulated entities, continuing to treat data that is shared with EPA to be confidential and subject to the existing process under 40 C.F.R. Part 2 will result in fewer instances where EPA publicly releases information that is not otherwise deemed available for the public. Should the agency elect to proceed with explicitly defining classes of information subject to 40 C.F.R. Part 2, EPA should ensure that confidential information submitted regarding advanced technologies or off-cycle credits is not considered ‘emission data.’ [EPA-HQ-OAR-2019-0055-1303-A1, p.7]

Auto Innovators requests that any final regulatory changes on these and related topics be consolidated in either Part 2 or Part 1068. As proposed, the new language straddles both parts (and suggests the standard-setting part has even more pertinent provisions) and this is likely to cause confusion for industry and the agency in implementation. [EPA-HQ-OAR-2019-0055-1303-A1, p.7] Finally, Auto Innovators recommends that EPA delete the text ‘and to any information we collect from inspections, audits, or other site visits’ from the proposed lead-in to 40 C.F.R. 1068.10. Information collected from these sources should not be a part of the CBI analysis because it is not information that is ‘submitted’ but is rather information obtained on the spot by EPA. [EPA-HQ-OAR-2019-0055-1303-A1, p.8]

Organization: *California Air Resources Board (CARB)*

CARB staff supports the proposal that specified categories of information that manufacturers 'must submit under the standard-setting parts for certification, compliance oversight, and in response to certain enforcement activities would be subject to disclosure to the public without further notice.'197 CARB staff also supports the proposal 'to establish a broadly applicable set of confidential business information determinations by categories of information, through rulemaking.'198 [EPA-HQ-OAR-2019-0055-1186-A2, p.130]

197 NPRM at p. 17609.

198 NPRM at p. 17610.

These proposals are appropriate and warranted for the reasons set forth by U.S. EPA in the NPRM. They will enable U.S. EPA to more efficiently respond to freedom of information act requests, will help ensure that U.S. EPA consistently applies the proposed confidentiality determinations across the numerous categories of information it receives under specified certification, compliance, and certain enforcement programs, will provide more objective and predictable guidance for information providers and requesters, and will provide the public greater transparency regarding the certification programs. [EPA-HQ-OAR-2019-0055-1186-A2, p.130]

U.S. EPA is specifically requesting comment regarding the proposed categories of information, the confidentiality determinations of those categories, and its proposed placement of data points within the proposed categories.199 [EPA-HQ-OAR-2019-0055-1186-A2, p.131]

199 NPRM at p. 17619.

CARB staff recommends that U.S. EPA retain the proposed categories of information: (1) certification and compliance information, (2) fleet value information, (3) source family information, (4) test information and results, (5) ABT credit information, (6) production volume information, (7) defect and recall information, and (8) SEA compliance information. CARB staff concurs that although 'much of the information submitted under the standard-setting parts could be logically grouped into more than one category',200 the proposed approach of categorizing information into the proposed categories of information both appropriately describes the affected information and clarifies the proposed confidentiality determinations for each above-mentioned category of information. [EPA-HQ-OAR-2019-0055-1186-A2, p.131]

200 NPRM at 17611.

U.S. EPA is specifically requesting comment regarding every rationale presented in the confidential business information (CBI) chart for information proposed to be classified as emissions data.201 [EPA-HQ-OAR-2019-0055-1186-A2, p.131]

201 NPRM at 17611.

CARB staff supports the proposed confidentiality determinations for the proposed categories of information, including the proposed inclusion of subcategories of information, (i.e., data points) within each of the proposed categories, for the reasons expressed by U.S. EPA in pages 17611 through 17619 in the NPRM, and in the CBI chart associated with this proposal.202 [EPA-HQ-OAR-2019-0055-1186-A2, p.131]

202 'CBI Categories for All Industries All Programs' (hereinafter 'CBI Chart'), attachment to Memorandum to docket EPA–HQ–OAR-2019-0055, 'Supplemental Information for CBI Categories for All Industries and All Programs,' Zaremski, Sara. October 1, 2021, EPA-HQ-OAR-2019-0055-0765_attachment_1.

CARB staff offers the following recommendation:

- The proposal would maintain confidential treatment for the subcategories of information identified in Sections XI.A.1.i.a, XI.A.1.i.b, and XI.A.1.i.c until the product described by that information is introduced into commerce. U.S. EPA states that the introduction to commerce date is specified in an application for certification. However, the applications for certification for certain regulated products, including on-road HDEs and light-duty motor vehicles, do not appear to expressly require manufacturers to specify the date they intend to introduce certified engines into commerce (see, e.g., 40 CFR 1036.205, 86.007-21, 86.004-21, 86.094-21, 40 CFR 86.1844-01).203 CARB staff suggests that the categories of information identified in Sections XI.A.1.i.a, XI.A.1.i.b, and XI.A.1.i.c would be entitled to confidential treatment until the date the certificate of conformity for a regulated product is issued. [EPA-HQ-OAR-2019-0055-1186-A2, pp.131-132]

203 See also 40 CFR 59.623 (information required in applications for certification of portable fuel containers.)

U.S. EPA is requesting comment regarding how it can treat preliminary or superseded information supplied by manufacturers to certify products and to demonstrate compliance, to 'protect the public from incomplete or inaccurate information.'204 [EPA-HQ-OAR-2019-0055-1186-A2, p.132]

204 NPRM at p. 17618.

CARB staff suggests that, to the extent U.S. EPA is aware that requested information constitutes preliminary information, it can include an express disclaimer informing the requester of that fact. Similarly, to the extent that U.S. EPA is aware that requested information constitutes superseded information, it can include an express disclaimer informing the requester of that fact. [EPA-HQ-OAR-2019-0055-1186-A2, p.132]

Organization: *Cummins Inc. (Cummins)*

EPA proposes in §1068.11(a) that several categories of information qualify as emissions data which EPA may disclose to the public. Cummins disagrees with allowing the categories in (a)(4)-(8) to be disclosed to the public. Those categories, especially related to testing, modeling inputs (including steady-state fuel maps and other GEM engine inputs as would be required by §1036.815), ABT information, production volumes, and defect and recall information, contain sensitive and trade secret information. That information is developed at great expense and effort by the manufacturer and is not readily obtainable by others. Disclosing it publicly could give competitors insight on a manufacturer’s technical and business strategies. Cummins urges EPA not to finalize the changes to confidentiality in §1068.11(a)(4)-(8) and §1036.815. [EPA-HQ-OAR-2019-0055-1325-A1, p. 17]

EPA proposes to retain today's case-by-case confidentiality determination of other categories of information in §1068.11(c), which Cummins supports. [EPA-HQ-OAR-2019-0055-1325-A1, p. 18]

Organization: *Department of Navy, Department of Defense (DoD)*

In the preamble EPA states: "We are proposing amendments in two areas of note for the general compliance provisions in 40 CFR part 1068. First, we are proposing to take a comprehensive approach for making confidentiality determinations related to compliance information that companies submit to EPA. We are proposing to apply these provisions for all highway, nonroad, and stationary engine, vehicle, and equipment programs, as well as aircraft and portable fuel containers." [EPA-HQ-OAR-2019-0055-1222-A1, p.3]

In finalizing EPA's stated goal of a "comprehensive approach" for confidentiality determinations related to engine manufacturer compliance information submitted to EPA for all emissions standard setting provisions, DoD requests that EPA incorporate provisions to the rule to accommodate DoD national security concerns about broad availability of non-emissions technical performance data for engines used in national defense and homeland security applications. This would include but would not be limited to engines covered by exemptions found at 40 CFR 1068.225(d). [EPA-HQ-OAR-2019-0055-1222-A1, p.3]

DoD's concern is that the availability of critical data, such as fuel flow rates for engines used in military aircraft, ground vehicles and marine applications can provide a strategic advantage to foreign adversaries. This security concern also extends to key stationary engines being used as emergency generators, where knowledge of technical data for these engines would provide insight into DoD critical installation resiliency capabilities in event of actions such as a cyber-attack on commercial grid power sources. [EPA-HQ-OAR-2019-0055-1222-A1, p.3]

Recommendation: DoD requests EPA include provisions for allowing engine manufacturers to claim as confidential any engine performance data (e.g., emissions rate) that is considered "national security information". [EPA-HQ-OAR-2019-0055-1222-A1, p.3]

DoD is willing to work with EPA on specific language to include in the final rule that would address DoD's national security concern and meet EPA's intent for public availability of engine technical information. [EPA-HQ-OAR-2019-0055-1222-A1,p .3]

DoD suggests any such language be structured so the EPA would approve only those manufacturers "national security information" designation requests where that request to EPA has been endorsed by an agency of the Federal Government responsible for national defense or homeland security. This would be similar to existing EPA requirement founds at 40 CFR 1068.225(d) for case by case EPA review of national security exemptions for engines. [EPA-HQ-OAR-2019-0055-1222-A1, p.3]

Organization: *Moving Forward Network (MFN)*

While we have utilized numerous resources and the best data publicly available, we have no way to validate our estimates of the sales-weighted distribution of certified engines and the credits generated by these engines, owing to the limitations of the current confidentiality-determination process. While greater data is available under the light- and heavy-duty vehicle greenhouse gas programs, and stakeholders including state regulators and the engine manufacturers themselves have access to this engine certification data, the general public does not. [EPA-HQ-OAR-2019-0055-1277-A1, pp. 50 - 51]

Information about credits and compliance goes directly to the public's ability to assess how well the program is driving actual emissions reductions, as compared to the generation of credits from so-called flexibilities which can undercut those reductions. Transparency in such credits is critical. [EPA-HQ-OAR-2019-0055-1277-A1, p. 51]

The purported basis for concealing "Confidential Business Information" (CBI) is that it would provide competitors with an advantage. However, many of the information categories EPA has proposed eliminating confidential treatment for are already available to competitors through expensive industry databases. Manufacturers are therefore not at greater risk under the proposed relaxation of these specific categories, and it is the public who is at risk if they continue to remain in the dark under the current constraints. [EPA-HQ-OAR-2019-0055-1277-A1, p. 51]

For example, the real-world performance data provided by EPA on heavy-duty trucks187 illustrated the massive shortcomings in the current test procedures and emissions control equipment as well as the harms those vehicles posed in real-world operation, and organizations were able to sort through that data to identify systemic problems and aid in advocating for solutions.188 However, by the time this data was released, some of those dirty vehicles had been polluting communities for as many as 8 years. Moreover, there was no way to assess the health impacts of these shortfalls because while information about an individual truck and engine configuration were identified (e.g., a 2010 Ford F-650 delivery vehicle with a Cummins ISB 6.7 diesel engine), there is little information on usage or sales to extrapolate the breadth of the shortfall of emissions from these trucks. Given the breadth of data collected by the agency as part of its proposed off-cycle program and the value that such detailed data can have for communities affected on the ground by freight traffic, expanding the availability of this data collected as part of regulatory compliance, can help identify such problematic issues in a timelier manner. [EPA-HQ-OAR-2019-0055-1277-A1, p. 51]

187. https://www.epa.gov/compliance-and-fuel-economy-data/manufacturer-run-use-testing-program-data-heavy-duty-diesel-1

188. For example, https://theicct.org/publication/current-state-of-nox-emissions-from-in-use-heavy-duty-diesel-vehicles-in-theunited- states/.

By improving transparency of its datasets, EPA can also ensure that its own data is more accurate. Environmental justice communities that directly experience the emissions from these trucks and the volume of traffic from these trucks have had to hold truck counts because of outdated data being considered by the agency. Greater transparency in the assumptions being used by EPA can improve clarity to the public how valid its assumptions are (or not), and provide another check for the community to assess when EPA's assumptions are inconsistent with local freight impacts. [EPA-HQ-OAR-2019-0055-1277-A1, p. 51]

We strongly support the greater transparency that the proposed adjustments to CBI determination will have. Moving forward, we request that EPA continue to improve transparency for all of its vehicle programs regulated under the Clean Air Act, particularly on reporting more data at an engine/vehicle level to understand how individual classes, applications, and/or manufacturers may be responding to these regulations. The public deserves more information to fully understand engine and vehicle emissions performance, including for specific configurations. Currently manufacturers already have such access—it's long past time that the public does as well. [EPA-HQ-OAR-2019-0055-1277-A1, p. 51]

Organization: *Roush CleanTech (Roush)*

Roush supports the addition of the proposed 1065.410(c) language relative to use of standard electronic tools, as well as the updated disclosure and confidentiality language in part 1068. Roush would further recommend that EPA codify requirements for manufacturers to fully disclose, without claiming as confidential, all information reasonably required in order to conduct emissions testing as specified in the standard. We believe that the ability for agencies and third parties to be able to verify emissions testing results is crucial, but is typically impossible under current disclosure practices-- even such basic parameters as curb idle transmission torque are not typically disclosed in the FOI application even though it is clear this is not protected confidential business information. If manufacturers utilize non-production hardware (such as transmission or other vehicle signal simulators, non-production ECU's, etc.) and/or non-production software (such as calibrations which are modified to disable OBD faults related to vehicle testing) in order to conduct certification testing, manufacturers should be required to disclose the designs of such devices as well as provide information required for agencies or third parties to obtain the required items for testing. It is simply unacceptable that current engine test results cannot be verified by third parties. We anticipate this issue only getting worse with the new standard; for example, the new 1065.510(a) requires disabling torque output AECD's, but there is no requirement to document how the AECD's were disabled or how they would be disabled during agency or third party testing. Similarly, the new 1066.415(e)(2) requires written notification to the agency for modifications required for dynamometer testing, but no clear requirement for these to be included in the certification application. [EPA-HQ-OAR-2019-0055-1276-A1, p.5]

Organization: *S&P Global Mobility*

S&P Global Mobility supports the Environmental Protection Agency's (EPA) Notice of Proposed Rulemaking for Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards (NPRM), specifically the provisions related to production volume data being considered emissions data not subject to confidential treatment.

The EPA's proposal that production volume information is intrinsically emissions data, not Confidential Business Information (CBI), is an important step forward in providing data transparency around emissions compliance. This data is fundamental to the determination of overall fleet emissions compliance. As fleet emissions compliance values are necessarily a sales-weighted average of individual vehicle or engine certification levels, final production volumes associated with each certification group (e.g., test group) should be disclosed publicly to facilitate the transparency of compliance determinations. It is only through public access to both the emissions certification levels ***and*** the final production volumes that emissions compliance position can be replicated by concerned third-party organizations. The ability to replicate the manufacturers' compliance positions is an important part of the integrity of the EPA's mobile source emissions programs, including the Greenhouse Gas Program. [EPA-HQ-OAR-2019-0055-1273-A1, p. 1]

Public disclosure of a manufacturer's final production volume for each discrete make, model, and powertrain combination will not compromise a manufacturer's competitive position, particularly when considering year-end volumes. After the close of a model year the production volume information related to the past model year production will have become historical performance. By the time that EPA releases this data to the public it should no longer be considered CBI. The disclosure of historical production performance should not be viewed as creating commercial harm. The public interest is improved through greater transparency in assuring compliance with emissions regulations. [EPA-HQ-OAR-2019-0055-1273-A1, pp. 1 - 2]

The adoption of the policies outlined on pages 17614 and 17618 related to the publication of production volumes as emissions data, not subject to confidential treatment, is a positive development. Much of that information can currently be pieced together via third-party data sources, including S&P Global Mobility's database of vehicle technical specifications combined with sources of vehicle registration data. However, these data sources are not completely aligned with the actual data used by EPA to determine emissions compliance. Thus, without the actual production volume inputs used by EPA to compute manufacturers' emissions compliance, the true compliance position cannot be publicly replicated. We view this as a serious shortcoming which can be easily remedied through the adoption of the EPA's proposal to make public the production volume information at the conclusion of each model year. [EPA-HQ-OAR-2019-0055-1273-A1, p. 2]

Organization: *Truck and Engine Manufacturers Association (EMA)*

EPA is proposing "to take a comprehensive approach for making confidentiality determinations related to the compliance information that companies submit to EPA." (87 FR at 17426.) More specifically, the Agency is proposing to make a series of categorical determinations that certain types of submitted compliance information will not be treated as confidential business information. The Agency also is proposing to maintain "the 40 CFR part 2" case-by-case process for making CBI determinations for all other submitted information not covered by the proposed categorial determinations of non-confidentiality. [EPA-HQ-OAR-2019-0055-1203-A1, p. 165]

EPA has categorized the types of emissions data that will be deemed subject to public disclosure, as follows:

- Certification and compliance information, which includes models and parts information, family determinants, general emission control systems information, and certificate request/requestor information;
- Fleet value information, which includes offsets, displacements, useful life, power payload tons, load factor, integrated work cycle, cycle conversion factors and test cycle, source classification, averaging set, intended application, and advanced technology ("AT") factors;
- Source family information, which includes engine family information, vehicle family information, subfamily name, engine family designation, and test group information;
- Test information and results, which include information collected during the certification process, PLT testing, in-use testing programs, and testing performed during in SEA, and which covers the actual test results themselves and the information necessary to understand those results and how the testing was conducted (including adjustments, modifications, maintenance, service hours, and detailed information regarding the recruitment and testing of in-use vehicles);
- Averaging, banking, and trading ("ABT") credit information, including banked credits, transferred credits, total credits, credit balance, and annual credit balance;
- Production volume information, which includes the total number of engines, vehicles or equipment produced;
- Defect and recall information, which includes any reported emissions data and an estimate of the defect's impacts on emissions, and the relevant information collected under the standard-setting parts, but not including the "defect investigation report;" and
- Selective enforcement audit ("SEA") compliance information, which includes family name, when and where the SEA was conducted, the number of tests conducted, test article details, how the engines were shipped and stored, and test results. (See 87 FR at pp. 17611-17618.) [EPA-HQ-OAR-2019-0055-1203-A1, pp. 16-166]

The Agency's proposal also lists a number of information categories where the confidentiality determination will continue to be made on a 40 CRR Part 2 case-by-case basis, as is the current practice. EPA describes those categories of emissions-data information, as follows:

(1) projected production and sales,

(2) production start and end dates outside of the defect and recall context,

(3) specific and detailed descriptions of the emissions control operation and function,

(4) design specifications related to aftertreatment devices,

(5) specific and detailed descriptions of auxiliary emission control devices (AECDs),

(6) plans for meeting regulatory requirements (e.g., ABT pre-production plans),

(7) procedures to determine deterioration factors and other emission adjustment factors and any information used to justify those procedures,

(8) financial information related to ABT credit transactions (including dollar amount, parties to the transaction and contract information involved) and manufacturer bond provisions (including aggregate U.S. asset holdings, financial details regarding specific assets, whether the manufacturer or importer obtains a bond, and copies of bond policies),

(9) serial numbers or other information to identify specific engines or equipment selected for testing,

(10) procedures that apply based on the manufacturers request to test engines or equipment differently than we specify in the applicable standard-setting parts,

(11) information related to testing vanadium catalysts in 40 CFR part 1065, subpart L (proposed in the NPRM),

(12) GPS data identifying the location and route for in-use emission testing,

(13) defect investigation reports — The information contained in defect investigation reports may encompass both emission data and information that may be CBI, so EPA is not proposing a determination for this report as whole. Instead, procedurally the Agency will treat those reports in accordance with the existing case-by-case determination process — and

(14) comments submitted in the “comment field” of EPA’s compliance reporting software. (See 87 FR at p. 17619.) [EPA-HQ-OAR-2019-0055-1203-A1, pp. 166-167]

EMA has a number of concerns regarding the Agency’s proposal for making generalized CBI determinations going forward. More specifically, a number of the broad categories of submitted information that the Agency proposes to treat generally as non-confidential do, in fact, include CBI that warrants protection from public disclosure. [EPA-HQ-OAR-2019-0055-1203-A1, p. 167]

The Agency’s proposed rationale for making such broad and general a priori CBI/non-CBI determinations seems to stem from the workload that the Agency needs to undertake to ensure that FOIA requests do not sweep-up or otherwise compromise CBI. But a desire to reduce the Agency’s workload is not a sufficient basis to violate manufacturer’s trade secret rights, including under the Uniform Trade Secrets Act. Moreover, to the extent that EPA acts to remove the current presumptive protections for manufacturers’ CBI claims, the Agency actually will incentivize more, not fewer, FOIA requests, as competitors would be spurred-on to discover all that they could about other OEM’s products and processes, an outcome that could have grave consequences for the industry. [EPA-HQ-OAR-2019-0055-1203-A1, p. 167]

In light of the foregoing, the Agency will need to revise its proposed categorical determinations accordingly. Set forth below is a chart that delineates EMA’s concerns in this regard. [EPA-HQ-OAR-2019-0055-1203-A1, p. 167]

Section: § 1068.11(a)(1)

Comment: This paragraph (a) applies the definition of ‘‘Emission data’’ in 40 CFR 2.301(a) for information related to engines/equipment subject to this part. ‘‘Emission data’’ cannot be treated as confidential business information and shall be available to be disclosed to the public except as specified in § 1068.10(d)(1). The following categories of information qualify as emission data, except as specified in paragraph (c) of this section:

Text: 1. Certification and compliance information, which includes models and parts information, family determinants, general emission control systems information, and certificate request/requestor information;

EMA comments: Except for the certificate requestor, all of this information is released with a Certificate of Conformity. [EPA-HQ-OAR-2019-0055-1203-A1, p. 167]

Section: § 1068.11(a)(2)

Comment: Proposed categorization as nonconfidential information

Text: 2. Fleet value information, which includes offsets, displacements, useful life, power payload tons, load factor, integrated work cycle, cycle conversion factors and test cycle, source classification, averaging set, intended application, and advanced technology (“AT”) factors;

EMA comments: All of this is public information. [EPA-HQ-OAR-2019-0055-1203-A1, p. 167]

Section: § 1068.11(a)(3)

Comment: Proposed categorization as nonconfidential information

Text: 3. Source family information, which includes engine family information, vehicle family information, subfamily name, engine family designation, and test group information;

EMA comments: All of this is public information. [EPA-HQ-OAR-2019-0055-1203-A1, pp. 167-168]

Section: § 1068.11(a)(4)

Comment: Proposed categorization as nonconfidential information. Instead, should be handled on case-by-case basis.

Text: 4. Test information and results, which include information collected during the certification process, PLT testing, in-use testing programs, and testing performed during an SEA, and which covers the actual test results themselves and the information necessary to understand those results and how the testing was conducted (including adjustments, modifications, maintenance, service hours, and detailed information regarding the recruitment and testing of in-use vehicles);

EMA comments: This category includes very competitive CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 168]

Section: § 1068.11(a)(5)

Comment: Proposed categorization as nonconfidential information. Instead, should be handled on case-by-case basis.

Text: 5. Averaging, banking, and trading (“ABT”) credit information, including banked credits, transferred credits, total credits, credit balance, and annual credit balance;

EMA comments: This category includes very competitive CBI [EPA-HQ-OAR-2019-0055-1203-A1, p. 168]

Section: § 1068.11(a)(6)

Comment: Proposed categorization as nonconfidential information. Instead, should be handled on case-by-case basis.

Text: 6. Production volume information, which includes the total number of engines, vehicles or equipment produced;

EMA comments: For HDOH engines, this information is released after the end of the model year. Before then, projections should remain CBI. In addition, other engine-product sectors do not disclose production volumes, and that information from those other engine-product sectors should remain CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 168]

Section: § 1068.11(a)(7)

Comment: Proposed categorization as nonconfidential information. Instead, should be handled on case-by-case basis.

Text: 7. Defect and recall information, which includes any reported emissions data and an estimate of the defect’s impacts on emissions, and the relevant information collected under the standard-setting parts, but not including the “defect investigation report;” and

EMA comments: Emissions data are competitive CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 168]

Section: § 1068.11(a)(8)

Comment: Proposed categorization as nonconfidential information. Instead, should be handled on case-by-case basis.

Text: 8. Selective enforcement audit (“SEA”) compliance information, which includes family name, when and where the SEA was conducted, the number of tests conducted, test article details, how the engines were shipped and stored, and test results.

EMA comments: Test results are competitive CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 168]

Section: § 1068.11(b)(1)

Comment: (b) The following categories of information are not eligible for confidential treatment, except as specified in § 1068.10(d)(1): (d) If you submit information that is not addressed in paragraphs (a) through (c) of this section, you may claim the information as confidential. We may require you to provide us with information to substantiate your claims. If claimed, we may consider this substantiating information to be confidential to the same degree as the information for which you are requesting confidential treatment. We will make our determination based on your statements to us, the supporting information you send us, and any other available information. However, we may determine that your information is not subject to confidential treatment consistent with 40 CFR part 2 and 5 U.S.C. 552(b)(4).

Text: Published information, including information that is made available in annual and quarterly filings submitted to the U.S. Securities and Exchanges Commission, on company websites, or otherwise made publicly available by the other submitter.

EMA comments: EMA agrees. [EPA-HQ-OAR-2019-0055-1203-A1, p. 169]

Section: § 1068.11(b)(2) and § 1068.11(c)(1)

Comment: Not confidential information. The following categories of information are subject to the process for confidentiality determinations in 40 CFR part 2, as described in 40 CFR 2.301(j)(5).

Text: Observable information available to the public after the introduction to commerce date. (1)Projected sales and production volumes.

EMA comments: EMA agrees. Projected numbers should remain CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 169]

Section: § 1068.11(c)(2)

Comment: May ask for CBI

Text: (2)Production start and end dates.

EMA comments: EMA agrees. Production dates could be competitive. [EPA-HQ-OAR-2019-0055-1203-A1, p. 169]

Section: § 1068.11(c)(3)

Comment: May ask for CBI

Text: (3) Detailed description of emission control operation and function.

EMA comments: Highly competitive CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 169]

Section: § 1068.11(c)(4)

Comment: May ask for CBI

Text: (4) Design specifications related to aftertreatment devices.

EMA comments: Highly competitive CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 169]

Section: § 1068.11(c)(5)

Comment: May ask for CBI

Text: (5)Description of auxiliary emission control devices (AECDs).

EMA comments: These strategies are highly sensitive CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 169]

Section: § 1068.11(c)(6)

Comment: May ask for CBI

Text: (6) Plans for meeting regulatory requirements. For example, this applies for any projections of emission credits for the coming model year or determinations of the number of required repair facilities that are based on projected production volumes.

EMA comments: Plans should always remain CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 169]

Section: § 1068.11(c)(7)

Comment: May ask for CBI

Text: (7) The following information related to deterioration factors and other adjustment factors: (i) Procedures to determine deterioration factors and other emission adjustment factors. (ii)Any information used to justify those procedures. (iii)Emission measurements you use to compare procedures or demonstrate that the
procedures are appropriate.

EMA comments: Emissions data are competitive CBI. [EPA-HQ-OAR-2019-0055-1203-A1, pp. 169-170]

Section: § 1068.11(c)(8)

Comment: May ask for CBI

Text: (8) Financial information related to the following items: (i)ABT credit transactions, including dollar amount, identity of parties, and contract information. (ii)Meeting bond requirements, including aggregate U.S. asset holdings, financial details regarding specific assets, whether the manufacturer or importer obtains a bond, and copies of bond policies.

EMA comments: Financial information relating to ABT is CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 170]

Section: § 1068.11(c)(9)

Comment: May ask for CBI

Text: (9) Serial numbers or other information to identify specific engines or equipment selected for testing.

EMA comments: EMA agrees. [EPA-HQ-OAR-2019-0055-1203-A1, p. 170]

Section: § 1068.11(c)(10)

Comment: May ask for CBI

Text: (10)Procedures that apply based on your request to test engines/equipment differently than we specify in the regulation. This applies for special and alternative test procedures. This also applies, for example, if we approve a broader or narrower zone of engine operation for not-to-exceed testing.

EMA comments: Emissions testing protocols outside the prescribed regulations can be competitive CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 170]

Section: § 1068.11(c)(11)

Comment: May ask for CBI

Text: (11) Information related to testing vanadium catalysts in 40 CFR part 1065, subpart L.

EMA comments: EMA agrees. [EPA-HQ-OAR-2019-0055-1203-A1, p. 170]

Section: § 1068.11(c)(12)

Comment: May ask for CBI

Text: (12) GPS data identifying the location for in-use emission measurements.

EMA comments: Route information can be very competitive CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 170]

Section: § 1068.11(c)(13)

Comment: May ask for CBI

Text: (13) Information related to possible defects that are subject to further investigation (not confirmed defects).

EMA comments: During the investigative phase these should remain CBI. [EPA-HQ-OAR-2019-0055-1203-A1, p. 170]

EPA should revise its proposal regarding future confidentiality determinations in a manner consistent with the foregoing highlighted concerns. [EPA-HQ-OAR-2019-0055-1203-A1, p. 170]

Organization: *Volkswagen Group of America, Inc., (Volkswagen) (VWGoA)*

<u>40 CFR 1068.10 General compliance provisions for highway, stationary, and nonroad programs</u>

We recommend that various data submitted either during certification, defect reporting, or In-use testing continue to be treated by the EPA as CBI unless specifically declared public by the OEM. While creating public-facing documents is possible, continuing to treat data that is shared with EPA to be confidential will lead to far fewer mistakes of potentially revealing data not otherwise deemed available for the public. [EPA-HQ-OAR-2019-0055-1296-A1, p.3]

Organization: *Volvo Group*

The Volvo Group wants to assure that test data and other vehicle, engine, powertrain, and component information not reasonably obtainable is held as confidential business information (CBI). [EPA-HQ-OAR-2019-0055-1324-A1, p. 9]

The Volvo Group is supportive of the agency's attempt to streamline the current case-by-case confidentiality determination procedure as proposed in the Clean Trucks Plan NPRM; however, we do have substantial concerns in some areas. [EPA-HQ-OAR-2019-0055-1324-A1, p. 9]

First, given the ambiguous definition of Emission data as given in 40 CFR 2.301(a)(2), it could be construed that any information provided to the Agency for certification of engines or vehicles, unless voluntarily submitted, could be considered as non-confidential, even where a determination of non-confidentiality has not been made in the proposed rule. [EPA-HQ-OAR-2019-0055-1324-A1, p. 9]

For example, an Auxiliary Emission Control Device (AECD) description covering shift strategy for an automated transmission, which is proposed to be considered indeterminate and covered under the case-by-case process, could be critical in determining the "amount, frequency, concentration, or other characteristics (to the extent related to air quality) of any emission which has been emitted by the source (or of any pollutant resulting from any emission by the source), or any combination of the foregoing" as noted in the definition of emission data from 40 CFR 2.301(a)(2)(i)(A), thus making a proprietary technology that other manufacturers have attempted to copy available for easy replication. It could also be argued that the same information could be considered emission data under 2.301(a)(2)(i)(C), which defines emission data as "A general description of the location and/or nature of the source to the extent necessary to identify the source and to distinguish it from other sources (including, to the extent necessary for such purposes, a description of the device, installation, or operation constituting the source)". [EPA-HQ-OAR-2019-0055-1324-A1, p. 9]

Additionally, it is not entirely certain whether the emission data definition applies to raw test data and results, including raw coast down data and an actual vehicle's drag coefficient (Cd) and subsequent Faltaero calculations and values, or whether it only includes the GEM inputs necessary to determine the FEL (e.g., Bin V). If the latter, it is not clear whether the emission data and subsequent confidentiality determination would apply only to the required ten vehicle configurations for each vehicle family certification application or would also apply to all possible configurations. [EPA-HQ-OAR-2019-0055-1324-A1, p. 9]

Given this, the Volvo Group requests either a revision of the 40 CFR 2.301(a)(2) definitions for clarity, or additional discussion in the preamble to the final rule and to 40 CFR 1068.11 to provide additional examples of what is, and is not, emission data under the Part 2 definition. Those items noted above (and other similar items to be identified) should then be classified as confidential under the "reasonably obtainable" provisions of 40 CFR 2.208 as allowed in 40 CFR 2.301(e). [EPA-HQ-OAR-2019-0055-1324-A1, p. 9]

Secondly, we are disappointed in EPA's lack of confidentiality determinations for specific data types. Given the potential loss of competitive advantage due to the release of proprietary information, as well as the possibility for the misleading competitive marketing use of specific test data and results, we strongly urge the Agency to make these confidentiality determinations wherever possible. [EPA-HQ-OAR-2019-0055-1324-A1, p. 10]

As an example, the Volvo Group has what we believe to be a competitive advantage using proprietary transmission shift strategies and corresponding engine control strategies that could be derived from AECD information or powertrain and fuel maps and test data. Considering those same fuel maps, a competitor could take our engine fuel map specifically calibrated to provide best fuel economy with our shift strategy and compare it to their engine fuel map in their vehicle specification with an entirely different shift strategy, resulting in a misleading advantage for their engine. [EPA-HQ-OAR-2019-0055-1324-A1, p. 10]

In conclusion, greenhouse gas certification data is not like criteria emissions data. Fuel economy is a significant part of the total cost of operation (TCO) for heavy-duty truck fleets. As such, fuel economy is a highly competitive aspect of our industry and proprietary strategies are highly guarded. Additionally, there are many different heavy-duty vehicle types and duty cycles that are not represented by the GEM calculations for which the GEM inputs could be misconstrued as providing more or less benefit for a specific customer's application. On top of this, manufacturers may utilize different strategies in certifying vehicles based on risk determinations, to include adding margin on GEM inputs to assure compliance to in-use and SEA (Selective Enforcement Audit) audits, whereas a competitor may not. [EPA-HQ-OAR-2019-0055-1324-A1, p. 10]

Thus, to avoid competitive issues, we would like to work with the Agency to develop a clear definition of proprietary information, and other required data that could be used in a misleading way to gain competitive advantage. The resultant set of information should then be determined confidential in a finalized Confidentiality Determination. Alternatively, and at a minimum, the identified information must be specified as “indeterminate” and follow the 40 CFR Part 2 ‘case-by-case” determination process. [EPA-HQ-OAR-2019-0055-1324-A1, p. 10]

Organization: *Walmart*

We believe broadcasting signals of fleet specific information must be confidential and systems should be designed to protect fleet owners and operators. [EPA-HQ-OAR-2019-0055-1191-A2, p. 4]

EPA Summary and Response

Comment ID(s): 1186 (CARB), 1277 (MFN), 1276 (Roush), 1273 (S&P)	**Response:**
Many commenters support the determination that specified categories of information are emission data and, therefore, not entitled to confidential treatment. These commenters support the increased efficiency and consistency with which these determinations will enable EPA to respond to requests under the Freedom of Information Act (FOIA). The commenters also support the greater transparency these determinations will provide in the context of EPA's certification programs. One commenter particularly supported EPA's determination that production volume is emission data, as this information is "fundamental to the determination of overall fleet emissions compliance." (EPA-HQ-OAR-2019-0055-1273-A1, at 1 (S&P)). Another commenter specifically provided support for the organization of the information at issue in the determination, stating that "the proposed approach of categorizing information into the proposed categories of information both appropriately described the affected information and clarifies the proposed confidentiality determinations for each…category of information." (EPA-HQ-OAR-2019-0055-1186-A2, at 131 (CARB)).	EPA acknowledges the commenters' support on the emission data determinations in this rulemaking.

Comment ID(s): 1303 (Auto Innovators), 1296 (VW), 1191 (Walmart), 1324 (Volvo), 1325 (Cummins), 1203 (EMA) Some commenters recommended that EPA continue using the confidentiality determination process established in 40 CFR part 2 for certain information collected during certification, greenhouse gas reporting, defect reporting, and in-use testing, including fleet specific information, fuel maps, fuel economy and GHG certification data, GEM inputs, AECD, ABT information, production volumes, defect and recall information, advanced technologies or off-cycle credits, and certain testing information. The commenters stated that applying the existing process under 40 CFR part 2 to the specified information is appropriate due to the information's sensitive, competitive and proprietary nature. Additionally, the commenters state that applying the 40 CFR part 2 process would result in fewer instances where EPA publicly releases information that is not otherwise available to the public, since the information is not reasonably obtainable by the public and disclosing it could give their competitors an unfair advantage. The commenters also asserted that this method is consistent with the Supreme Court's holding in *Food Marketing Institute v. Argus Leader Media*, 139 S.Ct. 2356, 2366 (2019).	**Response:** EPA understands the concerns raised by the commenters. However, as explained in the proposed action, EPA is determining that certain categories of information are "emissions data." Under the CAA, information that is emissions data must be publicly available and, therefore, would not be entitled to confidential treatment under the 40 CFR part 2 process. While the commenters assert that the 40 CFR part 2 process would provide greater protections for the information at issue, that is not correct. Under the 40 CFR part 2 process, affected manufacturers would be offered an opportunity to substantiate their claims of confidentiality, and EPA, after considering the substantiation responses, would determine whether the information is entitled to confidential treatment. However, if EPA determines that the information is emission data under the Clean Air Act and 40 C.F.R §2.301(a), then no further review of the information submitter's claims is necessary under 40 CFR part 2 to determine whether the information meets the requirements for confidential treatment. EPA would then issue a determination that the information is not entitled to confidential treatment and the information submitter would have no further administrative recourse to refute EPA's determination. The only remaining recourse an information submitter would have would be to seek judicial review of EPA's determination that the information is not entitled to confidential treatment because the information is emission data. As explained in the proposal for this action, EPA is electing to make such a determination for certain categories of information in advance through rulemaking. Through this notice and comment process, EPA has given affected manufacturers the opportunity to address and respond to EPA's proposed finding that the information is emission data. To this point, the commenters have failed to provide any articulated explanation for why the information at issue in	

	the proposed determinations do not constitute "emission data." Indeed, the commenters do not address the nature of the information as emission data at all, or in some instances they appear to concede the point, calling the information at issue "emission data" themselves. (See EPA-HQ-OAR-2019-0055-1203-A1 at 168, EMA supplement at 2). Because the commenters did not provide a reasoned basis to support an argument that the information is not emissions data, and for the reasons explained in preamble Section XI, EPA is proceeding with these determinations. Some commenters pointed to the decision in *Argus Leader* for the proposition that EPA should be providing an express indication about how it intends to treat submitted information. EPA notes that through this rulemaking the agency is providing such an express indication, consistent with the *Argus Leader* case. Where the government provides an express indication to the submitter prior to or at the time the information is submitted to the government that the government would publicly disclose the information, then the submitter cannot reasonably expect confidentiality of the information upon submission, and the information is not entitled to confidential treatment. Through this rule, EPA has provided such an explicit notice regarding the information specified in 40 CFR 1068.11.	

Comment ID(s): 1303 (Auto Innovators)	**Response:**
The Alliance for Automotive Innovators (Auto Innovators) described EPA's information categories as vague. Auto Innovators asserted that is unclear how EPA will apply the categories to information it receives, particularly when emission data and other data that is still subject to the 40 CFR part 2 process are submitted in a single form. Auto Innovators also asserted that the information at issue in the determinations in this rulemaking, mainly information submitted or collected for certification or compliance, "could arguably encompass the entirety if the information submitted by automakers to the EPA." EPA-HQ-OAR-2019-0055-1303-A1, at 7.	In addition to the description of the information categories provided in the preamble, EPA has also provided a list of all categories of the information addressed by this determination in the docket for this rule. EPA also identified this information by citation to the specific regulations that require submission of such information for further clarity in a document included in the docket and referenced in the proposed and final rule preambles (CBI Categories for All Industries and All Programs.xlsx). Without more specific feedback from the commenter, it is unclear how EPA can provide greater clarity as to what information is within each category subject to this determination, as the Agency has already indexed all the information it collects by category and determination. Regardless, EPA notes that when submitters provide information on forms that is emissions data along with other information that may be entitled treatment as confidential, EPA subject matter experts who respond to FOIA requests will use the list of information and apply the corresponding confidentiality determination for each field.

Comment ID(s): 1303 (Auto Innovators), 1324 (Volvo) Some commenters alleged that releasing the information according to the determinations made in this rulemaking would result in more information than that covered by the categories to be discerned by the structure, groupings, relationship, and organization of the data. For example, one commenter suggested that information requesters would be able to glean proprietary transmission shift strategies and corresponding engine control strategies from AECD information or powertrain and fuel maps and certain test data. The commenters assert that this will disadvantage them by providing their competitors with access to their proprietary information.	**Response:** Regardless of whether the information EPA is here determining to be emission data could be used to discern other, related manufacturer information, the CAA specifies that information that qualifies as emission data cannot be withheld. For example, the commenters did not dispute EPA's proposed finding that the information in section 1068.11(a) meets the definition of emission data under 40 C.F.R. §2.301(a)(2). Additionally, it is not clear how the release of the information determined in this rule to be emission data could allow competitors to glean additional information that the manufacturers claim as confidential. Lastly, it is important to highlight that EPA is not, at this time, making any determination concerning detailed AECD information (AECD documents submitted by manufacturers at the time of certification). Thus, that information remains a type of information for which EPA will continue to make emissions data or confidentiality determinations on a case-by-case basis under the 40 CFR part 2 process.

Comment ID(s): 1303 (Auto Innovators), 1203 (EMA)	Response:
One commenter stated that the emission data determinations are inconsistent with the definition of emission data in 40 CFR 2.301(a)(2), which the commenter asserts only applies to information about the past (i.e., "emission which has been emitted," 40 CFR 2.301(a)(2)). This commenter specifically raised this question with respect to ABT credit information, which includes information submitted for current and future compliance demonstrations using credits. The commenter asserts that this information could be interpreted to include forecasted sales volumes and product mix, which are inseparable from emissions performance in the context of ABT credit and compliance demonstrations. Another commenter similarly suggested that projected sales and production estimates should be maintained as confidential.	EPA does not agree that only historical data, i.e., data from the past, constitutes emissions data. As an initial matter, the commenter fails to acknowledge that the specific type of information referenced in the comment is not purely information about future emissions. ABT credits and deficits can be generated based on current, past, and future products, used for immediate compliance, or banked and used for future compliance or traded. If EPA were to adopt the narrow interpretation of "emission which has been emitted" that the commenter advocates, it would lead to confusion about the public release of certificate information, and potentially a lack of transparency about emissions contrary to the intent of CAA section 208, because during the useful life of the engine or equipment that certificate information would simultaneously provide information relevant to both the future emissions and past emissions of the source. Additionally, there are three parts to the definition of "emission data" codified in 40 CFR 2.301(a)(2)(i), and this commenter refers to only the first, 40 CFR 2.301(a)(2)(i)(A). The other two subsections under the regulatory definition of "emission data" include information relating to "emissions which, under an applicable standard or limitation, the source was authorized to emit (including, to the extent necessary for such purposes, a description of the manner or rate of operation of the source)" (e.g., future emissions that have been authorized), and information "necessary to identify the source and to distinguish it from other sources (including, to the extent necessary for such purposes, a description of the device, installation, or operation constituting the source)." The emission data definition at 40 CFR 2.301(a)(2)(ii) excludes information concerning research or information about products that have not entered into commerce. Therefore, part (i) of

	the definition is intended to cover all information submitted once the engine is offered in commerce. Moreover, the CAA is clear that emission data must be available to the public and is not entitled to confidentiality. Therefore, it is reasonable that EPA determine that information that is inseparable from emissions performance in the context of ABT credits and compliance demonstrations is not entitled to confidential treatment as emission data. Lastly, EPA has specifically excluded forecasted or projected sales information from this determination, and thus such information will remain subject to the 40 CFR part 2 process under 40 CFR 1068.11(c)(1).
Comment ID(s): 1303 (Auto Innovators) Auto Innovators requested that EPA consolidate all the emission data determinations, and other confidentiality determinations, in one part under Title 40 instead of in both 40 CFR part 2 and part 1068. Auto Innovators stated that having related regulations in multiple parts is likely to cause confusion for industry stakeholders.	**Response:** EPA understands that having regulations that relate to the same topic, in this instance the treatment of information, in more than part in the Code of Federal Regulations may potentially be confusing to regulated entities and the public. However, EPA notes that the current 40 CFR part 2 regulations are generally applicable for CAA purposes, whereas the 40 CFR part 1068 regulations are specific to information related to mobile sources. EPA is modifying 40 CFR part 2 with a provision that clearly refers the reader to the 40 CFR part 1068 regulations. We anticipate that this cross reference will be sufficient to alert industry stakeholders about the interrelationship of the relevant 40 CFR part 2 and part 1068 regulations.

Comment ID(s): 1303 (Auto Innovators)	**Response:**
Auto Innovators requested that information collected from inspections, audits, or other site visits be excluded from the information determined to be emission data in this rulemaking. The commenter stated that, because this information is not submitted to the Agency, but is instead collected "on the spot" by EPA, it should not be included in the confidentiality determination in this rulemaking.	The CAA does not distinguish between information that is submitted by a regulated party and information that EPA collects through inspections, audits, or other site visits. Section 208(a) and (b) provide EPA with authority to obtain information by a variety of methods. Section 208(c) expressly provides that such information shall be available to the public if it is emissions data. EPA treats the information it has, regardless of how it was obtained, according to the nature of that information (e.g., whether it is emission data, trade secrets, etc.). Information EPA has collected during inspections, audits, or other site visits may qualify as emission data, and if so would not be entitled to confidential treatment. EPA has provided an extensive spreadsheet of the information it obtains, the information category it falls under, and whether it is emission data or otherwise not entitled to confidential treatment, in the docket for this rule (CBI Categories for All Industries and All Programs.xlsx).

Comment ID(s): 1186 (CARB), The California Air Resource Board (CARB) provided feedback on EPA's proposal to maintain confidential treatment for the subcategories of information identified in preamble Sections XI.A.1.i.a, XI.A.1.i.b, and XI.A.1.i.c until the product described by that information is introduced into commerce. CARB highlighted that the introduction to commerce date is not specified in all applications for certification. For example, applications for certification for on-road heavy-duty engines and light-duty motor vehicles, do not appear to expressly require manufacturers to specify the date they intend to introduce certified engines into commerce (see, e.g., 40 CFR 1036.205, 86.007-21, 86.004-21, 86.094-21, 86.1844-01; see also 40 CFR 59.623). CARB suggested that the categories of information identified above should be entitled to confidential treatment until the date the certificate of conformity for a regulated product is issued.	**Response:** EPA agrees with the commenter. Generally, EPA does receive an introduction-into-commerce date with an application for a certificate of conformity, even in cases where it is not required. However, when an application for certification does not specify an introduction-into-commerce date, or in situations where introduction into commerce occurs before the certificate is issued, EPA will apply the provisions related to confidentiality determinations in 40 CFR 1068.11 based on the date the certificate is issued.
Comment ID(s): 1186 (CARB), CARB suggested that, in regard to preliminary or superseded information, EPA include an express disclaimer informing the requester of the preliminary or superseded nature of the information.	**Response:** EPA agrees that an express disclaimer would be an appropriate way to convey to information requesters the preliminary or superseded nature of the information requested. Though not a requirement of this final rule, EPA intends to provide disclaimers as appropriate. Additionally, EPA does not intend to publish preliminary or superseded information on its own initiative but would only provide the information in response to specific requests and in accordance with any applicable exemptions to the definitions of emissions data in 40 CFR part 2.

Comment ID(s): 1325 (Cummins), 1203 (EMA)	**Response:**
Some commenters opposed EPA's proposed emission data determinations on the basis that some of the information at issue constitutes "trade secrets." These commenters highlight that the CAA protects trade secrets "in accordance with the purposes of section 1905 of title 18[]" of the U.S. Code. The commenters explain that title 18 refers to the Uniform Trade Secrets Act ("UTSA"), and that the provisions of section 1905 prohibit the unauthorized disclosure of information that "concerns or relates to the trade secrets, processes, operations, style of work, or apparatus, or to the confidential statistical data … of any person, firm, partnership corporation, or association." The commenters seek to ensure that the disclosure of a manufacturer's emission data does not allow others, including direct competitors, to reverse-engineer that manufacturer's emission-control strategies, designs, methods, techniques, processes, programs or codes. They assert that EPA must interpret the CAA to give meaning to the restrictions of the UTSA, meaning that EPA cannot disclose emission data in a manner that nullifies manufacturers' statutory rights to the protection of their "trade secrets." The commenters specifically state the following information constitutes "trade secrets": (1) one Hertz (Hz) in-use emissions data, or any other similar second-by-second off cycle data, other than emission values and engine speed; (2) engine fuel maps, including any associated NOx data; (3) one Hz data from SEA reports or similar compliance-assessment reports, other than emission values and engine speed; (4) data regarding the manner in which manufacturers electronically protect passwords and/or encrypt data to restrict the adjustment of electronically adjustable parameters and to prevent unauthorized reflashes (see section 1068.50); and (5) any other emissions data deemed capable of facilitating reverse-	As an initial matter, the Uniform Trade Secrets Act restricts the "unauthorized disclosure" of information that qualifies as a "trade secret." In this instance, the CAA authorizes, if not mandates, the disclosure of information that qualifies as "emission data." In section 208(c), the CAA expressly provides that only information "other than emissions data" is capable of treatment as trade secrets. Otherwise, section 208(c) expressly provides that "[a]ny records, reports or information obtained under this part or part C of this subchapter shall be available to the public." As described at length in the proposed and final rule preambles, the specific categories of information addressed by EPA's determination in this action is either emission data or otherwise not entitled to confidential treatment, or information that remains subject to the confidentiality determination process of 40 CFR part 2. EPA notes that the commenters have not disputed EPA's determination the information specified in the categories of §1068.11(c) are emission data, under EPA's longstanding regulatory definition of that term. Indeed, one commenter appears to have conceded as much, referring to the information at issue as "emission data" in its comments. (See EPA-HQ-OAR-2019-0055-1203-A1 at p. 168, EMA supplement at 2). Given the nature of the information as emission data, the CAA unambiguously prohibits treating emission data as confidential, and therefore authorizes EPA to release this information to the public, regardless of how submitters may characterize the sensitivity of the information.

engineering of a manufacturer's trade secrets. The one Hz data that would be subject to public disclosure under this rule are trade secrets in that they would allow parties to reverse-engineer each other's emissions-related designs and strategies, including warm-up controls, fuel-map configurations, and more—all of which are developed at a cost by trained staff and carefully guarded by manufacturers. Similarly, manufacturers' engine fuel maps, including associated NOx data, are also trade secrets, and their disclosure would allow parties to reverse-engineer manufacturers' thermal controls, fuel system and injection controls, and strategies for controlling engine emissions to ensure they comply with the broad range of emissions tests (FTP, RMC, LLC, NTE) and GHG limits that are required. Disclosing this information would destroy the manufacturers' capital investments and violate their rights to the protection of confidential trade secrets.	

Comment ID(s): 1222 (DoD)	**Response:**
The Department of Defense requested that EPA include provisions allowing engine manufacturers to claim as confidential any engine performance data (e.g., emissions rate) that is considered "national security information." The Department of Defense suggested that any such language be structured so EPA would approve only those manufacturers' designation requests for "national security information" where that request has been endorsed by an agency of the Federal Government responsible for national defense or homeland security, similar to the existing EPA requirement at 40 CFR 1068.225(d). The Department of Defense requested that EPA accommodate their national security concerns about broad availability of non-emissions technical performance data for engines used in national defense and homeland security applications. The Department of Navy was concerned that the availability of critical data, such as fuel flow rates for engines used in military aircraft, ground vehicles, and marine applications, as well as certain key stationary engines, could provide a strategic advantage to foreign adversaries.	Most of the information of concern for national security is never submitted to EPA. FAA excludes military aircraft from airworthiness certification requirements, which in turn excludes those aircraft from EPA emission standards. We therefore never receive information related to military aircraft. As specified in 40 CFR 1068.225, engines installed in land-based or marine vehicles or equipment that are used in combat applications are similarly automatically exempted from EPA standards and we therefore never receive information related to those engines. A qualified exemption applies for land-based and marine applications that do not qualify for an automatic exemption. Manufacturers are generally required to submit information as needed to demonstrate the need for their engines to be exempt from emission standards. After consideration of comments, we are revising the final rule at 40 CFR 1068.11(c)(14) to clarify that information submitted in support of such a request for an exemption from emission standards and certification requirements will be subject to the 40 CFR part 2 process. These provisions apply equally for exemptions identified in 40 CFR part 1068, subpart C or D, or in the standard-setting part.

Comment ID(s): 1203 (EMA)	**Response:**
The Truck and Engine Manufacturers Association (EMA) stated that EPA's reasoning behind the emission data determinations appears to be merely administrative convenience and easing its own workload relating to FOIA requests. EMA stated this is not a sufficient basis for removing the presumptive protections for manufacturers' claiming their information as confidential. EMA further stated that the determinations in §1068.11 will only incentivize additional FOIA requests to which EPA must respond, as competitors will be spurred on to discover all that they can about other manufacturers' products and processes.	EPA did not undertake this rulemaking for "merely administrative convenience" or to "ease its own workload." EPA has determined that due to the nature of the information at issue in this rulemaking that it is appropriate to make advance determinations as to the status of the information. The determinations in this final rule are the same as those that EPA would otherwise make through case-by-case assessment under the 40 CFR part 2 process. As a result, the rulemaking serves to streamline the process for making information available. While the final rule will increase administrative efficiency, it also promotes greater transparency and provides certainty to both submitters and requestors of information. The final rule also provides certainty to manufacturers regarding the release of specific categories of information that EPA collects and ensures consistent treatment of such information across manufacturers. With this advance notice, each submitter will have certainty regarding how EPA will treat the information specified in section 1068.11.

Comment ID(s): 1324 (Volvo)	**Response:**
Volvo expressed a concern that the definition of “emission data” is so ambiguous that all the information manufacturers are required to submit for certification could be construed as not being entitled to confidential treatment even if that information is not identified as such. Accordingly, Volvo requested that EPA either revise the definition of “emission data” in 40 CFR 2.301(a)(2) for clarity or provide additional examples of what is and is not considered emission data by adding discussion in the preamble to the final rule and to 40 CFR 1068.11. Volvo further requested that EPA classify AECD descriptions covering shift strategies for an automated transmission, raw test data and results, and similar items as confidential under the “reasonably obtainable” provisions of 40 CFR 2.208 as allowed in 40 CFR 2.301(e). Volvo stated as an example that an AECD describing shift strategies could be critical in determining the compliance-related characteristics identified in 40 CFR 2.301(a)(2)(i)(A), and further stated that it could be argued that the same information could be considered emission data under 2.301(a)(2)(i)(C).	EPA did not propose, nor are we finalizing, any changes to the regulatory definition of “emission data” in 40 CFR 2.301(a). EPA did not reopen that regulatory definition in this rulemaking and any comments regarding changes to the existing definition of “emission data” are beyond the scope of this rulemaking. EPA promulgated that general regulatory definition in 1976. In this rulemaking, EPA is making determinations that merely apply the existing definition of emissions data to specific categories of information EPA collects. In the proposal notice, EPA described in great detail, with even further detail in the referenced and docketed CBI spreadsheet, about which types of certification and compliance information qualify as emission data under 40 CFR 2.301(a)(2)(i)(A), (B), or (C) (or multiple subsections, independently). In this final action, EPA is retaining the preamble description of the types of information that constitute emission data. EPA notes that through this process, EPA has in effect provided specific examples of information that are or are not emissions data that the commenter requested. Volvo appears to concede that the suggested data elements identified as indeterminate (i.e., not determined in this rule to be excluded from treatment as confidential) are in fact emission data that is not entitled to confidential treatment. However, EPA is not making an emission data determination in this rule regarding the AECD descriptions identified and instead will evaluate whether such information is emissions data, and thus not entitled to confidential treatment under the 40 CFR part 2 process, on a case-by-case basis.

Comment ID(s): 1324 (Volvo)	**Response:**
One commenter requested clarity as to whether the test information and results category includes raw test data and results, including raw coast down data, actual vehicle drag coefficient and $F_{altaero}$ calculations and values, or if the category only includes the GEM inputs necessary to determine the FEL. Additionally, the commenter requested clarity as to whether the GEM inputs covered by this determination apply only to the required ten vehicle configurations for each vehicle family certification application or to all possible configurations. This commenter opposed the emission data determination in this rule on the basis that the information may be misconstrued or provide a misleading impression of the emission benefit for a specific engine or vehicle application. Specifically, the commenter describes the many different heavy-duty engine and vehicle types and duty cycles that are not represented by the GEM calculations that could be misconstrued or appear misleading.	EPA understands the commenter's concerns about clarity and wishes to be very clear about these specific points. First, under the current regulations, EPA does not collect raw coast down data, actual vehicle drag coefficients, or the $F_{altaero}$ calculations and values. Accordingly, that information is beyond the scope of the emission data determinations made in this rule. Second, the test information and results category does include any GEM inputs submitted for certification application, as those model scenarios are used by EPA to determine compliance of the vehicles that are manufactured. EPA understands that the ten GEM configurations submitted for certification might potentially be misleading in isolation, because the configurations are hypothetical and demonstrate the highest and lowest emitting configurations, the manufacturer's highest projected sales configuration, and seven other likely or possible configurations. However, EPA believes that providing the end-of-year production information will resolve questions about a manufacturer's emission profile that may arise out of the GEM scenarios used at the time of certification. Additionally, the model scenarios are emission data as they are used to demonstrate that the manufacturer's products will likely meet the standards, though it is possible that the manufacturer might not produce the exact configurations represented in the GEM scenarios submitted during certification. The certificate of conformity that EPA issues based on the GEM configurations is used, as all certificates are, to ensure that the products produced comply with the requirements of the standard setting parts through conforming to the certificate issued.

Comment IDs: 1203 (EMA),	**Response:**
Some commenters suggested that, instead of collecting and disclosing certain emission data included in this determination, that EPA require manufacturers to keep those records for inspection at EPA's request. Commenters suggested that this would allow EPA access to the necessary information without the Agency obtaining it, which would subject the information to public disclosure as "emission data." Some specific examples included the one Hertz data, fuel maps, and GPS data for in-use testing.	EPA has carefully considered the information it collects and determined that the information currently collected is necessary for determining the compliance of parties with the requirements of the standard setting parts. EPA notes that one reason the CAA requires that emissions data be available to the public is to promote transparency and meaningful public participation. In particular, this transparency encourages source compliance. The commenters' preferred approach to information that is clearly emissions data needed to determine compliance would defeat that purpose. With respect to the specific types of information that the commenters identified, EPA uses the one Hertz data information to assess compliance with 40 CFR part 86, subpart T, Heavy Duty In-Use Testing provisions, while using the fuel maps are used to determine compliance with part 1036 testing requirements. Moreover, EPA has a long-standing practice of regularly releasing the one Hertz data in the heavy-duty in-use testing program under part 86, subpart T, and this regulation makes emission data determinations by rule that are consistent with the Agency's prior treatment of this information through regular web postings since 2017. Additionally, the one Hertz and fuel map information is emission data for the reasons described in the preamble and, therefore, should be made available to the public. The commenters have not disputed EPA's determination that this information is emission data. Lastly, EPA is not in this rulemaking making a determination whether GPS data from in-use testing programs is or is not emission data. Instead, the existing 40 CFR part 2 process will be used to determine on a case-by-case basis whether in-use testing GPS data is or is not entitled to confidential treatment.

30.2 Adjustable parameters

<u>Comments by Organizations</u>

Organization: *Alliance for Automotive Innovation (Auto Innovators)*

<u>40 C.F.R. 1068.50 Adjustable parameters.</u>

Auto Innovators requests clarification on the additional requirements to include driver selectable modes in this brand-new additional section. This section seems to require inclusion of information on each selectable mode as an adjustable parameter. In some vehicles, this could reach hundreds of possible drive modes and user-selectable features to be described in the certification application, creating unnecessary burden to timely review. We recommend that EPA update this section to exclude driver selectable modes from this description. [EPA-HQ-OAR-2019-0055-1303-A1, p.8]

Organization: *American Honda Motor Co., Inc. (Honda)*

1068.50 - General

For SSIE product, it is necessary to clarify more detailed definitions or exemption requirements for the adjustable parameter. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

1068.50 - Exemption

It should be clarified that governor adjustment mechanisms (such as "Turtle" to "Rabbit" levers or governor springs) are exempt from the adjustable parameter. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

It should be clarified that idle speed adjustment mechanisms (e.g., throttle stop screw) are exempt from the adjustable parameter, because they are necessary to achieve proper idle speed. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

It should be clarified that main jets, pilot jets of carburetor are exempt from the adjustable parameter.

The main jets or pilot jets are commercially available in different sizes and can be installed with common tools. Because the jets should be easily removable for maintenance which is necessary to prevent engine failure or emission increase. In addition, the necessity of jets for high altitude are described in the Clean Air Act (42 U.S.C. §7549) or regulations (40 CFR) and has been approved by EPA. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

According to proposed text, the service part is considered "practically adjustable" if it costs less than $30. However the cost of the SSIE carburetor would be less than $30. It should be clarified that such cases are exempt from adjustable parameters (i.e. Replacement of the carburetor is not considered as adjustable parameter). [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

It should be clarified that a manual lever choke mechanism only used for starting engine is not considered an adjustable parameter. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

1068.50 - Tamper resistance

It should be clarified that any approval of tamper resistant received in the past is still valid.

As tamper resistant mechanism, for example, adjustable range of the pilot screw limited by limiter cap, even though the limiter cap could be destroyed by the "ordinary tools" which includes very wide range of tools according to the proposed text, we believe that this should not be treated as "practically adjustable". [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

1068.50 - Definition

Definition of "significantly degrading engine performance" should be defined. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

Guideline of the determination of "Operating parameter" for SSIE is necessary in order to create application document. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

Definition of "mechanically controlled adjustable parameters" should be defined to clarify the criteria. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

Definition of "practically adjustable" should be made more clear, or should set clear requirement for exemption. Current description of 1065.50(d)(1) is too vague and not practical. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

Organization: *California Air Resources Board (CARB)*

With regards to the proposed changes to adjustable-parameter criteria in 1054.115, CARB staff notes that the Proposed Amendments to the California Exhaust Emission Standards and Test Procedures for New 2013 and Later Small Off-Road Engines; Engine-Testing Procedures ([California]Part 1054), which the board heard and approved in December, revise Section 1054.115(b) to read as follows:

- '(b) Adjustable parameters.
    - Engines that have adjustable parameters must meet all the requirements of this part for any adjustment in the physically adjustable range. An operating parameter is not considered adjustable if you permanently seal it. Operating parameters that can be adjusted using tools are considered adjustable. We may require that you set adjustable parameters to any specification within the adjustable ranges during any

> testing including certification testing, production-line testing, in-use testing, or new engine compliance testing.' [EPA-HQ-OAR-2019-0055-1186-A2, p.133]

CARB staff determined that this was necessary and appropriate given the availability of even ‘specialized’ tools (e.g., on Amazon.com and other online retailers) to the modern consumer. [EPA-HQ-OAR-2019-0055-1186-A2, p.133]

The proposed textual changes to 1054.115(b) reference 1068.50. CARB staff has reviewed 1068.50 as well. It is not clear from this review whether U.S. EPA will consider screws adjustable if they require specialized screwdrivers. On the one hand, it's clear those screwdrivers are ‘available’ as described in 1068.50(d)(1). On the other, they are not made available to operators by the manufacturers or their dealers, as described in 1068.50(g)(1). Would U.S. EPA consider screws that require specialized screwdrivers to be ‘adjustable’ based on the new language in 1068.50? If not, we note that as described above such specialized screwdrivers can be readily obtained by consumers, and that this should be accounted for in the proposed regulation. [EPA-HQ-OAR-2019-0055-1186-A2, p.133]

Organization: *Cummins Inc. (Cummins)*

EPA proposes to migrate, consolidate, and revise adjustable parameter provisions with a new proposed section §1068.50 which would apply broadly to on- and off-highway engine categories starting MY 2024. Among the updates are proposed provisions regarding the adjustability of electronically controlled parameters, which manufacturers must limit through ECM password or encryption protection. If EPA learns that the new provisions drive significant ECM changes such as hardware upgrades, EPA should provide additional lead time to implement the changes at least for some applications. For example, it may not be possible to upgrade ECMs for certain SI alternative fuel and off-highway families until MY 2027. EPA should allow additional lead time, especially for lower volume and/or non-SCR engines such as in these categories. That would facilitate prioritizing higher volume SCR-equipped engines in the 2024-2025 timeframe. [EPA-HQ-OAR-2019-0055-1325-A1, p. 15]

Regarding mechanically controlled parameters for engines at or above 560 kW discussed in §1068.50(d)(1), EPA proposes no limitation on the time or parts cost for those parameters to be considered “practically adjustable”. Cummins suggests determining a limit consistent with the higher cost of these engines to provide clarity for manufacturers. [EPA-HQ-OAR-2019-0055-1325-A1, p. 15]

Organization: *Maine Department of Environmental Protection (Department)*

The Department is fully supportive of provisions to ensure that there are measures in place to prevent engine control module (ECM) tampering. Motor vehicle tampering is a pervasive problem not only in Maine, but throughout the country, and EPA’s proposal that manufacturers include a document at time of certification which outlines and describes the process and/or industry technical standards that were used to prevent unauthorized access to the ECM on the vehicle is an important step in addressing this issue. Manufacturers should be required to take definitive actions to prevent unauthorized access to the ECM, ensure that calibration values, software, or diagnostic features cannot be overwritten or otherwise disabled; and respond to repeated, unauthorized attempts to reprogram the ECM, if they become aware of such attempts. [EPA-HQ-OAR-2019-0055-1288-A1,p.8]

Organization: *Midwest Ozone Group (MOG)*

The proposed rule to regulate emissions from Heavy Duty Trucks is very relevant to MOG as it continues to assess ozone improvement initiatives and state implementation plan development. MOG recommends EPA include directed regulatory provisions concerning inspections and enforcement to address circumstances like the defeat devices issues. Such provisions will significantly drive reliable emissions reductions. [EPA-HQ-OAR-2019-0055-1272-A1, p.2]

Organization: *Motorcycle Industry Council (MIC)*

Manufacturers benefit greatly from clear regulatory information that enables more efficient, correct, and complete preparation and execution of certification and compliance processes. EPA's proposal on adjustable parameters in 40 CFR 1068.50(f)(2) may result in unnecessary confusion and potential certification delays if it affects diagnostic tools as discussed below. These diagnostic tools are not used to create performance or functional adjustability in the ECU's control of emissions, but instead are to push through updates related to customer service campaigns and recalls. [EPA-HQ-OAR-2019-0055-1212-A1, p.1]

EPA proposes in 40 CFR 1068.50(f)(2) that software and other products sold or offered for sale by manufacturers having the capability to reflash or modify the electronic control unit (ECU) be included in consideration of the practically adjustable range. EPA's proposal may be reasonable for some consumer products but does not make sense for diagnostic tools normally sold or made available to dealers or professional service technicians. Manufacturers may not always be able to limit or control sales of those diagnostic tools. [EPA-HQ-OAR-2019-0055-1212-A1, p.1]

Adjustments requiring reflash of the ECU using professional grade diagnostic tools and software are typically related to recalls and customer service campaigns and are not intended to create performance or functional adjustability in the ECU's control of emissions. Adjustments made using this equipment are vehicle manufacturer approved and supplied to dealers and professional service technicians to maintain compliance with regulatory requirements. These diagnostic tools do not open ECUs so dealers or technicians can independently adjust or create ranges of engine and emission control operating parameters or calibrations, they overwrite and update entire ECU calibrations. Including these professional diagnostic tools would create manufacturer confusion about how to determine related adjustable operation ranges and parameters for their consideration, potentially resulting in certification delays. [EPA-HQ-OAR-2019-0055-1212-A1, p.1]

MIC recommends EPA not include diagnostic tools normally sold or made available to dealers and used by professional service technicians in the proposed consideration of the practicably adjustable range in 40 CFR 1068.50(f)(2). [EPA-HQ-OAR-2019-0055-1212-A1, p.2]

Diagnostic tools normally sold or made accessible to dealers and professional service technicians are intended to ensure ECUs and vehicles remain in safe and compliant operation. They are not intended to create independent adjustability in manufacturer supplied calibrations. Including these diagnostic tools in the scope of this regulatory activity will work against EPA's target of clarifying requirements so MIC, SVIA and ROHVA request EPA exclude these diagnostic tools from the regulation. [EPA-HQ-OAR-2019-0055-1212-A1, p.2]

Organization: *National Association of Clean Air Agencies (NACAA)*

Effective provisions to detect and enforce against tampering with vehicle emission controls are key to ensuring long-term in-use emissions performance. Recognizing the complexity of engine control modules (ECM) and the sophistication of tampering methods, EPA's proposal to prevent ECM tampering is designed to provide manufacturers with flexibility to quickly respond to new or emerging threats and vulnerabilities. Under the proposal, manufacturers would be required to include in their certification application a description of all adjustable parameters, including electronically controlled parameters, as well as the approach or industry technical standards used to prevent unauthorized access to a vehicle's ECM; ensure that calibration values, software and diagnostic features cannot be modified or disabled; and respond to repeated unauthorized attempts to reprogram or tamper. Manufacturers would also be required to attest that they are using sufficient measures to secure the ECM, thereby limiting adjustment or alteration beyond those used in the certified configuration. EPA would retain the right to evaluate a manufacturer's decisions regarding the measures used to prevent access to and tampering with the ECM. [EPA-HQ-OAR-2019-0055-1232-A1, p. 16]

EPA should finalize these proposed anti-tampering provisions. [EPA-HQ-OAR-2019-0055-1232-A1, p. 16]

Organization: *Northeast States for Coordinated Air Use Management (NESCAUM)*

Should EPA instead promulgate Option 1, we urge the Agency to make the following changes to the proposed standards: The NESCAUM states are prioritizing detection and enforcement against tampered vehicles because tampered vehicles substantially increase vehicle NOx emissions. Given the importance of identifying tampered vehicles and enforcing against emission control system tampering, NESCAUM supports EPA's proposed provision to ensure that there are measures in place to prevent engine control module (ECM) tampering. EPA proposes that manufacturers include a document at the time of certification that outlines and describes the process and/or industry technical standards that were used to prevent unauthorized access to the ECM on the vehicle. This document shall describe the measures that a manufacturer has used to: prevent unauthorized access to the ECM; ensure that calibration values, software, or diagnostic features cannot be overwritten or otherwise disabled; and respond to repeated, unauthorized attempts to reprogram the ECM, if they become aware of such attempts. [EPA-HQ-OAR-2019-0055-1249-A1, p. 16]

Organization: *North Central Texas Council of Governments (NCTCOG)*

NCTCOG supports the EPA's current anti-tampering efforts outlined in the 2020 National Compliance Initiatives and encourages significantly more attention to minimize excessive vehicle emissions. [EPA-HQ-OAR-2019-0055-1254-A2, p.4]

Organization: *Outdoor Power Equipment Institute (OPEI)*

However, several aspects the proposed amendments to Part 1068.50, Adjustable Parameters have raised concern for small spark-ignited engine stakeholders. As a result, OPEI has included several comments, questions and proposed revisions to this section for EPA's consideration. [EPA-HQ-OAR-2019-0055-1205-A1, pp.1-2]

1054.801 – Adjustable Parameter means any device, system, or element of design that someone can adjust (including those which are difficult to access) and that, if adjusted, may affect emissions or engine performance during emission testing or normal in-use operation. This includes, but is not limited to, parameters related to injection timing and fueling rate. You may ask us to exclude a parameter that is difficult to access if it cannot be adjusted to affect emissions without significantly degrading engine performance, or if you otherwise show us that it will not be adjusted in a way that affects emissions during in-use operation. [EPA-HQ-OAR-2019-0055-1205-A1, p.2]

Section 1054.115(b) – Adjustable Parameters With the removal of language in 1054.115(b), it appears permanent sealing off an operating parameter may no longer exclude a parameter from being adjustable. However, 1068.50(c)(2)(ii) allows use of recessed fasteners sealed with a durable plug, cap or cover plate that adequately limits access to the faster, consistent with paragraph (d)(1) of this section to determine a parameter is not adjustable.

- **i. OPEI recommends the current language in 1054.115 is retained for clarity as permanent seals have long been effective, have long been accepted by EPA, and are applied to many small spark-ignited engines.**
- **ii. Regarding permanent seals, OPEI is seeking clarification where 'extraordinary measures' to access a 'parameter' change from goodfaith tamper-resistance to end-user tampering? It is OPEI's interpretation that if a 'parameter' (setting) is sealed with, for example, a durable interference-fit plug, not intended to be accessed or serviced, and if an end-user uses a hammer, chisel, screwdriver or drill to destroy the plug and access the parameter, this is tampering, and does not otherwise constitute a parameter as 'adjustable'.** [EPA-HQ-OAR-2019-0055-1205-A1, p.2]

For example, it is OPEI's understanding that if an owner used a hand drill to drill out (destroy) a press fit cap, or used pliers to disassemble a glued or plastic welded electronic component consisting of a circuit board (but unpotted), these actions are extraordinary measures beyond the manufacturers control and tampering. In outdoor power equipment applications, while the effects of destroying such seals may not be immediately realized (may not immediately negatively impact performance), destruction of such seals may indeed have long-term performance impacts on equipment due to dirt and debris that may be ingested through uncovered circuits (both mechanical and electrical). [EPA-HQ-OAR-2019-0055-1205-A1, p.3]

Additionally, OPEI believes altering computer codes would similarly be considered extraordinary measures and tampering if done so without ‘reasonably available ordinary tools’ provided by the manufacturer. [EPA-HQ-OAR-2019-0055-1205-A1, p.3]

Section 1054.115(b) – Adjustable Parameters OPEI is seeking clarification that engine throttle controls, commonly known as idle speed control / adjustment / setting, or rabbit / turtle control / adjustment / setting, and governor settings are not considered ‘adjustable parameters’ per Parts 1054 or 1068. [EPA-HQ-OAR-2019-0055-1205-A1, p.3]

When working with different regulators in the U.S., OPEI members have received inconsistent responses regarding whether the engine idle speed controls and governor settings are considered adjustable parameters. While speed settings are ‘adjustable’ from high-idle to low-idle, they are fixed in range for the end-user. In this sense, the emissions are fixed along that range. In this regard, adjustment of engine speed does not ‘affect emissions or engine performance during emission testing or normal in-use operation’ [EPA-HQ-OAR-2019-0055-1205-A1, p.3]

Additionally, the ability of the user to operate the engine at low and high speeds is necessary for the start ability, performance and safety of many small spark-ignited engine equipment. However, equipment function and performance are generally optimized for the engine to be loaded from ‘high idle’ and this speed reflects normal operating condition. For example, a lawn mower blade tip speed or governor frequency are optimized from the engine high idle speed and as a result generally reflect the normal engine speed / operating conditions. [EPA-HQ-OAR-2019-0055-1205-A1, pp.3-4]

For these reasons OPEI does not interpret engine idle speed controls or governor settings to be adjustable parameters. OPEI is seeking clarification that these specific parameters are not considered adjustable parameters for consistent application of the requirement across regulators. [EPA-HQ-OAR-2019-0055-1205-A1, p.4]

Section 1068.50 – Adjustable Parameters Today’s small-engine manufacturers follow industry-developed guidance to develop tamper resistance methods which are effective (see Appendix A). The requirements in this guidance have (to-date) been accepted by EPA. However, the potential all-inclusive nature of tools in the Proposed Rule and the ability to use tools to destroy seals, caps and covers would result in a significant increase in stringency, with undetermined costs and benefits. [EPA-HQ-OAR-2019-0055-1205-A1, p.5]

Furthermore, almost any small spark-ignited engine adjustment / parameter can be accessible in 15-minutes for a person with small engine knowledge and a desire to tamper – However that does not mean it happens with a frequency that impacts overall fleet emissions and that the cost of potential new requirements is justified. For these reasons OPEI does not believe the additional provisions of Part 1068.50 are necessary for small spark-ignited engines. SSIE should be exempted from these provisions. [EPA-HQ-OAR-2019-0055-1205-A1, p.5]

OPEI is concerned that technology differences in SSIE and the wide range of applications covered by the sector require unique consideration and that requirements for adjustable parameters are most appropriate in the rulemaking section (part 1054). [EPA-HQ-OAR-2019-0055-1205-A1, p.5]

Section 1068.50 – Adjustable Parameters: OPEI is concerned with the applicability and requirements of the Proposed Rule. Practically speaking, many small spark-ignited engines may be partially or completely disassembled in 15 minutes with ‘hand tools’. [EPA-HQ-OAR-2019-0055-1205-A1, p.5]

Arguably, the engine compression could be considered an adjustable parameter because it is an ‘element of design’ that could be ‘adjusted’ by changing bore, stroke or piston(s) and ‘affect emissions or engine performance during emission testing or normal in-use operation’. For example, the original equipment manufacturer piston in a chain saw, which is designed to be serviced/replaced, could be replaced with an aftermarket (non-OEM), higher compression piston in 15 minutes, ‘affecting emissions or engine performance during emission testing or normal in-use operation’. However, practically speaking the piston cannot be tamper resistant because its access is necessary for maintenance, service and replacement purposes. Other (less complicated) examples include fuel lines, or intake flow restrictor plates, both of which if changed could impact the air fuel ratio element of design / operating parameter, but need to be accessible for normal maintenance and service. This creates complexity for interpretation and enforcement of the regulation not realized for other sectors (specifically applications >30kW in which the engines take significant time to access, adjust, tamper and/or repair, likely much greater than 30 minutes). [EPA-HQ-OAR-2019-0055-1205-A1, pp.5-6]

One solution may be to update the Proposed Rule to clarify that the responsibility of identifying adjustable parameters shall be limited to original equipment manufacturer components offered each specific family. In the above example, if the OEM did not provide service parts that change the compression (for example different pistons or conrods), the compression would not be considered an adjustable parameter (assuming the components can be replaced in less than 15 minutes), regardless of the state of OEM non-endorsed aftermarket components. [EPA-HQ-OAR-2019-0055-1205-A1, p.6]

Section 1068.50(a) – Adjustable Parameters A model year 2024 implementation date does not provide the lead time necessary to comply with a Final Rule. OPEI requests the provisions or Part 1068.50 be rescheduled until at least model year 2025 to allow manufacturers time to assess products, implement necessary design changes (if/as needed, including exhausting existing inventory), certify products and work though supply chain challenges. Other parts of the amendments appear to have longer lead times. [EPA-HQ-OAR-2019-0055-1205-A1, p.6]

Today’s rule is ‘proposed’. OPEI and other stakeholders have included several comments EPA will consider before promulgating the Final Rule. In the spirit of this rulemaking process, manufacturers cannot be expected to invest in adjustable parameter analysis and redesign before a rule is ‘final’ (certain). [EPA-HQ-OAR-2019-0055-1205-A1, p.6]

Based on OPEI rulemaking experience, a Final Rule may not be published until late 2022. Manufacturers will start preparing for model year 2024 certification in the first months of 2023. The Proposed Rule includes several new requirements for which manufacturers will need to analyze and potentially redesign adjustable parameters. An appropriate lead time is needed to complete analysis and redesign (if/as needed), and work through supply chain challenges, including supplier production and inventory and engine manufacturer inventory, to assure compliance with new requirements for a given model year. This will need to be completed by early 2023 for the MY 2024 certification season. Furthermore, section (k) outlines significant compliance risk for which appropriate time is needed to minimize. For these reasons OPEI requests the provisions of section 1068.50 be rescheduled until at least model year 2025. [EPA-HQ-OAR-2019-0055-1205-A1, pp.6-7]

Section 1068.50(b)(1) – Adjustable Parameters OPEI is seeking clarification regarding the decision process related to adjustable parameters. It is unclear if EPA will require and/or provide 'approval' (upon request) for adjustable parameters based on the criteria of (b)(1) and other relevant parts of 1054.60. [EPA-HQ-OAR-2019-0055-1205-A1, p.7]

1. If approval is required, or if a manufacturer seeks a preliminary approval, what is EPA's expectation for who will apply for adjustable parameter approval? The SSIE sector is non-integrated for many components and equipment types. Equipment manufacturers rely largely on sourced components, including 'approved' components with adjustable parameters, for assembly into end products. This complicate certification and implementation of component design changes for the sector and needs consideration for rule implementation. [EPA-HQ-OAR-2019-0055-1205-A1, p.7]
2. Regarding EPA 'establishing the adequacy of the limits, stops, seals, or other means used to limit adjustment', OPEI requests additional detail of how this process and analysis will work; more specifically:
    - a. Is approval component level, engine level, and/or equipment level based? OPEI requests EPA consider providing a flexible 'approval' path with the consideration of component manufacturers and lead times needed to rollout design changes +industry wide;
    - b. Will EPA require a sample component, engine, and/or piece of equipment for determination of whether a parameter is 'not practically adjustable' (1068.50(d))?
        - i. In some cases, the California Air Resources has 'approved' methods to protect adjustable parameters.
            - 1. What will EPA require and what analysis will EPA conduct if a CARB approval is provided?
            - 2. CARB is promulgating new rules which will ban small engine-powered equipment. Moving forward manufacturers will not likely be receiving 'approval' (new or on-going) from CARB for tamper resistant methods. Will EPA recognize CARB approvals, and for how long?
    - c. Will EPA provide a template for evaluation and/or certification purposes?
    - d. Based on experience with another agency for similar approvals, OPEI is concerned this test and determination can be subjective and varies from test

personnel to test personnel. For this reason, OPEI is interested in further understanding:

    - i. Where will testing be conducted and by whom (for both certification and compliance purposes)?
    - ii. What steps/process will be in-place to assure consistency across testing personnel?
    - iii. How will EPA determine an adjustment ‘does not affect emissions’?
    - iv. How will EPA determine ‘significant engine performance degradation’ and ‘the effect of adjustments on engine performance’ (see (g)(1))?
    - v. What does a report or approval look like?
  - e. What is the expected evaluation and approval time?
  - f. How long is an EPA approval valid for (what are the terms of an approval or compliance inspection)? [EPA-HQ-OAR-2019-0055-1205-A1, pp.7-8]

Section 1068.50(c)(2)(i) – Adjustable Parameters OPEI is seeking clarification regarding what is ‘adjustable’ on circuit boards and onboard computers? It is OPEI’s opinion that rebuilding circuit boards is an extraordinary event and tampering. OPEI is not aware of users tampering with circuit boards or onboard computers for small spark-ignited engine equipment in such a way. Requiring ‘potted’ circuit boards for small spark-ignited engine electronic components is an unnecessary cost and may not be technologically practical for all equipment. [EPA-HQ-OAR-2019-0055-1205-A1, pp.8-9]

Section 1068.50(c)(2)(ii) – Adjustable Parameters OPEI is seeking clarification that a recessed plugged, capped or covered parameter is not considered practically adjustable. OPEI is seeking clarification of the term ‘simple’ tools’. OPEI is seeking clarification that the intent is that ‘simple tools’ are used for their generally intended purposes. [EPA-HQ-OAR-2019-0055-1205-A1, p.9]

OPEI members have reported that another agency has determined that a durably plugged, capped or covered parameter is indeed accessible and ‘adjustable’ after destroying caps and covers with combinations of punches, hammers, pliers and similarly ‘ordinary tools’. OPEI understands 1068.50(c)(2)(ii) to say that recessed capped, plugged or covered parameters are not considered adjustable, however industry experiences raise concerns. [EPA-HQ-OAR-2019-0055-1205-A1, p.9]

Furthermore, based on the experiences noted above, OPEI is concerned ‘durable’ (plug) is subjective. OPEI is seeking clarification of what EPA considers durable, including things like interference fit (pressed) and adhesive bonding ‘durable’ (but not indestructible), and how durability will specifically evaluated. A test procedure must be developed with consideration of how tools may be used and by whom. If plugs, caps and covers are going to be subject human testing, additional guidance is needed to identify repeatable evaluation requirements. [EPA-HQ-OAR-2019-0055-1205-A1, p.9]

This section introduces the term ‘simple tools’. OPEI is seeking clarification of the definition of ‘simple tools’ vs ‘ordinary tools’ vs ‘hand tools’ (a subcategory of ‘ordinary tools’), specifically as the definition relates to an adjustment of a sheared fastener or recessed and plugged/capped/covered parameter. [EPA-HQ-OAR-2019-0055-1205-A1, p.9]

Finally, OPEI is also seeking clarification that it is the intent that 'simple' and 'ordinary' tools are used for their generally intended purpose, and not in destructive ways. For example, using a hand drill to penetrate and remove a press-fit plug is not the generally intended use of that tool. [EPA-HQ-OAR-2019-0055-1205-A1, pp.9-10]

Section 1068.50(c)(2)(iii) – Adjustable Parameters OPEI is seeking clarification that bimetal springs that a contained within a housing with a crimped cover are also considered not practically adjustable. It is OPEI's opinion that crimping offers the same level of adjustment protection as welding, rivets, or sealed threaded fasteners. Installing bimetal springs into a housing incorporated into the exhaust system with a crimped cover is a common approach for today's small spark-ignited engines when these springs are used. OPEI is not aware of users tampering with bimetal springs in these applications where crimped housing covers are used. [EPA-HQ-OAR-2019-0055-1205-A1, p.10]

Section 1068.50(d)(1) – Adjustable Parameters OPEI is seeking clarification that 'adjustment' times and 'service part' costs are in terms of the normal consumer/operator, not a servicing dealer or otherwise 'experienced mechanic' with regards to engines and equipment powered by engines at or below 30 kW. [EPA-HQ-OAR-2019-0055-1205-A1, p.10]

Section 1068.50(d)(1) – Adjustable Parameters OPEI is seeking clarification that 'specialized tools' intended exclusively for servicing dealers, including software and hardware for analysis of electronics, and not intended for retail to the consumer/operator are not considered 'ordinary tools' if not otherwise 'reasonably available' as described in section (d)(1) with regards to engines and equipment powered by engines at or below 30 kW. [EPA-HQ-OAR-2019-0055-1205-A1, p.10]

Section (g)(1) of the proposal states 'if your published maintenance instructions describe routine procedures for adjusting engines or if you or your dealers make specialized tools available to operators….' OPEI understands this to mean that specialized tools intended for dealer-only use are not considered 'reasonably available ordinary tools' and would not automatically result in a determination that a parameter is 'practically adjustable'. [EPA-HQ-OAR-2019-0055-1205-A1, p.10]

Section 1068.50(d)(1) – Adjustable Parameters OPEI is seeking clarification that 'hand tools' included in the scope of 'ordinary tools' are limited to screwdrivers, pliers, hammers, awls, wrenches, electric screwdrivers, electric drills and any tools supplied by the manufacturer with the product, and that 'hand tools' not included in this list are not considered 'ordinary tools'. OPEI recommends 'simple tools', 'specialized tools', 'ordinary tools' and 'hand tools' are defined in 1068.30. [EPA-HQ-OAR-2019-0055-1205-A1, p.11]

Section (d)(1) specifically identifies 'hand tools' as screwdrivers, pliers, hammers, awls, wrenches, electric screwdrivers, electric drills and any tools supplied by the manufacturer with the product. OPEI appreciates the inclusion of this list of 'hand tools' and is seeking clarification that this list is all-inclusive of 'ordinary hand tools'. OPEI does not consider 'hand tools' not included in this list to be 'ordinary tools' or 'other supplies that are reasonably available to the operator' ('other supplies' is not a 'catch all' for *any* tool that could be purchased). [EPA-HQ-OAR-2019-0055-1205-A1, p.11]

Nonetheless, OPEI is concerned that this section may imply or be interpreted to state that any tool that may be purchased on the internet or at a retail store is an 'available' tool and the cost of any such tools shall not be included in the ($30) threshold for determining if a parameter is 'practically adjustable'. A manufacturer cannot practically confirm the availability of all existing tools in the world, considering the number of internet options and retailers, and speculate how an end user may use *any* tool to tamper with a product (whether it is the tools 'normal' or 'intended' use or not). It is also unclear how a manufacturer would demonstrate compliance if questioned by EPA certification staff or enforcement. [EPA-HQ-OAR-2019-0055-1205-A1, p.11]

Finally, OPEI is unclear why a product unique or 'specialty' tool sold for the purpose of a specific repair or adjustment, for specific equipment, should be excluded from the cost of repair. 'Specialty' tools, such as diagnostic tools and software specific to a product, likely have significant cost in comparison to the outdoor power equipment product cost, which industry believes minimizes the risk of such tools being purchased for tampering. As a result, such 'specialty' tools should be included in the tampering cost threshold, and/or excluded from 'ordinary' and 'simple' tools, even if provided by the manufacturer. [EPA-HQ-OAR-2019-0055-1205-A1, pp.11-12]

Section 1068.50(f)(2) & (g)(1) – Adjustable Parameters OPEI recommends clarification that these sections ('sell or offer for sale software or other products that could be used to modify the ECU', 'if you or your dealers make specialized tools available to operators') clarify the intent of these sections is to make resources available to 'equipment owners / operators', 'end users', and/or 'final purchasers'. [EPA-HQ-OAR-2019-0055-1205-A1, p.12]

Section 1068.50 – Adjustable Parameters OPEI is concerned that Right to Repair regulations may conflict with draft requirements. [EPA-HQ-OAR-2019-0055-1205-A1, p.12]

OPEI is engaged with Congress, States, and the Federal Trade Commission ('FTC') regarding ongoing 'right to repair' legislation and regulations. OPEI continues to express concerns that right to repair regulations may impact consumer safety specific to outdoor power equipment and will directly conflict with U.S. EPA adjustable parameter and tamperproof requirements, both currently in place and outlined in the proposed amendments. OPEI requests that EPA investigate:

- (1) How the FTC's new policy statement (adopted unanimously on July 21, 2021), outlining its enforcement strategy on corporate practices deemed anticompetitive and unfair to consumers with regards to product repair, impacts current and proposed adjustable parameters and tamper resistance regulations;
- (2) How the Fair Repair Act (HR 4006), requiring equipment OEMs to more broadly provide repair tools and information without proper regard for the risks of modification

and tampering with equipment safety and emissions controls, would impact current and proposed adjustable parameters and tamper resistance regulations; and

- (3) How proposed state legislation would impact current and proposed adjustable parameters and tamper resistance regulations. [EPA-HQ-OAR-2019-0055-1205-A1, p.12]

Section 1068.50 – Adjustable Parameters OPEI is seeking feedback regarding the impact of the draft adjustable parameter requirements on the existing OPEI guidance regarding tamper resistance guidelines for small spark ignition engine and carburetor manufacturers. [EPA-HQ-OAR-2019-0055-1205-A1, p.13]

In 2011 OPEI published the Tamper Resistance Guidance for Small Spark Ignition Engine and Carburetor Manufacturers document. See Appendix A. Industry manufacturers have been proactive and relied on this guidance document to streamline certification activities and reduce compliance risk for a decade. The guidelines and examples provided there-in have been successful in identifying adjustable parameters and tamper resistance methods consistent with the written and 'in-spirit' requirements of current regulations. OPEI is seeking EPA feedback regarding how the proposed regulations would impact the specific guidance outlined in this document. [EPA-HQ-OAR-2019-0055-1205-A1, p.13] [Appendix A is located at EPA-HQ-OAR-2019-0055-1205-A1, pp.14-27]

Organization: *Ozone Transport Commission (OTC) and Mid-Atlantic/Northeast Visibility Union (MANE-VU)*

Tampering-related provisions: The OTC members are prioritizing detection and enforcement against tampered vehicles because tampered vehicles substantially increase vehicle NOx emissions. Given the importance of identifying tampered vehicles and enforcing against emission control system tampering, OTC supports EPA proposed provision to ensure that there are measures in place to prevent engine control module (ECM) tampering. EPA proposes that manufacturers include a document at time of certification that outlines and describes the process and/or industry technical standards that were used to prevent unauthorized access to the ECM on the vehicle. This document shall describe the measures that a manufacturer has used to: prevent unauthorized access to the ECM; ensure that calibration values, software, or diagnostic features cannot be overwritten or otherwise disabled; and respond to repeated, unauthorized attempts to reprogram the ECM, if they become aware of such attempts. [EPA-HQ-OAR-2019-0055-1250-A1, p.17]

Organization: *Truck and Engine Manufacturers Association (EMA)*

EPA has proposed to transition the "adjustable parameters" provisions to §1068.50, including numerous amendments. EMA supports the consolidation of these requirements, and finds most of the proposed requirements to be reasonable and practical. EMA recommends several modifications, however, to address various concerns. [EPA-HQ-OAR-2019-0055-1203-A1, p. 129]

EPA's proposal to migrate, consolidate, and revise adjustable parameter provisions in a new proposed section 1068.50, would apply broadly to on- and off-highway engine categories starting in MY 2024. Among the updates are proposed provisions regarding the adjustability of electronically controlled parameters, which manufacturers must limit through ECM password or encryption protection. In that regard, if EPA learns that the new provisions drive significant ECM changes such as hardware upgrades, EPA should provide additional lead time to implement the changes at least for some applications. For example, it may not be possible to upgrade ECMs for certain spark-ignited alternative fuel and off-highway families until MY 2027. EPA should allow additional lead time, especially for lower volume and/or non-SCR engines such as in these categories. [EPA-HQ-OAR-2019-0055-1203-A1, pp. 129 - 130]

More generally, the proposed adjustable parameters provisions should be streamlined for improved understanding and greater consistency. There are three main ways in which this could be accomplished. First, the provisions could be restructured to define basic concepts, then to break down how they apply to physically adjustable parameters, programmable adjustable parameters, and replenishable parameters. Second, it is not necessary to define "operating parameters" to achieve EPA's goals in these provisions. Finally, it is recommended to apply greater consistency in terminology. We will discuss these points in detail, and make other recommendations as well. [EPA-HQ-OAR-2019-0055-1203-A1, p. 130]

EMA recommends restructuring the proposed §1068.50 to improve clarity and consistency in the application of the fundamental principles of EPA's adjustable parameter controls. The provisions should start with the most fundamental principle that emissions compliance is required, consistent with the standard setting part, over the range of adjustments to which the user has access. "Adjustable parameter" should then be defined, including the specific requirements regarding the "practical" range of adjustment with respect to the three types of adjustable parameters of relevance: physically adjustable parameters, programmable parameters and user-replenishable consumables. For each of those three types of adjustable parameters, EPA should set forth the requirements and limitations that EPA considers appropriate for the practical range of adjustment. [EPA-HQ-OAR-2019-0055-1203-A1, p. 130]

Consistent with the recommendation of the previous paragraph, §1068.50(a) should be modified. The provision as proposed, which states: The standard-setting part generally requires that production engines, preproduction engines, and in-use engines with adjustable parameters meet all the requirements of this part for any adjustment in the physically adjustable range. should be modified to read: The standard-setting part generally requires that, as a condition of certification, engines with adjustable parameters meet all the requirements of the standard-setting part for any adjustment in the practically adjustable range. [EPA-HQ-OAR-2019-0055-1203-A1, p. 130]

Related to the improved structure recommended above, the new provisions could be simplified by eliminating the definition of "operating parameter." It is adequate, clearer and more efficient to simply define an "adjustable parameter," including the special condition of the practical range of adjustment, and the consequence of emissions increases. EPA should not finalize requirements that could be interpreted as requiring manufacturers to disclose all "operating parameters," because on most modern engines there are thousands of programmable parameters coded into the ECUs. For example, §§§1036.205(r) and §1039.205(s) require that manufacturers "Describe all adjustable operating parameters (see §1036.115(f)), including production tolerances. For any operating parameters that do not qualify as adjustable parameters, include a description supporting your conclusion." The manufacturer's responsibility should be to disclose all parameters to which users have practical access for adjustment. Descriptions of how manufacturers will limit access to ECU code through passwords and encryption can be managed without the complexity EPA included in the proposed definition of "operating parameter." [EPA-HQ-OAR-2019-0055-1203-A1, pp. 130 - 131]

EPA includes the following in §1068.50(c)(1): "An operating parameter is not an adjustable parameter if…we determine that engine operation over the full range of adjustment does not affect emissions without also degrading engine performance to the extent that operators will be aware of the problem." However, §86.094-22(e)(ii) provides that, "The Administrator may, in addition, determine to be subject to adjustment any other parameters on any vehicle or engine which is physically capable of being adjusted and which may significantly affect emissions." (Emphasis added.) The requirement that emissions impacts from adjustable parameters should be significant as a condition for adjustment limitation requirements is an important consideration, as adjustments should not be encumbered with regulated adjustment limitations and related obligations when the emissions impacts are minor. The final provisions should not exclude the "significant" qualifier when addressing emissions impacts related to adjustable parameters. [EPA-HQ-OAR-2019-0055-1203-A1, p. 131]

Regarding terminology, the term "physically adjustable parameter" should be used in lieu of "mechanically controlled parameter," and "programmable parameter" in lieu of "electronically controlled parameter" and "electronically controlled setting." In addition, §1068.50(c)(2)(ii) and (iii) should not be limited to "mechanically controlled engines." [EPA-HQ-OAR-2019-0055-1203-A1, p. 131]

The proposed regulations require further consolidation related to adjustable parameters to eliminate confusion as to definitions and applicability. For example, the definition of "Adjustable Parameter" in §1039.801 should be replaced with a reference to the proposed §1068.50. Additionally, §1036.250(r) and §1039.205(s) include further descriptive elements related to adjustable parameters, including requirements to provide in the application for certification "nominal or recommended setting, the intended physically adjustable range, and the limits or stops used to establish adjustable ranges. Also include information showing why the limits, stops, or other means of inhibiting adjustment are effective in preventing adjustment of parameters on in use engines to settings outside your intended physically adjustable range." (Emphasis added.) While perhaps reasonably descriptive, the various terms used may cause confusion when referencing §1068.50. EMA stands ready to work with the Agency on improving the consistency and clarity of the various CFR provisions related to adjustable parameters. While we have made reference in these comments to the adjustable parameter provisions in Parts 1036 and 1037, our comments should be applied more generally to other sections where adjustable parameters are included, such as Part 1042. Additionally, §86.094-22 may require modification to terminate its applicability at the appropriate model year. [EPA-HQ-OAR-2019-0055-1203-A1, p. 131]

Many states are adopting "right to repair" legislation or regulations that compel manufacturers to make service tools and instructions available to third-party independent repair facilities. Those regulations usually require that manufacturers allow the independent repair centers to gain access to programmability normally protected from anyone outside the OEM's dealer network, including granting the ability to reflash ECUs with different ratings. EMA opposes those right-to-repair laws and regulations because, among other concerns, they could lead to problems where engines and vehicles are not in their certified configuration, or, even, worse, they open the door for nefarious actions violative of EPA's tampering prohibitions. Notwithstanding EMA's opposition, right-to-repair regulations are becoming more and more prevalent each year. Engine manufacturers cannot be held liable for the actions of the independent repair facilities. It is important for EPA to acknowledge this by providing appropriate protections in the adjustable parameter provisions. To that end, EMA recommends that EPA add the italicized text to §1068.50(d)(2):

> Conversely, such parameters are not practically adjustable if you limit access to the electronic control units with password or encryption protection. You must have adequate protections in place to prevent distribution and use of passwords or encryption keys, *except where required by law to make them available*. We may exclude… [EPA-HQ-OAR-2019-0055-1203-A1, p. 131 - 132]

In addition to EMA's concerns related to right-to-repair laws, there are also concerns about the adjustable parameter provisions as they relate to enterprises unlawfully marketing emissions "delete" kits that employ various techniques, through programming or hardware changes or both, to tamper with emissions control systems. While engine manufacturers take significant steps to try to prevent those actors from "hacking" into the ECU to reprogram controls or to override tampering detection capabilities, it is impossible to completely protect engine systems from such actions. We therefore recommend that §1068.50(f)(3) be modified as follows:

> If your engines/equipment have other electronic [*programmable*] settings that can be *legally* modified or accessed as described in paragraph (d)(2) of this section, consider all those settings to be within the practically adjustable range. [EPA-HQ-OAR-2019-0055-1203-A1, p. 132]

Similarly, §1068.50(d)(1) should be modified to say:

> …Any such items that are *legally* sold at hardware stores, automotive parts supply stores or on the Internet are considered available. [EPA-HQ-OAR-2019-0055-1203-A1, p. 132]

As well, (d)(2) should be modified to say:

> Electronically controlled parameters are considered "practically adjustable" if they can be adjusted using any *legally* available tools (including devices that are used to alter computer code). [EPA-HQ-OAR-2019-0055-1203-A1, p. 132]

These recommended amendments to the proposal are important to avoid undue manufacturer liability as it relates to certain tampering actions. [EPA-HQ-OAR-2019-0055-1203-A1, p. 132]

EMA also recommends a specific change to the adjustable parameters provisions applicable to small SI engines ("SSIE"). In proposed §1054.115(b), after the reference to §1068.50, the following language should be added: However, engine speed control (insert rabbit turtle symbol) and governor (insert paperclip symbol) levers on engines regulated under Part 1054 are not considered to be adjustable parameters as defined in §1068.50. [EPA-HQ-OAR-2019-0055-1203-A1, p. 132]

Due to the inherent design of SSIEs, it is inappropriate to include the engine speed control and governor levers as adjustable parameters. EMA provided extensive background information to the EPA Gasoline Engine Compliance Center, Compliance Division on August 24, 2020, in a follow up discussion after the issuance of the May 11, 2020, Test Cycle Guidance Document. The presentation appended as Exhibit "F" to these comments was used to demonstrate the operation and function of speed controls and governor levers, and explained why it is inappropriate for them to be considered adjustable parameters. We believe EPA staff understood and agreed with EMA's position based on subsequent discussions. [EPA-HQ-OAR-2019-0055-1203-A1, p. 133]

From a broader viewpoint, EPA is proposing that the consolidated and modernized adjustable parameter provisions of §1068.50, applying to on- and off-highway engine categories, would be effective starting MY 2024. Among the updates proposed are provisions regarding the adjustability of electronically controlled parameters, which manufacturers must limit through ECM password or encryption protection. As noted, if the new provisions compel significant ECM changes, such as hardware upgrades, EPA should provide additional lead time to implement the changes, at least for some applications. For example, it may not be possible to upgrade ECMs for certain spark-ignited alternative fuel or off-highway families until MY 2027. EPA should allow additional lead time for such engines, especially for lower volume and/or non-SCR applications. [EPA-HQ-OAR-2019-0055-1203-A1, p. 133]

Finally, EPA should review all guidance documents related to adjustable parameters and update them as appropriate to be consistent with the revised adjustable parameter provisions. EMA stands ready to support the Agency in this effort. [EPA-HQ-OAR-2019-0055-1203-A1, p. 133]

Organization: *Volkswagen Group of America, Inc., (Volkswagen) (VWGoA)*

<u>40 CFR 1068.50 Adjustable parameters</u>

We request clarification on the additional requirements to include driver-selectable modes in this brand new additional section. This section seems to require the inclusion of information on each selectable mode as an adjustable parameter. In some vehicles, this could reach hundreds of possible drive modes and user-selectable features to be described in the certification application, creating an unnecessary burden to timely review. Please update this section to exclude driver-selectable modes such as 'sport' or 'trailer tow' from this description. [EPA-HQ-OAR-2019-0055-1296-A1, p.3]

EPA Summary and Response

Comment Summary	EPA Response
OPEI requested that EPA delay the new requirements by at least one year to allow manufacturers time to assess products, implement necessary design changes, certify products, and work though supply chain challenges; manufacturers would also need to prepare for the compliance responsibilities identified in the proposed §1068.50(k). OPEI stated that these tasks would need to be completed by early 2023 for certifying all their engine families for model year 2024, including consideration of the effect of other amendments in this rule. OPEI pointed out that they cannot be expected to invest in adjustable parameter analysis and redesign before EPA completes the final rule. Cummins commented that EPA should provide additional lead time to implement the changes, especially to account for reducing the priority of lower-volume families in favor of meeting requirements for high-volume families in the 2024-2025 time frame. EMA recommended that EPA provide additional lead time as needed to account for manufacturers' redesign efforts to improve protections to prevent tampering with electronic control modules. EMA suggested that manufacturers may need until model year 2027 to comply with the new requirements for lower-volume and/or non-SCR engines.	Preamble Section XI.A.2 responds to these comments.

OPEI: Almost any small spark-ignited engine parameter can be accessible in 15-minutes for a person with small engine knowledge and a desire to tamper. However, that does not mean it happens with a frequency that impacts overall fleet emissions or that the cost of potential new requirements would be justified. OPEI therefore does not believe the additional provisions of 1068.50 are necessary for small spark-ignited engines.	We have made several changes for the final rule to more carefully align with the existing guidance for Small SI engines. Where the final rule includes provisions that go beyond the existing guidance, we believe those provisions are justified for establishing how manufacturers need to improve tamper-resistance with current or future engine designs. The responses to more detailed comments in this section elaborate on these broad conclusions.
Honda suggested the need for defining terms: Guideline of the determination of "Operating parameter" for SSIE is necessary in order to create application document. Definition of "mechanically controlled adjustable parameters" should be defined to clarify the criteria. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1] Definition of "practically adjustable" should be made more clear, or should set clear requirement for exemption. Current description of 1065.50(d)(1) is too vague and not practical.	The final rule includes several changes to the proposed 40 CFR 1068.50 to reorganize and clarify the content of 40 CFR 1068.50 including updates to 40 CFR 1068.50(d) where we clarified the definition of practically adjustable as compared to the proposal. We believe this addresses the concerns for clarity for identifying operating parameters, adjustable parameters, and the practically adjustable range. Note that we are changing terminology to reference “physically adjustable parameters” instead of “mechanically controlled adjustable parameters.”
Honda: EPA should define "significantly degrading engine performance".	The proposed regulation does not include the expression "significantly degrading engine performance". The proposed regulation instead referred to “degrading engine performance to the extent that operators will be aware of the problem.” We believe this description, finalized as proposed, establishes the degree of degradation necessary to understand and apply the provision.

CARB: Consumers can readily obtain specialized screwdrivers and other tools from Amazon.com and other online retailers. This should be accounted for in the proposed regulation for Small SI engines. CARB staff has already determined that this was necessary and appropriate and revised their regulation accordingly.	EPA's proposed rule specified that specialty hardware from stores and online retailers should be considered ordinary tools for purposes of evaluating tamper-proof designs for certification. We are including this provision in the final rule. However, we expect consumers operating Small SI engines will not be likely to pursue specialty tools for the purpose of tampering with their engines as these engines are relatively inexpensive, are generally in wide use, and there are many repair shops for small engines. We believe this applies equally for engines less than 30 kW that are used in recreational vehicles or marine applications. We are therefore identifying the list of "ordinary tools" for engines less than 30 kW without naming such specialty tools.
Honda: It should be clarified that any approval of tamper resistance received in the past is still valid.	The provisions we are adopting in 40 CFR 1068.50 are consistent with the existing guidance for Small SI engines. We therefore expect that Small SI engine manufacturers will not need to make changes to comply with the new requirements. However, if we find that engine designs do not comply, we will require them to upgrade the engine designs. We note too that we intend to be aware of ongoing developments and monitor in-use experiences so that we can require manufacturers to upgrade their engine designs to reflect best practices that are in place for each sector.

Honda – extraordinary measures. 1. According to proposed text, the service part is considered "practically adjustable" if it costs less than $30. However, the cost of the SSIE carburetor would be less than $30. It should be clarified that such cases are exempt from adjustable parameters (i.e. Replacement of the carburetor is not considered as adjustable parameter). 2. The main jets or pilot jets are commercially available in different sizes and can be installed with common tools. Because the jets should be easily removable for maintenance which is necessary to prevent engine failure or emission increase. In addition, the necessity of jets for high altitude are described in the Clean Air Act (42 U.S.C. §7549) or regulations (40 CFR) and has been approved by EPA. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1] 3. It should be clarified that main jets, pilot jets of carburetor are exempt from the adjustable parameter. 4. As tamper resistant mechanism, for example, adjustable range of the pilot screw limited by limiter cap, even though the limiter cap could be destroyed by the "ordinary tools" which includes very wide range of tools according to the proposed text, we believe that this should not be treated as "practically adjustable".	We have revised the proposal in the final rule to acknowledge that manufacturers do not need to include tamper-resistance measures to protect against extraordinary measures. The list of extraordinary measures includes fully or partially removing carburetors and drilling or grinding through caps or plugs. This change to the proposal is consistent with existing guidance for Small SI engines.

OPEI recognized that speed settings are 'adjustable' from high-idle to low-idle, but stated that they are fixed in range for the end-user, which fixes emissions in that range. In this regard, adjustment of engine speed does not 'affect emissions or engine performance during emission testing or normal in-use operation.' OPEI further argued that the user's ability to operate the engine at low and high speeds may be necessary for the startability, performance, and safety, but noted that equipment function and performance are generally optimized for the engine to be loaded from the normal operating condition of 'high idle.' OPEI gave as an example that lawn mower blade tip speed or governor frequency are optimized from the engine high idle speed and as a result generally reflect normal operating conditions. OPEI therefore believes idle speed controls should not qualify as adjustable parameters. Honda requested that idle speed controls not be considered adjustable parameters because they are necessary to achieve proper idle speed. EMA also requested that idle speed controls not be considered adjustable parameters.	Idle speed screws and similar adjustment mechanisms are designed to allow operators to make adjustments to the engine's speed at idle. Those controls are therefore adjustable parameters and manufacturers are responsible for any setting in the adjustable range. If it is important for engines to operate at a high-idle speed as a normal operating condition before applying a load, manufacturers should design their engines to ensure that idle speed increases without depending on the operator to change the idle speed setting. As long as the design depends on the operator to establish the idle speed setting, it is an adjustable parameter. Manufacturers do not need to account for adjustments between user-selectable operating modes if the controls are designed to prevent operators from selecting those operating points. Even assuming OPEI is correct that idle speed does not affect emissions, there should be no problem with manufacturers accepting the responsibility to control emissions across the engine's physically adjustable range.
Honda requested clarification that a manual lever choke mechanism only used for starting engine is not considered an adjustable parameter.	Misapplied choke setting degrades engine performance after engine warm-up to the extent that the operator will be aware of the problem. The regulation therefore allows for considering this operating parameter to not be adjustable (see 40 CFR 1068.50(d)(2).

EMA and Honda suggested that governor adjustment mechanisms (such as "Turtle" to "Rabbit" levers or governor springs) should not be considered adjustable parameters.	User-selectable features, such as the rabbit-turtle option for Small SI engines, and the functions controlled by those features should properly be considered adjustable parameters under the proposed and final regulation. These features are specifically designed to invite operators to adjust an engine's control settings to achieve the desired performance. These are excellent examples of what manufacturers should consider for demonstrating that engines meet standards for all settings within the physically adjustable range. We have held this position consistently from the earliest implementation of standards for Small SI engines.
VW and Auto Innovators: Request clarification on the proposed requirement to identify driver-selectable modes. Section 1068.50 seems to require manufacturers to include information on each selectable mode as an adjustable parameter. In some vehicles, this could reach hundreds of possible drive modes and user-selectable features to be described in the certification application, creating unnecessary burden to timely review. We recommend that EPA update this section to exclude driver selectable modes such as "sport" or "trailer tow" from this description.	We note that we did not propose to apply the provisions of 40 CFR 1068.50 to vehicles subject to standards under 40 CFR part 86, subpart S. However, those vehicles are subject to similar requirements under 40 CFR 86.1833-01. As with the Honda comment on rabbit-turtle controls, user-selectable features and the functions controlled by those features are properly considered adjustable parameters under both 40 CFR 86.1833-01 and 1068.50. These features are specifically designed to invite operators to adjust control settings to achieve the desired performance. It is therefore important for manufacturers to comply with standards for all those settings that fall within the physically adjustable range.

Cummins suggests that EPA provide clarity for manufacturers by adopting a limit on the time and parts cost to be considered “practically adjustable” for mechanically controlled parameters on engines with rated power at or above 560 kW. The limits should be consistent with the higher cost of these engines.	We recognize that manufacturers can’t reasonably be expected to design an engine to be tamper-proof if a mechanic would have unlimited time to modify an engine. We are therefore adopting in the final rule the same 60-minute limit that applies for 30-560 kW engines, as a change from the proposal. An additional change from proposal in the final rule to address this concern is the provision naming cylinder head removal to be an extraordinary measure that manufacturers need not consider for tamper-proofing. We consider any modifications to the engine’s internal parts to be inherently resistant to tampering due to the degree of difficulty to access and specialty knowledge required to modify these components. At the same time, we understand that cost considerations for buying, servicing, and operating these very large engines lead us to believe that we should not exclude any potential modifications based only on the price of service parts. Therefore, we will not be including a price exclusion for engines with rated power at or above 560 kW.

NACAA: EPA should finalize the proposed anti-tampering provisions. Maine's Department of Environmental Protection is fully supportive of provisions to ensure that there are measures in place to prevent engine control module (ECM) tampering. Manufacturers should be required to take definitive actions to prevent unauthorized access to the ECM, ensure that calibration values, software, or diagnostic features cannot be overwritten or otherwise disabled; and respond to repeated, unauthorized attempts to reprogram the ECM, if they become aware of such attempts. NESCAUM OTC and MANE-VU support EPA's proposed provision to ensure that there are measures in place to prevent engine control module (ECM) tampering. NESCAUM also supports the procedural requirements to describe measures to: • prevent unauthorized access to the ECM • ensure that calibration values, software, or diagnostic features cannot be overwritten or otherwise disabled • respond to repeated, unauthorized attempts to reprogram the ECM, if they become aware of such attempts NCTCOG supports EPA's current anti-tampering efforts outlined in the 2020 National Compliance Initiatives and encourages significantly more attention to minimize excessive vehicle emissions.	We acknowledge the affirmation that the proposed rule appropriately addresses these issues. We note that the proposed and finalized provisions do not aim to establish a definitive approach for preventing unauthorized access and modification to ECMs, or to ensure that ECM software will not be overwritten or disabled. Rather, we intend to evaluate manufacturer statements in their application for certification to monitor developments in ECM security so we can ensure that manufacturers are taking appropriate steps to reasonably prevent unauthorized access to the ECM as risks, vulnerabilities, and technology solutions evolve over time. We also note that the proposed and finalized provisions do not include specific requirements to respond to attempted tampering with ECMs. Rather, if we determine that ECM tampering exists with a manufacturer's engines, we would expect to engage in discussions with that manufacturer to identify methods of upgrading ECM security for the affected engines.

MIC recommends that EPA not consider diagnostic tools normally sold or made available to dealers and used by professional service technicians for determining the practicably adjustable range. Vehicle manufacturers approve adjustments using this equipment and they supply the tools to dealers and professional service technicians to push through updates related to customer service campaigns and recalls, which helps to maintain compliance with regulatory requirements and keep vehicles safe and compliant. These diagnostic tools do not open ECUs so dealers or technicians can independently adjust or create ranges of engine and emission control operating parameters or calibrations for making performance or functional adjustability. Rather, they overwrite and update entire ECU calibrations. Including these professional diagnostic tools would create manufacturer confusion about how to determine related adjustable operation ranges and parameters for their consideration, potentially resulting in certification delays.	We state in final 40 CFR 1068.50(e)(2) that programmable adjustable parameters are not considered practically adjustable if access to the electronic control modules is limited by password or encryption protection with appropriate protections in place to prevent distribution and use of passwords or encryption keys. These access limitations are intended to allow the manufacturer and agents acting on the manufacturer's behalf to perform any necessary diagnosis and testing. If diagnostic tools allow independent dealers and professional service technicians to modify an engine to be outside of its certified configuration, those modifications would be included in the engine's adjustable range.
OPEI recommends retaining the current language in §1054.115 to recognize that permanent seals can be used to demonstrate that operating parameters are not physically adjustable. OPEI is also seeking clarification regarding 'extraordinary measures' that are outside the scope of EPA's anti-tampering assessment. It is OPEI's interpretation that if a 'parameter' (setting) is sealed with, for example, a durable interference-fit plug, not intended to be accessed or serviced, and if an end-user uses a hammer, chisel, screwdriver or drill to destroy the plug and access the parameter, this is tampering, and does not otherwise constitute a parameter as 'adjustable'.	We agree with the comment but are not adopting the suggested modification to the proposal. We have instead modified from proposal the final 40 CFR 1068.50(e)(1)(vii)(C) to explicitly call out "drilling or grinding through caps or plugs" as an extraordinary measure that we will not consider in assessing an engine's tamper-resistance. We agree that the actions suggested in the comment to destroy permanent seals would qualify as tampering and the associated engine modification would not qualify as representing part of the engine's practically adjustable range.

OPEI believes altering computer codes would be considered extraordinary measures and tampering if done so without ‘reasonably available ordinary tools’ provided by the manufacturer. EMA expressed a concern that enterprises may unlawfully market emission “delete” kits that employ various techniques, through programming or hardware changes or both, to tamper with emission control systems.	The proposal acknowledged that we would not automatically hold a manufacturer responsible if a third party independently created a tool for reflashing an ECM. On the other hand, as described in the proposed rule, we intend to review a manufacturer’s plans for limiting access to ECM software to prevent unauthorized changes. Rather than defining unauthorized ECM modifications as an extraordinary measure, we would implement these requirements by evaluating whether the manufacturer should do more to prevent unauthorized access to their ECM. We would then expect to engage with the manufacturer to consider whether or how to upgrade future designs for better protection (see Section XI.A.2.ii of the preamble). If someone alters an engine from its certified configuration, they will be liable for violating the tampering prohibitions of §1068.101(b)(1) or the defeat device prohibition in §1068.101(b)(2).

OPEI: Arguably, the engine compression could be considered an adjustable parameter because it is an ‘element of design’ that could be ‘adjusted’ by changing bore, stroke or piston(s) and ‘affect emissions or engine performance during emission testing or normal in-use operation’. Other (less complicated) examples include fuel lines, or intake flow restrictor plates, both of which if changed could impact the air fuel ratio element of design / operating parameter, but need to be accessible for normal maintenance and service. This creates complexity for interpretation and enforcement of the regulation not realized for other sectors (specifically applications >30kW in which the engines take significant time to access, adjust, tamper and/or repair, likely much greater than 30 minutes). One solution may be to update the Proposed Rule to limit the responsibility of identifying adjustable parameters to the components the manufacturer offers. In the above example, if the OEM did not provide service parts that change the compression (for example different pistons or conrods), the compression would not be considered an adjustable parameter (assuming the components can be replaced in less than 15 minutes), regardless of the availability of aftermarket components not endorsed by the manufacturer	We agree that manufacturers’ tamper-resistance designs should not need to account for replacing pistons and other actions requiring engine disassembly. This applies equally for engines above and below 30 kW. We have therefore made a change from proposal for the final regulations to specify removing a cylinder head as an extraordinary measure.

OPEI: If approval is required, or if a manufacturer seeks a preliminary approval, what is EPA's expectation for who will apply for adjustable parameter approval?	Yearly approval is required by the manufacturer as a condition of certification, and all engines with adjustable parameters need to meet all the requirements of the standard-setting part. The standard setting part for small SI engines includes the provisions in 40 CFR 1068.50 so all adjustable parameter approvals will be included in the application for certification. We expect that any request for approval or preliminary approval for strategies that limit adjustable parameters will be submitted by the manufacturer during the yearly process of applying for certification.
OPEI: Is approval component level, engine level, and/or equipment level based?	We will review adjustable parameter approval in the context of reviewing an application for certification for a specific engine family or vehicle family. We would expect to reach consistent conclusions for technologies or strategies that a manufacturer uses across engine families and across model years unless changes are made in tamper-resistant methods of the engine or equipment, or we determine that existing methods are no longer enough to address concerns for tampering with in-use engines. Manufacturers seeking preliminary approval before submitting their application for certification would be able to request approval in a way that would apply more broadly than for a single engine family or vehicle family. We will consider all aspects of any engine or equipment to ensure that any adjustable parameters are limited to their in-use range or appropriate steps have been taken to limit access to operating parameters.
OPEI: Will EPA require a sample component, engine, and/or piece of equipment for determination of whether a parameter is 'not practically adjustable'?	We have codified, as proposed, the ability to perform inspection in §1068.50(j). We may request the manufacturer to supply an engine or equipment at any time for inspection.

OPEI: What will EPA require and what analysis will EPA conduct if a CARB approval is provided?	We expect that any CARB approval will be provided for review during the engine or equipment certification process. We would expect to review the documentation related to CARB's approval. We may also perform additional review to ensure that engines meet requirements.
OPEI: CARB is promulgating new rules that will ban small engine-powered equipment. Moving forward manufacturers will not likely be receiving 'approval' (new or on-going) from CARB for tamper resistant methods. Will EPA recognize CARB approvals, and for how long?	As is currently the case, we will consider any available information from CARB's review and approval of tamper-proofing designs. To the extent further review is warranted, we would expect to review available information to determine whether engines meet the requirements of 40 CFR 1068.50. We expect that a new request for approval will be submitted every year with the application for certification process. We expect that this application will be carried over from year to year unless changes are made in tamper-resistant methods of the engine or equipment, or we determine that existing methods are no longer enough to address concerns for tampering with in-use engines.
OPEI: Will EPA provide a template for evaluation and/or certification purposes?	At this time, EPA does not intend to create a template. We plan to continue using the same methods that apply today by reviewing the application for certification.
OPEI: Where will testing be conducted and by whom (for both certification and compliance purposes)?	If we choose to perform testing on emission-data engines as part of certification, or with in-use engines after certification is approved, we may perform that testing ourselves, or we may choose any commercially available organization to do that testing for us. Manufacturers generally perform testing in a selective enforcement audit, but we may include testing instructions to adjust engine controls to any setting within the physically adjustable range.

OPEI: What steps/process will be in-place to assure consistency across testing personnel?	As with all implementation questions for certification, EPA reviewers make every effort to maintain a consistent approach for ensuring that manufacturers comply with regulatory requirements as adopted. Where there is a need to apply judgment for testing engines or establishing consistent performance criteria, we would expect to EPA staff to adopt a coordinated approach for all manufacturers within a given industry sector, and, as appropriate, for all industry sectors.
OPEI: How will EPA determine an adjustment 'does not affect emissions'? How will EPA determine 'significant engine performance degradation' and 'the effect of adjustments on engine performance' (see (g)(1))?	As proposed, we have retained language from 40 CFR 1054.801 as a criterion for excluding an operating parameter from being an adjustable parameter. As proposed, it is further defined in final 40 CFR 1068.50(d)(2) as "degrading engine performance to the extent that operators will be aware of the problem". If a manufacturer claims that an operating parameter is not an adjustable parameter because it does not increase emissions without also degrading engine performance, we would start by reviewing any available information and analysis from the manufacturer to support that conclusion. We might also operate engines as needed to determine emission impacts and any associated degradation of engine performance. For example, manual choke levers are exempt in the final requirements from being considered adjustable parameters because warmed-up engines have unacceptable performance when operating with the choke engaged.

OPEI: What does a report or approval look like?	The final regulation describes what manufacturers should include in the application for certification. Manufacturers may request preliminary approval before submitting the application. EPA will review available information and follow up as needed for additional information. We may also request that the manufacturer supply engines or engine components for testing. The approval will be included with the standard certification approval, there will be no separate approval process for adjustable parameters. If preliminary approval is received for adjustable parameters, this information will need to be included in the final submittal of the application for certification and we can re-review as part of the final certification approval. As preliminary approval has already been received, we expect there would be no issue receiving final approval for adjustable parameters unless changes are made in tamper-resistant methods of the engine or equipment, or we determine that existing methods are no longer enough to address concerns for tampering with in-use engines.
OPEI: What is the expected evaluation and approval time?	Manufacturers should request preliminary approval if the application for certification will be time-sensitive with respect to a manufacturer’s plans for producing and selling engines or equipment. We expect that the evaluation and approval time will not significantly extend the application for certification process, but some additional time may be needed if a manufacturer’s description is incomplete or if the designs do not clearly meet the requirements of 40 CFR 1068.50.

OPEI: How long is an EPA approval valid for (what are the terms of an approval or compliance inspection)?	EPA certification is always valid for one model year. Information regarding adjustable parameters will be required to be submitted with each application for certification. EPA's review for engines certified with carryover emission data consistent with the prior model year, will typically be rather cursory, but manufacturers should not expect that EPA will re-approve tamper-proof designs just because they were approved for the preceding year. New information could lead us to determine those existing methods are no longer enough to address concerns for tampering with in-use engines
OPEI is seeking clarification regarding what is 'adjustable' on circuit boards and onboard computers? Requiring 'potted' circuit boards for small spark-ignited engine electronic components is an unnecessary cost and may not be technologically practical for all equipment.	As an example, EPA understands that sensor inputs on an ECU can be modified to read differently than their actual value and cause the engine or equipment to run outside of their intended in-use range. Implementation of adjustable-parameter provisions for programmable operating parameters focuses on reflashing with different calibrations or other settings. We are removing the requirement of potting or encapsulating circuit boards to prevent tampering from the proposed rule. Manufacturers may still choose to do this for durability concerns, but we don't anticipate that owners or service personnel would modify programmable operating parameters by modifying circuit boards since third-party programming tools have become more widely available and user friendly.

OPEI is seeking clarification of the term 'simple' tools'. OPEI is seeking clarification that the intent is that 'simple tools' are used for their generally intended purposes.	We have updated from proposal our final terminology for the tools specified in 40 CFR 1068.50(e)(1) to "ordinary tools" for engines at or below 560 kW and stayed consistent with this terminology throughout the final 40 CFR 1068.50. We have also modified the list of ordinary tools from the proposal to a specific list of tools for engines less than 30 kW. This list is expanded for engines between 30 and 560 kW. The list of "ordinary tools" for engines below 30 kW is a complete list of tools. The final regulation specifies that these tools need to be used for their intended purpose for applying the provisions of 40 CFR 1068.50. For 30 – 560 kW engines, the set of ordinary tools expands to include reasonably available solvents or supplies, and any hand tools that are available from retail or online merchants. For engines above 560 kW, all tools are considered available.
OPEI is seeking clarification that bimetal springs contained within a housing with a crimped cover are also considered not practically adjustable.	We have updated from proposal our final regulation text to address both crimped fasteners and bimetal springs. 40 CFR 1068.50(f)(1) and (2) define the characteristics of a physical limit or stop that are adequate for limiting the practically adjustable range. These characteristics include crimped threads and bimetal springs recessed within a larger permanently sealed body if they meet the time and cost thresholds in 40 CFR 1068.50(e)(1).
OPEI is seeking clarification that 'specialized tools' intended exclusively for servicing dealers, including software and hardware for analysis of electronics, and not intended for retail to the consumer/operator are not considered 'ordinary tools' if not otherwise 'reasonably available' as described in section (d)(1) with regards to engines and equipment powered by engines at or below 30 kW.	If manufacturer-specific service tools, especially tools with the ability to reflash, are not made directly available to the operators, they will not be considered ordinary tools. An inclusive list of ordinary tools for engines below 30 kW is defined in 40 CFR 1068.50(e)(1)(vi)(A).

OPEI is unclear why a product unique or 'specialty' tool sold for the purpose of a specific repair or adjustment, for specific equipment, should be excluded from the cost of repair. 'Specialty' tools, such as diagnostic tools and software specific to a product, likely have significant cost in comparison to the outdoor power equipment product cost, which industry believes minimizes the risk of such tools being purchased for tampering. As a result, such 'specialty' tools should be included in the tampering cost threshold, and/or excluded from 'ordinary' and 'simple' tools, even if provided by the manufacturer.	Such specialty tools would alone almost always exceed the cost threshold without considering the cost of service parts. Including consideration of the cost of such specialty tools would therefore automatically prevent us from determining that modifications with those tools is tampering. Moreover, we would expect anyone purchasing a specialized tool to be ready to use that tool for modifying multiple engines to justify the significant cost of purchasing the tool. However, we are modifying the final rule to align with existing guidance for engines below 30 kW. Specifically, we name the list of tools that manufacturers must consider for evaluating tamper-resistance for engines below 30 kW. That list includes unique or specialty tools only to the extent that those tools are supplied by the manufacturer. We would not expect a typical user of engines below 30 kW to seek out third-party or aftermarket specialty tools to modify engines. If the manufacturer designs, produces, and supplies such specialty tools, we would consider those tools to be available to typical users.

O**PEI** is concerned that right to repair regulations may impact consumer safety specific to outdoor power equipment and will directly conflict with U.S. EPA adjustable parameter and tamperproof requirements, both currently in place and outlined in the proposed amendments. OPEI requests that EPA investigate how the FTC's new policy statement (adopted unanimously on July 21, 2021), the Fair Repair Act (HR 4006), and proposed state legislation would impact current and proposed adjustable-parameter and tamper-resistance regulations. EMA noted that many states are adopting "right to repair" legislation or regulations that compel manufacturers to make service tools and instructions available to third-party independent repair facilities. Those regulations usually require that manufacturers allow the independent repair centers to gain access to programmability normally protected from anyone outside the OEM's dealer network, including granting the ability to reflash ECUs with different ratings. Engine manufacturers cannot be held liable for the actions of the independent repair facilities. It is important for EPA to acknowledge this by providing appropriate protections in the adjustable parameter provisions. To that end, EMA recommends that EPA adds "*except where required by law to make them available*" when referring to the need for manufacturers to prevent distribution and use of passwords.	We are finalizing the adjustable-parameter provisions without the exception recommended by EMA ("except where required by law to make them available"). This exception, coupled with a hypothetical state law that requires disclosure of adjustable parameters information beyond the configurable range, would give owners and mechanics the information they need to easily modify the engine to be outside of its certified configuration. Such modifications could allow engines to operate with emissions substantially exceeding emission standards, with consequent negative environmental impacts. This would frustrate the purpose of the adjustable parameter regulations, as well as the tampering and defeat-device provisions of the CAA and EPA's regulations. EPA therefore acts well within its authority in adopting the adjustable parameters regulations without the suggested exception. The commenters did not identify with reasonable specificity any existing state law that conflicts with EPA's regulation or specify how any existing federal law conflicts with EPA's regulation. Any regulation or guidance from FTC or other federal agencies will not supersede the tampering and defeat-device provisions of the CAA and EPA's regulations. EPA will not speculate on pending state or federal legislative processes. However, we note that any state laws that conflict with EPA's regulations are preempted. We also note that the latest draft of HR 4006 includes language to create a specific exception for motor vehicles. EPA intends to monitor the development of state laws in this area and may issue clarifying guidance as appropriate.

OPEI is seeking EPA feedback regarding how the proposed regulations would impact the specific guidance outlined in EPA's 2011 guidance document on adjustable parameters.	We intended for the proposed rule to be consistent with the 2011 guidance document for engines less than 30 kW. The comments from OPEI and others have led us to make several adjustments to the final regulation as compared to the proposal to more carefully align with the guidance document. Where the new final regulation differs from the guidance document, or where manufacturers didn't take the guidance as normative, there will need to be modest changes to the manufacturers current approach to adjustable parameters. Adding specifications for electronic controls is the most significant new content compared to the 2011 guidance document in the final 40 CFR 1068.50; however, we note that most engines below 30 kW do not have electronic controls.
EMA supports the consolidation of adjustable-parameter requirements, and finds most of the proposed requirements to be reasonable and practical. EMA recommends streamlining provisions for improved understanding and greater consistency. The provisions could be restructured to define basic concepts, then to break down how they apply to physically adjustable parameters, programmable adjustable parameters, and replenishable parameters. EMA also recommends apply greater consistency in terminology.	We acknowledge the affirmation that the proposed rule appropriately addresses these issues. We recognized that improvements to the proposal were appropriate and the final preamble and regulation text reflect more organized and easier-to-read requirements which in part use suggestions from the commentor, to the extent EPA agreed such suggestions aligned with the intent and purposes of the new adjustable parameter regulation.

EMA: Related to the improved structure recommended above, the new provisions could be simplified by eliminating the definition of "operating parameter." It is adequate, clearer and more efficient to simply define an "adjustable parameter," including the special condition of the practical range of adjustment, and the consequence of emissions increases. EPA should not finalize requirements that could be interpreted as requiring manufacturers to disclose all "operating parameters," because on most modern engines there are thousands of programmable parameters coded into the ECUs. The manufacturer's responsibility should be to disclose all parameters to which users have practical access for adjustment. Descriptions of how manufacturers will limit access to ECU code through passwords and encryption can be managed without the complexity EPA included in the proposed definition of "operating parameter."	We are keeping the definition of "operating parameter" because the application for certification needs to identify any operating parameters that the manufacturer does not consider to be adjustable parameters. We agree that manufacturers do not need to name every programmable parameter coded into the ECU to support EPA's need to evaluate tamper-resistance. Rather, we have modified the final regulation from proposal to state that manufacturers should consider all programmable parameters not involving user-selectable controls to be a single, collective operating parameter. This would effectively treat the ECU with its access restrictions as the operating parameter of interest for purposes of 40 CFR 1068.50.
EMA recommends that the condition in proposed §1068.50(c)(1) include a reference to "significant" emission impacts. This would preserve what already applies under 40 CFR 86.094-22(e)(1)(ii). The adjustable-parameter provisions should not apply for things that have only a minor impact on emissions.	40 CFR 86.094-22 and proposed 40 CFR 1068.50 set up the logic to allow EPA to approve a decision to exclude operating parameters from being considered adjustable parameters if the effect on emissions causes a corresponding performance degradation. The important part of this assessment relates to the performance degradation. If the operator is aware of a performance problem, they can be expected to operate the engine in a way that avoids the degradation. Adding a further restriction to allow EPA to exclude operating parameters only if the emission effect is significant would be both unwarranted and adverse to manufacturers' interest. We are therefore not revising final 40 CFR 1068.50(d)(2) to add the word "significantly" to qualify the extent of emission impact that is considered for excluding operating parameters.

EMA: Regarding terminology, the term “physically adjustable parameter” should be used in lieu of “mechanically controlled parameter,” and “programmable parameter” in lieu of “electronically controlled parameter” and “electronically controlled setting.”	We have adopted this suggested terminology in the final 40 CFR 1068.50 to present more consistent, organized, and easier-to-read requirements.
EMA: Proposed §1068.50(c)(2)(ii) and (iii) should not be limited to “mechanically controlled engines.”	We have revised final 40 CFR 1068.50(f)(1) and (2) for threaded fasteners and bimetal springs to remove the limitation to mechanically controlled engines since threaded fasteners and bimetal springs are not limited in application to mechanically controlled engines.
EMA: There are also concerns about the adjustable parameter provisions as they relate to enterprises unlawfully marketing emission “delete” kits that employ various techniques, through programming or hardware changes or both, to tamper with emissions control systems.	If someone alters an engine or equipment from the certified configuration, they will be liable for violating the tampering prohibition of 40 CFR 1068.101(b)(1) or the defeat-device prohibition in 40 CFR 1068.101(b)(2). The manufacturer will be responsible in each certification application for ensuring that all aspects of the manufacturer’s statements regarding adjustable parameters are still appropriate. We may also engage with the manufacturer to see if there is a need or opportunity to upgrade future designs for better protection as stated in final 40 CFR 1068.50(i)(2). For example, it may be appropriate to design electronic controls to recognize that certain programming or hardware changes take the engine out if its certified configuration and to include some appropriate design algorithm to prevent the engine from operating in the tampered condition.

EMA suggested that modifying the proposed §1068.50(d)(2) to reference "legally available tools", rather than allowing for use of any available tools.	As described in the preamble, we would generally not hold manufacturers liable for tools developed by third parties to tamper with an engine's electronic controls. This presumes that the manufacturer is not cooperating with third parties to develop or make available such tools. However, if we find that such tools are available to operators, we may engage with the manufacturer to see if there is a need or opportunity to upgrade future designs for better limitations and protection. This measured approach establishes a process for considering tools that do not qualify as "legally available." As such, it would not be appropriate to modify the regulation to exclude consideration of such tools.
EMA suggested replacing the definition of "adjustable parameter" in §1039.801 and other standard-setting parts with a reference to §1068.50 to avoid confusion. EMA also suggested that the description for the applications for certification was perhaps reasonably descriptive, but suggested that there was a risk of confusion when comparing to the provisions in §1068.50.	In the proposed rule we inadvertently left the existing definitions of "Adjustable parameter" in the standard-setting parts. The new provisions in §1068.50 clearly replace those existing definitions, so we are revising the final rule to change all the definitions to instead reference §1068.50. We have modified the instructions for the application for certification to more carefully align with the terminology in §1068.50.

30.3 ULSD-related exemption for Guam

Comments by Organizations

Organization: *Truck and Engine Manufacturers Association (EMA)*

EPA proposes to remove the exemption for aftertreatment-equipped engines sold in~~to~~ Guam because USLDF is now widely available in that territory (§1036.655). EMA supports the proposal, but manufacturers will need more time to plan for this change and to modify emissions labels accordingly. To simplify planning of product supply and delivery, EMA recommends that EPA implement this change to be effective at the start of a new calendar year. Given the anticipated timing of the CTP rulemaking, EMA recommends that the exemption become effective on January 1, 2023. [EPA-HQ-OAR-2019-0055-1203-A1, p. 134]

Also related to the ULSDF exemption, EPA has proposed to limit the exclusion for nonroad engines in the territories of American Samoa and the Commonwealth of the Northern Mariana

Islands to engines “at or above 56kW” (§1039.655). Many manufacturers’ products below 56kW use DPFs to control PM emissions. Those engines require ULSDF to ensure long-term emissions control. EPA should not limit the exemption to engines at or above 56kW. [EPA-HQ-OAR-2019-0055-1203-A1, p. 134]

EPA Summary and Response

Comment Summary	EPA Response
EMA supports the proposed removal of the exemption for aftertreatment-equipped engines sold into Guam because USLDF is now widely available in that territory (§1036.655), but manufacturers will need more time to plan for this change and to modify emissions labels accordingly. EMA recommends that EPA implement this change to be effective at the start of a new calendar year. Given the anticipated timing of the CTP rulemaking, EMA recommends that the exemption continue to be available until January 1, 2023.	We recognize that manufacturers need some established time frame to work out commercial considerations related to discontinuing the exemption for engines shipped to Guam. This may be for managing orders and inventory in addition to updating emission labels. With the uncertain timing for publication in the Federal Register, we believe it is appropriate to identify January 1, 2024 as the fixed date for discontinuing the Guam exemption. This applies equally for highway and nonroad engines.
EMA also objected to the change in the analogous proposal for nonroad diesel engines in §1039.655, which applied the exemption only for engines at or above 56 kW. Many manufacturers’ products below 56kW use DPFs to control PM emissions. Those engines require ULSDF to ensure long-term emissions control and they therefore also need the exemption.	The proposed limitation for engines at or above 56 kW was based on a consideration of the need for engines to have ULSD for SCR. We recognize that similar concerns apply for engines below 56 kW that may use DPF technology to meet Tier 4 PM standards. We are therefore retracting this amendment for the final rule.

30.4 Deterioration factors for certifying nonroad engines

Comments by Organizations

Organization: *California Air Resources Board (CARB)*

On page 17628 of the NPRM, U.S. EPA requests comments regarding the proposed alternative for establishing and verifying DF for the identified nonroad engines. [EPA-HQ-OAR-2019-0055-1186-A2, p.134]

CARB staff has concerns regarding applying the on-highway durability procedures to nonroad applications and believes it would be premature and inappropriate for U.S. EPA to finalize regulations allowing that at this time. The nonroad sector is very diverse in terms of operations and the types of emission control systems used. CARB is currently funding a nonroad demonstration contract to support the development of Tier 5 off-road standards. CARB staff suggests that U.S. EPA and CARB staff work together to consider any changes to off-road durability protocols. [EPA-HQ-OAR-2019-0055-1186-A2, p.134]

Organization: *Deere & Company*

Section XI.A.8 of the NPRM proposes the addition of a new provision 40 CFR 1039.245(e) for nonroad engines giving the engine manufacturer the option to determine Deterioration Factors (‘DF’) based on bench-aging aftertreatment per 40 CFR 1036.245 and 1036.246. It is not clear which provisions of 40CFR 1036.245 and 1036.246 are applicable to nonroad engines. For example, 40 CFR 1036.246(d)(2) requires the testing of at least five engines using the procedure specified in 40 CFR 1036.520, which references the moving average windows calculations described in 40 CFR 1036.515. These calculations are not directly applicable to nonroad engines. Another example is the case of a nonroad engine family with low annual usage, never reaching the minimum age requirement defined in Table 1 of 40 CFR1036.246(c): it is not clear whether the provisions of 40 CFR 1036.246(c)(5) are applicable to nonroad engines or not. [EPA-HQ-OAR-2019-0055-2743, p.1]

Organization: *Cummins Inc. (Cummins)*

Cummins supports inclusion of the aftertreatment bench aging option as a more efficient and accurate method for determining DFs for off-highway engine DF determination, as EPA has proposed in §1033.245, §1039.245, §1042.245, and §1048.240. [EPA-HQ-OAR-2019-0055-1325-A1, p. 11]

Cummins appreciates that EPA proposes to allow aftertreatment bench aging as an option for DF testing in lieu of traditional engine dynamometer-based aging for other regulatory categories beyond on highway, including nonroad, marine, locomotive, and large spark-ignited (LSI) engines. However, there are significant and unique differences in those regulations, customers, and markets which warrant differences in DF verification requirements compared to on-highway. While EPA seems to have taken some of this into account in its proposal, additional considerations and flexibilities need to be incorporated. [EPA-HQ-OAR-2019-0055-1325-A1, p. 12]

For marine engines in §1042.245, a manufacturer should be allowed to propose an alternate verification method, similar to the alternative option (f) EPA included in their guidance document CD-2022-02 for marine DF validation. For example, for any marine engine family that is a direct carry-across from a previously certified nonroad engine family, the manufacturer may submit durability-demonstration test data from that nonroad engine family, which will constitute sufficient validation for the DF of the carry across marine engine family. [EPA-HQ-OAR-2019-0055-1325-A1, p. 12]

For locomotive engines in §1033.245, EPA should leverage the existing in-use program in Subpart E that already covers 50-75% of useful life and only additionally require a single-step DF verification at >85% useful life. [EPA-HQ-OAR-2019-0055-1325-A1, p. 12]

Finally, regarding LSI engines in §1048.240, it is unclear whether the experiences from studies by EPA, the Truck & Engine Manufacturers Association (EMA), and SwRI, which resulted in the DF validation guidance documents issued by EPA for SCR-based diesel CI engines, necessitate an additional verification program for LSI. Since LSI has an existing in-use program in Subpart E, EPA should provide data to demonstrate that DF verification is additionally needed for this category. [EPA-HQ-OAR-2019-0055-1325-A1, p. 12]

Organization: *Truck and Engine Manufacturers Association (EMA)*

EPA has proposed to allow bench-aging of aftertreatment systems as an alternative to traditional dyno-based aging processes. EMA fully supports this approach for HDOH engines, as well as locomotive engines in §1033.245, non-road engines as described in §1039.245, marine engines in §1042.245, and LSI engines in §1048.240. [EPA-HQ-OAR-2019-0055-1203-A1, p. 111]

EPA proposes that non-road engine manufacturers may "alternatively determine and verify deterioration factors based on bench-aged aftertreatment." (§1039.245(e)). The existing provisions of (§1039.245), however, apply at the family level. EMA recommends that §1039.245(e) applies only for each DF demonstration, not for all engine families to which DF's were applied through carry-over or carry-across provisions. [EPA-HQ-OAR-2019-0055-1203-A1, p. 113]

For marine engines in §1042.245, a manufacturer should be allowed to propose an alternate verification method, similar to the alternative option (f) EPA included in their guidance document CD-2022-02 for marine DF validation. For example, for any marine engine family that is a direct carry-across from a previously certified nonroad engine family, the manufacturer should be allowed to submit durability-demonstration test data from that nonroad engine family, which will constitute sufficient validation for the DF of the carry-across marine engine family. For locomotive engines in §1033.245, EPA should leverage the existing in-use program in Subpart E that already covers 50-75% of useful life, and only additionally require a single-step DF verification at >85% useful life. [EPA-HQ-OAR-2019-0055-1203-A1, p. 113]

Finally, regarding LSI engines in §1048.240, it is unclear whether the experiences from studies by EPA, EMA, and SwRI, which resulted in the DF validation guidance documents issued by EPA for SCR-based diesel compression-ignition engines, necessitate an additional verification program for LSI. Since LSI has an existing in-use program in Subpart E, EPA should provide data to demonstrate that DF verification is additionally needed for this category. [EPA-HQ-OAR-2019-0055-1203-A1, p. 113]

EPA Summary and Response

Comment Summary	EPA Response
CARB staff believes it would be premature and inappropriate for U.S. EPA to finalize regulations allowing the highway durability procedures for nonroad applications. The nonroad sector is very diverse in operations and the types of emission control systems used. CARB is currently funding a nonroad demonstration contract to support the development Tier 5 off-road standards. CARB staff suggests that U.S. EPA and CARB staff work together to consider any changes to off-road durability protocols.	Current regulations allow us to approve alternative DF demonstration programs for individual manufacturers. The proposal simply expanded on that broad authority to clarify specific provisions that capture the principles and general measurement procedures for highway engines. We are prepared to revisit all provisions related to DF procedures in the context of future rulemakings for the various types of nonroad engines. In the meantime, we are confident that the methodology we finalize for heavy-duty highway engines will serve as a reasonable starting point to establish acceptable alternative DF demonstration procedures for nonroad engines.

Deere: It is not clear which provisions of 40 CFR 1036.245 and 1036.246 apply to nonroad engines. For example, 40 CFR 1036.246(d)(2) requires testing with the procedure specified in 40 CFR 1036.520, which references the moving average windows calculations described in 40 CFR 1036.515. These calculations are not directly applicable to nonroad engines. It is also not clear how to apply the minimum age requirement in 40 CFR 1036.246(c)(5) for a nonroad engine family with low annual usage.	Deere raises these specific concerns: 1. The proposal included the instruction to “use good engineering judgment to perform verification testing using the procedures of § 1039.515 rather than 40 CFR 1036.520.” We used this approach specifically to avoid relying on moving average windows from §1036.515. 2. The proposal instructs manufacturers to test engines after accumulating operating hours as a percentage of the useful life. We would expect manufacturers to preferentially select equipment with a consistently high usage rate, both to meet the testing requirements and to compete testing as quickly as possible. Deere also raises the broader point that the regulation is unclear for performing DF verification for nonroad engines. We recognize that there is a need to apply judgment in adapting the principles embodied in the highway program for performing DF verification with nonroad engines. We might pursue further clarity in a future rulemaking by adopting provisions that are specific to nonroad engines. In the meantime, we are confident that this provision can provide a good option for manufacturers wanting to accelerate the certification process and instead rely on in-use testing to verify deterioration factors.
EMA and Cummins support inclusion of the aftertreatment bench-aging option as a more efficient and accurate method for determining DFs for off-highway engine DF determination, as EPA has proposed in §1033.245, §1039.245, §1042.245, and §1048.240.	We acknowledge the affirmation of the proposed provisions for the subject nonroad engines.

EMA and Cummins elaborated that the different types of nonroad engines have significantly different regulations, customers, and markets that should lead to different approaches for implementing DF verification requirements compared to highway engines. They requested that additional considerations and flexibilities be incorporated beyond what was included in the proposed rule. Marine CI (§1042.245): A manufacturer should be allowed to propose an alternate verification method, similar to the alternative option (f) in guidance document CD-2022-02. For example, for any marine engine family that is a direct carry-across from a previously certified nonroad engine family, the manufacturer may submit durability data from the nonroad engine family, which serves to validate the DF of the related marine engine family. Locomotive (§1033.245): EPA should leverage the existing in-use program in Subpart E that already covers 50-75% of useful life and only additionally require a single-step DF verification at >85% useful life. Large SI (§1048.240): Since Large SI engines already have an in-use testing program, EPA should provide data to demonstrate that it is necessary to add DF verification for this category. It is not clear that the proposed DF verification procedures designed abound SCR-equipped diesel engines justify applying the additional verification program.	1. We intend that the regulation for each sector properly reflect the unique circumstances that apply. To the extent there is a provision that doesn't translate well from 40 CFR part 1036, we would expect to work with the manufacturer to exercise good engineering judgment in making any appropriate adjustments. 2. The new provision allowing manufacturers to rely on the DF verification approach from 40 CFR part 1036 applies in addition to the existing guidance. Manufacturers may continue to certify within the guidelines of CD-2022-02. We may in a future rule broaden or narrow the range of options for determining deterioration factors in ways that account for all the learning that will occur in the years ahead. 3. It may be appropriate to apply good engineering judgment to accomplish DF verification with some incremental effort relative to current in-use testing. This might involve new testing at intermediate test points in addition to the need for a final emission measurement beyond 85 percent of useful life. We would be ready to work with any manufacturer wanting to pursue this option. 4. There is no additional burden to justify because the final rule simply adds an option for manufacturers to pursue a different approach for establishing deterioration factors. Even though the test parameters were designed based on SCR-equipped diesel engines, we are confident that the testing will give results that are at least as effective as the laboratory-based procedures that manufacturers use today. We may in a future rule revise these new procedures and perhaps broaden or narrow the range of options for determining deterioration factors in way that accounts for all the learning that will occur in the years ahead.

EMA—Nonroad CI (§1039.245): Existing provisions for deterioration factors apply at the family level. EMA recommends that the new DF verification procedures in §1039.245(e) apply only for each DF demonstration, not for all engine families to which DF's were applied through carry-over or carry-across provisions.	The DF verification procedure will continue to apply to all engine families to which the DFs applied as there is no reason to limit the family if there is an issue with the DFs. The procedure to verify DFs will remain in 40 CFR part 1036.246 but will be optional only upon EPA's request. See section IV.F.2 of the preamble.

31 Provisions related to refueling light-duty and heavy-duty vehicles

31.1 Gasoline dispensing rates for facilities serving heavy-duty vehicles

Comments by Organizations

Organization: *California Air Resources Board (CARB)*

The NPRM states: 'We are proposing a requirement for all gasoline-fueled HD highway vehicle manufacturers to comply with refueling standards, it is no longer appropriate to preserve the exemption from the dispensing rate limit for dispensing pumps dedicated exclusively to HD vehicles.' [EPA-HQ-OAR-2019-0055-1186-A2, p.123]

CARB staff agrees with this assessment. Unlike retail diesel dispensing facilities (i.e., truck stops), gasoline dispensing pumps 'dedicated exclusively to heavy-duty vehicles' do not exist in California because the gasoline flow rate at the nozzle is limited to a maximum of 10 gallons per minute. For reference, the 10 gallons per minute flow rate limitation is contained in CARB certification Executive Orders for Phase II (Stage II) systems.187 In other words, in California, heavy-duty gasoline powered vehicles use the same dispensing pumps that serve passenger cars and light-duty trucks. As such, CARB staff agrees that there is no need to maintain an exemption for heavy-duty vehicles. [EPA-HQ-OAR-2019-0055-1186-A2, p.123]

187 Reference https://ww2.arb.ca.gov/our-work/programs/vapor-recovery/vapor-recovery-equipment-defects-list and Vapor Recovery Phase II EVR Executive Orders | California Air Resources Board

CARB staff also agrees with the assessment in the NPRM stating: 'Retail stations and fleets rarely have dispensing pumps that are dedicated to HD vehicles. Since there are no concerns of feasibility or other issues related to meeting the 10 gallon per minute dispensing limit, we are proposing to remove the exemption upon the effective date of the final rule.' [EPA-HQ-OAR-2019-0055-1186-A2, p.123]

The NPRM also requests comments regarding: 'We request comment on allowing additional lead time for any legacy installations that continue to have higher dispensing rates for gasoline-fueled HD vehicles. We expect few such cases. This may occur, for example, with a remaining fleet of gasoline-fueled school buses or with farms that have refueling capabilities for delivery trucks along with nonroad implements.' CARB staff does not believe additional lead time is necessary in California, since there are no legacy installations in California. [EPA-HQ-OAR-2019-0055-1186-A2, p.123]

EPA Summary and Response

Comment Summary	EPA Response
CARB staff agrees that there is no need to keep the exemption from the 10 gallon-per-minute dispensing limit for stations dedicated to heavy-duty vehicles. CARB staff does not believe additional lead time is necessary in California.	We acknowledge the affirmation to adopt the proposed provision applying the 10 gallon-per-minute limitation to any stations that may be dedicated to servicing heavy-duty vehicles.

31.2 Refueling interface for gasoline-fueled motor vehicles

Comments by Organizations

Organization: *California Air Resources Board (CARB)*

Section 109 of the federal CAA authorizes and directs U.S. EPA to establish national ambient air quality standards (NAAQS) for air pollutants, and U.S. EPA has promulgated NAAQS for a number of air pollutants, including ozone. [EPA-HQ-OAR-2019-0055-1186-A2, p.124]

States that have not attained a NAAQS for a specified pollutant are required by section 110(a)(1) of the CAA to adopt SIP that describe how they will attain the NAAQS in those regions by certain deadlines. California has, and continues to experience some of the worst air quality in the nation, and the South Coast and San Joaquin Valley Air Basins, in particular, are in extreme non-attainment with the national ambient air quality standard for ozone. [EPA-HQ-OAR-2019-0055-1186-A2, p.124]

CARB has developed regulations that require gasoline dispensing facilities to incorporate Stage II vapor recovery systems. Such systems help to control the evaporative emissions that are displaced from the fuel systems of motor vehicles as they are fueled. Several air districts within California, including the South Coast Air Quality Management District and the San Joaquin Valley Air Pollution Control District, have incorporated CARB's Stage II vapor recovery systems within their local regulations and have included those regulations within their SIPs, and U.S. EPA has approved such submissions.188 [EPA-HQ-OAR-2019-0055-1186-A2, p.124]

188 See, e.g., 78 Fed Reg. 21543 (Apr. 11, 2013) (approving SCAQMD Rule 461; available at Regulations.gov), 80 Fed. Reg. 7345 (Feb. 10, 2015) (San Joaquin Air Quality Management District Regulation 4622; available at Regulations.gov)); 78 Fed. Reg. 897 (Jan. 7, 2013) (approving Sacramento Metropolitan Air Quality Management District Rule 449; available at RULE449 CLEAN.doc (airquality.org))

NPRM states that: 'The filler-neck restriction is no longer needed to prevent misfuelling with leaded fuel. There is also no need for new vehicles to be designed to accommodate Stage II refueling controls now that they are subject to vehicle-based refueling standards. As a result, the only remaining need for restricting the filler-neck diameter is for those vehicles that depend on such a design to meet spitback and refueling standards.'
As discussed below, CARB staff disagrees with U.S. EPA’s statement that 'there is no need for new vehicles to accommodate Stage II controls now that they are subject to vehicle-based refueling standards':

- a) Unlike other states that have decommissioned Stage II vapor control at gasoline dispensing facilities, California has retained Phase II (similar to U.S. EPA Stage II) vapor recovery requirements on a statewide basis. California’s Phase II systems are dependent on nozzles and vehicle fill pipes having uniform dimensions in order to achieve a good seal, which is assisted by the fill pipe restriction, during the refueling process. Specifically, a good seal enables the Phase II nozzle to detect if the vehicle is equipped with on-board refueling vapor recovery (ORVR) or non-ORVR. CARB field studies189 have concluded, without uniform dimensions (standardization) for the nozzle and vehicle fill pipe interface, a poor seal will occur, resulting in excess air ingestion, storage tank headspace overpressure, and excess breathing loss emissions. [EPA-HQ-OAR-2019-0055-1186-A2, pp.124-125]

189 Reference: CARB field studies VR-OP-A3 and VR-OP-A4 available at: https://ww2.arb.ca.gov/resources/documents/overpressure-studies-and-technical-support-documents

As of 2022, approximately 90 percent of California’s gasoline powered vehicle population is equipped with a vehicle based ORVR emission control system. Despite this high percentage of ORVR equipped vehicles, Phase II vapor recovery controls are still needed to capture the displaced gasoline vapors that are generated by the remaining 10 percent of California’s vehicle population, not equipped with ORVR system. In a state where some regions have the worst air quality in the nation, retaining Phase II control is needed to help achieve NAAQS attainment goals. [EPA-HQ-OAR-2019-0055-1186-A2, p.125]

CARB staff estimates that even when about 98 percent of gasoline in California will be dispensed to vehicles with ORVR (predicted to be about 2030 or later), Phase II controls will provide volatile organic compound (VOC) emission reductions of about nine tons per day.190 Making up nine tons per day VOC emissions in the 2030 timeframe may be extremely difficult since most of the cost-effective VOC control measures have already been implemented. [EPA-HQ-OAR-2019-0055-1186-A2, p.125]

190 Reference: https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2018/gdfnozzles2018/fsor.pdf

- b) Gasoline vapors that are displaced during the storage and transfer of gasoline contain benzene, a known carcinogen. CARB's Benzene Air Toxic Control Measure191 requires Phase II vapor recovery at retail gasoline dispensing facilities regardless of ozone attainment status, in order to reduce public exposure to benzene. Reducing benzene exposure requires a good seal between the fill pipe and the nozzle. [EPA-HQ-OAR-2019-0055-1186-A2, p.125]

191 Reference: https://ww2.arb.ca.gov/resources/documents/benzene-retail-service-stations#:~:text=The%20California%20Air%20Resources%20Board,Benzene%20from%20Retail%20Service%20Stations.

- c) In California, certain non-retail gasoline dispensing facilities are exempt from Phase II controls if they serve a captive fleet of predominately ORVR equipped vehicles. In 2015,192 CARB adopted standards for Enhanced Conventional (ECO) nozzles that do not include vapor recovery, but are required to control liquid releases including spillage, post-fueling drips, spitting, and liquid retention. ECO nozzles are subject to a spillage standard of 0.12 pounds per 1,000 gallons dispensed, which represents an approximately 80 percent reduction over spillage rates from conventional nozzles. [EPA-HQ-OAR-2019-0055-1186-A2, p.125]

192 Reference: https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2015/vapor2015/vapor15eo.pdf

Additionally, CARB staff found the currently certified ECO nozzles can comply with a more stringent spillage standard of 0.05 pounds per 1,000 gallons, a 90 percent reduction.193 [EPA-HQ-OAR-2019-0055-1186-A2, p.126]

193 Reference: ISOR_EVR_2020 (ca.gov)

In order to meet these liquid release standards, ECO nozzles are equipped with similar features found on Phase II nozzles including spout design, insertion interlock (minimizes spillage), face plate, and bellows. With ECO nozzles, adequate contact between vehicle fill pipe and nozzle face plate is required for the insertion interlock feature to work properly. ECO nozzles are also subject to almost identical dimensional standards as required for Phase II nozzles. [EPA-HQ-OAR-2019-0055-1186-A2, p.126]

According to the 2015 staff report, at least 17 states (other than California) will consider the use of ECO nozzles. Those 17 states have a combined population and annual gasoline throughput, that is approximately three times greater than California. If those states moved forward with

ECO nozzle requirements, the national emission reductions associated with the reduced spillage of gasoline would be significant. [EPA-HQ-OAR-2019-0055-1186-A2, p.126]

As explained above in the CARB comments in subsections (a) through (c) above, the proposal to delete the preexisting requirement for vehicles to incorporate a fuel filler restriction does not consider the extent to which the proposal may adversely affect the effectiveness of Phase II vapor recovery systems to capture displaced gasoline vapors generated by motor vehicles, or the corresponding projected increases of VOCs, ozone emissions, or benzene emissions. These considerations constitute an important aspect of states' abilities to attain or maintain compliance with NAAQS and to maintain the effectiveness of state adopted measures to protect the health of their citizens, and NPRM therefore improperly failed to address those considerations. State Farm, 463 U.S. at 43. It is also clear that U.S. EPA's rationale that its proposal will not result in increased emissions is directly inconsistent with the evidence presented in CARB staff's comments, State Farm, 463 U.S. at 473. Moreover, these considerations arguably preclude U.S. EPA from demonstrating there are good reasons for the proposal, including a justification for 'disregarding facts and circumstances that underlay or were engendered by the prior policy.' FCC v Fox Television Stations, 556 U.S. at 515-516. [EPA-HQ-OAR-2019-0055-1186-A2, p.126]

The CAA requires that federal agencies ensure that their actions do not interfere with a state's ability to implement its SIP and to attain applicable NAAQS. CAA section 176(c)(1)-(2). As previously discussed, U.S. EPA's proposal will result in the increase of VOC emissions that could affect ozone formation e, but U.S. EPA has not evaluated or considered the extent to which its proposal will likely result in increased VOC emissions in states that have approved SIPs containing Stage II vapor recovery systems that are dependent upon fuel filler pipe restrictions in motor vehicles. It is accordingly clear that U.S. EPA must, at a minimum, reevaluate the foreseeable increased emissions attributable to the proposal to ensure its proposal does not violate its conformity obligations. [EPA-HQ-OAR-2019-0055-1186-A2, pp.126-127]

The NPRM states: 'Since there is no longer an external emission-related design constraint for filler necks, vehicle manufacturers will no longer be constrained to design their vehicles to meet spitback and refueling standards with a limiting orifice. If vehicle manufacturers need to have a narrow-diameter filler neck to achieve a mechanical seal for onboard refueling vapor recovery or to prevent spitback, then they will need to include those design specifications. If they can use a different orifice or no orifice at all and still meet spitback and refueling standards, that would also represent a compliant configuration. We therefore propose to remove the filler-neck restrictions from 40 CFR 80.24 without migrating those requirements to the CFR parts for light-duty or HD vehicles.' [EPA-HQ-OAR-2019-0055-1186-A2, p.127]

CARB staff disagrees with the concept of eliminating fill pipe dimensional standards especially removal of the filler-neck restrictions, which would result in excess emissions due incompatibility between the vehicle fill pipes and Phase II/ECO nozzles. Doing so would also be inconsistent with CARB regulations adopted in 2019 that are based upon findings and recommendations of the SAE Fuel System Task Force (Task Force). [EPA-HQ-OAR-2019-0055-1186-A2, p.127]

The goal of the Task Force was to identify design parameters to improve compatibility of nozzles and vehicle fill pipes by establishing a set of dimensions to effectively standardize the interface. In other words, the dimensional standards provide a ‘design envelope’ for both nozzle and vehicle fill pipe manufacturers to follow. The dimensions are found in SAE J285 (April 2019) for Phase II194 and ECO nozzles195 and CARB Specification for Fill Pipes196 and Openings of 2015 and Subsequent Model Motor Vehicle Fuel Tanks (May 31, 2019). [EPA-HQ-OAR-2019-0055-1186-A2, p.127]

194 https://www.arb.ca.gov/testmeth/vol2/cp201.pdf?_ga=2.178947043.654532313.1648057694-1201589631.1627687357

195 https://www.arb.ca.gov/testmeth/vol2/cp207.pdf?_ga=2.189967724.654532313.1648057694-1201589631.1627687357

196 https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2018/fillpipe2018/finalspecs.pdf?_ga=2.189967724.654532313.1648057694-1201589631.1627687357

In addition to forming a good seal between the Phase II and ECO nozzles and vehicle fill pipes, the Task Force considered other factors when determining appropriate dimensions, including pre-mature shutoff, loose latch, customer effort (insertion force), and likelihood of the nozzle becoming caught within the fill pipe pocket. [EPA-HQ-OAR-2019-0055-1186-A2, p.127]

The NPRM also states: 'We acknowledge that there are commercial reasons to have standardized specifications for filler necks. This is reflected by the referenced voluntary consensus standards adopted to accomplish that purpose.' [EPA-HQ-OAR-2019-0055-1186-A2, p.128]

CARB staff agrees with this assessment and recommends that the U.S. EPA reference SAE J285 (April 2019) for Phase II and ECO nozzles and CARB Specification for Fill Pipes and Openings of 2015 and Subsequent Model Motor Vehicle Fuel Tanks (May 31, 2019) for the vehicle fill pipe. [EPA-HQ-OAR-2019-0055-1186-A2, p.128]

As mentioned in the comment above, these documents retain the fill pipe restriction needed to support Phase II and ECO nozzles and were developed after extensive deliberations by CARB, nozzle, vehicle, and fill pipe manufacturers who participated in the SAE Task Force. In 2019, CARB adopted the dimensional specifications listed in these documents. [EPA-HQ-OAR-2019-0055-1186-A2, p.128]

Standardization of Phase II and ECO nozzle and vehicle fill pipe dimensions provides a defined ‘design envelope’ needed by the nozzle, vehicle, and fill pipe manufacturers to effectively produce a compatible interface. These dimensional specifications provide flexibility to manufacturers because they include a range of values, rather than a single value. As mentioned in a prior comment, in developing these dimensional specifications, the Task Force considered other factors such as pre-mature shutoff, loose latch, customer effort (insertion force), and likelihood of the nozzle becoming caught within the fill pipe pocket. [EPA-HQ-OAR-2019-0055-1186-A2, p.128]

Additionally, the NPRM states: ‘U.S. EPA's existing specifications are compatible with those published standards but allow for a much wider range of dimensions. The comment from the earlier rulemaking requested that we update our specifications to match those in the voluntary consensus standards.’ [EPA-HQ-OAR-2019-0055-1186-A2, p.128]

CARB staff recommends that U.S. EPA consider updating the nozzle and vehicle fill pipe requirements by referencing applicable portions of SAE J285 and CARB Specifications for Fill Pipes and Openings of 2015 and subsequent Model Motor Vehicles (May 31, 2019). [EPA-HQ-OAR-2019-0055-1186-A2, p.128]

The NPRM also states: ‘We request comment on the appropriateness of either keeping the existing specifications or adopting the specifications from voluntary consensus standards into the U.S. EPA regulations. We specifically request comment on the benefit of adopting such standards and on the authority for adopting such standards under CAA considering that we intend to remove the now obsolete requirements in 40 CFR 80.24.’ [EPA-HQ-OAR-2019-0055-1186-A2, p.128]

CARB staff refers to previous comments concerning the need for U.S. EPA to update existing specifications to include the new dimensional specifications recommended by the SAE Task Force. Providing a standardized ‘design envelope’ will ensure Phase II and ECO nozzles are compatible with vehicle fill pipes and will minimize emissions during refueling. [EPA-HQ-OAR-2019-0055-1186-A2, p.128]

Organization: *Ingevity Corporation (Ingevity)*

EPA’s assessment that the fill neck restriction was put in place in 1973 to prevent misfuelling with leaded fuel is correct, and since leaded fuel is no longer in use, it is appropriate to suggest that this requirement be eliminated. However, its purposes are not necessarily obsolete. Since the implementation of this requirement, fuel system designers have considered its role in helping to retain the nozzle in the fill pipe during refueling, its effects on air ingestion into the fill pipe during refueling, and the dynamics of nozzle shut off at the end of a refueling event. In fact, the presence of the fill neck restrictor is accounted for in the anchor spring requirements of SAE J285 for gasoline fuel dispensing nozzles. Eliminating the regulatory requirement will not necessarily lead the manufacturers to remove the fill neck restrictor from vehicle designs since its presence is now considered in other functions which occur during the refueling event. [EPA-HQ-OAR-2019-0055-1213-A1, p. 7]

Furthermore, there is one other very important consideration of the role of the fill neck restrictor which EPA did not mention in the NPRM. Note that within SAE J285 the nozzle spout outer diameter specification for an unleaded fuel nozzle is 20.5/21.34 mm, and that for a diesel fuel nozzle spout the specification is 23.6/25.5 mm for a low flow nozzle, and 28.5/38.5 mm for a high flow nozzle. The provisions of 40 CFR §80.24 specify a not to exceed diameter of 23.63 mm for the inlet restriction for a gasoline-fueled vehicle. This regulatory specification effectively eliminates the potential for diesel misfuelling, which is a special point of interest for HDGVs. [EPA-HQ-OAR-2019-0055-1213-A1, p. 7]

EPA also sought comment on removing the provisions of 40 CFR §80.22 and replacing them with those of SAE J285 through incorporation by reference. We support incorporating by reference the appropriate portions of SAE J285 as a means of updating these provisions. [EPA-HQ-OAR-2019-0055-1213-A1, p. 7]

<u>EPA Summary and Response</u>

Comment Summary	EPA Response
CARB staff disagrees with eliminating the filler-neck restrictions. CARB staff disagrees with U.S. EPA's statement that 'there is no need for new vehicles to accommodate Stage II controls now that they are subject to vehicle-based refueling standards. CARB has developed regulations that require gasoline dispensing facilities to incorporate Phase II vapor recovery systems. California's Phase II systems are dependent on nozzles and vehicle fill pipes having uniform dimensions in order to achieve a good seal, which is assisted by the fill pipe restriction, during the refueling process. As of 2022, Phase II vapor recovery controls are still needed to capture the displaced gasoline vapors that are generated by the 10 percent of California's vehicle population not equipped with ORVR system. In 2015, CARB adopted standards for Enhanced Conventional (ECO) nozzles that do not include vapor recovery, but are required to control liquid releases including spillage, post-fueling drips, spitting, and liquid retention. With ECO nozzles, adequate contact between vehicle fill pipe and nozzle face plate is required for proper operation. CARB staff estimate that at least 17 states will consider adopting California's requirement to use ECO nozzles.	We recognize that state refueling-related requirements depend on a consistent filler-neck restriction to ensure a proper interface for controlling emissions. We are therefore preserving the longstanding requirement for vehicle manufacturers to include the existing filler-neck restriction for all vehicles up to 14,000 pounds GVWR. We are codifying this provision in 40 CFR 86.1810-17 instead of 40 CFR 80.24. We are including no lead time for this requirement because it is consistent with the requirement from 40 CFR 80.24.

Ingevity: Fuel system designers consider the filler-neck restriction to retain the nozzle in the fill pipe during refueling and to account for its effects on air ingestion into the fill pipe during refueling and the dynamics of nozzle shut off at the end of a refueling event. Eliminating the regulatory requirement will not necessarily lead the manufacturers to remove the fill neck restrictor from vehicle designs. The filler-neck restriction also effectively eliminates the potential for diesel misfuelling, which is a special point of interest for gasoline-fueled heavy-duty vehicles.	We recognize that the existing filler-neck restriction has the additional benefit of preventing operators from inadvertently dispensing diesel fuel into fuel tanks for gasoline-fueled vehicles. As described for the previous comment, we are migrating the existing filler-neck restriction from 40 CFR 80.24 to 40 CFR 86.1810-17.
Standardization of Phase II and ECO nozzle and vehicle fill pipe dimensions provides a defined 'design envelope' needed by the nozzle, vehicle, and fill pipe manufacturers to effectively produce a compatible interface. CARB staff recommends that EPA update the nozzle and vehicle fill pipe requirements by referencing applicable portions of SAE J285 and CARB Specifications for Fill Pipes and Openings of 2015 and subsequent Model Motor Vehicles (May 31, 2019).	
Ingevity supports incorporating by reference the appropriate portions of SAE J285 as a means of provisions to specify geometry for gasoline refueling nozzles.	

32 Sector-specific amendments to EPA's emission control programs

32.1 Test procedures for electric vehicles

<u>**Comments by Organizations**</u>

Organization: *Alliance for Automotive Innovation (Auto Innovators)*

<u>40 C.F.R. 600.011 Incorporation by reference.</u>

Auto Innovators generally supports the incorporation of the 2021 version of SAE J1634 by reference at 40 C.F.R. 600.011(c)(2). Incorporating the 2021 revision of SAE J1634 would harmonize BEV test procedures with the California Air Resource Board (CARB) proposed Advanced Clean Cars II test procedures. [EPA-HQ-OAR-2019-0055-1303-A1, p.3]

We also request the option to allow use of the Short Multi-Cycle Test (sMCT) and the Short Multi-Cycle Test Plus Steady State (sMCT+) procedures. Allowing these procedures would also harmonize with the CARB proposed test procedures and significantly reduce laboratory test burden associated with BEV testing while providing equivalent test results. [EPA-HQ-OAR-2019-0055-1303-A1, p.3]

EPA's current proposal prohibits manufacturers from using thermal conditioning during cold soak periods. Unlike vehicles with internal combustion engines, managing battery temperature in BEV vehicles is critical to battery durability, vehicle performance, and energy efficiency. Thermal conditioning of the BEV propulsion battery can provide real-world benefits in these areas. We would like to request for EPA to remove requirements explicitly prohibiting thermal conditioning in order to not restrict emerging technologies that could improve real-world performance and efficiency, for example under extreme cold start conditions during short trip city driving. [EPA-HQ-OAR-2019-0055-1303-A1, p.3]

We would also request for the use of thermal conditioning to be considered as part of the 5-cycle test procedure approval process. Keeping in mind that the industry is still learning about customer behavior related to BEV thermal conditioning, and any allowance of thermal conditioning should be customer representative, either by default operation, manufacturer instruction, or demonstrated real-word usage, we urge the EPA to allow manufacturers to incorporate new technologies such as this one, when sufficient justification is provided. [EPA-HQ-OAR-2019-0055-1303-A1, p.3]

<u>40 C.F.R. 600.116-12 Special procedures related to electric vehicles and hybrid electric vehicles.</u>

(2)(i) We request that EPA omit the 15 second idle energy from the highway cycle energy consumption. Including the idle in the highway phase data does not align with the highway test for ICE vehicles. The idle energy should be included in the overall Usable Battery Energy (UBE).

(a)(4) We request that EPA remove the requirement to use Method 1 or Method 2 described in SAE J1634 Appendix A to estimate the mid-test constant speed cycle distance (dM). OEMs are developing methods to calculate dM which ensure the CSCe distance is less than 20% of the overall distance with margin to reduce the risk of invalid tests. Requiring the use of the SAE J1634 methods will require process changes and may result in less accurate determination of dM.

(a)(5) —"At the conclusion of each mid-test constant speed phase a minimum 5-minute key-off soak will be performed."
We would like further clarification of this requirement. Specifically, we'd like to inquire whether this means a key-off would be necessary before the dynamic UDDS3 segment?

(a)(8) We request that all energy measured during the entire test be included in the usable battery energy (UBE). The UDDS and HFET cycles are used to calculate energy efficiency over these

cycles. The remaining test is used to determine total DC discharge energy. Including all energy measured during the test, including key-off soaks and idles, represents the UBE stored in the battery.

(a)(11)(i)—"The 20 °F charge-depleting UDDS must be performed with a minimum 10-minute key-off soak period between each UDDS cycle. Key-off soak periods of up to 30 minutes are allowed."
With the final rule expected to be released shortly before MY 2025 vehicles are launched, there is very limited lead-time to implement change for MY 2024, or even MY 2025 vehicles. Therefore, we request to make this procedure optional prior to MY26 to allow labs to make any necessary upgrades or training.

(a)(11)(iii)— "Beginning with the 2024 model year the 20 °F UDDS charge-depleting UDDS test will be replaced with a 20 °F UDDS test consisting of 2 UDDS cycles performed with a 10-minute key-off soak between the two UDDS cycles."
It is of our opinion that MY24 is too soon for this type of testing requirement. We propose the following changes: "Beginning with the **2026 model year, optional prior to MY26,** the 20 °F UDDS charge-depleting UDDS test will be replaced with a 20 °F UDDS test consisting of 2 UDDS cycles performed with a 10-minute key-off soak between the two UDDS cycles." This additional lead time will give OEMs enough time to address any potential issues that may arise.

(a)(11)(iv)(D)—"Beginning in model year 2024 the *RunningFC* equation used to calculate the City Fuel Economy found on Page 30 in Appendix C of J1634 should be replaced with the following equation when calculating City Fuel Economy."
We would like to align this requirement with our request for (11)(iii) and extend the timeframe to begin in MY26. We propose the following language: ""**When 2 UDDS cycles are used, as described in (a)(11)(iii)**, the *RunningFC* equation used to calculate the City Fuel Economy found on Page 30 in Appendix C of J1634 should be replaced with the following equation when calculating City Fuel Economy."

Organization: *Rivian Automotive, LLC (Rivian)*

Additional Considerations Regarding Proposed Amendments to LDV GHG and Fuel Economy Testing. EPA used the NPRM to introduce a variety of amendments to LDV GHG and fuel economy testing procedures. Beginning with MY2024, EPA is proposing that manufacturers be allowed to perform only two UDDS cycles when running the CTTP, with a 10-minute key-off soak between the UDDS cycles to generate a BEV 5- cycle adjustment factor. Rivian recommends a different approach to these amendments and offers additional related comments. [EPA-HQ-OAR-2019-0055-1229-A1, p.6]

- **Timeline**. EPA should provide sufficient lead time for manufacturers to implement changes. Testing for MY2023 is already underway and MY2024 work will begin before the conclusion of this rulemaking. The agency should provide additional time to manufacturers before requiring any changes in test procedure.
- **Flexibility**. Rather than mandate a new approach to testing, the agency should provide manufacturers with optionality. Specifically, EPA should allow up to 6 UDDS cycles when running the CTTP at the manufacturer's recommended state of charge. [EPA-HQ-OAR-2019-0055-1229-A1, p.6]

Organization: *Volkswagen Group of America, Inc., (Volkswagen) (VWGoA)*

<u>40 CFR 600.011 Fuel economy and greenhouse gas exhaust emission of motor vehicles</u>

EPA proposes to incorporate the 2017 version of SAE J1634 Battery Electric Vehicle Energy Consumption and Range Test Procedure. We appreciate EPA's acceptance of this important, consensus-based standard, however, there is an even more recent version. J1634 was successfully updated in 2021 and VWGoA requests that this version be codified in this section for use in its entirety throughout the testing process. [EPA-HQ-OAR-2019-0055-1296-A1, p.2]

We support allowing the option to use thermal conditioning during the cold temperature test as defined in the 2021 version of SAE J1634. Unlike vehicles with internal combustion engines, managing battery temperature in BEV vehicles is critical to battery durability, vehicle performance, and energy efficiency. Thermal conditioning of the BEV propulsion battery provides real-world benefits in these areas. By allowing the option to use thermal conditioning prior to the cold test BEV vehicles will more accurately demonstrate real-world performance and efficiency under extreme cold start conditions during short trip city driving. Significant innovation continues in the area of battery thermal management. Prohibiting thermal conditioning during the cold test may result in constraining innovation and limit real-world benefits. [EPA-HQ-OAR-2019-0055-1296-A1, p.2]

<u>40 C.F.R. 600.116-12 (a)(11) Special procedures related to electric vehicles and hybrid electric vehicles.</u>

It is our opinion that removing the option to perform a full charge depletion 20 °F cold test no longer allows manufacturers to demonstrate the efficiency improvements of technologies more prevalent in the full charge depletion test procedure. We see this as a barrier to investment in advanced technologies. To preserve the 5-cycle test procedure pathway as a driver of efficient technologies, we ask that the EPA reconsider the impact of the proposed change and preserve the option of performing a full charge depletion 20 °F cold test beyond MY 2024. [EPA-HQ-OAR-2019-0055-1296-A1, p.2]

Organization: *General Motors LLC (GM)*

General Motors supports comments provided by the Alliance for Automotive Innovation related to BEV test procedures. Allowing usage of the Short Multi-Cycle Test (sMCT) and the Short Multi-Cycle Test Plus Steady State (sMCT+) procedures harmonizes with the California Air Resource Board (CARB) proposed Advanced Clean Cars II test procedures and significantly reduces laboratory test burden. [EPA-HQ-OAR-2019-0055-1246-A1, pp.6-7]

General Motors supports usage of battery thermal conditioning as outlined in the 2021 revision of SAE J1634. By applying a small amount of wall energy to keeping the battery at efficient operating conditions, battery thermal conditioning leverages existing customer behavior of leaving EVs plugged in when not in use and optimizes vehicle performance throughout a wide range of ambient temperatures. It also improves system efficiency, fast charging performance, and battery durability. The inclusion of battery thermal conditioning on test procedures would advance the administration's goals for EV adoption by encouraging the introduction of vehicles with this technology's improved real-world performance by making it visible to customers on the label. Prohibiting thermal conditioning during testing could limit such innovation. [EPA-HQ-OAR-2019-0055-1246-A1, p.7]

For example, GM agrees with the EPA's statement in the NPRM that "the intent of the CTTP (Cold Temperature Test Procedure) is to capture the performance of vehicles under extreme cold start conditions during short trip city driving". BEVs utilizing thermal conditioning will demonstrate improved real-world performance on short trip city driving under these conditions. Reflection of this benefit on the label allows customers a more accurate comparison between vehicles. [EPA-HQ-OAR-2019-0055-1246-A1, p.7]

Moreover, allowing these technologies on test procedures would incentivize manufacturers to further encourage customers to adopt the desirable behavior of leaving EVs plugged in when not in use. This practice will become increasingly important not just to benefit from vehicle innovations such as thermal conditioning, but also to enable future transformative network improvements such as smart grids. [EPA-HQ-OAR-2019-0055-1246-A1, p.7]

Organization: *Tesla, Inc. (Tesla)*

EPA also proposes several changes to the existing light-duty BEV test procedures.156 As per below, Tesla provides response to a number of these specific proposals. In support of these comments, Tesla has provided confidential business information to the agency containing this relevant data.157 [EPA-HQ-OAR-2019-0055-1219-A1, p.20]

156 87 Fed. Reg. at 17631-17635.

157 See, Appendix 2. Submitted separately as confidential business information.

A. EPA Proposal: *For model year 2023, manufacturers may continue to perform full charge depletion testing on BEVs when running the CTTP to determine the 5-cycle adjustment factor. However, EPA is proposing that in model year 2023 manufacturers would be required to perform a 10-minute key-off soak between each UDDS cycle performed as part of the charge depleting CTTP. We are not proposing to change the existing requirement to submit a written request for EPA approval to perform 5-cycle testing prior to beginning 5-cycle adjustment procedure testing. EPA is proposing that manufacturers will be required to attest that the vehicle was not preconditioned or connected to an external power source during the 20°F cold soak period.*158 [EPA-HQ-OAR-2019-0055-1219-A1, p.20]

158 87 Fed. Reg. at 17632/1.

Tesla disagrees with this proposal. Enforcing a 10-minute key-off soak during the CTTP will increase the test length of the CTTP by approximately 45%. Based on our physics-based modeling, the change from 0 to a 10- minute soak is expected to impact the cold running consumption by 4.5% and overall consumption by 0.5%. This rule change would significantly increase test burden with little impact to the overall sticker range/MPGe. Additionally, Tesla proposes that EPA only require retesting on new vehicle lines or existing vehicle lines with product changes significantly affecting fuel economy. For vehicle lines that are substantially similar to the previously certified Model Year, EPA should allow carry-over of data from previous Model Year. This would significantly help reduce the additional testing burden induced by this proposed change. [EPA-HQ-OAR-2019-0055-1219-A1, p.20]

B. EPA Proposal: *Beginning with model year 2024, EPA is proposing that manufacturers would be allowed to perform only two UDDS cycles when running the CTTP, with a 10-minute key-off soak between the UDDS cycles to generate their BEV 5- cycle adjustment factor. The running fuel consumption for the City fuel economy equation would be modified from the equation provided in Appendix C of the 2017 version of SAE J1634. The charge depletion value would be replaced with the results from Bag 2 of the first and second UDDS and Bag 1 from the second UDDS. The Agency would allow manufacturers to use their existing CTTP test results to make these calculations, or they could perform new tests with the option to have the vehicle's state-of-charge set to a value specified by the manufacturer such that the vehicle can capture regeneration energy during the first UDDS cycle.*159 [EPA-HQ-OAR-2019-0055-1219-A1, pp.20-21]

159 Id.

Tesla understands and appreciates the EPA's proposal and desire to reduce testing burden on manufacturers. However, Tesla is concerned that the proposed change is not in the spirit of the significance of the Cold Temperature Running Fuel Use as originally proposed in the EPA's 5-cycle support document to capture the 'Fuel use once the engine is warmed up at colder temperatures.'160 The 5-cycle support document states explicitly that the assumption is that the vehicle is fully warmed up by the end of Bag 1 of the FTP.161 Per the document, the impact was studied on conventional internal combustion engine (ICE) vehicles and Hybrid Electric Vehicle (HEV) and the assumption was found to have a larger negative impact on HEVs (1.2%) than ICE vehicles (0.3%) mainly because the powertrain had not adequately reached steady state operating temperatures.162 With BEVs, the impact is generally much larger for the same reason – it takes longer for the HV battery and other powertrain components to heat up relative to other fuel types. If we take inspiration from the previously accepted threshold of 1.2% impact on MPG for HEVs, then this change being almost 3x that threshold is unacceptable and would put BEVs at a disadvantage due to inaccurate representation relative to other fuel types. Appendix 2, Error! Reference source not found. provided in Tesla's confidential business information (CBI) submission summarizes the impact that the proposed rule change would have on all currently approved Tesla vehicles, showing an average impact of 3.4%, far above the previously acceptable 1.2% threshold established for HEVs and 0.3% for ICE vehicles. Tesla urges the EPA reconsider the proposal and not put BEVs at a disadvantage relative to other fuel types. [EPA-HQ-OAR-2019-0055-1219-A1, p.21]

160 EPA, Final Technical Support Document Fuel Economy Labeling of Motor Vehicles: Revisions to Improve Calculation of Fuel Economy Estimates EPA-420-R-06-017 (Dec. 2006) at 4, 36.

161 Id. at 78.

162 Id. at 136.

EPA outlines its justification of the methodology a difference in calculation between BEVs and other fuel types to include an additional datapoint (UDDS2 Bag2) in the calculation procedure to account for the expectation that 'BEVs will require more than two UDDS cycles with a 10-minute key-off soak between them for the vehicle to reach a fully warmed up and stabilized operating point.' 163Tesla believes that the 2 cycles (even with the inclusion of the addition bag) are insufficient to capture the cold steady-state consumption. Tesla has studied the impact on this change and found it to decrease consumption by an average of 0.5% compared to the methodology used for other fuel types as shown in Appendix 2, of Tesla's CBI submission. [EPA-HQ-OAR-2019-0055-1219-A1, p.21]

163 EPA, Final Technical Support Document Fuel Economy Labeling of Motor Vehicles: Revisions to Improve Calculation of Fuel Economy Estimates (Dec. 2006) at 220.

Tesla appreciates the acknowledgement of the differences in warm-up times and the desire to reduce test burden, but Tesla believes the agency is heading in the wrong direction with these proposed changes. EPA's goal should be to encourage automakers to produce more efficient vehicles. Since most BEVs will not achieve steady state operating condition during the first 2 cycles, if EPA's proposed change is adopted, it will disincentivize manufacturers to improve their steady-state consumption in the cold. In fact, it could do the opposite and encourage them to make the consumption worse in hopes of reducing the cold start fuel penalty. Tesla believes the actual stabilized cold consumption is an important aspect to capture in the five-cycle methodology. [EPA-HQ-OAR-2019-0055-1219-A1, p.21]

If EPA is hoping to reduce test burden while also capturing the steady-state consumption during cold city driving conditions without conducting a full cold depletion, Tesla highly recommends that EPA consider an asymptotic convergence criterion for stopping the CTTP. Our simple proposal is to stop the CTTP when the consumption has stabilized and take the average consumption over the last few cycles as the cold running consumption. If we consider the proposal of stopping when the latest cycle consumption is within 3% of the running consumption of the last three cycles (as shown in Tesla's CBI submission Appendix 2, on the 2022 Tesla Model 3 Long Range AWD) we could reduce the number of cycles driven in the CTTP from 41 to 5 (88%) with only a 2.1% increase in Cold Running Consumption, which translates to a 0.4% change in range/MPGe. With this proposal, we would be in the same accuracy region as ICE vehicles in the original proposal. Tesla believes a procedure such as the one proposed could accomplish the EPA's goals of reducing test burden while more accurately capturing the true steady-state cold energy consumption. [EPA-HQ-OAR-2019-0055-1219-A1, pp.21-22]
Applying the Tesla proposed convergence criterion methodology for all other currently Tesla vehicles, we get an average impact of -0.1% with an average reduction of CTTP test cycles by 85% as shown in Appendix 2, in the Tesla CBI submission. [EPA-HQ-OAR-2019-0055-1219-A1, p.22]

The proposed asymptotic convergence criterion by Tesla accomplishes the EPA's goal of capturing the warmed up consumption in the cold while significantly reducing the testing burden with only 0.1% impact to the overall MPGe on average. The method proposed here is also much more robust to different vehicle architectures with larger battery packs and cabins than specifying an arbitrary number of cycles to conduct the testing. Tesla urges the EPA to consider further study this proposal as an efficient way to reduce testing burden while accurately capture the warmed-up cold consumption. [EPA-HQ-OAR-2019-0055-1219-A1, p.22]

Tesla would also like to urge the EPA to consider revamping the 5-cycle testing methodology to capture important effects that are not yet captured in the current regulations specifically related to BEVs. Tesla is open to working with the EPA together to support a new testing standard that captures all the important considerations for BEV customers instead of making minor revisions to existing standards that were not originally developed with BEVs in mind. [EPA-HQ-OAR-2019-0055-1219-A1, p.22]

Namely, Tesla firmly believes that the range and MPGe should be decoupled from each other. The two values represent different types of driving concerns that should not be linked. Customers generally care about range on long trips where their behavior more closely mimics highway driving, while MPGe should more accurately capture the lower speed stop and start nature of day-to-day driving. Tesla also believes that the label should be broken out based on temperature to give customers a more accurate representation of the consumption they should expect under cold conditions, given that it is a large deterrent for customers from colder climates. Other governments around the world have taken the lead in showing cold consumption estimates on their label (Tesla will refrain from commenting on their methodology here). If customers in the U.S. had information for how BEVs performed in the cold relative to ambient conditions that were backed by a governing body, it could give customers more confidence in their buying choice and help meet the federal government's goal of increasing the share of electric vehicle sales on the road. [EPA-HQ-OAR-2019-0055-1219-A1, p.22]

C. EPA Proposal: E*PA is proposing to update the SAE J1634 standard referenced in 40 CFR part 600 from the 2012 version to the 2017 version. This update will require manufacturers to use 65 mph for the constant speed cycles of the MCT. In addition, this update will allow manufacturers to use the BEV 5-cycle adjustment factor methodology outlined in Appendices B and C of the 2017 version of SAE J1634 with the revisions described below.*164 [EPA-HQ-OAR-2019-0055-1219-A1, p.22]

Tesla supports the regulations update to reference the 2017 version of SAE J1634 that requires the constant speed cycles to be conducted at 65 mph, but Tesla urges the EPA to instead adopt the latest published version of SAE J1634 from April 2021. The April 2021 revision represents the industry's best understanding of the real world use of BEVs and how to test them. [EPA-HQ-OAR-2019-0055-1219-A1, p.22]

164 87 Fed. Reg. at 17631/3

D. EPA Proposal: *The Agency is also proposing additional changes to the procedures outlined in the 2017 version of SAE J1634 including: Specifying a maximum constant speed phase time of 1 hour with a minimum 5-minute soak following each one-hour constant speed phase; specifying the use of the methods in Appendix A of the 2017 version of SAE J1634 to determine the constant speed cycle's total time for the mid-test constant speed cycle; and, specifying that energy* *depleted from the propulsion battery during key-off engine soak periods is not included in the useable battery energy (UBE) measurement.*165 [EPA-HQ-OAR-2019-0055-1219-A1, p.23]

165 87 Fed. Reg. 17632/1-2

Tesla does not support these changes to the regulations. First, Tesla does not agree that mandating breaks during the CSCM is necessary or represents the real-world driving behavior. If a manufacturer or an independent test lab can perform the complete CSCM without taking a break, they should not be required to take a break. Mandating a 5-minute break every hour will introduce another source of error by increasing the number of instances where a test operator needs to act and potentially result in an invalid test. [EPA-HQ-OAR-2019-0055-1219-A1, p.23]

E. EPA Proposal: *Manufacturers predetermine estimates of the mid-test constant speed cycle distance (dM) using the methods in SAE J1634, Appendix A.*166 [EPA-HQ-OAR-2019-0055-1219-A1, p.23]

166 87 Fed. Reg. 17632/1

Tesla believes that each manufacturer should be given the flexibility to determine the length of the CSCM using their own methodology. Specifying the exact calculation procedure is unnecessary and will stifle innovation in this domain. Better methods (than those detailed in Appendix A of SAE J1634 2017) exist and manufacturers should be able to use them if they are capable. For example, the calculation in Appendix A of SAE J1634 2017 uses a target speed of 65 mph to calculate the time necessary to complete the target distance. What is not accounted for is if the vehicle is not driven exactly at 65 mph but instead driven at speeds closer to 67 mph, the CSCM will experience both a higher consumption and a larger distance travelled than intended, potentially creating an invalid test if we were to run out of energy during the second dynamic section. Tesla can monitor its cars remotely and can switch from the CSCM to the dynamic section when necessary by measuring the appropriate signals. This helps ensure repeatability on our end and significantly reduces the likelihood of us running out of energy during the second dynamic section, creating an invalid test. [EPA-HQ-OAR-2019-0055-1219-A1, p.23]

F. EPA Proposal: *Discharge energy that occurs during the key-off soak periods is not included in the useable battery energy.*167 [EPA-HQ-OAR-2019-0055-1219-A1, p.23]

167 Id.

Tesla disagrees that the energy during the key-off soak periods should be excluded from the UBE measurement. This proposal seems to be in direct contrast to the true intent of measuring UBE, which is to determine the totality of the energy available in the HV battery available to the vehicle for driving. If the energy during breaks is excluded, it would result in an artificial and arbitrary limit to the total range and give a false impression to the user about the true capability of the vehicle. Moreover, by including the energy during the CSCM break in the UBE, we can realize the EPA's goal of reducing testing variability by ensuring that no matter how the CSCM is conducted, each laboratory should be able to recreate the same energy number. [EPA-HQ-OAR-2019-0055-1219-A1, p.23]

EPA Summary and Response

Auto Innovators, Volkswagen, and Tesla recommended revising the proposed rule to reference the 2021 version of SAE J1634 to harmonize BEV test procedures with the California Air Resource Board and capture the current best understanding of real-world effects for BEVs. Auto Innovators also requested the option to allow use of the Short Multi-Cycle Test (sMCT) and the Short Multi-Cycle Test Plus Steady State (sMCT+) procedures to harmonize with CARB and significantly reduce laboratory test burden associated with BEV testing, while providing equivalent test results.

> It is EPA's understanding California will allow manufacturers to utilize the SMCT, SMCT+, MCT, or SCT procedure to determine in-use BEV range values as part of California's proposed BEV durability requirements beginning in the 2026 MY. California retains the right to perform any of the test procedures. While California allows manufacturers to submit data utilizing the SMCT and SMCT+ test procedures, California may not utilize those procedures when performing their battery durability testing on the same vehicles.
>
> Currently EPA BEV testing regulations are used to determine BEV range and MPGe for fuel economy labeling, the Agency currently does not have BEV durability requirements similar to the requirements proposed by California. California's proposal is for in-use vehicles to be tested to determine whether the vehicle meets the California battery durability requirement. Manufacturer generated data submitted to EPA is used to determine fuel economy label values and EPA routinely performs confirmatory testing on BEVs.
>
> The Agency is currently evaluating the updated test procedures in the 2021 version of J1634. The Agency needs to understand if the different procedures produce different test results. The Agency needs to understand prior to adopting the updated standard if any differences in vehicle performance and UBE are observed between the SMCT, SMCT+, MCT, and SCT test procedures. Prior to adopting the 2021 updates to SAE J1634 EPA believes it is important to understand these differences and the potential impact on range and MPGe label values.
>
> EPA notes the Auto Innovators did not provide data supporting the conclusion that the SMCT and the SMCT+ test results were equivalent with each other and with the 2017 J1634 version MCT test procedure. The Agency is aware that there is very little publicly available test data that could be used to conclude the procedures produce equivalent test results.
>
> EPA understands managing propulsion battery temperature is important for battery durability, vehicle performance, and energy efficiency. Current EPA regulations and the proposed update to the 2017 version of J1634 do not allow for the use of thermal conditioning during the cold soak portion of the Cold Temperature Test Procedure (CTTP or 20°F charge depleting UDDS).

The Agency does not agree with the Auto Alliance's assertion that the current regulations and policy "restrict emerging technologies that could improve real-world performance and efficiency." The Agency understands that many BEVs available today have remote start and battery and cabin preheating features. These features have been introduced by the manufacturers without the benefit of these features being captured during the CTTP and used to determine the 5-cycle adjustment factor. In addition, significant investments are being made by industry to develop higher efficiency HVAC systems for BEVs including adopting heat pumps. The improvements due to the higher efficiency HVAC systems are captured when performing 5-cycle adjustment factor testing.

The fuel economy label essentially serves two purposes: (1) to provide consumers with a basis on which to compare the fuel economy of different vehicles, and (2) to provide consumers with a reasonable estimate of the fuel economy they can expect to achieve (71 FR 77873). EPA extended fuel economy labeling requirements to BEVs beginning in the 2013 MY with the adoption of the NHTSA/EPA Revisions and Additions to Motor Vehicle Fuel Economy Label Final Rule in July 2011 (76 FR 39478). The 2011 rule further extended the capability to compare fuel economy not only from vehicles using the same fuel, but to vehicles using different fuels including BEVs with the adoption of the equivalent MPG (MPGe) value for vehicles using non-liquid fuels. For the fuel economy comparisons to be relevant it's important that the estimates are determined as EPA has noted in prior rulemakings 'using a "common yardstick" – that is the same test run under the exact same set of conditions, making the fuel economy estimates a fair comparison from vehicle-to-vehicle' (71 FR 77874).

At this time the Agency is not prepared to adopt the 2021 version of SAE J1634. The Agency is evaluating the new test procedures (SMCT and SMCT+) to ensure they produce results equivalent to those generated using the existing SCT and MCT test procedures. In addition, the Agency is assessing the use of pre-conditioning the battery and cabin of BEVs prior to performing tests. The Agency is not prepared to adopt preconditioning for BEVs during the soak period prior to starting the drive cycle for the CTTP. The intent of the 12- to 36-hour cold soak period prior to the start of the drive cycle for the CTTP is to stabilize the vehicle and its components at 20°F prior to starting the driving portion of the test. While BEVs have technology and operating modes designed to precondition the battery and cabin while the vehicle is soaking, for this technology to function the vehicle must have access to a dedicated EVSE and the operator must enable this operation. The Agency does not expect that a predominance of BEVs will have access to a dedicated EVSE while the vehicle is 'cold soaking' prior to many cold starts and the operator will also have enabled the preconditioning mode. Therefore, the Agency is not prepared to adopt the 2021 version of SAE J1634.

Auto Innovators, General Motors, and Volkswagen requested that EPA remove proposed requirements explicitly prohibiting thermal conditioning to avoid restricting emerging technologies that could improve real-world performance and efficiency (for example, under extreme cold start conditions during short trip city driving). Manufacturers further requested that EPA consider allowing them to incorporate new thermal-conditioning technologies as part of the 5-cycle test procedure approval process, based on the manufacturer's demonstration that the technology represents real-world operation (such as through default settings, instructions from the manufacturer, or demonstrated in-use behavior). General Motors further suggested that modifying the regulation to account for thermal-conditioning technologies would incentivize manufacturers to motivate customers to adopt better charging practices, which could also become important to enable future transformative network improvements such as smart grids.

> EPA recognizes the Agency allows test procedures to be modified based on determinations that the test procedure modification is something that will occur in customer operation based on default operation or demonstrated real-world usage. One current example relates to the use of premium grade fuel when performing testing to demonstrate compliance with EPA's criteria pollutant standards. With the adoption of the Tier3 regulation EPA revised the test fuel specifications for demonstrating compliance with criteria emissions. EPA revised the fuel specification so that it more closely matched commercial fuel. Compared to the Tier 2 test fuel, the Tier 3 test fuel has a lower octane rating and includes 10% ethanol. The Agency, however, does allow manufacturers to perform certification testing using a premium fuel when the manufacturer conditions the warranty on use of premium gasoline. Based on broad market availability of premium fuel and the manufacturer informing their customer that the powertrain warranty requires use of the premium fuel, the Agency allows manufacturers to use premium fuel for certification testing.
>
> While EPA believes a manufacturer could instruct a BEV owner to 'precondition their vehicle' by plugging it into an EVSE while the vehicle is parked and the ambient temperature is below a specified cold temperature, the Agency believes this will not occur for many of the cold temperature parking conditions BEVs will encounter. It is the Agency's understanding that this type of conditioning occurs only while the vehicle is connected to the EVSE and consuming power from the electric utility which will require the owner to locate and connect to an EVSE during extended parking periods. BEV owners who commute to a workplace will experience an extended soak at home and at their workplace. The Agency would expect BEV owners, who also live in a single-family home would have the ability to ensure their BEV is plugged in and the vehicle is programmed to precondition the battery during the overnight cold soak. BEV owners that live in communities without a specified parking spot most likely do not have 24-hour access to an EVSE. These BEV owners therefore would most likely not be able to ensure the vehicle is connected to the EVSE and programmed to maintain the battery temperature during the overnight soak. In addition, at the workplace the vehicle will most likely not have access to a dedicated charger. Therefore, the daily cold soak at the workplace will most likely not include battery preconditioning.
>
> The Agency is not prepared to adopt preconditioning for BEVs during the soak period prior to starting the drive cycle for the CTTP. The intent of the 12- to 36-hour cold soak period prior to the start of the drive cycle for the CTTP is to stabilize the vehicle and its components at 20°F prior to starting the driving portion of the test. While BEVs have technology and operating modes designed to precondition the battery and cabin while the vehicle is soaking, for this technology to function the vehicle must have access to a dedicated EVSE and the operator must enable this operation. The Agency does not expect that a predominance of BEVs will have access to a dedicated EVSE while the vehicle is

‘cold soaking’ prior to many cold starts and the operator will also have enabled the preconditioning mode. Therefore, the Agency is not prepared to adopt the 2021 version of SAE J1634.

The possibility exists a manufacturer may decide to consume stored battery energy to precondition the battery depending on the ambient temperature, the battery temperature when the vehicle is parked, and other factors. Using stored battery energy for preconditioning the battery temperature also has not been addressed in either EPA regulations or SAE J1634. If a manufacturer were to implement such a strategy, the Agency would expect the energy consumed during the extended cold soak prior to the CTTP would need to be measured and captured as DC discharge energy. The current BEV CTTP procedure does not require measuring BEV DC discharge energy during the extended cold soak prior to performing the CTTP since it is assumed the BEV goes into sleep mode during the extended cold soak and consumes minimal to no electrical energy during this time. If a vehicle does not go into a minimal to no energy consumption condition during an extended cold soak while not connected to an EVSE and this energy is used for conditioning any vehicle components, including the battery or the cabin, the Agency would want to work with the manufacturer to determine a means to capture this energy consumption and include it in the measured DC energy as part of the test procedure.

The Agency is not aware of any vehicles which when not plugged into an EVSE will consume stored energy to maintain the temperature of the battery during extended cold soaks.

<u>Auto Innovators had the following comments on the changes proposed in 40 CFR 600.116-12:</u>

§600.116-12(a)(2)(i) Auto Innovators request that EPA omit the 15 second idle energy from the highway cycle energy consumption. Including the idle in the highway phase data does not align with the highway test for ICE vehicles. The idle energy should be included in the overall Usable Battery Energy (UBE).

We agree that the BEV measurement procedure should align with testing for engine-equipped vehicles, for which emission sampling starts at the beginning of the HFET cycle. We have amended the regulation accordingly. With respect to UBE, the 2017 version of SAE J1634 specifies UBE as the summation of the measured DC discharge energy for the MCT drive cycles. As the commentor noted, the measured portion of the HFET does not include the idle period before starting the HFET. In addition, the measured portion of the UDDS does not include the idle period following the UDDS; this 15 second idle is therefore not included in either the UDDS or HFET energy consumption and therefore is also not included in the UBE.

§600.116-12(a)(4) Auto Innovators request that EPA remove the requirement to use Method 1 or Method 2 described in SAE J1634 Appendix A to estimate the mid-test constant speed cycle distance (dM). Manufacturers are developing methods to calculate dM to ensure that the CSCe distance is less than 20% of the overall distance, with margin to reduce the risk of invalid tests. Requiring the methods from SAE J1634 will require process changes and may result in less accurate determination of dM.

EPA is adding an additional option allowing manufacturers to determine mid-test constant speed distance using a method based on good engineering judgment, or using the methods outlined in Appendix A. *§600.116-12(a)(5)* Auto Innovators request that EPA clarify the requirement to perform a minimum 5-minute key-off soak at the conclusion of each mid-test constant speed phase; specifically regarding the need for key-off before the dynamic UDDS3 segment.

As noted in Section 6.6 of the 2017 version of SAE J1634 the phase breaks during the constant speed cycle require a 5- to 30-minute key-off soak period. The Agency is setting the other soak periods (key-on and key-off) equivalent to those outlined in the 2017 version of SAE J1634. Therefore, at the conclusion of the mid-test constant speed cycle, the vehicle does not need to have a key-off pause before starting UDDS3.

§600.116-12(a)(8) Auto Innovators requested that all energy measured during the entire test be included for determining usable battery energy (UBE). Auto Innovators stated that the UDDS and HFET cycles are used to calculate energy efficiency over these cycles, and that the remaining test is used to determine total DC discharge energy. Auto Innovators also stated that including all energy measured during the test, including key-off soaks and idles, represents the UBE stored in the battery.

This request is inconsistent with SAE J1634. UBE is the summation of the battery energy captured during the measured phases of the MCT. DC discharge energy is not measured during the key-off soak periods.

As noted in §1066.425(e), sampling for a drive cycle concludes when the vehicle is shut down at the conclusion of the drive cycle and the sampling response time elapses. SAE J1634 does not specify a response time for the DC discharge energy measurement; the standard does specify a maximum integration time of 0.05 seconds. Therefore, the measurement of each cycle concludes once the vehicle speed reaches 0 mph at the conclusion of the drive cycle. SAE J1634 defines UBE as the total DC discharge energy (Edc_{total}) measured for a full discharge test. SAE J1634 also defines Edc_{total} as the sum of all discharge energies for all phases of a test. The key-off soak periods occur before or after a measured phase or cycle. As the key-off soak periods are not measured periods of drive cycles, we are writing the final rule to exclude the key-off battery discharge from the UBE measurement.

§600.116-12(a)(11)(i), (iii), and (iv)(D) Auto Innovators requested that EPA modify the proposed regulation by delaying the requirements to perform the 20 °F charge-depleting UDDS with a 10-30 minute key-off soak period between each UDDS cycle, and the requirement to perform the 20 °F test using two UDDS cycles. Auto Innovators stated that the change to the regulation should be optional through model year 2025 to allow manufacturers enough lead time to address any potential issues, make any necessary upgrades, and to train testing personnel. Auto Innovators further requested that, to the extent EPA delays implementation of the requirement to perform cold temperature testing with two UDDS cycles, EPA should also delay the requirement to use the modified equation for “RunningFC” to calculate city fuel economy.

Rivian recommended allowing additional lead time beyond model year 2024 for manufacturers to implement the proposed requirement to perform only two UDDS cycles when running the CTTP to generate a BEV 5- cycle adjustment factor.

We agree that the timing of the final rule does not allow adequate lead time for manufacturers to comply with the updated requirements for model year 2024. We are changing the final rule to require manufacturers to meet the new requirements starting in model year 2025.

Rivian recommends changing the proposed requirement to perform only two UDDS cycles when running the CTTP to generate a BEV 5- cycle adjustment factor to instead provide manufacturers with options for a different amount of driving as part of the BEV procedure. Rivian specifically recommends allowing up to six UDDS cycles when running the CTTP.

Volkswagen objected to the proposed change to §600.116-12(a)(11) and requested that EPA instead preserve the option of performing a full charge-depletion 20 °F cold test beyond model year 2024. Volkswagen stated that removing the option to perform a full charge-depletion 20 °F cold test would no longer allow manufacturers to demonstrate the efficiency improvements of technologies more prevalent in the full charge-depletion test procedure, which would create a barrier to investment in advanced technologies.

> As noted in the preamble to the notice of proposed rulemaking (87 FR 17632), allowing BEVs to perform a full charge-depletion Cold Temperature Test Procedure (CTTP) creates test procedure differences between BEVs and non-BEVs. The intent of the CTTP is to capture the performance of vehicles under extreme cold-start conditions for the shorter trips associated with city driving. The NPRM proposed two options for BEV CTTP tests: (1) testing vehicles on two UDDS cycles with a 10-minute key-off soak between the cycles, or (2) follow the existing CTTP test procedure by running one UDDS cycle followed by a 10-minute soak and then running one Bag 1 phase from the second UDDS cycle. Performing more than two UDDS cycles during the CTTP does not represent extreme cold-start short-trip urban driving, which is the activity the CTTP captures for fuel economy labeling.

Tesla disagrees with the requirement to perform a 10-minjute key-off soak between each UDDS cycle. Tesla stated that enforcing a 10-minute key-off soak during the CTTP will increase the test length of the CTTP by approximately 45% and impact the cold running consumption by 4.5% and overall consumption by 0.5%, along with an increase in test burden with little impact to the overall sticker range/MPGe. Additionally, Tesla proposes that EPA only require retesting on new vehicle lines or existing vehicle lines with product changes significantly affecting fuel economy. Tesla stated that, for vehicle lines substantially similar to the previously certified Model Year, EPA should allow carry-over of data from previous Model Year to reduce testing burden.

> The Agency has identified two testing procedural issues with the Charge Depleting Cold Temperature Test Procedure (CD CTTP) for BEVs as outlined in the 2017 version of J1634. The primary procedural issue is using a full charge depletion test to determine the average UDDS energy consumption for the running fuel consumption calculation. The second procedural issue when allowing a full charge depletion is to not require the 10-minute soak between UDDS cycles following the second UDDS cycle. The CTTP is designed to capture short trip urban driving, which typically consists of multiple short trips with variable soak times between each trip. To not include the soak period after each UDDS cycle except between the first and second UDDS cycles is not representative of the driving experience the CTTP test is designed to capture. As noted by Tesla's analysis, not including the 10-minute soak period improves BEV efficiency as the vehicle does not lose heat.
>
> It was not the intent of the Agency to force all BEVs to perform new CD CTTP testing for model year 2023. The Agency intended for any new CD CTTP testing to be

performed with the 10-minute soak occurring between each UDDS cycle. As proposed this change in the CD CTTP test procedure would create a discrepancy between vehicles tested using the 5-cycle procedure prior to model year 2023 and vehicles tested in model year 2023. The Agency also agrees with Tesla that this change to the CD CTTP would add additional test burden due to the length of the CD CTTP for long range BEVs.

The Agency has concluded not to move forward with this proposal for a single model year for the reasons described above. If the Agency were to move forward with this proposal, the 5-cycle test procedures would be different between vehicles tested for model year 2023 and vehicles using carry-over fuel economy label data from model years prior to 2023. This is not consistent with the Agency's objective of maintaining test procedure consistency for fuel economy labeling.

Tesla is concerned that the proposed testing changes in §600.116 are not in the spirit of the significance of the Cold Temperature Running Fuel Use as originally proposed in the EPA's 5-cycle support document. Tesla observed that EPA's 5-cycle support document explicitly assumes that the vehicle is fully warmed up by the end of Bag 1 of the FTP. Tesla urges that EPA reconsider the proposal and not put BEVs at a disadvantage relative to other fuel types. Tesla believes that the two UDDS cycles are insufficient to capture the cold steady-state consumption. Tesla stated EPA's proposed change would disincentivize manufacturers to improve their steady-state consumption in the cold. Tesla believes the actual stabilized cold consumption is an important aspect to capture in the five-cycle methodology.

Tesla highly recommends that EPA consider an asymptotic convergence criterion for stopping the CTTP. Our simple proposal is to stop the CTTP when the consumption has stabilized and take the average consumption over the last few cycles as the cold running consumption.

Tesla would also like to urge EPA to consider revamping the 5-cycle testing methodology to capture important effects that are not yet captured in the current regulations specifically related to BEVs. Namely, Tesla firmly believes that the range and MPGe should be decoupled from each other. Tesla stated that the two values represent different types of driving concerns that should not be linked and that, if customers in the U.S. had information for how BEVs performed in the cold relative to ambient conditions that were backed by a governing body, customers would have more confidence in their buying choice.

As noted in the Final Technical Support Document (Final Technical Support Document: Fuel Economy Labeling of Motor Vehicle Revisions to Improve Calculation of Fuel Economy Estimates, December 2006, EPA-420-R-06-017), the Agency understood that vehicles using spark-ignition internal combustion engines did not reach fully warmed up operating temperatures during Bag 2 and Bag 3 of the 20°F FTP, or Cold Temperature Test Procedure (CTTP). The following language is from the Final TSD:

"As discussed in detail in the Draft Technical Support Document to the NPRM, it is not clear that vehicles are fully warmed up during Bags 2 and 3 at 20°F. However, as described above, the average city driving trip is only 4.1 miles, well below that of the FTP (7.5 miles). Thus, Bags 2 and 3 of the cold FTP provide a reasonable estimate of warmed up driving during city-like driving (i.e., the vehicle is warmed up to the extent that it typically reaches during short trips). The effect of cold temperature on [running] fuel use during city driving can be estimated from the difference in fuel use over Bags 2 and 3 of the FTP at 20°F and that at 75°F." (EPA-420-R-06-017, December 2006, pg. 78)

The intent of the CTTP and its use in the 5-cycle equation was to capture the running fuel consumption observed during average city driving. As the average city trip was determined at the time of the 5-cycle fuel economy label rulemaking to be 4.1 miles, bags 2 and 3 of the CTTP are representative of 'running' as opposed to 'cold start' vehicle operation (Bag 1) during an average city trip. The intent for these data in the fuel economy label calculation is to capture the running fuel consumption of the vehicle, during a city trip and not to determine the fully warmed up energy consumption at the colder ambient temperature. This criterion applies to all vehicles, independent of the power source.

To reduce the CTTP test burden Tesla proposes to stop the CTTP once the BEV's energy consumption has stabilized and take the consumption over the last few UDDS cycles for the running fuel consumption calculation. Tesla indicates this would require approximately 5 to 7 UDDS cycles. The Tesla proposal would use the energy consumption measured after the vehicle has driven anywhere from 3 to 5 UDDS cycles to represent the energy consumption occurring during the first two UDDS cycles.

The Tesla proposal would have the running fuel consumption used to represent city driving be measured after the vehicle has driven a minimum of 22.5 miles. As this value is intended to represent the running fuel consumption on a city trip which is typically much shorter than 22.5 miles, this procedure would not generate representative fuel consumption data for an average city trip during cold ambient conditions following a cold soak.

Tesla is also requesting the Agency revise the 5-cycle regulations specifically for BEVs. The Agency is not currently considering any further revisions to the 5-cycle regulations, beyond the changes adopted in this rulemaking.

Tesla does not support changing the regulation to (1) specify a maximum one-hour constant-speed phase time with a minimum 5-minute soak after each phase, (2) specify methods to determine the total time for the mid-test constant speed cycle, and (3), specify that energy depleted from the propulsion battery during key-off engine soak periods is not included in the useable battery energy (UBE) measurement. First, Tesla does not agree that mandating breaks during the CSCM is necessary or represents the real-world driving behavior. Tesla stated that, if a manufacturer or an independent test lab can perform the complete CSCM without taking a break, they should not be required to take a break, instead of introducing another source of error.

EPA believes it is appropriate to require breaks during the constant-speed portion of the MCT. SAE J1634 allows for breaking the constant speed cycles into phases and the Agency has concluded that it is appropriate to have a consistent approach to the operation of the vehicle during the constant-speed portion. The Agency believes allowing drivers to take a break after an hour of constant-speed driving is appropriate and will not add significant time to the MCT procedure and will reduce driver/operator fatigue.

Tesla believes manufacturers should be allowed to determine the length of the CSCM for their own testing, and that specifying the exact calculation procedure is unnecessary and will stifle innovation in this domain. Tesla stated that better methods exist and manufacturers should be able to use them if they are capable. Tesla suggested as an example that SAE J1634 2017 uses a speed value of 65 mph to calculate the time necessary to complete the target distance, but it does not account for the fact that the CSCM will experience both a higher consumption and a larger distance travelled than intended if vehicle speed is closer to 67 mph than 65 mph, potentially creating an invalid test. Tesla can switch from the CSCM to the dynamic section when necessary, which helps ensure repeatability and significantly reduces the risk an invalid test resulting from running out of energy during the second dynamic section.

EPA agrees with this comment and will include an additional option for determining the length of the CSCM. The additional option is for the manufacturer to determine the appropriate length using good engineering judgment. This will allow manufacturers to innovate and utilize their extensive knowledge and understanding of their products to determine the appropriate length of the CSCM.

Tesla believes energy during the key-off soak periods should be included in the UBE measurement to reflect the true intent of measuring UBE, which is to determine the totality of the energy available in the HV battery available to the vehicle for driving. Tesla stated that, excluding energy during breaks would result in an artificial and arbitrary limit to the total range and give a false impression to the user about the true capability of the vehicle. Tesla also stated that they can reduce test variability by including the energy during the CSCM break in the UBE.

UBE is defined in the 2017 version of SAE J1634. UBE is defined as the total DC discharge energy (Edc_{total}), measured in DC watt-hours for a full discharge test. The UBE represents the total deliverable energy the battery can provide while a vehicle follows test cycles on a chassis dynamometer. As noted in the definition, UBE is measured while the vehicle is following test cycles. The measured portion of each phase does not include the key-off portion of test cycle. This is the case for all vehicles, independent of whether they use electricity or another fuel.

32.2 Miscellaneous amendments for light-duty vehicles

Comments by Organizations

Organization: *Alliance for Automotive Innovation (Auto Innovators)*

40 C.F.R. 86.117-96 Evaporative emission enclosure calibrations.

We request a correction to the proposed methanol mass equation in 86.117-96(d) by replacing the following NPRM proposed equation: [See equations at docket number EPA-HQ-OAR-2019-0055-1303-A1, p. 2]

$$M_{CH3OH} = V_n \times \left[\frac{\left(TE_f \times (C_{MS1f} \times AV_{1f}) + (C_{MS2f} \times AV_{2f})\right)}{V_{Ef} \times T_{SHEDf}}\right] - \left[\frac{\left(TE_i \times (C_{MS1i} \times AV_{1i}) + (C_{MS2i} \times AV_{2i})\right)}{V_{Ei} \times T_{SHEDi}}\right] + \left(M_{CH3OH,out} - M_{CH3OH,in}\right)$$

With the following corrected equation:

$$M_{CH3OH} = V_n \text{ x } \left[\frac{TE_f \text{ x } \left((C_{MS1f} \text{ x } AV_{1f}) + (C_{MS2f} \text{ x } AV_{2f})\right)}{V_{Ef} \text{ x } T_{SHEDf}}\right] - \left[\frac{TE_i \text{ x } \left((C_{MS1i} \text{ x } AV_{1i}) + (C_{MS2i} \text{ x } AV_{2i})\right)}{V_{Ei} \text{ x } T_{SHEDi}}\right] + \left(M_{CH3OH,out} - M_{CH3OH,in}\right)$$

We also request that an update be made for the Methanol Mass Equation in 86.143-96(b)(1)(i) to align with the corrected equation 86.117-96(d). [EPA-HQ-OAR-2019-0055-1303-A1, p.2]

Additionally, we request a correction for the THC density reference error in 86.143-96(c). The THC density referenced in 1066.1005(f) is based on a hydrogen to carbon ratio of 1.85. As defined in 86.143-96(b)(ii), for evaporative emissions the THC mass assumes a hydrogen to carbon ratio of 2.3. We recommend a THC density with an H/C ratio of 2.3 (576.816 g/m3) be added to 1066.1005(f) and that EPA update the reference in 86.143-96(c) accordingly. [EPA-HQ-OAR-2019-0055-1303-A1, p.2]

<u>40 C.F.R. 86.1823-08 Durability demonstration procedures for exhaust emissions.</u>

Auto Innovators requests the provisions in (m) be optional until 26MY.

Additionally, we request that the following edit be made in (iii):

> (iii) For plug-in hybrid electric vehicles and any other vehicle model the manufacturer determines will experience increased CO2 emissions over the vehicle's useful life, consistent with good engineering judgment, manufacturers must either install aged **<u>batteries and/or other relevant</u> c**omponents on test vehicles as provided in paragraph (f)(2) of this section, determine a deterioration factor based on testing, or provide an engineering analysis that the vehicle is designed such that CO_2 emissions will not increase over the vehicle's useful life. Manufacturers may test using the whole-vehicle mileage accumulation procedures in 86.1823-08(c) or (d)(1), or manufacturers may request prior EPA approval for an alternative durability procedure **<u>or an engineering analysis</u>** based on good engineering judgment. [EPA-HQ-OAR-2019-0055-1303-A1, p.2]

40 C.F.R 600.311-12 Determination of values for fuel economy labels

In this section the phrase 'actual in-use driving conditions' is used. We would like further clarification on the definition of this term or reference to previous section, and clarification on the method or equation used to make the required adjustments. [EPA-HQ-OAR-2019-0055-1303-A1, p.4]

40 C.F.R. 600.512-12 Model year report.

Auto Innovators requested similar revisions in 2020 and supports these proposed changes. [EPA-HQ-OAR-2019-0055-1303-A1, p.4]

Labeling for Battery Electric Vehicles.

Auto Innovators would like to request EPA review testing, labeling and associated processes of vehicles with advanced technology propulsion systems to ensure that drivers of these vehicles are given a clear, concise picture of the capabilities of these vehicles. Testing should be efficient and the labels should be understandable and reflective of understood processes. If items in the testing and labeling process should be updated, EPA should begin to work with stakeholders prior to the Multipollutant Rule to identify what items are outdated and require revision. [EPA-HQ-OAR-2019-0055-1303-A1, p.4]

40 C.F.R 1066.420 Test Preparation.

We agree with EPA's revision to help minimize NMHC contamination in the sampling system for LD diesel vehicles. The language in this section for LD vehicles (below 14,000 lbs GVWR) refers to the HD requirement in 40 C.F.R. 1065.520 (f). 40 C.F.R 1065.520(f)(8) notes that if the initial hang-up in the sampling system exceeds the greatest of the three values shown below, then the source of contamination must be identified and corrective action, such as purging the system, must be performed. [EPA-HQ-OAR-2019-0055-1303-A1, p.5]

(i) 2 % of the flow-weighted mean concentration expected at the HC (THC or NMHC) standard.

(ii) 2 % of the flow-weighted mean concentration of HC (THC or NMHC) measured during testing.

(iii) 2 µmol/mol. [EPA-HQ-OAR-2019-0055-1303-A1, p.6]

The greatest of the three values for light duty will always be the 2 PPM (2 µmol/mol.). For LD, a HC hang-up value on the order of 0.5 PPM is considered high and causes negative drift during testing. The 2 PPM limit is not appropriate for LD testing. [EPA-HQ-OAR-2019-0055-1303-A1, p.6]

Auto Innovators proposes the following change to 40 C.F.R. 1066.420(b)(1)(ii) Perform the contamination verification in paragraph (b)(2) of this section, except use 0.5 µmol/mol in 40 CFR 1065.520(f)(8)(iii) [EPA-HQ-OAR-2019-0055-1303-A1, p.6]

40 C.F.R. 1066.710 Cold temperature testing procedures for measuring CO and NMHC emissions and determining fuel economy.

We support the agency proposal to move the test sequence figure to 40 C.F.R. 1066.710(f). [EPA-HQ-OAR-2019-0055-1303-A1, p.6]

However, it isn't clear what the maximum temperature excursion allowance is during the emissions test. Using the language that is already included in the precondition step, Auto Innovators proposes to improve the clarity of maximum temperature excursion allowed during the emissions test by adding the following to 40 C.F.R. 1066.710(b)(1) At no time may the ambient temperatures be below −12.0 °C or above −1.0 °C. [EPA-HQ-OAR-2019-0055-1303-A1, p.6]

Further, we find it confusing that the high and low limit temperature values aren't equidistant from the nominal value. We suggest simplifying 40 C.F.R. 1066.710 by setting the temperature limits to -7 ± 5 °C for maximum instantaneous excursions and -7 ± 3 °C for three-minute excursions in the text and in the figure for consistency, ease of use, software and hardware implementation. [EPA-HQ-OAR-2019-0055-1303-A1, p.6]

40 C.F.R. 1066.835 Exhaust emission test procedure for SC03 emissions.

Auto Innovators supports the proposed changes in this section as we believe they improve the clarity of the requirements overall. [EPA-HQ-OAR-2019-0055-1303-A1, p.6]

40 C.F.R.1066.1010 Incorporation by reference.

While we support the decision to update to SAE J2263 MAY 2020, we request that the implementation be optional until MY26 to allow time for track and environmental condition updates to be completed. The most recent version contains several updates and tighter tolerances for completion of coast-down testing. These may require construction and testing of new surfaces and hardware. [EPA-HQ-OAR-2019-0055-1303-A1, p.6]

Auto Innovators generally supports the incorporation of the 2021 version of SAE J1634 by reference at 40 C.F.R.1066.1010(b)(2). Incorporating the 2021 revision of SAE J1634 would harmonize BEV test procedures with the California Air Resource Board (CARB) proposed Advanced Clean Cars II test procedures. [EPA-HQ-OAR-2019-0055-1303-A1, p.6]

Organization: *Volkswagen Group of America, Inc., (Volkswagen) (VWGoA)*

40 CFR 86.1823(m) Durability demonstration procedures for exhaust emissions

EPA proposes to add the requirement to generate deterioration factors for CO2 and updates language pertaining to PHEV test procedures.

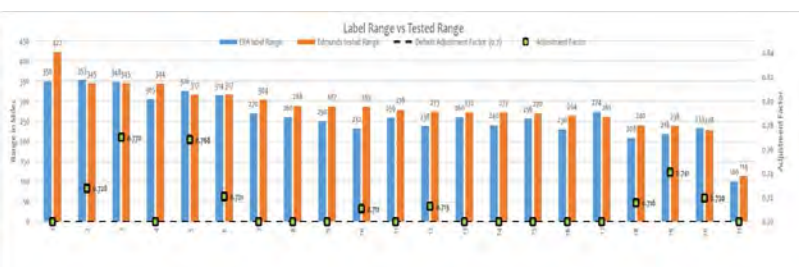
VWGoA requests that EPA allow optional implementation of this until 26MY as this rule will be finalized too close to the start of production for 25MY, and 24MY will already be underway by the time this Final Rule becomes effective.

In subsection (m)(iii) we request the following addition to allow alternative engineering analysis as an alternative durability procedure:

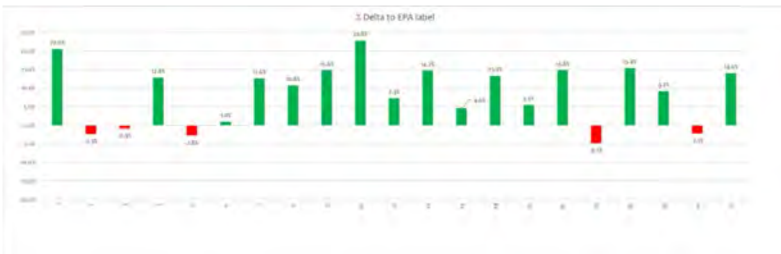
'[…] determines will experience increased CO2 emissions over the vehicle's useful life, consistent with good engineering judgment, manufacturers must either install aged components on test vehicles as provided in paragraph (f)(2) of this section, determine a deterioration factor based on testing, or provide an engineering analysis that the vehicle is designed such that CO2 emissions will not increase over the vehicle's useful life. ~~Alternatively, manufacturers may use~~ Manufacturers may test using the whole-vehicle mileage accumulation procedures in 86.182308 (c) or (d)(1) ~~to determine CO2 deterioration factors~~, or manufacturers may request prior EPA approval for an alternative durability procedure <u>**or an engineering analysis**</u> based on good engineering judgment. [EPA-HQ-OAR-2019-0055-1296-A1, p.1]

<u>40 CFR 600.210-12 (d)(3)(ii)-(iii) Calculation of fuel economy and CO2 emission values for labeling</u>

This section relates to the approval of an adjustment factor for deriving 5-cycle fuel economy results from 2-cycle test data that is based on operating data from their in-use vehicles. As you stated in guidance CD 15-15, the 0.7 factor was no longer to be used for conventional vehicles because it was based on outdated data (then). It remained available for BEVs because there was not enough data to generate a new factor. It has been 7 years since that guidance and BEV models have increased. It is time for EPA to increase this factor. Current research shows that using current model years and real-world driving patterns, this factor could be as high as 0.74. [EPA-HQ-OAR-2019-0055-1296-A1, p.2]



Furthermore, when you look at these 2021MY and 2022MY in terms of differences in the certification range, you see a stark difference to an arguably more real-world test cycle. OEMs should not be penalizing these vehicles right at the time when they are needed most. If this data is not sufficient, EPA should work with OEMs to generate data to update this factor in a meaningful way. [EPA-HQ-OAR-2019-0055-1296-A1, p.2]



Organization: *Rivian Automotive, LLC (Rivian)*

Labeling and Test Groups. EPA should approach the below in both an immediate and longer-term approach including any changes that can be made in this rule, new guidance, or rules ahead of the 2027 LD GHG program.

- Reexamine the label. Consider an approach that focuses on real-world highway driving for range
- Allow for a broader definition of test group including the addition of 2WD and 4WD in the same test group, irrespective of number of motors, with EPA approval.
- Additional test group flexibilities should be examined in light of upcoming battery durability and testing requirements being considered by the California Air Resources Board ("CARB") and POSSIBLE common test group definitions across CARB and EPA.
- Provide an analytically derived range and consumption method specific to EVs.
- Reconsider the default 0.7 adjustment factor to reduce unnecessary test burden and be more reflective of the original 5-Cycle adjustment. This is especially important given the experience gained in implementing EV technology in both hot and cold conditions. [EPA-HQ-OAR-2019-0055-1229-A1, p.6]

Organization: *Edwin J. Ward*

Keeping Section 86.1823-08 as is, with the ultimate goal of ending the light-duty truck loophole

The next source of potential emissions reductions I will address is the enduring light-duty truck emissions loophole. Although this proposed rule is primarily targeted at heavy-duty vehicle emissions, there is nevertheless a section dedicated to light-duty vehicle standards in Section X(E). The light-duty truck loophole allows vehicles not considered heavy-duty, but still larger and heavier than smaller vehicles and sedans, to escape the more stringent emissions requirements of smaller vehicles.10 This loophole dates back to 1975, when few individual drivers were purchasing large trucks for everyday use, and those vehicles were limited to commercial operations.[11] The loophole means that light-duty trucks have to comply with emissions standards that are 34-36% less stringent than the ones that apply to smaller cars like sedans.[11] Unfortunately, a huge proportion of vehicles now sold in the US fall under the light- duty truck loophole. SUVs, pickup trucks, and even some crossovers like the Toyota RAV4 and Honda CR-V are considered light-duty trucks.[11] Last year, twenty of the top twenty-five bestselling vehicles in America were pickups, SUVs, and crossovers, presumably falling into the light-duty truck loophole.[12] [EPA-HQ-OAR-2019-0055-1050]

EPA's proposed rule for light-duty trucks would eliminate the requirement for manufacturers to perform emissions tests with vehicles fully loaded. The proposed revision is quoted in its entirety below:

“Section 86.1823-08: Revising to specify a simulated test weight based on Loaded Vehicle Weight for light light-duty trucks (LDT1 and LDT2). The regulation inadvertently applies adjusted loaded vehicle weight, which is substantially greater and inappropriate for light light-duty trucks because they are most often used like lightly loaded passenger vehicles rather than cargo-carrying commercial trucks. In practice, we have been allowing manufacturers to implement test requirements for these vehicles based on Loaded Vehicle Weight. This proposed revision is responsive to manufacturers' request to clarify test weights for the affected vehicles.” [EPA-HQ-OAR-2019-0055-1050]

This proposed revision is disheartening for two reasons. First, by allowing manufacturers to test light-duty trucks without a full load, EPA is in effect weakening emission standards even further for light-duty trucks, which will widen the already large gap between standards for light- duty trucks and smaller cars like sedans. Manufacturers have fully taken advantage of this loophole over the preceding decades to transform their fleet offerings by heavily investing in large trucks and SUVs, while discontinuing smaller car models. EPA has accounted for this disturbing trend by labeling it simply as “market shift,”[13] despite the fact that modelers have specifically attributed part of the auto industry’s shift to heavier, less efficient vehicles on the loophole.[14] For instance, Ford Motor Company decided in 2020 to axe every single sedan from its lineup[15], leaving exclusively larger, more polluting, and more dangerous[16] trucks and crossovers for its customers.

The second dismaying part of the proposed light duty truck revision is that EPA acknowledges that light-duty trucks are “most often used like lightly loaded passenger vehicles rather than cargo-carrying commercial trucks.” By declaring that trucks should be tested as if they are passenger vehicles, EPA is effectively conceding that the light-duty truck loophole doesn’t make any practical sense. The loophole allows manufacturers to exploit a broken system and undermine potential emissions reductions by simply not making any vehicles subject to the more stringent standards (like Ford did). [EPA-HQ-OAR-2019-0055-1050]

Rejecting the proposed revision to Section 86.1823-08 will not close the light-duty truck loophole. Rejecting it will, however, prevent any further erosion of emissions standards for light-duty trucks until EPA has a chance to propose new light-duty vehicle emission standards that finally, after nearly a half-century, close the loophole. Consequently, I urge EPA to reject the proposed revision to Section 86.1823-08 of the light-duty truck Loaded Vehicle Weight testing standards. [EPA-HQ-OAR-2019-0055-1050]

[Conclusion] In the medium term, EPA should finally close the light-duty truck loophole so manufacturers aren’t incentivized to sell larger, more polluting vehicles. EPA should also evaluate potential idling technologies like start-stop to further reduce emissions. [EPA-HQ-OAR-2019-0055-1050]

EPA Summary and Response

Auto Innovators and EMA requested that EPA correct equations in part 86, subpart B: (1) Correcting the proposed adjustment to the methanol mass equation in §86.117-96(d) by applying the TE_f and TE_i factors to the sum of the subsequent terms, and (2) Update the methanol mass equation in §86.143-96(b)(1)(i) to match the updated equation in §86.117(d).

We agree with the comment and have revised the regulation accordingly.

Auto Innovators and EMA requested a correction for the THC density reference error in §86.143-96(c). Commenters stated that the THC density referenced in §1066.1005(f) is based on a hydrogen-to-carbon ratio of 1.85. Commenters stated that, as defined in §86.143-96(b)(ii), the THC mass for evaporative emissions assumes a hydrogen-to-carbon ratio of 2.3. Commenters recommended adding a THC density with a hydrogen-to-carbon ratio of 2.3 (576.816 g/m^3) to §1066.1005(f) and updating the reference in §86.143-96(c) accordingly.

The proposed rule did not include any changes to density reference errors. Auto Innovators did not provide any data or rationale supporting their recommendation. If there is a need to reconsider hydrogen-to-carbon ratios, we will consider that in a future rulemaking.

Auto Innovators and Volkswagen requested that we amend the proposed regulation at §86.1823-12(m) to make the new provisions optional through model year 2025 to allow manufacturers enough lead time.

> The revisions to §86.1823-12(m)clarify how certification and testing procedures apply in areas that are not entirely specified in current regulations. The amendments in this final rule reflect the procedures EPA and manufacturers have worked out in the absence of the detailed regulatory provisions. We do not see any need to allow additional lead time for these established procedures.

Auto Innovators suggested adding a reference in §86.1823-12(m) to “installing aged batteries and/or other relevant components” instead of referring only to “aged components” for PHEV durability testing.

> We agree that it is appropriate to call out batteries as the specific component of interest, along with other relevant components. There is no need to consider the other relevant components separate from the battery, so we have omitted the “or” from the suggested insert.

Auto Innovators and Volkswagen suggested adding a reference in §86.1823-12(m) to “or an engineering analysis” in the description of the option for manufacturers to request an alternative PHEV durability procedure.

> The proposed regulation set up the sentence in question to describe how the manufacturers have the option to either follow the specified whole-vehicle testing procedures, or do something different based on good engineering judgment. There is no specified limit to what the alternative demonstration might include, other than the need to stay within the bounds of good engineering judgment. Manufacturers might properly apply engineering analysis in conjunction with something other than the specified whole-vehicle testing procedures. We therefore find it unnecessary to insert the extra words in the description of option to pursue an alternative durability procedure. We also don’t see any possibility that an alternative durability demonstration would involve engineering analysis completely separate from testing.

Auto Innovators requested that we clarify the meaning of “Adjust the values to reflect actual in-use driving conditions…” in the proposed §600.311-12, and also clarify how to make the required adjustments.

> We have revised the regulation to instead say “Adjust these values to represent derived 5-cycle values…”. We have also made further editorial changes to more clearly describe the process for adjusting values to give a proper result.

Auto Innovators stated that they supported the proposed changes to §600.512-12 and noted that they had requested that we make changes similar to the proposed changes in 2020.

> We acknowledge this comment supporting the proposed provisions.

Volkswagen suggested that we work with manufacturers to review or generate data as needed to be able to update the 0.7 factor used in §600.210(d) to determine fuel economy and CO_2 values for electric vehicles. Volkswagen suggested that current research would suggest that data may support a factor as high as 0.74. Volkswagen stated that the artificially low value leads manufacturers to penalize electric vehicles a time that they are needed most.

We will consider whether to pursue the suggested amendment in a future rulemaking.

Auto Innovators would like to request EPA review testing, labeling and associated processes of vehicles with advanced technology propulsion systems to ensure that drivers of these vehicles are given a clear, concise picture of the capabilities of these vehicles. Testing should be efficient and the labels should be understandable and reflective of understood processes. If items in the testing and labeling process should be updated, EPA should begin to work with stakeholders prior to the Multipollutant Rule to identify what items are outdated and require revision.

We will consider whether to pursue the suggested amendment in a future rulemaking.

Auto Innovators suggested three separate amendments: (1) Auto Innovators suggested amending 40 CFR 1066.420 to reduce the HC hang-up limit value for LD tests to 0.5 ppm, as the current value of 2 ppm causes negative drift during testing because it is too high for LD testing. (2) Auto Innovators suggested amending 40 CFR 1066.710(b)(1) with the following text to improve the clarity of the specified maximum allowable temperature excursion: “At no time may the ambient temperatures be below −12.0 °C or above −1.0 °C.” (3) Auto Innovators stated that they support updating the regulation to reference the 2020 version of SAE J2263 for coastdown testing procedures, but requested that the implementation be optional until model year 2026 to allow time for completing updates for track and environmental condition updates.

EPA agrees with the reasoning and conclusions in the comments and has amended the final rule accordingly.

Auto Innovators found it confusing that the values for high and low temperatures in 40 CFR 1066.710 are not expressed as a range around a fixed nominal value. They recommended making the change for consistency, for ease of use, and for implementing software and hardware. The specifically suggest setting the temperature limits to -7 ± 5 °C (from the current -12.0 °C to -1.0 °C) for maximum instantaneous excursions and -7 ± 3 °C (from the current -9.0 °C to -4.0 °C) for three-minute excursions.

EPA does not agree with the suggested change. The convention for specifying ranges in the testing regulations, established at 40 CFR 1065.20(f), states that manufacturers must target the nominal value if the range is expressed as a nominal value with a specified range. Alternatively, expressing a range simply as a pair of minimum and maximum values allows manufacturers to complete a successful test by targeting any temperature as long as they stay within the temperature range over the course of the test. The current approach is to specify the range based on the pair of minimum and maximum values. Changing the format of the specified range may require manufacturers to change their current test methods to more carefully control temperatures. We believe this change is neither necessary nor appropriate for testing under 40 CFR 1066.710. Auto Innovators provided no data or other numerical assessment in support of their suggested amendment.

Auto Innovators stated that they support the changes to 40 CFR 1066.835 for measuring exhaust emissions for the SC03 testing.

EPA acknowledges the comment supporting the proposed changes.

Rivian recommends that EPA consider the following near-term and long-term amendments to the regulation: (1) Revise labeling requirements to reflect real-world driving for range, (2) Allow for a broader definition of test group, including the addition of 2WD and 4WD in the same test group, irrespective of number of motors, with EPA approval, (3) Consider additional test group flexibilities in light of upcoming battery durability and testing requirements being considered by the California Air Resources Board ("CARB") and possible common test group definitions across CARB and EPA, (4) Provide an analytically derived range and consumption method specific to EVs, and (5) Reconsider the default 0.7 adjustment factor to reduce unnecessary test burden and be more reflective of the original 5-Cycle adjustment to account for the experience gained in implementing EV technology in both hot and cold conditions.

We will consider whether to pursue these suggested amendments in a future rulemaking.

VW and Auto Innovators request clarification on the proposed requirement to identify driver-selectable modes. Section 1068.50 seems to require manufacturers to include information on each selectable mode as an adjustable parameter. In some vehicles, this could reach hundreds of possible drive modes and user-selectable features to be described in the certification application, creating unnecessary burden to timely review. We recommend that EPA update this section to exclude driver selectable modes such as "sport" or "trailer tow" from this description.

> We note that we did not propose to apply the provisions of 40 CFR 1068.50 to vehicles subject to standards under 40 CFR part 86, subpart S. However, those vehicles are subject to similar requirements under 40 CFR 86.1833-01. As with the Honda comment on rabbit-turtle controls, user-selectable features and the functions controlled by those features are properly considered adjustable parameters under both 40 CFR 86.1333-01 and 1068.50. These features are specifically designed to invite operators to adjust control settings to achieve the desired performance. It is therefore important for manufacturers to comply with standards for all those settings that fall within the physically adjustable range.

Edwin J. Ward commented that EPA should close the "light-duty truck emissions loophole," which has since 1975 allowed passenger vehicles classified as light-duty trucks to meet less stringent emission standards even though their usage is very similar to that for passenger cars. Mr. Ward also objected to the proposed change to decrease the test weight for light light-duty trucks (LDT1 and LDT2), since that further reduces stringency for these vehicles.

> EPA adopted criteria exhaust emission standards for cars and light trucks in the early 1970s, and updated those standards several times since then. The Tier 3 standards that apply today apply equally to all sizes of light-duty vehicles and light-duty trucks. Different measurement procedures and standards apply for heavy-duty vehicles (with gross vehicle weight rating above 8500 pounds). For criteria exhaust emission standards, there is therefore no longer any "light-duty truck emissions loophole.
>
> EPA more recently adopted GHG emission standards that apply separately to cars and light trucks. Those standards were based on a feasibility assessment for the different types of vehicles. We are aware of the significant impact those standards have had on marketing plans for several manufacturers. We are in the process of evaluating new

standards for model year 2027 and later vehicles that will revisit the question of relative stringency for cars and light trucks.

The commenter may also have in mind evaporative and refueling emission standards. The refueling emission standard is expressed in grams of emitted hydrocarbon per gallon of dispensed fuel; the standard of 0.2 g/gal applies equally to all sizes of light-duty and heavy-duty vehicles. The evaporative emission standards continue to allow for higher emissions for the increasing size of light-duty trucks and heavy-duty vehicles. This difference has decreased over the years as the emission standard became more stringent. The remaining difference is generally based on the expected size of fuel tanks and operating characteristics relative to the vehicles' ability to purge evaporative canisters.

Also, to be complete, OBD standards and requirements apply equally for all sizes of light-duty vehicles and light-duty trucks.

Emission standards are most effective for controlling emissions if the measurement procedure most closely represents in-use operation. As described in the proposed rule, we are decreasing the test weight for LDT1 and LDT2 because they are operated more like passenger cars than heavy-duty vehicles. The emission standards adopted for these vehicles were assessed based on the lighter test weights. The proposed change simply corrects an error in the test procedure to more appropriately measure emissions from these vehicles.

32.3 Engine test speed - Small SI Engines

Comments by Organizations

Organization: *California Air Resources Board (CARB)*

U.S. EPA proposed several amendments to Part 1054 regarding testing and certification of Small SI engines at or below 19 kW. [EPA-HQ-OAR-2019-0055-1186-A2, p.132]

With regards to engine test speed, CARB staff suggests that it would make more sense to run the test at the engine's rated speed, and if this speed is not either 3060 or 3600 rpm, to use the special provisions. [EPA-HQ-OAR-2019-0055-1186-A2, p.132]

EPA Summary and Response

Comment Summary	EPA Response
CARB staff suggests that it would make more sense to test at the engine's rated speed, and if this speed is not either 3060 or 3600 rpm, to use the special provisions.	EPA certification depends on testing individual engines to represent families that include a range of engine calibrations, applications, and models. The proposed approach directs manufacturers to test engines within an engine family by grouping them into sets of engines that can be properly represented by testing at 3060 or 3600 rpm. Different test speeds apply for engines with rated speed below 2700 rpm or above 4000 rpm. We believe this approach allows manufacturers to properly and consistently perform testing that best represents engines across their product line.

32.4 Steady-state duty cycles - Small SI Engines

Comments by Organizations

Organization: *American Honda Motor Co., Inc. (Honda)*

1054.505(b)(2)

It should be clarified that 5mode is an option and that additional 5mode testing will not be required for the engines approved in 6mode before (As no definition of Idle, necessity of 5mode testing should be based on manufacturer's GEJ).

If the GEJ is not allowed, 5mode results should be allowed to be calculated from the 6mode results in order to avoid retesting burden. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

1054.505(d)

In determining the worst case of emission when the test mode (5mode or 6mode) and/or test speed (3060rpm or 3600rpm) are different, it should be clarified that it is not necessary to prepare durability engines for all cases, and also the durability conditions during accumulation cycle and EM testing for DF should be allowed to use one representative durability condition determined by manufacturer. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

It should be clarified that no certification tests other than worst case are required. Worst case determinations should be based on GEJ or in-house tests. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

With regards to changes in requirements for engine test speed and duty cycle, it should be clarified that retesting is not required for previously approved specifications, and the carryover is allowed as long as the specifications don't change. [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

Organization: *California Air Resources Board (CARB)*

With regards to steady state duty cycles:

1. CARB staff sees no issue with the multi-mode duty cycle proposed.
2. It is not clear whether there is an advantage to removing the existing ramped-modal test from the regulations, as it may have utility for other kinds of testing, however CARB staff agrees that not adding an additional ramped-modal duty cycle for the new five-mode test is reasonable. [EPA-HQ-OAR-2019-0055-1186-A2, pp.132-133]

EPA Summary and Response

Comment Summary	EPA Response
Honda: 1054.505(b)(2). Clarify that 5mode is an option and that additional 5mode testing will not be required for the engines approved in 6mode before (As no definition of Idle, necessity of 5mode testing should be based on manufacturer's GEJ). If the GEJ is not allowed, 5mode results should be allowed to be calculated from the 6mode results to avoid retesting burden.	The proposed regulation requires five-mode testing for engines that are not designed to idle. If the manufacturer designs all their engines to idle, there is no need to determine emission results over the five-mode cycle. If the manufacturers make some engines designed to idle and some engines not designed to idle, they can measure emissions using the six-mode duty cycle and then simply recalculate a weighted emission result for the five-mode testing using the same testing to generate a six-mode test result. We agree that manufacturers can and will use good engineering judgment to determine whether they have designed an engine to idle.

Honda: 1054.505(d). In determining the worst case of emission when the test mode (5mode or 6mode) and/or test speed (3060rpm or 3600rpm) are different, it should be clarified that it is not necessary to prepare durability engines for all cases, and also the durability conditions during accumulation cycle and EM testing for DF should be allowed to use one representative durability condition determined by manufacturer.	The regulation at 40 CFR 1054.235(a) instruct manufacturers to select a configuration from the engine family that is most likely to exceed the HC+NOx standard, using good engineering judgment. Further, 40 CFR 1054.240(a) establishes that an emission family complies with standards if tested engines representing the family have test results showing deteriorated emission levels at or below these standards. We agree that a manufacturer meet requirements by performing durability testing with a single configuration to represent worst-case full-life emissions. We are revising the regulation to state that the manufacturer's reporting obligation for certification is limited to the worst-case condition between five-mode testing and six-mode testing.
Honda: 1054.505(d). It should be clarified that no certification tests other than worst case are required. Worst case determinations should be based on GEJ or in-house tests.	Manufacturers can select configurations using engineering analysis and good engineering judgment. That analysis may be informed by additional testing. To the extent that manufacturers perform valid certification tests for such additional testing, they would need to report those emissions results in the application for certification.

Honda: 1054.505(d). With regards to changes in requirements for engine test speed and duty cycle, it should be clarified that retesting is not required for previously approved specifications, and the carryover is allowed as long as the specifications don't change.	As always, the amended regulation does not invalidate certificates issued under the regulations that applied at the time. We will approve an application for certification based on carryover test data if the earlier testing complies with current requirements. This means that manufacturers may need to perform testing at different speed settings. They would also need to submit new test results using the five-mode or six-mode duty cycle if that is needed to properly represent a worst-case test configuration for the engine family. The amended regulation is based on provisions that have applied through guidance for many years, so we don’t expect manufacturers to need additional time to meet these requirements. This expectation is reinforced by the fact that engine manufacturers, through their associations, requested that EPA codify the proposed amendments.
With regards to steady-state duty cycles, CARB staff sees no issue with the proposed multi-mode duty cycle. It is not clear whether there is an advantage to removing the existing ramped-modal test from the regulations, as it may have utility for other kinds of testing, however CARB staff agrees that not adding an additional ramped-modal duty cycle for the new five-mode test is reasonable.	We acknowledge the affirmation that the new five-mode duty cycle is appropriate for Small SI engines. We have gained clarity that engine manufacturers will have an enduring lack of interest in testing with ramped-modal duty cycles. We also see no value in preserving the ramped-modal duty cycle for EPA testing separate from what manufacturers do. We are therefore removing the ramped-modal from the regulation, as proposed.

32.5 Engine family criteria - Small SI Engines

Comments by Organizations

Organization: *California Air Resources Board (CARB)*

With regards to engine family criteria, CARB staff sees no issues with the proposed rule. [EPA-HQ-OAR-2019-0055-1186-A2, p.133]

Organization: *Outdoor Power Equipment Institute (OPEI)*

Section 1054.230(b)(8) – How Do I Select Emission Families? OPEI is seeking clarification (additional examples) of what methods of controls for engines may be grouped into an emission family. [EPA-HQ-OAR-2019-0055-1205-A1, p.4]

The example provided in 1054.230(b)(8) may be confusing. It is OPEI's understanding that different fuel injection technologies, such as open and closed-loop fuel injection systems, may be included in the same emission family. OPEI recognizes an exhaustive list of examples is not practical, however, some additional examples or guidance may be helpful to clarify common emission family technology groupings. [EPA-HQ-OAR-2019-0055-1205-A1, p.4]

Organization: *Truck and Engine Manufacturers Association (EMA)*

In addition, in proposed §1054.230(b)(8) an example is included to provide additional guidance to manufacturers. While this example is helpful, EMA recommends that the provision clearly state that in cases where an engine manufacturer sources a component from multiple suppliers, those components being made to the same specifications, the engines produced from those components may be included in the same engine family. [EPA-HQ-OAR-2019-0055-1203-A1, p .133]

EPA Summary and Response

Comment Summary	EPA Response
With regards to engine family criteria, CARB staff sees no issues with the proposed rule.	We acknowledge the lack of objection to our proposed provisions to establish clearer criteria for defining engine families.

OPEI: The example provided in 1054.230(b)(8) may be confusing. It is OPEI's understanding that different fuel injection technologies, such as open and closed-loop fuel injection systems, may be included in the same emission family. OPEI recognizes an exhaustive list of examples is not practical, however, some additional examples or guidance may be helpful to clarify common emission family technology groupings.	The regulation currently specifies that engines should be grouped into a family only if they have the same method of controlling engine operation. We proposed to include an example to establish that port fuel injection with multi-cylinder engines is a fundamentally different control method than carburetion or throttle-body injection, but that these latter two methods are not fundamentally different from each other. We don't see anything confusing about the way we described that principle. We are not ready to identify additional control methods that we should identify as being categorically alike or different. For example, we may consider open-loop and closed-loop systems to be alike or different, depending on whether engines will operate differently when adding the specific designs for a feedback loop with closed-loop fueling.
EMA acknowledges that the example proposed in §1054.230(b)(8) for defining engine family criteria is helpful. EMA recommends that the provision clearly state that in cases where an engine manufacturer sources a component from multiple suppliers, those components being made to the same specifications, the engines produced from those components may be included in the same engine family.	We have always implemented certification requirements across all sectors without requiring manufacturers to create separate families based on sourcing components from different suppliers. We will continue to implement certification this way, and do not believe it is necessary to describe this in the regulation. The regulation instead identifies how manufacturers must group engines that are the same in regard to several defining characteristics.

32.6 Miscellaneous amendments for marine compression-ignition engines

__Comments by Organization__

Organization: *Truck and Engine Manufacturers Association (EMA)*

The proposed modifications to §1042.660(b) require clarification. EPA should define "non-compliant operation" and "appropriate reductant." The provision should also be clarified as being applicable to “all engines on covered vessels even if the engines are certified to U.S. EPA Appendix VI…”

EPA Summary and Response

Comment Summary	EPA Response
EMA requested that we define or clarify the terms “appropriate reductant” and “noncompliant operation” where we amended the reporting requirements in 40 CFR 1042.660(b) related to operation of SCR-equipped engines without urea or other reductant.	The reporting requirement in §1042.660(b) is tied to SCR systems requiring the use of urea or other reductants. The reductant specifications are in turn driven by the manufacturers’ designs and the corresponding operating instructions for users. The regulation properly references “any operation of such vessels without the appropriate reductant.” This means the operator needs to take steps (1) to purchase reductant meeting the engine manufacturer’s specifications, (2) to handle the reductant in a way that prevents it from being diluted, degraded from extended storage or exposure to high temperatures, and (3) to operate the vessel with the appropriate reductant. Similarly, “noncompliant operation” is any operation where the operator fails to take the steps described above.
EMA also requested that §1042.660(b) should be clarified as being applicable to “all engines on covered vessels even if the engines are certified to U.S. EPA Appendix VI…”	The proposed rule already clarified that this reporting requirement applies for all engines on covered vessels even if the engines are certified to Annex VI standards instead of or in addition to EPA standards under part 1042. It is not clear how we can further clarify how the reporting requirement applies for engines subject to different emission standards.

33 Comments outside the scope of the proposed rule

Comments by Organization

Organization: *Alliance for Vehicle Efficiency (AVE)*

The EPA should, however, consider a filter-enforcing particulate standard for Medium Duty gasoline vehicles. This will help the U.S. implement best available technology as done today in

China and Europe, where the PM/PN standards require OEMs to add filters. [EPA-HQ-OAR-2019-0055-1280-A1, p .3]

Organization: *Advanced Engine Systems Institute (AESI)*

EPA should also close the apparent loophole in the Phase II mandate that Diesel Particulate Filters (DPF) be installed on all new vehicles with Auxiliary Power Units (APU) starting in MY 2024, as set forth in 40 CFR 1039.699. APU manufacturers are avoiding the clear intent of the Phase II rule to control PM emissions with significant public health consequences, particularly for frontline communities. The final rule should contain a remedy for this issue. [EPA-HQ-OAR-2019-0055-1281-A1, p. 2]

Organization: *American Honda Motor Co., Inc. (Honda)*

1051.501(C)(2)

In order to be consistent with the specification in 40 CFR 1060.515, Honda proposes to amend as follows:

> *"Prior to permeation testing of fuel line, precondition the fuel line by filling it with the fuel specified in paragraph (d)(3) of this section, sealing the openings, and soaking it for 4 weeks at (23 ± 5) °C. To measure fuel-line permeation emissions, use the equipment and procedures specified in SAE J30 as described in 40 CFR 1060.810. Use the fuel specified in paragraph (d)(3) of this section. Perform daily measurements for 14 days, except that you may omit up to two daily measurements in any seven-day period. Determine your final emission result based on the average of measured values over the 14-day sampling period. Maintain an ambient temperature of (23 ± 2) °C throughout the sampling period, except for intervals up to 30 minutes for weight measurements."* [EPA-HQ-OAR-2019-0055-1348-A2, p. 1]

Organization: *American Lung Association et al.*

US EPA must move quickly to ensure the transition to zero-emission trucking under the Phase 3 Greenhouse Gas Emission Standards that follow this current proposed rulemaking. The shift to zero-emission trucks will yield major clean air and climate benefits and provide much-needed relief to communities most directly affected by trucking pollution today. The American Lung Association recently issued a report finding that the United States could experience over $1 trillion in public health benefits between 2020 and 2050 through widespread shifts to zero-emission transportation and electricity generation, with the potential for over 110,000 lives saved.5 US EPA must move quickly to establish a clear and direct pathway to the full transition to zero-emission trucks in the near term. [EPA-HQ-OAR-2019-0055-1271-A1, p.3]

Organization: *Amy Lane*

The proposed rule regarding heavy duty engine standards beginning in 2027 is insufficient for mitigating nitrous oxides (NOx) and other greenhouse gas (GHG) emissions as intended.

Experts believe that our planet may hit “peak oil” in 13 years or less, triggering societal and economic collapse if society has not drastically lessened its reliance on petroleum products. (Withgott and Laposata 2018, 520) The most sustainable, logical, and efficient course of action for addressing the emissions produced by heavy duty engines is a timely transition to renewable fuel sources. With only 20% of our nation’s electricity generated by renewables, electric vehicles are not sufficient in reducing GHG emissions or our reliance on fossil fuels. (U.S. Energy Administration n.d.) [EPA-HQ-OAR-2019-0055-1217]

On December 7, 2021, the EPA proposed a rule that would strengthen the Renewable Fuels Standards Program (RFSP), with the claim by EPA Administrator Michael S. Regan that, “This package of actions will enable us to get the RFS program back in growth mode by setting ambitious levels for 2022, and by reinforcing the foundation of the program so that it’s rooted in science and the law.” (EPA.gov 2021) The RFSP is required to set the volumes of biofuels used by the transportation industry under the Clean Air Act (CAA). However, the EPA is proposing a rule for heavy duty engines that relies on technology which excludes renewable fuel sources. Also in December, the U.S. Department of Agriculture (USDA) announced its plan to invest $800 million in supporting biofuel producers and infrastructure, with an additional $100 million available to expand the biofuel sales and use of biofuels derived from U.S. agricultural products. (U.S. Environmental Protection Agency 2021) The U.S. Department of Energy (DOE) even provides financial assistance for new infrastructure and upgrades to existing infrastructure for qualified biodiesel retailers under the Renewable Fuels Infrastructure Program (RFIP). (U.S. Department of Energy n.d.) A lack of cohesion between statutes, agencies, and rules, along with an unwillingness to act with the authority it has been granted has plagued the EPA for too long. This is an opportunity for the EPA to apply best practices in a comprehensive, efficient, and effective manner. [EPA-HQ-OAR-2019-0055-1217]

A collaborative effort between the RFSP, RFIP, and a heavy duty engine standards rule would create a high demand for renewables, which could also alleviate the burden felt by small refineries to achieve compliance with the RFSP, thus lessening the amount of resources used for exemption proceedings. By ignoring this obvious collaborative solution, the EPA is essentially denying the refineries that are bound by the RFSP rule a market which gives them the opportunity to both be in compliance with the RFSP and propel their business into the future sustainably. Mr. Regan claims to want the RFSP back in growth mode, with a scientific foundation. What better way to inspire growth in the production of renewables than to create high demand through regulation which relies on sound science and best practices? [EPA-HQ-OAR-2019-0055-1217]

The proposed Heavy Duty Engine Standards rule is counterproductive to mitigating anthropogenic climate change, the RFSP and refineries that are required to comply with it, U.S. farmers growing biodiesel feedstocks, the RFIP, and the industries that will suffer due to their reliance on fossil fuels. The time to transition to renewables was yesterday, and the agency that is entrusted with the protection of environmental health needs to make every effort to ensure that transition is being made- across all rules, statutes, agencies, and industries. I strongly urge the EPA to reconsider EPA-HQ-OAR-2019-0055 and instead create a rule proposal that is in alignment with the vision of the RSFP, the USDA, and the RFIP. [EPA-HQ-OAR-2019-0055-1217]

Organization: *B & H Tractor & Truck*

Also the way the government addressed truck drivers shortage by making them pay $4000.00 and go to school is ridiculous. [EPA-HQ-OAR-2019-0055-1751, p.1]

Organization: Brian Lopez

As addressed by the proposed rule document, early adoption incentives can be a useful tool to encourage policy change. For this we can look towards incentives that have encouraged policy change for renewable energy. Financial incentives have been used to encourage the use of renewable sources of energy through the monetary advantages offered to encourage the accessibility of renewable energy resources by reducing the burden of purchasing for manufacturers and consumers. The use of financial incentives has encouraged the eradication of barriers encountered when supporting the growth of the renewable energy sector. Policies providing financial incentives have been used to reduce the risks characterizing the investment in this sector, especially on long-term projects with extended break-even periods. Varying levels of government have played key roles in supporting the advancement of company investment into renewable energy in order to enhance the development of diversified sources of reusable energy. Such a move has been considered as a strategy to encourage sustainability in line with the current and future demands and capacity needs in the country. Since 2016, over 46 countries have instituted financial incentives to offer support to investors seeking to venture into renewable energy. [EPA-HQ-OAR-2019-1040]

Moreover, many consumers incorrectly believe that an increase in a vehicle’s fuel efficiency is correlated to an increase in fuel savings. Due to the curvilinear relationship between fuel efficiency and fuel consumption, the combined fuel-efficiency value would always be lower than the simple average, resulting in consistent overestimations of the actual fuel efficiency. Therefore, it is possible that consumers can be making suboptimal choices between vehicles, while at the same time believing that they are making rational and environmentally positive choices. [EPA-HQ-OAR-2019-1040]

Organization: *California Air Resources Board (CARB)*

CARB staff proposes to add ‘State the regulatory subcategory that determines the applicable emission standards for the vehicle family (see definition in 1037.801)’ as 1037.135 (c)(4). [EPA-HQ-OAR-2019-0055-1186-A2, p.85]

CARB staff recommends U.S. EPA to adopt a zero-emission standard for off-road powertrains in Part 1039. The standard could be an optional zero-emission standard with no other programmatic tie-ins (i.e., no compliance credit), like the zero-emission standard established by California’s ZEP certification regulation. [EPA-HQ-OAR-2019-0055-1186-A2, p.134]

This change is needed because:

- One of the greatest opportunities to transition into zero-emission in the off-road sector can be found in construction and farm equipment.
- CAA section 209(e) preempts California from establishing emission standards for 'new engines which are used in construction equipment or vehicles or used in farm equipment or vehicles and which are smaller than 175 horsepower.'
- California is exploring various strategies to increase zero-emission technology deployment in construction and farm equipment, including fleet rules that would require fleets to purchase zero-emission equipment.
- By establishing a federal zero-emission standard for off-road powertrains, U.S. EPA would clear the path for CARB to establish zero-emission fleet rules for construction and farm equipment that may arguably fall within the section 209(e) preemption category. [EPA-HQ-OAR-2019-0055-1186-A2, pp.134-135]

CARB staff believes that U.S. EPA’s defect reporting and corrective action program would be improved if U.S. EPA aligned with CARB’s requirements for the reasons summarized below:

<u>Defect Reporting</u> - U.S. EPA’s defect reporting requirements are not as robust as CARB’s. The defect reports currently required by U.S. EPA do not require as much information about the defect as CARB’s program. Also, U.S. EPA’s defect reports are not required to be submitted continuously throughout the warranty reporting period, while CARB’s requirements have manufacturers provide warranty repair information updates on a quarterly basis once the reporting threshold has been exceeded. [EPA-HQ-OAR-2019-0055-1186-A2, p.129]

<u>Corrective Action Requirements</u> - U.S. EPA’s corrective action threshold appears to be more subjective than CARB’s. The corrective action threshold is based on a 'substantial number' of failures, while CARB’s program is based on a percentage of defects exceeding a specific threshold. CARB’s recall requirements also have the added benefit of the Department of Motor Vehicles (DMV) registration tie-in program. The DMV registration tie-in program helps ensure a high capture rate for recalls by preventing owners from renewing their vehicle registrations until after they have the recall repair work completed. U.S. EPA should consider requiring manufacturers meet a high capture for all recalls like 90 percent like what is obtained by California’s DMV registration tie-in program. This can be done by International Registration Plan holds, required multiple mailings or requiring that manufacturer provide owners incentives to get timely repairs done. Lastly, the Omnibus rulemaking established automatic recalls based on specified warranty defects rates. This change was critical, as it will allow CARB staff to require manufacturers to take corrective action once the corrective action threshold has been exceeded, without having to conduct costly and resource-intensive testing to prove an exceedance of emission standards. [EPA-HQ-OAR-2019-0055-1186-A2, p.129]

Organization: *Clay Miller*

I think that before the trucking industry is loaded down with more regulations the RXR industry should be looked at because these old locomotives are still being used and emit more smoke than any truck I have seen on the roads. Are they required to refit with exhaust the burn emissions or DEF injection like trucks, tractors, pretty much every machine that runs on diesel [comment ends here; EPA-HQ-OAR-2019-0055-1539]

Organization: *Clean Energy (CE)*

In addition to this rulemaking, U.S. EPA should support near-zero trucks and buses in all other programs and future regulations pertaining to clean transportation and especially those which seek to tackle air quality issues in environmental justice communities. [EPA-HQ-OAR-2019-0055-1350-A1, p.4]

Organization: *Clean Fuels Alliance America (Clean Fuels)*

Additionally, as part of their PLANET 2050 environmental sustainability strategy, Cummins is committed to powering a healthier environment, stronger communities, and robust and inclusive economies. In the environmental part of their ESG plan Cummins has committed to Destination Zero, whereby their mission is to power a more prosperous world by helping customers succeed through innovative and dependable products that are good for their customers and the environment.6 Cummins is focused on improving GHG emissions that come from the internal combustion engines that dominate most industrial applications today. Cummins recognizes that these reductions are projected to provide more cumulative carbon reductions than an alternate scenario of waiting until the grid is green and deploying technology that relies on electric charging. [EPA-HQ-OAR-2019-0055-1248-A1, p.3]

Organization: *Clean Harbors Environmental Services*

However, ZEV technology still is in its infancy. While the industry is investing heavily in a zero-emissions future, the high costs of zero-emission trucks and the lack of the essential national recharging/refueling infrastructure needed to operate those vehicles virtually guarantees that trucking fleets cannot yet make the switch to zero. We must invest in a comprehensive strategy to build the nationwide infrastructure that is essential to support widespread ZEV adoption while also providing fleet owners – 97% of which are small businesses – with the incentives necessary to offset the higher costs of ZEVs.[EPA-HQ-OAR-2019-0055-1063-A2, p.2]

Organization: *ClearFlame Engine Technologies (ClearFlame), Remora, and SixWheel*

In addition, we ask EPA to add "ethanol" to the general categories of fuels that are included in the agency's definition of "Fuel Type."12 Currently, the Proposal lists gasoline blended with 10 percent ethanol as merely one example of a fuel grade with the gasoline fuel type, just as premium and regular gasoline are listed. Instead, we request that EPA adds an Ethanol fuel type to list of general categories of fuels, alongside diesel fuel, gasoline, and natural gas. Within this fuel type, we request that EPA include both E85 and E98 as fuel grades that can be used for certification and other purposes. 13 [EPA-HQ-OAR-2019-0055-1261-A1, p. 9]

12 See Proposal, at 17724.

13 See Table 1 to Paragraph (b)(4) of Section 1036.530 – Reference Fuel Properties and related discussion. This table and discussion does list high-blend ethanol, but does not specify whether E98 can be used. This should be corrected in the final rule. See Proposal, pp. 17703-17704.

Organization: *David Pedersen*

I also believe that the Agency should retroactively change standards for existing engines such that DPFs and SCR are no longer required; in fact, I believe a separate rulemaking process to propose banning the use of DPFs as public-health hazards would be beneficial as well. While the difference in emissions may seem significant, the Administrator *must* take into account the study referenced herein that *shows* that DPFs (and, to a lesser degree, SCR) are themselves contributors to the very pollution that the Agency is mandated to address. Allowing the removal of DPFs would improve safety, have a minimal effect on air quality relative to the status quo, and decrease safety and cost concerns for owners and operators. [EPA-HQ-OAR-2019-0055-1059]

Organization: *David Wong*

The "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards" is a proposed rule seemingly primarily concerned with "highway" heavy-duty vehicles and engines, based on the emphasis in the first sentence of the rule summary. I have a few main concerns with this rule. First, preexisting engines are not addressed, and little to no incentive is provided to encourage the replacement of older engines. Second, the plan does not directly emphasize, encourage, or support a focus toward improving public transit and public transit hotspots for human activity and thus breathing conditions in those areas especially. [EPA-HQ-OAR-2019-0055-1097]

Scalable increasing improvements should be pushed hard with financial and other penalties that can go toward helping offset damage done by emissions. I recommend that locomotive companies be incentivized to augment preexisting emission control systems and replace diesel engines with electric entirely as soon as possible. I recommend the same thing for public buses and bus stations since more people congregate there with the congregated bus diesel emissions than practically anywhere except for possibly the most metropolitan intersections. I also recommend that the EPA jointly propose another rule for preexisting heavy-duty engines that fairly holds extremely emission-heavy older engines to the highest possible standards by the 2035 time- marker that this rule frequently mentions. One possible idea is to tax the use/mileage of emission-heavy older motors based on estimated or measured emission differences from recent standards, and apply the tax to air filtration and emission control projects. [EPA-HQ-OAR-2019-0055-1097]

The Clean Air Act is 52 years old now, and the Urban bus standards (section 219) have not been significantly amended since 1990. Nitrogen Oxides (NOx), Carbon Monoxide (CO), and particulates in general (PM, aka PM10 coarse dust or PM2.5 fine dust) have been generally accepted as carcinogenic and harmful to human breathing. Hydrocarbons (THC) and Volatile Organic Compounds are also generally seen as very dangerous, but their specific contents and effects vary a bit more. Still, any amount of these is not meant for human consumption. We can keep minimizing over and over, but if we don't put a final goal date on the complete elimination of emissions, it's hard to see how the environment can heal fast enough. So the final big question is: do we really want a completely zero-emission society ever, and if so, when? What is the maximum amount of NOx, CO, and THC that 7 billion people could be personally responsible for emitting each day and the environment still be sustainable? That's the emission max allotment figures we should be working toward today, but I think the public transit systems and reailways should take the lead in going above and beyond by moving to zero emissions soonest. [EPA-HQ-OAR-2019-0055-1097]

Locomotives may burn a much dirtier diesel fuel than trucks, containing up to 500 parts per million sulfur, whereas trucks since 2006 have been limited to fuel with 15 parts per million sulfur (Lyderson, 2010). [EPA-HQ-OAR-2019-0055-1097]

A 2006 report called "Smokestacks on Rails" by the Environmental Defense Fund, a New York- based nonprofit, estimated the economic impact of adverse health effects totaled 23.2 billion dollars due to factors such as premature deaths, non-fatal heart attacks, breathing issues in children, and approximately 290,000 lost work days (Scott & Sinnamon, 2006). [EPA-HQ-OAR-2019-0055-1097]

Adverse health effects associated with 2006 locomotive pollution

Premature deaths	3,400
Non-fatal heart attacks	4,400
Acute bronchitis and asthma exacerbations in children	61,000
Lost work days	290,000
Total economic impact of adverse health effects	$23.2 billion

Compare these figures to the EPA estimates by 2045 for their "most ambitious option" outlined in this proposed rule, that would result in the following annual benefits:

"

- Up to 2,100 fewer premature deaths
- 6,700 fewer hospital admissions and emergency department visits
- 18,000 fewer cases of asthma onset in children
- 3.1 million fewer cases of asthma symptoms and allergic rhinitis symptoms
- 78,000 fewer lost days of work
- 1.1 million fewer lost school days for children

" (from https://www.epa.gov/newsreleases/epa-proposes-stronger-standards-heavy-duty- vehicles-promote-clean-air-protect) [EPA-HQ-OAR-2019-0055-1097]

Weighing the Environmental Defense Fund negative impact estimates for 2006 for locomotives against the EPA estimated positive impacts of this proposed rule nicknamed the EPA's "Clean Trucks Plan", it appears that a mild to moderate reduction of the locomotive emission adverse effects would be approximately as impactful/beneficial as this rule. Because the scope could be narrowed down to just locomotive engines and practically nothing else, I assume the implementation cost for locomotive improvements would be immensely more cost-effective. An electric locomotive is about $4-6.5 million, compared to approximately $1-2 million for a diesel locomotive (Nally, 2022). With more than 28,000 locomotives in the United States, the hardware cost to replace every single diesel locomotive with an electric one might be about $168 billion (28,000 * 6,000,000), plus operational transition costs. If the total economic impact of adverse health effects is actually over $20 billion per year, we can assume that a radical change to electric locomotives would pay itself off in health costs in about 8 years assuming implementation was instant. Furthermore, if public transport moved to zero-emissions, it could finally be seen as the "greenest" option in practically every way and encourage more people to take public transport and be even more environmentally economical than probably all other (motor) transport options. [EPA-HQ-OAR-2019-0055-1097]

A Mayo Clinic study of 3,933 people found "children who lived in census tracts facing the intersections with major highways or railroads had about 40% to 70% increased risks of developing childhood asthma compared with those who lived in census tracts not facing such intersections". (Juhn et al., 2010). I feel that diesel soot from train engines is particularly dense and noticeably smelly to my backyard, which is directly adjacent and only a few feet away from Orlando's train tracks. The hindered plant growth is clearly visible and more brown along the closer fenceline than the plant life farther away and on the other side of the house. In addition to the toxic consequences to human health, there must be devastating effects to wildlife that are much less measured. [EPA-HQ-OAR-2019-0055-1097]

The last guidelines for the Control of Emissions of Air Pollution From Locomotive Engines and Marine Compression-Ignition Engines Less Than 30 Liters per Cylinder were republished in June 2008. The standards only began to take effect in 2015. That program was projected to reduce annual emissions of particulate matter and nitrogen oxides by thousands of tons- but not eliminate them. I am proposing that efforts be made immediately to move to *ELIMINATE* and not just reduce emissions by 2035 by switching to electric locomotive engines as soon as possible. Perhaps older exhaust systems could be augmented to fully or 99% capture/filter particulate matter and nitrous oxides. Notice the emission standards for the year 2023 in Table 1 below from Subpart B - Emission Standards and Related Requirements § 1033.101 Exhaust emission standards. [EPA-HQ-OAR-2019-0055-1097]

Table 1 to § 1033.101 - Line-Haul Locomotive Emission Standards

Year of original manufacture	Tier of standards	Standards (g/bhp-hr)			
		NO_X	PM	HC	CO
1973-1992[a]	Tier 0[b]	8.0	0.22	1.00	5.0
1993[a]-2004	Tier 1[b]	7.4	0.22	0.55	2.2
2005-2011	Tier 2[b]	5.5	[e] 0.10	0.30	1.5
2012-2014	Tier 3[c]	5.5	0.10	0.30	1.5
2015 or later	Tier 4[d]	1.3	0.03	0.14	1.5

The standards for locomotive engines before 2014 are roughly 4-6x less than those for (line-haul) engines manufactured in 2015 or later. Switch-style locomotives are slightly different, but still similarly comparable. I don't see policy that attempts to compensate or correct the older engine emission levels by roughly 4-6 times the particulate matter and nitrogen oxides. [EPA-HQ-OAR-2019-0055-1097]

Busses may be seen similarly. The table 1 below from the EPA Office of Transportation and Air Quality "Average In-Use Emissions from Urban Buses and School Buses - Emission Facts" published in 2008 shows typical bus emissions in grams per mile (note it is not the same unit described for locomotive emissions). [EPA-HQ-OAR-2019-0055-1097]

Table 1 presents average in-use emission rates for urban buses and school buses while being driven.

Table 1: Average Emission Rates for Urban Buses and School Buses*
(in grams per mile)

Pollutant	Urban Diesel Buses	School Diesel Buses	School Gasoline Buses
VOC	0.349	0.642	7.580
THC	0.353	0.653	7.791
CO	3.376	2.312	89.600
NOx	14.793	10.536	7.477
$PM_{2.5}$	.0274	0.556	0.104
PM_{10}	0.297	0.604	0.145

Approximately 65,000 public city buses were operational in December of 2017 (Carlier, 2021). A new electric bus costs about $1,000,000 or more but is actually cheaper upfront than most diesel busses and definitely cheaper and easier to maintain over time. Replacing all of this quickly is probably much, much easier than replacing train locomotives, and it is good to see that the United States seems well on it's way to making all busses electric. However, I recommend that new gas/diesel buses for public city transport be forbidden by 2025, and only new electric be allowed. Perhaps exceptions can be made for remanufactured gas/diesel engines up until 2030 or 2035. [EPA-HQ-OAR-2019-0055-1097]

Organization: *Diesel Technology Forum*

Reducing Emissions should be more than just Setting New Engine Standards, but also Implementing More Immediate Term Solutions Like Use Of Renewable Fuels And Accelerating The Turnover Of The Legacy Fleet

- The most substantial opportunities to reduce emissions in our communities in the relative near term are ones that this proposed rule does not address, the use of renewable fuels and the existing population of older commercial trucks — the legacy fleet. [EPA-HQ-OAR-2019-0055-1004 and Public Hearing Day 1 Testimony, EPA-HQ-OAR-2019-0055-2867]

- Consider if more commercial trucks were operating on blends of 100 percent renewable low- carbon biodiesel fuels. According to EPA's own detailed analysis, the current pool of biodiesel is of very high quality and blends of biodiesel may function seamlessly with next-generation aftertreatment devices developed to meet this low standard. The fuel is available now. The infrastructure to deliver it is available now. The vehicles qualified to use it are available now. Putting it in operation now, can begin reducing emissions now, and, like compound interest, we will be banking emissions reductions every mile, starting now. It is a competitive strategy that is more affordable and available than mandating ZEVs or very stringent future NOx standards. [EPA-HQ-OAR-2019-0055-1004 and Public Hearing Day 1 Testimony, EPA-HQ-OAR-2019-0055-2867]

- As for the legacy fleet, it is large. According to our most recent analysis of vehicles in operation (VIO) data from IHSMarkit as of the end of 2021, 53 percent are 2011 and newer model year vehicles and 47 percent are an older generation. These are pre-2011 model year vehicles with relatively higher emissions. Those made before 2007 do not have particulate traps and/or selective catalytic reduction technology to help combat emissions. They are second, or third, owner trucks operated by independent truckers and smaller fleet operators. [EPA-HQ-OAR-2019-0055-1004 and Public Hearing Day 1 Testimony, EPA-HQ-OAR-2019-0055-2867]

- The potential for rapid mitigation of both NOX and PM emissions by accelerating the turnover of this older fleet to advanced diesel technology, is tremendous. The Diesel Emissions Reduction Act has played an important role in addressing turnover in this legacy fleet and has delivered immediate improvements in local emissions. The new set of options and standards proposed will continue to improve the health of all impacted by the transportation network. While the proposals continue to clean the air, with as much as a 90 percent NOx reduction across the vehicle fleet, we are setting the stage to gain the benefits of these new proposals over the next 25 years. [EPA-HQ-OAR-2019-0055-1004 and Public Hearing Day 1 Testimony, EPA-HQ-OAR-2019-0055-2867]

Organization: *Evergreen Action*

While we appreciate that the EPA is moving forward with a new NOx rule, we urge the agency to ensure that the regulations are as strong as possible which includes limiting loopholes and ensuring maximum compliance with pollution reduction controls. Currently 'glider' trucks which use old engines in new trucks are still on the road even as the Phase 2 Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium and Heavy Duty Engines and vehicles went into effect last year. These incredibly high polluting vehicles ignore the need to rapidly reduce emissions and they continue to put the public at risk of excessive pollution. The EPA must use this rulemaking as an opportunity to close the glider truck loophole for good. [EPA-HQ-OAR-2019-0055-1289-A1, pp.1-2]

Organization: *Ford Motor Company (Ford)*

We would like to work with EPA in the future to develop an alternative compliance pathway for 2024 model year and later engine certification. Our recommended alternative compliance approach would provide significant GHG and criteria emission reductions through greater penetration of ZEVs in the Heavy-Duty fleet. In addition to providing emissions benefits, the proposed alternative compliance pathway would simplify the criteria emissions and engine-based CO2 compliance requirements. The key elements of the recommended alternative compliance pathway are:

• 50-state ZEV targets (using the same ZEV definitions and credit trading rules as the California Heavy-Duty ZEV regulations)
• HD ZEVs would not earn NOx credits.
• No changes to GEM-based vehicle GHG standards
• Non-ZEVs would be allowed to trade criteria emission and engine-based CO2 credits across primary intended service classes (e.g., between compression-ignition Light Heavy-Duty and compression-ignition Medium Heavy-Duty classes). This change would have no negative impact on fleet NOx or CO2 emissions and would enable manufacturers to more efficiently invest in the powertrains of the future. [EPA-HQ-OAR-2019-0055-1300-A1, p. 6]

Organization: *Fuel Cell and Hydrogen Energy Association (FCHEA)*

Finally, another significant non-financial incentive that would encourage fleets to purchase zero-emission trucks is an activity that the EPA could conduct in coordination with the Department of Transportation (DOT) Federal Highway Administration (FHWA). Currently, both battery electric and natural gas-powered heavy-duty trucks benefit from the existing 82,000-pound exemption due to their higher vehicle weights. EPA could work with FHWA to support providing parity in this exemption to hydrogen fuel cell electric trucks. [EPA-HQ-OAR-2019-0055-1187-A2, p. 2]

Organization: *International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)*

UAW members are ready and willing to build the advanced technology trucks of the future. In fact, UAW members are already building a variety of zero-emission medium and heavy-duty vehicles, along with a wide range of continuously improving ICE (Internal Combustion Engine) vehicles. These zero-emission vehicles built by UAW workers include:

- Thomas Built Bus Saf-T-Liner C2 Jouley EV school bus in High Point, NC
- IC Bus Electric CE school bus in Tulsa, OK
- Ford E-Transit EV commercial van in Kansas City, MO
- Mack LR EV refuse truck in Macungie, PA
- Volvo Truck VNR Electric class 8 truck in Dublin, VA
- Components for these vehicles at supplier plants located throughout our country [EPA-HQ-OAR-2019-0055-1138-A1, p.2]

Organization: *Kenny Sites*

Furthermore has anyone considered that all of the airplanes in the air every day swirling the atmosphere is causing an accelerated effect of climate change not just elevated levels of carbon dioxide. We were told in science class that the different layers of gases in the atmosphere helped shield the earth from the affects of the sun. Thousands of flights a day swirling all theses layers up to 50000 ft. looks to me may be part of the problem. [EPA-HQ-OAR-2019-0055-1495]

Organization: *Labor Network for Sustainability (LNS)*

LNS writes to express our concern about the Rule's impact on workers in the trucking industry and how EPA could address those impacts. [EPA-HQ-OAR-2019-0055-1257-A1, p.1]

Our comments are limited to the potential harmful impacts of the Proposed Rule on workers in the medium and heavy duty trucking industry. The Proposed Rule fails to take into account the industry's current independent contractor (owner-operator) model and the accompanying problem of widespread worker misclassification. Failure to address this problem potentially delays and even reduces the beneficial impact the Rule aims to achieve. [EPA-HQ-OAR-2019-0055-1257-A1, p.2]

As we show more fully below, the deregulation of the trucking industry and corresponding decline of unionized trucking labor gave way to an independent contractor model of employment for trucking and delivery occupations, which has accelerated worker misclassification and caused the deterioration of wages and working conditions. [EPA-HQ-OAR-2019-0055-1257-A1, p.2]

As we will show, EPA has the authority to take further action including models for interagency consultation that could help mitigate harmful impacts of the Proposed Rule to already severely burdened truck drivers. Since EPA's Proposed Rule is being issued consistent with its authority under the Clean Air Act and with Executive Order 14037 (E.O. 14037), Strengthening American Leadership in Clean Cars and Trucks, signed by President Biden on August 5, 2021,3 it has the authority and the imperative for further action to protect workers, public health, and the environment. Specifically:

- EPA must not leave emission reductions and requirements to future rule and should transition to zero-emission trucks and buses by setting stringent emission standards and zero-emission-vehicle sales mandates now.
- EPA should require that all new trucks have zero emissions beginning in 2035 and retire all combustion trucks before 2045.
- EPA should take all available further action within its authority to help mitigate the economic impacts of its Proposed Rule on misclassified and independent contractor truck drivers and ensure that the companies hiring drivers bear the costs for leasing, operating, and maintaining vehicles.
- EPA should enter into purposeful interagency consultation and collaboration with other federal agencies, like DOL-DOT's Driving Good Jobs Initiative, and help develop a system of information and data sharing that leads to enforcement of labor and employment laws, which could protect misclassified and independent contractor truck drivers from further cost burdens associated with the Proposed Rule and later regulation. [EPA-HQ-OAR-2019-0055-1257-A1, p.3]

3 Strengthening American Leadership in Clean Cars and Trucks, 86 Fed. Reg. 43,583 - 43,585 (Aug. 10, 2021)

More than 3.5 million people in the U.S. work as truck drivers4 transporting goods from the ports where they arrive and factories where they are manufactured, across the Interstate Highway

System, and, increasingly, all the way to our front doorsteps. [EPA-HQ-OAR-2019-0055-1257-A1, p.4]

4 Jennifer C. Day & Andrew W. Hait, America Keeps on Truckin', Number of Truckers at All-Time High, U.S. Census Bureau, June 2019, https://www.census.gov/library/stories/2019/06/america-keeps-on-trucking.html

For years, analysts have been warning about a 'shortage' of truck drivers to fill the needs of the industry. The American Trucking Association estimates that by 2028, the country will be 'short' 160,000 truckers.5 This shortage has its roots in the deregulation of the industry and accompanying devaluation of trucking jobs which began with the 1980 Motor Carrier Act. This legislation, and similar laws, deregulated the trucking and logistics industries thereby enabling carriers to reduce rates.6 But a core mechanism by which these rate reductions were made possible was by imposing mass driver dislocation and insecurity. [EPA-HQ-OAR-2019-0055-1257-A1, p.4]

5 Bob Costello & Alan Karikhoff, Truck Driver Shortage Analysis 2019, American Trucking Associations, July 2019, https://www.trucking.org/sites/default/files/2020-01/ATAs%20Driver%20Shortage%20Report%202019%20with%20cover.pdf

6 Jerry Ellig, Trucking & Rail Regulatory Reforms Provide a Model for Bipartisan Cooperation, Regulatory Studies Center, The George Washington University, October 7, 2020, https://regulatorystudies.columbian.gwu.edu/sites/g/files/zaxdzs3306/f/downloads/Commentaries/GW%20Reg%20Studies%20-%20Motor%20Carrier%20and%20Staggers%20Act%20Turn%2040%20-%20JEllig.pdf

Decline in unionization was one of the effects of deregulation. Union density in the regulated sector of the trucking industry dropped from 60% to about 25% in 1990.7 Today, only 2% of long-haul trucking jobs are estimated to be union jobs.8 [EPA-HQ-OAR-2019-0055-1257-A1, p.4]

7 Barry T. Hirsch, Trucking Deregulation and Labor Earnings: Is the Union Premium a Compensating Differential?, 11 J. Lab. Econ., 279 (1993), unionstats.gsu.edu/bhirsch/TruckingDeregulation.pdf

8 John D. Schulz, Union-free carriers trying hard to stay that way, Logistics Mgmt. (Dec. 18, 2013), https://www.logisticsmgmt.com/article/union_free_carriers_trying_hard_to_stay_that_way

Deregulation and the accompanying de-unionization of the industry have caused the deterioration of drivers' wages, benefits and working conditions. Even after adjusting for inflation, median wages for truck drivers fell from $110,00 in 1980 to $47,130 in 2020.9 This deterioration has also resulted in an average 100% industry turnover rate.10 Further, it has given way to an independent contracting model for truck driver employment.11 and paved the way for rampant misclassification of drivers who are employees in all but name and remain dependent on the companies who hire them. [EPA-HQ-OAR-2019-0055-1257-A1, p.4]

11 Ibid.

The misclassification problem is especially acute for long-haul truck drivers who have been identified as a segment having high concentrations of misclassified truck drivers.12 [EPA-HQ-OAR-2019-0055-1257-A1, p.5]

12 Appel, Sam and Carol Zabin. Truck Driver Misclassification: Climate, Labor, and Environmental Justice Impacts. Center for Labor Research and Education, University of California, Berkeley. August 2019. http://laborcenter.berkeley.edu/truck-driver-misclassification/

According to a 2010 national study conducted by the National Institute on Occupational Safety and Health (NIOSH) ‘approximately 28% of long-haul drivers are leased contractors without their own operating authority.’ These are drivers who ‘would likely be considered misclassified under a number of legal tests . . . .’13 [EPA-HQ-OAR-2019-0055-1257-A1, p.5]

13 Id. at 9.

For drayage drivers, the misclassification problem is even greater. It has been estimated that ‘between 75% and 85%’ of port truck drivers were likely misclassified. The plight of drayage drivers has been well documented.14 15 16 [EPA-HQ-OAR-2019-0055-1257-A1, p.5]

14 Gracey Kay, Truckers at backlogged ports say they've waited in miles-long lines for up to 8 hours without pay, Bus. Insider, (Nov. 4, 2021), https://www.businessinsider.com/truckers-wait-outside-backlogged-ports-8-hourswithout-pay-2021-11

15 Ari Ashe, Port truckers battle over ‘detention’ pay, J. Com. Online, (Apr. 4, 2019), https://www.joc.com/truckinglogistics/drayage/port-truckers-battle-over-%E2%80%98detention%E2%80%99-pay_20190404.html

16 American Shipper Staff, LA drayage truckers file $1m driver misclassification suit against employer, Am. Shipper, (Oct. 23, 2017), https://www.freightwaves.com/news/la-drayage-truckers-file-1m-driver-misclassificationsuit-against-employer

Finally, when goods ordered over the internet make the last-mile journey to our doorsteps, they are often delivered by drivers who are misclassified as independent contractors and bear the burden of the high costs and maintenance associated with operating their vehicles. According to UC Berkeley: ‘In the package delivery segment of short-haul trucking, firms such as FedEx Ground, Amazon, and XPO Logistics all use contract truck drivers, and studies and lawsuits have documented evidence of widespread misclassification at these companies.’17 [EPA-HQ-OAR-2019-0055-1257-A1, p.5]

17 Appel & Zabin, supra note 12 at 8.

Similarly, the Netherlands-based Centre for Research on Multinational Corporations (SOMO) which recently analyzed the last-mile policies of six large parcel-delivery companies, including Amazon, FedEx, UPS, and Walmart, with respect to global warming and found that ‘[s]ubcontracting practices in the last-mile delivery sector have been associated with poor working conditions and labour rights violations in many countries.’18 [EPA-HQ-OAR-2019-0055-1257-A1, p.5]

18 Ilona Hartlief & David Ollivier de Leth, Parcel delivery on a warming planet: The efforts and ambitions of six companies, (December 2021), https://www.somo.nl/wp-content/uploads/2021/12/Parcel-Delivery-on-a-Warming-Planet_Final.pdf

Amazon’s practices, in particular, illustrate the pervasiveness of sub-contracting in the last-mile delivery sector. Over the past few years, the company has brought the majority of its last-mile delivery operations quasi-in house, with two models that have come to predominate. First, there are Amazon Flex drivers ‘who like their Uber or Instacart counterparts are classified as independent contractors exempt from U.S. employment laws,’19; second are employees of its subcontracted Delivery Service Partners (DSP), whose fleets deliver Amazon packages almost exclusively.20 [EPA-HQ-OAR-2019-0055-1257-A1, pp.5-6]

19 Josh Eidelson & Matt Day, Drivers don't work for Amazon but company has lots of rules for them, Detroit News, (May 5, 2021), https://www.detroitnews.com/story/business/2021/05/05/drivers-dont-work-amazon-butcompany-has-lots-rules-them/4955413001/

20 https://www.businessinsider.com/amazon-controls-delivery-drivers-without-paying-wages-2018-9

DSP-type companies face ‘strong pressure . . . to reduce delivery costs and shorten delivery times’ and these ‘[s]ubcontractors themselves often outsource activities to other subcontractors or independent workers.’21 [EPA-HQ-OAR-2019-0055-1257-A1, p.6]

21 Hartlief & Ollivier de Leth, supra note 18 at 18.

UC Berkeley, Labor Center describes the problem of misclassification as follows:

‘While . . . even very large companies misclassify their workers, small firms that misclassify proliferate in the highly fragmented trucking market and regulatory landscape, particularly in local [e.g., last-mile] and port trucking sub-segments. **Ultimately, misclassification is less an episodic problem of misbehavior by large or small companies, and instead a failure of public policy** to create labor market conditions that incentivize fair competition towards high road, environmentally accountable economic development.’22 (emphasis added) [EPA-HQ-OAR-2019-0055-1257-A1, p.6]

22 Appel & Zabin, supra note 12 at 13.

The problem with misclassification is greater than simply an evasion of the law. The model promotes the deterioration of wages, hours, and working conditions of owner-operators/drivers. [EPA-HQ-OAR-2019-0055-1257-A1, p.6]

According to a 2018 study of misclassified port truckers and the California Clean Truck program, written by Claire Sears, drivers ‘provide their own rigs, maintenance, fuel, insurance and other incidental costs like phone service and retirement.’23 Sears further explains that ‘after expenses and deductions, independent driver’s net income floats around minimum wage rates.’24 Similarly, the National Employment Law Project (NELP) found that drayage drivers classified as independent contractors make an average of $28,780 annually on an average 59-hour work week.25 [EPA-HQ-OAR-2019-0055-1257-A1, p.6]

23 Claire Sears, Driver Misclassification and Clean Truck Programs: An In-depth Analysis of Two Southern California Ports, Occidental College, (May 4, 2018), https://www.oxy.edu/sites/default/files/assets/UEP/Comps/Claire%20Sears_Driver%20Miscalssification%20and%20Clean%20Truck%20Program.pdf

25 Rebecca Smith, et al., The Big Rig Overhaul: Restoring Middle-Class Jobs at America’s Port Through Labor Law Enforcement, Nat’l. Emp. L. Project, (Feb. 2014), https://www.nelp.org/wp-content/uploads/2015/03/Big-Rig-Overhaul-Misclassification-Port-Truck-Drivers-Labor-Law-Enforcement.pdf

Additionally, ‘long-haul truckers are typically paid on a per-mile basis with paid time averaging between 7 to 8 hours per day. However, these same drivers are typically working upwards of 14 hours per day, with roughly half of those hours being unpaid time spent refueling or waiting for cargo.26 [EPA-HQ-OAR-2019-0055-1257-A1, pp. 6-7]

26 Naomi J. Dun, et. al, Driver Detention Times in Commercial Motor Vehicle Operations, Dep’t of Transp., (Dec. 1, 2014), https://rosap.ntl.bts.gov/view/dot/193

In the last-mile sphere, Amazon’s increasingly dominant model similarly overburdens drivers. Amazon Flex drivers ‘must provide their own vehicles (or rented delivery van).’27 Similarly, a DSP is ‘responsible for procuring delivery vehicles for its operations’ and can also ‘lease Amazon-branded vans designed specifically for this program . . . .’28 DSPs fleet sizes are capped by Amazon at a maximum of 40 vans ‘mak[ing] it difficult for these small firms to gain leveraging power against Amazon, while giving Amazon flexibility.’ 29 [EPA-HQ-OAR-2019-0055-1257-A1, p.7]

29 Alimahomed-Wilson, supra note 27.

UC Berkeley's Labor Center analysis describes the unequal distribution of costs between firms and drivers concisely: 'Contracting out truck driving shifts the costs of truck ownership and operation from trucking companies to individual truck drivers. Contract truck drivers, particularly misclassified contractors, earn low incomes and face high capital costs. While regulatory compliance costs for large trucking firms represent a small percent of total revenue, contract truck drivers face compliance expenses far in excess of their yearly income. Under the contractor business model, truck drivers least equipped financially to buy and maintain clean vehicles bear the financial burden of attaining the state's climate goals in this sector.'30 [EPA-HQ-OAR-2019-0055-1257-A1, p.7]

30 Appel & Zabin, supra note 12 at 1.

As a result of EPA omitting considerations of driver misclassification and the independent contractor model, not only does the Proposed Rule ignore the risk of increased harm to truck drivers, it consequently ignores the risk to its own objectives of getting cleaner heavy-duty vehicles on the road. [EPA-HQ-OAR-2019-0055-1257-A1, p.9]

The analysis by UC Berkeley, looking at compliance with the California Air Resources Board (CARB) regulations of heavy-duty truck emissions, concludes that there is 'clear evidence that non-compliance is concentrated in the contractor segment of the commercial trucking industry.'38 The report finds that the low wages paid to contract drivers 'are the primary reason contract drivers lack capital for clean vehicle investments' and goes on to cite a surprising finding from a 2010 report by the Los Angeles Alliance for a New Economy (LAANE) that cleaner diesel trucks 'cost approximately 70% more to maintain than conventional trucks.'39 [EPA-HQ-OAR-2019-0055-1257-A1, p.9]

38 Appel & Zabin, supra note 12.

39 Ibid.

Sears similarly finds, for those owner-operators who must finance their own vehicles, 'misclassification prevents environmental improvements by requiring drivers to purchase and maintain their own trucks' and that poor wages mean 'they often purchase older trucks which typically are cheaper and emit larger amounts of diesel pollution.'40 [EPA-HQ-OAR-2019-0055-1257-A1, p.9]

40 Sears, supra note 23 at 7

The matrix whereby large firms use either independent contractor drivers, or increasingly, smaller company subcontractors (who often in turn use independent contractor drivers) means that the largest firms who control the nationwide flow of freight shipping can further shield themselves from the responsibility of limiting their operations' harmful impacts to environmental and public health. This Russian nesting doll model of subcontracting diffuses the operations of the wealthiest actors, and obfuscates who shoulders the industry's labor and environmental responsibilities, as distinct from who ultimately benefits and therefore should actually shoulder these responsibilities. [EPA-HQ-OAR-2019-0055-1257-A1, p.9]

Analyzing compliance with CARB regulations, UC Berkeley finds that 'fleets with 1 to 3 trucks, where contract truck drivers are found, boast the largest share of non-compliant trucks, with 44% of all non-compliant trucks.'41 They deduce that 'non-compliant trucks operated by misclassified drivers are prevalent in the short-haul segment' where 'federal operating authority may not be required and yet many drivers are still misclassified.'42 Likewise, in SOMO's analysis of six major last-mile package delivery firms, they make it clear that the diluting of responsibility from layers of subcontracting will not be righted by the companies themselves: 'None of the six companies in this research state explicitly whether their emission reduction targets and fleet electrification measures also apply to outsourced activities.'43 SOMO further observes that 'the strong pressure to reduce costs and the complexity of subcontracting relations in the last-mile delivery sector reduce subcontractor companies' abilities to mitigate environmental impacts.'44 [EPA-HQ-OAR-2019-0055-1257-A1, pp.9-10]

41 Appel & Zabin, supra note 12 at 10.

42 Id. at 12.

43 Hartlief & Ollivier de Leth, supra note 18 at 18.

44 Id.

Still, UC Berkeley's analysis makes clear that 'even very large companies misclassify their workers. CARB compliance data show examples of non-compliant trucks driven by likely misclassified contract truck drivers for major corporations.'45 The port trucking sector provides a clear example of the environmental consequences of even large firms' failure to properly employ and compensate their drivers. One of the early attempts at addressing both heavy-duty vehicle pollution and driver exploitation yielded a 2008 Concession Agreement between the Port of Los Angeles and large carriers. The agreement was 'designed to encourage . . . Licensed Motor Carriers (LMCs) [to] enter into drayage concession agreements with the Port and [be] responsible for owning and maintaining the trucks used to perform drayage services at the Port.'46 Sears shows a finding attached to the 2008 agreement explicating a primary reason for mandating a reclassification to full employment status of port drivers:

'Many drayage truck drivers have testified at the Board of Harbor Commissioners meetings of both Ports of Los Angeles and Long Beach, stating that they are unable to afford and maintain the cleaner trucks needed to achieve air quality standards, even with the subsidies proposed to be offered by the Ports.'47 [EPA-HQ-OAR-2019-0055-1257-A1, p.10]

45 Appel & Zabin, supra note 12.

46 The Port of Los Angeles, Port of Los Angeles' Clean Truck Program Concession Agreement and Application are Now Available for Licensed Motor Carriers, (July 18, 2008), https://www.portoflosangeles.org/references/news_071808ctp

47 Sears, supra note 23 at 36.

The Warehouse Workers for Justice (WWJ) published a complete sector analysis of the warehousing and trucking hub in Will County, Illinois. WWJ's report shows how poor wages and working conditions for drivers and warehouse workers are inseparable from environmental pollution plaguing the surrounding, largely black and brown, communities and the feedback loop that develops between the two. The community members rendered sick by the industry's pollution are often the same workers who are hyper-exploited by the industry's dominant corporations. In a detailed interview with an area truck driver, WWJ shows that poor compensation models for drivers (e.g., 'per load') lead 'some drivers [to] cut through residential areas to make the most money as they pick up and drop off a load as quickly as possible.'48 They show throughout their study that the 'same systems exploiting truckers at work also forces truckers to contribute to pollution in residential neighborhoods.'49 If EPA is serious about its objectives with the Proposed Rule, it must account for the ways in which misclassified and destabilized trucking labor is undermining otherwise environmentally beneficial regulation. [EPA-HQ-OAR-2019-0055-1257-A1, pp.10-11]

48 Madison Lisle & Yana Kalmyka, For Good Jobs & Clean Air: How a Just Transition to Zero Emission Vehicles Can Transform Warehousing 17 (2022), https://www.ww4j.org/uploads/7/0/0/6/70064813/wwj_report_good_jobs_clean_air.pdf

49 Ibid.

Once again, UC Berkeley's analysis encapsulates with particular concision the confluence of the problems outlined throughout this comment:

'This report documents the significant problem of non-compliance with clean vehicle policies in the commercial trucking industry. It presents evidence of the concentration of non-compliance in the contract trucking sector . . . . The report also links contract trucking, where compliance is lowest, to evidence of high prevalence of misclassification of truck drivers as contractors instead of employees. It concludes that the low incomes of contract drivers, including misclassified truck drivers, are a key obstacle to full compliance with clean truck standards.'50 [EPA-HQ-OAR-2019-0055-1257-A1, p.11]

50 Appel & Zabin, supra note 12 at 13.

EPA's Proposed Rule is being issued pursuant to its authority under the Clean Air Act and with Executive Order 14037 (E.O. 14037), Strengthening American Leadership in Clean Cars and Trucks, signed by President Biden on August 5, 2021.51 E.O. 14037, section 6(b) orders that 'the Administrator of the EPA shall consult with the Secretaries of Commerce, Labor, and

Energy on ways to achieve the goals laid out in section 1 of this order,' such goals including 'to grow jobs that provide good pay and benefits.'52 The White House Fact Sheet announcing E.O. 14037 states that to achieve its goal, it will 'leverage once-in-generation investments and a whole-of-government effort to lift up the American autoworker and strengthen American leadership in clean cars and trucks.'53 [EPA-HQ-OAR-2019-0055-1257-A1, p.11]

51 Strengthening American Leadership in Clean Cars and Trucks, supra note 3.

As such, EPA should be doing all that is within its authority to take these impacts into account and assist in addressing misclassification, ensuring that the companies hiring drivers bear the costs for leasing, operating, and maintaining vehicles. EPA can be a significant part of the solution to these issues by participating in ongoing interagency collaborative frameworks (and by developing new ones), which are being implemented to identify and address these kinds of problems. [EPA-HQ-OAR-2019-0055-1257-A1, pp.11-12]

A prime and ready example would be for EPA to immediately formalize a framework of consultation and data exchange regarding the Proposed Rule's impacts on misclassified drivers in partnership with the Departments of Labor and Transportation's Driving Good Jobs Initiative. [EPA-HQ-OAR-2019-0055-1257-A1, p.12]

As a part of President Biden's Trucking Action Plan, launched in December 2021, the joint DOL-DOT Driving Good Jobs initiative is aimed at 'supporting drivers and ensuring that trucking jobs are good jobs . . . for a strong, safe, and stable trucking workforce.'54 Objectives include 'identifying longer term actions, such as potential administrative or regulatory actions that support drivers and driver retention by improving the quality of trucking jobs.'55 An April 4th White House update states that as part of the initiative DOL and DOT are 'conducting joint outreach and education to employers and drivers about these rights and responsibilities under federal wage and hour law' and are 'committed to addressing core challenges, such as worker misclassification . . . .'56 [EPA-HQ-OAR-2019-0055-1257-A1, p.12]

54 Fact Sheet: The Biden-â Harris Administration Trucking Action Plan to Strengthen America's Trucking Workforce, The White House, n.d., https://www.whitehouse.gov/briefing-room/statements-releases/2021/12/16/fact-sheet-thebiden-%E2%81%A0harris-administration-trucking-action-plan-to-strengthen-americas-trucking-workforce/

55 Ibid.

56 Fact Sheet: The Biden Administration's Unprecedented Actions to Expand and Improve Trucking Jobs, The White House, n.d., https://www.whitehouse.gov/briefing-room/statements-releases/2022/04/04/fact-sheet-the-bidenadministrations-unprecedented-actions-to-expand-and-improve-trucking-jobs/

Manufacturing companies must obtain certificates of conformity from EPA under Clean Air Act section 206 in order to sell each heavy-duty engine or vehicle they produce (i.e., each mobile emissions 'source.')57 Pursuant to an application for certification, EPA collects crucial testing and demonstration data and other information from manufacturers in order to approve their applications and issue certificates of conformity. A ready example, EPA requires Production Volume data from manufacturers as a part of certifying compliance with its Proposed Rule. Production Volume data is defined as 'the number of engines, subject to [the Proposed Rule] produced by a manufacturer for which the manufacturer has a reasonable assurance that sale was or will be made to ultimate purchasers in the United States.'58 [EPA-HQ-OAR-2019-0055-1257-A1, p.12]

57 42 U.S.C. 7521 (2018)

58 EPA, Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, 87 Fed. Reg. 17,726 (Mar. 28, 2022), https://www.govinfo.gov/content/pkg/FR-2022-03-28/pdf/2022-04934.pdf

The Bureau of Transportation Statistics (BTS) and the Federal Motor Carrier Safety Administration (FMCSA) within DOT, along with the Bureau of Labor Statistics (BLS) and the Wage and Hour Division (WHD) within DOL, would be ideal agencies with which to establish a formal Data Exchange Committee whereby relevant data can be compiled, analyzed, and identified for enforcement authorities. BTS collects data and reports on registered motor carriers, including their truck assets, employment, and more. FMCSA maintains critical registration information on motor carriers, the details of their operations, and enforces issues pursuant to safe vehicles and safe driving. BLS likewise collects data and issues detailed reports on employment and industry within the U.S. while WHD enforces cases of worker misclassification, compensation, and other worker benefits and standards. EPA stands out as a missing link that could enable the tracking of its Proposed Rule's impacts on misclassified drivers by helping to monitor where newly compliant engines are purchased, by what classification of driver they are eventually used, and to support enforcement to correct the misclassified employment status of drivers - activities that will benefit both workers and the environment. [EPA-HQ-OAR-2019-0055-1257-A1, pp.12-13]

There is ample precedent for such collaboration and interagency exchange from which to think about and even model creative consultation frameworks. EPA and DOL's Occupational Health and Safety Administration (OSHA) established a robust MOU in 1991 to better protect workers and the environment, which included an 'Enforcement and Compliance Monitoring Data Exchange Program.'59 This program established a Data Exchange Committee to 'facilitate understanding of each agency's data and data systems by exchanging data and system descriptions and by providing presentations about data and data systems' for purposes including 'determining compliance histories or background information on specific facilities, industrial segments or categories or related reasons.'60 A similar pathway can easily be imagined for the purposes of EPA assisting in the enforcement of fair labor standards for truck drivers while further ensuring environmental protection. [EPA-HQ-OAR-2019-0055-1257-A1, p.13]

59 EPA & OSHA, Memorandum of Understanding between The U.S. Department of Labor Occupational Safety and Health Administration and The U.S. Environmental Protection Agency Office of Enforcement (Feb. 13, 1991), https://www.osha.gov/laws-regs/mou/1991-02-13

60 Ibid.

Perhaps just as crucially, EPA's assistance in tracking the proliferation of newly compliant heavy-duty trucks would help identify to which carriers compliant products are not going. This will be critical information in identifying smaller carriers, sub-contractors, and similar operations that might be more likely to have drivers misclassified yet still controlled by the largest, most wealthy companies. Smaller operations are also of course where UC Berkeley identifies the largest gap in CARB's regulatory compliance correlated with high rates of independently contracted drivers. [EPA-HQ-OAR-2019-0055-1257-A1, p.13]

Indeed, action by EPA in these and similar ways would also add some muscle to President Biden's oft-stated commitment to being the most pro-union President in modern history. There was established on December 8, 2021, an MOU between WHD and the National Labor Relations Board with the purpose of improving 'law enforcement and greater coordination between the agencies through information sharing, joint investigations and enforcement activity, training, education, and outreach.'61 One of the goals set out in the MOU is 'the identification and investigation of complex or fissured employment structures, including single or joint employer, alter ego, and business models designed to evade legal accountability, such as the misclassification of employees.'62 EPA entering into interagency consultation that establishes robust frameworks for data sharing and analysis, consistent with its granted authority, could lead to a virtuous feedback loop of interagency collaboration that benefits truck drivers, labor in general, the public, and the environment. [EPA-HQ-OAR-2019-0055-1257-A1, pp.13-14]

61 DOL/WHD & NLRB, Memorandum of Understanding Between The U.S. Department of Labor, Wage and Hour Division and the National Labor Relations Board (Dec. 8, 2021), https://www.dol.gov/agencies/whd/flsa/national-labor-relations-board-mou

62 Ibid.

Additionally, EPA could also vocally be taking advantage of the ample opportunity for ongoing interagency consultation to boost the government-wide imperative to further environmental justice. For instance, EPA's Environmental Justice Screening and Mapping Tool would be of great service in prioritizing, for example, in what communities the burgeoning 90-Day Trucking Apprenticeship challenge should be supported and scaled. This initiative, led by the collaborative efforts of DOL and DOT within the Trucking Action Plan referenced above, would greatly benefit from EPA's input and would be consistent with providing direction in related efforts such as prioritizing 40% of the benefits of federal support for communities historically burdened by environmental injustices (i.e., Justice40). An assertive EPA could be directing the efforts to establish good jobs in trucking in such manners consistent with its authority and with the President's explicit commitments to justice. [EPA-HQ-OAR-2019-0055-1257-A1, p.14]

In sum, EPA must consider and acknowledge the impacts of its Proposed Rule on misclassified and independent contractor truck drivers and then act to remedy the resultant harms. EPA must make full use of and act creatively with its authority to work collaboratively with other federal agencies consistent with E.O. 14037 and the President's ubiquitously stated 'whole-of-government approach.'63 64 65 It should enter thoughtfully planned and lasting interagency collaborative frameworks that truly further the purposes of this administration's lofty goals in building clean infrastructure, establishing resilient domestic supply chains, ensuring family-supporting jobs with the free and fair chance to join a union, and finally ending toxic pollution. [EPA-HQ-OAR-2019-0055-1257-A1, p.14]

>
> 65 Ahiza García-Hodges, Biden's vow to be 'most pro-union president' tested in first year, (Jan. 20, 2022), https://www.nbcnews.com/business/economy/bidens-vow-union-president-tested-first-year-rcna12791

LNS recommends that EPA take the actions within its authority outlined above to ensure that the Proposed Rule does not result in further devaluation and harm to truck driver labor and thus can actually achieve what it sets out to achieve. [EPA-HQ-OAR-2019-0055-1257-A1, p.15]

Specifically, LNS recommends the following actions:

- EPA should take all available further action within its authority to help mitigate the economic impacts of its Proposed Rule on misclassified and independent contractor truck drivers and ensure that the companies hiring drivers bear the costs for leasing, operating, and maintaining vehicles.
- EPA should enter into purposeful interagency consultation and collaboration with other federal agencies, like DOL-DOT's Driving Good Jobs Initiative, and help develop a system of information and data sharing that leads to enforcement of labor and employment laws, which could protect misclassified and independent contractor truck drivers from further cost burdens associated with the Proposed Rule and later regulation. [EPA-HQ-OAR-2019-0055-1257-A1, p.15]

Organization: *Manufacturers of Emission Controls Association (MECA)*

Technologies exist to ensure that MD gasoline engines can meet stringent standards like their diesel and natural gas counterparts. We encourage EPA to set tighter MD standards as the agency has indicated in the forthcoming Tier 4 light-duty regulation. [EPA-HQ-OAR-2019-0055-1320-A1, p.31]

Furthermore, we believe that technology available for reducing exhaust emissions from light-duty vehicles and medium-duty chassis certified vehicles has advanced significantly and can be applied to engine certified products. Engine-based technologies that can address cold start emissions include cylinder deactivation, electrical heaters and heated catalysts, hybridization and electronic variable valve timing. To control exhaust temperature under high load, technologies that can be applied to engines include exhaust gas recirculation, Miller cycle, cooled exhaust manifolds, electronic throttle control and advanced transmissions. [EPA-HQ-OAR-2019-0055-1320-A1, p.31]

In addition to the engine technologies described above, several aftertreatment choices can be made to optimize emissions performance. The technology base of advanced three-way catalysts deposited on high cell density, thin-walled substrates has evolved dramatically from light- and medium-duty chassis certified vehicles to comply with Tier 3 and LEV 3 standards. Recent advances have yielded high porosity, low thermal mass substrates with narrow pore size distributions, which enable high emissions reduction efficiency with less precious metal loading [49] [50]. Catalyst manufacturers have developed coating techniques based on layered or zoned architectures to strategically deposit precious metals in ways that optimizes their performance at a minimum of cost. The coated substrates are then packaged using specially designed matting materials and passive thermal management strategies, secondary air injection systems to allow chassis certified medium-duty trucks to meet the stringent Tier 3 emission fleet average limit of 30 mg/mile or approximately 100 mg/bhp-hr. Close-coupled catalyst exhaust architectures have been on light-duty vehicles starting with Tier 2 standards and are an effective strategy for addressing cold-start or low load operation. These same approaches can be readily optimized and applied to allow all medium-duty and heavy-duty gasoline vehicles to achieve the same ultra-low exhaust emission levels being considered for diesel engines by this rule.[EPA-HQ-OAR-2019-0055-1320-A1, pp.31-32]

[49] T. Asako, D. Saito, T. Hirao and E. Popp, ‘Achieving SULEV30 Regulation Requirement with Three-Way Catalyst on High-Porosity Substrate while Reducing Platinum Group Metal Loading (SAE 2022-01-0543),’ in SAE WCX, Detroit, MI, 2022.

[50] J. Warkins, T. Tao, M. Shen and S. Lyu, ‘Application of Low-Mass Corning FLORA Substrates for Cold-Start Emissions Reduction to Meet Upcoming LEV III SULEV30 Regulation Requirement (SAE 2020-01-0652),’ in SAE WCX, Detroit, MI, 2020.

In 2007, MECA applied the above-mentioned strategies to two full-sized 2004 pick-up trucks equipped with a 5.4L and 6.0L engine [51]. The aftertreatment systems were packaged with dual-wall insulated exhaust systems and fully aged to represent 120,000 miles of real-world operation. Even with 15 year old engine technology and limited engine calibration on one of the vehicles, both vehicles achieved FTP NMHC+NOx emissions of 60-70 mg/mile. Although we did not replace the cast-iron exhaust manifolds on these vehicles, an OEM likely would take advantage of such cost effective passive thermal management strategies, including dual-wall insulated exhaust or integrated exhaust manifolds, to further reduce cold-start emissions. [EPA-HQ-OAR-2019-0055-1320-A1, p.32]

[51] J. W. Anthony and J. E. Kubsh, 'The Potential for Achieving Low Hydrocarbon and NOx Exhaust Emissions from Large Light-Duty Gasoline Vehicles,' in SAE Technical Paper 2007-01-1261, 2007.

Engines and aftertreatment systems have evolved significantly over the past 15 years and in fact, in support of the Tier 3 light-duty regulation [52], EPA tested a 2011 LDT4 pick-up truck with a 5.3L V8 engine that included a MECA supplied aftertreatment system. The aftertreatment consisted of advanced catalyst coating on 900 cpsi substrates in the close-coupled location as well as underfloor catalysts and was aged to 150,000 miles. The system was combined with cylinder deactivation and achieved an FTP NMHC+NOx level of 18 mg/mile. We believe that these same technology approaches can be deployed on medium-duty gasoline engines to meet the same stringent emission levels being considered for medium-duty diesel engines. Best in class Class 2b and 3 vehicles are currently reporting levels that are up to 75% below the Tier 3 NMOG+NOx certification standards. [EPA-HQ-OAR-2019-0055-1320-A1, p.32]

Organization: *Moving Forward Network (MFN)*

The exploitative practice of a freight transportation system that relies on misclassified workers ultimately undermines any regulatory policy that aims to "clean up" the trucking industry by shifting costs of emissions reductions to the most economically vulnerable within the industry. However, with the correct policy levers in place and working with the whole of government approach, while centering frontline and fence line experience and knowledge the EPA could be proposing the necessary successful Rule that would move ZEVS with the goal of just transition and entering environmental justice. Otherwise, we risk leaving zero emission transition up to chance. 158 [EPA-HQ-OAR-2019-0055-1277-A1, p. 40]

158. https://laborcenter.berkeley.edu/pdf/2019/Truck-Driver-Misclassification.pdf

In the workplace, the just transition framework centers the voices of workers whose jobs will radically transform by the promise of clean energy industries. Bearing in mind that the jobs of truckers and some warehouse workers might look quite different in an electrified world, looking to workers to provide leadership on what their needs will look like around training, affordability, and working conditions is a way to ensure a fair progression to EVs.159 [EPA-HQ-OAR-2019-0055-1277-A1, p. 40]

159. https://www.ww4j.org/uploads/7/0/0/6/70064813/wwj_report_good_jobs_clean_air.pdf

Port drivers have become indentured servants to their trucks. “Drivers are on the job five days a week, from ten to twelve hours a day, earning an average income of $28,000 per year.”160 Because they are not considered to be employees they have no benefits -- no health care, pension, paid vacation, etc. As previously stated, drivers have to pay the total cost of their rigs and of being on the road. [EPA-HQ-OAR-2019-0055-1277-A1, p. 40]

160. Bensman, David. (2009). Port trucking down the low road: a sad story of deregulation. Rutgers University. DEMOS pg.5

In the National Employment Law Project Report in 2014, Big Rig: Poverty, Pollution, and the Misclassification of Truck Drivers at America’s Ports, found that over 60% of port truck drivers are misclassified as independent contractors.161 The labor practice of misclassifying workers in the trucking industry undermines climate action by shifting the costs of emission reductions from companies onto the most economically vulnerable in the industry: contract truck drivers. Contract truck drivers often earn a low income and face high capital costs. These drivers “purchase” the truck that will fall under the new emission standard at a higher cost and are responsible for paying the for ownership and operation costs that can be significantly above their earnings. Drivers are often in the position of absorbing the costs of upgrading to new technologies, while trucking companies externalize their costs. [EPA-HQ-OAR-2019-0055-1277-A1, p. 40]

161. https://www.nelp.org/wp-content/uploads/2015/03/Big-Rig-Overhaul-Misclassification-Port-Truck-Drivers-Labor-Law- Enforcement.pdf

To begin to address the issues of exploitation of the workforce especially for port truck drivers the EPA needs to propose a just transition towards zero emission vehicles. This means that there would be supportive policies and programs needed to ensure that workers within the port transportation sector are not further burdened but actually could benefit from the increases in job growth. MFN is committed to a just transition towards zero emissions.162 This means that the voices of workers are critical to the success of policies and programs that will ultimately move towards zero emission solutions across the freight transportation system. [EPA-HQ-OAR-2019-0055-1277-A1, pp. 40 - 41]

162. The Just Transition Alliance defines this concept as “a principle, a process and a practice. The principle of just transition is that a healthy economy and a clean environment can and should co-exist. The process for achieving this vision should be a fair one that should not cost workers or community residents their health, environment, jobs, or economic assets. “What Is Just Transition?” Just Transition Alliance, http://jtalliance.org/what-is-just transition/.

“Just transition advocates within the labor movement often say that while ‘transition is assured, justice is not.’” - Warehouse Workers for Justice, For Good Jobs & Clean Air, How a Just Transition to Zero Emission Vehicles Can Transform Warehousing163 [EPA-HQ-OAR-2019-0055-1277-A1, p. 41]

163. https://www.ww4j.org/uploads/7/0/0/6/70064813/wwj_report_good_jobs_clean_air.pdf

Organization: *North Central Texas Council of Governments (NCTCOG)*

EPA must ensure that legacy HD trucks are still maintaining their emissions components and staying compliant with Clean Air Act requirements with regard to emissions component tampering and deterioration. To continue efforts, EPA must address legacy HD trucks and vehicles by providing funding incentives for replacing diesel engines with newer alternative fuel vehicles. [EPA-HQ-OAR-2019-0055-1254-A2, p.4]

Organization: *Natural Gas Vehicles for America (NGVAmerica)*

NGVAmerica and its members submit the following recommendations for policies and programs that the EPA and other federal agencies can advance to encourage the use of cleaner trucks.

3) Adopt incentives for hybrid electric vehicles that are powered by alternative fuels for a number of years to aid in the commercialization of these technologies, which previously have not been available and have not benefited from regulatory incentives; this includes extending sales multiplier for hybrid electric and plug-in electric vehicles that are powered by alternative fuel; [EPA-HQ-OAR-2019-0055-1330-A1, pp.12-13]

6) Amend the greenhouse gas regulations for all types of medium- and heavy-duty motor vehicles and incorporate the benefits of renewable natural gas as part of the engine and vehicle certification regulations; these credits could be based on the percentage of RNG expected to be used during the timeframe covered, or alternatively EPA could reinstate the 0.15 factor for calculating GHG emissions for NGVs, which is in line with the expected reductions achieved by the fuel mix of RNG and conventional fuel currently in use; [EPA-HQ-OAR-2019-0055-1330-A1, p.13]

7) Provide enhanced SmartWay designations for trucks powered by low-NOx engines and fueled by renewable natural gas; [EPA-HQ-OAR-2019-0055-1330-A1, p.13]

8) Fund pilot programs and infrastructure development that demonstrate the ways in which natural gas can be used to fuel a variety of different transportation sectors by supporting the purchase of vehicles and equipment at multimodal facilities such as ports and rail facilities; [EPA-HQ-OAR-2019-0055-1330-A1, p.13]

10) Work with state authorities to ensure that transportation policies include performance metrics and consider a variety of different technologies as opposed to only promoting specific technologies regardless of their cost; [EPA-HQ-OAR-2019-0055-1330-A1, p.14]

11) Work with state authorities to ensure that they give effect to the recently enacted weight allowance (i.e., 2,000 lb.) for natural gas trucks operating on the federal interstate system and consider extending this provision to state roads to maximize the benefit of this provision; [EPA-HQ-OAR-2019-0055-1330-A1, p.14]

12) Work with Congress to extend the alternative fuel tax credit (AFTC) for natural gas used as a motor vehicle fuel for a minimum of five years to stimulate real demand for cleaner new truck purchases; [EPA-HQ-OAR-2019-0055-1330-A1, p.14]

Organization: *PACCAR, Inc (PACCAR)*

PACCAR is committed to ultimately moving toward a zero emission future to help reduce the carbon footprint associated with U.S. commerce, and we believe that a GHG Phase 3 rule will help achieve this goal. PACCAR supports the GHG Phase 3 rulemaking and other rulemakings that provide regulatory certainty and facilitate product planning. [EPA-HQ-OAR-2019-0055-1346-A1, p.3]

Organization: *Red Fox Resources*

We wish to point out that engine emission controls make use of Platinum Group Metals (PGM) such as platinum and palladium. Due to their scarcity, recycling as part of sustainable circular economy best practices, is critical to control costs and to ensure emission control products and other products (such as hydrogen fuel cells and electrolyzers) remain affordable and cost effective. Today, extractive mining accounts for approximately 70% of the global supply of PGM, while the remaining 30% comes from recycling. [EPA-HQ-OAR-2019-0055-1209-A1, p.1]

The environmental impact of recycling these metals is dramatically less than traditional extractive mining, as recycling precious metals produces about one-twentieth the emissions than mining (a 95% reduction). Also, increasing reclaimed PGM from the domestic use, lessens the threat of supply interruptions from foreign countries. [EPA-HQ-OAR-2019-0055-1209-A1, p.1]

For these reasons, we strongly encourage the EPA to make manufacturers aware of the opportunity for recycling, and to incorporate best practices for end-of-life and sustainability in the design, manufacture, and support of emissions components. Examples of this include OEMs implementing core return programs to ensure the maximum number of components are cost effectively aggregated for recycling, and kept out of the secondary markets, scrap metals bins, or landfills. Without these core return programs, these components often get scrapped and the PGM is lost. Another example is that the components are designed for ease of recycling; in terms of both the types of material used and layout of the parts. [EPA-HQ-OAR-2019-0055-1209-A1, pp. 1-2]

One last consideration is that these catalyzed emissions components be designed with anti-theft measure in mind. Given the increasing value of some parts, theft has become and will continue to an important issue that causes downtime for fleets and adds to an overall cost increase to the industry and their customers. [EPA-HQ-OAR-2019-0055-1209-A1, p.2]

Organization: *Repair Association/Repair.org*

Given that the EPA has the goals; ‘to reduce in-use emissions under a broad range of operating conditions,’ ‘the CTI can be summarized as a holistic approach to implementing our Clean Air

Act obligations,' and 'CTI should support improved vehicle reliability' The EPA has stated that this proposed rule shall apply to 'various types of nonroad engines' I hope that the EPA will also promulgate this rule to equipment used in agriculture. [EPA-HQ-OAR-2019-0055-1036-A1, p.1]

Hours of use verses miles traveled: Agricultural and Construction equipment do not use miles traveled as a measurement of the usage or age of the engine. Industry standard is the hours of operation.
Recommendation: The rule should include both measures and where appropriate, provide a translation between the two measurement systems. [EPA-HQ-OAR-2019-0055-1036-A1, p.2]

Adequate maintenance instructions: Agricultural equipment manufactures do not make available service information of emission control systems as required by rule 74 FR 8310, February 24, 2009.[1] John Deere CTO Jahmy Hindman publicly stated that because of regulation they do not allow for repairs by owners and independent service organizations.[2]
Recommendation: The rule should require all information provided to franchise dealership as intended by the Clean Air Act, Section 202(m)(5)

> Information availability - The Administrator, by regulation, shall require (subject to the provisions of section 7542(c) of this title regarding the protection of methods or processes entitled to protection as trade secrets) manufacturers to provide promptly to any person engaged in the repairing or servicing of motor vehicles or motor vehicle engines, and the Administrator for use by any such persons, with any and all information needed to make use of the emission control diagnostics system prescribed under this subsection and such other information including instructions for making emission related diagnosis and repairs. No such information may be withheld under section 7542(c) of this title if that information is provided (directly or indirectly) by the manufacturer to franchised dealers or other persons engaged in the repair, diagnosing, or servicing of motor vehicles or motor vehicle engines. Such information shall also be available to the Administrator, subject to section 7542(c) of this title, in carrying out the Administrator's responsibilities under this section. [EPA-HQ-OAR-2019-0055-1036-A1, pp.2-3]
>
> [1] 'manufacturers make available to the service and repair industry information necessary to perform repair and maintenance service on OBD systems and other emission related engine components.'
>
> [2] https://www.theverge.com/22533735/john-deere-cto-hindman-decoder-interview-right-to-repair-tractors, June 15, 2021, accessed on 24-April-2022.

Warranty of 5 years or 50,000 miles: Warranties of agricultural equipment are typically one year. Additional warranty coverage may be purchased from the dealer.
Recommendation: I recommend that the rule include explicit warranty requirements analogous to current or proposed regulations in equivalent hours with regards to emissions equipment. [EPA-HQ-OAR-2019-0055-1036-A1, p.3]

Usefulness of currently available emission diagnostic information and equipment: Some agricultural equipment manufactures do NOT make emission diagnostic information available to owners and independent service organizations. Some may provide the information on a limited rental basis only to the equipment owner. In the Case of John Deere, the tool needed for diagnostic information, Dealer Level Service ADVISOR is controlled in real time for exclusive use by current dealer service technicians. Additionally, full completion of an emission repair may require a technician be provided additional resources from exclusively the original manufacture often in an encrypted format. [EPA-HQ-OAR-2019-0055-1036-A1, p.3]

Certain manufactures of agricultural equipment have error codes that are colloquially known as ‘latch codes.’ They are often associated with issues with the emission control system that can disable the equipment’s designed functionality until cleared. These ‘latch codes’ exclusively require an franchise dealership technician to clear the code and restore the equipment to full working order. It is useful to note that a ‘latch code’ does not necessarily involve a repair. But rather can be tripped by an inadvertent action by the equipment operator and corrected by the equipment operator. Nevertheless, the equipment would need to be serviced by a dealer technician using the restricted software tool. [EPA-HQ-OAR-2019-0055-1036-A1, p.3]

Recommendation: I recommend that any information or software tools related to the service, repair, installation or replacement of parts or systems developed by third party (Tier 1) suppliers for OEMs, to the extent they are made available to franchise dealerships be made available to equipment owners and independent repair facilities. [EPA-HQ-OAR-2019-0055-1036-A1, p.3]

The adequacy of emission-related training for diagnosis and repair of these systems: Training of emission related diagnosis and subsequent repair is only provided to franchise dealership technicians.
Recommendation: I recommend that any information or software tools related to the service, repair, installation or replacement of parts, or systems developed by third party (Tier 1) suppliers for OEMs, to the extent they are made available to franchise dealerships be made available to equipment owners and independent repair facilities. [EPA-HQ-OAR-2019-0055-1036-A1, p.4]

The readiness and capabilities of repair facilities in making repairs: The availability of qualified technicians is an decades old problem that is well documented by Diane Benck, General Operations Manager and Owner, West Side Tractor Sales Co., in her testimony before the U.S. House of Representatives Small Business Committee's Innovation, Entrepreneurship and Workforce Development Subcommittee on March 31, 2022 3
Recommendation: I recommend that any information or software tools related to the service, repair, installation or replacement of parts, or systems developed by third party (Tier 1) suppliers for OEMs, to the extent they are made available to franchise dealerships be made available to equipment owners and independent repair facilities.[EPA-HQ-OAR-2019-0055-1036-A1, p.4]

3 https://docs.house.gov/Committee/Calendar/ByEvent.aspx?EventID=114554, Statement: https://docs.house.gov/meetings/SM/SM22/20220331/114554/HHRG-117-SM22-Wstate-BenckD-20220331.pdf, accessed 24-April-2022.

The reasonableness of the cost of purchasing this information and the equipment: Some agricultural equipment manufacturers such as John Deere’s Customer Level Service ADVISOR, make a reduced functionality version of the dealer level software or a ‘lite’ version. These ‘lite’

versions of the software often limit information, diagnostics, and repair capabilities especially with regards to emission issues. The annual license fee of this software tool is very high, hard to order, and not well subscribed.
Recommendation: I recommend that any information or software tools related to the service, repair, installation or replacement of parts, or systems developed by third party (Tier 1) suppliers for OEMs, to the extent they are made available to franchise dealerships be made available to equipment owners and independent repair facilities on fair and reasonable terms. [EPA-HQ-OAR-2019-0055-1036-A1, pp.4-5]

The prevalence of repairing this equipment outside of large repair facilities: Because agricultural equipment manufactures regularly limit the use of the software tools to only franchise dealership both small and large, agricultural equipment dealers of other manufactures, do not have access to the necessary tools.
Recommendation: I recommend that equipment owners and independent repair facilities be allowed to either own or rent any information or software tools related to the service, repair, installation or replacement of parts, or systems developed by third party (Tier 1) suppliers for OEMs, to the extent they are made available to franchise dealerships. [EPA-HQ-OAR-2019-0055-1036-A1, p.5]

If there are any existing barriers to enabling owners to quickly diagnose emission control system problems: Agricultural equipment manufactures suggest existing paper-based manuals as an alternative to software tools. Often those materials exclude information on the maintenance and repair of the emission control system and certainly are not regularly updated. A recent review of a John Deere 8530 Tractor Operation Manual listed 706 error codes of which 627 (89%) referred the user to contact their dealer for the indicated repair. See Appendix A.
Recommendation: I recommend that any information or software tools related to the service, repair, installation or replacement of parts, or systems developed by third party (Tier 1) suppliers for OEMs, to the extent they are made available to franchise dealerships be made available to equipment owners and independent repair facilities. [EPA-HQ-OAR-2019-0055-1036-A1, p.5]

Inadequate maintenance instructions lead to Mal-maintenance: Because the information and the required tools are often not available to owners and independent service organizations on the maintenance of emission control systems owners may defeat, eliminate, or disable, emission control systems out of desperation for meeting tight time limitations of planting, spraying, and harvesting.4
Recommendation: I recommend that any information or software tools related to the service, repair, installation or replacement of parts, or systems developed by third party (Tier 1) suppliers for OEMs, to the extent they are made available to franchise dealerships be made available to equipment owners and independent repair facilities. [EPA-HQ-OAR-2019-0055-1036-A1, pp.5-6]

4 https://www.agequipmentintelligence.com/articles/3728-dealers-alerted-to-consequences-of-illegal-modifications-to-ag-equipment-systems, accessed 24-April-2022.

Broad comment on actions EPA should take, if any, to improve maintenance practices and the repair experience for owners: The EPA should enforce section 2 of rule 74 FR 8310, February 24, 2009, or promulgate similar rules as it pertains to off-road agriculture vehicles over 14,000 GVW. Additionally, the EPA should widely publicize the false and misleading information that agricultural equipment manufactures, and their associations have promulgated that the EPA limits agricultural equipment owners and independent service organization from maintaining or repairing their equipment emission systems, such as 'Farmers and ranchers have the ability to perform the vast majority of repairs on their equipment unless it impacts federally mandated safety or emissions regulations.'5 [EPA-HQ-OAR-2019-0055-1036-A1, p.6]

5 https://r2rsolutions.org/right-to-repair-legislation/, accessed 24-April-2022

Organization: *Saahil Pasha*

The EPA is proposing a legislation to significantly reduce dangerous emissions from such heavy-duty gasoline and diesel engines. As a public health professional, I strongly support the EPA in this legislation. Although there is opposition displayed from the partners in the trucking industry about costs or government overreach, the EPA must prioritize the protection of air, land, and water to ensure public health and welfare. Furthermore, the EPA should bolster this proposed regulation with:

1. Congress sponsored, incentive-based tax credit to encourage industry participation.
2. U.S. Department of Transportation sponsored modified trucking and freight routes to avoid urban areas.
3. Longitudinal study to assess outcomes and impacts of the proposed legislation.

The proposed rule from the EPA to control emissions on heavy duty gasoline and diesel engines is well structured and informed. It is the responsibility of the EPA to work towards protecting the environmental conditions and public health and welfare. This rule definitely takes a step towards improving the surrounding environmental conditions for North Texans. The projected reduction in nitrogen oxide air pollution and the positive monetized health benefits align with achieving the goals of cleaner air in North Texas. Nonetheless, there are some recommendations that must be considered to increase industry participation, reduce risks for disadvantaged communities, and identify emission and health outcomes. [EPA-HQ-OAR-2019-0055-1206]

RECOMMENDATIONS [EPA-HQ-OAR-2019-0055-1206]

1. Work with the United States Congress to create a tax credit: through this strategy the EPA would urge Congress to pass a bill that provides tax credits for industry partners and businesses that choose to purchase heavy duty vehicles that follow the standards set by the EPA's proposed rule. The tax credit could also be extended to include businesses that use vehicles with zero emission engines or renewable energy engines. This strategy would incentivize industry partners to participate in purchasing vehicles with stricter emission standards and assist with the progression of the improved health outcomes (German & Parilla, 2021).

2. Work with Department of Transportation (DOT) to modify trucking routes: through this strategy, the EPA would urge the U.S. DOT to create regulations which

would alter trucking routes and prevent heavy freight traffic from passing through densely populated or urban areas. This strategy would improve equity because trucking routes and population impact minority and low-income populations at a higher rate. The U.S. DOT would work with the Freight Advisory Committee to determine methods for limiting freight trucking through urban areas. This strategy could include requiring large freight trucks to dispatch their loads, outside cities, to smaller trucks with reduced emission that could travel through urban areas.

3. Longitudinal research to study outcomes and impacts: this strategy would provide the EPA with valuable feedback about the impact of the proposed regulation over the years. This study would occur over a 15–30-year period and researchers would analyze, biological indicators such as lung function, blood pressure, health outcomes, pollution levels, etc. Longitudinal studies are important when analyzing policies that project to have long term impacts (Adar et al., 2018).

CONCLUSION. With increasing temperatures and climate changes, the issue of ground level ozone will only continue to get worse. Moreover, the impacts of ground level ozone and air pollution are disproportionately impacting minority and low-income populations. The EPA must focus all efforts toward passing the proposed legislation. The EPA must work with industry partners to increase participation, attempt to change trucking routes in urban areas, and conduct a longitudinal study to assess impacts. Future EPA regulations should work towards eliminating the usage of fossil fuel combustion for energy. These efforts will significantly contribute to improving the lives of millions of people across the United States. [EPA-HQ-OAR-2019-0055-1206]

Organization: *San Joaquin Valley Air Pollution Control District (District)*

We also urge EPA to consider the other major portion of our 2016 petition and begin formal rulemaking to reduce emissions from locomotives, another source category of growing relative importance as the District and CARB work to reduce other sources of emissions. [EPA-HQ-OAR-2019-0055-1291-A1, p.3]

Organization: *Taxpayers Protection Alliance (TPA)*

Additionally, TPA urges the EPA and Biden administration to consider deregulatory alternatives that could decrease emissions while keeping inflation in check. For example, the administration is currently exploring increased rail regulations, including crew size mandates (despite little evidence of safety gains from such a rule).6 Because alternatives such as rail tend to pollute less than heavy-duty vehicles, reducing the regulatory burden on different modes of freight transportation would allow for the supply chain to embrace flexibility and lower emissions. This is a far better strategy for controlling emissions than introducing ever-costlier rules. [EPA-HQ-OAR-2019-0055-1102-A1, p.2]

6 Ike Brannon and Michael Gorman, 'The Biden Administration’s Rail Regulation Efforts Make Little Sense,' The Regulatory Review (May 3, 2022).

Organization: *Victoria D'Amico*

Small businesses should receive aid for the expenses they may incur in making these transitions. I have read some other comments and that seemed to be a common theme among some small business owners. The Political Economy Research Institute (2022) states that 100 companies are responsible for 70% of global emissions. This demonstrates that large corporations and governments are the biggest problem in combating climate change. Large corporations are often given large tax breaks or incentives for programs like these. A program designed to help small businesses continue to thrive during this transition would be extremely important to keeping their businesses afloat and keeping public support with this rule. [EPA-HQ-OAR-2019-1214]

Organization: *WE ACT for Environmental Justice*

In addition to putting in place a national regulatory framework to reduce NOx and GHG emissions by the end of the year, we urge the EPA to advance other policies that support mandatory emissions reductions and remedy environmental injustices from the entire freight transport sector. Complementary to encouraging the transition to all-electric trucks and buses by 2035, the Agency should encourage the rapid retirement of internal combustion trucks on or before 2045. This would close the loop and ensure we truly reap the pollution reductions, public health, and climate gains from the deployment of these zero-emission vehicles,28 especially in overburdened communities. Federal and state coordination is needed to rapidly build out the charging infrastructure to support this level of deployment. It is also critical that transportation electrification be matched with aggressive movement towards renewable electricity generation, displacing fossil fuels to avoid shifting emissions from vehicles to power plants. [EPA-HQ-OAR-2019-0055-1347-A1, p.5]

https://www.mjbradley.com/sites/default/files/EDF MHDVEVFeasibilityReport22jul21.pdf

Organization: *William Limpert*

I would also like to see EPA promote other forms of transportation for environmental , health, and climate benefits. My father worked for the Baltimore and Ohio Railroad, and I am always impressed by the extensive rail systems that are in place in other countries. Moving freight by rail is 3-4 times more efficient in fuel consumption, pollution emissions, and greenhouse gas emissions than moving freight by truck, even under current conditions, and without full electrification. We may be able to attain full electrification of rail systems sooner than we can with trucks. Moving freight by rail would also reduce the public safety issues with large trucks on crowded highways. It would be of great benefit to move more freight by rail, especially for long distance transportation across our country. Trucks could still be used for moving freight from the rail terminal to local businesses and industry. The same may be true for moving freight by boat or barges, and even more so if that freight is being moved downstream, or with the prevailing winds. I don't think air freight transport would be more efficient than truck transport. EPA should consider more efficient and less polluting freight transport, and rail and ship transport should be greatly encouraged. [EPA-HQ-OAR-2019-0055-1190]

- Reward manufacturers, especially American manufacturers who comply by offering incentives for early compliance, and incentives for reducing emissions below the levels set in the rules. Even more so, reward those who develop vehicles that are powered by only electricity as quickly as possible. This could be done by public acknowledgement, including public acknowledgement by President Biden. [EPA-HQ-OAR-2019-0055-1190]

- Punish those who do not comply with the finalized rules with minimal penalties for initial or minor violations, and escalating penalties for ongoing and major violations. The penalties must be cost effective in assuring that the penalty costs more than the savings that would be gained by the violation. For the most egregious violations, incarceration and a fine should be considered. I, and the public, are frustrated and angry when the wealthy and powerful pay a fine for violating the law, when ordinary citizens would be incarcerated for the same violation. Volkswagen's falsification of emission test findings comes to mind in this regard. [EPA-HQ-OAR-2019-0055-1190]

- Consider subsidizing the industry to enable a faster transition to low emission and zero emission technologies. The revenue for subsidizing the industry should predominantly come from wealthier tax payers, most of whom currently do not pay their fair share of taxes. In 2012 my elderly mom earned $17 thousand in income, and Mitt Romney earned $19 million in income. My mom paid a higher percentage of her income in taxes than did Romney. [EPA-HQ-OAR-2019-0055-1190]

EPA Summary and Response

Comments on the proposed rule covered a wide range of topics across most of the industry sectors that are subject to EPA emission standards and we appreciate the thoughtful recommendations and information shared by commenters. Comments in this section are related to topics that are out of scope for this final rule, as noted below.

We did not propose or request comment on the following topics raised by commenters and are not taking final action in this rule related to: more stringent standards specific to the medium-duty vehicle category, standards for sectors other than heavy-duty highway engines and vehicles (e.g., locomotive, airplane, off-road vehicles, light duty vehicles, agricultural, industrial applications), APU requirements in 1039.699, test procedures in 1051.501, requirements for glider vehicles[74], incentives for use of renewable fuels, adding ethanol as a fuel type in 1036.530, additional definition references in 1037.135(c), defect reporting, recalls, and corrective action (i.e., "remedial action" for EPA) requirements, SmartWay designations, pilot programs for natural gas fueled vehicles or infrastructure, coordination with states on alternative fuel programs, and coordinating heavy-duty engine programs with renewable fuels programs from EPA and other federal agencies. We may consider some of these commenter recommendations in a future rule.

[74] We note that, as part of our migration from 40 CFR part 86 to 40 CFR part 1036, we are finalizing a revision to 40 CFR 1037.635(b)(2) that updates the reference to the applicable standards for glider vehicle engines. Any other requested changes regarding glider vehicle regulations are out of scope for this rule.

We did not propose or request comment on the following additional topics and are also not taking final action in this rule related to: maintenance of emission components on legacy trucks, addressing the resilience of the supply chain, recycling platinum and palladium, tax credits for new technologies or usage taxes for older technologies, modification of trucking routes, retroactive changes to emission standards for existing engines, incentives to replace older engines, improvements to and incentives for public transit, truck driver shortages, truck driver unionization, classification, or exploitation, direct financial incentives to encourage biodiesel use, and financial assistance for small business to meet new standards.

We agree with comments recommending we coordinate with other federal agencies when our programs overlap and that longitudinal research studies can provide valuable feedback on the long-term impacts of our rulemakings. While generally not at issue in this rule, we may pursue these recommendations in the future as applicable.

As explained in preamble Sections III and IV and sections 3 and 12 of this document, we are not finalizing the proposed allowance for manufacturers to generate NO_X emissions credits from heavy-duty ZEVs and the final criteria pollutant standards are not based on projected utilization of ZEV technologies, although manufacturers may choose to comply with the standards through using ZEV technologies, or other technology pathways than included in our demonstration program. As noted in section 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. Therefore, we are not taking final action at this time regarding issues raised in comments relating to CO_2 and other GHG emissions, ZEV infrastructure, manufacturers' and labor's willingness to develop ZEVs, incentives and exemptions for fuel cell technologies, and coordination with other federal agencies' ZEV or fuel cell programs. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider the comments in this section of this document in the development of that future rulemaking. In response to comments on alternative compliance pathways that involve ZEV targets for reaching GHG and/or criteria pollutant emissions standards, we refer readers to discussion in section 3.1.1 of this document, as well as the discussion on not finalizing the proposed allowance for manufacturers to generate NO_X emissions credits from heavy-duty ZEVs, which was previously noted as located in section 12 of this document.

34 Late Comments

The Agency has been, is, and will continue to be committed to considering timely comments received on proposed rules. The compressed final rule schedule is necessary to finalize the standards this year to ensure that these important emission reductions occur as soon as possible. However, EPA was able to also consider late comments on this final action up to those submitted on October 4, 2022. In the interest of transparency, we have included comments we received after October 4, 2022 in the docket; however, those comments are not part of the record for judicial review of this rule.

Organization: *California Air Resources Board (CARB): EPA-HQ-OAR-2019-0055-2857*

Since the submission of California Air Resources Board's (CARB) comments on May 13, 2022, and the closing of the comment period for the Clean Trucks Plan (CTP) notice of proposed rulemaking (NPRM) on May 16, 2022, CARB staff has reviewed the comments submitted by other stakeholders on the CTP NPRM. I am writing this supplemental letter to comment on some requests and statements made by other stakeholders in order to provide CARB's feedback and clarity on "matters of central relevance to the rulemaking" before the U.S. Environmental Protection Agency (U.S. EPA).1

1 42 U.S.C. § 7607(d)(4)(B)(i); see also id. §7607(d)(7)(A) (providing that such material forms part of the administrative record for judicial review).

Because this letter bears upon such matters, please add it to the record of this rulemaking and all appropriate dockets. The main points of our supplemental comments are summarized below:

- The Truck and Engine Manufacturer Association (EMA) has asked the U.S. EPA to provide a 0.026 Grams per brake-horsepower hour (g/bhp-hr) margin when setting nitrogen oxides (NOx) standards. The margin requested by EMA is dangerously and unnecessarily large, given the margins with which manufacturers have historically certified. In addition, crankcase ventilation, which was not included in U.S. EPA's NPRM technology package, offers a cheap, widely used way for manufacturers to provide additional margin if needed.
- Regarding EMA's concerns about possible pre-buy and no-buy caused by the proposed regulations, we expect any pre-buy and no-buy effects to be small. History shows sales are driven by economic factors (recession, etc.) much more than any emission standard changes. In addition, supply chain issues today make pre-buy impossible or unlikely. Finally, sensitivity analyses CARB staff performed for the Omnibus regulation show that even with a 20 percent pre-buy/no-buy, the Omnibus regulation was still cost-effective and worth pursuing, and the same would hold true for U.S. EPA's program.
- CARB staff opposes Daimler's ask for regulatory relief for hydrogen-fueled internal combustion engines (HrlCE) because such engines emit tailpipe NOx just like traditional combustion engines. In addition, adding special flexibilities for HrlCE technology would violate applicable public notice requirements because it is outside the scope of U.S. EPA's rulemaking.
- CARB staff opposes EMA's request for U.S. EPA to retain the language defining the parent engine based on existing requirements because doing that would allow manufacturers to avoid testing the engine with highest potential emissions.
- CARB staff objects to EMA's assertion that biodiesel specification regulations are needed as part of the CTP rulemaking.
- CARB staff disagrees with EMA's comments regarding a need for more consideration of on-board diagnostics (OBD) requirements and capabilities before adoption of the proposed standards.
- CARB staff believes there is a need to continue particulate matter (PM) and non-methane hydrocarbons (NMHC) measurements as a part of the heavy-duty in-use testing (HDIUT) program.

- Many private and public agencies are investing in future infrastructure activities to support the heavy-duty (HD) sector's transition to zero-emission. Furthermore, CARB staff believes that rollout of initial heavy-duty zero-emission vehicle (HD ZEV) volumes is not dependent on the infrastructure of pre-existing public charging networks.

CARB staff's supplementary comments are presented in detail below:

Margin Requirement - EPA-HQ-OAR-2019-0055-1203_Attachment_1.pdf (Pages 23-33), EMA

In its comment letter, EMA uses a margin stack-up analysis to request a 0.026 g/bhp-hr margin to be included in establishing future NOx emissions standard in order to ensure that 97.7 percent of the future engine sales would have emission levels below the applicable standards (page 28 of the EMA comment letter).

CARB staff conducted a historical survey of past margin levels used by HD diesel engine manufacturers and submitted the information in its comment letter2 to U.S. EPA. If EMA's margin stack-up analysis was correct, it should also apply to previous engine sales as these engines would also require similar (or greater) margin levels in order to comply with the existing emissions standards. Based on historical certification data, a 0.026 g/bhp-hr NOx margin requirement would mean that 24 percent of the HD diesel engine families sold between 2010 and 2020 model years in California did not have sufficient margin levels to be certified but were nevertheless certified by engine manufacturers. The historical data indeed suggests that engine manufacturers do not feel the need to include any margins when certifying their existing products for sale. It therefore does not make sense to include margin stack-ups for establishing future standards.

2 https://www.regulations.gov/comment/EPA-HQ-OAR-2019-0055-1186 . Pages 41-44.

It should also be noted that engine manufacturers have many options to comply with the proposed Option 1 standards including establishing a margin by deploying new emission control technologies. For instance, today's diesel engines do not typically use closed crankcase ventilation systems, and hence vented blowby or open crankcase ventilation presents an untapped means to further reduce NOx emissions from on-road HD diesel engines. Rather than closing crankcases, most HD diesel manufacturers instead measure and account for emissions from the blowby gases, which are vented directly to the atmosphere. Some rudimentary physical filtration is typically employed to reduce oil mist and a portion of PM emissions from the raw exhaust of the blowby gases. But NOx aftertreatment has not been applied to these directly vented blowby gases.

Blowby vented from the crankcase presents a ready opportunity for significant additional NOx reductions. For 0.20 g/bhp-hr NOx certified engines, the blowby NOx contribution was typically a very small fraction of total engine NOx emissions, which were dominated by the tailpipe contribution. However, as the blowby percentage of total exhaust flow approaches the percentage of NOx surviving the aftertreatment, the blowby becomes a much more important opportunity for reducing an engine's overall NOx emissions impact. For example, if one percent of raw exhaust is escaping via blowby and the aftertreatment reduces the remaining exhaust flow's tailpipe NOx by 99 percent, then both blowby NOx and tailpipe NOx emission rates would be of similar orders of magnitude.

Currently, technological pathways exist for eliminating blowby NOx emissions. Closed crankcase ventilation is an obvious pathway to eliminate the NOx emissions contribution from blowby. Routing the blowby crankcase vapors to eventually go through the existing exhaust aftertreatment would render blowby NOx negligible and could be accomplished in a number of ways.

Introducing the blowby gases into the inlet of the engine has been employed in the light-duty sector for many years as well as in Cummins Optional Low NOx certified medium- and heavy-HD engines certified through diesel test procedures since the 2016 model year.3 Cummins reported a 70 percent reduction in methane emissions just by closing the crankcase of those methane powered engines.4 They apparently valued the emissions reductions sufficiently to merit working through whatever potential durability challenges the blowby gases in the intake tract may have presented to turbo compressor wheels, various intake air sensors and the like.

3 https:/lwww.truckinginfo.com/137270/cummins-starts-production-of-isl-g-natural-gas-engine
4 https://mart.cummins.com/imagelibrary/data/assetfiles/0042998.pdf

Alternatively, one could avoid exposing the turbo compressor to blowby gases by routing blowby gases into the main exhaust prior to the aftertreatment with the associated backpressure on the crankcase. This could also be achieved without the crankcase pressure rise by actively pumping blowby gases to a post turbo compressor (boosted) intake location or an exhaust pre-aftertreatment location using a smaller version of the exhaust gas recirculation pumps available today.5 Actively pumped crankcase ventilation strategies are used extensively across stationary and marine reciprocating engines to control oil mist and reduce operator exposures.

5 https:/lwww.eaton.com/us/en-us/productslengine-solutionslsuperchargers/NS-technology-applications/tvs- diesel-egr-pump.html

The fraction of gases escaping as blowby is also a potential target for engineering improvements. The designs of valve guides and valve stem seals, turbocharger shaft seals, and the piston ring stack and cylinder liners can each affect the amount of blowby experienced by a given engine initially and as it wears. Each approach to eliminating blowby NOx would have different engineering tasks to assure acceptable function and durability, but sufficient physical filtering of these gases in preparation for combustion or catalytic treatment is an application engineering endeavor not an act of technology invention.

Testing shows elimination of blowby NOx emissions would yield significant "compliance margin" beyond current Low NOx Engine demonstrations. The industry typical approach of including vented blowby emissions in the emissions measurement was also employed in the Southwest Research Institute Stage 1 and Stage 3/Stage 3 Rework Low NOx diesel engines and further work is being done on an Off-Road Low NOx engine. The performance reported previously for these engines has not exploited the significant additional NOx reduction opportunity from eliminating blowby emissions that are being directly vented to the environment. Measurements with and without the blowby included were conducted on more than one base engine platform and showed that blowby emissions contribute between 20-60 percent of cycle average NOx depending on engine designs and test cycles. Applying this kind of closed crankcase benefit specifically to the Stage 3 Rework engine is projected to yield an overall 20 percent federal test procedure (FTP) compliance margin at 435,000 miles, 35 percent FTP compliance margin at 600,000 miles, and 18 percent at 800,000 miles (see attached presentation by Southwest Research Institute).

Cost for closed crankcase ventilation is expected to be low compared to other means for additionally achieving equivalent NOx reductions. Closed crankcase ventilation has already been commercially demonstrated on medium- and heavy-HD Optional Low NOx engines for 6 model years and across 3 displacements (6.7-liter, 8.9-liter and 12-liter). It is quite likely that the any additional filtering of the closed crankcase blowby gases needed to maintain durability across longer useful life could be accomplished for very reasonable cost. The cost of implementing such filtering is expected to be very competitive compared to other methods of securing additional margin from engines already well equipped with modern generation catalysts and aftertreatment architectures, model-based controls, and cylinder deactivation and exhaust gas recirculation cooler bypass thermal management hardware. Products for closing turbocharged diesel crankcases already exist ready for evaluation and validation from many suppliers.6 7 8 One might note that Cummins initially chose in model year 2016 to reduce greenhouse gas (GHG) emissions relative to their existing ISL-G engine by capturing the blowby methane via external closed crankcase methods rather than immediately investing in the spark-ignition specific cylinder head and other engine internal design changes subsequently seen in their about-to-be-released lower GHG spark-ignited products. This may be another indication of the closed crankcase approach's practicality and cost effectiveness for reducing blowby emissions relative to other means of improving the engine itself.

Concern regarding possible pre-buy and no-buy caused by the proposed regulations EPA-HO-OAR-2019-0055 1168_Attachment_1.pdf {Exhibit "D"}, EMA

EMA voiced concerns that the proposed regulations would cause economic disruption and have less benefits than projected due to pre-buy or no-buy of vehicles due to the regulation's increased cost of engines. But this scenario simply cannot offset the benefits of more stringent standards. At a fundamental level, companies are not going to rush out and buy so many trucks in a few years (especially under current economic conditions) as to undermine comprehensive national rules, or fail to buy trucks for many years. Even very substantial responses along these lines, should they occur, would not warrant setting weaker standards because remaining reductions are still very large. As mentioned in the final statement of reasons9 (FSOR) for the Low NOx Omnibus Regulation, CARB staff conducted an analysis to see the possible impacts of a pre-buy no-buy scenario. Staff analyzed a scenario where there is a 20 percent decrease in sales and fleets retain their existing vehicles longer throughout the life of the regulation. This would result in fewer Low NOx engine sales in the analyzed time period up to 2050. The retained vehicles would have engines meeting the current 0.2 g/bhp-hr NOx emissions standard. In this analysis, from 2024 to 2050, the pre-buy and no buy effect resulted in approximately 40 percent less NOx benefits compared to the assumed compliance. The cost effectiveness increased to $7.50 per pound NOx. Even if a pre-buy no-buy would occur as a result of the regulation, there would be a significant reduction in NOx in the time period adding up to 206,312 tons of NOx. The benefits would be significant, cost effective and worth pursuing.

9 https:/lww2.arb.ca.gov/sites/default/files/barcu/board/rulemaking/hdomnibuslownox/fsor.pdf

The historical assessment of pre-buy based on HD emissions regulations was investigated in Anticipation and Environmental Regulation by Rittenhouse and Zaragoza-Watikins, as cited by U.S. EPA.10 Their analysis shows minimal impacts on sales projections due to upcoming regulations. Diesel aftertreatments were first introduced in 2007 and the analysis showed an increase in sales slightly outside of regular variation for four months. There was a symmetric decrease in sales lasting for four months. Their study shows the impacts of pre-buy due to regulation changes are minimal and occur for only a short time span. The comments from the Moving Forward Network11 (MFN) also reached this conclusion on page 38. Additionally, the MFN comments also showed the impact on sales of HD vehicles greatly depends on economic factors. Events like the dot com crash, great recession and COVID-19 pandemic have a much greater impact than any emission standard changes, affecting hundreds of thousands of engine sales.

10 Draft Regulator Impact Analysis. Page 407. March 2022, EPA-420-D-22-00

11 https:/lwww.regulations.gov/comment/EPA-HQ-OAR-2019-0055-1277 ; page 38

In the current economic climate and supply chain shortages resulting from COVID-19, there are doubts that pre-buy could even be possible. The supply chain delays have made the supply of any type of vehicle very limited. We are a couple of years into low production/high demand conditions where desired vehicle purchases are stacking up due to aging fleets because dealers cannot secure vehicles from original equipment manufacturers (OEM) who are constrained on accessing parts (e.g., computer chips, castings, and at times certain lubricants)12• The vehicles that were not manufactured are a permanent 'hole' in the age distribution of vehicles moving through the fleet resulting in further demand for vehicles for the foreseeable future that will also drive-up vehicle prices until the production volumes catch up. Because the cost of vehicles is currently inflated due to supply chain problems, pre-buying additional vehicles today would not provide savings. It is also expected that 2023 vehicle production will also suffer computer chip and other supply chain constraints on manufacturer volumes13•14•15•16• Under these supply chain limitations, ramping up production to make more vehicles in a year would not be possible. Vehicle manufacturers will need to get back to their previous production volumes to satisfy replacements, and then produce more to start working through the backlog of pent-up demand

and growth in the transportation sector. If it takes them half as many years to make up the 2020 to 2023 hole in production starting in 2024, that leaves only 2026 to execute a "pre-buy" effort. Because fleets will likely already have been buying vehicles at an accelerated rate just to backfill their delayed replacements, it is unlikely they would have the resources to further accelerate purchasing to execute a pre-buy.

Request for Regulatory Relief for H2-ICE Hydrogen-Fueled Internal Combustion Engines - EPA-HQ-OAR-2019-0055 168_Attachment_1.pdf (Pages 125-129), Daimler Truck North America LLC (Daimler)

Daimler is requesting the introduction of so-called regulatory relief measures applicable to future model year HrlCEs. According to Daimler, the intent of these measures is to " ... foster innovation and enable immediate penetration of innovative technologies with effectively zero carbon dioxide (CO2) emissions and near-zero NOx emissions such as HrlCE engines".

CARB staff is strongly opposed Daimler's request for two reasons:

- CARB staff does not believe that the H2-ICE technology is equivalent to other zero-emission technologies such as battery- or fuel-cell electric vehicles. As stated by Daimler, HrlCE technology does emit tailpipe NOx emissions, and the engine-out NOx emissions are high enough that a complex selective catalytic reduction (SCR) aftertreatment system would be needed to reduce the tailpipe emissions to a level that complies with the regulations. It is therefore unreasonable to consider H2-ICE technology as an advanced zero-emission technology. CARB staff firmly believes that future H2-ICE products should go through a vigorous certification process to evaluate the durability of the hardware as well as demonstrating compliance with auxiliary emission control device requirements as well as all other regulatory requirements for internal combustion engines.

- As a threshold matter, Daimler's proposal would require U.S. EPA to take final actions in contravention of applicable public notice requirements, 17 because such final actions would impermissibly depart from "the terms or substance of the proposed rule", and "[the] description of the subjects and issues involved"18 in the NPRM.19 U.S. EPA expressly states that it is not proposing to enact policies to advance the introduction of zero-emission vehicles (ZEV) in this rulemaking action, nor is it proposing to establish nationwide requirements that manufacturers must produce a portion of their vehicle fleets as ZEVs, but states it will consider such policies in the context of future rulemaking proposals.20 Moreover, the NPRM does not contain either factual data, the methodology of obtaining and analyzing such data, or the major legal interpretations and policy considerations underlying Daimler's proposal, in contravention of 42 U.S.C. § 7607(d)(3)(A) through (C).

17 5 U.S.C. § 553(6), 42 U.S.C. § 7607(d)(3)
18 5 u.s.c. § 553(6)(3)
19 Envtl. Integrity Project v. EPA, 425 F.3d 992 (D.C. Cir. 2005).
20 NPRM at 17420.

It is accordingly clear that the NPRM notice fails to provide adequate notice and opportunity to comment on a final U.S. EPA action that would finalize Daimler's proposal, given that U.S. EPA expressly stated it would not enact policies or requirements regarding ZEVs in the NPRM.21 Furthermore, the proposed final U.S. EPA action cannot be considered a "logical outgrowth" of the NPRM notice since the logical outgrowth doctrine does not extend to final rules that are not rooted in the agency's proposal or to situations where "interested parties would have had to 'divine [the agency's] unspoken thoughts,'." Envtl. Integrity Project, 425 F.3d at 996. Moreover, the logical outgrowth doctrine only applies if the N PRM itself provides recipients sufficient notice of the final action that U.S. EPA may take- i.e., U.S. EPA cannot assert that requisite notice resulted from comments received. Shell Oil Co. v. EPA, 950 F.2d 741, 760 (D.C. Cir. 1991); Small Refiner Lead Phase-Down Task Force v EPA, 705 F.2d 506, 549-550 (D.C. Cir. 1983). First, this request is beyond the scope of the CTP rulemaking and was not proposed in the NPRM. In order to evaluate the benefits and feasibility of this request, an official proposal would need to be provided by U.S. EPA so that all stakeholders would have the opportunity to evaluate and provide comments to U.S. EPA. Daimler's request completely circumvents the rulemaking process and should not be considered by U.S. EPA.

21 "If the APA's notice requirements mean anything, they require that a reasonable commenter must be able to trust an agency's representations about which particular aspects of its proposal are open for consideration." Envtl. Integrity Project v. EPA, 425 F.3d at 998.

Request Regarding Selection of Test Engines - EPA-HQ-OAR-2019-0055-1203_Attachment_1.pdf (Pages 114-115), EMA

EMA submitted a comment requesting that U.S. EPA retain the language defining the parent engine based on existing requirements in §86.096-24(b)(3)(ii) which allows selecting "the engine that features the highest fuel feed per stroke, primarily at the speed of maximum rated torque and secondarily at rated speed." It should be noted that this language was originally established for combustion engines that did not deploy any aftertreatment systems. In making its proposal, EMA has overlooked the requirement in §86.096-24(b)(3)(iii) which states:

> The Administrator may select a maximum of one additional engine within each engine-system combination based upon features indicating that it may have the highest emission

> levels of the engines of that combination. In selecting this engine, the Administrator will consider such features as the injection system, fuel system, compression ratio, rated speed, rated horsepower, peak torque speed, and peak torque.

CARB's Omnibus regulation modified the applicable regulatory language in §86.096-24(b)(3)(iii) by adding the following statement to the end of subparagraph:

> For 2024 and subsequent model years, the Executive Officer will also consider the aftertreatment conversion efficiency.

CARB staff supports the proposed U.S. EPA language in §1036.235(a)(1) that requires the manufacturer to select an engine configuration for criteria pollutant certification testing that is "most likely to exceed (or have emissions nearer to) an applicable emission standard or FEL...." That approach would be consistent with the requirements in §86.096-24(b)(3)(iii). In terms of the parent engine selection process, the methodology for determining the model with the highest emission levels can be discussed with the certification staff.

Furthermore, given the introduction of GHG subfamilies under recent phase 2 technical amendments in §1036.230(f):

> Engine families may be divided into subfamilies with respect to compliance with CO2 standards.

CARB staff does not believe that the requirement for parent engine selection would interfere with GHG subfamily determination. While the parent engine would determine the certification NOx level, different GHG subfamilies would be declared to represent the corresponding GHG family certification levels for the various subfamilies.

Concerns Regarding Fuel Quality - EPA-HQ-OAR-2019-0055-1203_Attachment_1.pdf (Pages 134-141), EMA

In addition to EMA, other engine manufacturers including Daimler, Navistar, and Paccar have once again raised issues and concerns regarding the quality of biodiesel fuel in the U.S. and how poor fuel quality may adversely impact the emission performance of diesel engines in the field. Volvo's comments,22 while expressing a desire for tighter fuel standards, acknowledge that biodiesel quality problems are not widespread. Navistar and others refer to a CARB study of biodiesel NOx mitigation additive efficacy while ignoring the regulatory countermeasures23 CARB put in place in 2020 as a direct result of this study. The study showed that certain additives to finished biodiesel were not mitigating non-aftertreatment engines' increased NOx emissions while that fuel was being used. The study does not indicate damage to aftertreatment systems but rather describes a compliance issue for fuel suppliers not vehicle or engine manufacturers. CARB and U.S. EPA's vehicle and engine testing procedures already have mechanisms for dealing with in-use vehicles encountered with demonstrably out-of-spec fuel in their tanks. The range of engine-out NOx increases even for the out-of-spec fuels were within the capability of SCR systems to compensate and control at the tailpipe. It is important to differentiate between an engine's instantaneous and reversible NOx response between two different fuel compositions that is the subject of the CARB study of biodiesel NOx mitigation additive efficacy (especially so if a test fuel is not even legal for sale) and separately the potential for actual damage to the aftertreatment from purported fuel contamination as might be the case for high metal content fuels. Some of the commenters appear to conflate the former effect and its limited effect duration during that given tank of fuel with the latter effect that rather integrates toward long-term cumulative effect via a catalyst deactivation mechanism.

22 https:/lwww.regulations.gov/comment/EPA-HO-OAR-2019-0055-1324
23 https:/lww2.arb.ca.gov/rulemaking/2020/adf2020

CARB staff performed an extensive field sampling study of diesel and biodiesel fuel quality in the California market and found no evidence that would substantiate the claims by engine manufacturers of contaminated fuel. The results of this study were provided to U.S. EPA24 during the Advanced NPRM comment period. CARB also analyzed nationally obtained samples provided from a U.S. EPA sampling campaign with consistent results. EMA commented that a Fuels Institute study found SO percent of samples contained detectable metals. Merely possessing the analytical chemistry capability to detect the presence of a given element does not address whether that element is present in sufficient quantities to be a practical concern. Indeed, EMA notes that levels were well below recommended limits. The large field sample count results of the Fuels Institute study and the several years of BO-9000 producer audit data are all consistent with the CARB field sampling study's result that fuel contamination is not a widespread issue.

24 https:/lwww.regulations.gov/comment/EPA-HQ-OAR-2019-0055-0471

In the past, CARB staff has reached out to OEMs and requested information regarding the origin of their poor-quality samples that have been identified. Each time, the OEMs have refused to provide information regarding the source of these samples. Without further information, claims regarding poor-quality fuels cannot be corroborated. Therefore, CARB staff firmly objects to the need for new biodiesel specification regulations as part of the CTP rulemaking.

The most potentially significant issues OEMs raised allege the possibility for occasional deviation outside of fuel specifications or an "off spec batch" that as discussed above has not been found to be a frequent occurrence. This is much different from when the 2007/2010 standards necessitated an entirely new fuel to be able to even conduct the engine demonstration testing in the lab and then the subsequent wide-spread oil refinery upgrades and 2006 rollout of Ultra Low Sulfur Diesel distribution to enable the proposed technology's commercial introduction. Again, the OEM fuel quality control concerns raised here are much different than the earlier situation of a current on-spec fuel (200 parts per million Low Sulfur Diesel) being positively destructive to the proposed technology PM and NOx catalyzed aftertreatment). U.S. EPA is not dependent on improvements in fuel quality to be able to move forward with standards at least as stringent as the NPRM's Option 1.

CARB staff also note that an additional relief from chemical aging compared to today's situation is anticipated on the lubricant composition side via recent American Petroleum Institute actions to define a new generation of "PC-12" category oils. These new oils are expected to become available in time for 2027 coinciding with CARB and anticipated U.S. EPA standards. Among the target improvements is compatibility with longer useful lives and warranty periods and "improved aftertreatment capability."25·26

25 https:/lwww.trucking info.com/1016027Sinew-diesel-emissions-regs-mean-new-engine-oil-category
26 https:/lwww.forconstructionpros.com/equipment/fleet-maintenance/oils-lubricants- greases/news/21940827Iapi-approves-development-of-pc12-diesel-engine-oil-category

CARB in the Omnibus FSOR responses27 to comments noted the likelihood of just such action and its potential additional benefit, though the Omnibus standard stringency was not based on assuming such lubricant improvements. U.S. EPA likewise is not dependent on such future lubricant improvements to move forward with standards at least as stringent as the NPRM’s Option 1.

27

378-379.

Concerns Regarding OBD – EPA-HO-OAR-2019-0055- 1203_Attachment_1.pdf (Pages 90-101), EMA

CARB staff respectfully disagrees with EMA's comments on pages 90-92 of their comment letter," Environmental Protection Agency (EPA) Has Not Fully Considered All of the OBD Requirements and Capabilities that Could Frustrate the Implementation of the Low-NOx Regulations." CARB staff would like to note that EMA provided the same comments28 to CARB for its Omnibus rulemaking, and CARB staff provided responses for all these comments as part of the FSOR for the rulemaking.29

28 https:/lwww.arb.ca.gov/lists/com-attach/10-hdomnibus2020-JAxb8FFZFNoOFNbo.zip . Pages 98-101.
29
https:/lww2.arb.ca.gov/sites/default/files/barcu/board/rulemaking/hdomnibuslownox/fsor.pdf

CARB staff also disagrees with EMA's comments on page 93, "OBD threshold requirements," supporting U.S. EPA's proposed OBD thresholds. While CARB staff understand that U.S. EPA's proposed OBD thresholds were intended to harmonize with CARB's Omnibus OBD thresholds, CARB staff now believes the OBD thresholds can be more stringent than the proposed federal OBD thresholds. While CARB staff did not have much data to support more stringent thresholds when developing the Omnibus OBD thresholds, staff has since received information that some diesel and gasoline engines certified to lower emission standards are able to meet more stringent OBD thresholds than EPA's proposed OBD thresholds. As such, CARB staff believes that more stringent OBD thresholds than those being proposed by U.S. EPA are feasible and recommends that U.S. EPA adopt more stringent OBD thresholds based on available data. Should U.S. EPA adopt more stringent OBD thresholds, CARB staff would likely propose harmonizing with U.S. EPA's thresholds in a future rulemaking update.

In-Use Testing for PM and NMHC Should Be Eliminated - EPA-HQ-OAR-2019-0055-1168_Attachment_1.pdf (Pages 41-129), EMA

EMA is requesting to eliminate requirements to test the criteria pollutants PM and NMHC from in-use testing. EMA argues there has only been one incidence in the in-use program where an engine failed due to a cracked diesel particulate filter (DPF) and misfuelling. While this seems compelling, U.S. EPA and CARB staff have discovered manufacturers have been inappropriately screening their HDIUT vehicles. This includes but is not limited to rejecting engines likely to have excess PM based on visual inspections which identify excess PM on the exhaust and replacing DPFs prior to testing. These screening practices were discussed by CARB at the 2021 EMA workshop. These practices produce tests that are unrepresentative of real in-use PM emissions. Since it is unclear how the historical engines were screened for in-use PM testing, CARB staff believes it is prudent to continue PM testing using the appropriate test procedures. EMA argues the costs of testing PM and NMHC are burdensome. CARB staff acknowledges the costs of the portable emissions monitoring systems needed for the HDIUT program for all criteria pollutants, however it is important to ensure all certified criteria pollutants are evaluated in the real world to ensure compliance. Considering these arguments, CARB staff believes there is a need to continue PM and NMHC measurements as a part of the HDIUT program.

Infrastructure for HD ZEV

In addition to these responsive comments, CARB staff noted multiple comments discussing infrastructure issues. CARB staff would like to take the opportunity to emphasize that many public and private organizations are currently working on projects focused on developing charging and fueling infrastructure for HD zero-emission technologies. A partial listing of these projects was provided on pages 6-8 of the CARB comment letter.30

30 https:/lwww.regulations.gov/comment/EPA-HQ-OAR-2019-0055-1186

California is tackling Medium-HD Zero-Emission Vehicle (MHD ZEV) infrastructure from many angles and providing funding for MHD ZEVs and supporting infrastructure to CARB, California Energy Commission (CEC}, Department of Transportation, among other agencies. For a primer, the California ZEV Market Development Strategy31 lays out the overall strategy to meet the State's ZEV goals and addresses vehicles, infrastructure, end users and workforce. The Zero-Emission Plan,32 developed by CEC supports and provides a fuller description of near- and long-term actions to ensure that ZEV infrastructure will meet the needs of the growing ZEV market.

31 https://business.ca.gov/industries/zero-emission-vehicles/zev-strategy/
32 https:l/www.energy.ca.gov/sites/default/files/2022-04/CEC-600-2022-054.pdf

Today, one source of infrastructure funding for HD ZEV fleets is EnergllZE, which provides funding for charging and hydrogen stations for HD vehicles. EnergllZE has 4 funding lanes covering (1) fleets that need fast assistance to accommodate pending electric truck deliveries, (2) small fleets, transit or school bus fleets, or fleets operating in disadvantaged communities; (3) public DC fast charging; and (4) public hydrogen refueling. The program opened with initial allocation of $50 million with the state legislature sending strong signals to provide additional funding to this program on an annual basis. In addition, the Innovative Small e-Fleets program, which is expected to launch this summer will provide funding for creative mechanisms, like truck-as-a-service, and will support both zero-emission trucks and infrastructure solutions to small fleets that otherwise face barriers to electrification.

On the utility side, the larger investor-owned utilities have been authorized by the California Public Utilities Commission to fund transportation electrification programs. With this authorization, utilities can pay for utility upgrades necessary to bring power to the site as well as provide power to the charging infrastructure make-readies.

CARB staff has observed that there is ample opportunity for electrification across many applications without dependence on a pre-existing public HD charging network. While availability of convenient and reliable public charging networks is helpful and being actively worked on, it is not a necessary prerequisite for U.S. EPA to consider significant HD ZEV penetration across the HD sector. This is especially true in the initial introductory period of 2027-2030 which U.S. EPA is considering for Phase 2 GHG updates prior to mature exploitation of these electrification opportunities. Support for this observation of ample electrification opportunity prior to wide-spread public charging networks comes from analysis looking at the usage and operational characteristics of trucks in California conducted as part of the Advanced Clean Trucks33·34 and Advanced Clean Fleets35 regulatory development work. The Advanced Clean Truck's one-time Large Entity Reporting (LER)36 from >50 truck fleets, entities with >$SOM revenue and government agencies was conducted in early calendar year 2022. Of the 386,286 vehicles represented in the LER, 31 percent of day-cab tractors and 78 percent of non-tractor trucks go less than 100 miles/day. The LER also showed daily return to base facility by 91 percent of day-cab tractors and 57 percent of non- tractor trucks. Furthermore, 65 percent of day-cab tractors and 52 percent of non-tractor trucks reported having "predictable usage patterns." Further detailed aggregated breakdowns of the LER data is available on CARB's website. The ubiquity of low daily mileage usage patterns in the LER is consistent with the 2018 California Vehicle Inventory and Use Survey (VIUS)37 data showing most "straight-trucks" travel less than 100 miles/day and 2002 VIUS based on national data indicating almost 90 percent of Class 2b-Class 7 vehicles and 80 percent of Class 8 vehicles also travel less than 100 miles/day. 38 Despite the potential for individual fleet specific needs and constraints, there is broad electrification opportunity for delivery, solid waste collection, short-haul, and a wide range of Class 4-8 vocational applications and especially during the early deployment period when the easiest routes and applications are still available to electrification early adopters.

[Attachment omitted; proprietary information]

EPA Response

We appreciate the comments from CARB on the proposed rule. Regarding comments on the standards, in-use margin, and how we incorporated the emissions reductions from closed crankcase systems in setting the standards, see our responses in preamble section III, and section 3 of this document. Regarding comments on pre-buy and no-buy, see our responses to comments in section 25 of this document. Regarding the comment on the rule being cost-effective and worth pursuing even with 20% pre-buy/no-buy, as explained in Section X of the preamble and section 25 of this document, EPA maintains our assessment that any possible sales effects of the final rule are likely to be minimal and short lived, see RIA Chapter 10 for more detail and we have not undertaken such a sensitivity analysis at 20%. Regarding comments on supply chain issues, see our responses to comments in sections 3.2 and 25 of this document. Regarding comments on regulatory relief for hydrogen-fueled internal combustion engines, see our responses to comments in section 3.10 of this document. Regarding comments on the definition of parent engine, see our responses to comments in section 29.3 of this document. Regarding comments on OBD, see our responses to comments in section 7 of this document. Regarding comments on heavy-duty in-use testing (HDIUT) program, see our responses to comments in section 11 of this document.

As explained in preamble Sections III and IV and sections 3 and 12 of this document, we are not finalizing the proposed allowance for manufacturers to generate NO_X emissions credits from heavy-duty ZEVs and the final criteria pollutant standards are not based on projected utilization of ZEV technologies, although manufacturers may choose to comply with the standards through using ZEV technologies, or other technology pathways than included in our demonstration program. As noted in section 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. Therefore, we are not taking final action at this time regarding issues raised in comments relating to ZEV infrastructure. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider the comments in this section of this document in the development of that future rulemaking.

Organization: *Catherine Horine, Laura Ubasczewski, Jennifer Ryan: EPA-HQ-OAR-2019-2872, 2873, 2875*

Thank you for your recently announced proposal to reduce air pollution from medium- and heavy-duty trucks. As a person who cares about the impact of pollution on lung health, I am concerned that the proposed rule doesn't do enough to reduce dangerous air pollution or to protect environmental justice communities that are often disproportionally impacted by pollution from overwhelmingly diesel-fueled medium- and heavy-duty trucks.

This is important for all communities, especially those with higher truck traffic. The primary concerns I have are as follows:

- The proposed tighter tailpipe emission requirements don’t kick in until 2027. California and several other states are already requiring trucks sold within their borders to meet tighter pollution standards by 2024. EPA should do what states are already requiring by 2027. EPA should adopt the schedule and pollution limits in the California NOx Omnibus Rule.

- EPA’s rule allows for manufactures to make more dirtier diesel trucks if they offset their impact by making electric zero-emissions trucks. EPA should account for electric truck sales that are already being driven by state requirements in multiple states and provide for adjustments if more states adopt such requirements. Credit should only be given if manufacturers go above and beyond what they already must do.

- EPA needs to set a zero - emissions standard in this rule and a set a date by which it is the default requirement. In short, EPA should require increasing sales of electric trucks over time and require that all new trucks sold are zero - emission versions by 2035.

Additionally, because of the points above, I believe that the proposed rule fails Environmental Justice (EJ) communities. It ignores the disproportionate impact that diesel pollution has on community health, especially in communities already inundated with medium - and heavy - duty vehicle traffic and pollution. The proposed rule punts meaningful action on stricter requirements onto uncertain future decisions, which delays or possibly prevents cleaner air for those communities. Forgoing action now to reduce harmful diesel pollution exposure to the greatest extent possible will reinforce and entrench historic inequities.

The EPA should be proposing solutions aimed at phasing out our dependency on deadly diesel. I do not accept partial solutions that leave the air we all breathe and the climate we all depend on further burdened and damaged by pollution for decades to come, and urge the Agency to fix the rule to address the above faults.

EPA Response

We appreciate the comments from Catherine Horine, Laura Ubasczewski, and Jennifer Ryan on the proposed rule. Regarding the comments on the level of the standards and alignment with CARB, see our responses in section 3.1.2 of this document. Regarding comments on credits for zero-emission vehicles, see section 12 of this document. Regarding comments on setting standards based on zero-emission vehicles, see sections 3.1.1 and 28 of this document.

Regarding comments on communities with Environmental Justice concerns, see section 22 and 23 of this document.

Organization: *ChargeEVC-NJ: EPA-HQ-OAR-2019-0055-1418*

ChargEVC-NJ, a coalition of utilities, OEMs, technology companies, organized labor, developers, power producers, environment, consumer and equity advocates, support the Environmental Protection Agency (EPA) in finalizing a Clean Trucks Plan that accelerates the transition to zero-emission medium and heavy-duty electric vehicles. The Clean Trucks Plan represents a unique opportunity for the US to transition to widespread electrification of trucks and buses, spurring economic development, innovation, the creation of new jobs and skills. Importantly, this transition will result in significantly cleaner air for the generations that follow.

New Jersey is among six states – representing twenty (20) percent (%) of national medium and heavy- duty vehicle registrations – that have adopted the Advanced Clean Trucks (ACT) standard, which sets a minimum level of zero-emission sales in these six states. This policy will drive nearly 20% of Class 4-8 sales in model year 2027, nearly 30% in model year 2028 and nearly 40% in model year 2029.1 There is a notable gap in EPA's assessment proposed updates to the Phase 2 GHG standards, which calls for just 1.5% of Class 4-8 vehicle national sales in model year 2027 versus the ACT's 20% requirement. Federal standards should not lag so far behind the commitments of 20% of the market.

> 1 Based on sales-weighted averages of zero-emission vehicle sales requirements in the Advanced Clean Trucks standard for Class 4-8 straight trucks and Class 7-8 tractors.

We call attention to the varied and multiple policy mechanisms the EPA can use, in coordination with other Federal agencies and policies, to achieve this transition in an accelerated time frame. There needs to be a whole of government approach to accelerate zero-emission vehicle deployments over the next decade, that will set us up for future success.

Parallel to our support of regulatory action is our support of state and federal policies for incentives, investments, and creation of new markets for zero-emission vehicles and infrastructure. While the Infrastructure Investment and Jobs Act is an important step towards providing financial support for the transition to zero-emission vehicles, more is needed, such as the tax incentives for zero-emission vehicles and infrastructure, including storage. Again, a whole of government approach is required on the incentive and market side.

We have done a lot in New Jersey to help move along this transition but additional support from the Federal Government is needed. We stand by ready to work with EPA and the other Federal agencies to enable this market.

EPA Response

We appreciate the comments from Charge EVC-NJ in support of accelerating ZEV adoption and the need for incentives to support the transition to ZEVs. As explained in preamble Sections III and IV and sections 3 and 12 of this document, we are not finalizing the proposed allowance for manufacturers to generate NO_X emissions credits from heavy-duty ZEVs and the final criteria pollutant standards are not based on projected utilization of ZEV technologies, although manufacturers may choose to comply with the standards through using ZEV technologies, or other technology pathways than included in our demonstration program. As noted in section 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider this comment in the development of that future rulemaking.

Organization: *Clean Air for the Long Haul; EPA-HQ-OAR-2019-0055-2889*

We write to urge the Environmental Protection Agency (EPA) to finalize the strongest and most protective heavy-duty trucks nitrogen oxides (NOx) standards by the end of 2022 to safeguard overburdened communities and put us on a path towards a zero-emissions future.

As a coalition of environmental justice organizations from across the country, the Clean Air for the Long Haul Cohort lives in and advocates for communities that are disproportionately and adversely impacted by harmful air pollution from the transportation sector. Medium- and heavy-duty trucks, in particular, are the largest source of harmful smog and soot-forming nitrogen oxides in the U.S.1 Our communities are unjustly exposed to greater concentrations of these health-harming pollutants due to their proximity to “diesel death zones,” composed of high-traffic roadways and trucking routes, bus depots, and goods movement facilities.

Transportation pollution compounds upon similarly concentrated industrial air pollution in our communities, all due to this country’s legacy of discriminatory transportation and land-use planning. Low-income and communities of color that are overburdened by unrelentingly poor air quality face heart attacks, other cardiovascular and respiratory conditions, asthma-related emergency room visits, and premature deaths. Chronic exposure to harmful air pollution is the reason our friends and families are more susceptible to viruses that cause the COVID-19 pandemic.

Option 1 of the Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards (Docket no. EPA-HQ-QAR-2019-0055) could provide necessary relief to overburdened communities.8s This option, if aligned with the stringency and abridged timeline of California’s Heavy-Duty Omnibus rule,9 would require 90% NOx emissions reductions from medium- and heavy-duty vehicles and engines by 2027, avoiding $1.3 trillion in health damages linked to fine particulates and ozone pollution from 2027-2050.10,11 In contrast, Option 2 would require 75% NOx emissions reductions starting in 2027, achieving less reductions than Option 1,12 and would create less stringent useful life and warranty periods. This weaker option prioritizes industrial interests and does little to alleviate the environmental and health burdens of diesel pollution that has plagued our communities for generations.

To further strengthen Option 1, we ask that you eliminate zero-emission vehicle crediting and not allow early action credits. These proposed flexibilities would undermine the emission reduction standards and incentivize continued purchasing of dirty fossil fuel trucks and buses. The 72 million people living within 200 meters of major trucking routes, many of which are low-income and people of color,13 will continue to suffer from unequal health impacts from medium- and heavy-duty vehicle pollution if crediting is advanced.

The agency should set stringent standards that align with California's Heavy-Duty Omnibus requirements, ensuring that stringent NOx emission reductions are achieved across the country, and encouraging a ramp-up of zero-emission electric technology for all classes of trucks and buses. To address the health and environmental burdens placed disproportionately upon environmental justice communities, we urge the EPA to move swiftly in finalizing the Clean Trucks rule with an enhanced Option 1.

Thank you for your leadership on this issue and we welcome any opportunities for further discussion. For inquiries or to schedule a meeting with the Clean Air for the Long Haul Cohort, please reach out Anastasia Gordon via email at anastasia@weact.org.

EPA Response

This comment was submitted to EPA as official correspondence to the Administrator. We appreciate the comments from Clean Air for the Long Haul. on the proposed rule. Regarding the comments on the level of the standards and alignment with CARB, see our responses in section 3.1.2 of this document. As noted in sections 3.1.1 and 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider this comment in the development of that future rulemaking. Regarding comments on credits for zero-emission vehicles, see section 12 of this document. Regarding comments on communities with Environmental Justice concerns, see section 22 and 23 of this document.

Organization: *Clean Air Task Force et al: EPA-HQ-OAR-2019-0055-2878*

Clean Air Task Force, Environmental Law & Policy Center, National Parks Conservation Association, and Sierra Club ("Commenters") respectfully submit these supplemental comments on the Environmental Protection Agency's ("EPA") Proposed Rule for Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, 87 Fed. Reg. 17,414 (Mar. 28, 2022) (the "Proposal"). Here, we outline important new developments that (1) provide additional factual support for the positions on the criteria pollutant standards laid out in the Commenters' initial comments submitted on May 16, 2022, and (2) provide information that EPA must consider as it develops a supplemental notice of proposed rulemaking ("NPRM") on the GHG standards.[1] Many of the materials cited in these comments are attached as exhibits and are listed in the "List of Attachments."

[1] *See* Comments of Environmental and Public Health Organizations on Proposed Rule Regarding Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, Docket No. EPA-HQ-OAR-2019-0055-1302 (May 16, 2022),

https://wwwregulations.gov/comment/EPA-HQ-OAR-2019-0055-1302 ("Initial Comments").

Introduction

Since the close of the comment period for the Proposal, additional information has become available that further underscores the feasibility of promulgating strong rules to curtail dangerous emissions from heavy-duty vehicles and engines. In particular, the recent passage of the Inflation Reduction Act ("IRA") provides billions of dollars in funding for heavy-duty ("HD") zero-emission vehicles ("ZEVs") and lends further support to a baseline HD ZEV penetration rate much higher than the rate contained in EPA's Proposal, and likely one even higher than the range suggested in Commenters' initial comments. EPA must consider the IRA's impacts on the baseline HD ZEV penetration rate when setting the criteria pollutant standards—which EPA still intends to finalize by December—because the baseline HD ZEV penetration rate also informs the feasibility and appropriate stringency of those standards.

EPA has recognized the IRA's impact on the Agency's rulemaking. The Agency has announced plans to issue a supplemental NPRM in December on the portion of the Proposal concerning updates to the HD greenhouse gas ("GHG") standards in order to consider more stringent standards for model years 2027–2029.[2] For that supplemental NPRM, EPA must consider the IRA's impact on the baseline HD ZEV penetration rate, which is integral to setting standards that fulfill EPA's mandate to protect health and welfare.

[2] David Shepardson, *Exclusive: U.S. EPA to Consider Tougher Emissions Rules for Heavy Trucks*, Reuters (Sept. 21, 2022), https://www reuters.com/business/sustainable-business/exclusive-us-epa-consider-tougher-emissions-rules-heavy-tru cks-2022-09-21/.

The forthcoming supplemental NPRM should reflect the significant support that the IRA adds to the already substantial record regarding the feasibility and cost-effectiveness of zero-emission technologies. Through the IRA, Congress has encouraged the growth of those technologies in all vehicle sectors. EPA must not only consider an updated and accurate baseline HD ZEV market penetration rate but should propose standards that ensure that nationwide levels of HD ZEV deployment go beyond the baseline rates that would occur absent regulation. Only by doing so can EPA meet its statutory mandate to set standards that are adequately protective of public health and welfare.

In addition to providing new information from the IRA in support of a baseline HD ZEV penetration rate higher than that contained in EPA's Proposal, Commenters urge EPA to issue the GHG standards supplemental NPRM and finalize the criteria pollutant standards before the end of this calendar year. EPA should finalize the GHG standards no later than May 2023.

Section I explains how the IRA, through which Congress endorsed and provided substantial funding for greater development and deployment of HD zero-emission technologies and related infrastructure, supports a higher baseline HD ZEV penetration rate than that contained in EPA's Proposal. Section II explains how the IRA supports a greater role for zero-emission technologies in upcoming rulemakings.

I. THE IRA PROVIDES FURTHER SUPPORT FOR A HIGHER BASELINE HD ZEV PENETRATION THAN EPA'S PROPOSAL.

To meet its obligations under section 202 of the Clean Air Act, EPA must set technology-forcing standards that spur improvements in emissions control technologies and prioritize public health and welfare.[3] And to fulfill its duty to engage in reasoned decision making, EPA must consider a realistic HD ZEV baseline penetration rate both in finalizing the criteria pollutant standards and in formulating its supplemental NPRM for the GHG standards. EPA's proposed rate of 1.5% in MY 2027 is unreasonable because it is based on outdated information and flawed methodology, and is "far below even voluntary industry commitments."[4]

3 Commenters' initial comments on the Proposal include a thorough discussion of the legal requirements placed on EPA. *See* Initial Comments at 9–11.

4 Margo Oge, *Inflation Reduction Act Doesn't Meet Biden's Climate Goals: How to Close the Gaps on Transportation,* The Hill (Aug. 31, 2022), https://thehill.com/opinion/energy-environment/3622646-inflation-reduction-act-doesnt-meet-bidens-climate-goals- how-to-close-the-gaps-on-transportation/. For example, Commenters' initial comments described projections from both Navistar and Volvo of 50% ZEV truck sales by 2030 and projections from Navistar of 100% ZEV truck sales by 2040. *See* Initial Comments at 39 & 43. Volvo also projects 100% ZEV truck and bus sales by 2040, and Daimler expects 60% of its truck sales to be ZEVs by 2030. Oge (2022).

The IRA's programs offer significant funding for HD ZEVs, further supporting a baseline penetration rate far greater than EPA's proposed rate of 1.5% in MY 2027, and likely one even higher than the baseline ranges proposed in Commenters' initial comments (at least 8–11% for MY 2027 and 19–27% for MY 2030). In fact, early analyses of the IRA have recognized that the law will support a high baseline HD ZEV number, explaining that "the bill's investments will change the baseline for rulemakings…as it brings down the cost of clean technologies"[5] including HD ZEVs, and that the IRA will "accelerate the adoption of clean vehicles across the sector" and "enable accelerated deployment,"[6] such as can be achieved through standards set by EPA.

In response to the Proposal, some commenters noted that federal and state measures supporting ZEV adoption, manufacturing, and infrastructure would be helpful complements to EPA's standards and would speed the adoption of zero-emission technologies. The IRA, with its "tens of billions of dollars in grants, tax credits, and loan programs to develop manufacturing and supply chains for clean energy components, batteries, electric vehicles, and critical minerals,"[7] does exactly that. In light of these developments, EPA's proposed HD ZEV penetration rate of 1.5% becomes even more unreasonable.

[7] Jesse D. Jenkins et al., *Preliminary Report: The Climate and Energy Impacts of the Inflation Reduction Act of 2022*, Princeton University Zero Lab 16 (Aug. 2022), https://repeatproject.org/docs/REPEAT_IRA_Prelminary_Report_2022-08-12.pdf.

As explained in our initial comments, an accurate baseline HD ZEV market penetration rate is vital to EPA's standards.[8] For the GHG standards, EPA's supplemental NPRM must recognize a much higher baseline penetration rate than the 1.5% rate in the Proposal. Because the GHG standards apply as a fleet average, by vastly underestimating the penetration rate in the Proposal, EPA in turn underestimates the percentage of vehicles that would be able to meet the current Phase 2 GHG standards without installing emission-reduction technologies, undermining the program's goal of requiring all conventional vehicles to install such controls.[9] Moreover, failing to revisit the GHG standards with an approach that would further drive adoption of zero-emission technologies—a regulatory path that is clearly feasible—results in standards that fall far short of meeting the Clean Air Act's mandate. Commenters' initial comments outlined information supporting a baseline HD ZEV penetration of at least 8–11% for MY 2027 and 19–27% for MY 2030—rates far greater than EPA's 1.5% in MY 2027. The IRA provides support for a baseline HD ZEV penetration rate likely even higher than the range in Commenters' initial comments, and EPA must consider this new information in determining the baseline HD ZEV penetration rate used in its upcoming supplemental NPRM for the GHG standards.

[8] See Initial Comments at 20–23 (discussing the impacts of underestimating baseline market penetration of HD ZEVs).

[9] EPA explains in the Proposal that "[t]he intent of the existing HD GHG Phase 2 program was to set the stringency of the standards at a level that all conventional vehicles would need to install some level and combination of emission-reducing technologies or offset another conventional vehicle not installing such technology, since at that time we predicted very little market penetration of EVs." 87 Fed. Reg. at 17,603.

The baseline HD ZEV penetration rate also informs the feasibility and appropriate stringency of the criteria pollutant standards, and considering a more accurate (higher) baseline HD ZEV market penetration "could lead to a more stringent NO_X emission standard," as EPA acknowledges in the Proposal.[10] EPA recognizes that, for the NO_X standards, "information showing higher [battery electric vehicle ("BEV")/fuel cell electric vehicle ("FCEV")] market penetration in the MY 2027 or later timeframe" could require "inclu[ding] [hybrid electric vehicle ("HEV")], BEV and or FCEV technologies in [its] feasibility analysis," and that it may have to "re-evaluate [its] approach" in the final rule.[11]

The information provided regarding baseline HD ZEV penetration rates in Commenters' initial comments, and the IRA's new programs and funding, all support a penetration rate much higher than EPA's 1.5% in MY 2027 and beyond. The Clean Air Act commands EPA to set standards that "reflect the greatest degree of emission reduction achievable through the application of technology" which "will be available for the model year to which the standards apply,"[12] and therefore EPA must consider and include zero-emission technologies within its standard-setting analysis.

[10] 87 Fed. Reg. at 17,561.
[11] 87 Fed. Reg. at 17,458 (requesting comment on revising numeric standards to include HEV, BEV, and FCEV technologies).
[12] 42 U.S.C. § 7521(a)(3)(A)(i).

EPA must also consider an accurate baseline HD ZEV penetration rate, informed by the information contained in Commenters' initial comments and the new funding from the IRA, when considering emissions credits for the criteria pollutant standards. Under EPA's Proposal, HD ZEVs can generate NO_X emissions credits—an especially problematic departure from EPA's prior rules when an accurate baseline HD ZEV penetration rate is taken into account.[13] Underestimating the baseline market penetration of HD ZEVs will lead to the generation of a significant amount of credits that will dramatically undermine the goals of the NO_X standards and fail to protect public health and welfare. The IRA provides even more reason that EPA must consider a revised, more accurate baseline HD ZEV penetration rate and revisit these credits to ensure that the rule reflects the greatest degree of emission reduction achievable, as is EPA's statutory mandate.

[13] See 87 Fed. Reg. at 17,556 ("However, under the current criteria pollutant program, manufacturers do not have a pathway to generate NO_X emission credits for HEVs, BEVs, or FCEVs. For BEVs and FCEVs, current 40 CFR 86.016-1(d)(4) stipulates that these technologies may not generate NO_X emission credits…"); id. at 17,561–62 (proposing to allow ZEVs to generate NO_X emissions credits); 40 CFR 86.016-1(d)(4) ("Electric heavy-duty vehicles may not generate NO_X or PM emission credits.").

A. The IRA's investments in ZEV manufacturing will make many HD ZEVs cheaper to produce, expediting the path to total cost of ownership and purchase price parity with HD internal combustion engine vehicles.

Commenters' initial comments provide an overview of the extensive manufacturer investments in and commitments to HD ZEV technology, even prior to receiving the IRA's extra support.[14] The IRA makes available billions of dollars of investment in clean energy manufacturing, much of which can be used by HD ZEV manufacturers. As manufacturers are able to pass these financial benefits on to HD ZEV purchasers, these manufacturing investments will in turn expedite the path to both purchase price parity and total cost of ownership ("TCO") parity with HD internal combustion engine ("ICE") vehicles. The IRA will support further growth within the already rapidly expanding HD ZEV sector, enabling manufacturers to increase production of HD ZEVs and resulting in a much higher baseline HD ZEV penetration rate than EPA's proposed rate—and one that likely exceeds the range included in Commenters' initial comments—even without considering the effect of future EPA standards. To fulfill its obligations under section 202(a) of the Clean Air Act, then, EPA must consider the impact of the IRA and these more accurate higher baseline penetration rates.

[14] *See* Initial Comments at 39–44.

First, the IRA provides for significant tax credits that will directly reduce manufacturers' costs to produce HD ZEVs. For example, the IRA includes a production tax credit for the domestic production and sale of qualifying components for energy projects, including batteries and critical minerals. Under this Advanced Manufacturing Production Credit, domestically produced battery cells qualify for a credit of $35/kWh of capacity, and battery modules qualify for a credit of $10/kWh of capacity (or $45/kWh for battery modules that do not use battery cells).[15] Battery costs are the largest contributor to the cost difference between ZEVs and conventional vehicles, and these credits could offset a substantial proportion of those costs, bringing down total vehicle costs in turn. Because HD ZEVs use large batteries, manufacturers could qualify for large credits. For example, Volvo has explained that its HD trucks can use batteries with a total energy content of 540kWh or more, contained in six 90kWh modules.[16] For such a battery, a battery manufacturer could receive a credit of approximately $24,300. And for Class 8 long-haul trucks, which could include batteries between 1,173 and 1,800kWh,[17] the credits could decrease the cost of production between $52,785 and $81,000 per vehicle.[18] Furthermore, assuming a Class 8 short-haul truck with a 300-mile range and a battery of 682kWh, the Advanced Manufacturing Production Credit could reduce cost of production by $30,690, and for a Class 4 parcel truck with a battery of 155kWh, by $6,975.[19] This credit will further lower the production costs for manufacturers of HD ZEVs, supporting a higher baseline ZEV penetration rate.

[17] Chad Hunter et al., *Spatial and Temporal Analysis of the Total Cost of Ownership for Class 8 Tractors and Class 4 Parcel Delivery Trucks*, NREL 8 (Sept. 2021), https://www nrel.gov/docs/fy21osti/71796.pdf. Battery size estimates are for 2025 for Class 8 long-haul trucks with 500 and 750 mile range.
[18] Assuming the full value of the credit passed along to HDV production.
[19] *Id.* Battery size estimates are for 2025.

The IRA also revises and expands investment tax credits for projects that equip, expand, or establish manufacturing facilities producing specified clean energy equipment, including HD electric, hybrid, and fuel cell vehicle production and related technologies, components, or materials, along with associated charging or refueling infrastructure.[20] These Advanced Energy Project Credits offer a base credit equal to 6% of the qualified investment, increasing to 30% if the project meets prevailing wage and apprenticeship requirements.[21] The allocation for this program is $10 billion.[22]

[20] IRA § 13501(a) & § 13501(b)(2)(I); *see also* 26 U.S.C. § 48C.
[21] IRA § 13501(a).
[22] *Id.*

In addition to tax credits for HD ZEV manufacturing, the IRA also provides for grants and loans to support ZEV production. The Domestic Manufacturing Conversion Grants program allocates $2 billion for grants to retool existing automobile manufacturing facilities for the production of electric, hybrid, and fuel cell electric vehicles.[23] These grants can cover up to 50% of the costs of a particular project.[24] The IRA also expands the Department of Energy's lending authorities under the Advanced Technology Vehicle Manufacturing ("ATVM") program, adding $3 billion for direct loans for the cost of establishing or expanding U.S. manufacturing facilities that produce advanced technology vehicles or components with low or zero GHG emissions, including qualified HD trucks.[25] The ATVM loan program has a history of successfully supporting progress in zero-emission technologies. For example, an ATVM program loan to Tesla Motors in 2010 supported the company's commercial-scale deployment, helping create more than 1,500 jobs at Tesla's ATVM-supported facilities and securing Tesla as the largest automotive employer in California.[26] Tesla was able to fully repay its loan in 2013, nine years ahead of schedule.[27] The ATVM program will work with the Domestic Manufacturing Conversion Grants program and the manufacturer tax credits to make HD ZEV production increasingly attractive to manufacturers. Taken together, all of these programs are expected to increase the baseline HD ZEV penetration rate even without taking emission standards into account.

[27] Tesla, *Tesla Repays Department of Energy Loan Nine Years Early* (May 22, 2013), https://www.tesla.com/blog/tesla-repays-department-energy-loan-nine-years-early.

Moreover, the IRA provides support not only for vehicle manufacturers themselves, but also for related industries such as critical minerals and infrastructure development. For critical minerals, the Advanced Manufacturing Production Credits offer credits in an amount equal to 10% of the costs incurred by the taxpayer with respect to production of critical minerals, including those used in ZEVs such as cobalt, graphite, lithium, and nickel.[28] The Advanced Energy Project credits for critical minerals projects are like those described above for ZEV manufacturers, offering a base credit equal to 6% of the qualified investment and an increase to 30% if the project meets prevailing wage and apprenticeship requirements.[29] The Advanced Energy Project credits are available to projects that re-equip, expand, or establish industrial facilities for the processing, refining, or recycling of critical minerals, including those used in ZEVs.[30] Additionally, the IRA allocates $500 million that can be used for critical minerals processing under the Defense Production Act of 1950.[31]

[28] *See* IRA § 13502(a).

[29] IRA § 13501(a).

The IRA also furthers the development of the infrastructure needed to support HD ZEVs, including through the Advanced Energy Project credits and the Alternative Fuel Refueling Infrastructure tax credits. Support for ZEV charging infrastructure can contribute significantly to lowering total cost of ownership and reducing barriers to HD ZEV uptake. For charging and refueling infrastructure related to HD electric or fuel cell vehicles, the Advanced Energy Project credits are the same as for ZEV manufacturing and critical minerals—credits equal to 6% of the qualified investment with an increase to 30% if the project meets prevailing wage and apprenticeship requirements.[32] The IRA expanded and extended the Alternative Fuel Refueling Infrastructure tax credit for the purchase and installation of charging assets or infrastructure in certain situations. The credit provides 30% of the cost per charger, and the IRA expands the credit to up to $100,000 per site.[33] The IRA also extends the credit through 2032,[34] which "improves the viability of projects with longer lead-times and allows for sequenced development of new fueling station networks."[35]

Together, all of these programs will reduce costs for manufacturers producing HD vehicles utilizing zero-emission technologies. Manufacturers are already recognizing these IRA benefits. Leaders at Daimler Truck, the nation's largest manufacturer of Class 6–8 commercial vehicles, extended a "special thanks" for the IRA's provisions that apply to zero-emission commercial vehicles.[36] And "[a]s a result [of the IRA], dozens of energy, automobile and clean technology companies have announced plans to move forward with new projects or accelerate the timeline on previous deals," including: Honda and LG Energy Solution opening a new $4.4 billion battery plant with annual production capacity of 40GWh; Hyundai accelerating construction of a $5.54 billion EV and battery plant in Georgia; Panasonic (battery supplier to Tesla) considering a second $4 billion domestic battery plant; Tesla seeking approval to set up a lithium refinery in Texas with construction possible in the fourth quarter of 2022 and commercial production by the end of 2024; Volkswagen and Canada signing an agreement to advance a sustainable battery supply chain and supply lithium, nickel, and cobalt; Sparkz (a battery startup) announcing West Virginia as the site of a future plant that will commercialize a zero-cobalt battery; and Piedmont Lithium Inc. announcing plans to build a $600 million lithium processing plant in Tennessee that will begin production in 2025 with a target of 30,000 metric tons per year.[37]

As a historic piece of legislation, the IRA provides "robust support for the development of American manufacturing of…battery and electric vehicle components and assembly as well as critical minerals processing,"[38] all of which will make production of HD ZEVs even more favorable for manufacturers. Commenters' initial comments provided a thorough discussion of TCO projections for HD ZEVs, citing numerous studies that estimate that different categories of HD ZEVs have either already reached TCO parity with their diesel counterparts, and/or will reach TCO parity prior to 2027.[39] Assuming manufacturer cost savings are passed on to HD truck purchasers, these vehicles will reach purchase price parity and TCO parity with HD ICE vehicles even sooner than the already favorable pre-IRA projections. For example, a recent analysis by BloombergNEF found that with the credits available in the IRA, "heavy-duty trucks operating in urban routes—which are already near price parity—may get close to 20% cost advantage by 2023 over similar diesel-engine vehicles," and long-haul electric trucks may reach TCO parity with diesel counterparts by 2030.[40] All of these manufacturer benefits in the IRA support a baseline HD ZEV penetration rate of at least 8–11% for MY 2027 and 19–27% for MY 2030, and very likely higher.

[38] Jesse D. Jenkins et al., *Preliminary Report: The Climate and Energy Impacts of the Inflation Reduction Act of 2022*, Princeton University Zero Lab 20 (Aug. 2022), https://repeatproject.org/docs/REPEAT_IRA_Prelminary_Report_2022-08-12.pdf.

[39] *See* Initial Comments at 44–49.

[40] BloombergNEF, *Commercial Vehicles Decarbonization Monthly: Inflation Reduction Act Eliminates Cost Premium of Electric Trucks* (Aug. 25, 2022) (subscription required) (TCO parity projections assume full battery credit is passed on to the final customer).

B. The IRA's credits for HD ZEV purchasers will expedite TCO and purchase price parity with HD ICE vehicles, supporting a HD ZEV baseline penetration rate well above 1.5%.

The IRA also contains significant funding to support HD ZEV purchasers that will facilitate near-term TCO and purchase price parity with HD ICE trucks. The IRA's primary funding for HD truck purchasers is through the Qualified Commercial Clean Vehicle tax credit, which is expected to "turbocharge adoption of electric medium-duty and heavy-duty trucks."[41] Through this credit, purchasers of HD battery or fuel-cell powered trucks receive a tax credit for either the vehicle's incremental cost over its ICE counterpart, or 30% of the vehicle's purchase price, whichever is less, with a maximum credit cap of $40,000 per vehicle purchase.[42] At a starting purchase price of $150,000, a Tesla Semi, for example, already offers a better cost of operation per mile than its diesel counterpart.[43] This tax credit will make the cost per mile "even more competitive."[44] Numerous state and local incentives, some of which are discussed in Commenters' initial comments,[45] could reduce the purchase price and cost per mile even further.

[41] Ari Kahn et al., *The Inflation Reduction Act Will Help Electrify Heavy-Duty Trucking*, RMI (Aug. 25, 2022), https://rmi.org/inflation-reduction-act-will-help-electrify-heavy-duty-trucking/.
[42] IRA § 13403.
[43] Fred Lambert, *Electric Trucks Like Tesla Semi Will Get Up to $40,000 in Incentives with New Bill*, Electrek (July 29, 2022), https://electrek.co/2022/07/29/electric-trucks-tesla-semi-40000-incentives-new-bill/.
[44] *Id.*
[45] *See* Initial Comments at 33–35, 37–38.

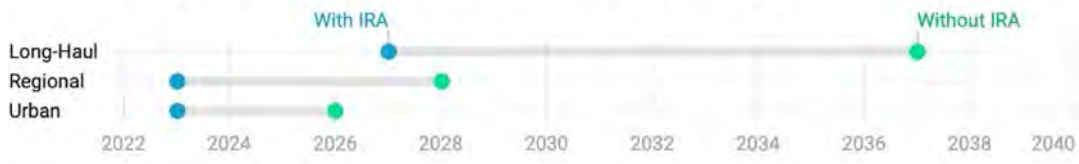
This credit therefore will effectively decrease the initial purchase price of an HD ZEV, with these vehicles likely to achieve TCO and purchase price parity with their ICE counterparts even sooner than previously estimated. Industry leaders have called this credit "a huge boost to support companies" committed to increasing the proportion of their fleet made up of HD ZEVs, and have pointed out that it "can greatly reduce the cost difference" between ZEVs and ICE vehicles, "allow[ing] fleets to make larger commitments to clean vehicle acquisitions and charging infrastructure."[46]

[46] Matt Donath, *Breaking it Down: What Does the IRA Mean for Fleet Electrification*, Edison Energy (Aug. 18, 2022), https://www.edisonenergy.com/blog/breaking-it-down-what-does-the-ira-mean-for-fleet-electrification/ (quoting Simon Horton, Edison Energy's EV Infrastructure Lead).

A recent analysis by RMI found that this credit "makes owning an electric truck cheaper than owning a diesel one in most use cases, with urban and regional electric trucks being cost-superior to diesel ones as soon as 2023. Trucks can travel 100,000 miles per year, and electrification creates significant fuel savings. Even many long-haul trucks that are hardest to electrify could be transformed."[47] Specifically, the RMI analysis found that with the IRA, TCO parity would be achieved five years sooner than without the law, and that this "is true for urban trucks that travel locally in cities an average of 50–100 miles a day; regional trucks that move 100–250 miles per day and return to the same depot; and long-haul trucks that travel 250 or more miles between cities and need to recharge in route."[48] RMI's data is illustrated in the following figure:[49]

[47] Kahn et al. (2022).
[48] *Id.*
[49] This figure is copied from *id.*

Electric truck parity dates with diesel by duty cycle



In light of the IRA, the Environmental Defense Fund ("EDF") worked with ERM to update a previously performed assessment of projected business-as-usual medium- and heavy-duty ZEV sales, and came to similar conclusions.[50] ERM's analysis included Class 4–8 trucks and found that when the IRA's ZEV tax credit is incorporated, "purchase price parity for a wide range of M/HD ZEVs is reached at least 5 years and as much as 12 years earlier than would occur without the credit."[51] It also found that additional funding for ZEV manufacturing and charging "could further reduce the total cost of ownership" of commercial ZEVs.[52]

[50] ERM, *Memo to EDF re Investment Reduction Act Supplemental Assessment: Analysis of Alternative Medium- and Heavy-Duty Zero-Emission Vehicle Business-As-Usual Scenarios* (Aug. 19, 2022), https://www.erm.com/contentassets/154d08e0d0674752925cd82c66b3e2b1/edf-zev-baseline-technical-memo-adden dum.pdf (to be submitted to the docket by EDF).
[51] *Id.* at 1.
[52] *Id.*

In addition, some fleets looking to install charging technology to support their vehicles will qualify for the Alternative Fuel Refueling Infrastructure Tax Credit discussed above, receiving a credit for up 30% of the cost per charger and up to $100,000 per site.[53]

[53] IRA § 13404(b)(2)(B).

The IRA also provides direct support to federal, state, municipal and other public entities looking to increase the share of ZEVs in their HD vehicle fleets. For example, the new Clean Heavy Duty Vehicles rebate program provides $1 billion in rebates for states, municipalities, Indian tribes and school associations to convert fleets to HD ZEVs, along with funding specifically reserved for communities located in nonattainment areas.[54] These rebates can cover up to 100% of incremental costs of replacing non-ZEV HD trucks with ZEVs, and 100% of the costs of charging, refueling, and operation infrastructure; workforce development; and planning and technical activities directed at the adoption and deployment of ZEVs.[55] Other relevant IRA programs include:

- The U.S. Postal Service Clean Fleets program, providing up to $3 billion for the Postal Service to purchase ZEVs and install related infrastructure.[56]

- GHG air pollution implementation grants, earmarking $4.75 billion for the implementation of GHG reduction plans by states, air pollution control agencies, municipalities, or Indian tribes, which includes replacing high-emission ICE trucks with ZEVs.[57]
- $50 million in funding to address air pollution in schools, which could be used to fund zero-emission school buses.
- $3 billion in grants to reduce air pollution at ports, which can be used to purchase or install zero-emission port technology, including for HD trucks.[58]
- $27 billion in direct and indirect financing in the form of grants to states, municipalities, tribal governments and nonprofit organizations for projects implementing zero-emission technologies to reduce GHG emissions, which can include HD ZEV projects.[59]
- $5 million in funding to provide grants to states to adopt and implement GHG and zero-emission standards for mobile sources (including HD trucks) pursuant to section 177 of the Clean Air Act.[60]
- $60 million in grants, rebates, or loans for projects by state, tribal, local, regional, or port authorities and for-profit and nonprofit entities that qualify under the Diesel Emissions Reduction Act, which can include funding the costs of emission reduction technology applicable to HD trucks.[61]

[61] IRA § 60104. *See also* 42 U.S.C. § 16132.

C. Early modeling and analyses of the IRA further confirm that EPA’s proposed baseline HD ZEV penetration is far too low.

Early modeling and analyses of the IRA offer significant support for baseline HD ZEV penetration rates far higher than EPA’s 1.5% estimation. For example, modeling conducted by RMI found that with the IRA, over 60% of new truck sales could be electric by 2030.[62] Energy Innovation also modeled sales shares of battery electric vehicles (“BEVs”) under various scenarios and found that, with the IRA, 2030 BEV penetration rates could be as high as 36–38% for light/medium trucks, 20–21% for buses, and 24–27% for heavy trucks.[63] ERM’s updated analysis for EDF found that, for the five scenarios ERM considered, ZEV sales for Class 4–8 trucks average 29% of total sales by 2029.[64] ERM found that post-IRA Class 4–8 ZEV sales were projected to be 46% higher in 2029 than pre-IRA ZEV sales projections, when averaging across the five scenarios.[65] And a pre-IRA analysis considering commercial ZEV tax credits similar to those contained in the IRA found that 50–80% of several truck types could be ZEVs by 2035.[66]

[62] Kahn et al. (2022). RMI's modeling considered vehicles greater than 14,000 pounds Gross Vehicle Weight Rating.
[63] Megan Mahajan et al., *Updated Inflation Reduction Act Modeling Using the Energy Policy Simulator*, Energy Innovation 9 (Aug. 2022), https://energyinnovation.org/wp-content/uploads/2022/08/Updated-Inflation-Reduction-Act-Modeling-Using-the-En ergy-Policy-Simulator.pdf.
[64] ERM, *Memo to EDF re Investment Reduction Act Supplemental Assessment: Analysis of Alternative Medium- and Heavy-Duty Zero-Emission Vehicle Business-As-Usual Scenarios* at 1. ERM's projections include Class 4–8 trucks but exclude long-haul combination trucks. *Id.* at 1 n.1.
[65] *Id.* This projection also excludes long-haul combination trucks.
[66] The credits considered were more ambitious than those in the final version of the IRA, but also excluded all of the bill's other incentives. *See* Joshua Linn & Wesley Look, *An Analysis of U.S. Subsidies for Electric Buses and Freight Trucks*, Resources for the Future Issue Brief 22-1, at 2 (Jan. 2022), https://media.rff.org/documents/IB_22-1.pdf.

Many analysts are still considering the IRA's impacts on baseline ZEV penetration rates. Commenters expect that additional analyses could become available in the coming weeks, and encourage EPA to consider any such information as it becomes available.

II. THE IRA SUPPORTS A GREATER ROLE FOR ZERO-EMISSION TECHNOLOGIES IN UPCOMING RULEMAKINGS.

EPA should also consider the impact of the IRA on "the potential for ZEV technologies to significantly reduce air pollution from the heavy-duty vehicle sector" as the Agency undertakes future light- and heavy-duty rulemakings, including its forthcoming supplemental NPRM for the model year 2027-2029 GHG standards.[67] The IRA strongly supports a greater role for zero-emission technologies, including in the long-haul and fuel cell electric vehicle ("FCEV") applications discussed in our initial comments.

[67] 87 Fed. Reg. at 17,420 (requesting comment on this topic).

Beyond its significant incentives for BEVs, the IRA includes unprecedented investments in hydrogen-based systems like FCEVs and recharging stations, which offer additional promise for long-haul and other heavy-duty market segments that may be slower to electrify. The Qualified Commercial Vehicles tax credit, Alternative Fuel Refueling Infrastructure tax credit, and Clean Heavy Duty Vehicle grants and rebates are all available for hydrogen-based systems and FCEVs, and these investments in FCEVs and related technologies will "giv[e] an unprecedented lift to clean hydrogen."[68] EPA must consider the impacts of these programs on the feasibility of FCEVs and their effect on baseline HD ZEV penetration rates.

[68] Glenn Zorpette, *2022—The Year the Hydrogen Economy Launched?*, IEEE Spectrum (Aug. 17, 2022), https://spectrum.ieee.org/hydrogen-economy-inflation-reduction-act#toggle-gdpr.

By funding a variety of zero-emission technologies, the IRA provides support for an even greater mix of transportation-sector zero-emission options, offering EPA several zero-emission technology pathways to consider as it develops future rules. The programs and funding in the IRA will further reduce the costs companies face in using zero-emission technology of all types to comply with EPA's standards, and will favor both manufacturers and purchasers of HD ZEVs.

Conclusion

For the reasons set forth in Commenters' initial comments and these supplemental comments, EPA must finalize a strong criteria pollutant rule this year to curtail dangerous emissions from heavy-duty vehicles and engines. EPA also must include a higher, more accurate baseline HD ZEV penetration rate in its forthcoming supplemental NPRM for the GHG standards, and should propose standards that ensure HD ZEV deployment beyond the baseline. Adopting Commenters' recommendations would result in feasible and cost-beneficial rules that fulfill EPA's statutory duty to protect public health and welfare.

[Attachments omitted]

EPA Response

We appreciate the comments from Clean Air Task Force et al. with information relating to the Inflation Reduction Act (IRA) and its potential impacts on ZEV technologies adoption. As explained in preamble Sections III and IV and sections 3 and 12 of this document, we are not finalizing the proposed allowance for manufacturers to generate NO_X emissions credits from heavy-duty ZEVs and the final criteria pollutant standards are not based on projected utilization of ZEV technologies, although manufacturers may choose to comply with the standards through using ZEV technologies, or other technology pathways than included in our demonstration program. In section 3.1.1 of this document we respond to comments requesting that the final criteria pollutant standards be based on the projected utilization of ZEV technologies, which in part discusses the timing of the IRA relative to this final rulemaking. As noted in section 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider this comment in the development of that future rulemaking.

Organization: *Jan Hughes: EPA-HQ-OAR-2019-0055-2874*

National Forests, which process carbon dioxide, produce oxygen, filter air pollution, and house many endangered species, could be opened up to oil drilling. Because of the many services forests provide us, destroying forests in order to produce fossil fuels would have far-reaching effects not only on ecosystems but also on people.

The new rule proposed by the Department of the Interior would remove public input, stop the Forest Service from doing environmental review, and remove the requirement for the Forest Service to consent to oil leases. These changes would make it quick and easy for the fossil fuel industry to move in and take over our forests, both destroying nature and increasing the effects of climate change.

Forests are an extremely important part of our nation because of their effects on climate and public health. Trees take in carbon dioxide, which is a greenhouse gas, and in turn release oxygen, which we need to breathe. In this way, trees can help to mitigate the effects of climate change by taking up some of the carbon dioxide produced by burning fossil fuels. Trees also clean the air as they take in carbon dioxide and filter out toxic particles. Besides these benefits for humans, forests host a wide variety of plants and animals, which are already suffering from intense deforestation.

Every year semi-trucks, busses, and other heavy-duty vehicles emit millions of tons of nitrogen oxides (NOx) and other greenhouse gas pollutants driving climate change.

NOx air pollution from heavy-duty vehicles contributes to ozone and fine particulate pollution, which are unsafe to breathe, especially for the young and elderly and anyone exercising outdoors. This pollution is particularly dangerous for communities located close to high truck traffic areas, affecting millions of people that live near highways, warehouses, or ports. In our national parks it harms plants, trees, insects and other animals and it reduces the ability of visitors to see and appreciate the views of our treasured park landscapes.

Heavy-duty vehicles are also one of the nation's top sources of climate pollution. Nearly all of America's national parks are threatened by the symptoms of a warming climate including more frequent heat waves, drought, sea level rise, coastal flooding, and extreme wildfires.

To tackle this threat, the Biden administration must pursue the strongest possible NOx and greenhouse standards for heavy-duty vehicle engines. Any standards adopted should achieve a 90% reduction in NOx pollution from new heavy- duty vehicles by no later than 2027, which has already been implemented in a half-dozen states and counting.

Moreover, the administration should strengthen the rule's greenhouse gas requirements to set us on a path towards 100% zero-emission heavy-duty vehicle sales by 2035.

EPA Response

The Agency's response to general comments with respect to the stringency of the criteria pollutant standards can be found in Section 3.1.1 of this document.

With respect to GHG standards, we appreciate the comment in support of accelerating ZEV technologies adoption. As noted in section 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider this comment in the development of that future rulemaking.

Finally, we acknowledge that forests are an important part of the national ecosystem. Actions taken to directly preserve that ecosystem are led by the Department of the Interior and are out of scope for this rule that sets standards for heavy-duty highway engines and vehicles.

Organization: *Martin L Dutcher: EPA-HQ-OAR-2019-2870*

Myself (Martin Dutcher), along with researchers, health professionals, economists, engineers, and planners, respectfully submit this comment in support of the strongest possible heavy-duty nitrogen oxides (NOx) truck pollution standards. The Environmental Protection Agency (EPA) has made explicit commitments to climate, clean air, and environmental justice under this administration. Environmental justice communities suffer a disproportionate burden of pollution from the goods movement sector writ large. Thus: This NOx rule should be strengthened ASAP to live up to these important stated commitments and to set us on a path to a zero-emission transportation future.

EPA Response

We appreciate the comments from Martin L Dutcher in support of strong NOx standards and EPA's commitment to climate, clean air, and environmental justice. See the Agency's response to general comments with respect to the stringency of the criteria pollutant standards in Section 3.1.1 of this document. See also section 23 of this document for responses to Environmental Justice concerns. As explained in preamble Sections III and IV and sections 3 and 12 of this document, the final criteria pollutant standards are not based on projected utilization of ZEV technologies. As noted in section 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider this comment in the development of that future rulemaking.

Thank you for your recently announced proposal to address pollution from medium and heavy-duty trucks. I am worried about the impacts of the climate crisis on the health of our communities, and I'm concerned that the proposal does not go far enough. I'm writing to you today to ask that you please consider strengthening the final standards. The transportation sector is the leading source of climate pollution in the US. The climate crisis is harming our families and our communities today, and heavy-duty vehicles are a major contributor to this pollution. In fact, despite making up only 10% of the total number of vehicles on the road, medium- and heavy-duty trucks contribute a quarter of the total climate pollution from the transportation sector. Trucks are also major sources of other deadly air pollution. Medium and heavy-duty trucks are major contributors to NOx emissions, a potent precursor to ground-level ozone pollution, and they account for more than 60% percent of the deadly particle pollution that comes from vehicles. Particle pollution cuts short tens of thousands of lives in the US every year and contributes to the heavy burden of asthma on our nation's children. Moreover, air pollution impacts are inequitably distributed and disproportionately harm Blacks and Latinos compared to whites. That's why the U.S. should enact standards that put the American truck and bus fleet on a clear roadway to 100% zero-emission sales by 2035. To protect the health of our communities, and to address environmental injustices, EPA must take urgent action to strengthen the proposed standards today to reduce health-harming pollutants, including NOx and PM and greenhouse gasses from medium and heavy-duty combustion vehicles — while continuing to accelerate our transition to zero-emissions vehicles. By taking these steps, the U.S. will be well positioned to protect our family's health, reduce fuel costs for truckers and fleets, strengthen our energy security, and advance environmental justice. [EPA-HQ-OAR-2019-0055-2876]

EPA Response

The Agency's response to general comments can be found in Section 1 of this document. See the Agency's response to general comments with respect to the stringency of the criteria pollutant standards in Section 3.1.1 of this document. See also sections 20 and 21 of this document for responses to air quality impacts and health benefits.

Organization: *Mass Comment Campaign sponsoring organization unknown (**157**)*

Every year semi-trucks, busses, and other heavy-duty vehicles emit millions of tons of nitrogen oxides (NOx) and other greenhouse gas pollutants driving climate change. NOx air pollution from heavy-duty vehicles contributes to ozone and fine particulate pollution, which are unsafe to breathe, especially for the young and elderly and anyone exercising outdoors. This pollution is particularly dangerous for communities located close to high truck traffic areas, affecting millions of people that live near highways, warehouses, or ports. In our national parks it harms plants, trees, insects and other animals and it reduces the ability of visitors to see and appreciate the views of our treasured park landscapes. Heavy-duty vehicles are also one of the nation's top sources of climate pollution. Nearly all of America's national parks are threatened by the symptoms of a warming climate including more frequent heat waves, drought, sea level rise, coastal flooding, and extreme wildfires. To tackle this threat, the Biden administration must pursue the strongest possible NOx and greenhouse standards for heavy-duty vehicle engines. Any standards adopted should achieve a 90% reduction in NOx pollution from new heavy-duty vehicles by no later than 2027, which has already been implemented in a half-dozen states and counting. Moreover, the administration should strengthen the rule's greenhouse gas requirements to set us on a path towards 100% zero-emission heavy-duty vehicle sales by 2035. [EPA-HQ-OAR-2019-0055-2877]

EPA Response

The Agency's response to general comments can be found in Section 1 of this document. See also section 23 of this document for responses to Environmental Justice concerns.

Organization: *Nanette Diaz Barragán et al., Members of Congress and United States Senators; EPA-HQ-OAR-2019-0055-2886*

In our shared effort to protect environmental justice communities and curb air pollution and climate crises, we are writing to urge that the Environmental Protection Agency (EPA) finalize the strongest possible heavy-duty vehicle requirements via the Clean Trucks Plan, now released as a Notice of Proposed Rulemaking (NPRM) Docket ID No. EPA-HQ-OAR-2019-0055. The importance of the heavy-duty rule in accelerating deployment of zero emission vehicles cannot be overstated: it is critical for addressing the climate crisis, safeguarding clean air, and improving public health in our communities. Due to strong state action, the medium- and heavy-duty zero-emission truck market is growing, and EPA has a critical role to play to ensure that zero-emission technologies for all types of trucks and buses are deployed so we can be on the path for all new vehicles to be zero-emissions beginning in 2035. The rule should strengthen EPA's proposed Option 1 by building on the successes of the Advanced Clean Trucks (ACT) rule adopted by seven states: California, New Jersey, Washington, Oregon, New York, Massachusetts, and Connecticut, and set the expectation that at least 50 percent of sales should be zero-emission by 2030, putting the United States on track for all truck sales to be zero-emission by 2035. And as we advance our goals to transition to zero-emission trucks as quickly as possible, it is also important that EPA ensure the remaining new diesel truck purchases operate as cleanly as possible to protect public health, especially in our most overburdened communities.

Diesel trucks play an outsized role in creating and perpetuating environmental injustice and impose a disproportionate burden on Black, Latino, Asian, and Indigenous communities. All diesel- and gasoline- powered trucks produce nitrogen oxides (NOx) and the secondary formation of toxic particulate matter pollution, which causes an increase in cancer rates and mortality. NOx also causes lung irritation and weakens the body's immunity on its own and has worse health consequences when combined with ground level ozone exposure. Updating the outdated NOx standards is a top priority and it is critical that this rule provide pollution reductions that are at least as protective as the reductions that are codified in California's recent Heavy-Duty Omnibus and Advanced Clean Trucks rules. This means, at a minimum, EPA should meet or exceed California's Heavy-Duty Omnibus program by setting a standard that achieves, by 2027, a greater than 90% reduction in NOx emissions from trucks that are sold today relative to 2010 standards. Having a unified national program will provide needed equity of reduced emissions across the country, reduced regulatory complexity, and reduce unnecessary costs of complying with two separate regulatory requirements.

At the same time, this rule must accelerate the adoption of zero-emission trucks by providing a clear signal for manufacturers to chart a path to eliminating tailpipe pollution. At a minimum, the federal government should require that all new trucks must have zero emissions beginning in 2035, with intermediate targets before then. In addition, after completing this Heavy-Duty rule in 2022, EPA should move quickly to advance additional policies to eliminate emissions from the freight sector to accelerate the retirement of all combustion trucks by 2045.

At every regulatory opportunity, EPA must include policies that rapidly advance zero emissions technologies for the entire truck sector. Road freight is the fastest growing source of carbon emissions.[1] Heavy-duty vehicles make up only 10 percent of all vehicles on roads in the U.S., but contribute 45 percent of the transportation sector's nitrogen oxide pollution, 57 percent of its fine particulate matter pollution, and 28 percent of global warming emissions.[2] These impacts fall disproportionately on low-income communities and people of color due to proximity to heavy vehicle traffic and trucking corridors.[3] Recent studies show that diesel traffic is the largest source of nitrogen oxide disparity by race in the United States.[4] Transitioning from combustion to zero-emission trucks is therefore one of our greatest opportunities to tackle both the climate crisis and environmental injustice.

During this transition, remaining sales of combustion trucks should be required to make full use of the identified vehicle technologies that improve overall truck efficiency and reduce fuel consumption and tailpipe emissions. Thus, EPA should strengthen the NOx and Phase 2 greenhouse gas requirements for trucks to account for the aggressive adoption of zero emission heavy-duty trucks. The proposed Clean Trucks Plan underestimates a low penetration of zero-emission trucks in assisting truck engine manufacturer compliance with diesel engine NOx and PM. While we support policies that accelerate the transition to zero emission trucks, we cannot afford dirtier diesel trucks that offset the benefits of successful heavy duty ZEV deployment.

Due to demand from fleets and state action, today there are already over 100 commercially available models of zero-emissions medium- and heavy-duty trucks and buses, with additional models expected to enter production this year.[5] Federal policy is vital to increase zero-emission model availability and speed the transition towards clean transportation. More expansive progress is achievable, given that two-thirds of the current truck fleet is already ripe for electrification, based on their duty cycles and charging needs.[6] Additionally, states are leading the way - six states have already adopted the Advanced Clean Trucks (ACT) rule and more states are expected to follow their lead this year. While the ACT states make up 17 percent of the national truck market, together they will cause only 8 percent of trucks sold to be electric in 2027 and 13 percent in 2030. These percentages fall far short of the President's goals and the urgency that the climate crisis and air pollution demand. However, if EPA were to adopt requirements similar to the ACT, national market share for zero-emission trucks and buses would exceed 30 percent in 2030.

Multiple studies support the consensus that zero-emission trucks produce substantial savings, even more than electric cars; zero-emission trucks have short (and shrinking) payback periods due to reduced fuel and maintenance costs and more predictable maintenance schedules.[7] A recent, in-depth total cost of ownership analysis by California Air Resources Board (CARB) found that starting today, zero-emission trucks save money for their owners in many cases.[8] By 2030, zero-emission trucks have superior cost savings compared to diesel in every category analyzed, including Class 8 long-haul.[9] In addition, a team of GridLab, Energy Innovation, and UC Berkeley's Center for Environmental Public Policy found that electrifying the nation's car and truck sales by 2035 would create a net of 2 million jobs.[10] These benefits do not even account for the far greater health and climate savings, which with targeted implementation would flow to disadvantaged communities who have borne the brunt of truck pollution. New reports by MJ Bradley show the thousands of lives that would be saved in each state if those states were to adopt California's Advanced Clean Truck Rule.[11]

Thank you for your consideration. There is no time to wait; there is a critical need for the EPA to take swift action moving towards a zero-emissions future to protect the health and safety of environmental justice communities. We are confident that you agree on the urgency of this issue.

EPA Response

This comment was submitted to EPA as official correspondence to the Administrator. We appreciate the comments from Nanette Diaz Barragán et al., on the proposed rule. Regarding the comments on the level of the standards and alignment with CARB, see our responses in section 3.1.2 of this document. As noted in sections 3.1.1 and 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider this comment in the development of that future rulemaking. Regarding comments on credits for zero-emission vehicles, see section 12 of this document. Regarding comments on communities with Environmental Justice concerns, see section 22 and 23 of this document.

Organization: *Sherrod Brown et al., United States Senators EPA-HQ-OAR-2019-0055-2859*

We write you today regarding the proposed rule on the "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicles Standards" (Docket ID No. EPA-HQ-QAR-2019-0055). Achieving significant reductions in nitrogen oxides (NOx) and other pollutants for new heavy duty engines and vehicles is imperative, and we encourage you to take an inclusive, consensus-based approach as you finalize these regulations.

We support setting new, more stringent standards to reduce pollution from heavy-duty vehicles and diesel engines, including emissions of smog- and soot-forming NOx from heavy-duty gasoline and diesel engines. In developing new regulations it is critical that the federal government do so in a manner that is durable and reflects a consensus view among stakeholders.

The proposed rule on the "Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicles Standards" includes two options for reducing NOx tailpipe emissions. Option 1 consists of a two-step process to achieve a 90% reduction, from 0.2 to 0.02, in NOx emission reductions by Model Year (MY) 2031. Option 2 consists of a single-step 75% reduction, from 0.2 to 0.05 by (MY) 2027. We have heard from a number of stakeholders, including manufacturers and labor unions, concerned about the feasibility of option 1 and the potential for unintended consequences.

A workable standard should support efforts to transition to zero-emission electric vehicles (EV) -- which will ultimately result in the most significant improvement in air quality. The industry is committed to developing zero-emissions vehicles and has been making considerable investment in research and development. One of the likely unintended consequences of adopting option 1 would be a diversion of investment and resources from developing and scaling up zero-emission EV technology to the development of new heavy-duty engines and vehicles that can comply with option 1 and slowing the EV transition.

EPA has addressed emissions from heavy-duty vehicles since the mid-1980s, and has improved emissions standards several times since, including actions in 2004, 2005, and 2008 to limit emissions of NOx and particulate matter from heavy duty highway vehicles, marine vehicles, locomotives, and aircraft. These improvements are the result of a process that has worked with both advocates and industry. As you move forward with this this rulemaking process, we urge you to take the same approach – working directly with major stakeholders in developing a final rule that achieves significant NOx reductions and supports the transition to cleaner EV options.

Thank you for considering our request and concerns as you move forward with this important initiative.

EPA Response

This comment was submitted to EPA as official correspondence to the Administrator, in addition to being provided to the docket. Regarding comments on the standards, see our responses in preamble section III, and section 3 of this document. As explained in preamble Sections III and IV and sections 3 and 12 of this document, we are not finalizing the proposed allowance for manufacturers to generate NO_X emissions credits from heavy-duty ZEVs and the final criteria pollutant standards are not based on projected utilization of ZEV technologies. As noted in section 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider this comment in the development of that future rulemaking.

Organization: *Tracey Gold: EPA-HQ-OAR-2019-2871*

Thank you for your recently announced proposal to address pollution from medium and heavy-duty trucks. I'm writing to you today to ask that you please consider strengthening the final standards. Trucks are major sources of other deadly air pollution. That's why the U.S. should enact final standards that put the American truck and bus fleet on a clear roadway to 100% zero-emission sales ASAP. Especially the public transportation system!! By taking bold steps, the U.S. will be well positioned to protect our family's health, reduce fuel costs for truckers and fleets, strengthen our energy security, and advance environmental justice.

EPA Response

We appreciate the comments from Tracey Gold in support of strengthening the final standards and accelerating ZEV technologies adoption. See the Agency's response to general comments with respect to the stringency of the criteria pollutant standards in Section 3.1.1 of this document. As noted in section 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider this comment in the development of that future rulemaking. See also section 23 of this document for responses to Environmental Justice concerns.

Organization: *Truck and Engine Manufacturers Association: EPA-HQ-OAR-2019-0055-2858*

This memorandum is a follow-up to our discussions on June 16th, and a supplement to the relevant portion of EMA's detailed written comments on the Agency's NPRM for the CTP. (See EMA's Comments, pp. 162- 167.) As we discussed, EMA is requesting revisions to the Agency's proposal to streamline and narrow the process for protecting manufacturers' confidential business information (CBI). Perhaps the best way to do that will be for the Agency to allow for manufacturers to collect and store certain types of “emission data,” as opposed to submitting those data routinely. EPA would retain the authority to separately request the submission of those certain types of data when necessary to assist in compliance-related matters. As discussed below, this kind of approach is necessitated by the need to preserve and account for both the Agency’s mandate to collect and make public “emissions data,” and manufacturers’ statutory rights to the protection of their confidential “trade secrets.”

The relevant statutory background to this issue is summarized briefly below.

Sections 114 and 208 of the Clean Air Act (CAA) require manufacturers to collect and submit to the Agency testing data and reports to demonstrate that their products are in compliance with the applicable emission standards and related requirements, and with the corollary test procedures. In addition, and in particular, section 208(c) of the CAA provides that,

> Any records, reports or information obtained [by the Agency] under this part or part C of this subchapter shall be available to the public, except that upon a showing satisfactory to the Administrator by any person that records, reports, or information, or a particular portion thereof (*other than emission data*), to which the Administrator has access under this section, if made public, would divulge methods or processes entitled to protection as trade secrets of that person, the Administrator shall consider the record, report, or information or particular portion thereof confidential in accordance with the purposes of section 1905 of title 18. (42 U.S.C. §7542(c).) (Emphasis added.)

Under the foregoing provision of the CAA, “emission data” is carved-out from the types of data for which CBI protection may be sought. In addition, 40 CFR §2.301(a)(2)(i) broadly defines “emission data” to mean,

(A) Information necessary to determine the identity, amount, frequency, concentration or other characteristics (to the extent related to air quality) of any emission which has been emitted by the source (or of any pollutant resulting from any emission by the source), or any combination of the foregoing.
(B) Information necessary to determine the identity, amount, frequency, concentration or other characteristics (to the extent related to air quality) of the emissions which, under an applicable standard or limitation, the source was authorized to emit (including, to the extent necessary for such purposes, a description of the manner or rate or operation of the source), and
(C) A general description of the location and/or nature of the source to the extent necessary to identify the source and to distinguish it from other sources (including, to the extent necessary for such purposes, a description of the device installation, or operation constituting the source).

The net result of the foregoing statutory provisions is that a broad range of “emission data” that the Agency has “obtained” under CAA section 208(c) shall be made available to the public.

At the same time, federal law also provides broad protection for “trade secrets,” including potential criminal liability for the unauthorized disclosure of trade secrets. More specifically, title 18 section 1905, the statutory provision specifically referenced in CAA section 208(c), prohibits the unauthorized disclosure of information that “concerns or relates to the trade secrets, processes, operations, style of work, or apparatus, or to the confidential statistical data . . . of any person, firm, partnership, corporation, or association.” In addition, the more recent enactment of the federal Trade Secrets Act (see 18 U.S.C. §§1832, et seq.) expressly prohibits the unauthorized communication or receipt of “trade secrets,” which are broadly defined to include “all forms and types of business, scientific, technical, economic or engineering information, including patterns, plans, compilations, design, prototypes, methods, techniques, processes, procedures, programs, or codes . . . if the information derives independent economic value, actual or potential, from not being generally known . . . by another person who can obtain economic value from the disclosure or use of the information.”

From these various federal statutes, it seems clear that there are two important policy considerations at issue: (i) ensuring the reasonable public availability of “emission data,” and (ii) ensuring the robust protection of “trade secrets.” Of particular relevance in this instance is ensuring that the public release of a manufacturer’s emission data does not allow others, including direct competitors, to reverse-engineer that manufacturer’s emission-control strategies, designs, methods, techniques, processes, programs or codes. Heretofore, the Agency has understood this, and has treated such emissions data as CBI. Indeed, if that type of protection is not afforded to this sort of emissions-related trade secret data, the independent economic value of manufacturers’ emission- control research, advancements and designs will be subject to forfeit to any competitor that elects to file a FOIA request. The economic consequences throughout the industry, and the disincentives to invest in the research and development of advanced emission-control systems, would be both obvious and very significant.

Importantly, the basic rules of statutory construction prohibit the Agency from causing such detrimental outcomes. More specifically, it is black letter law that overlapping statutes must be construed to give effect to both. Thus, the Agency’s directive to make “emission data” publicly available cannot be implemented in a manner that nullifies manufacturers’ statutory rights to the protection of their “trade secrets.”

One way to ensure that necessary reconciliation is for the Agency to limit in the first instance the types of emission data it will routinely “obtain” from manufacturers, thereby limiting the types of emission data subject to routine public disclosure. In that regard, the Agency has broad discretion regarding the types of “emission data” it deems necessary for submission to verify compliance.

With the foregoing in mind, and in order to guard against the risk of unlawful FOIA-enabled reverse- engineering of manufacturers’ trade secrets, EPA should confirm that the thirteen (13) types of data described in the pending NPRM (along with any comments submitted in the “comments field” of EPA’s compliance reporting software) (see, 87 FR at p. 17619; proposed sections 1068.11(c)(1) through (c)(13)) will remain eligible for CBI treatment and protection. In addition, to enhance the protection for certain subsets of those data, EPA should refrain from routinely obtaining the following types of trade-secret-related CBI:

(i) one Hertz (Hz) in-use emissions data, or any other similar second-by-second off-cycle data, other than emission values and engine speed;
(ii) engine fuel maps, including any associated NOx data;
(iii) one Hz data from SEA reports or similar compliance-assessment reports, other than emission values and engine speed;
(iv) data regarding the manner in which manufacturers electronically protect passwords and/or encrypt data to restrict the adjustment of electronically adjustable parameters and to prevent unauthorized reflashes (see section 1068.50) and
(v) any other emissions data deemed capable of facilitating reverse-engineering of a manufacturer's trade secrets.

It is vital that EPA protect the foregoing types of confidential emissions-related trade secret data from public disclosure. The applicable federal statutes require as much. In that regard, the types of 1 Hz data that could be subject to public disclosure under EPA's proposal are clearly CBI because, using those data, manufacturers can reverse-engineer each other's emissions-related designs and strategies, including warm-up controls, fuel-map configurations, and more—all of which are carefully guarded trade secrets. Further, those types of 1Hz data are not otherwise readily obtainable without resource-intensive configuration and testing of a competitor's product in a test cell utilizing significant amounts of trained staff's time. The high bar necessary to gather such data serves as protection for the independent economic value of those data and of the manufacturer's related capital investments, such that giving away those data through routine FOIA requests would destroy those capital investments and would violate the manufacturer's rights to the protection of confidential trade secrets.

Similarly, manufacturers' engine fuel maps, including associated NOx data, are also CBI because, from those maps and data, one manufacturer can reverse-engineer another's thermal controls, fuel system and injection controls, and strategies for controlling engine emissions to ensure they comply with the broad range of emissions tests (FTP, RMC, LLC, NTE) and GHG limits that are required. As with the 1 Hz data at issue, these fuel maps and associated data are not readily obtainable without resource-intensive analyses of a competitor's product in a test cell using significant commitments of trained staff's time. The high bar necessary to gather such data again serves as protection for the independent economic value of those data and the manufacturer's investments therein, such that giving away those data through routine FOIA requests would unlawfully vitiate those investments and the associated trade secrets.

Given the foregoing, it is clear that the stakes pertaining to this issue are very high. We look forward to additional discussions regarding this critically important matter.

<u>EPA Summary and Response</u>

We appreciate the comments from EMA on the proposed rule. We have responded to this comment, identified as #1203, in section 30.1 of this document.

Organization: *Truck and Engine Manufacturers Association: EPA-HQ-OAR-2019-0055-2869*

The Truck and Engine Manufacturers Association (EMA) hereby submits its response to the supplemental comments that the California Air Resources Board (CARB) sent to EPA on June 20, 2022, regarding the NPRM for the Agency's Clean Trucks Plan. (See 87 FR 17414-17888.) EMA filed its initial comments on the NPRM on May 30, 2022. EMA is filing these supplemental comments to address certain incorrect assertions that CARB has made, and to address "matters of central relevance to the rulemaking" before the Agency.1 Because this supplement involves such centrally relevant matters, please add it (and the attachments) to the record for this rulemaking and all appropriate dockets. [EPA-HQ-OAR-2019-0055-2869]

1 See 42 U.S.C. §7607 (d)(4)(B)(i) (providing that documents that "are of central relevance to the rulemaking shall be placed in the docket as soon as possible after their availability"); see also 42 U.S.C. §7607 (d)(7)A).

The main points of EMA's supplemental comments are summarized below [EPA-HQ-OAR-2019-0055-2869]:

- CARB asserts in its supplemental filing that a NOx compliance margin of 0.026 g/bhp-hr, similar to the compliance margin of 0.030 that EMA has recommended, "is dangerously and unnecessarily high." That is untrue. Compliance margins are not dangerous; they are an important consideration that account for the variety of real-world conditions under which compliance is demanded, and the laws of physics as they relate to the demonstrated technology. Moreover, a compliance margin of 0.026 (or 0.030) is not unnecessarily high. To the contrary, recent data from Southwest Research Institute (SwRI) proves that EMA's recommended margin was far too low. More specifically, SwRI has completed emissions testing of the "Stage 3 RW" prototype under cold ambient conditions (approximately 5°to 7°C) and has found that the "Bin 3" NOx levels increase by approximately 0.04 g/bhp-hr under those conditions over a representative in-use test cycle. That cold-ambient margin (0.04) is much higher (nearly 20-times higher) than the margin component for "cold ambient operation" (0.0023) that EMA used in the margin stackup analysis included in EMA's original comments. Thus, factoring in the actual margin demand attributable to cold ambient operation, EMA's margin stackup would increase to 0.064. Accordingly, instead of reducing the compliance margin at issue, EPA will need to provide an in-use compliance margin of approximately 0.065 g/bhp-hr (and likely even higher to cover ambient temperatures lower than those tested at SwRI) to ensure that the Agency's proposed NOx standards are feasible.

- Tests under similar cold ambient conditions over the Low Load Cycle resulted in even higher NOx increases. The Stage 3 RW engine's NOx over this cycle increased from 0.032 g/bhp-hr to as much as 0.105 g/bhp-hr.

- A copy of the PowerPoint presentation that SwRI has prepared regarding the results of its cold-ambient testing of the Stage 3 RW prototype is attached, and needs to be included in the underlying rulemaking record. EMA's updated margin stackup analysis reflecting these latest results is also attached.

- CARB contradicts their own assertion that data-based compliance margin allowances are unnecessary by suggesting that manufacturers could "establish a margin by deploying new emissions control technologies." CARB states that closed crankcase ventilation ("CCV") systems could be used to enable compliance, without regard to the fact that CCV is not commonly used on modern diesel engines (they refer to Cummins use of CCV on natural gas engines, which is an altogether different and less challenging application), without acknowledging that these systems are known to cause turbo compressor damage that leads to CO2 emissions increases, and without having developed a shred of emissions data showing that engines using CCV systems can withstand the rigors of heavy-duty engine service over the nearly-doubled useful life periods included in the proposal. Moreover, EPA did not include the cost of CCV components, nor the cost associated with their maintenance requirements, in the cost assessment for the CTP rulemaking.

- CARB also asserts that any pre-buy and no-buy responses to a stringent and costly low- NOx rule will be "small." That is not the case. As confirmed by a recent report prepared by ACT Research, "Bigger Than Ever?: The Higher the Cost, The Bigger the Prebuy," (a copy of which is attached for inclusion in the docket), a low-NOx rule that aligns with EPA's Option 1 or CARB's "Omnibus" regulations would result in "the largest truck prebuy ever, beginning sometime in 2025 or 2026."

- Another issue raised by CARB is that they disagree that current provisions related to the determination of data engines should be retained. EPA's CTP standards will be developed based on demonstrations using ratings typical of the current data engine provisions. Furthermore, neither EPA nor CARB has evaluated the emissions performance implications of revised data engine requirements. Setting up such a disparity between a feasibility demonstration to establish new emissions standards, and new rules regarding the engine rating selected to demonstrate compliance to those standards, would be unreasonable and unfair.

- Also raised in CARB's supplemental comments is an objection to "EMA's assertion that biodiesel specification regulations are needed as part of the CTP rulemaking." CARB is simply ignoring the fact that the Stage 3 RW demonstration, aged to 800,000 miles under conditions representative of operation on quality-controlled pure petroleum diesel, did not produce emissions results compliant with EPA's proposal throughout the proposed useful life period. Fuel contaminants in biodiesel, including biodiesel blends limited to B20, will further reduce the NOx conversion efficiency of those same SCR systems. Biodiesel fuel quality standards absolutely must be improved to enable compliance to the aggressive NOx standards EPA will establish in the final rule.

- Yet another objection raised by CARB is EMA's recommendation that EPA eliminate PM and NMHC testing when complying with an in-use test order. The basis for EMA's recommendation is clearly stated in our comments. Any suspicion on CARB's part concerning visual screening methods for PM exceedances on vehicles considered

> for in- use testing would not be rectified by requiring measurement of PM emissions during an in- use evaluation. EMA supports EPA's consideration to finalize the CTP regulation to require PM and/or NMHC emissions testing requirements only in cases where there is reason to believe exceedances may be present.

[Attachments omitted]

<u>EPA Response</u>

We appreciate the comments from EMA on the proposed rule. Regarding comments on the standards and in-use margin, see our response in preamble section III, and section 3 of this document. Regarding EMA's updated margin analysis, as discussed in preamble III.C and section 3 of this document, our assessment is that the final off-cycle standards that include margin also include the emissions impacts due to cold ambient temperature. Regarding comments on the definition of parent engine (data engines), see our responses to comments in section 29.3 of this document. As discussed in preamble section III and section 3 to this document, we have considered the emissions levels of other engine ratings within an engine family when setting the final standards. Regarding comments on closed crankcase systems, see our responses to comments in section 3.9 of this document. Regarding EPA's assessment of the costs of closed crankcase systems, see RIA chapters 3.1 and 7. Regarding comments on pre-buy and no-buy, see our responses to comments in section 25 of this document. Regarding comments on fuel quality and its effect on feasibility, see preamble Section III.B and III.C for more information on how we consider these elements in setting the standards. Regarding comments on PM and NHMC measurements for the heavy-duty in-use testing (HDIUT) program, see our responses to comments in section 11 of this document.

Organization: *Alliance of Nurses for Healthy Environments et al.: EPA-HQ-OAR-2019-0055-2879*

On behalf of 21 health, environmental, and community groups, please find the attached on the Environmental Protection Agency's Proposed Rule for Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, 87 Fed. Reg. 17,414.

The undersigned organizations representing millions of members respectfully urge that, by May of next year at the latest, EPA finalize rigorous and comprehensive standards for new medium- and heavy-duty vehicles that help to ensure levels of new zero emitting vehicles in 2029 are at least as great as those required by California's Advanced Clean Trucks Rule, if those standards applied nationwide. These standards must also be consistent with and help ensure that all new medium- and heavy-duty vehicles will be zero-emission by 2035. The Agency must, in setting these standards, consider the game-changing clean vehicle provisions of the Inflation Reduction Act (IRA), which dramatically accelerate the deployment of medium- and heavy-duty zero emission vehicles (ZEVs).

The IRA reinforces EPA's longstanding and well-established authority to adopt protective pollution standards for medium- and heavy-duty trucks and buses. It also turbocharges the availability of zero emitting solutions that eliminate lethal particulates, smog-forming nitrogen oxides and climate-destabilizing pollution, accelerating vital protections for communities who have been bearing the heavy burden of pollution for far too long, while mobilizing made-in-America manufacturing – and high-quality jobs across our nation.

Experts have already completed analyses of the significant benefits the IRA will have in accelerating ZEV deployment, including analysis by ERM concluding that the IRA will pull ahead price parity for medium- and heavy-duty ZEVs by 5 to 12 years and result, on average, in 29 percent baseline levels of new vehicle ZEV sales in 2029, without considering the role of EPA standards.1 Additional analysis by Roush Advanced Engineering has likewise found the IRA will result in many medium- and heavy-duty ZEVs reaching price parity in 2023, delivering substantial savings to truckers and fleets over those vehicles' lifetime and further underscoring the opportunity for protective standards.

> 1 Robo, Ellen and Seamonds, Dave. "EDF ZEV Baseline Technical Memo Addendum." ERM. 19 Aug 2022. https://www.erm.com/contentassets/154d08e0d0674752925cd82c66b3e2b1/edf-zev-baseline-technical-memoaddendum.pdf.

Recent reporting has suggested EPA plans to issue a supplemental proposal this December to consider the impacts of the IRA on EPA's proposed pollution standards for model years 2027-2029 vehicles.2 We respectfully urge EPA to finalize the MY 2027-2029 standards by May of next year at the latest. Swiftly finalizing these standards is consistent with the extensive information already in the record on the need for and feasibility of medium- and heavy-duty ZEV deployment3 and with the analysis that has likewise been developed documenting the substantial impacts of the IRA. Moreover, finalization by May is important to ensure EPA proposes and finalizes protective Phase 3 standards for MY 2030 and later vehicles on a timeline consistent with the President's August 2021 Executive Order and EPA's commitments in its regulatory agenda.

> 2 E.g., Shepardson, David, Exclusive U.S. EPA to consider tougher emissions rules for heavy trucks, (Sept. 21, 2022); https://www.reuters.com/business/sustainable-business/exclusive-us-epa-consider-tougher-emissions-rulesheavy-trucks-2022-09-21/.
>
> 3 See, e.g., Comments of Environmental Defense Fund, EPA-HQ-OAR-2019-0055-1265, https://www.regulations.gov/comment/EPA-HQ-OAR-2019-0055-1265.

In addition, EPA's supplemental proposal must help to ensure nationwide levels of ZEV deployment that are at least as great as those required by California's Advanced Clean Trucks Rule (adopted as feasible even before enactment of the Infrastructure Investment and Jobs Act and the IRA). The IRA analyses add to a significant and compelling body of information on the feasibility and benefits of ZEVs, including substantial investments and rapid introduction of new models by manufacturers in advance of the IRA's passage. Standards consistent with California's Clean Trucks Rule are critical to ensure America's communities and people realize the full health, climate, equity and economic benefits of the Inflation Reduction Act. The robust IRA programs enacted by Congress demonstrate the urgent need to dramatically reduce truck pollution now, and only strong standards will ensure that the IRA programs are fully subscribed and utilized.

There is a pivotal opportunity for EPA to finalize protective standards consistent with the game-changing provisions of the Inflation Reduction Act. Now is the time for action, and we look forward to EPA's response to these requests.

EPA Response

We appreciate the comments from Alliance of Nurses for Healthy Environments et al. in support of accelerating ZEV technologies adoption. As explained in preamble Sections III and IV and sections 3 and 12 of this document, we are not finalizing the proposed allowance for manufacturers to generate NO_X emissions credits from heavy-duty ZEVs and the final criteria pollutant standards are not based on projected utilization of ZEV technologies, although manufacturers may choose to comply with the standards through using ZEV technologies, or other technology pathways than included in our demonstration program. In section 3.1.1 of this document we respond to comments requesting that the final criteria pollutant standards be based on the projected utilization of ZEV technologies, which in part discusses the timing of the IRA relative to this final rulemaking. As noted in section 28 of this document, EPA is not taking final action at this time on the portion of the HD 2027 NPRM regarding proposed changes to HD GHG Phase 2 standards. EPA intends to undertake a separate rulemaking regarding more stringent HD GHG standards in the future (i.e., HD GHG Phase 3 standards) and may consider this comment in the development of that future rulemaking.

Appendix 1: Index of Commenters in Text

This appendix contains the following information:

- List of individual comments excerpted verbatim in this Response to Comment Document
- List of mass mailer comments (those received before the docket closed on May 16, 2022)
- List of late comments (received after docket closed thru October 4, 2022)
- Description of industry-related letter campaigns; a description of our approach to these campaigns is provided at the end of this appendix.
    - State Trucker Association (1)
    - State Trucker Association (2)
    - Engine and Truck Organizations
    - Motorcoach Companies.

Description of Industry-Related Letter Campaigns

When reviewing the written comments posted to the docket for this proposal, we identified four industry-related letter campaigns that were not treated like mass comment campaigns by the EPA Docket Center:

- State Trucker Association 1
- State Trucker Association 2
- Engine and Truck Organizations
- Motorcoach Companies

To avoid repeating the same text up to 24 times in the same Response to Comment Section, we include it only once, with the Docket Number for the reference comment. In those cases where an individual comment provided additional information, the additional information is also included in relevant section with the docket ID number for that comment. Note that many companies submitted both the State Trucker Assn. 1 and State Trucker Assn. 2 comments. Some submitted separate documents to the docket; others provided both comments under one document. As a result, the same Docket ID number may occur in both lists. The letter campaigns are set out in the following table.

Comment Campaign	Docket ID	Company	Addt'l Info Provided
State Trucker Assn 1 (24 comments)	1075	Hawaii Transportation Assn.; REFERENCE COMMENT	
	1085	Florida Trucking Assn.	
	1086	Maryland Motor Truck Assn.	
	1087	Idaho Trucking Assn.	
	1088	Motor Transport Assn of Connecticut	Yes
	1093	Oklahoma Trucking Assn.	
	1094	Pennsylvania Motor Truck Assn.	
	1095	Indiana Motor Truck Assn.	Yes
	1104	New Jersey Motor Truck Assn.

Appendix 2: Other Comments Received, Not Reproduced Verbatim in Text

This appendix contains a list of comments that are general in nature and do not require detailed EPA response, and/or contain opinions or statements about issues without detailed information or reasonable specificity.

<u>Summary of Comments</u>

We characterize the nature of these comments by classifying the statements along seven dimensions based on whether one or more of the topics were mentioned (one statement may reflect several dimensions):

- Generally support
- Program not stringent enough
- Program too stringent
- Human Health and Welfare (including air quality, benefits)
- Environmental Justice
- Costs
- Owner/operator concerns

About 21% of these commenters were supportive of the proposed program; 59% said they would like EPA to adopt more stringent standards. Only 20% of these commenters expressed opposition to the proposal.
Of the commenters that were supportive, about 27% mentioned an aspect of the health and environmental impacts of emissions, and about 12% mentioned an aspect of environmental justice.
Of the commenters that requested EPA do more to control emissions from these sources, about 27% mentioned an aspect of the health and environmental impacts of emissions, and about 32% mentioned an aspect of environmental justice.
Of the commenters that said program is too stringent, 49% mentioned an aspect of owner/operator concerns and 42% mentioned an aspect of costs. In addition, of the commenters that cited owner/operator concerns, 57% mentioned an aspect of costs.
Finally, about 100 comments did not comment on any of the 7 topics. The statements made in these comments are outside the scope of this final rule; for example, they request EPA to regulate other sources than what is covered within the scope of this rulemaking (e.g., locomotives, stationary sources) or they provided opinions on the workings of EPA or the federal government generally on topics also outside the scope of this rulemaking.

<u>EPA Response</u>

See responses in Section 1 of this document.

Appendix 3: List of Testifiers at Public Hearings

This appendix contains a list of individuals who testified at a virtual public hearing on the proposal, which was held on April 12, 13, and 14, 2022.[76] A redacted version of the hearing transcript can be found in the docket for this rule (EPA-OAQ-HQ-2019-0055-2867).[77]
Over the 3 days of the hearings, 278 testifiers provided statements voicing their support for or concerns about the proposal:

Number of Testifiers Per Day

Hearing Day	**Number of Testifiers**
May 12, 2022	108
May 13, 2022	103
May 14, 2022	67
Total	**278**

Most of those who testified, 212 people, spoke on behalf of or identified as a member of a specific organization. The remaining testifiers, 66, spoke in their personal capacity. The organizations that were affiliated with the largest number of testifiers are as follows:

Number of Testifiers Affiliated with Selected Organizations

Organization	**Number of Testifiers**
Moms Clean Air Force, various chapters	31
Sierra Club (Various Chapters)	19
Chispa (League of Conservation Voters, various states)	10
American Lung Association	8
Alliance of Nurses for Healthy Environments (ANHE)	5
CleanAirNow	5

Most of the hearing testimony is general in nature and does not require detailed EPA response, and/or contain opinions or statements about issues without detailed information or reasonable specificity. Those hearing statements that are more specific in nature and are not included written comments submitted by the testifier or the testifier's organization are included verbatim in this document.

<u>Summary of Testimony</u>

[76] The third day was added to accommodate the large number of people who requested to be able to testify, and the comment period for the rule was extended to accommodate that extra day of testimony.
[77] The transcript was redacted to remove potential Personally Identifiable Information (PII) pertaining to third parties.

We characterize the nature of the testimony by classifying the statements along seven dimensions based on whether one or more of the topics were mentioned (one statement may reflect several dimensions):

- Generally support
- Program not stringent enough
- Program too stringent
- Human Health and Welfare (including air quality, benefits)
- Environmental Justice
- Costs
- Owner/operator concerns

The vast majority of individuals, 87% testified on two or three topics, typically an aspect of human health and welfare (90%), Environmental Justice (50%), and/or or the program doesn't go far enough to reduce emissions (74%)
The breakdown of topic raised by the testifiers is as follows:

Number of Testifiers by General Topic

Topic	**Number of Testifiers**
Human Health and Welfare (including air quality, benefits)	249
Environmental Justice	138
Costs	35
Owner/operator concerns	10
Generally support	48
Program not stringent enough	207
Program too stringent	9

Many of those who stated that the program is not stringent enough also mentioned aspects of the impact of emissions on human health and welfare (197) and environmental justice (111). Similarly, many of those who expressed general support for the program also mentioned aspects of the effects of emissions on human health and welfare (39) and environmental justice (22). The 9 testifiers who said the program is too stringent mentioned owner/operator concerns (4) and/or costs (5).

EPA Response

See responses in Section 1 of this document.

List of Testifiers

Appendix 4: General Statements Excerpted from the Detailed Comments Included in the Document

EPA categorized the content of detailed written comment received on this rule by topic area and assembled them for response in the various sections of this Response to Comment Document. In addition to detailed comments on specific aspects of the proposed rule, many commenters also provided general statements that indicate their support for the proposal as written, support for the proposal while also stating that the proposal doesn't go far enough or general opposition to the proposal. Because these statements are general in nature, they were not assigned to specific sections of the document. Instead, these statements are summarized in Section 1; full excerpts are provided in this Appendix for completeness.

Comments by Organization

Organization: *350Marin*

President Biden promised actions to transform the U.S. into a zero-emission economy by 2050 But these EPA proposals do not require zero emission trucks and buses even though zero emission vehicles are available now. Zero-emission electric trucks are the best available technology to both reduce harmful NOx and climate pollution. [EPA-HQ-OAR-2019-0055-2474, p.1]

Therefore, we urge this administration to set the strongest standards possible because many lives, especially our children and those most vulnerable in our communities, depend on it. The EPA must put the country's medium- and heavy-duty fleets on a pathway to 100% zero-emission all electric vehicles by 2035. [EPA-HQ-OAR-2019-0055-2474, p.1]

Organization: *350 Colorado*

[*From Hearing Testimony, April 13, 2022, Heidi Leathwood*] I am here in support of rules for clean trucks and to urge even more protective rules to address climate change and right the environmental injustice wrongs of the past and present. The effects of climate change are not confined to the future. They are already here. The American West is in the worst drought for 1,200 years, and here in Colorado we are having year-round wildfires that are burning down homes and killing people. Denver has very bad air pollution, a D rating from the American Lung Association, and our ozone non-attainment rating is severe. Transportation is one of the top causes of this. Here is my specific ruling representing 350 Colorado. Greenhouse gas standards should be made more stringent in model years 2027 to 2029 and beyond. The goal is to get gas and diesel vehicles off the road as soon as possible, but in the meantime adopt the strongest technologies for reducing pollution from these vehicles and for state-of-the-art monitoring and communication about the pollution. EPA should adopt provisions as strong or stronger than California for all states. Natural gas should not be encouraged or incentivized as a fuel in any way. Fuel transmission and combustion emissions would be locked into the 30- to 40-year life of the vehicle. Zero-emission vehicle purchases should be the priority of the rule. Testing should be conducted not only for engines alone but with the whole vehicle in use, and testing standards for particulates should not be reduced. Particulate pollution is a serious health threat. Cost should not be considered higher than protection of health. We support longer emissions warranty periods, and we support the strongest possible rules to prevent tampering and to detect system failures, also to ensure adequate maintenance of the vehicles and to ensure engine rebuilding does not result in higher pollution. The IPCC continue to get more and more urgent. We need to reduce greenhouse gasses now. Since the new rules cannot take effect until model year 2027, they need to be even stronger. I am here to urge you to strengthen the rules and to complete rulemaking in 2022. This will have a positive effect, not only on pollution but on the development of clean transportation resources that our country and the world need in order to stay under 1.5-degree of global warming. [EPA-HQ-OAR-2019-0055-2867]

Organization: *Achates Power, Inc.*

Achates Power has good and growing evidence that the CARB 2027 ultra-low NOx regulation and the EPA 2027 GHG II regulation and the most stringent EPA NOx proposal can be met with substantial compliance margin and with only existing conventional aftertreatment systems making the solutions cost-effective and robust while utilizing existing manufacturing, servicing, and fueling infrastructure. [EPA-HQ-OAR-2019-0055-1216-A1, p. 4]

Transportation is vital to prosperity as it provides access to education, jobs, markets, health care, and recreation. Yet our current modes of transportation inflict a heavy price in poor air quality, environmental harm, and poor human health, particularly among the most impacted. We need to take every reasonable measure to reduce the harmful impact of our transportation industry so all can continue to benefit from what our society has to offer. [EPA-HQ-OAR-2019-0055-1216-A1, p. 4]

As a industry we can plan and hope that battery electric or fuel cell technologies provide reliable, environmentally friendly, and cost-effective transportation solutions. But we cannot wait and need not wait until these technologies are proven capable and are widely adopted to meaningfully reduce the harmful impacts of transportation. [EPA-HQ-OAR-2019-0055-1216-A1, p. 4]

Achates Power has strong and growing evidence that meeting our near-term environmental goals by substantially reducing both criteria and CO2 emissions from commercial vehicles can be done quickly without an increase in either the cost to purchase or use those vehicles, and with existing facilities and infrastructure for manufacturing, distributing, fueling, and servicing. The EPA's most stringent option can be met in a practical and cost-effective manner, and its adoption will spur technology innovation to improve air quality and human health in the near term, with benefits compounding even while complementary zero-emission solutions are brought to market over an unknown and unknowable timeframe. [EPA-HQ-OAR-2019-0055-1216-A1, p. 4]

Organization: *Adrian Shelley, Citizen.*

[*From Hearing Testimony, April 13, 2022*] So I am joining today to a strong rule that limits NOx pollution and other pollutants as well from the heavy truck industry. I want to just start by noting that truck traffic is typically concentrated in what we think of as environmental justice communities, low-income, communities of color, and the presence of traffic, particularly heavy truck traffic, is often the result of structural racism, redlining, you know, a history of geographic marginalization of communities of color. So those impacts are still felt today. In my own work I have seen this in communities like Pasadena, in the East Harris County area, Galena Park, La Porte, Morgan's Point, Channelview. These are communities that deal with this truck traffic every single day. NOx improvements are obviously overdue and the strongest NOx standard possible will provide the most health benefits. And a lot of those benefits will come from co-pollutants. You know, particularly diesel particulates and ultrafine particulates are probably understated in their health impacts. You know, those impacts begin in the womb, with everything from brain development in infants to low birth weights to exacerbation of diabetes, stroke, heart attack, and all the way up to premature death. So, you know, heavy truck pollution kills, and it kills in a way that impacts certain communities the most, due to a history of injustice and structural racism. So I think we need to keep that in mind. With that in mind, the health impacts from just heavy truck pollution alone in a major U.S. city is going to be in the hundreds of millions to billions of dollars. The calculated health impacts of this rule, I think if you are just looking at NOx, show that it is outpaces the cost by billions of dollars. I want to encourage investment in inherently zero-emission technologies, electric trucks. You know, the emissions requirements can be met by other technologies but there are other consequences, you know, natural gas, for example, fracking, and whatnot. You know, hydrogen and other technologies might potentially have other impacts. So inherently zero-emission technology is what we prefer, and, you know, there are concerns with control technologies as well. There has been a long history of defeat devices, workarounds for equipment, BPS, and that sort of thing, and from outright cheating from companies. So we want to discourage that and inherently zero-emission vehicles are another way to do that. So, in conclusion, I support the strongest rule possible, mindful of the inequitable health impacts of heavy truck pollution in communities today. I encourage a transition toward electric vehicles, a good investment in zero-emission technologies and equitable investment in electrification in communities, and a swift transition away from polluting heavy trucks. [EPA-HQ-OAR-2019-0055-2867]

Organization: Advanced Engine Systems Institute (AESI)

AESI members are committed to the following principles, which should underlie EPA's final rule regulating NOx and GHG emissions from Heavy Duty vehicles and engines.

- ASEI members support the goals of clean mobility and reduced NOx and GHG emissions that lead to the decarbonization of the transportation sector and clean air. [EPA-HQ-OAR-2019-0055-1281-A1, p. 1]
- AESI supports technology neutral standards which are performance based and cost efficient. [EPA-HQ-OAR-2019-0055-1281-A1, p. 1]
- One set of National Standards for NOx is critical from the market perspective of suppliers. EPA has an opportunity to ensure a single harmonized national HD NOx standard by finalizing Option 1. A failure of EPA to align standards with the California Omnibus will result in a patchwork of state standards. This would create unacceptable market uncertainties; stifle innovation; and cause disruptions in freight with significant economic impacts. [EPA-HQ-OAR-2019-0055-1281-A1, p. 1]
- Long term regulatory certainty is essential for suppliers to make critical investment choices regarding advanced technology, product development and production. Regulatory

certainty stimulates investment and job creation. [EPA-HQ-OAR-2019-0055-1281-A1, p. 1]

- These regulations should drive simultaneous NOx and GHG reduction. Peer reviewed published data cited here (below) and elsewhere demonstrate multiple technology pathways are available to achieve simultaneous NOx and CO2 reductions from ICE-based powertrains. [EPA-HQ-OAR-2019-0055-1281-A1, p. 1]

AESI strongly supports EPA's proposed Option I to regulate NOx emissions and believe that it closely aligns with the California Omnibus Rule. Recently published data [Matheaus, A., Neely, G., Sharp, C., Hopkins, J. et al., "Fast Diesel Aftertreatment Heat-up Using CDA and an Electrical Heater," SAE Technical Paper 2021-01-0211, 2021, https://doi.org/10.4271/2021-01-0211] suggest that the stringent standards proposed in Option I can be achieved with a significant margin for compliance. These data should be considered by EPA in shaping the Final rule, which critically does not take effect for another 5 years during which further innovation will occur. Option II is a completely unacceptable outcome for AESI members. [EPA-HQ-OAR-2019-0055-1281-A1, pp. 1 - 2]

There are more data, including the comprehensive technology demonstration program at Southwest Research Institute (SWRI), underlying this rule than any in EPA's mobile source history; all of these data support Option I. [EPA-HQ-OAR-2019-0055-1281-A1, p. 2]

NOx emissions are a critical urban public health issue, which disproportionately effect frontline communities. Data cited here in the Eaton/SWRI manuscript and data generated by other suppliers, demonstrate that the Option 1 NOx standards can be achieved with a substantial compliance margin at a reasonable cost while simultaneously reducing CO2 emission from medium and heavy duty vehicles. The diesel trucks that are sold going forward should be as clean and fuel efficient as possible. This rule offers EPA perhaps the final opportunity to ensure that goal is achieved. [EPA-HQ-OAR-2019-0055-1281-A1, p. 2]

Organization: *Agricultural Retailers Association (ARA) (1251 and 1421)*

ARA supports practical, technologically feasible, and cost-effective efforts to promote newer technologies that will reduce emissions in heavy-duty trucks and other motor vehicles with the goal of cleaner air and healthier communities. However, the EPA's current proposals are not practical or cost-effective and not technologically feasible in the near term. These new EPA standards are being proposed at a time the United States continues to face record inflation and cost increases on new and used vehicles as well as every other essential consumer good. This proposal will lead to users keeping and maintaining older vehicles on the road longer, thereby keeping emissions high and running directly counter to the EP A's stated goals. ARA does not believe either Proposal 1 or 2 establish a practical timeline to ensure vehicle performance and reliability. [EPA-HQ-OAR-2019-0055-1251-A1, pp. 1 - 2]

To be effective, any final rule must result in new trucks that are:

- Affordable: If trucking companies choose not to purchase new trucks due to cost or reliability concerns, older trucks will stay on the road longer and environment goals will not be achieved;
- Durable: New, more expensive trucks are not purchased to sit in repair bays. Trucks are unproductive pieces of equipment unless they are moving freight;
- Safe: Safety is a top priority in every trucking operation. Putting off the purchase of the newest equipment will delay the use of the latest safety technologies; and
- Cleaner: An unworkable rule will delay fleet turnover and impede environmental progress. The long-term promotion of alternative, renewable fuels such as low-emission biofuels need to be part of any long-term solution to promoting cleaner air and healthier communities. [EPA-HQ-OAR-2019-0055-1251-A1, p. 4]

Fleets do not make trucks -- they are consumers that buy trucks. While this rule is directed at manufacturers, it is agricultural retailers, trucking companies, and other businesses buying modern technologies that determine the success or failure in the implementation of every truck emissions regulation. Fleets remain extremely sensitive to the many difficulties involved in running a company - a matter that is especially significant to the 97 percent of fleets classified as small businesses. [EPA-HQ-OAR-2019-0055-1251-A1, p. 4]

Here is a look at the numbers behind EPA's overly stringent proposed rule according to the Truck and Engine Manufacturers Association (EMA)3:

- 4.5 million: With more than 4.5 million medium- and heavy-duty trucks on the road today delivering 72% of the goods, services, and freight that consumers depend on every day, EPA's final rule would have a sweeping impact on the nation's economy.
- 98%: Almost all (98%) of U.S. fleet owners are small businesses operating fleets with 20 or fewer commercial vehicles. Nine out of ten of these fleets (91 %) operate six or fewer trucks.
- 11.6%: Research from Ramboll Group shows NOx emissions could actually increase by as much as 11.6% under EPA's more stringent rule because of delayed fleet turnover and older, higher-emitting trucks staying on the road longer.
- $42,000: Contrary to EPA's claims that per-unit truck cost increases will be minor, analysis from Ricardo Strategic Consulting found the per -unit cost increase for heavy-duty diesel engines could exceed $42,000, including increased operating costs, making it unlikely that fleet owners will be able to afford to purchase the new trucks. An earlier cost study that the California Air Resources Board commissioned from the National Renewable Energy Laboratory (NREL) reached similar conclusions.
- 221,000: ACT research found that, under one scenario, as many as 221,000 good-paying jobs in the truck and engine manufacturing industries could be at risk if EPA pursues a poorly designed rule such as the one it has proposed. [EPA-HQ-OAR-2019-0055-1251-A1, pp. 3 - 4]

***Organization**: Ali P.*

We need to implement as many pollution and greenhouse gas reduction measures as possible and do so as quickly as we can to begin decreasing the detrimental effects that anthropogenic activities have on the planet. This proposed rule would bring us one small step closer to accomplishing this goal. It would begin reducing the negative effects that pollution has on people's overall health and on the state of the world's ecosystems. It would also help begin reducing the country's enormous volume of greenhouse gas emissions. It is a step towards better preservation of both humanity and the environment. While humans have destroyed much of the earth, it is not too late to actively work to restore it. But the time to act is now. Too many people are either refusing to work towards improving the environment or are treating its improvement as a lost cause. Both of these mentalities will result in our increase in global destruction and our eventual downfall. We need to make every effort that we can to save the environment and ourselves. Implementing policies such as this proposed rule should only be the beginning. [EPA-HQ-OAR-2019-1031]

***Organization:** Alliance for Vehicle Efficiency (AVE)*

AVE supports EPA's effort to reduce emissions, specifically nitrogen oxides (NOx), and particulate matter (PM) from this important segment of the transportation sector. [EPA-HQ-OAR-2019-0055-1280-A1, p. 1]

AVE urges EPA to move beyond tailpipe only definitions for ZEVs and integrate lifecycle analysis for future standards. [EPA-HQ-OAR-2019-0055-1280-A1, p. 5]

Defining ZEVs only at the tailpipe distorts the environmental gains of vehicles with known upstream emissions. Relying on the current definition of ZEVs serves as a barrier to automotive technologies that can deliver significant real-world emission reductions. For example, hydrogen combustion engines can deliver significant emission reductions, and when compared to other vehicles on a lifecycle basis, can match the environmental impact of vehicles currently defined as ZEVs. [EPA-HQ-OAR-2019-0055-1280-A1, p. 5]

Continuing to focus solely on tailpipe emissions for future standards also ignores President Biden's January 25, 2021, Executive Order, in which he stressed the need for environmental standards to account for all greenhouse gas emissions. [EPA-HQ-OAR-2019-0055-1280-A1, p. 5]

"Sec. 5. Accounting for the Benefits of Reducing Climate Pollution. (a) It is essential that agencies capture the full costs of greenhouse gas emissions as accurately as possible, including by taking global damages into account. Doing so facilitates sound decision-making, recognizes the breadth of climate impacts, and supports the international leadership of the United States on climate issues." 10 [EPA-HQ-OAR-2019-0055-1280-A1, p. 5]

10. 7040 Federal Register / Vol. 86, No. 14 / Monday, January 25, 2021 / Presidential Documents

Congress is also encouraging EPA to assess lifecycle emissions when setting future vehicle standards: [EPA-HQ-OAR-2019-0055-1280-A1, p. 5]

Vehicle Emissions Lifecycle Analysis. — The Committee believes it is essential that when setting future standards for reducing greenhouse gas emissions, the Agency fully evaluate emission impacts of vehicle technologies and transportation fuels (including electricity used as a fuel) from well to wheel, and the vehicle cycle through material recovery and vehicle disposal in order to capture the full impacts of greenhouse gas emissions as accurately as possible. The Committee encourages the Agency to develop standardized modeling to evaluate the full lifecycle of vehicle technologies and transportation fuels, as new standards to reduce pollutants are being developed, and to coordinate as necessary, with other federal agencies that are conducting similar models for vehicles in an effort to accurately determine the full impact of reducing greenhouse gas emissions when conducting cost-benefit analyses of regulatory and other actions. 11 (Emphasis added) [EPA-HQ-OAR-2019-0055-1280-A1, p. 5]

> 11. See, H. Rept. 117-83 – Dept. of the Interior, Environment, & Related Agencies Appropriations Bill, 2022 at P. 84.

In setting new national standards, AVE supports EPA adopting the most stringent standards that are technically feasible and cost-effective. EPA’s Proposal provides an excellent opportunity to target the largest segment of NOx and PM emissions across the majority of the country for the first time in almost 20-years and to provide much needed, cost-effective relief to states facing daunting Ozone-attainment challenges. [EPA-HQ-OAR-2019-0055-1280-A1, p. 8]

The investments made over the last decade by automotive suppliers has made more stringent standards possible. We believe that a strong and feasible national standard provides the greatest public health benefits while providing the much-needed regulatory certainty for the industry to continue to innovate and invest. [EPA-HQ-OAR-2019-0055-1280-A1, p. 8]

Organization: *Allison Transmission, Inc. (Allison)*

EPA should consider whether there are any additional quantitative or qualitative impacts that may be projected from imposing standards based on the control of criteria air pollutants like NOx versus impacting GHG emissions. In addition to any available data, this review could consider how the additional of additional emission control technology for criteria versus GHG impacts may be perceived in the marketplace. Considering the commercial vehicle end-user perspective there is significant capital involved in fleet-turnover that drives more caution and slower willingness to adopt significantly different technology that goes beyond the total cost of ownership (“TCO”) or purely economic comparisons. Consideration of the need to conduct trials and build confidence in technology prior to fleet turnover could drive a different estimates of ZEV adoption in the medium- and heavy-duty market compared with the passenger car market. This, in turn, reinforces the importance of a maintaining non-ZEV path for CO2 reduction based on more mature technology. Allison explores these issues further in Sections XVI and XVII of these comments.[EPA-HQ-OAR-2019-0055-1231-A1, p.22]

Additionally, it is clear that EPA and CARB will increasingly need to consider not only tailpipe and avoided GHG emissions, but also upstream components to the GHG profile of heavy-duty ZEVs. As EPA is well aware, the overall emissions impact of a ZEV is tied to the carbon content of the electricity used to charge its batteries; such content will vary across different areas of the country, resulting in very real differences in net climate benefits. These differences can be very substantial, varying from 12 grams of CO2 per kilowatt hour ("kWh")to 2.23 lbs. per kWh.69 While this rulemaking does not address this issue and the relative effect of upstream emissions from electricity generation is not a current, major concern given the relatively low penetration of ZEVs in the heavy-duty sector, by EPA's own estimates this effect will increase over time. EPA should therefore more proactively discuss this issue going-forward during the series of rulemakings that are currently part of its agenda in the HDV sector. [EPA-HQ-OAR-2019-0055-1231-A1, p.33]

> 69 Nationwide, CO2 emissions per kilowatt-hour ("kWh") averaged 0.85 lbs./kWh in 2020. But the rate varied from near-zero for certain forms of energy (e.g., from 48 gCO2eq/kWh for solar, 24gCO2eq/kWh for hydropower and 12gCO2eq/kWh for nuclear) as compared with 2.23 lbs./kWh for coal-fired power plants. See, e.g., eia.gov/tools/faqs; www.hydropower.org.

Beyond scope of Clean Air Act, ZEVs also face numerous other environmental issues, including the extent of recovery of battery materials, recyclability, and closed loop systems. Battery material reclamation is a very important consideration for the long-term sustainability of ZEV. [EPA-HQ-OAR-2019-0055-1231-A1, p.33]

While all of these issues may not be able to be addressed pursuant to the Agency's Clean Air Act authority, these impacts have associated costs and cannot be ignored over the long-term. Proactively discussing such issues would aid the vehicle manufacturing sector in planning for future design and sourcing agreements early within vehicle development cycles. Such an assessment should be performed prior to adoption of any explicit or implicit ZEV targets; EPA should not in this rulemaking attempt to align final regulations with the measures and timing contained in the CARB HD Omnibus regulation or the CARB Advanced Clean Trucks regulation. [EPA-HQ-OAR-2019-0055-1231-A1, p.33]

Organization: *Amber Wheeldon*

I have browsed the previously posted comments regarding the new rule being proposed by the EPA. It is abundantly clear that no person commenting in favor of stricter emission controls has any knowledge of the transportation industry. More stringent emission controls will be detrimental to the trucking industry. When the American trucking industry struggles, so do the American people. [EPA-HQ-OAR-2019-0055-1154]

Current emission controls already fail. They fail constantly. The technology we have currently for emission control products isn't working. How can we believe further controls will work? Large amounts of trucks are out of service in every state with emission control errors. The effects of trucks out of service can be seen in our already low inventory shelves in the grocery stores. But those inventories are also low for truck parts. For example, the truck parts necessary for repairing the trucks with emission control errors. Trucks can be put out of service for months waiting for repair. So, while the truck has no actual mechanical issues, it can't be used. Small fleet owners cannot afford to be out of service for long periods. There is a significant loss of income in just a few weeks. Once the parts are available, now they must pay high costs for the emission control products that will still continue to fail. Small fleet owners will be forced out of business because of the emission control failures. [EPA-HQ-OAR-2019-0055-1154]

Fleet Size Group	Fleet Size by Power Units	Number of Carriers	Carrier % of Total	Total Power Units	Power Unit % of Total
Very Small	1 to 6	502,626	86.00%	924,467	19.81%
Small	7 to 19	53,332	9.13%	583,105	12.49%
Medium	20 to 100	24,133	4.13%	955,280	20.47%
Large	101 to 2,000	4,212	0.72%	1,236,217	26.49%
Very Large	2,001 to 5,000	93	0.02%	278,517	5.97%
Mega	5,001+	41	0.01%	689,461	14.77%
Totals		**584,437**	**100.00%**	**4,667,047**	

Data Source: FMCSA, Motor Carrier Management Information System (MCMIS), data snapshot of interstate carriers as of December 2020

As seen in the table above, very small - medium fleets, that will be most affected by the new regulations, make up no small sum of the overall trucking numbers in America. More rigid controls on emissions will be disastrous for the over 580,000 small carriers. Everyone would agree that improving air pollution and greenhouse gases is a good thing. Unfortunately, this particular program is a failure. If the products cannot be manufactured now to work efficiently, we cannot move forward with more ineffective regulations that put small business owners out of work and moreover the American people out of the products they need on their shelves. [EPA-HQ-OAR-2019-0055-1154]

Rules and regulations are passed too often without being aware of the effects it passes down on the people. By passing more regulation that continues to fail them, it fails us all. [EPA-HQ-OAR-2019-0055-1154]

Organization: *American Bus Association (ABA) (1070 and 1308)*

Initially, ABA's overarching concern with the Proposal, and the EPA's review for that matter, is the apparent lack of understanding of the types of vehicles and industries that use and rely on heavy-duty, compression-ignition engines. Although the Proposal targets engine emissions by way of regulating engine manufacturers, in reality it is the use of these engines on the nations roadways that affects air quality. In the Executive Summary of the Notice, the Industry Overview focuses exclusively on property-carrying vehicles (Notice, Executive Summary Section A. 1.). A further description, and one of the few allusions to passenger transport, occurs in the Introduction, where middle weight class heavy-duty vehicles are described as those that tend to be used for municipal work to "transport people … locally and regionally…." (Notices, Section I. A.) A cursory reading of the lengthy Notice suggests the rulemaking has no bearing on engines or vehicles used by the private passenger-carrying motorcoach industry. Clearly this is not the case, as EPA does review a number of comments from motorcoach operators in discussing the negative impacts of its current inducement policy (See Notice, Section IV. D.). However, the emphasis on trucks or property-carrying vehicles, particularly in terms of data, does raise several questions and concerns about the underlying assumptions and analyses used to support the Proposal. [EPA-HQ-OAR-2019-0055-1308-A1, pp.2-3]

Further, if the Proposal degrades the motorcoach industry it will have an impact on the economy through job loss, reduced transportation capacity, and the loss of transportation options for the most vulnerable and price-sensitive communities who rely heavily on motorcoach transportation. In addition, the drivers of the motorcoach industry represent a diverse group, providing employment opportunities for underserved communities at rates that exceed the national averages for other industries. Meaning, that the loss of the motorcoach coach industry will lead to increased unemployment for communities of color, as well as women. It is an expressed goal of this Administration (see “Executive Order on Tackling the Climate Crisis at Home and Abroad,” January 2022) to create jobs in tackling climate initiatives, not take them away. Despite the driver shortage, over 90,000 motorcoach drivers are currently employed. [EPA-HQ-OAR-2019-0055-1308-A1, p.5]

Organization: *American Council for an Energy Efficient Economy (ACEEE)*

ACEEE supports EPA in its effort to limit NOx emissions as much as possible to protect the health of our communities. However, our comments are focused on the GHG components of the proposal as global climate change remains a major economic and national security threat. After a year of severe forest fires and flooding, EPA cannot miss an opportunity to make significant progress on emission reductions. The stringency and structure of these standards will have lasting impacts as they will determine which vehicles will be sold and used on the road for decades to come and will also set the baseline that the upcoming Phase 3 standards will start from. It is therefore crucial that EPA gets these standards right. Reducing carbon emissions is critical to tackling climate change but increasing HDV efficiency will also have significant benefits to air quality and reduce fueling costs for our nation’s trucks and delivery vehicles, costs that are passed onto the consumer in the form of higher prices for their everyday goods and groceries. Stricter GHG limits for heavy-duty vehicles will also decrease oil consumption. This is key to supporting vital US security interests including moderating oil prices and ensuring a stable oil supply for the US and allied nations. [EPA-HQ-OAR-2019-0055-2852-A1, p.2]

EPA’s medium- and heavy-duty vehicle emission standards are a vital tool to protecting vehicle owners, the environment, and the public. Standards that push technology forward help consumers save on fuel costs, reduce environmental damage, and reduce dangerous pollution that increases the risk of breathing-related illness. ACEEE believes that EPA has built a good framework in this proposed rule, but believes it needs to be more ambitious to reflect the White House’s new goals for emission reductions by 2030 and EV market development. [EPA-HQ-OAR-2019-0055-2852-A1, p.10]

Organization: *American Farm Bureau Federation (Farm Bureau)*

This rule has the potential to delay the turnover to newer vehicles with cleaner emission technologies, forcing vehicle owners to keep their higher-emitting trucks longer. This not only will delay EPA's anticipated environmental benefits, it also would cause environmental backsliding that seems to be in conflict with the goals of the agency. Furthermore, a poorly designed final rule will cause market disruptions, will delay or undermine the ability of manufacturers to recoup their investment in developing compliant technologies, and worse, could have significant adverse impacts on the economy. [EPA-HQ-OAR-2019-0055-1163-A1, p.1]

It is again important to emphasize that trucking is enormously important to the economy—the industry moves 72% of goods in America and is the foundation of a well-functioning supply chain. When trucking costs go up, the cost of nearly all goods go up with it. As the White House recently noted, trucking costs grew more than 20% last year, and we know that sharply increased fuel costs thus far in 2022 have only exacerbated economic burdens. [EPA-HQ-OAR-2019-0055-1163-A1, p.2]

Farm Bureau believes the proposed rule is not technologically feasible, cost-effective or acceptable to the needs of America's farmers and ranchers. Our policy, developed by hardworking farmers and ranchers, clearly enunciates opposition to any further attempt to restrict or regulate exhaust emissions on new or used farm equipment, heavy equipment or trucks. We therefore urge EPA to take extra caution to avoid requirements that could intensify the already challenging economic conditions facing rural America and the U.S. economy. [EPA-HQ-OAR-2019-0055-1163-A1, p.2]

Organization: *American Fuel & Petrochemical Manufacturers (AFPM)*

Finally, the Proposal's GHG provisions are reliant upon California's Advanced Clean Truck rule for significant BET sales even though there is no California waiver in place for Heavy Duty (HD) trucks. EPA is acting arbitrarily in depending on a preempted California standard to demonstrate regulatory achievability. [EPA-HQ-OAR-2019-0055-1262-A1, p.2]

Heavy duty trucks can be used for more than a million miles, and this will mean that for BETs, there will be several battery replacements during their lifetime. The battery is the energy storage media on the vehicle, just as the fuel is on a diesel ICE (internal combustion engine) vehicle. [EPA-HQ-OAR-2019-0055-1262-A1, p.2]

The analysis included in the Proposal does not assume battery replacements and essentially ignores an issue of key importance to the problem EPA is working to resolve. Lithium-ion batteries are made from critical minerals including cobalt, graphite, lithium, nickel, and manganese. Electric vehicles (EVs) require six times the mineral inputs of traditional internal combustion engines.3 One study suggests that the extraction and processing of critical minerals are responsible for approximately 20 percent of the GHG emissions associated with battery production.4 A typical light-duty lithium EV battery weighs about 1,000 pounds. While there are dozens of variations, a typical battery contains around 25 pounds of lithium, 30 pounds of cobalt, 60 pounds of nickel, 110 pounds of graphite, and 90 pounds of copper. Since ore grades vary, acquiring these five elements to produce a single battery requires mining about 90,000 pounds of ore.5 Roughly 90,000 pounds of ore requires digging and moving between 200,000 and over 1,500,000 pounds of earth, a rough average of more than 500,000 pounds per battery.6 These numbers are significantly higher for heavy-duty EV batteries. Further, the International Energy Agency (IEA) pins the average GHG intensity for production of lithium carbonate at around 5 metric tons of Carbon Dioxide Equivalent (CO2e) emitted per ton of metal, and approximately 15 CO2e metric tons per ton of cobalt sulfate.7 The mining of minerals for BETs typically occurs in countries where environmental, health, and safety precautions are significantly less stringent than those in the U.S.8,9 [EPA-HQ-OAR-2019-0055-1262-A1, p.3]

9 In addition to GHG emissions, such mining activities are also responsible for PM emissions, NOx emissions, and other air pollutant emissions.

Organization: *American Lung Association et al.*

We view US EPA’s proposed Option 1 as a far more health-protective pathway to cleaning up trucking emissions than Option 2, which we do not believe is an appropriate pathway for health protection or technology availability or to a zero-emission trucking future. Adopting a stronger Option 1 is critical to reducing health and equity burdens and setting a stronger course to a sustainable transportation system. Of the two options proposed, Option 1 would provide greater health benefits than Option 2, including up to $33 billion in health benefits, and significant ozone-related health benefits up to: 2,100 premature deaths avoided 16,000 pediatric asthma cases avoided 2.8 million instances of asthma symptoms avoided 1.1 million lost school days avoided 3 [EPA-HQ-OAR-2019-0055-1271-A1, pp.1-2]

> 3 US EPA. Regulatory Impact Analysis Draft at page 394 (Note: additional particle pollution-related health endpoints are included in the analysis at page 393). March 2022. https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10144K0.pdf

In 2016, leading health and medical organizations called for stronger truck standards in a letter to then US EPA Administrator McCarthy, noting then that standard in line with the proposed Option 1 introduced in March 2022 was needed to protect health and align with the 2015 ozone standards. Once again, we call on US EPA to establish a health-protective standard for all new trucks. [EPA-HQ-OAR-2019-0055-1271-A1, p.2]

The final standards must ensure a 90 percent reduction in emissions from new trucks compared with the current standards, or 0.02 grams per brake horsepower hour of NOx emissions. The standards must include stronger provisions to address pollution caused throughout the operations of the truck, including low-load standards, idling and highway conditions. Option 1 must be strengthened and – at a minimum – harmonized with the California Low NOx Omnibus rule adopted in 2020 to deliver a 90 percent reduction in NOx emissions from new trucks as of 2027, along with the California low-load and idle emissions requirements. US EPA should accelerate Option 1 to align to this schedule. Further, we support the proposal to strengthen particle emission standards to 5 milligrams per mile to account for advances in engine designs and to protect against backsliding within any future engine technologies. Again, public health demands that US EPA act to establish a long-overdue, comprehensive, and health protective standard: **It is imperative that the US EPA strengthen and adopt Option 1 in 2022.** [EPA-HQ-OAR-2019-0055-1271-A1, p.2]

In summary, we urge US EPA to strengthen the Option 1 standard and to adopt the final rule this year to ensure implementation by 2027. We urge you to not only finalize strong standards, but also ensure real-world benefits by requiring pollution controls for the full lives of these vehicles and throughout all real-world operating conditions. [EPA-HQ-OAR-2019-0055-1271-A1, p.3]

Organization: *American Truck Dealers (ATD)*

Prospective purchasers and lessors apply rigorous total cost of ownership (TCO) and return on investment (ROI) decision-making when considering investments in new CMVs. Consequently, CMVs equipped with HDEs subject to new NOx emission reduction mandates must be affordable to buy or lease, must be cost effective to operate, and must offer acceptable levels of reliability (i.e., uptime). The trucking industry learned this firsthand with HDEs subject to EPA’s 2002-10 NOx standards. A study conducted in-house by ATD details the dramatic impact those standards had because they proved costly to comply with and degraded vehicle .4 The study found that EPA underestimated control strategy and technology compliance costs by a factor of 2-5, resulting in dramatically higher prices for new CMVs. It also found that EPA’s mandates resulted in significantly higher operating costs, due to increased maintenance requirements, reduced reliability, and lower fuel economy. [EPA-HQ-OAR-2019-0055-1321-A1, p. 2]

4. See Attachment B, Calpin and Plaza Jennings, A Look Back at EPA's Cost and Other Impact Projections for My 2004-2010 Heavy-Duty Truck Emissions Standards (2/13/12)

Organization: *American Trucking Associations (ATA)*

In its capacity as the national representative of the trucking industry, ATA regularly comments on matters affecting trucking's common interests and providing its expertise and understanding of the industry. While HD2027 is not specifically directed at trucking fleets, the trucking industry's purchasing decisions will ultimately decide the success or failure of this rule. The consistent messaging from fleets to EPA regarding HD2027 is clear – minimize purchase, maintenance, warranty, and operational costs; maximize performance, durability, and driver satisfaction; maintain fleet flexibility in technology and fuel choices; do not re-open the final Phase 2 rule; and do not create unintended consequences such as equipment pre-buys/low-buys or no-buys, alteration of fleet turnover cycles, and fuel economy degradation. ATA supports the underlying goals of HD2027 and appreciates EPA's receptiveness in receiving stakeholder input, including ATA's testimony during the agency's April 12-14 virtual public hearing. As always, ATA's path forward will be driven where the facts, science, and economics leads us. [EPA-HQ-OAR-2019-0055-1326-A1, pp. 2 - 3]

While ATA cannot address every aspect of HD2027, we are supportive of the underlying environmental objectives and several of the elements being proposed. ATA's areas of support include:

- EPA acknowledgement that cleaner diesel trucks will remain integral for the foreseeable near-term future as the nation transitions to the use of zero-emission vehicles ("ZEVs"). [EPA-HQ-OAR-2019-0055-1326-A1, p. 3]
- Allowing manufacturer flexibility in their technology platform pathways. [EPA-HQ-OAR-2019-0055-1326-A1, p. 3]

ATA has established 12 fleet Guiding Principles that should be considered in the development of HD2027 including:

• The rule should not be based on technology-forcing standards.

• Compliance pathways must remain fuel and technology neutral. [EPA-HQ-OAR-2019-0055-1326-A1, p. 5]

Organization: *Anne Mellinger-Birdsong*

I support this proposal and urges EPA to make it stronger. [EPA-HQ-OAR-2019-0055-1244]

Organization: *Anonymous 1032*

The EPA should absolutely increase the air pollution standards for heavy duty vehicles. Even a minor adjustment to the standards would have a noticeable positive effect on greenhouse gas emissions. According to the EPA, 29% of greenhouse gas emissions currently come from the transportation sector, and of that 29%, about 25% comes from heavy duty vehicles. This means that over 7% of America's greenhouse gas emissions come directly from heavy duty vehicles. [EPA-HQ-OAR-2019-1032]

Time is running out on mitigating the effects of climate change. If all greenhouse gas emissions were to cease this instant, the planet would still warm by approximately 0.6 degrees celsius. While it is not possible to cause this drastic reduction, it is absolutely necessary that we curb our emissions to a degree such that global warming will not exceed 1.5 degrees celsius. An increase of more than this amount would have catastrophic impacts on the global population, creating severe weather, drought, and rising sea levels that would leave countless people dead or without homes. Any viable options to reduce greenhouse gas emissions should be taken up as quickly as possible, which is the primary reason that the implementation of this program is so important. In terms of greenhouse gas reduction, the proposal would primarily be responsible for reductions in NOx emissions. This is important because while NOx gasses are less prevalent in the atmosphere than other common gasses like CO_2, they have much greater warming potential. The NOx global warming potential is 298 times that of CO_2, meaning that emissions standards that focus on that gas have the potential to have a large positive impact on mitigating our nation's carbon emissions. [EPA-HQ-OAR-2019-1032]

In addition, the emissions standards will have a positive effect on reducing the particulate matter emissions of heavy-duty vehicles. There are multiple size categories for particulate matter, those being 10 micrometers and 2.5 micrometers. Particulate emissions from heavy duty vehicles would be primarily 2.5 micrometers. These particles are incredibly dangerous because they are small enough that they can be inhaled and enter the bloodstream along with oxygen through the process of respiration. This can cause serious health issues such as asthma, cardiovascular disease, and lung cancer. PM 2.5 is responsible for approximately 95% of the public health consequences caused by air pollution, and thus it is incredibly important to reduce sources of this particularly damaging air pollutant. [EPA-HQ-OAR-2019-1032]

The proposal has the potential to have a really noticeable positive impact in the reduction of emissions. There are two different proposed options for the plan. The first is more drastic, and would cause a 50% reduction in NOx emissions from heavy-duty vehicles by the year 2045. The second less drastic option would still be able to create a 47% reduction. By this point in time, the majority of current vehicles will have outlasted their lifespan, and they will have been replaced by new vehicles that will have to be created in accordance with the emissions standards in the EPA's proposal. [EPA-HQ-OAR-2019-1032]

The calculated positive impact of reductions in air pollutants will be drastic as well. The feasibility of this plan can be calculated by weighing its expected loss (in the expenses of making drivers meet these more strict emissions standards) versus the expected benefits that come from implementing the action. Although it seems morbid to put value on human life, it is what must be done in order to evaluate the benefits of implementing the program. In the lives that would be saved from reducing the air pollution, the EPA calculated that approximately between 10 and 30 billion dollars would be saved annually, depending on discount rates and implemented options. Either one of the proposed options should logically be implemented, as they will cause net positive financial impacts with their implementation. By the year 2045 once the program has been fully implemented, annual net benefits would outweigh annual net costs. All aspects of this program were studied by the EPA and then peer reviewed, so it is clear that this information is accurate. [EPA-HQ-OAR-2019-1032]

Climate change is the most important issue of our generation, and anything that can be done to reduce its impact on society should absolutely be implemented. This proposed program has the potential to both positively impact human health through reductions in air pollution, as well as drastically reducing NOx emissions, which contribute significantly to climate change. The program has been carefully evaluated, and although it could be expensive to require these new increased emissions standards, the net benefits provided by the mortality reductions from the decreased air pollution are absolutely enough to justify the implementation of this program. I am strongly in favor of this EPA proposal, and I think anyone who takes the time to look over the benefits provided by these emission reductions will agree with me. [EPA-HQ-OAR-2019-1032]

Organization: *Anonymous 1091*

As a nation and throughout the world, it is imperative to adopt EPA's most stringent proposal, "Option 1," and aggressively pursue the follow-on programs of regulating GHG's and moving as quickly as possible toward electrification of heavy truck transportation systems. [EPA-HQ-OAR-2019-0055-1091]

My comments are in part a response to the Diesel Technology Forum testimony, April 12 2022 "Testimony of the Diesel Technology Forum Before the U.S. Environmental Protection Agency NOTICE OF PROPOSED RULEMAKING" [EPA-HQ-OAR-2019-0055-1091]

"The last thing anyone wants out of this is that truckers stop buying new trucks because they are too expensive, too unpredictable, and too complex." Actually, the last thing anyone wants is unbreathable air. The last thing anyone wants is a surface temperature of 140 degrees F as recently reported in India. The last thing anyone wants is the continued destruction of the global ecosystem. Ask people living in devastated wildfire zones, or coastal flood zones, what the last thing is that they want. Let's keep our eye on what's truly important and the reality of what people want and don't want. It is not the same as what the diesel fuels industry wants.
The last thing we want is delay, and complaints that it is "too expensive, too unpredictable, and too complex" to eliminate the carbon pollutants from the delivery chain. What we want is a responsible trucking and fuel industry that realizes ASAP that business as usual must come to an immediate halt. [EPA-HQ-OAR-2019-0055-1091]

It should also be remembered that when government and industry are compelled, or if there is enough profit to be made, nothing is too complex. Everyone says "Nothing stands in the way of American ingenuity and industriousness" when there is a lot of money to be made. An unimaginably complex global Internet gets built. Vaccines are developed in record time with national-government-scale support and privatized profits. Spacecraft are built by the private sector with unquantified benefit to mankind some time in an indeterminate future. If Business wants it, it gets done. If Government mandates and supports it, it gets done. Professing that a solution is too complex or too expensive is code for "We Don't Want To." [EPA-HQ-OAR-2019-0055-1091]

“A balanced rule will alleviate undesirable outcomes like swings in the new truck market.” The petroleum-based economy is out of time to make timid steps with “balanced” rules. Swings in the market seem acceptable to industries all the time, because that’s how a free market is supposed to work: the market converges on an equilibrium for all participants, not just new truck makers. [EPA-HQ-OAR-2019-0055-1091]

If the scope and rate of environmental and climate destruction were “balanced” perhaps we could afford to be “balanced” in our approaches to remediate it, but that opportunity ended decades ago. Obstruction and deception from hydrocarbon-vested interests over decades caused delays that eroded the bulwark of time available to mitigate and make slower, “balanced” changes. [EPA-HQ-OAR-2019-0055-1091]

In Silicon Valley, land of astronomical technical achievements and astronomical riches, the mantra is move fast and break things!” and up-and-coming groundbreaking developments are called “disruptive.” If that’s the much-vaunted and adored approach Silicon Valley uses, with its outsized share of spectacular successes of rapid adoption, why can’t hydrocarbon-based industries adopt this mantra as the way to get complicated expensive things done quickly? [EPA-HQ-OAR-2019-0055-1091]

Why is it good to disrupt workers with very complex robotic systems, replace drivers with labor-free self-driving, hugely complex autonomous trucks, but not good to replace diesel engines with electric ones? The hypocrisy is embarrassing. We don’t want “balanced rules” – we want disruption of the internal-combustion-engine sector, and we want it a decade ago. We don’t want “advanced diesel” or “renewable diesel” – we want radical change in improving and expanding electrification. Better diesel is a hard requirement anyway and must proceed post-haste, but it is not an excuse to delay urgent electrification efforts everywhere it can support the required carbon intensity mandates. [EPA-HQ-OAR-2019-0055-1091]

Since electrification of the heavy truck fleet at significant scale is an existential threat to the diesel fuel industry, of course they will push for ways to stay in the game and slow the inevitable, with costs borne by all other stakeholders. They aggressively market renewable lower-carbon fuels as a front-line solution, and issues pleas that more stringent standards are onerous, too expensive, too complex, and too costly. But they could, and should, instead be investing now in a different future: scrubbing, full- lifecycle optimization, sequestration of recovered hydrocarbons, and repurposed applications for hydrocarbon compounds, preventing them being burned on our streets and highways. The means exist to do this. “Move fast and break things. Nothing stands in the way of American ingenuity or industriousness.” [EPA-HQ-OAR-2019-0055-1091]

Mitigating the impacts of inadequate emissions reductions require solutions much more onerous, expensive, and complex than electrification of the heavy vehicle ecosystem. Any argument that claims the burden of implementing maximally stringent emissions requirements is too difficult for the hydrocarbon fuels, or any other industry, is dissembling. If they thought they could make enough money, and there was enough Government support, there would be no objection to whatever scale adaptation is required. Objections, obstructions, and slow-track recommendations socialize climate and ecological risks, putting them onto other industries, the public, and the systems that support life on Earth. [EPA-HQ-OAR-2019-0055-1091]

Organization: *Anonymous 1412*

I oppose. More restriction which usually results in less miles per gallon is just shortening service life of vehicles and causing more money to be spend on fuel. Focus your time on till-less planting and limiting city expansions and quit pretending vehicle emissions impact is a significant issue. This is a waste of time and money with the scope of what is available for you people to focus on. [EPA-HQ-OAR-2019-0055-1412]

Organization: *BorgWarner*

BorgWarner appreciates this opportunity to offer the following comments to the U.S. Environmental Protection Agency (EPA) and strongly supports efforts to reduce tailpipe emissions from Heavy-Duty Trucks, primarily nitrogen oxides (NOx) and particulate matter (PM). [EPA-HQ-OAR-2019-0055-1234-A1, p. 1]

BorgWarner supports lifecycle analysis for all future vehicle regulations. We support the transition from a tailpipe-based standard (i.e., tank-to-wheel) to a more holistic assessment (e.g., well-to-wheel emissions, or more completely, full lifecycle emissions) as the proper metric for determining the environmental impact of the vehicle as a product. This approach is consistent with technology neutrality, global carbon neutrality goals, and a holistic environmental impact assessment. [EPA-HQ-OAR-2019-0055-1234-A1, p. 3]

Organization: *B & H Tractor & Truck*

This rule will harm the trucking industry even more by pushing truck cost up and creating more expensive repairs. The smaller companies will not be able to do small repairs. DEF has added unreliability to trucks also making simple roadside repairs difficult. This will raise the cost of trucking to a point where the market cannot compete. [EPA-HQ-OAR-2019-0055-1751, p.1]

Organization: *Bar B Que Specialties, Inc.*

As a business owner who relies on the trucking industry to get my product to grocery stores, I feel this rule will kill American small business. Gas prices already are having a huge impact on the price of trucking, adding these emissions regulations will increase them even more. Small businesses can't absorb these costs which in turn will make us raise the price of our product which is a) make the price go up on the shelf b) increase the likelihood that businesses will not continue to carry the product and c) decrease online sales because people will not like the new price. No one wins in this situation. [EPA-HQ-OAR-2019-0055-2260, p.1]

Organization: *BYD Motors, LLC (BYD)*

In the United States, BYD employs 700 members of the Sheet Metal Air Rail and Transportation Workers Union in the manufacture of zero-emission transit buses and heavy-duty trucks that are not only Buy America compliant, but contributing to the everyday well-being of communities around the United States. [EPA-HQ-OAR-2019-0055-1207-A1, p. 1]

BYD supports the EPA's proposal to strengthen heavy-duty vehicle emission standards and, in support of a request by the Environmental Defense Fund, respectfully urges the agency to further strengthen the proposal in key areas. [EPA-HQ-OAR-2019-0055-1207-A1, p. 1]

There is an urgent need to set protective standards that achieve deep reductions in pollution from diesel and internal combustion vehicles, and to ensure greater pollution reductions via the deployment of zero-emission technologies like battery-electric vehicles. [EPA-HQ-OAR-2019-0055-1207-A1, p. 1]

Immediate emissions reductions are crucial to mitigating the effects of climate change and protecting public health -- especially in low-income communities and communities of color that are disproportionately affected by transportation air pollution. With continued commitment from your agency, it can be done. [EPA-HQ-OAR-2019-0055-1207-A1, p. 1]

Globally, BYD has committed to corporate social responsibility, deeply monitoring its supply chain in terms of human rights, environmental safety, hazardous substance control and intellectual property rights. The company only selects suppliers who share its commitment to just labor practices, human rights standards and the environment. [EPA-HQ-OAR-2019-0055-1207-A1, p. 2]

Organization: *California Air Pollution Control Officers Association (CAPCOA)*

On behalf of the California Air Pollution Control Officers Association (CAPCOA), I respectfully inform you of our strong support for the U.S. Environmental Protection Agency's (U.S. EPA) proposed rule "Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards" published in the Federal Register March 28, 2022. [EPA-HQ-OAR-2019-0055-1253-A1, p.1]

Organization: *California Air Resources Board (CARB)*

Heavy-duty trucks are a dominant source of dangerous air pollution in California, and especially in communities already experiencing high levels of pollution along freight corridors. The Biden Administration's commitment to environmental justice, its responsibility under the Clean Air Act, and continuing technology improvements all support the strongest possible standards for these vehicles. [EPA-HQ-OAR-2019-0055-1186-A1, p.1]

CARB is committed to working with U.S. EPA to finalize a comprehensive and effective federal heavy-duty engine and vehicle program. [EPA-HQ-OAR-2019-0055-1186-A1, p.3]

CARB staff believes that the emissions standards and other emissions-related requirements associated with Option 1, in conjunction with CARB-staff-recommended modifications to other elements of the CTP that are described in greater detail in these comments, most closely conforms to U.S. EPA's obligations under the federal Clean Air Act (CAA), and that the corresponding emission reductions will provide significant emissions benefits needed to ensure the health and welfare of our nation's residents. CARB staff accordingly hopes that these comments will assist U.S. EPA. [EPA-HQ-OAR-2019-0055-1186-A2, p.10]

Organization: *California Association of Sanitation Agencies (CASA)*

The California Association of Sanitation Agencies (CASA) appreciates this opportunity to comment in support of the Proposed Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards (Proposed Standards) released on March 28 for comment. [EPA-HQ-OAR-2019-0055-1301-A1,p.1]

The updates to the Proposed Standards are intended to balance incentivizing zero and near-zero emissions vehicle (ZEV and NZEV) development with ensuring that the standards achieve an appropriate fleet-wide level of greenhouse gas (GHG) emissions reductions, while also achieving necessary reductions of nitrogen oxides (NOx) and particulate matter (PM) to satisfy existing regulations. This is critical and we strongly support the approach.[EPA-HQ-OAR-2019-0055-1301-A1, p.1]

Organization: *CALSTART*

We support strong actions from EPA to reduce air pollution and global warming emissions from vehicles and other sources. The transportation industry has made significant strides in developing innovative, cost-effective emissions-reducing technologies and zero-emission powertrains. Now we need the right balance of polices to encourage adoption of these technologies in the medium- and heavy-duty vehicle industry as soon as possible. [EPA-HQ-OAR-2019-0055-1313-A1, p.4]

In addition to zero tailpipe emissions, battery and fuel cell electric vehicles offer significant reductions in global warming emissions compared to combustion vehicles. As shown in Figure 2 below, with the average sources of electricity in the US, heavy-duty electric vehicles reduce global warming emissions by approximately 50 to 80 percent depending on a vehicle's average speed over the course of its trip (O'Dea, 2019). Emissions associated with charging electric vehicles will continue to decline as lowercarbon sources of electricity are required to be deployed through state laws. Heavy-duty fuel cell electric vehicles also offer emission reductions compared to vehicles fueled with diesel. For hydrogen generated from steam-reforming of methane, a fuel cell transit bus, for example, has life cycle GHG emissions 40 percent lower than a comparable diesel transit bus (Union of Concerned Scientists, 2016). Using hydrogen generated from electrolysis of water using renewable electricity will provide significantly lower life cycle GHG emissions. [EPA-HQ-OAR-2019-0055-1313-A1, p.6]

Organization: *Capital Area Council of Governments (CAPCOG) and Central Texas Clean Air Coalition (CAV)*

Since grants from the Texas Emission Reduction Plan (TERP) will enable accelerated replacement of older trucks with newer, cleaner trucks, the Austin-Round Rock-Georgetown MSA and other metro areas in Texas will be uniquely able to take advantage of these new standards quickly. [EPA-HQ-OAR-2019-0055-1274-A1, p.1]

The CAC supports this effort to further reduce NOx emissions from heavy-duty vehicles and urges EPA to promulgate new standards and test procedures as soon as possible so that communities like ours can benefit from cleaner air as soon as possible. [EPA-HQ-OAR-2019-0055-1274-A1, p.1]

Organization: *Cameron Prescott*

This rule proposes two options for feedback: Option 1 provides a more aggressive approach with two parts that will result in lower emissions in the years 2027-2030 and then even more of a reduction in the years 2031 and later; Option 2 provides a less aggressive approach that will result in a smaller emission reduction than Option 1 by 2027 and later. I am writing this comment to ask for a more aggressive response such as having net-zero emission goals rather than either option for the following reasons. [EPA-HQ-OAR-2019-1058]

1. Emissions from transportation vehicles currently account for 27 percent of all emissions in the United States alone. On a global scale transportation accounts for 41 percent of all emissions. This is a pressing issue due to the effects that the emission of greenhouse gasses are responsible for. The proposed options do not adequately account for the serious risks that greenhouse gasses from transportation create (EESI, 2015). [EPA-HQ-OAR-2019-1058]
2. Health issues resulting from heavy engine use are imminent if use is not monitored well. It has been studied that exposure to pollutants from cars, such as NOx and other GHG can ensue health problems such as asthma, lung disease, and cancer as well as others. Exposure to NOx, a major emission attempted to be regulated by this rule, has shown a plethora of health issues it exacerbates. NOx exposure can often result in bronchitis, emphysema, and heart disease (Ogunkle & Ahmed 2021). Additionally it has been stated by the World Health Organization that there are 4.2 million deaths each year globally that are due to pollution in the air (WHO). By not taking a more aggressive approach than the one currently listed in the EPA's proposed options to regulate emissions from heavy engines, the EPA is failing its responsibility to the U.S. citizens affected by this issue. [EPA-HQ-OAR-2019-1058]
3. The lack of regulations on greenhouse gasses inherently is prejudiced and affects minorities to a higher extent. Due to living conditions of minority populations in the U.S. from systemic racism and demographically living in more urbanized areas, there is more exposure to air pollution and climate affected areas. Beyond exposure, the populations of minorities often live in areas where climate change can have more intense effects on its populations. Statistics have shown that "black people are 40 percent more likely than other groups to live in paces where extreme temperatures driven by climate chane will result in higher mortality rates" (Fears & Grandoni,

2021). To not create a more aggressive option for emission regulation, particularly one that will eradicate emissions in general, is negligently ignoring the significant effect towards minorities from the lack of efficient policy. [EPA-HQ-OAR-2019-1058]

4. There is already technology in the realms of engines and heavy duty engines that have net-zero emissions. This is technology needs to be pressured further into the realm of heavy engines. By not creating an option that wants to achieve net-zero emissions, there is less incentive to move to this technology at the rate that is needed by the U.S. environment and its people. There is discussion that these engines are not feasible for companies to transfer to, but the cost of a safer environment for people and the climate are arguably more important. The costs of these engines will not compare to the preservation of the future of the U.S. in regards to citizens' health and the prevention of worsening climate catastrophes (Russel, et. al, 2021). [EPA-HQ-OAR-2019-1058]
5. The climate cannot handle weaker approaches to tackle climate change and GHG. Over the previous years, climate change's effects have only become worse. It is shown through various studies that in the upcoming years we are expected to see more climate disasters: floods, hurricanes, tropical storms, etc. By going with Option 1 or Option 2, the EPA is only prescribing a minimal change to emission regulations on the drastic issue. There needs to be an approach that advocates for more government pressure for companies to produce and use zero-emission engines for the preservation of the current environment in the U.S. to preserve safety and viability in the country's land (NASA 2021). [EPA-HQ-OAR-2019-1058]

Organization: *Carreras Tours, LLC (2033)*

Diesel pollution kills. Others face heart attacks, asthma, and respiratory conditions that damage their wellbeing and quality of life. The EPA's proposed rulemaking on diesel emissions is much needed. [EPA-HQ-OAR-2019-0055-2033, p.1]

While these rules are a good start, they don't go far enough. [EPA-HQ-OAR-2019-0055-2033, p.1]

EPA's plan needs to eliminate tailpipe emissions and transition the trucking industry to zero emissions. Many states have already required truck manufacturers to reduce NOx emissions by 90% by 2027. EPA can build on these standards by incorporating strong greenhouse gas standards in order to reach 100% clean trucking by 2035. [EPA-HQ-OAR-2019-0055-2033, p.1]

Organization: *Center for Climate and Energy Solutions (C2ES)*

As underscored by the most recent report from the Intergovernmental Panel on Climate Change (IPCC), it is imperative that we reduce global greenhouse gas emissions as swiftly as possible to keep global warming to 1.5 degrees Celsius above pre-industrial levels.1 In the United States, transportation is the largest sectoral source of emissions, and while medium- and heavy-duty vehicles make up only 5 percent of vehicles on the road, they account disproportionately for almost a quarter of all transportation emissions.2 Reducing the emissions from these vehicles must be central to the United State's decarbonization strategy. [EPA-HQ-OAR-2019-0055-1165-A1, p.2]

1 Intergovernmental Panel on Climate Change, 'Summary for Policymakers,' in Climate Change 2022: Mitigation of Climate Change. Contribution of Working Group III to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change, ed. [P.R. Shukla, J. Skea, R. Slade, A. Al Khourdajie, R. van Diemen, D. McCollum, M. Pathak, S. Some, P. Vyas, R. Fradera, M. Belkacemi, A. Hasija, G. Lisboa, S. Luz, and J. Malley] (Cambridge, UK and New York: Cambridge University Press, 2022), https://report.ipcc.ch/ar6wg3/pdf/IPCC_AR6_WGIII_SummaryForPolicymakers.pdf.

2 U.S. Environmental Protection Agency, Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2020 (Washington,DC: U.S. Environmental Protection Agency, 2020), https://www.epa.gov/system/files/documents/2022-04/us-ghginventory-2022-main-text.pdf.

C2ES welcomes EPA's proposed updates to the heavy-duty emission control program, including the proposed updates to the emissions standards, test procedures, useful life, and other requirements. C2ES also supports the proposed targeted updates to the existing Heavy-Duty Greenhouse Gas Emissions Phase 2 program, particularly with regards to the greenhouse gas standards for school buses, transit buses, delivery trucks, and short-haul tractors. [EPA-HQ-OAR-2019-0055-1165-A1, p.2]

Recent geopolitical events have also demonstrated the need to accelerate the shift away from unabated fossil fuels, including by electrifying the U.S. vehicle fleet. Russia's invasion of Ukraine has sent shockwaves through the global energy system, which has exacerbated price volatility and exposed the economic and national security vulnerabilities of our dependence on petroleum, the price of which is set in global markets and influenced by the actions of hostile foreign powers. [EPA-HQ-OAR-2019-0055-1165-A1, p.3]

In addition to the climate impacts of burning gasoline and diesel, the fundamental role these fuels play in our transportation system only makes it more imperative that we reduce our reliance on them to bolster the resilience of the U.S. economy to future geopolitical shocks. Other agencies, including the Department of Energy, are taking action to secure domestic supplies of critical minerals used to produce batteries and are considering ways to onshore processing and domestic production capacity. [EPA-HQ-OAR-2019-0055-1165-A1, pp.3-4]

Given the benefits of improved efficiency and fuel savings as outlined in the draft regulatory impact analysis, EPA should adopt emissions standards at the more stringent end than the proposed range. Setting stringent standards will support both innovation and reduced fuel consumption across the medium- and heavy-duty transportation sector. [EPA-HQ-OAR-2019-0055-1165-A1, p.4] Both of EPA's proposed options, as well as the alternative, would significantly reduce NOx emissions over the coming decades. To address historic injustices, EPA should consider the most expedient course toward emission reductions, and should prioritize real-world emissions reductions in the use cases that most disproportionately harm historically marginalized communities. [EPA-HQ-OAR-2019-0055-1165-A1, p.4]

Organization: *Center for Community Action and Environmental Justice (CCAEJ)*

I am submitting this comments on behalf of the Center for Community Action and Environmental Justice working with communities here in the Inland Empire which have suffered under years of oppressive polluted and toxic air. While we are glad to see that some work is being done to tackle the issue and move forward, we do not feel that the current proposals are adequate enough for meeting the challenge. Instead, they provide too much leeway to polluters to continue to inject toxins into our communities. Zero must mean zero. We call for the EPA to move forward with a strong rule that the prioritizes community health and ends the onslaught of pollution. Despite improvements of the last several decades, we continue to suffer from some of the worst air quality in the nation, including a worsening of PM2.5. The EPA has an opportunity to make a generational investment in clean air and a livable planet for historically marginalized communities via this rulemaking. This means ensuring that it does not give a pass to false solutions such as natural gas that perpetuate fossil fuel usage. Instead, we need to see a zero emissions mandate to ensure that the communities will truly see the realization of the benefits that the rule intends to provide. Thank you for the opportunity to provide these comments and we look forward to a strong and transformative rule. [EPA-HQ-OAR-2019-0055-1258, p. 1]

Organization: *Ceres BICEP (Business for Innovative Climate and Energy Policy) Network*

On behalf of the Ceres BICEP (Business for Innovative Climate and Energy Policy) Network - a coalition of 75 major employers across the United States – I am writing to urge you to strengthen the proposed heavy-duty truck standards. [EPA-HQ-OAR-2019-0055-2714-A1, p.1]

BICEP Network members are committed to ambitious climate action, advocating for stronger climate and clean energy policies at the state and federal levels in the U.S. Our members see reducing greenhouse gas (GHG) emissions by transitioning to zero-emission medium- and heavy-duty vehicles (MHDVs) as a major economic opportunity. They recognize that zero-emission vehicles (ZEVs) bring significant economic and environmental benefits, including operational cost savings, improved air quality, and GHG reductions. However, while BICEP members are working to do their part as individual companies, strong standards are necessary to ensure the widespread availability of clean trucks in the U.S., as well as to drive the economies of scale that will reduce costs and accelerate the necessary transition to electrification. [EPA-HQ-OAR-2019-0055-2714-A1, p.1]

Thus, on behalf of the companies in the BICEP network, I urge EPA to strengthen the proposed standards, which are not sufficiently stringent to accelerate the cost-effective deployment of electric commercial trucks at the necessary rate and scale, are inconsistent with climate goals, and fail to adequately reduce air pollution in disadvantaged communities. Finally, given the urgency of the climate crisis, and of remedying longstanding negative health impacts in disadvantaged communities, we urge EPA to finalize the standards this year. [EPA-HQ-OAR-2019-0055-2714-A1, p.2]

As a representative of this coalition, I am writing to urge you to strengthen the proposed heavy-duty truck standards. Our members see climate change as a significant risk and reducing greenhouse gas (GHG) emissions as a major economic opportunity. [EPA-HQ-OAR-2019-0055-2714-A2, p.1]

Corporate Electric Vehicle Alliance members share a common goal of electrifying their on-road fleets and networked vehicles as well as reducing their transportation carbon footprint, and recognize that strong standards are necessary to affect this critical transition. In fact, a recent survey of Corporate Electric Vehicle Alliance members demonstrates robust demand for zero-emission vehicles (ZEVs) over the next five years. However, while some ZEV classes are becoming increasingly cost competitive with conventional models, electric medium- and heavy-duty vehicles can be up to three to four times the purchase price of a comparable conventional model. Strong policies are necessary to ensure the availability, adequate production volume, and sufficient variety of zero emission trucks to meet the needs of commercial fleets. [EPA-HQ-OAR-2019-0055-2714-A2, p.1]

While our members are working to do their part as individual companies, we need strong standards to ensure the widespread availability of clean trucks in the U.S., as well as to drive the economies of scale that will accelerate the necessary transition to electrification. The U.S. Environmental Protection Agency's (EPA) proposal projects a ZEV sales share of 1.5% in key market segments in 2027, which falls far short of corporate demand as well as what will be needed to meet climate goals and several states' regulatory requirements. [EPA-HQ-OAR-2019-0055-2714-A2, p.1]

In sum, on behalf of the Alliance, I urge EPA to strengthen the proposed standards, which are not sufficiently stringent to accelerate the cost-effective deployment of electric commercial trucks at the rate and scale that we envision, are inconsistent with climate goals, and fail to adequately reduce air pollution in disadvantaged communities. [EPA-HQ-OAR-2019-0055-2714-A2, pp.1-2]

As long-term investors with over $700 billion in assets under management, we are writing to urge you to strengthen the proposed heavy-duty vehicle (HDV) standards. As investors, we see climate change as a significant economic risk, and reducing greenhouse gas (GHG) emissions by transitioning to zero emission medium- and heavy-duty vehicles (MHDVs) as a major economic opportunity. The U.S.' ability to meet climate and public health goals, and the future global competitiveness of the U.S. truck industry, are contingent on strong engine and truck emission standards that will drive a rapid shift to zero emission vehicles (ZEVs) while reducing harmful emissions in the interim. Unfortunately, the proposed regulations are inconsistent with climate goals, the pressing need to improve air quality, particularly in disadvantaged communities which bear the brunt of truck pollution, and stated corporate and manufacturer global commitments. [EPA-HQ-OAR-2019-0055-2714-A3, p.1]

The demand for zero-emissions trucks is growing as fleet owners and shippers increasingly commit to net zero goals and recognize the economic benefits of ZEVs. For example, a recent survey of Corporate Electric Vehicle Alliance members demonstrates robust demand for ZEVs. In turn, major truck manufacturers are proposing ambitious goals; for example, Volvo has stated that 50% of its trucks sales will be ZEVs by 2030 globally and Daimler has set a goal of 60% ZEV truck sales globally. However, strong standards will be necessary to ensure the availability of ZEVs in the U.S., and to accelerate the transition to electrification at the rate and scale required by climate goals.[EPA-HQ-OAR-2019-0055-2714-A3, pp.1-2]

Robust truck standards are critical to meeting climate goals, ensuring the global competitiveness of the U.S. truck industry, and reducing air pollution in communities that have suffered too long from truck pollution. Accordingly, we urge you to significantly strengthen the proposed rules to realize these critical climate, economic and public health goals. [EPA-HQ-OAR-2019-0055-2714-A3, p.2]

Organization: *Christopher Lish*

I am glad that, after 20 years of delay, the Environmental Protection Agency has finally proposed stronger tailpipe toxic pollution standards for heavy-duty diesel trucks.
However, while these rules are a good start, they don't go far enough. Now is the time to eliminate toxic tailpipe emissions from trucks. Black, Latino, Asian American, and other marginalized communities living in highly trafficked areas have suffered the health impacts of diesel trucks for far too long. To deliver on the Biden Administration's environmental justice, public health, and climate goals, the Environmental Protection Agency must make the rules stronger and finalize a strong heavy-duty vehicle rule this year that sets us on a rapid path to cleaning up and electrifying the most polluting vehicles on the roads—our trucks and buses—by 2035, if not sooner. [EPA-HQ-OAR-2019-1147; see also Section 1.2/2.4]

I appreciate President Biden making clean transportation a day-one priority and the Environmental Protection Agency moving quickly to propose long-overdue regulations to clean up pollution from dirty heavy-duty vehicles. The Environmental Protection Agency's proposed rulemaking on diesel emissions is much needed. However, our communities and our planet require bolder standards that will reduce health-harming smog and cut greenhouse gas emissions to a degree that matches the urgency of the climate and public health crisis. That can only happen if both the nitrogen oxide (NOx) standard and the greenhouse gas standards are strong enough to make trucks cleaner while moving quickly to get zero-emission trucks on the road. I ask you to adopt the strongest possible standards to reduce pollution from diesel truck engines and establish a national zero-emissions truck sales requirement to help phase out fossil fuels and slash air pollution in the most-impacted communities more quickly. [EPA-HQ-OAR-2019-1147]

We will not be able to tackle the climate crisis without cleaner trucks on our roads. The transportation sector is our country's largest source of carbon pollution, with heavy-duty vehicles contributing substantially to our total greenhouse gas emissions. In order to curb our emissions by at least 50% by 2030, a pace that scientists agree is necessary to mitigate the worst effects of climate change, we must adopt the strongest possible standards for trucks and buses. This will promote a transition to fully electric vehicles and slow the sale of dirty diesel trucks over the next decade. [EPA-HQ-OAR-2019-1147]

Moreover, the standards must not be undermined by giveaways to an industry that would allow manufacturers to keep producing fossil fuel trucks far into the next decade. The Environmental Protection Agency must strengthen the final rule by accelerating the trajectory towards zero-emission vehicles and eliminating the various credit giveaways that significantly erode the standard. We cannot afford more loopholes and giveaways for multi-billion-dollar companies to get a pass on poisoning frontline communities in favor of increased profits. It's past time for the Environmental Protection Agency to expire all avenues for skirting pollution standards. [EPA-HQ-OAR-2019-1147]

Time is of the essence: the administration must finalize this proposal by the end of 2022 for the nation to realize the full health benefits of the rule. If the Environmental Protection Agency misses this window of opportunity, it will mean a full additional year of production of polluting trucks. This makes it critical to ensure that heavy-duty vehicles are as efficient as possible and that we adopt and enforce strict emissions limits as we shift away from fleets powered by fossil fuels. Our communities cannot afford to wait for cleaner air. [EPA-HQ-OAR-2019-1147]

Disappointingly, the strongest version of this proposed rule does not do enough to build on the work California and other states have already done to fight diesel pollution from trucks. The Environmental Protection Agency has a responsibility to slash air pollution, protect public health, and address the climate crisis all at once by pursuing strong standards for heavy-duty vehicle emissions. The science and economics clearly shows that zero-emission trucks can be deployed now. [EPA-HQ-OAR-2019-1147]

We have the technology and the ability to cut pollution and save money today. At this moment, electric trucks and buses are already capable of supporting the majority of the United States' freight, delivery, and transit uses and needs—and there are dozens more zero-emission vehicles coming to the market within a couple of years. Cleaner trucks are not only available and ready now, they also are projected to deliver critical cost savings for operators and drivers. Across nearly every vehicle class, zero-emission electric trucks and buses are projected to be cheaper to own and operate than their combustion engine counterparts within five years. [EPA-HQ-OAR-2019-1147]

Many states have already required truck manufacturers to reduce NOx emissions by 90% by 2027. The Environmental Protection Agency can build on these standards by incorporating strong greenhouse gas standards in order to reach 100% clean trucking by 2035, if not, preferably, sooner. [EPA-HQ-OAR-2019-1147]

Thank you for initiating action on this important issue. Zero-emission trucks will save lives. I look forward to the Environmental Protection Agency once again responding to health, equity, and environmental advocates, and particularly frontline communities bearing the brunt of the toxic diesel pollution, by making much-needed improvements to this rule. While Option 1 is a start, the standards should at least align with California's recent clean trucks rule. These standards must reduce deadly pollution from nitrogen oxides by 90% by 2027, and put our nation's buses and trucks on a clear path to 100% zero-emission all-electric vehicles by 2035. I urge the Environmental Protection Agency to protect our health and eliminate toxic tailpipe emissions from trucks by adopting a stronger rule that accelerates the rollout of zero-emission trucks and to boldly pursue environmental justice as it reduces diesel emissions and improves the health of communities near ports and freight corridors. Please finalize the strongest possible rule to deliver cleaner air. [EPA-HQ-OAR-2019-1147]

Organization: *ChargePoint, Inc. (ChargePoint)*

ChargePoint, Inc. appreciates the EPA's dedication to the decarbonization of the transportation sector and the opportunity to provide comments on the Notice of Proposed Rulemaking for the Control of Air Pollution from New Motor Vehicles: Heavy Duty Engine and Vehicle Standards as part of the "Clean Trucks Plan." ChargePoint applauds EPA's efforts to cut down on air pollution through emissions standards1 and continues to support efforts to reduce oxides of nitrogen (NOx) emissions in the medium and heavy-duty engines that traverse our nation's highways swiftly and effectively by finalizing emission standards encouraging a zero-emission medium and heavy-duty vehicle (MHDV) sector. [EPA-HQ-OAR-2019-0055-1294-A1, p. 1]

Organization: *City of Seattle, Office of Sustainability & Environment*

This proposed rule has monumental implications for cities across this country, as it sets the stage for the trucks and buses operating on our streets and in our neighborhoods for decades. As a Port-City, we understand the importance of trucks and cargo movement in a thriving economy and workforce. As we work to make our community strong, the City of Seattle urges you to adopt the strongest possible rule to cut deadly pollution from heavy-duty vehicles, so that all communities can thrive. [EPA-HQ-OAR-2019-0055-1287-A1, p.1]

Organization: *Clean Air Board of Central Pennsylvania*

The U.S. Environmental Protection Agency has proposed new vehicle emission standards for medium and heavy-duty trucks. The Clean Air Board welcomes the proposed rulemaking. The last medium and heavy-duty emission standards were established in 2002. Vehicles purchased in the next few years will be on the road for many years and potentially for decades. It is critically important to set standards now. This important rulemaking will help transition the transportation sector toward lower emissions of harmful air pollutants and greenhouse gases. [EPA-HQ-OAR-2019-0055-1305-A1, p.1]

The proposed standards would significantly reduce emissions of NOx from heavy-duty gasoline and diesel engines and set stronger greenhouse gas standards for heavy-duty vehicles. Updated NOx standards are technically feasible. Updated NOx standards are economically feasible. Stricter NOx regulations reduce cumulative heavy duty vehicle NOx emissions (from existing and new vehicles). [EPA-HQ-OAR-2019-0055-1305-A1, p.1]

Organization: *Clean Energy (CE)*

We support new EPA regulations for heavy-duty engines and vehicles which significantly reduce NOx emissions and encourage the deployment of scalable early compliant technologies. [EPA-HQ-OAR-2019-0055-1350-A1, p.1]

We support the Option 1 NOx standard. California state authorities have already adopted new engine standards that require moving to the 0.02 NOx level beginning in 2027. [EPA-HQ-OAR-2019-0055-1350-A1, p.5]

Organization: *Clean Air Task Force, Environmental Law & Policy Center, National Parks Conservation Association, and Sierra Club*

With this rulemaking, EPA has an opportunity to take critical steps toward addressing the public health burdens, environmental injustices, and climate dangers caused by heavy-duty vehicles (HDVs) powered by internal combustion engines. More than a decade after EPA's existing criteria pollutant standards took effect, communities continue to suffer the impacts of air pollution from these vehicles. EPA must set strong emissions standards for both criteria pollutants and greenhouse gases (GHGs) in this rulemaking to achieve critically necessary protections to public health and welfare, especially in light of the feasibility and increasing fleet penetration of zero-emission technologies. We also urge EPA to finalize the rule before the end of this calendar year, particularly the criteria pollutant standards given statutory lead time requirements, so that the new standards take effect in model year (MY) 2027. See 42 U.S.C. 7521(a)(3)(C). Finalizing quickly is critical to avoid unjustifiably withholding both necessary GHG reductions and the air quality benefits that overburdened communities need now. [EPA-HQ-OAR-2019-0055-1302-A1, p.7]

As detailed below, EPA must set protective, evidence-based standards in this rulemaking to comply with the Clean Air Act's statutory commands, act in accordance with principles of reasoned decisionmaking, and mitigate HDVs' contribution to ongoing public health and climate crises. [EPA-HQ-OAR-2019-0055-1302-A1, p.9]

First, Option 2's minimal emissions reductions are woefully inadequate in light of the clear endangerment that heavy-duty vehicles and engines pose to public health and welfare. See Sections II.C.1–2, supra (describing health impacts). EPA acknowledges the seriousness of these threats to public health and welfare and the need to achieve greater reductions in emissions. See generally 87 Fed. Reg. at 17,441–56; DRIA Ch. 4. And it correctly concludes, based on extensive data, that both Options 1 and 2 are technologically feasible. 87 Fed. Reg. at 17,436; see generally DRIA Ch. 3. Option 2, however, would unjustifiably allow much higher criteria pollutant emissions than Option 1 or a national program based on the Omnibus. See DRIA at 262, 277–87. In 2045 alone, Option 2 would create 120,000 tons more NOx than Option 1 and achieve only a 47% reduction in NOx emissions from the baseline, compared to Option 1's 61% reduction. 87 Fed. Reg. at 17,579–80; DRIA at 262 (Table 5-34). Option 2's higher emissions—nearly 1.25 million more tons of NOx between 2027–2045 than Option 1, see DRIA at 262 (Table 5-34)—translate into worse human health outcomes. [EPA-HQ-OAR-2019-0055-1302-A1, p.50]

Organization: *Clean Energy Ventures et al.*

We strongly support EPA's efforts to reduce emissions of nitrogen oxides (NOx) and greenhouse gases (GHGs) from our nation's heavy-duty engines and vehicles. We also strongly support the Biden administration's goal of reaching net zero GHG emissions by 2050. [EPA-HQ-OAR-2019-0055-2339-A2, p.1]

In sum, meeting the Biden administration's "net zero by 2050" goal requires EPA to implement a regulatory model that will maximize the scale and cost-effectiveness of potential GHG emissions reductions that are possible across the entire heavy-duty sector over the coming critical decade and longer, regardless of the fuel, power source, or technology deployed. [EPA-HQ-OAR-2019-0055-2339-A2, p.2]

We strongly encourage you to finalize the Proposal in a way that sends the right market signals and encourages data-driven innovation that is far more likely to result in greater and more cost-effective GHG emissions reductions than a technology-specific approach that rewards only two of the many decarbonization strategies being developed for the heavy-duty transportation sector. [EPA-HQ-OAR-2019-0055-2339-A2, p.2]

Organization: *Clean Harbors Environmental Services*

Clean Harbors has a shared interest in the proposed rule to establish a stronger national standard to reduce nitrogen oxides (NOx) emissions from heavy-duty trucks. We support the push for cleaner air and healthier communities for all and stand ready to serve as constructive partners as EPA develops a workable final rule that will achieve those results.[EPA-HQ-OAR-2019-0055-1063-A2, p.1]

To that end, we strongly encourage you to keep two key considerations in mind as you work toward a final rule. [EPA-HQ-OAR-2019-0055-1063-A2, p.1]

First, cleaner air and healthier communities for all require replacing older trucks with newer ones. Today, roughly half of the trucks on the road were built before 2010, and those older vehicles emit significantly more air pollutants than modern trucks equipped with effective emission reduction technology. If the new rule does not facilitate the development of affordable, durable trucks that can meet customer needs, fleet owners are more likely to hold onto their older, dirtier trucks longer – which could result in the loss of good-paying jobs. Most importantly, that also would delay the cleanest trucks from hitting the road and cause further harm in communities near highways, ports, and warehouses that historically and currently suffer from the highest concentration of air pollution. [EPA-HQ-OAR-2019-0055-1063-A2, p.1]

Second, we must ensure the final rule serves as a bridge, not a potential barrier, to a zero-emissions future. Zero Emission Vehicles (ZEVs) will eliminate all tailpipe emissions and dramatically reduce the nation’s reliance on burning fossil fuels, which will diminish our dependency on foreign energy sources and greatly benefit public health. [EPA-HQ-OAR-2019-0055-1063-A2, p.1]

We are committed to partnering with EPA and other stakeholders to further reduce emissions from heavy-duty trucks without diverting resources necessary to foster a phased transition to ZEVs. We look forward to working with you to finalize a cost-effective rule – informed by data and science – that will further reduce emissions, protect American jobs, and result in cleaner air and healthier communities for all.[EPA-HQ-OAR-2019-0055-1063-A2, p.2]

Organization: *CleanEarth4Kids*

It is critical that heavy-duty vehicles are as efficient as possible with strict limits on emissions as we move from fossil fuels. [EPA-HQ-OAR-2019-0055-1208-A1, p.1]

The EPA's proposed Heavy Duty Vehicle rule is not nearly strong enough. What is proposed is weaker than many existing state rules and fails to quickly deploy zero-emission trucks. The EPA must require a fast transition to zero-emission trucks by establishing a national zero-emissions truck sales requirement while cutting nitrogen oxide and particulate matter pollution, revise all exhaust emission standards, test procedures, and other emissions-related requirements for heavy-duty trucks starting in model years 2024 with no exceptions or loopholes. [EPA-HQ-OAR-2019-0055-1208-A1, p.1]

Organization: *ClearFlame Engine Technologies (ClearFlame), Remora, and SixWheel*

We strongly urge the EPA to expand this incentive program beyond BEVs and FCEVs. To maximize emissions reductions, this program should be fuel-neutral, technology-neutral, and should rely on measurable performance-based emissions standards. In particular, this approach should incorporate upstream emissions for all zero-emission and near-zero emission vehicles. For example, the carbon intensity of the grid should be reflected in the emissions assumptions of projected BEV sales, and a diesel engine running on biogenic carbon (e.g., ethanol) should get credit for the improvement to the overall emissions performance of the engine provided by the fuel. [EPA-HQ-OAR-2019-0055-1329-A2, p. 4]

Organization: *ClearFlame Engine Technologies (ClearFlame)*

ClearFlame Engine Technologies is pleased to present these comments1 in support of the U.S. Environmental Protection Agency's Clean Trucks Plan and EPA's proposal to reduce emissions of nitrogen oxides (NOx) and greenhouse gases (GHG) from our nation's heavy-duty trucks and buses.2 [EPA-HQ-OAR-2019-0055-1261-A1, p. 1]

> 1. These comments supplement the oral testimony provided to EPA at its virtual hearing on April 12, 2022, and a comment letter submitted by BJ Johnson into the ANPRM record dated February 20, 2022. The oral testimony is attached hereto as Appendix 1, and the February 20, 2022 letter is attached hereto as Appendix 2. Each document is hereby incorporated herein.

EPA Should Finalize this Proposal and Draft Next Year's GHG Proposal to Encourage Near-Term GHG Reductions at Scale, This Decade. [EPA-HQ-OAR-2019-0055-1261-A1, p. 3]

Earlier this year, we all read the latest warning from the Intergovernmental Panel on Climate Change that we cannot wait any longer to deeply decarbonize the entire economy and take steps to adapt to a changing climate.3 The IPCC's message was clear: we need "urgent, more ambitious and accelerated action and, at the same time, rapid and deep cuts in greenhouse gas emissions. The quicker and further emissions fall, the more scope there is for people and nature to adapt."4 In short, we need to deeply decarbonize all segments of our economy this decade in order to avoid the worst impacts of climate change. [EPA-HQ-OAR-2019-0055-1261-A1, pp. 3 - 4]

3. IPCC, Climate Change 2022: Impacts, Adaptation and Vulnerability, Working Group II Report to the Sixth Assessment of the Intergovernmental Panel on Climate Change, April 2022. ("Climate Change 2022").

4. IPCC, Climate Change 2022, Frequently Asked Questions, accessed on May 15, 2022 at: https://www.ipcc.ch/report/ar6/wg2/about/frequently-asked-questions/keyfaq1

At ClearFlame, we could not agree more. While electrification appears to be the fastest pathway to decarbonizing passenger cars, transit buses, school buses, and certain commercial delivery vehicles, we must concurrently accelerate our efforts to deeply decarbonize the engines and vehicles that will continue to run on liquid fuels for decades to come. [EPA-HQ-OAR-2019-0055-1261-A1, p. 4]

This Proposal—and next year's expected proposal to reduce GHG emissions from all heavy-duty engines and vehicles—should encourage innovation that results in engines and vehicles that are dramatically lower in GHG emissions than the engines and vehicles they replace, and that can scale up this decade. Speed and scale matters – just as individuals cannot save enough for retirement by waiting until the last moment to invest in their future, we will not meet our societal responsibility by investing only in solutions that will not scale for many years to come. [EPA-HQ-OAR-2019-0055-1261-A1, p. 4]

Only by pursuing every pathway towards decarbonization at scale this decade—as a complement to longer-term electrification strategies—will we be able to address and meet the global challenge facing us. [EPA-HQ-OAR-2019-0055-1261-A1, p. 4]

As you finalize this proposal, we strongly urge EPA to finalize a rule that includes Option 1, and that reduces NOx emissions from new heavy-duty diesel engines by 90 percent, starting in MY 2027. As you update the Phase 2 GHG standards and develop the agency's approach for next year's expected Phase 3 GHG proposal, we strongly urge the agency to adapt the fuel-neutral/technology-neutral approach that has reduced diesel PM and NOx emissions so dramatically and cost-effectively over the past two decades to deeply reduce greenhouse gas emissions from all heavy-duty and nonroad diesel applications, not just those vehicles that are most ready for electrification. Towards that end, we ask that the final rule ensures that ethanol can be used to certify diesel engines that comply with the Clean Trucks Plan's emission standards, and that ethanol will be listed as a fuel that can be used by these engines throughout their useful lives. [EPA-HQ-OAR-2019-0055-1261-A1, p. 9]

We are confident that adopting these approaches will help ensure a final rule that will meet the administration's air quality, human health, and climate goals as quickly as possible – and more quickly and more cost-effectively than any approach that limits the technology choices in the marketplace and that hampers innovation by companies that are developing new approaches to emissions reduction. We are similarly confident that this approach will continue the agency's long track record of success that has become the model for nations around the world—and that has enabled American businesses to be the world leaders in emissions reduction technology. [EPA-HQ-OAR-2019-0055-1261-A1, pp. 9 - 10]

We look forward to working with the Agency towards a successful Clean Trucks Plan that improves air quality and health in disadvantaged and other communities across the country, and that decarbonizes all heavy-duty and nonroad engines and vehicles in years to come. [EPA-HQ-OAR-2019-0055-1261-A1, p. 10]

Organization: *Coach USA, Inc. (Coach USA)*

The Proposed Rule is almost entirely trucking-centric and, while apparently applicable to engines used in motorcoaches, devotes only sparse attention to the unique safety and other considerations surrounding passenger versus cargo transportation. [EPA-HQ-OAR-2019-0055-1307-A1, p. 2]

Organization: *Coingecko Company Sa*

Very interesting.
Very useful for the evolution of the planet. [EPA-HQ-OAR-2019-0055-1847, p.1]

Organization: *Colorado Energy Office, et al.*

Colorado data suggests that over 80% of our heavy duty truck traffic comes from vehicles that are not registered in Colorado. While Colorado can influence change for trucks registered in our state, strong EPA standards that improve the status quo for all trucks helps us to further improve air quality, and also helps ensure parity for Colorado companies versus those in neighboring states. [EPA-HQ-OAR-2019-0055-1297-A1, p.1]

We appreciate the Administration's efforts to re-establish the United States as a leader on climate, and to regain ground on clean transportation. The President's agenda - including the goal to ensure half of all new vehicles sold in 2030 are zero emission, and planned investments in the IIJA and proposed Build Back Better - would be transformational. We now urge the Administration to take the next step and codify this action by adopting the strongest national NOx and GHG standards possible for medium- and heavy-duty vehicles. We appreciate the Administration's leadership [EPA-HQ-OAR-2019-0055-1297-A1, p.3]

Organization: *Columbia River Plumbing*

I am absolutely against this clean air act regarding truck emissions going into for sore application. The American trucking industry is so much farther ahead than the rest of the world in a missions that until they catch up, do not hamper, hinder, or retard the American economy by inflicting heavy cost like this at this time. I'm all for clean air and responsibility, but not at the expense of our fragile economy right now. This is just one way to try pushing everything to an alternative fuel before we are ready for it. This will increase costs across the country in all products. Do not pass this new rule. [EPA-HQ-OAR-2019-0055-1014, p.1]

Organization: *Connecticut Department of Energy and Environmental Protection (CTDEEP)*

In this action, EPA seeks comment on the revised standards for nitrogen oxides (NOx) emissions from heavy-duty (HD) trucks. Connecticut strongly supports EPA's development of new engine and vehicle emission standards for heavy-duty trucks provided this action results in robust emission standards that significantly reduce emissions. Connecticut has urged EPA to promulgate robust federal emission standards to improve public health, advance environmental justice and to address our State's intractable ozone nonattainment challenge.1 [EPA-HQ-OAR-2019-0055-1306-A1, p.1]

1 NY-CT-NJ-Letter-RE-Heavy-Duty-Truck-NOx-Emission-Standards_112321.pdf

Organization: *Consumer Energy Alliance (CEA)*

On behalf of Consumer Energy Alliance (CEA), I write today regarding the development of the final rule on tailpipe emissions from heavy-duty trucks in support of a single national low-NOx rule that is technologically feasible, protects vital American jobs, and does not cause further damage to our critical supply chains. [EPA-HQ-OAR-2019-0055-1260-A1, p.1]

Our members support a rational, all-of-the-above energy policy that utilizes all our domestic natural resources – both traditional and renewable – while ensuring commonsense environmental protections are in place. Therefore, we support thoughtful emissions reduction strategies as we move towards a greener and cleaner future that keep the cost and reliability needs of the consumer in mind. [EPA-HQ-OAR-2019-0055-1260-A1, p.1]

Ninety-seven percent of trucking fleets are small, family-owned businesses that run on small margins and often face issues with competitive pricing that is hard to overcome in a normal market. With rising diesel prices and inflation, along with increased vehicle costs, family-owned trucking companies are simply not able to weather the storm like the larger carriers can and are now being forced to make difficult business decisions impacting the critical supply chains our country relies on. [EPA-HQ-OAR-2019-0055-1260-A1, p.1]

The U.S. EPA must consider these small businesses in order to further environmental progress without destroying jobs or damaging our fragile economic recovery. [EPA-HQ-OAR-2019-0055-1260-A1, p.1]

As such, a single national low-NOx rule must facilitate the development of affordable, durable commercial vehicles that can meet customer needs while serving as a bridge, not a potential barrier, to a zero-emissions future. [EPA-HQ-OAR-2019-0055-1260-A1, p.2]

Organization: *Consumer Reports (CR)*

While the proposal is a good start, it can and should go further to lower greenhouse gas (GHG) emissions and nitrogen oxides (NOx). Such reductions are imperative to lower dangerous tailpipe emissions, to increase adoption of zero-emission vehicles (ZEVs) and to achieve President Biden's goal of reducing greenhouse gas emissions by 50-52% compared to 2005 levels by 2030.1 Heavy-duty vehicles deliver consumer goods to warehouses and homes across the country. As e-commerce expands, consumer reliance on these trucks will grow. Such reliance has hidden costs in the form of harmful air pollution to consumers making purchases, and to communities living near freight routes. [EPA-HQ-OAR-2019-0055-1285-A1, p.1]

> 1 White House, Fact Sheet: Vice President Harris Announces Actions to Accelerate Clean Transit, Buses, School Buses and Trucks,(March 07, 2022). Available at: https://www.whitehouse.gov/briefing-room/statements-releases/2022/03/07/fact-sheet-vice-president-harris-announces-actions-to-accelerate-clean-transit-buses-school-buses-and-trucks/

CR supports a strong federal heavy-duty engine and vehicle (HDV) standard for NOx and GHG. [EPA-HQ-OAR-2019-0055-1285-A1, p.1]

CR is encouraged to see EPA working towards reducing tailpipe emissions that are dangerous to public health and the environment. However, given the outsized impact of these vehicles on air quality, EPA should go further to reduce emissions and to meet its obligations under the CAA to establish emission standards that 'reflect the greatest degree of emission reduction achievable through the application of technology.' [EPA-HQ-OAR-2019-0055-1285-A1, pp.10-11]

Organization: *Creation Justice Ministries*

It doesn't have to be this way. The movement of people and goods can be a good thing. It can be a blessing from God and a blessing to our world. But that's only if it is powered by clean and renewable energy. [EPA-HQ-OAR-2019-0055-2482, p.1]

That's why I'm submitting this comment on behalf of our Creation Justice community and the millions of caring Christians in this country. Together, we ask the EPA to create the strongest possible limits on heavyduty vehicle pollution and put our national bus and truck fleet on a clear path to 100% zero-emission all-electric vehicles by 2035. [EPA-HQ-OAR-2019-0055-2482, p.1]

Organization: *Cummins Inc. (Cummins)*

Cummins Inc. appreciates this opportunity to provide comments in response to the NPRM. This rulemaking provides a unique opportunity to achieve significant emissions reductions from heavy-duty vehicles as the country transitions to the zero-emissions future we all envision. To have a positive impact on the environment and communities, the final rule must be achievable with technologies our customers can readily adopt. [EPA-HQ-OAR-2019-0055-1325-A1, p. 20]

Additionally, we urge EPA and CARB to work together towards a single, nationwide standard. We are optimistic that all stakeholders can come together in support of a durable final rule that is a win for U.S. innovation, competitiveness, and the environment. [EPA-HQ-OAR-2019-0055-1325-A1, p. 21]

Organization: *Daimler Truck North America LLC (DTNA) (1045 and 1168)*

In the comments that follow, Daimler Truck suggests that the Proposed Rule can and should be improved by:

- Ensuring that EPA's next-tier emission regulations for HDVs are achievable and supported by sound technical analysis and demonstration;
- Providing market incentives for original equipment manufacturers (OEMs)—small and large—to develop and sell quality next-generation ZEVs;
- Developing a fulsome analysis of the real cost and market impacts of the standards and requirements proposed; and
- Striking the right balance between the environmental benefits and socio-economic impacts of stringent emission reduction regulations, bearing in mind the unique role that the heavy-duty (HD) freight sector as the literal 'engines' of the economy, particularly with respect to consumer goods. Daimler Truck appreciates EPA's consideration of the following comments and welcomes the opportunity for further engagement with the Agency on this important effort. We request that the Agency reconsider its Proposed Rule, that it take the time to engage with industry and stakeholders, and that it re-issue the proposal once it has fully considered the technical, cost, and market impact data gathered in this round of public comments. [EPA-HQ-OAR-2019-0055-1168-A1, p.2]

Daimler Truck is ready and able to build upon its previous efforts to help the Agency make needed changes to the Proposed Rule—potentially through the interim step of a supplemental proposal and another round of public comment—to ensure that the end result is a win for the environment and propels the industry towards investment in the technologies of the future. [EPA-HQ-OAR-2019-0055-1168-A1, p.5]

Not included in the ACT Research Impacts Study, but equally important for EPA's impact analysis, is the likelihood of diminished choices in the marketplace for new HDVs and related impacts on consumers. As emissions stringency drives up manufacturing costs, manufacturers are likely to decide that certain types of vehicles are simply not worth producing for commercial sale, as profit margins are too slim, and a business case to invest in these programs may not exist. The result will be significantly reduced product availability starting in the MY 2027 timeframe, as manufacturers struggle to justify investments across all applications or as technical solutions prove infeasible. This will almost certainly lead to decreased competition in the engine/vehicle market and an increase in vehicle prices. We believe this is already the case for MY 2024 engines and vehicles in markets that have adopted the California Omnibus rule; we urge EPA to study the impacts of the California Omnibus rule on product availability and to use this analysis to inform predictions about the market impacts of the Proposed Rule. [EPA-HQ-OAR-2019-0055-1168-A1, p.23]

Another impact that EPA appears not to have considered are the environmental disbenefits of the market shifts anticipated to follow from implementation of the Agency's proposed standards. Manufacturers who have traditionally focused on the production of diesel engines and vehicles may transition production to gasoline-powered products, to facilitate compliance with EPA's proposed standards. Daimler Truck has seen this transition take place in the marketplace already, with potentially unintended consequences: while the shift to gasoline in the HD market may help to reduce NOx emissions from the sector, it is at the expense of other pollutant emissions, most importantly CO2. EPA GHG Phase 2 standards allow higher CO2 emissions from gasoline-powered vehicles as compared to their diesel counterparts, in recognition of the inherent differences between gasoline and diesel combustion. Gasoline engines will have worse CO2 performance, thus EPA's NOx stringency proposal potentially creates perverse incentives to increase fleet contributions to climate change. [EPA-HQ-OAR-2019-0055-1168-A1, p.23]

Finally, EPA needs to evaluate the economic impact of the Proposed Rule in comparison to other regulatory or incentive programs that could achieve the same desired emission reductions for significantly less cost. Such analysis is necessary to ensure that any decision by the Agency to finalize its proposal is based upon a 'reasoned determination' that the benefits of the regulatory program justify its costs and that EPA has fully assessed available alternatives to direct regulation—such as economic incentives—as required under Executive Order 12866.62 For instance, the Agency should evaluate whether it may be more efficient and cost-effective to achieve the desired NOx and other pollutant reductions through a vehicle rebate program that would encourage older vehicles to be taken out of service. Indeed, it stands to reason that an incentive program that subsidizes the cost of turning over older, dirtier vehicles manufactured to much less stringent standards would be a better use of resources than utilizing the Agency's CAA Section 202(a) authority to target manufacturers, who are already looking beyond these next-tier standards to develop the zero-emission technologies of the future. [EPA-HQ-OAR-2019-0055-1168-A1, p.24]

> 62 See Executive Order 12,866, 'Regulatory Planning and Review' (Sept. 30, 1993) at Section 1.b(6) ('Each agency shall assess both the costs and the benefits of the intended regulation and, recognizing that some costs and benefits are difficult to quantify, propose or adopt a regulation only upon a reasoned determination that the benefits of the intended regulation justify its costs.'); Section 1.b(3) ('Each agency shall identify and assess available alternatives to direct regulation, including providing economic incentives to encourage the desired behavior.').

In summary, EPA's cost-benefit and economic analyses are undermined by significant omissions and incomplete assumptions about what the impacts of the Proposed Rule will actually be. It thus appears that EPA has failed to use the best reasonably obtainable economic information concerning the consequences of the Proposed Rule, in contravention of the Agency's obligations under Executive Order 12866. Daimler Truck encourages the Agency to re-visit its impact analyses, to ensure that the real costs and likely impacts of the Proposed Rule are captured. [EPA-HQ-OAR-2019-0055-1168-A1, p. 24]

Organization: *Dave Arndt*

[*From Hearing Testimony, April 12, 2022*] We need to tackle all the pollution sources one by one. We have the technology today; electric trucks are a good start. Oh, by the why, I forgot to mention the climate crisis, most of these neighborhoods are on the water and are not prepared for the sea level rise caused by burning fossil fuels. Please pass at least option 1 this year, however please have it go into effect in 2024, we don't have time to wait. Please put the health of our citizens and the climate over the profits of companies. [EPA-HQ-OAR-2019-0055-2867; see also EPA-HQ-OAR-2019-0055-0994]

Organization: *David Pedersen*

I have been studying air pollution in-depth for over two years now and it is an issue that is of great concern to me. I am a pedestrian, and as a result I am forced to inhale diesel exhaust against my will, thereby depriving me of my constitutional and environmental rights. [EPA-HQ-OAR-2019-0055-1059]

I am strongly in favour of cleaning up emissions from the transportation sector. It is overwhelmingly obvious that mobile-source emissions pose real and immediate dangers to public health (I do not need to cite any studies here since it is considered common knowledge), especially to near-road communities (many of which are BIPOC, or racialized, which are already overexposed to air pollution). Furthermore, I am deeply concerned about the impacts of mobile-source emissions on my friends, acquaintances, and fellow activists – many of whom are forced to remain indoors because of the regular diesel emissions (among other sources) outside their homes. [EPA-HQ-OAR-2019-0055-1059]

However, I disagree with the idea of lowering allowable emissions rates if the permissible values are not reduced to zero. My reasoning for this is straightforward and grounded entirely in science: there is no safe level of air pollution1, so it does not matter how clean an engine is if it emits any harmful pollutants whatsoever. Indeed, as Barnett (2014) states:
Change is long overdue. Air pollution can be complex. There are multiple gases and metals that are measured on unfamiliar scales. Air pollution is often difficult to measure and many pollutants interact with the weather, meaning measurements just 100 metres apart can be ery different. However, the epidemiology of air pollution is simple: when average levels increase, the average health effects increase, and this association has been shown repeatedly around the world. I have lost count of the number of government-commissioned environmental reports that have used the safe or dangerous fallacy. The practice should have ended years ago and proper cost-benefit studies should be undertaken for the current massive projects that could affect many people's lives, such as the expansion (https://onlinelibrary.wiley.com/doi/epdf/10.1111/1753-6405.12264) [EPA-HQ-OAR-2019-0055-1059]

1 https://onlinelibrary.wiley.com/doi/epdf/10.1111/1753-6405.12264

Organization: *Delta Car Care LLC*

These additional regulations will do nothing but hurt the American people and the trucking industry! This will escalate costs of all of our consumer goods! Emissions have already been reduced a huge amount! It makes no sense to cause harm to the economy and the trucking industry over something like this. The natural disasters already cause much more issues than these trucks that are currently very clean already! [EPA-HQ-OAR-2019-0055-2256, p.1]

Organization: *Diesel Technology Forum*

Future Emissions Standards Must Encourage Continued Investment Through Proper Balance In Timing, Stringency And Other Factors

The last thing anyone wants out of this is that truckers stop buying new trucks because they are too expensive, too unpredictable, and too complex. A balanced rule will alleviate undesirable outcomes like swings in the new truck market including a pre-buying of current generation technology. We support the continued development of robust technologies that have proven they meet the challenges of reducing emissions. The value of the technologies will need to be obvious to the truckers in order to avoid outcomes that will be detrimental for jobs, the economy, and the environment. [EPA-HQ-OAR-2019-0055-1004 and Public Hearing Day 1 Testimony, EPA-HQ-OAR-2019-0055-2867]

Future And Zero Emission Vehicles

The agency’s decision not to pursue a ZEV mandate is appropriate because ZEV mandates effectively alter otherwise open markets and take away options and fuels that may be more desirable, available, and affordable. Regardless of what today’s studies and projections of total cost of ownership might show, there are many uncertainties about the ultimate timing and market for ZEVs, not the least of which is the adequacy and availability of the charging and fueling infrastructure. [EPA-HQ-OAR-2019-0055-1004 and Public Hearing Day 1 Testimony, EPA-HQ-OAR-2019-0055-2867]

Summary

Above all else, this proposed rule must enable continued investment in the next generation of diesel technology by manufacturers, suppliers, and their customers. Without that, none of the anticipated benefits will accrue, older trucks will stay on the road for longer, and both manufacturers and suppliers will not have the capital to invest in future fuels and technologies. [EPA-HQ-OAR-2019-0055-1004 and Public Hearing Day 1 Testimony, EPA-HQ-OAR-2019-0055-2867]

Organization: *Edison Electric Institute (EEI)*

EPA should finalize an ambitious rule. [EPA-HQ-OAR-2019-0055-1282-A1, p. 9]

[Comment provided by one company that joined this letter campaign:] As a whole, the trucking industry in Pennsylvania is more than significant, and impacts every citizen in our

Commonwealth and in the United States of America. Considering the state of affairs in this country today, why would we want to throw more disruption and costs to further disable the vital trucking industry in Pennsylvania and this Country? [See Engine and Truck Organization letter campaign at EPA-HQ-OAR-2019-0055-1177-A1, p.1; this comment is from EPA-HQ-OAR-2019-0055-1179]

Organization: *EVHybridNoire*

[*From Hearing Testimony, April 13, 2022, Shelly Francis*] Our mission is to increase awareness of electric vehicles and accelerate the adoption of those vehicles so that all communities have access to this new mobility. Our membership is made up of people and members who identify as black and brown, so our organization is the voice of this technology. I live in Atlanta, Georgia, but today, interestingly enough, I'm sitting in Cancer Alley in New Orleans, Louisiana, meeting with key stakeholders from around the country who look like me, along with many names you would recognize. We are also here with a number of allies who don't look like me, and we're discussing ways to further climate justice and environmental justice. This evening I am here first as a concerned citizen and then, second, as a public health and mobility expert. I want to thank the administration for making it a priority to update these outdated rules and urge the EPA to create the strongest possible ruling on heavy-duty vehicle pollution. These standards here in the states where we live and work will begin to provide the much-needed relief from the burden of diesel fumes and air pollution. Vehicle manufacturers have had the technology to meet stronger standards but have failed to act on their own without the guiding hand of the EPA. I am particularly concerned about transportation air pollution. As a child I was very active and loved to play outside with friends, and played a lot of sports, and it was only a few years ago that I began to use an inhaler and experience respiratory issues. I don't live next to a transportation corridor. I don't live next to a refinery or waste facility, but imagine if I did. I have to be careful when the air quality is poor because I will have respiratory programs. So this issue is critically important to me from a public health and justice perspective, but it is also very personal for me. This rule will set the standard for vehicles which will be on the road for decades to come. Families in diesel death zones and in environmental justice communities, whether they are in West Oakland [inaudible] or Cancer Alley, Houston, or eastern North Carolina, they have suffered for far too long and as a result they have increased risk for cardiovascular disease, lung cancer, and other respiratory health illness. Diesel emissions cause nearly 21,000 premature deaths each year and impact nearly 135 million Americans, with these majority of these individuals belonging to BIPOC communities, and that is black and indigenous people of color. I like to refer to this as the public health crisis that not enough people are talking about. So I conclusion, once again I want to strongly urge and encourage this administration to enact the strongest standards possible. Every day we fail to act more families are falling victim to preventable health diseases. Clean air is a necessity, and not a luxury. It's a human right. We need to reduce deadly NOx pollution by 90 percent within five years, and fully realize the positive health impacts of a 100 percent zero-emission vehicle fleet. If this administration wants to make good on its bold climate goals it will really have to prioritize people and communities first, not industry standard. [EPA-HQ-OAR-2019-0055-2867]

Organization: *Elders Climate Action*

To contribute to timely attainment of the ozone NAAQS for all Americans, and slow global warming and avoid the worst consequences of a warming climate, a zero emission standard for HDVs is urgently need to accelerate the transition to zero NOx, PM and GHG emissions from onroad transportation sources. EPA must signal now that the industry must plan for that transition by establishing a zero emission standard and phase-in schedule. [EPA-HQ-OAR-2019-0055-1218-A1, p. 28]

Organization: *Energy Innovation, LLC*

The EPA's proposed rules outline Option 1 as the more stringent between Option 1 and Option 2. However, both fall short of what is needed to meaningfully reduce harmful pollution from HDTs. To the extent the EPA receives evidence to support the technological availability to meet the more stringent Alternative Option, or more stringent standards beyond NOx reductions of 16.7 percent in CY 2030 and 61.3 percent in CY 2045, the EPA should pursue the highest possible stringency and should minimize the credits allocated to polluting vehicles. Ideally, EPA's standards should align with California's Heavy-Duty Omnibus requirement of 90 percent reduction in NOx emissions beginning in 2027.xlii [EPA-HQ-OAR-2019-0055-1310-A1, p.7]

> xlii California Air Resources Board, Facts about the Low Hox Heavy-Duty Omnibus Regulation, https://ww2.arb.ca.gov/sites/default/files/classic/msprog/hdlownox/files/HD_NOx_Omnibus_Fact_Sheet.pdf.

In conclusion, we appreciate the EPA's efforts to update and improve the rules governing the U.S. transportation sector and ensure new vehicles are built to high performance standards that reduce GHG emissions and improve air quality and public health. We recognize there are always tradeoffs in rulemaking, but accounting for the longterm impact of the actions made this decade is imperative to address the most pressing threat of our time. Incremental improvements will be insufficient to tackle climate emissions at the speed and scale necessary to avert climate disasters. Communities cannot be expected to endure another decade or more of harmful pollution due to inaction. We encourage the EPA to continue its laudable work to find cross-cutting solutions that achieve policy goals and benefit communities, while continuing to raise the bar for the private sector and technology innovation. [EPA-HQ-OAR-2019-0055-1310-A1, p.7]

Organization: *Environmental Defense Fund (EDF) (1265 and 2855)*

Environmental Defense Fund (EDF) respectfully submits the following comments in support of Environmental Protection Agency's (EPA) Proposed Rule, Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, 87 Fed. Reg. 17414 (Mar. 28, 2022) ('Proposal' or 'Proposed Standards'). EDF supports substantially strengthening the heavy-duty vehicle emissions standards and respectfully urges EPA to strengthen the Proposal in key respects. These comments highlight the importance and urgency of finalizing health protective standards that achieve deep reductions in pollution from diesel vehicles and that ensure greater pollution reductions through meaningful deployment of zero-emission technologies. Near-term emissions reductions are vital to mitigating the effects of climate change and to protecting public health, especially the health of low-income communities and communities of color disproportionately impacted by transportation air pollution. [EPA-HQ-OAR-2019-0055-1265-A1, p.1]

EDF supports EPA's and the Administration's vision to 'lead the world on clean and efficient cars and trucks' in order to 'improve our economy and public health, boost energy security, secure consumer savings, advance environmental justice, and address the climate crisis.'1 As both the Proposal and President Biden's August 5, 2021 Executive Order 14037 recognize, the substantial deployment of zero-emission vehicles ('ZEVs') will play an important role in achieving this goal.2 [EPA-HQ-OAR-2019-0055-1265-A1, p.1]

> 1 Executive Order 14037, Strengthening American Leadership in Clean Cars and Trucks, 86 Fed. Reg. 43583, 43583 (Aug. 10, 2021).
>
> 2 See id.

This Proposal is a critical piece of that overall vision, and indeed in his August 2021 Executive Order, the President expressly directed EPA to consider the role ZEVs can play in EPA standards for model years 2027-2029. However, the Proposal must be substantially strengthened to deliver critical climate reductions, protect public health, achieve the administration's above-described commitments, and provide a strong foundation for next generation standards that drive even deeper pollution reductions from these vehicles. [EPA-HQ-OAR-2019-0055-1265-A1, p.1]

We urge EPA to move forward swiftly with standards that protect human health and the environment for all people and all communities, by reducing harmful diesel pollution and ensuring greater deployment of ZEVs. We respectfully urge EPA to consider all available tools to achieve deep pollution reductions and rapid ZEV deployment as quickly as possible. These actions will save money for truckers and fleets, strengthen our energy security, and help to support and grow domestic jobs. [EPA-HQ-OAR-2019-0055-1265-A1, p.3]

Accordingly, we urge EPA to substantially increase its ZEV baseline projections, which, as proposed, fail to account for state and federal policies along with manufacturer and fleet commitments and investments, and to finalize performance-based pollution standards that substantially increase ZEV deployment beyond the baseline for model years (MY) 2027-2029. In particular, these performance-based standards must help to ensure 80 percent of new school and transit buses are ZEVs by MY 2029, which will protect America's children and transit riders and mobilize the billions of dollars invested in buses through the Bipartisan Infrastructure Law. To protect the millions of people afflicted by freight pollution we similarly encourage EPA to ensure its standards achieve 40 percent of new Class 4-7 vehicles and Class 8 short-haul tractors are ZEVs by 2029. [EPA-HQ-OAR-2019-0055-1265-A1, p.2]

> Protective multipollutant standards that ensure these levels of ZEV deployment are likewise critically important to provide a strong foundation for future Phase 3 standards that achieve 100 percent ZEV sales by 2035. To that end, we likewise urge EPA to commit to a swift and clear timeline for completing those critical next-generation

standards. Though, to be clear, those Phase 3 standards cannot substitute for the progress we must make now to deploy available, cost-effective, and life-saving ZEV technologies to reduce medium- and heavy-duty vehicle pollution. [EPA-HQ-OAR-2019-0055-1265-A1, p.2]

A rapid transition to ZEVs is critical to reduce climate pollution and protect public health, and this must be paired with the strongest possible NOx standards for diesel vehicles that achieve reductions consistent with the reductions that will be achieved by California's NOx Omnibus rule. To ensure maximum possible NOx reductions, we identify several areas where EPA's proposal must be strengthened, including recommending substantial adjustment to the credit provisions for NOx, updating the ZEV sales baseline to reflect current expert projections, and strengthening of the idle standards for NOx. [EPA-HQ-OAR-2019-0055-1265-A1, p.2]

Numerous recent cost studies, clear market trends, recent federal investments, and strong state actions all support the feasibility of significant near-term deployment of ZEVs.89 Analysis from ERM projects Class 4-8 ZEV sales as high as 34 percent in 2029. GHG standards must both incorporate adjustments to the baseline and likewise strengthen standards to secure reductions beyond business as usual levels. The attached EDF White Paper shows the significant environmental and health benefits and the broad economic savings that would accrue from ensuring some new ZEV sales by 2029. [EPA-HQ-OAR-2019-0055-1265-A1, p.19]

89 See supra Section I.B.

Establishing an accurate ZEV sales baseline is critical to the efficacy of EPA's NOx and GHG standards. EPA's proposal assumes a ZEV uptake of only 1.5 percent in several early-adopting market segments in MY 2027–2029. This estimate is far below the pace projected by industry experts. As cited extensively above, manufacturer, municipal, and federal electrification commitments together with state leadership and IIJA funding will continue to drive demand for purchase of new Class 4-8 electric trucks and buses between now and 2029. [EPA-HQ-OAR-2019-0055-1265-A1, p.19]

EDF commissioned a study from ERM to evaluate baseline sales of medium- and heavy-duty BEVs over the next 10 years given these trends.90 ERM evaluated five different scenarios encompassing different assumptions about how many states would ultimately adopt ACT regulations (the current six or a total of thirteen), as well as different assumptions for EV market growth in non-ACT states. Low growth assumptions were based on BEV sales projections in EIA's 2022 Annual Energy Outlook91 and high growth assumptions were based on a recent report from the National Renewable Energy Laboratory (NREL), which projects significantly higher annual sales due to most BEV trucks reaching cost parity with ICE vehicles by 2035.92 [EPA-HQ-OAR-2019-0055-1265-A1, p.19]

90 E. Robo and D. Seamonds, Technical Memo: Analysis on Alternative Medium- and Heavy-Duty ZEV Baseline, ERM for EDF, May 10, 2022.

91 Annual Energy Outlook 2021,' Reference Case Projections Tables, US Energy Information Administration (EIA), table 49, https://www.eia.gov/outlooks/aeo/tables_ref.php.

92 Ledna et al., Decarbonizing Medium- and Heavy-Duty On-road Vehicles: Zero-Emission Vehicles Cost Analysis, National Renewable Energy Laboratory, March 2022.

The ERM analysis indicates that for all new medium- and heavy-duty vehicles sold in 2029, midpoint scenarios project medium- and heavy-duty ZEV deployment in excess of 20 percent and more optimistic scenarios project ZEV sales of over 33 percent of all class 4-8 single unit trucks, short-haul tractor trailers and school and transit buses. These estimates far exceed EPA's assumption in the proposal. EPA must use the most current data and projections to update its ZEV sales baseline for the final rulemaking. Failure to establish an accurate baseline will significantly undermine the Agency's proposed standards. [EPA-HQ-OAR-2019-0055-1265-A1, p.20]

Zero-emission vehicles are already available and cost-effective. Deploying zero-emitting medium and heavy-duty vehicles is critical to reach our health and climate goals. EPA must seize this opportunity to protect human health and the environment for all people and all communities by setting standards that ensure greater deployment of zero-emission vehicles. [EPA-HQ-OAR-2019-0055-1265-A1, p.20]

The White Paper EDF is submitting along with these comments documents in detail issues surrounding cost, feasibility, and lead-time supporting the feasibility and reasonableness of EPA establishing performance-based pollution standards that help to ensure 40 percent of new class 4-7 and class 80 short haul vehicles are ZEVs by 2029 and 80 percent of new school and transit buses are ZEVs by that year.93 We don't reiterate those findings here, but note only that it provides extensive and well-documented evidence that, in the M/HDV market ZEV cost reductions, technology advancements, company ESG commitments, state goals and regulations, and federal funding under IIJA are all causing ZEV demand to increase. The increased ZEV demand has, in turn, resulted in major manufacturers of gasoline and diesel vehicles introducing ZEV models and making investments to increase ZEV production to meet the increased demand. While starting a few years later, this is the same positive feedback loop that is happening in the light-duty vehicle market. The light-duty ZEV market has dramatically accelerated in the past few years, and there are strong signs that similar acceleration will happen in the M/HDV market in the next few years. [EPA-HQ-OAR-2019-0055-1265-A1, p.20]

93 EDF, 'Medium- and heavy-duty ZEV market readiness summary,' (May 16, 2022). (Attachment I)

However, it is critical that EPA establish pollution standards to support and reinforce these trends, consistent with its statutory mandate. As ERM's baseline analysis makes clear, there are a wide range of potential baseline values that might occur absent protective EPA standards, and accordingly, EPA must act to provide a strong, clear, and realistic market signal to secure urgently needed pollution reductions, ensure ZEV deployment levels consistent with what is needed to protective communities and the climate, and provide a strong foundation for protective

Phase III standards going forward. Finally, while we have not included specific recommendations for standards in model years 2027 and 2028, we would respectfully recommend that EPA establish standards in those model years consistent with the above-describe lead time and feasibility considerations. [EPA-HQ-OAR-2019-0055-1265-A1, p.20]

Organization: *Environmental Entrepreneurs (ER)*

[From Hearing Testimony, April 12, 2022, Sandra Purohit] I urge the EPA to finalize a heavy-duty trucks rule this year that is stronger than both Option 1 and Option 2, as currently proposed. Just last week, in two new reports on climate, the Biden-Harris administration's Office Of Management And Budget and the United Nations International Intergovernmental Panel on Climate change made clear we simply do not have time for incremental change. Business leaders agree. Climate-driven floods, wildfires, hurricanes, and droughts already threaten businesses directly, disrupt supply chains, and drive up input costs by destroying raw materials from produce to lumber. In 2021, climate-related disasters cost our economy $145 billion, the highest in any -- of any country. Along with the critical climate need, the EPA must do more to address the air pollution that is driving workers, customers, and community members into hospitals. In particular, aggressive action is needed to make a long-overdue difference on the disproportionate impact of these emissions on workers, and communities of color, and low-income communities. A few key points to make. [Technical difficulties during the hearing here; resume testimony] Heavy-duty trucks are only 10 percent of the on-road vehicles but contribute 33 percent of mobile-source NOx emissions and are the second-largest contributor to mobile-source greenhouse gas emissions, the point being that strongest standards here can make a huge impact. We already have commercially-available zero-emission trucks that address NOx particulate matter and climate emissions. These trucks also lower fleet operating and maintenance costs. With a strong market signal from the EPA to help drive production, they will become even more affordable to make and buy. What we don't have is the luxury of time. EPA cannot lag behind the market or fail to advance the deployment of zero-emission trucks at the pace needed to address the urgent public health and climate crisis. As such, we urge EPA to disregard Option 2 as wholly inadequate and to strengthen Option 1 in three ways: to align with heavy-duty omnibus rules stringency in Model Year 2027; eliminate the credit mechanism better roads standard; and to adopt a zero-emission vehicle sales mandate. The greenhouse gas standards should be updated to reflect existing state requirements that will lead to higher penetration rates in Model Year 2027 and the 1.5 percent assumed by the Agency. The EPA has the mandate and the authority to set standards that more assertively scale up solutions and moves the needle on climate and public health-harming emissions. On behalf of E2 business leaders, we urge you to do so, and once again, thank you for the time. [EPA-HQ-OAR-2019-0055-2867]

Organization: *Environmental Protection Network (EPN)*

EPN recommends that EPA's decision be guided by the demonstrated need for very large NOx reductions from the heavy-duty (HD) sector. This need is especially great for those populations living near major traffic areas. The goal should be to achieve the lowest feasible NOx standard, which will provide California, other states, and disadvantaged communities the NOx reductions they desperately need. [EPA-HQ-OAR-2019-0055-1233-A1, p. 1]

EPN advocates that decisions on the level of the standards, the useful life period, the applicable Model Years (MY), and other standard-setting and compliance related issues should all be guided by this goal. This means that when EPA balances the various relevant factors, EPN recommends that EPA place great weight on the clear need for major NOx reductions to protect public health and welfare. EPN suggests that EPA should be clear in its reasoning that this factor appropriately carries great weight, and that it is an important part of EPA's justification for deciding to make changes in the direction of more, not less, reduction of NOx emissions. [EPA-HQ-OAR-2019-0055-1233-A1, p. 1]

EPN strongly recommends that EPA strengthen both the NOx and GHG requirements in the Final Rule in ways that maintain EPA leadership in improving air quality and public health and addressing the global climate crisis. [EPA-HQ-OAR-2019-0055-1233-A1, p. 4]

Organization: *Evangelical Environmental Network (EEN)*

Our children's lives, health, and future will be decided by reducing all forms of air pollution including climate change causing carbon. Addressing heavy-duty truck now, will go a long way in deciding our children's future. Please promulgate the strongest possible standards to save our kids, display our technical abilities to the world, and create a sustainable future with family supporting jobs for all. [EPA-HQ-OAR-2019-0055-0993-A1, p.2]

Once again, I urge this administration to set the strongest standards possible because many lives, especially our children and those most vulnerable in our communities, depend on it. Zero-emission electric trucks are the best available technology to both reduce harmful NOx and carbon pollution. The EPA must put our national bus and truck fleet on a clear path to 100% zero-emission all-electric vehicles by 2035. [EPA-HQ-OAR-2019-0055-1134-A1, p.2]

Organization: *Evergreen Action*

The most impactful way to reduce the public health burden from MHDV pollution and achieve national and international climate goals is to utilize zero emissions technologies which are now available for all heavy duty trucks. Zero emission heavy duty vehicles are increasingly becoming cost competitive and have better range and lower maintenance costs than traditional heavy duty vehicles. EPA's baseline analysis should reflect the growing market adoption of zero emission MHDVs given that this new standard will not become effective until 2027. [EPA-HQ-OAR-2019-0055-1289-A1, p.2]

Organization: *Ezra Rumbold Trucking*

Since 2007 emissions, our trucking industry has already cleaned up much of the air with DEF fluid along side the diesel fuel on all truck applications. We also have had the onerous regen feature which is inserting the exhaust fumes back through the engine for reprocessing a second time. We have already cleaned up the air for almost 15 years. [EPA-HQ-OAR-2019-0055-1013, p.1]

I'm not sure what this latest proposal would incur, however we are tapped out on further engine restriction! Thanks for listening to my concerns on this topic. [EPA-HQ-OAR-2019-0055-1013, p.1]

Organization: *Faessler Farms LTD*

I think there is enough burden on the truckers and we should leave well enough alone. It is getting harder and harder to get trucks and drivers because of all the regulations. Put yourself in their shoes and I bet you would feel differently about all your regulations that you impose on these hard working drivers trying to make a living. [EPA-HQ-OAR-2019-0055-2247, p.1]

Organization: *Farmington Road Wrecker Services*

As a small business owner, I’m concerned about what these new regulations would cost us and if we could even afford it right now because of the state of our economy. [EPA-HQ-OAR-2019-0055-2264, p.1]

Organization: *Florida Council of Churches*

I thank this administration for acting swiftly on clean trucks but urge EPA to create the strongest possible limits on heavy duty vehicle pollution. The EPA must put our national bus and truck fleet on a clear path to 100% zero-emission all-electric vehicles by 2035. Life and breath depend on this action. [EPA-HQ-OAR-2019-0055-1006, p.1]

The dirty air we breathe plays a major role in cutting lives short. Establishing clean exhaust regulations is a matter of life and breath for large numbers of Floridians. Removing the pollutants from fuel, especially from trucks and other large vehicles, will restore the breath of life to millions of people and the soil itself. The technology exists for clean vehicles. The market is ready for them. Clean standards will move us all forward in ways that lead to health and prosperity. Not to act now is to say we as a nation want those who bear the greatest burden of air pollutants to die early deaths and their children to struggle with acquired learning disabilities and other ailments. As a nation I know that is not who we are. EPA clean standards are life and breath to millions of people and the environment itself. The standards EPA sets should achieve 100 percent zero-emission truck sales by 2035. That sets a pace to deliver much needed health benefits to all of us and especially communities of color and the ground that sustains us. [EPA-HQ-OAR-2019-0055-1006, p.2]

Organization: *Flower Shoppe & Gifts*

Now is not the time to enact strict regulations on our national trucking system. We already face shortages and delays in receiving goods not to mention the increased costs that are placed upon us which drive up costs to our consumers. I strongly urge you to not pass these regulations on heavy duty engines. [EPA-HQ-OAR-2019-0055-2267, p.1]

Organization: *Foxy Travel, Inc. dba FTI Coach*

The number one issue with newer coaches center around the emissions system and it makes us hesitant to upgrade our older fleet. Countless times we have had buses shuttling in Boston where there is no place to do a parked regen and had to send a mechanic out to do a forced regen. We have had numerous times we have sent our coaches away and had a failed nox sensor take a bus out of service. Coaches were towed, other buses dispatched, passengers stuck on the side of the road, it can be an absolute nightmare! If a coach is on a 7 day trip, even 60 hours isn't enough to get it home and have it fixed. Instead we send out older coaches without the emissions systems because we can't trust little things like nox sensors or having proper places in major cities to do a regen. For the record, we use high quality DEF from Dennison Lubricants. [EPA-HQ-OAR-2019-0055-2060, p. 1]

Organization: *Gary Frederick*

While it is commendable that the EPA is seeking to tighten clean truck standards, we need to ensure that the rules do just that in a strong and meaningful way to truly tackle NOx and greenhouse gases. The most recent United Nations report bluntly states that we are almost out of time for curbing the worst effects of global warming. As such, each country, each state and each town must dramatically do what it can to avert a catastrophe. New Jersey has been on the front lines in the fight against global warming, with our large coastline, congested cities, and warming climate. Unfortunately, we've also been on the front lines of 18-wheel trucks heading up and down the Turnpike to New York City and beyond, immense FedEx, Amazon and other retail warehouses, and more SuperFund sites than most other states. [EPA-HQ-OAR-2019-0055-1393]

The trucks targeted by this rule change will be on the road for decades, so it imperative we take steps now to get dirty diesel trucks off the roads and replace them with cleaner trucks. There are many zero-emission trucks ready for the market now or in the near future. Not only are they projected to be cheaper to own and operate than their diesel engine counterparts, a recent Dept of Energy study projects that by 2030, zero-emission trucks could be 42% of sales. A meaningful rule change by the EPA could speed that along. [EPA-HQ-OAR-2019-0055-1393]

The proposed rule outlines two options for reducing NOx and other particulates. Option 1 is not as strong as California's Heavy Duty Omnibus Rule. And Option 2 does not go far enough in curtailing pollutants. It risks being a giveaway to the biggest polluters in the engine manufacturing industry. That surely cannot be the intent of the proposed rule changes. [EPA-HQ-OAR-2019-0055-1393] [EPA-HQ-OAR-2019-0055-1393]

I am urging the EPA to take strong action to curb pollution and tighten heavy-duty engine and vehicle standards, with a goal of 100% zero-emission electric vehicles by 2035. Zero-emission electric trucks remain our best way to curb harmful NOx and GHG emissions and do our part to avert the worst impacts of global warming.[EPA-HQ-OAR-2019-0055-1393]

Organization: *Greg Pagliuzza*

I am writing as a Christian, who after many years as an executive in hospital finance, has gotten involved in taking care of God's creation. I view the Earth as a patient which needs a lot of attention and requires all of us to invest back into preserving its health. It is comparable to the work and investment one needs to take care of patients but on a much grander scale. I am grateful that this administration is acting swiftly on clean trucks but urge EPA to create the strongest possible limits on heavy duty vehicle pollution. [EPA-HQ-OAR-2019-0055-1215]

I have lived the majority of my life in the Chicagoland area. As it is a hub for transportation, there are many trucks which leave their tell-tale signs of diesel discharge for all of us to breath. I recognize that my health and the health of my children and grandchildren has been negatively impacted by trucking's tailpipe discharges. I look forward to the day when those discharges and the negative impact it has on me, my family, my community, and the earth in total is eliminated. Climate change is the existential threat to God's creation. The sooner action is taken to eliminate the long-term threat of the polluting discharges from trucks and buses, the better it will be slow down the degradation to our environment. [EPA-HQ-OAR-2019-0055-1215]

As a former hospital CFO and financial expert, I have to note that investing in the future jobs of clean energy transportation will enhance the United States' economic strength for years to come. It will also require less investment of healthcare dollars to treat those who will be harmed by doing nothing. This is a message that both sides of the aisle should support wholeheartedly. [EPA-HQ-OAR-2019-0055-1215]

As a Christian, my specific concerns are:

- We have a moral and Biblical mandate to defend the health of all God's children, including from harmful air pollution from highly polluting heavy duty trucks and vehicles, which have an outsized influence on air pollution and climate change.
- As an evangelical Christian, I believe that all human life is sacred; that each person conceived is of equal and innate value and dignity, and that all human life is worthy of protection.
- Pro-life means protecting life - a theology shared by the National Association of Evangelicals and Catholic social teaching under the guidance of Pope Francis in his encyclical letter, Laudato si' on care for our common home.
- Jesus was especially concerned about vulnerable populations being denied abundant life. "Jesus said, 'Let the little children come to me, and do not hinder them, for the kingdom of heaven belongs to such as these.'" (Matthew 19:14)
- Medical research shows that ozone exposure increases the likelihood of reproductive and developmental harm, including reduced fertility, preterm birth, stillbirth and low birth weight
- Between 15,000 to 30,000 preterm births occur due to exposure to soot (PM2.5), that is also emitted by heavy duty trucks. Soot-related pre-term births cost approximately $4.33 billion to the United States economy — and 33% of these children die at birth or shortly after.1

1 Teresa M Attina, Russ Hauser, Sheela Sathyanarayana, Patricia A Hunt, Jean-Pierre Bourguignon, John Peterson Myers, Joseph DiGangi,R Thomas Zoeller, Leonardo Trasande, Particulate Matter Exposure and Preterm Birth:

I am writing because I know the following to be true and as man created this problem.

- Smog and soot air pollution caused by trucks and buses are among the greatest threats to public health for the more than 45 million people in the U.S. living within 300 feet of a major roadway or transportation facility.
- EPA has recognized that more than 13 million people (including 3.5 million children) live near major marine and inland ports or rail yards, and that these individuals are disproportionately low- income communities of color and susceptible to increased health risks from air pollution.
- Heavy duty vehicles spew dangerous nitrogen oxides and other pollution into our air, harming respiratory health, especially in marginalized communities.
- Diesel pollution from heavy duty trucks and buses is a massive public health threat.
- Diesel pollution worsens asthma and is particularly dangerous to children’s developing lungs.
- Dangerous nitrogen oxides and other pollution that heavy duty vehicles like trucks and buses spew into our air hurt low wealth communities first and worst.
- The transportation sector is the largest single source of heat-trapping greenhouse gases

Now man can work to correct it.

- We have the technology and the ability to cut pollution and save money today.
- Today, electric trucks and buses are already capable of supporting the majority of freight, delivery, and transit uses and needs.
- Today, electric trucks and buses are already capable of supporting the majority of freight, delivery, and transit uses and needs.
- Across nearly every vehicle class, zero-emission electric trucks and buses are projected to be cheaper to own and operate than their combustion engine counterparts within 5 years.
- In fact, a recent DOE study predicts that by 2030, zero-emission trucks could grow to 42% of sales just based on the fact that they will be cheaper to buy and own, but we need strong policies to achieve this reality.

The bottom line is, I urge this administration to set the strongest standards possible as soon as possible because many lives depend on it. It’s past time to clean-up our air and defend our children and families from harmful traffic emissions that threaten our health and fuel global warming. These standards must accomplish two things: 1) reducing deadly NOx pollution 90% by 2027, and 2) putting our national bus and truck fleet on a clear path to 100% zero-emission all-electric vehicles by 2035. [EPA-HQ-OAR-2019-0055-1215]

Organization: *Hyliion, Inc.*

First, we write to thank the EPA for ongoing efforts to reduce emissions of toxic diesel particulates and smog-forming oxides of nitrogen. It is clear that to achieve National Ambient

Air Quality Standards (NAAQS), emissions from medium and heavy-duty vehicles must decrease to zero and near zero levels. [EPA-HQ-OAR-2019-0055-1238-A1, p. 1]

Organization: *International Union, United Automobile, Aerospace & International Union, United Automobile, Aerospace & Agricultural Implement Workers of America - UAW Region 1A*

Frankly, we are very concerned that the proposed rule from EPA on tailpipe emissions from heavy-duty trucks as part of the 'Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards,' may not be technologically feasible. That means Original Equipment Makers (OEMs) will spend hundreds of millions of dollars chasing at worst an impossible standard, and at best a costly standard, rather than strategically deploying critical resources on proven technologies. [EPA-HQ-OAR-2019-0055-1062-A1, p.1]

We share, of course, your commitment to the environment and applaud the accomplishments already achieved by commercial vehicle manufacturers to reduce nitrogen oxides (NOx) emissions from heavy-duty trucks. We support the ongoing efforts for cleaner air and healthier communities for all. However, we also recognize the importance of preserving – not effectively dismantling through higher costs and wasted expenditures – this critical industry. [EPA-HQ-OAR-2019-0055-1062-A1, p.1]

We urge you to amend the proposed rule so that it reduces emissions, protects American jobs, and results in cleaner air and healthier communities for all. [EPA-HQ-OAR-2019-0055-1062-A1, p.1]

To be effective, the final rule must be: Environmentally beneficial. An unworkable rule will delay fleet turnover and prevent environmental progress, creating greater harm in communities most at-risk for high air pollution. [EPA-HQ-OAR-2019-0055-1062-A1, pp.1-2]

Organization: *International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)*

We support and value the EPA's mandate through the Clean Air Act to regulate harmful pollutants and greenhouse gas emissions to protect communities from negative health effects and address the threat of climate change. [EPA-HQ-OAR-2019-0055-1138-A1, p.2]

The UAW supports using regulations that help bring innovative technologies to heavy-duty fleets, so long as the technologies are proven and cost-effective, regulatory timelines are feasible, and manufacturers have flexibility to meet stringency requirements through multiple technology paths. [EPA-HQ-OAR-2019-0055-1138-A1, p.3]

Additionally, if regulations result in high regulatory costs and reduced vehicle sales, it could place financial constraints on the industry at a time when companies require capital to make major investments in new technologies. Truck manufacturers have shown a commitment to major investments to transition to zero-emission vehicles, but that transition will require significant financial resources. Poorly designed regulations could have the unintended consequences of hampering the industry's ability to invest in the technologies of the future and build them here in the U.S. [EPA-HQ-OAR-2019-0055-1138-A1, pp.4-5]

We urge the EPA ensure new regulations do not create economic hardship for working families by creating significant market disruptions. To achieve this goal, the final rule must be consistent with the following principles:

- Create regulatory certainty and avoid disruptions to the trucking market
- Provide manufacturers with the necessary lead time and flexibility to meet stringency standards
- Work towards a single national standard that is harmonized with existing regulations
- Build upon realistic analysis of the feasibility, cost, and market potential of new technologies [EPA-HQ-OAR-2019-0055-1138-A1, p.5]

UAW commends the EPA's continued efforts to incorporate stakeholder input and create a national program that incentivizes investment in US manufacturing, promotes US leadership in advanced technology, supports fuel efficiency and reduced emissions, and provides the industry flexibility to meet those standards. We believe a negotiated national standard derived from a consensus-driven process that includes meaningful engagement with all stakeholders, including states, workers, manufacturers, suppliers, environmental advocates, and fleet operators, working together to reach an agreement on regulations will help the economy and the environment. [EPA-HQ-OAR-2019-0055-1138-A1, p.5]

Organization: *Jack Schneeman*

I have always been a staunch supporter of using regulations to alleviate the effects of climate change, and for this reason I fully support this proposed rule. Pollutants from heavy-duty engines, such as those used in semi-trucks and other diesel engines, are a known threat to the environment and to public health. According to the Congressional Research Service, these engines are the biggest contributors to emissions of Nix, which was roughly 32% in 2017 (CRS). Nix reacts in the atmosphere to form harmful pollutants such as smog (ozone) and particulate matter (soot). Furthermore, heavy-duty engines emitted roughly 457 million metric tons of carbon dioxide in 2019, equating roughly 25% of US CO_2 emissions from the transportation sector. [EPA-HQ-OAR-2019-0055-1053]

The adverse effects these pollutants have on human health and the environment is extreme, to say the least. According to the Centers for Disease Control, ground level smog (ozone) and particulate matter (soot) have the potential to cause many health problems for humans. Estimates that contain no regulatory updates (meaning should this rule not be implemented) suggest that roughly 1000-4300 additional premature deaths may be cause by the presence of smog and soot by 2050 (CDC). Furthermore, health related costs of ozone air pollution have been estimated at nearly 7 billion USD from a period between 2000 and 2002. Further, the Environmental Protection Agency itself estimates that smog and soot cause other adverse health effects, including premature death, respiratory illness (including childhood asthma), cardiovascular problems, and other adverse health impacts. Thus, the impact of heavy-duty engines is clear, and must be addressed. The effects of carbon dioxide produced by heavy-duty engines also pose a threat to public health and to the global environment and ecological systems as well. According to Proceedings of the National Academy of Sciences of the United States of America (PNAS), unregulated carbon dioxide emissions will cause irreversible damage to the planet's environment for up to 1000 years after CO2 emissions are curbed altogether (PNAS). The presence of greenhouse gasses in the atmosphere is a direct contributor to climate change, which has already caused a great deal of damage to the environment due to global warming. If CO2 emissions are not regulated, the planet will see an increase in the melting of polar ice caps, causing sea levels to rise, an increase in precipitation levels causing the potential for massive floods, increasing natural disasters such as hurricanes, wildfires, and tornadoes, and the global death of millions of species, which would cause irreversible damage to ecosystems and food supply necessary to sustain human life (PNAS). Essentially, it is imperative greenhouse gas emissions are regulated in order to ensure the survival of the human species. Thus, it is clear that the EPA's proposed rule must be implemented. [EPA-HQ-OAR-2019-0055-1053]

The EPA seeks to change emissions standards to heavy-duty engines through the power vested in it by the Clean Air Act of 1963 and Executive Order 14307: "Strengthening American Leadership in Clean Cars and Trucks" (CRS). This rule relates to companies that manufacture, sell, or import into the United States new heavy-duty highway engines, and would require them to meet certain efficiency and emissions standards in order to sell, import, or manufacture new heavy-duty engines for usage in the United States. According to the EPA, implementation of this rule would reduce heavy-duty engine emissions by roughly 50% by 2040 and 60% by 2045, which would be greatly beneficial for public and environmental health. [EPA-HQ-OAR-2019-0055-1053]

While it is difficult to ascertain the overall public reaction to this rule, I would argue that implementation of this rule would be very popular with the public. According to the Pew Research Center, 2/3 of Americans believe that the government should do more to address climate change, and thus targeting one of the biggest factors in emissions would be very popular the overall population, although less popular for the companies targeted by this rule proposal.

However, the complaints of these companies must be ignored in order to promote public and environmental health. [EPA-HQ-OAR-2019-0055-1053]

Thank you for giving me the opportunity to express my support for this rule proposal. In order to better secure a future in which public and environmental health is more valued, I express my support for this rule and urge its implementation by the EPA. Attached below are references to the sources I consulted in order to further research this rule proposal. [EPA-HQ-OAR-2019-0055-1053; references omitted]

Organization: *Jared Kurland*

The EPA’s new proposed rule on the control of air pollution from large heavy duty motor vehicles and vehicle standards sounds like a great idea on the outside. Reducing air pollution from highway bound heavy duty engines and vehicles is most certainly a benefit to society and the world. The reduction of dangerous air pollutants to the ozone layer and we as humans sounds great. Yet after reading several other public comments it seems as though the people who work firsthand with large engines are not happy with how this action is going to affect them. These changes will increase the challenges small business have in competing with big trucking companies. As a supporter in small business, I would hope that the EPA is working to support smaller trucking companies while still achieving their goal of making the engines cleaner. [EPA-HQ-OAR-2019-0055-1388]

Organization: *Jessica Stevens*

Considering the risks the emissions the transportation sector has on public health and the environment, I would urge the Environmental Protection Agency to pass this regulation. However, I would also encourage some adjustments to be made to the regulation. Particularly, I recommend even stronger regulations to be put in place not only on heavy duty trucks, but on all forms of transportation that are carbon and greenhouse gas producing. According to the Intergovernmental Panel on Climate Change, we must keep global warming below 1.5 degrees celsius to avoid catastrophic changes to our planet (Cho). This would require emissions to fall to half of production by 2030 and to zero by 2050. Although 136 countries pledged to this at the COP26, I believe that we still need to take strong steps as a country to get there, with the hope that other countries will follow in suit. This is why I do not think making standards, test procedures, life use, warranty, and other outline requirements in the proposal for only heavy duty trucks is enough to make sufficient progress against our climate crisis. I acknowledge that it is a step in the right direction, which is why I am endorsing this regulation, but I am recommending that further policies are put into place to make more progress in reducing our carbon footprint. [EPA-HQ-OAR-2019-0055-1028]

Additionally, I propose that more consideration is put into the economic strain this might place on the transportation and connected industries. I do not think they should have to foot the costs for the amendments made to requirements; the government should provide some form of subsidies because it is moving the future of our country and planet in a safer direction. [EPA-HQ-OAR-2019-0055-1028]

All in all, I support the implementation of this regulation. Transportation is the largest sector responsible for the production of greenhouse gasses, which has severe negative consequences on public health and environmental health. Furthermore, I urge that regulations are passed on a wider range of the transportation sector as greenhouse gasses must be reduced to prevent global warming from producing catastrophic impacts. [EPA-HQ-OAR-2019-0055-1028]

Organization: *K&M Outdoor, LLC*

This regulation will hurt the trucking industry that is already struggling due to high fuel prices and supply chain issues. Not only will this cause the cost of trucking to skyrocket but it will directly impact the consumer which would only add fuel to the fire we already have also considered 'Inflation'. Please do not do this to our trucker, they are the ones keeping the economy moving...without them or by hurting them we will cause great harm to everyone in this country. [EPA-HQ-OAR-2019-0055-1008, p.1]

Organization: *Kali Bach*

I believe this rule is an excellent start to keeping our air clean and breathable for all, especially for communities along the highways or busy roadways. One suggestion I would like to throw in is a tax incentive for truck manufacturers and companies to not only comply with the new law, but if they go beyond the requirements. If we can lessen our dependence on oil in this sector of the economy, then I hope we can move towards fully electric trucks in the near future to have a zero-emission fleet. This rule, in the meantime, is a good steppingstone towards that goal. [EPA-HQ-OAR-2019-0055-1390]

Organization: *Kimmons, Kenneth (OOIDA)*

I have been in the trucking business since 1966.My brother an uncle since the 40’s. Have watched the cost of equipment myself increase near tenfold since the mid 60’s. Reliable on the trucks gotten worse, repairs increasing yearly. Fancy so called emissions standards increasing at expense of the owners of sad equipment. Will it never end? All this talk about cleaner air, I’m all for it, but quit hitting trucks with more and more regulations. Great suggestion here for you in DC that knows nothing about an owner-operator’s daily problems. Shut it all down, no more trucks burning diesel or any gas. No cars on the road no trains just shut it all down. Return to horse and wagon, mules and horses pulling plows of farmers. No coal electric plants, no nuclear power plants. Return to coal oil lamps and wood burning stoves an fire places to cook an heat homes. Emissions problem solved. Back to our forefather’s ways of life, sailing ships etc. See how you like it then, good clean air you say, life expectancy mid 30-40. World population will drop by 60-70 percent within 18 months. Wake up folks got to be better solutions, quit regulating us out of business an into the poor house. [EPA-HQ-OAR-2019-0055-1266-A2, p.4]

Organization: *King County, Washington County Executive*

As the elected leader of King County, Washington, the nation’s 12th most populous county, I urge the Environmental Protection Agency (EPA) to finalize the strongest possible heavy-duty vehicle requirements via the Clean Trucks Plan, now released as a Notice of Proposed Rulemaking (NPRM) Docket ID No. EPA-HQ-OAR-2019-0055. Passage of strong requirements is essential to protect residents from the harmful impacts of air pollution, advance environmental justice, and slow the release of global warming emissions. [EPA-HQ-OAR-2019-0055-1188-A2, p.1]

The heavy-duty rule must accelerate deployment of zero-emission vehicles in order to safeguard clean air and improve public health in our communities. Our residents cannot wait a decade for cleaner air. [EPA-HQ-OAR-2019-0055-1188-A2, p.1]

There is no time to wait; we must move with urgency to reduce emissions from the transportation sector and protect the health of our most vulnerable communities. There is a critical need for the EPA to take swift action towards a zero-emissions future in order to ensure a safe environment for current and future generations. I am confident that you agree on the urgency of this issue and I urge you to finalize a strong rule. [EPA-HQ-OAR-2019-0055-1188-A2, p.2]

Organization: *Labor Network for Sustainability (LNS)*

EPA's Proposed Rule and accompanying Regulatory Impact Assessment (RIA) (herein 'the Proposed Rule') inadequately address the dangers of greenhouse gas and other polluting emissions from fossil fuel powered medium and heavy duty vehicles and thus falls short of the administration's commitment. LNS supports the rapid transition to zero-emissions vehicles (ZEVs) that would eliminate these emissions. However, we defer to other community and technical experts to address the shortcomings of the proposed final rulemaking with respect to its impacts on environmental and public health. We incorporate by reference the comments, testimony and recommendations submitted by the more than 50 organizations that make up the Moving Forward Network (MFN) who have submitted individual/organizational comments, as well as MFN's own comprehensive comment and public testimony. [EPA-HQ-OAR-2019-0055-1257-A1, p.2]

Given the realities of the independent contractor model, the Proposed Rule will likely result in increased cost burdens on these already devalued drivers rather than where the cost burdens of regulation should be placed, specifically the logistics corporations who fundamentally control the operations of medium and heavy-duty fleets from seaport to consumer. [EPA-HQ-OAR-2019-0055-1257-A1, pp.2-3]

Increasing cost burdens on devalued drivers risks undermining the objectives of the Proposed Rule and is likely to inhibit progress on our environmental justice, climate, and public health goals. [EPA-HQ-OAR-2019-0055-1257-A1, p.3]

Specifically, LNS recommends the following actions:

- EPA must not leave emission reductions and requirements to future rule and should transition to zero-emission trucks and buses by setting stringent emission standards and zero-emission-vehicle sales mandates now.
- EPA should require that all new trucks have zero emissions beginning in 2035 and retire all combustion trucks before 2045. [EPA-HQ-OAR-2019-0055-1257-A1, p.15]

Organization: *Lawson Construction Group*

We have enough regulations already! The impact has been very detrimental on our industry. Our carbon footprint is the smallest in the world. To fix the world's environmental issues in the United States alone is idiotic. Leave the industry be. [EPA-HQ-OAR-2019-0055-1007, p.1]

Organization: *Lion Electric Co. USA Inc. (Lion)*

As the United States moves towards a zero-emission future at an accelerated rate, it is even more crucial that appropriate incentives are offered to facilitate this transition. Many states have adopted their own zero-emission attainment goals and large numbers of fleet owners are eager to comply ahead of schedule. However, price remains the deciding factor for many of these operations, especially for small fleets with 10 or fewer heavy-duty vehicles. Lion assists fleet owners throughout the United States to leverage local, State, and Federal funding towards new zero-emission vehicles; however, there are often limitations that make funding difficult to obtain. [EPA-HQ-OAR-2019-0055-1151-A2, p. 2]

For example, the scrappage requirement for many programs, such as the California Air Resources Board (CARB) Statewide Carl Moyer Program, or the Volkswagen Mitigation Fund, renders many applicants ineligible. Narrow eligibility windows can exclude many fleets with old diesel vehicles that do not qualify for funding. Without feasible financial options for replacement, these vehicles may remain on the road long past their useful life, releasing harmful emissions into the environment. Alternatively, small fleets or newer businesses may not have vehicles available to scrap at all. For these reasons, we ask that the EPA to reconsider how to apply scrappage requirements for future funding programs, and to consider offering flexible options for applicants to meet them. [EPA-HQ-OAR-2019-0055-1151-A2, p. 2]

Lion cautions the EPA against providing high incentives for hybrid vehicles either as opposed to or in addition to zero-emission vehicles. With the end goal being a maximum reduction in air pollutants, the best way to achieve this is to encourage the adoption of all-electric vehicles. With the proper incentives, many fleet owners can move straight into zero-emission, ensuring early compliance with state goals and achieving the highest possible emission reduction. [EPA-HQ-OAR-2019-0055-1151-A2, p. 3]

Organization: *Louisiana Monuments and Signs*

Business's will be crippled if this is passed. One more thing struggling business's will have to struggle with, so many people will lose their jobs. I am a small business and the struggle is real on so many levels. This would be the last thing I would need to deal with. After struggles with 2020 situations still lingering. I Cant afford to buy a fleet of new trucks. I would be forced to shut down both of my small business's. [EPA-HQ-OAR-2019-0055-1015, p.1]

Organization: *Loren Marz*

I generally support the proposed action (Option 1) as presented in the proposed rule, although it appears that regulated levels of non-GHG emissions are approaching diminishing returns. [EPA-HQ-OAR-2019-0055-1394]

Organization: *Lubrizol Corporation (Lubrizol)*

We commend EPA on a Proposal that will deliver critically-needed environmental benefits, as soon as MY 2027. We support a final rule that includes Option 1 for NOx reduction, assuming suitable cost-effective technologies are available in time for the MY 2027 implementation of the new NOx standard. [EPA-HQ-OAR-2019-0055-1304-A1, pp.1-2]

Organization: *Machinery Northwest Co.*

I truly believe that we are the golden standard that all other industries and county’s around the world should want to have the same or better standards. We should not be forcing anyone industry in the USA to conform or change their current good practices until the rest of the work is able to catch up with and apply the same or better standards in there countries. [EPA-HQ-OAR-2019-0055-1713, p.1]

Organization: *Manufacturers of Emission Controls Association (MECA)*

The Manufacturers of Emission Controls Association (MECA) is pleased to provide comments in strong support of the U.S. EPA's notice of proposed rulemaking (NPRM) to revise oxides of nitrogen (NOx) emission standards for heavy-duty on-highway engines as well as update greenhouse gas (GHG) emission standards for heavy-duty on-highway vehicles. We believe an important opportunity exists to continue to reduce NOx and GHG emissions from heavy-duty engines and vehicles due to the evolution of engine and aftertreatment technologies in the 12 years since the last standards were fully implemented. In addition, we support continued reductions in GHG emissions from medium- and heavy-duty engines and vehicles through the application of innovative technologies and fuels. [EPA-HQ-OAR-2019-0055-1320-A1, p.1]

MECA thanks EPA for building upon the historic comprehensive test program that has demonstrated pathways for heavy-duty engines to achieve ultra-low NOx levels without impacting GHG emissions and provided data on end-of-life durability, performance over real-world cycles, in-use system compliance with the new moving average window requirements, emission sensor measurement capability, among others. MECA supports EPA's Proposed Option 1 with some modifications, which we feel will strengthen the regulation. We also support EPA's amendments of the Phase 2 MY 2027 GHG vehicle standards and have some suggestions on how the NPRM treats credits from electric vehicles [EPA-HQ-OAR-2019-0055-1320-A1, p.2]

Organization: *Marathon Cheese Transport*

We do these things because of cost savings and safety of our drivers and public, and yet more regulations that hamper the transportation industry, not help them. I do not support regulations that add higher costs but little value to my business. California's CARB system shows the imperfection of a standard that has pushed many trucking companies out of business or across state lines to set up businesses and still run miles in state of CA. [EPA-HQ-OAR-2019-0055-2516, p.1]

Organization: *Mass Comment Campaign sponsored by American Lung Association (248)*

As physicians, nurses, public health professionals and healthcare workers dedicated to providing our patients with a healthy future, we urge you to finalize strong emissions standards for heavy-duty vehicles and to move toward a zero-emission trucking sector. [EPA-HQ-OAR-2019-0055-1609-A1, p.1]

We thank the U.S. Environmental Protection Agency (EPA) for proposing rules to slash NOx emissions from new heavy-duty vehicles, recognizing the need to immediately curb pollution from the millions of heavy-duty vehicles on the roads today. We also appreciate the agency continuing to lay the groundwork to transition to zero-emission vehicles by updating greenhouse gas standards within this proposal. [EPA-HQ-OAR-2019-0055-1609-A1, p.1]

The health community is calling for EPA to choose the most health-protective option possible, achieve a 90% reduction in NOx pollution and finalize the rules by the end of 2022. We urge you to not only finalize strong standards, but also ensure real-world benefits by requiring pollution controls for the full lives of these vehicles and in realistic operating conditions.[EPA-HQ-OAR-2019-0055-1609-A1, p.1]

Finally, we then urge EPA to move forward with the next phase of setting strong greenhouse gas standards for medium and heavy-duty vehicles to drive the nationwide transition to zero-emission vehicles. [EPA-HQ-OAR-2019-0055-1609-A1, p.1]

Organization: *Mass Comment Campaign sponsored by Climate Action Campaign (82)*

I'm writing today to urge the EPA to create the strongest possible limits on heavy duty vehicle pollution to limit dangerous diesel pollution like nitrogen oxides (NOx). We need solutions for pollution, and these standards will provide much needed relief from the burden of diesel and other air pollution. The reality is that trucks regulated by this standard will be on the road for decades, so these vehicles must be cleaned up as soon as possible. [EPA-HQ-OAR-2019-0055-1193, p.1]

The bottom line is that zero-emission electric trucks are the best available technology to both reduce harmful NOx and carbon pollution. There are dozens of zero-emission medium- and heavy-duty trucks already available or coming to the market within a couple of years, and across nearly every vehicle class, zero-emission electric trucks and buses are projected to be cheaper to own and operate than their combustion engine counterparts within 5 years. [EPA-HQ-OAR-2019-0055-1193, p.1]

Strong pollution limits on heavy duty vehicles are a solution for pollution, and the EPA can and should use these standards to accelerate the transition to electric trucks. These standards must accomplish two things: 1) reducing deadly NOx pollution 90% by 2027, and 2) putting our national bus and truck fleet on a clear path to 100% zero-emission all-electric vehicles by 2035. [EPA-HQ-OAR-2019-0055-1193, p.1]

Organization: *Mass Comment Campaign sponsored by Climate Action Campaign (15,000)*

I’m writing today to urge the EPA to create the strongest possible limits on heavy duty vehicle pollution to limit dangerous diesel pollution like nitrogen oxides (NOx). We need solutions for pollution, and these standards will provide much needed relief from the burden of diesel and other air pollution. The reality is that trucks regulated by this standard will be on the road for decades, so these vehicles must be cleaned up as soon as possible.

- Families in diesel death zones, particularly communities of color and low wealth communities, have suffered long enough and cannot wait extra model years for clean air, and drivers cannot wait extra model years for more efficient, pollution-free trucks.
- Cleaner trucks are not only available and ready now, they also are projected to deliver critical cost savings for operators and drivers.
- Across nearly every vehicle class, zero-emission electric trucks and buses are projected to be cheaper to own and operate than their combustion engine counterparts within five years.

- Smog and soot air pollution caused by trucks and buses are among the greatest threats to public health for the more than 45 million people in the U.S. living within 300 feet of a major roadway or transportation facility.

The bottom line is that zero-emission electric trucks are the best available technology to both reduce harmful NOx and carbon pollution. There are dozens of zero-emission medium- and heavy-duty trucks already available or coming to the market within a couple of years, and across nearly every vehicle class, zero-emission electric trucks and buses are projected to be cheaper to own and operate than their combustion engine counterparts within 5 years. [EPA-HQ-OAR-2019-055-1617]

Organization: *Mass Comment Campaign sponsored by The Climate Reality Project (10,820)*

Even more important, accelerating the transition to 100% electric trucks would help protect the 72 million Americans who live by freight routes not just from NOx but also from soot and other pollutants spewing out of tailpipes. As you know, those affected are overwhelmingly people of color and poor families, making this not just about climate action and public health, but about basic justice for Americans. [EPA-HQ-OAR-2019-0055-1083-A1,p.2]

Yes, the timeline is aggressive. But the health of millions depends on it, and with more and more electric trucks options entering the market, we know we can do it. [EPA-HQ-OAR-2019-0055-1083-A1, p.2]

Organization: *Mass Comment Campaign sponsored by Environment America (11,390)*

We write to urge you to create the strongest possible limits on heavy-duty vehicle pollution. [EPA-HQ-OAR-2019-0055-1611-A1, p.1]

I urge the EPA to create the strongest possible limits on pollution from heavy-duty trucks and buses. Trucks create pollution that is warming our planet and polluting our communities. Smog pollution from trucks is a threat to public health, causing childhood asthma, cancer and even premature death. To protect our health and fight climate change, you must strengthen the proposed heavy-duty truck rule. [EPA-HQ-OAR-2019-0055-1611-A2, p.1]

Organization: *Mass Comment Campaign sponsored by Moms Clean Air Force and Arizona Climate Action Coalition (198)*

Thank you for your recently announced proposal to address pollution from medium and heavy-duty trucks. We, the undersigned Arizona community organizations, elected officials, and community members are joining together to ask for stronger heavy-duty engine and vehicle standards. We are concerned about the impacts of the climate crisis on our children and communities, and do not feel that the proposal goes far enough to address the urgency we are facing. [EPA-HQ-OAR-2019-0055-1192-A1,p.1]

We are writing to you today to ask that you please consider strengthening the proposed standards before they are finalized. The transportation sector is the leading source of climate pollution in the US.[EPA-HQ-OAR-2019-0055-1192-A1, p.1]

Organization: *Mass Comment Campaign sponsored by National Religious Partnership for the Environment (4,677)*

The Environmental Protection Agency has an opportunity to help address the injustice of pollution and climate change by enacting the strongest possible heavy duty truck standards. The standards EPA sets should achieve 100 percent zero-emission truck sales by 2035, which would be at a pace that would deliver much needed health benefits to communities of color. With zero emission trucks, which are commercially available, pollution from these trucks can be eliminated in our neighborhoods. [EPA-HQ-OAR-2019-0055-1122-A1, p.1]

We strongly urge the EPA to advance its environmental justice mandate by prioritizing zero emissions from heavy duty trucks and producing strong heavy duty truck standards that reduce pollution. [EPA-HQ-OAR-2019-0055-1122-A1, p.2]

Organization: *Mass Comment Campaign sponsored by Natural Resources Defense Council (28,240)*

Please accept these 28,240 public comments from members and online activists of the Natural Resources Defense Council (NRDC) asking you to adopt the strongest possible standards to reduce pollution from diesel truck engines and establish a national zero-emissions truck sales requirement to help phase out fossil fuels and slash air pollution in the most-impacted communities more quickly. [EPA-HQ-OAR-2019-0055-1614, p.1]

EPA has a responsibility to slash air pollution, protect public health, and address the climate crisis all at once by pursuing strong standards for heavy-duty vehicle emissions. [EPA-HQ-OAR-2019-0055-1614, p.1]

While we commend your agency for undertaking this effort, we are concerned that your draft proposal doesn’t go far enough and needs to be significantly strengthened. [EPA-HQ-OAR-2019-0055-1614, p.1]

Even with strong emissions standards in place, it will take years for the benefits to reach the people who need them most. That's why we also need a zero-emissions truck mandate. [EPA-HQ-OAR-2019-0055-1614, p.1]

By adopting the two abovementioned policies, we can make progress towards our climate goals and protect the communities most at-risk. [EPA-HQ-OAR-2019-0055-1614, p.1]

Organization: *Mass Comment Campaign* ***sponsored by PennEnvironment (50)***

We the undersigned organizations, businesses, and community leaders are writing to respectfully urge EPA to create the strongest possible limits on pollution from heavy-duty trucks and buses. EPA's proposal to rein in pollution from heavy-duty trucks and buses must be strengthened to truly protect public health from air and global warming pollution. Trucks create pollution that is warming our planet and polluting our communities. As the largest source of global warming pollution in the nation, we must zero out climate emissions from our transportation sector by 2050 to avoid the worst impacts of climate change. That means replacing trucks, buses, freight vehicles, delivery vans, and other vehicles that rely on fossil fuels with clean, electric versions of those vehicles. Smog pollution from trucks is also a threat to public health, causing childhood asthma, cancer and even premature death. To protect our health and fight climate change, EPA must strengthen the proposed heavy duty truck rule. While the limit on smog-forming nitrogen oxides (NOx) in EPA's proposed rule is a start, it doesn't go nearly far enough to protect public health. We call on the EPA to revise and improve the rule, and require NOx emissions to be reduced by 90% by 2027 for heavy duty trucks and buses. The greenhouse gas emission standard in the proposed rule is also far too weak, and must be improved to reduce global warming pollution and accelerate the market for electric trucks. EPA must enact standards that put the American truck and bus fleet on a clear roadway to 100% zero-emission sales by 2035. Vehicle manufacturers have the technology to meet stronger standards than those currently put forth by EPA in its proposed rule, and many recent analyses have shown that fully zero-emission trucks will be cheaper to purchase and operate than diesel-trucks within the timeframe of these standards. Cleaner trucks can deliver cleaner air. EPA can and must initiate a stronger rule that will quickly cut harmful emissions, meet the climate crisis, and protect the health of communities across the state and country. [EPA-HQ-OAR-2019-0055-1616]

Organization: *Mass Comment Campaign sponsored by Public Citizen (168)*

While these rules are a good start, they don’t go far enough. I call on the EPA to make the rules stronger. [EPA-HQ-OAR-2019-0055-1597-A2,p.1]

EPA’s plan needs to urgently eliminate tailpipe emissions and transition the trucking industry to zero emissions. Many states have already required truck manufacturers to reduce NOx emissions by 90% by 2027. EPA can build on these standards by incorporating strong greenhouse gas standards in order to reach 100% clean trucking by 2035. [EPA-HQ-OAR-2019-0055-1597-A2,p.1]

Organization: *Mass Comment Campaign sponsored by Union of Concerned Scientists - 1 (13,985)*

I am glad that, after 20 years, you have proposed stronger tailpipe toxic pollution standards for heavy-duty diesel trucks. But the rule falls short. [EPA-HQ-OAR-2019-0055-1194-A1, p.1]

I urge you to protect our health and eliminate toxic tailpipe emissions from trucks by adopting a stronger rule that accelerates the rollout of zero-emission trucks. [EPA-HQ-OAR-2019-0055-1194-A1, p.1]

Organization: *Mass Comment Campaign sponsored by Consumer Reports (CR) (17,499)*

I urge the EPA to set the strongest standards possible to reduce greenhouse gas and nitrogen oxides emissions from medium- and heavy-duty trucks manufactured in 2027 and beyond. [EPA-HQ-OAR-2019-0055-1613-A1, p.1]

It has been more than 10 years since these standards were updated, and we need the strongest rules possible to protect our health, air, and climate. [EPA-HQ-OAR-2019-0055-1613-A1, p.1]

Organization: *Mass Comment Campaign sponsoring organization unknown (20)*

I support because Climate change action can't wait! [EPA-HQ-OAR-2019-0055-1607, p.1]

Organization: *Mass Comment Campaign sponsoring organization unknown (5,967)*

Thank you for your recently announced proposal to address pollution from medium and heavy-duty trucks. I am worried about the impacts of the climate crisis on the health of our communities, and I'm concerned that the proposal does not go far enough. I'm writing to you today to ask that you please consider strengthening the final standards. The transportation sector is the leading source of climate pollution in the US. The climate crisis is harming our families and our communities today, and heavy-duty vehicles are a major contributor to this pollution. In fact, despite making up only 10% of the total number of vehicles on the road, medium- and heavy-duty trucks contribute a quarter of the total climate pollution from the transportation sector. Trucks are also major sources of other deadly air pollution. Medium and heavy-duty trucks are major contributors to NOx emissions, a potent precursor to ground-level ozone pollution, and they account for more than 60% percent of the deadly particle pollution that comes from vehicles. Particle pollution cuts short tens of thousands of lives in the US every year and contributes to the heavy burden of asthma on our nation's children. Moreover, air pollution impacts are inequitably distributed and disproportionately harm Blacks and Latinos compared to whites. That's why the U.S. should enact standards that put the American truck and bus fleet on a clear roadway to 100% zero-emission sales by 2035. To protect the health of our communities, and to address environmental injustices, EPA must take urgent action to strengthen the proposed standards today to reduce health-harming pollutants, including NOx and PM and greenhouse gasses from medium and heavy-duty combustion vehicles — while continuing to accelerate our transition to zero-emissions vehicles. By taking these steps, the U.S. will be well positioned to protect our family's health, reduce fuel costs for truckers and fleets, strengthen our energy security, and advance environmental justice. [EPA-HQ-OAR-2019-055-1593]

Organization: *Mass Comment Campaign sponsoring organization unknown (40)*

Thank you for your recently announced proposal to address pollution from medium- and heavy-duty trucks. As a parent concerned about the impacts of the climate crisis on our children and communities, I'm concerned that the proposal does not go far enough. I'm writing to you today to ask that you please consider strengthening the proposed standards before they are finalized. The transportation sector is the leading source of climate pollution in the US. The climate crisis is harming our families and our communities today, and heavy-duty vehicles are a major contributor to this pollution. In fact, despite making up only 10% of the total number of vehicles on the road, medium- and heavy-duty trucks contribute a quarter of the total climate pollution from the transportation sector. Trucks are also major sources of other deadly air pollution. Medium- and heavy-duty trucks account for more than 60% percent of the deadly particle pollution that comes from vehicles. Particle pollution cuts short tens of thousands of US lives per year and contributes to the heavy burden of asthma on our nation's children. Moreover, this type of pollution is inequitably distributed and disproportionately harms Blacks and Latinos compared to whites. To protect our children's health and future, and to address environmental injustice, EPA should take urgent and bolder action and strengthen the proposed standards today to reduce health-harming pollutants, including NOx and PM, and greenhouse gases from medium- and heavy-duty vehicles. Thank you for your dedication to protecting public health and to advancing justice and equity. [EPA-HQ-OAR-2019-055-1595]

Organization: *Mass Comment Campaign sponsoring organization unknown (984)*

We are attaching to this email a list of names of community leaders who are urging the EPA to adopt clean truck standards. We know that by adopting clean standards, that will reduce air pollution by 90% by 2027 and put us on a path so that by 2035 all-new trucks and buses are zero-emission. [EPA-HQ-OAR-2019-055-1596]

Organization: *Mass Comment Campaign sponsoring organization unknown (396)*

I find the proposed rule to be weak and urge EPA to withdraw it. I believe it would be better to establish a zero emission standard for all HDVs, for which zero emissions power trains are now commercially available, beginning with model year 2027. The current proposal would reduce CO_2 emissions by less than 1% compared to the existing rule, thereby allowing 2027 HDVs to emit an estimated 28,088,000 metric tons of CO_2 annually. That's 1.78 billion metric tons over a 20-year useful vehicle lifespan and is unacceptable! Many HD vehicle types are currently available with zero emission technology. By setting a zero emission standard for those vehicles now available, EPA could reduce by about 2/3 the total greenhouse gas emissions from this type of vehicle. Doing so would enable us to avoid roughly 1.25 billion metric tons of emissions between now and 2050, which is the equivalent of shutting down five large coal-fired power plants. The most recent IPCC report has told us that the climate crisis is accelerating and that we are out of time to take action. We must not forego these easily-achievable reductions. We must have a zero emission standard now! [EPA-HQ-OAR-2019-055-1601]

Organization: *Mass Comment Campaign sponsoring organization unknown (1,357)*

After decades of inaction that has allowed a growing fleet of dirty diesel trucks to pollute our communities, EPA must enact strict emission reductions and accelerate the transition to zero emissions trucks. I appreciate your agencys efforts in addressing these long-overdue updates to emission standards, but the proposed rule fails to set the ambitious standards required to rapidly adopt zero emissions requirements and address climate change. I urge EPA to propose stronger standards that will protect the health of my community and support the progress in achieving the pollution reduction goals laid out in the Chesapeake Clean Water Blueprint. Nitrogen oxides released from diesel engines contribute nitrogen to the waters of the Chesapeake Bay, which fuels harmful algae blooms and dead zones. If we are going to achieve and maintain the pollutant cuts needed to improve Bay water quality and restore this national treasure, EPA must do their part by adopting the strongest possible standards for heavy-duty truck emissions. Strengthened standards for greenhouse gas emissions are vital to put us on a path to zero-emissions trucks, tackling climate change impacts that are already threatening the Chesapeake region. Further, the dangerous air pollution from these heavy-duty vehicles disproportionately impacts BIPOC and lower income communities and communities of color, that are often the least able to advocate for better environmental conditions. I urge you to propose tougher and more ambitious standards, putting us on a path to zero-emissions from heavy-duty vehicles. This is a crucial opportunity to tackle the urgent threat of climate change, improve water quality in the ecologically and economically important Chesapeake Bay, and protect the health of our most vulnerable communities. I followed a tipper truck in MD yesterday that, whenever it accelerated it emitted more black exhaust smoke than a WW2 Destroyer laying a smoke screen to protect a convoy from enemy action. For decades now some European countries have had toll-free phone numbers for public use to report licence plate numbers of smokey diesel vehicles to their environmental protection authorities. Time to set that up here. [EPA-HQ-OAR-2019-055-1603]

Organization: *Mass Comment Campaign sponsoring organization unknown (**2,433**)*

Every year semi-trucks, busses, and other heavy-duty vehicles emit millions of tons of nitrogen oxides (NOx) and other greenhouse gas pollutants driving climate change. NOx air pollution from heavy-duty vehicles contributes to ozone and fine particulate pollution, which are unsafe to breathe, especially for the young and elderly and anyone exercising outdoors. This pollution is particularly dangerous for communities located close to high truck traffic areas, affecting millions of people that live near highways, warehouses, or ports. In our national parks it harms plants, trees, insects and other animals and it reduces the ability of visitors to see and appreciate the views of our treasured park landscapes. Heavy-duty vehicles are also one of the nation's top sources of climate pollution. Nearly all of America's national parks are threatened by the symptoms of a warming climate including more frequent heat waves, drought, sea level rise, coastal flooding, and extreme wildfires. To tackle this threat, the Biden administration must pursue the strongest possible NOx and greenhouse standards for heavy-duty vehicle engines. Any standards adopted should achieve a 90% reduction in NOx pollution from new heavy-duty vehicles by no later than 2027, which has already been implemented in a half-dozen states and counting. Moreover, the administration should strengthen the rule's greenhouse gas requirements to set us on a path towards 100% zero-emission heavy-duty vehicle sales by 2035. [EPA-HQ-OAR-2019-0055-1594]

Organization: *Mass Comment Campaign sponsoring organization unknown (1**65**)*

My faith urges me to care God's creation and protect human health. Doing so means attending to climate change and addressing environmental justice. Therefore, I join United Women in Faith and urge the Environmental Protection Agency to strengthen the current EPA proposed rule on heavy-duty trucks to move the US to 100% zero-emission trucks by 2035. Trucks and buses produce nearly 25 percent of the transportation sector's greenhouse gases, but only account for 4 percent of vehicles on the road. Smog and soot air pollution caused by trucks and buses are among the greatest threats to public health for the more than 45 million people in the U.S. Because of discriminatory transportation practices, highways and transportation depots are often placed near and through communities of color, placing these communities in greater danger from vehicle pollution. Reducing diesel emissions would not only address climate change but significantly reduce pollution in communities of color. Cleaner trucks are not only available and ready now, they are also projected to deliver critical cost savings for operators and drivers. Today, electric trucks and buses are already capable of supporting the majority of freight, delivery, and transit uses and needs. Across nearly every vehicle class, zero-emission electric trucks and buses are projected to be cheaper to own and operate than their combustion engine counterparts within 5 years. I urge the Environmental Protection Agency to address the injustice of pollution and climate change by enacting the strongest possible heavy duty truck standards to achieve 100 percent zero-emission truck sales by 2035.We absolutely need cleaner vehicles moving the vast amount of "stuff" in this country. When driving behind a truck now, it's easy to see the air pollution that it emits. If we are to have a more sustainable world, then changes need to be made quickly!! [EPA-HQ-OAR-2019-0055-1599]

Organization: *Mass Comment Campaign sponsoring organization unknown (**52,051**)*

Since the earliest days of his presidency and through subsequent executive orders, President Biden and his administration promised bold action to set strong rules and standards to lower emissions from the transportation sector, including heavy-duty vehicles. However, the EPA's proposed Heavy Duty Vehicle (HDV Ruling) provides weak regulations to ensure the damages of trucking pollution stop harming our community. I believe that the EPA needs to hear that the cleanest possible standards are urgently needed. We need a 90% reduction in diesel truck emissions. Time is of the essence: the administration must finalize this proposal by the end of 2022 for the nation to realize the full health benefits of the rule. If the agency misses this window of opportunity, it will mean a full additional year of production of polluting trucks. This makes it critical to ensure that heavy-duty vehicles are as efficient as possible and that we adopt and enforce strict emissions limits as we shift away from fleets powered by fossil fuels. Our communities cannot afford to wait for cleaner air. Black and Brown communities need a rapid transition to zero-emitting trucks and a clear path towards 100% electrification of polluting big rigs, trucks, and buses. Finally, we cannot afford more loopholes and giveaways for multi-billion dollar companies to get a pass on poisoning frontline communities in favor of increased profits. It's past time for the EPA to expire all avenues for skirting pollution standards. [EPA-HQ-OAR-2019-0055-1600]

Organization: *Mass Comment Campaign sponsoring organization unknown (**1,087**)*

As a person of faith and conscience, I recognize that we have a moral obligation to cut carbon emissions and other pollutants that harm our health and our communities. People of all faiths and spiritual traditions share a common bond to care for their neighbor and this planet we all share. To stop climate change and ensure our national security we MUST get off fossil fuels! It's NOT an option! That means electric vehicles. Again, NOT an option. This is a NECESSITY. Stop denying the obvious, bite the bullet, do what needs to be done, and switch to electric vehicles! Don't waste our time and money on fossil fuel vehicles when you KNOW our use of fossil fuels has a very limited shelf life at this point (because if they don't, WE DO). President Biden's larger climate agenda cannot be accomplished without a strong rule on America's 13million heavy-duty trucks and buses. I view much of this rule as a good starting point, but I would like to see it strengthened given the urgency of the climate crisis, the rapid advancement of EV technology and the increasingly understood human health impacts, particularly on communities of color and our most vulnerable residents. The EPA should use these standards to rapidly accelerate the transition to electric trucks and put our nation's medium- and heavy-duty vehicles on a pathway to 100% zero-emission electric vehicles by 2035. I urge the EPA to set the strongest standards possible recognizing the health and well being of current and future generations who will be impacted by this rule. It is essential that the final standards reduce dangerous NOx pollution 90% by 2027 and put our buses and trucks on a clear path to 100% zero-emission all-electric vehicles by 2035. [EPA-HQ-OAR-2019-0055-1602]

Organization: *Mass Comment Campaign sponsoring organization unknown (**2,804**)*

Diesel pollution kills. Nearly 10,000 people in the United States die each year from exposure to diesel emissions from the transportation sector, and hundreds of thousands of others face heart attacks, asthma, and respiratory conditions that damage their wellbeing and quality of life. The EPA's proposed rulemaking on diesel emissions is much needed. I appreciate the EPA for proposing these new standards to better protect the climate and the health of people. Diesel emissions most severely harm communities of color and working class communities, and cleaning up dirty diesel pollution helps to create a more just society. Having failed to act for so long to a health problem long recognized, these rules are at last a good start, but they fall well short of what is needed. I call on the EPA to make the rules stronger. EPA's plan needs to urgently eliminate tailpipe emissions and transition the trucking industry to zero emissions. Many states have already required truck manufacturers to reduce NOx emissions by 90% by 2027. EPA can build on these standards by incorporating strong greenhouse gas standards in order to reach 100% clean trucking by 2035. Improving these standards will improve health outcomes for communities hardest hit by diesel pollution. EPA should adopt requirements to address disproportionate health impacts so that those who are most harmed by diesel pollution can find relief quickly. I encourage the EPA to boldly pursue environmental justice as it reduces diesel emissions and improves the health of communities near ports and freight corridors. [EPA-HQ-OAR-2019-0055-1605]

Organization: *Max Keifer, Retired (CDC NIOSH).*

[*From Hearing Testimony, April 13, 2022*] It is heartening to see the administration acting on clean truck standards, and I would very much like to see the EPA establish stronger limits on heavy-duty vehicle pollution. I have an undergraduate degree in environmental health and a graduate degree in industrial hygiene and toxicology, and recently retired after a career in public health. As such, I have a strong interest in regulatory efforts to reduce or eliminate exposure to pollution from vehicles and other sources. I spent most of my working lifetime investigating worker health concerns and evaluating exposure to a wide variety of contaminants, including diesel and gas engine combustion products in trucking depots, bus maintenance facilities, and fire stations. I am acutely aware of the adverse health effects that can occur from exposure to heavy-duty vehicle exhaust, particularly to workers, who are the most heavily exposed. In addition to reducing the significant contribution of greenhouse gasses, the public health code benefits of strong regulation to reduce or eliminate emissions from heavy-duty trucks cannot be overstated. Without further reductions, heavy-duty vehicles will continue to be one of the largest contributors to mobile source emissions of oxides of nitrogen, greenhouse gasses, and particulate matter. Vehicle exhaust emissions consist of a complex mixture of combustion products that have been linked to adverse health effects such as eye and nose irritation, headaches, nausea, and asthma. Emissions from heavy-duty vehicles contribute to poor air quality and health across the country, especially in overburdened and underserved communities. The National Toxicology Program, EPA, and IARC have all found that exposure to diesel exhaust is reasonably anticipated to be a human carcinogen. The benefits of reducing exposure to these emissions cannot be overstated. It is important that this proposed rule protects both people from both oxides of nitrogen pollution and puts us on a path to having all trucks sold be zero-emission by 2035. Electric trucks and buses are already available and capable of supporting most freight, delivery, and transit uses and needs. Across nearly every vehicle class, zero-emission electric trucks and buses are projected to be cheaper to own and operate than their combustion engine counterparts within five years. The agency's most stringent proposal, Option 1, is insufficient and should be significantly strengthened as it would result in higher emissions of smog and oxides of nitrogen than that permitted by the California Heavy-Duty Omnibus Rule. Option 2 would result in unacceptably high levels of oxides of nitrogen pollution, and should not be considered. Again, I urge this administration to set the strongest possible emission standards to ensure 90 percent oxides of nitrogen reduction by 2027, and establish a clear roadmap to 100 percent zero-emission vehicles by 2035. EPA last revised the oxides of nitrogen standards for on-highway, heavy-duty trucks and engines in 2001, more than 20 years ago, and new technologies that are available today can help achieve the additional reductions we need. [EPA-HQ-OAR-2019-0055-2867]

Organization: *Mayer Automotive LLC*

I am all for clean air, but the cost of what they are proposing ? It will drive up cost of goods. And with driver shortages it will magnify the problem. [EPA-HQ-OAR-2019-0055-1018, p.1]

Organization: *Mayor, City of Albuquerque, NM et al.*

In our shared effort to protect our residents from air pollution, advance environmental justice, and confront the climate crises, we urge the Environmental Protection Agency (EPA) to finalize the strongest possible heavy-duty vehicle requirements via the Clean Trucks Plan, now released as a Notice of Proposed Rulemaking (NPRM) Docket ID No. EPA-HQ-OAR-2019-0055. [EPA-HQ-OAR-2019-0055-1316-A1, p.1]

Thank you for your consideration. There is no time to wait; there is a critical need for the EPA to take swift action moving towards a zero-emissions future in order to protect the health and safety of environmental justice communities. We are confident that you agree on the urgency of this issue and we urge you to finalize a strong rule. [EPA-HQ-OAR-2019-0055-1316-A1, p.2]

Organization: *Metropolitan Washington Air Quality Committee (MWAQC) et al.*

On behalf of the Metropolitan Washington Air Quality Committee (MWAQC), the National Capital Region Transportation Planning Board (TPB), and the Metropolitan Washington Council of Governments' (COG) Climate, Energy and Environment Policy Committee (CEEPC), we are writing to offer our support for the proposed rule to change the heavy-duty emission control program -- including the standards, test procedures, regulatory useful life, emission-related warranty, and other requirements -- to further reduce the air quality impacts of heavy-duty engines across a range of operating conditions and over a longer period of the operational life of heavy-duty engines. We also support the proposed targeted updates to the existing Heavy-Duty Greenhouse Gas (GHG) Emissions Phase 2 program that will further GHG reductions in the model year (MY) 2027 timeframe. [EPA-HQ-OAR-2019-0055-0996-A1, p. 1]

Organization: *Michigan Association of Timbermen*

On behalf of the membership of the Michigan Association of Timbermen, we would like to go on record as opposing final rule on tailpipe emissions from heavy-duty trucks as part of the 'Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards.' [EPA-HQ-OAR-2019-0055-1169-A1, p.1]

We urge you to amend the proposed rule so that it reduces emissions, protects American jobs, and results in cleaner air and healthier communities for all. [EPA-HQ-OAR-2019-0055-1169-A1, p.1]

Specifically, the EPA must reject Option 1 and revise Option 2. An overly aggressive standard will result in higher costs for fleet operators, jeopardize thousands of good-paying jobs, slow the transition to zero-emission vehicles, and fail to achieve the desired environmental benefits. [EPA-HQ-OAR-2019-0055-1169-A1, p.1]

Instead, the EPA must recognize the importance of a single-step, national rule. To be effective, the final rule must be:

- Customer-acceptable. If truck owners and operators choose not to purchase new trucks due to cost or reliability concerns that result from a bad federal rule, older trucks will stay on the roads longer and environment goals will not be achieved.

- Economically viable. If the final rule results in higher costs for manufacturers and fleet owners, manufacturers and small business owners may have no choice but to lay off workers and eliminate jobs.

- Environmentally beneficial. An unworkable rule will delay fleet turnover and prevent environmental progress, creating greater harm in communities most at-risk for high air pollution.

- A bridge to a zero-emissions future. The final rule must not prevent continued progress toward zero-emission commercial vehicles by forcing excessive, costly redesigns of traditional combustion engines at the expense of investments in the research and development of zero-emission vehicles. [EPA-HQ-OAR-2019-0055-1169-A1, p.1]

Under this proposed rule, we could see an increase in truck costs for 2027 models of between $35,000 and $45,000 per unit under just Phase 1. Phase 2 would require additional costs to our businesses. [EPA-HQ-OAR-2019-0055-1169-A1, p.2]

Organization: *Mid-America Regional Council (MARC) Air Quality Forum*

The Air Quality Forum commends the EPA for undertaking emission reductions from heavy-duty vehicles after last setting heavy-duty truck standards over twenty years ago. The benefits of this proposed rule support the Air Quality Forum's mission to maintain the health-based National Ambient Air Quality Standards for the Kansas City region and make progress in decreasing emissions from heavy-duty trucks that disproportionately impact people of color and low-income communities in the Kansas City region. [EPA-HQ-OAR-2019-0055-1131-A1, p. 1]

Despite heavy-duty vehicles representing only 5-percent of vehicles on the road, they have an outsized emissions impact--contributing roughly a quarter of transportation sector GHG emissions in the United States. Furthermore, we feel the proposed standards do not reflect the urgency of the climate crisis and rapid advancement of zero-emission truck technology. Therefore, the Air Quality Forum encourages the EPA to be more aggressive and adopt even more stringent limits than those currently proposed under Option 1 as an update to Phase 2 emissions standards. [EPA-HQ-OAR-2019-0055-1131-A1, p. 2]

Organization: *Motor & Equipment Manufacturers Association (MEMA)*

Therefore, more stringent HD NOx emissions standards and a comprehensive HD rulemaking have enormous implications on the motor vehicle supplier industry. The regulatory process provides the industry the needed certainty to develop and improve future products and systems. [EPA-HQ-OAR-2019-0055-1322-A1, p. 2]

As we have advocated in the past, it would also be beneficial to look at the entire lifecycle rather than just "tailpipe" emissions. As vehicles become significantly more fuel efficient, both upstream and downstream emissions become much more important when attempting to truly compare them. Significant infrastructure requirements would also come along with these rules, so if EPA were to try to match CARB there would need to be significant coordination with DOE in terms of planning for the national electric grid. [EPA-HQ-OAR-2019-0055-1322-A1, p. 8]

Per EPA's request for information on heavy-duty electric vehicle sales projections, including for what HD vehicle types, to help inform their HD electric vehicle sales projections in the MY 2024 through MY 2029 timeframe, MEMA urges the EPA to avoid regulations that allow backsliding on ICE technologies to make sure that ICE vehicles are as clean as current technology will allow. [EPA-HQ-OAR-2019-0055-1322-A1, p. 9]

Organization: *Moving Forward Network (MFN)*

For decades, communities across the country have been fighting for the right to breathe clean air. They have been forced to hold their breath for over 20 years as EPA has delayed adopting new standards that will once and for all clean up the deadly emissions from heavy-duty trucks and buses. The Administration and EPA often note their commitment to place environmental justice at the center of policies and programs, yet time and again, these efforts come up unacceptably short. As MFN Campaign Director and environmental justice advocate Angelo Logan put it, "the obvious answer is to dramatically speed up the use of zero-emission equipment—from the ships entering the ports, to the cargo handling vehicles at the docks, to the rail terminals and heavy-duty trucks moving goods to communities all over the country."1 The question is not about how—we have the zero-emission, life-saving technology to make sure every person in the United States can breathe clean air. The question is whether the EPA and this Administration are willing to take the necessary action that prioritizes the health and well-being of communities and the planet over industry. 2 [EPA-HQ-OAR-2019-0055-1277-A1, pp. 1 - 2]

1. https://thehill.com/opinion/energy-environment/592963-bidens-opportunity-to-end-diesel-pollution-of-port-communities/

2. https://thehill.com/opinion/energy-environment/592963-bidens-opportunity-to-end-diesel-pollution-of-port-communities/

As it stands, the current proposed criteria pollutant standards, both Option 1 and especially Option 2, will not relieve the daily burdens caused by the freight transportation system, felt by environmental justice communities but in fact risk an increase in these burdens from this polluting industry. The EPA's weak proposal is indefensible given the very real opportunity to bring zero emissions into the freight transportation system. Critical to implementing this Rule and subsequent Rules, the EPA must ensure that reductions in medium- and heavy-duty vehicle emissions occur within environmental justice communities. Unless and until EPA's proposal is significantly strengthened, this rule will, either perpetuate an already dangerous status quo and/or increase the impacts from medium and heavy-duty trucks and buses that are killing people. [EPA-HQ-OAR-2019-0055-1277-A1, p. 2]

The EPA needs to:

1. enact the most protective and stringent emission standards that ensure emission reductions in environmental justice communities;

2. transition to zero emission trucks and buses by setting stringent emissions standards and adopting a sales mandate;

3. require that all new trucks are zero emission by 2035 with intermediate targets and prioritization for deployment of in EJ communities;

4. retire all combustion trucks on or before 2045; and

5. Ensure that its rules do not allow for false solutions like natural gas. [EPA-HQ-OAR-2019-0055-1277-A1, p. 2]

As we documented in our October 26, 2021 letter to EPA,3 EPA's legal duty is clear: the agency must adopt emission standards that reflect "the greatest degree of emission reduction achievable." But the agency's proposal is a far cry from meeting this obligation. [EPA-HQ-OAR-2019-0055-1277-A1, p. 2]

3. MFN Letter to Administrator Regan: https://www.movingforwardnetwork.com/wp-content/uploads/2021/11/MFN-Zero-Emission-in-Freight-Letter-to-EPA-10_26_21.pdf

Zero-emission trucks are commercially available,4 economically compelling,5 and the single most effective solution for reducing freight emissions.6 Advances in this technology are outpacing even the best estimates from just a few years ago—cost and technology assessments of battery-electric trucks from 2018 are already becoming obsolete. The barriers that once relegated ZEVs to a niche solution are shrinking, allowing zero-emission trucks to become a real solution in our battle against air and climate pollution. At every regulatory opportunity, EPA must include policies that center environmental justice solutions and rapidly advance ZEVs not just in certain market segments but for the entire truck sector. [EPA-HQ-OAR-2019-0055-1277-A1, pp. 2 - 3]

4. See MJ Bradley & Associates, Medium- & Heavy-Duty Vehicles (July 2021) http://blogs.edf.org/climate411/files/2021/08/EDFMHDVEVFeasibilityReport22jul21.pdf.

5. See Amol Phadke et al, Why Regional and Long-Haul Trucks are Primed for Electrification Now (Mar. 2021) https://etapublications.lbl.gov/sites/default/files/updated_5_final_ehdv_report_033121.pdf

6. OECD, International Transport Forum, Transport Outlook - 2019, at 157 https://doi.org/10.1787/transp_outlook-en-2019-enstating "[s]caling up decarbonisation measures for road freight transport that have already been tested and are comparatively easy to introduce is one of the most immediate actions required."

MFN calls for the final proposal to include strong targets, including zero-emission targets, that reflect the technical feasibility and availability of zero-emission heavy-duty technology:

1. MFN urges EPA to finalize standards that include a separate standard for ZE trucks and require an increasing annual minimum number of ZE truck sales.

2. A zero-emission requirement should be separate and in addition to stronger heavy-duty combustion engine requirements to ensure maximum emission reductions are achieved to cut emissions from new combustion engines.

3. Barring a specific requirement for ZE trucks, EPA must lower the NOx standard to reflect feasible ZE trucks sales. If EPA insists on retaining ZE trucks in a vehicle NOx standard, EPA must lower the NOx standard to reflect the greatest degree of emission reductions achievable across the entire truck fleet based on the feasibility of widespread transition to ZE trucks.

4. Unless EPA intends to drive ZEV adoption, ZEV credits must be excluded from the NOx compliance calculation. Given the myriad risks posed by EPA's proposed averaging scheme, if EPA refuses to adopt more stringent standards that reflect the feasibility of achieving significant emissions reductions through the application of ZE truck technologies, EPA must remove ZEV credits from the NOx compliance calculations. [EPA-HQ-OAR-2019-0055-1277-A1, p. 3]

On October 26, 2021, the Moving Forward Network presented a letter to EPA detailing recommendations to address the disproportionate burdens caused by the freight transportation system on environmental justice communities. EPA must address the cumulative burdens across the entire freight sector and, while these comments will focus on the proposed Heavy Duty Truck Rule, we maintain that EPA must work from a "whole of government" approach and make intentional efforts to address the pollution and public health threats impacting environmental justice communities everyday. MFN's goals, priorities, and demands are summarized below:

1. First and foremost, any and all emission standards must eliminate all pollutant emissions, rather than focusing solely on reducing or eliminating carbon emissions. In this rulemaking, EPA should require that all new trucks be zero-emissions beginning in 2035, with robust interim targets before then. EPA should also set standards that require the retirement of all combustion trucks on or before 2045.

2. EPA must ensure that any new emission standards drive the market for zero-emission truck and bus technology.7

3. In setting these standards across the freight sector, EPA must consider environmental justice impacts and priorities "from source to tailpipe to grave."8 Put another way, the agency must carefully consider any unintended consequences of the proposed regulatory design. For example, regulations must avoid promoting false solutions (e.g., carbon trading and/or "greenwashed" energy that comes from non-renewable and heavy-polluting sources such as natural gas, biomass, etc.) that will only lead to further burdening our environmental justice communities.

4. Transportation electrification must be accompanied by standards and regulations that support renewable electricity generation, i.e., wind and solar,9 that will not further burden environmental justice communities. The EPA and its sister agencies should coordinate with environmental justice leaders in determining the siting details for the supporting electricity infrastructure to ensure that this does not lead to additional cumulative impacts and instead ensure mandatory emissions reductions for EJ communities. [EPA-HQ-OAR-2019-0055-1277-A1, pp. 6 - 7]

7. Regulations must avoid promoting false solutions, (e.g., carbon trading and/or "greenwashed" energy that comes from nonrenewable and heavy-polluting sources such as natural gas, biomass, etc.), that will only lead to further burdening our environmental justice communities

8. "To grave" means that how and where waste from retired zero emission and diesel vehicles is considered in the planning and implementation of zero emission policies and programs.

9. Renewable energy may have many definitions based on the source of energy. MFN considers solar and wind to be renewable energy. However, there are important EJ and equity implications that come from these "cleaner" energy sources (i.e siting, manufacturing, shipping, etc). All of these must be considered with EJ leadership before endorsing specific renewable energy recommendations.

Moreover, MFN and its members have and continue to emphasize that a cumulative impact framing is so critical because it demonstrates the need to move away from fragmented, limited approaches as “solutions”, and towards a more holistic, big-picture approach that will actually be able to address the real-world harms environmental justice communities face. [EPA-HQ-OAR-2019-0055-1277-A1, p. 11]

Along with the announcement for this rule the EPA shared the Transportation and Environmental Justice resource. In this document the EPA highlighted the impacts from the freight transportation system on environmental justice communities and their “comprehensive” approach to address the impacts from Medium- and Heavy-Duty Trucks. The above critical recommendations on how EPA needs to strengthen this rule and move in an intentional and significant way to zero emission vehicles does just that. The current two Options for emissions standards fall dangerously short and leave environmental justice communities and the millions of people who live in them at great risk for many years to come. The zero emissions component and proposed averaging scheme in no way aims to drive ZE sales and in fact could lead to increased emissions in environmental justice communities. MFN is committed to working with EPA to ensure that the regulations around freight impacts does actually meet the intended call to action that the Present set forth. We need EPA to act as the leaders the President is referencing and prioritize solutions which protect and prioritize overburdened and underserved communities. This Rule in its current draft does not meet this call to action. We cannot wait for future rules or proposals to address these impacts. We need EVERY rule, program, incentive that comes from EPA to prioritize addressing environmental racism, and protect environmental justice Now. The lives of our communities are at stake. [EPA-HQ-OAR-2019-0055-1277-A1, p. 60]

Organization: *National Association of Chemical Distributors (NACD)*

We agree that vehicle emissions should be reduced in the long term as emissions from heavy-duty vehicles impact the communities of NACD member employees and drivers. However, they must be reduced in a way that accounts for full economic impacts and allows for a realistic path to compliance. NACD looks to government regulators to consider and implement policy that provides for some level of reasonableness, certainty, and predictability. These three elements are lacking in the proposed rule, and NACD urges EPA to rework the proposal to include them to provide clarity and facilitate compliance. [EPA-HQ-OAR-2019-0055-1279-A1, p. 5]

Organization: *National Association of Clean Air Agencies (NACAA)*

We urge EPA to work thoughtfully and quickly to issue a final rule this year – incorporating NACAA’s recommendations – so that NOx emission standards and related program requirements apply beginning with MY 2027. [EPA-HQ-OAR-2019-0055-1232-A1, p. 17]

The gravity of timely compliance with the NAAQS requires this federal action. The protection of public health and welfare, particularly in overburdened communities across the nation, demands it. [EPA-HQ-OAR-2019-0055-1232-A1, p. 17]

Organization: *National Center for Health Research (NCHR)*

NCHR agrees with the Environmental Protection Agency (EPA) that the proposed truck pollution standards, which would reduce emissions of smog- and soot-forming nitrogen oxides, are a crucial step towards EPA's commitment to climate, clean air and environmental justice. However, in light of the ongoing health and climate crisis, the proposed standards fall short of a zero-emission transportation future, and we urge EPA to further strengthen the proposed standards. This has also long been requested by environmental justice communities across the country, because while truck pollution has been devastating the health of communities across the country, it has a disproportionate impact on communities of color. [1 [EPA-HQ-OAR-2019-0055-1227-A1, p.1]

> [1] Moving Forward Network. Demand Zero Emission Freight Now. https://www.movingforwardnetwork.com/zero-emissions/.We are particularly concerned that zero-emission trucks are not the number one priority of the proposed standards, even though electric trucks are already available today. Zero-emission trucks been shown to improve health outcomes, and new research demonstrates that by 2027 pollution-free trucks will be cost competitive with diesel over the lifetime of the vehicle. [2] The rule should also require the maximum possible reduction of emissions from diesel trucks. Diesel trucks are proven to contribute to smog and pollution, causing thousands of premature deaths nationwide each year [3]. [EPA-HQ-OAR-2019-0055-1227-A1, p.1]
>
> [2] Environmental Defense Fund. New Study Finds Rapidly Declining Costs for Zero-Emitting Freight Trucks and Buses. https://www.edf.org/media/new-study-finds-rapidly-declining-costs-zero-emitting-freight-trucks-and-buses. February, 2022.
>
> [3] Union of Concerned Scientists. Electrifying Trucks and Buses. https://ucsusa.org/resources/electrify-trucks. February, 2022.

Strengthened truck standards are an integral aspect of ensuring the health of our nation, and research has shown that pollution-free truck standards are feasible. Pollution also has long had a disproportionate effect on communities of color, making the issue even more pressing. We thus urge EPA to ensure that the proposed truck pollution standards are further strengthened so that they can have the necessary impact in order to protect public health and to set the United States on a path to a zero-emissions transportation future. [EPA-HQ-OAR-2019-0055-1227-A1, p.2]

Organization: *National Coalition for Advanced Transportation (NCAT)*

NCAT strongly supports EPA adopting strong heavy-duty vehicle standards, including a ZEV sales mandate that would culminate in 100 percent of new heavy-duty vehicle sales be ZEVs. To lay the foundation for such an approach, NCAT encourages EPA to consider strengthening the standards described in the proposal. Heavy-duty ZEVs are poised to play a bigger role in the near future than the agency currently assumes for Model Year 2027, supporting greater stringency in the standards. Five states have already adopted California's Advanced Clean Trucks rule and additional states are poised to adopt this rule in the coming years. [EPA-HQ-OAR-2019-0055-1290-A1, p. 2]

In conclusion, NCAT strongly urges EPA to strengthen NOx and GHG emissions standards for heavy-duty vehicles and to pursue a longer-term heavy-duty vehicle ZEV sales mandate to transition new heavy-duty vehicle sales to 100 percent ZEV by 2035. [EPA-HQ-OAR-2019-0055-1290-A1, p. 9]

Organization: *National Parks Conservation Association (NPCA)*

This EPA rule represents a necessary step to reduce NOx and greenhouse gas emissions from heavy-duty vehicles but falls short of CAA requirements and what is needed to ensure the health and welfare of our parks, communities and climate. [EPA-HQ-OAR-2019-0055-1314-A1, p.7]

Organization: *National Religious Partnership for the Environment*

To uphold our moral obligations to God's creation and protect the health and wellbeing of all human communities, the Environmental Protection Agency must move to zero-emission medium- and heavy-duty trucks by 2035. Electrifying these vehicles across the U.S. is key to improving air quality and saving lives in communities with some of the dirtiest air in the nation. It is also essential to achieving emission reductions needed to avoid the worst consequences of climate change and its impacts. [EPA-HQ-OAR-2019-0055-1221-A1, p.1]

A climate and pollution response grounded in justice demands that we move towards clean transportation. Enacting strong medium- and heavy-duty truck standards that prioritize zero emission vehicles will help ensure a more just future for communities of color and help protect all of God’s creation. [EPA-HQ-OAR-2019-0055-1221-A1, p.2]

Organization: *National Tribal Air Association (NTAA)*

NTAA was encouraged by EPA’s commitment expressed on March 7, 2022, that 'This proposed rule would ensure the heavy-duty vehicles and engines that drive American commerce and connect people across the country are as clean as possible…'. While this regulation proposed just three weeks later is an important step in reducing emissions of the many harmful pollutants from these vehicles, it would not achieve all that is possible. For example, - Given that proposed requirements begin with vehicle model year 2027, emissions reduction technologies and strategies should mandate those that are most current and rapidly developing.[EPA-HQ-OAR-2019-0055-1382-A2, p.2]

While acknowledging emerging engine technologies including electric and fuel cell, (see FR pages 17417 through 17418), the proposed rule is focused on promoting emissions reduction technologies, operation, and maintenance of diesel-fueled and, to a lesser extent gasoline fueled, vehicles. [EPA-HQ-OAR-2019-0055-1382-A2, p.2]

Climate change stimulated by emissions of greenhouse gases from many sources including heavy-duty vehicles and engines impacts and threatens Tribal communities throughout the United States. NTAA supports Executive Order 14037, the Clean Trucks Plan and EPA’s commitment to requirements that vehicles be 'as clean as possible'. This rule should be promulgated consistent with these commitments. [EPA-HQ-OAR-2019-0055-1382-A2, p.2]

Organization: *National Waste & Recycling Association (NWRA)*

As the industry that facilitates and conducts recycling throughout the country, NWRA members support EPA's goals to make the environment a better place and increase the cleanliness and efficiency of the vehicles their companies produce and operate. NWRA does not want to have a regulation that limits the strides our manufacturers and operating companies are already taking to incorporate zero emission vehicles (ZEV) into our fleets. An overly burdensome prescriptive standard could limit or slow down the momentum that is currently occurring in the transition to battery electric vehicles. NWRA-member truck manufacturers are already seeing an uptick in the request and ordering of ZEVs. NWRA requests that EPA institute a technologically feasible rule. [EPA-HQ-OAR-2019-0055-1242-A1, p. 1]

Organization: *Natural Gas Vehicles for America (NGVAmerica)*

NGVAmerica supports EPA finalizing regulations that encourage much needed emission reductions, are based on realistic expectations about the pace and cost of technology, and that encourage engine makers and vehicle manufacturers to deploy a variety of available, scalable, and cost-effective technologies. [EPA-HQ-OAR-2019-0055-1330-A1, p.1]

NGVAmerica supports the EPA's efforts in this rulemaking to promulgate more stringent NOx and greenhouse gas emission standards for heavy-duty engines and vehicles. As highlighted in EPA's notice, trucks and buses powered by medium- and heavy-duty engines contribute a disproportionate amount of pollution in urban areas throughout the U.S. In many cases, trucks and buses are the most significant contributors to ozone pollution and smog. This is not because cleaner technology does not exist but rather because cleaner technology is not being deployed in effective numbers and older, higher polluting vehicles remain on our roads and in-use. [EPA-HQ-OAR-2019-0055-1330-A1, pp.2-3]

The emissions impact of battery materials and battery production are not inconsequential. An ATRI study released this month 'found that while electric trucks have no direct tailpipe emissions, CO2 production associated with vehicle, battery and electricity production would only result in a 30 percent decrease in CO2 emissions when compared to a standard diesel truck.'14 According to ATRI, 'the marginal environmental benefits of electric trucks are due, in large part, to lithium-ion battery production – which generates more than six times the carbon of diesel truck production.' A story published by Politico included this significant datapoint: 'a thousand-pound electric car battery requires the moving of 500,000 pounds of earth in the course of mining.'15 The Financial Times has reported that 'between 5 and 15 tonnes of CO2 are produced per tonne of lithium extracted. This is equal to the total electric usage of between 1 and 2 U.S. homes for a whole year.'16 [EPA-HQ-OAR-2019-0055-1330-A1, p.7]

Organization: *Navistar, Inc. (Navistar)*

EPA’s proposed changes include not only new NOx certification standards, but also fundamentally new test procedures, and extended useful life and warranty requirements. Navistar is concerned that in setting the proposed NOx compliance standards and in-use emission limits that EPA did not fully take into account the cumulative effect of all of these new proposed requirements on HDOH engine and vehicle manufacturers. When all of these changes are combined, the magnitude of EPA’s proposed rule is unprecedented, raising significant feasibility and implementation concerns. In addition, the proposed rule has the effect of potentially slowing the progress of Navistar’s electrification and zero emission vehicle (“ZEV”) development efforts by requiring Navistar to divert significant time and capital resources to products that will provide only limited NOx emission reduction benefits. [EPA-HQ-OAR-2019-0055-1318-A1, p. 2]

While Navistar does not support EPA’s proposed rule as currently drafted, we remain hopeful that a consensus set of standards can be reached, which balances the priorities as described in this comment letter. [EPA-HQ-OAR-2019-0055-1318-A1, p. 2]

While Navistar supports EPA’s ultimate emissions reduction and climate change goals, there are a number of issues requiring clarification or modifications in the final rule. We remain hopeful that a consensus set of standards can be reached that balances the priorities we have described. [EPA-HQ-OAR-2019-0055-1318-A1, p. 7]

Organization: *Neste US, Inc*

Neste has a demonstrated interest in sustainability and supports EPA’s emphasis on reducing NOx and GHG emissions from heavy-duty vehicles. As a company, Neste supports more electrification and other zero-emission vehicle (ZEV) solutions because, fundamentally, they provide a net benefit for addressing climate change. However, going 'all-in' on one potential solution that won’t be ready for decades, means ignoring proven, low-emission solutions that work and are available today. [EPA-HQ-OAR-2019-0055-1225-A1, p.1]

Neste urges the Agency not to adopt what is effectively an electric vehicle (EV) mandate at the expense of clean, renewable diesel. While EVs and other zero emissions vehicles may be able to reduce emissions from the transportation sector, replacement of existing fleets with entirely new vehicles and technology will require significant time, financial investments, and other resources. [EPA-HQ-OAR-2019-0055-1225-A1, p.1]

Neste does not oppose EPA’s proposal to impose more stringent GHG standards on heavy-duty vehicles. Nor does Neste oppose EPA’s endorsement of EVs as a method to reduce emissions. However, Neste urges EPA to acknowledge the value of renewable diesel as an accompanying measure to achieve immediate GHG emissions reductions with no additional infrastructure, particularly as EV technologies continue to evolve.

EV benefits overinflated, while negative impacts overlooked

First, the benefits of EVs are often overinflated while the negative impacts are overlooked. EPA's focus on EV's lack of tailpipe emissions fails to adequately account for the economic impact of EVs or the lifecycle emissions associated with EVs, including the upstream emissions from charging batteries. [EPA-HQ-OAR-2019-0055-1225-A1, p.2]

The California Air Resources Board (CARB) recently conducted economic modeling of four GHG emissions reduction scenarios encompassing a range of sectors. CARB concluded that all four emissions reductions scenarios would slow job and economic growth. However, Alternative 1, which mandates carbon neutrality and 100% electrification of all sectors by 2035, would slow employment growth by nearly five times and economic growth by six times more that Alternative 3, which uses a broad portfolio of GHG reduction measures, including existing and emerging fossil fuel alternatives, electrification, and other technologies. See Figures 1 (employment) and 2 (state domestic product). [EPA-HQ-OAR-2019-0055-1225-A1, p.2]

Given the significant benefits associated with renewable fuels and the uncertainties regarding the climate and economic benefits and drawbacks of focusing on EVs, EPA should not favor EVs over other vehicle categories in planning for the de-carbonization of the U.S. transportation sector. [EPA-HQ-OAR-2019-0055-1225-A1, p.3]

Organization: *New York Farm Bureau (NYFB)*

While air quality is of upmost importance to New York farmers, there are several concerns with the proposed rule. This rule has the potential to delay the turnover to newer vehicles with cleaner emission technologies, forcing vehicle owners to keep their higher-emitting trucks longer and not update to model year (MY) 2027 in heavy-duty vehicles. This not only will delay EPA's anticipated environmental benefits, it also would cause environmental backsliding that seems to be in conflict with the goals of the agency. Furthermore, a poorly designed final rule will cause market disruptions, will delay or undermine the ability of manufacturers to recoup their investment in developing compliant technologies, and worse, could have significant adverse impacts on the economy. [EPA-HQ-OAR-2019-0055-1268-A1, p. 1]

As emphasized previously, heavy-duty trucks are the lifeblood not only of farms, but also throughout the entire supply chain. Increasing costs, decreasing availability and potentially encouraging negative environmental impacts through public policy should always be avoided. Yet, this proposed rule would multiply the supply chain, inflationary and input pressures New York farmers and consumers are already facing. More needs to be done to invest in infrastructure, vehicle and engine technology advancement and incentive programs before this rule is considered. While New York State has its own program for financial incentives for cleaner vehicle technology through the New York Truck Voucher Incentive Program (NYTVIP), the program is often over prescribed, and it's unclear if such a program could be replicated at the federal level. [EPA-HQ-OAR-2019-0055-1268-A1, p. 2]

It is again important to emphasize that trucking is enormously important to the economy—the industry moves 72% of goods in America and is the foundation of a well-functioning supply chain. When trucking costs go up, the cost of nearly all goods go up with it. As the White House recently noted, trucking costs grew more than 20% last year, and we know that sharply increased fuel costs thus far in 2022 have only exacerbated economic burdens. [EPA-HQ-OAR-2019-0055-1268-A1, p. 2]

NYFB believes the proposed rule is not technologically feasible, cost-effective or acceptable to the needs of farmers. Our policy, developed by hardworking farmers, clearly enunciates opposition to any further attempt to restrict or regulate exhaust emissions on new or used farm equipment, heavy equipment or trucks. NYFB therefore urges EPA to take extra caution to avoid requirements that could intensify the already challenging economic conditions facing rural communities and the U.S. economy. NYFB appreciates EPA's consideration of agriculture's concerns. [EPA-HQ-OAR-2019-0055-1268-A1, p. 2]

Organization: *Next Level Farmer, LLC*

Diesel truck emissions are just a small part of the problem. Plus, the USA is experiencing high rates of inflation because, of elevated fuel prices. All of America would be affected and most surely the working class would go bankrupt with additional demands on their razor-thin budgets. These bankruptcies would collapse the USA economy. [EPA-HQ-OAR-2019-0055-2785, p.1]

Organization: *North Carolina Assembly House of Representatives, John Faircloth*

Please do not discount the concerns expressed by commercial vehicle manufacturers. The economy of North Carolina – indeed, the entire country – is dependent on their continued growth, research, and reinvestment as we collectively work toward a cleaner environment. [EPA-HQ-OAR-2019-0055-2446, p. 2]

Organization: *North Carolina Federation of Republican Women*

The U.S. economy has suffered a mortal blow with runaway inflation exacerbated by ever-increasing fuel costs. Our nation cannot afford further financial damage, especially in an industry that is vital to our survival. Historically vital industries were protected from unnecessary damage from government regulations. In this proposed tightening of government standards, our vital trucking industry will be forced to adopt new technologies that will cripple smaller businesses and cause a jump in consumer prices. Truckers are the backbone of America and are rightly proud of their role in clean air success. At this moment of crisis when container ships are stranded off our coasts, we need to keep vital trucks rolling across America to feed our families and move needed goods in our economy. The 2,600 members of the North Carolina Federation of Republican Women urge the EPA to delay implementing these rules. Thank you. [EPA-HQ-OAR-2019-0055-2450, p. 1]

Organization: *North Carolina General Assembly, Philip E. Berger*

Commercial vehicle manufacturers are committed to partnering with EPA and other stakeholders to further reduce emissions from heavy-duty trucks without diverting resources necessary to foster a phased transition to ZEVs. We urge you to work with them - not against them - to finalize a cost-effective rule that will further reduce emissions, protect American jobs, and result in cleaner air and healthier communities for all. [EPA-HQ-OAR-2019-0055-1105-A1, p. 2]

Please do not discount the concerns expressed by commercial vehicle manufacturers. The economy of North Carolina - indeed, the entire country - is dependent on their continued growth, research, and reinvestment as we collectively work toward a cleaner environment. [EPA-HQ-OAR-2019-0055-1105-A1, p. 2]

Organization: *North Carolina House of Representatives, Office of the Speaker, Tim Moore*

Commercial vehicle manufacturers are committed to partnering with EPA and other stakeholders to further reduce emissions from heavy-duty trucks without diverting resources necessary to foster a phased transition to ZEVs. We urge you to work with them - not against them - to finalize a cost-effective rule that will further reduce emissions, protect American jobs, and result in cleaner air and healthier communities for all. [EPA-HQ-OAR-2019-0055-1146-A1, p. 2]

Please do not discount the concerns expressed by commercial vehicle manufacturers. The economy of North Carolina - indeed, the entire country - is dependent on their continued growth, research, and reinvestment as we collectively work toward a cleaner environment. [EPA-HQ-OAR-2019-0055-1146-A1, p. 2]

Organization: *North Carolina State House of Representatives, Larry W. Potts*

Please do not discount the concerns expressed by commercial vehicle manufacturers. The economy of North Carolina - indeed, the entire country- is dependent on their continued growth, research, and reinvestment as we collectively work toward a cleaner environment. [EPA-HQ-OAR-2019-0055-1061-A1, p. 2]

Organization: *Northeast States for Coordinated Air Use Management (NESCAUM)*

NESCAUM supports the adoption of a 0.020 gram NOx engine standard in 2027 at intermediate useful life and a 0.035 gram NOx standard at full useful life as specified in CARB's Omnibus regulation. Ample data from CARB, EPA, and other research programs exist supporting the feasibility of introducing a 0.020 gram NOx standard at intermediate useful life in 2027.19,20,21,22,23,24 EPA also released a memo on May 3, 2022 presenting heavy-duty diesel engine test results similarly indicating that current engines are already approaching this NOx standard, therefore supporting its feasibility by MY2027.25[EPA-HQ-OAR-2019-0055-1249-A1, p. 9]

Organization: *Northview Service Center*

The current regulations that are in effect are stringent enough and it would put most small operators out of business if there is a requirement to upgrade old equipment before that business is ready financially to purchase new or newer vehicles. These vehicles will eventually come out of service over time and be upgraded. [EPA-HQ-OAR-2019-0055-1016, p.1]

Organization: *NTH Equipment*

Against. These changes and new technologies need vetted by the industry for affectiveness. The last change with the uria requirements failed and caused major damage to engines and have and still cost millions upon millions to the industry and in turn the end users and add to inflation. We do not need to cause more cost to be added to the every day persons lives and that is exactly what more regulation will do. This is not the time to do this. [EPA-HQ-OAR-2019-0055-1044-A1, p.1]

Organization: *Odyne Systems, LLC (Odyne)*

Odyne applauds the efforts of the Environmental Protection Agency (EPA) to work with industry to reduce air pollution from highway heavy-duty vehicles and engines, including ozone, particulate matter, and greenhouse gases. [EPA-HQ-OAR-2019-0055-1264-A1, p.1]

Organization: *Our Children's Trust*

As the Nation's only law firm dedicated to representing youth whose constitutional rights are being infringed by their government's conduct that causes climate change, we write to advise EPA to set stronger nitrogen oxide ('NOx') and other greenhouse gas ('GHG') standards and further strengthen its heavy-duty greenhouse gas emission standards for MYs 2027-2029 and beyond to align with the swift emission reductions needed to correct Earth's energy imbalance and stabilize the climate system, and to abide by the constitutional, public trust, and legal obligations that constrain EPA's actions.1 [EPA-HQ-OAR-2019-0055-1317-A1, p.1]

> 1 Our comments here apply equally to the limited amendments to regulations for air pollutant emission standards for the other sectors referenced, including 'light-duty vehicles, marine diesel engines, locomotives, various types of non road engines, vehicles, and equipment.'

Organization: *Outdoor Power Equipment Institute (OPEI)*

OPEI largely supports the Proposed Rule. OPEI is primarily seeking clarification with these comments. [EPA-HQ-OAR-2019-0055-1205-A1, p.1]

Organization: *Owner-Operator Independent Drivers Association (OOIDA)*

The regulatory options presented in the NPRM maintain an impractical approach to achieving emissions reductions that discounts the contributions of the trucking industry, ignores realities from previous flawed emissions rulemakings, and does not thoroughly contemplate the operational impacts on small trucking businesses. [EPA-HQ-OAR-2019-0055-1266-A1, p.2]

Clean air is a priority for everyone, including truckers, but the technology used in heavy-duty trucks to improve air quality has to be affordable and reliable. Small-business truckers and owner-operators should not be used as trial cases for testing new technology, while getting priced out of business in the process. Unfortunately, each of the proposed timelines to achieve nitrogen oxides (NOx) emissions reductions leave us wondering if the same mistakes from previous rulemakings will be repeated. [EPA-HQ-OAR-2019-0055-1266-A1, p.2]

EPA must consider a more feasible implementation timeline that would provide reliable and affordable heavy-duty vehicles for consumers, particularly small trucking businesses and individual owner-operators. We believe there is a more realistic path forward to reducing commercial vehicle emissions that involves listening to the men and women of the trucking industry. EPA should continue seeking out feedback from these stakeholders as the agency develops any final rule. Truckers know all too well that poorly implemented regulations will result in breakdowns, downtime, and ultimately set back the goal of achieving cleaner air. [EPA-HQ-OAR-2019-0055-1266-A1, p.2]

As currently proposed, both option 1 and option 2 introduced in the NPRM fail also fail to provide adequate production timelines to ensure vehicle reliability for motor carriers. Again, other hurried emissions timelines have led to breakdowns, downtime, and ultimately set back the goal of achieving cleaner air. [EPA-HQ-OAR-2019-0055-1266-A1, p.5]

OOIDA has supported the administration's emphasis on improving driver recruitment and retention. The trucking profession is by no means an easy one. Our members spend on average 250 nights on the road each year, keeping them away from family, friends, and the comforts of home. They often work between 60 and 80 hours each week - a demanding schedule that is rarely reflected in their paychecks. Instead of taking actions to benefit those who make their living behind the wheel such as expanding truck parking capacity, increasing driver compensation, and improving working conditions, this proposed rule would make small-business truckers' jobs more difficult and push some out of the industry. The final rulemaking should reflect more practical timelines that do not force drivers out of business or make it more challenging for new drivers to enter the industry. [EPA-HQ-OAR-2019-0055-1266-A1, p.6]

OOIDA believes that industry stakeholders, specifically small-business truckers and owner-operators, will be an invaluable resource for EPA as the agency develops any final Heavy-Duty NOx emissions rulemaking. We appreciate the agency's willingness to hear from professional drivers that have real-world experience with emissions technologies. Moving forward, EPA must prioritize affordability, reliability, and serviceability in order to achieve practical standards that will reduce NOx emissions for heavy-duty vehicles. These objectives cannot be met until a comprehensive Regulatory Flexibility Act analysis is completed that addresses the Rule's impact on small-business truckers. [EPA-HQ-OAR-2019-0055-1266-A1, pp.12-13]

Organization: *Ozone Transport Commission (OTC) and Mid-Atlantic/Northeast Visibility Union (MANE-VU)*

The OTC and MANE-VU strongly support EPA's efforts to develop new heavy-duty engine and vehicle emission standards and test procedures that will reduce NOx emissions from heavy-duty trucks. NOx emissions are a primary precursor to the formation of ground-level ozone and secondary fine particulate matter (PM2.5) and contribute to acid deposition, eutrophication, and visibility impairment in the OTC region. [EPA-HQ-OAR-2019-0055-1250-A1, p.1]

The Clean Air Act requires ozone NAAQS attainment as 'expeditiously as practicable,' and EPA's proposed Options 1 and 2 do not meet this requirement. The introduction of effective and available heavy-duty engine and vehicle pollution reduction technologies will assist jurisdictions in the OTR in reaching attainment of the ozone standards. This is the most 'expeditiously as practicable' path called for by the Clean Air Act and anything less than this will not be acceptable. [EPA-HQ-OAR-2019-0055-1250-A1, p.13]

Organization: *PACCAR, Inc (PACCAR)*

PACCAR generally supports the goals of EPA's Proposed Rule, including many specific elements and proposed regulatory changes. [EPA-HQ-OAR-2019-0055-1346-A1, p.59]

Organization: *Pennsylvania Chamber of Business and Industry*

We strongly encourage EPA to modernize and streamline effective and durable nitrogen oxide (NOx) emission standards for heavy-duty highway engines, and to work with states and stakeholders so as to recognize cost-effective, technology-based requirements to achieve reductions that will facilitate an improvement in air quality and continued economic expansion. The options outlined in the most recent Notice of Proposed Rulemaking, published in the Federal Register this past March, are simply unworkable and overly aggressive, as we will describe below. [EPA-HQ-OAR-2019-0055-1319-A1, p.1]

With respect to air quality, the PA Chamber advocates for cost effective air laws, regulations and policies based on sound principles that are reasonable and technologically and economically feasible to protect and enhance public health and the environment without placing in-state businesses at a competitive disadvantage. The PA Chamber supports regulatory policy which balance societal environmental, energy, and economic objectives, fit rationally within any finally adopted and applicable national or international strategy, and capitalize on the availability of Pennsylvania's diverse natural resources to facilitate economic development in the Commonwealth. It should be noted that this approach to economic growth and environmental stewardship is also written into the Clean Air Act itself, where Section 101(b) directs EPA to implement the provisions of the Act in a manner 'to promote public health and welfare and the productive capacity of [the] population.' [EPA-HQ-OAR-2019-0055-1319-A1, p.2]

Organization: *Peoria Charter Coach Company*

In conclusion, now is time for the EPA to help our industry in regard to pollution. For, the air coming out of one of my vehicles is cleaner than the air (in certain cities} going in. I appreciate your consideration in altering the current ruling based on the most current data. [EPA-HQ-OAR-2019-0055-1241]

Organization: *Performance Truck*

This in no way going to help anyone.. the systems on these truck are prone to fail and end up costing the consumer and businesses thousands of dollers Remember we are a government for the people,,, YOU are making it AGAINST the people I look forward to the day when we start over [EPA-HQ-OAR-2019-0055-1009, p.1]

Organization: *Pinnacle Converting Equipment & Services, LLC*

As a small business owner in the US, please do not impose additional restrictions on trucking emissions. There are not enough trucks on the road today and the economic impact will be quite adverse in a time where the country has 1) not enough truck drivers and 2) not enough trucks to transport the good we have currently in our ports. [EPA-HQ-OAR-2019-0055-1011, p.1]

Additionally, with inflation running rampant and fuel prices over $6/gallon for diesel, the cost benefit analysis does not favor any additional regulation. [EPA-HQ-OAR-2019-0055-1011, p.1]

Instead of this regulation on American owned and operated vehicles, please consider imposing additional regulations on imports from China and India. Both countries have very different air quality requirements from the US. [EPA-HQ-OAR-2019-0055-1011, p.1]

Organization: *Port of Seattle, Port of Tacoma, and Northwest Seaport Alliance (NWSA)*

On behalf of the Port of Seattle, the Port of Tacoma, and The Northwest Seaport Alliance (NWSA), we are writing in support of this important effort to strengthen emission standards for criteria air pollutants and greenhouse gases from heavy duty engines and vehicles. The proposed rules align well with our own clean air, climate, and environmental justice goals, and will help advance the ambitious vision of our recently updated clean air strategy: to eliminate emissions from all seaport activities by 2050. From our perspective as one of the country's largest cargo gateways, the transition to cleaner – and, ultimately, zero-emission – heavy duty trucks and equipment will require significant financial, technical, and policy assistance from the U.S. government to facilitate and accelerate the procurement of cleaner/zero-emission trucks and equipment and the development of the necessary charging and fueling infrastructure here in the Puget Sound region and Washington State. [EPA-HQ-OAR-2019-0055-1312-A1, p.1]

Organization: *Proterra*

Proterra thanks the EPA for its commitment to protecting the environment and human health, and for the opportunity to comment on this rulemaking which represents a good first step in the right direction towards a cleaner transportation future. [EPA-HQ-OAR-2019-0055-1344-A1, p.1]

Proterra has entered into partnerships to develop or supply battery systems with more than a dozen OEMs across 19 vehicle programs, powering zero-emission electric delivery vehicles and work trucks, semi-trucks, construction and mining equipment, port container handlers and forklifts, school and coach buses, and low-floor cutaway shuttles. [EPA-HQ-OAR-2019-0055-1344-A1, p.1]

These partnerships have signaled the readiness of various medium- and heavy-duty sectors to electrify, from Class 3 to Class 8. Proterra has invested to meet this customer demand. Several states have also exhibited leadership in the move toward zero emission transportation. California has led with the implementation of the Innovative Clean Transit rule for public transportation, the Zero-Emission Airport Shuttle rule for airport shuttles, and the Advanced Clean Truck rule for vehicle manufacturers, demonstrating the readiness of the market to meet clean transportation needs. [EPA-HQ-OAR-2019-0055-1344-A1, p.1]

Other states like Oregon, Washington, New York, New Jersey and Massachusetts have also led with the adoption of the Advanced Clean Truck rule first modeled by California. New York State has led with a plan to fully electrify every school bus in the state by 2035. [EPA-HQ-OAR-2019-0055-1344-A1, p.2]

These state level efforts can be complemented with national leadership by EPA to create regulatory certainty via this rulemaking and to encourage the further implementation of zero emission vehicles across the country and further investments in US technology development and job creation as the world moves toward an electric transportation future. [EPA-HQ-OAR-2019-0055-1344-A1, p.2]

Organization: *Public Citizen and Healthy Port Communities Coalition (HPCC)*

We appreciate the Proposal put forth and support the need for urgent emission reductions from the heavy-duty vehicle sector. We urge the EPA to strengthen the proposed rule and to move quickly to finalize, implement, and enforce strong standards that will protect the health of the 72 million people living within one tenth of a mile of truck routes and quickly reduce greenhouse gas emissions in order to limit global temperature rise to 1.5° Celsius. [EPA-HQ-OAR-2019-0055-1417-A2, p. 1]

Organization: *Randolph M. Lyon*

EPA is to be commended for assessing these issues and proposing a stronger regulatory posture. The analysis presented to date, however, focuses on two options, termed Option 1 and Option 2 by EPA. Option 1 is the stronger of these two options and it has positive economic net benefits and important health and social equity impacts under the different discount rates and other technical assumptions considered. Also, significantly, Option 1 has greater net benefits than Option 2 under the assumptions considered. The relative net benefits of the two main options and the proposed rule's limited published information on greenhouse gas (GHG) emissions raise several important questions that EPA should consider.

1. <u>What would be the effects on net benefits, social equity, and public health of an option that provides even stronger environmental protection than Option 1</u>? Based on the information provided with the current proposed rule, it is possible that a stronger option would provide net economic, social equity, and public health benefits that are even greater than those of Option 1. Once other collateral benefits, such as those from GHG reductions, are considered, this possibility is likely to become even more likely.

2. <u>What are the specific greenhouse gas reductions, in terms of tonnages and climatic impacts, associated with different options</u>? At a minimum, the specific tonnages should be presented to enable analysts and policy makers to evaluate the net benefits associated with these emission reductions.

3. <u>What would be the effects on net benefits, social equity, and public health of considering a positive economic value for GHG reductions in the analysis</u>? EPA should include results that present monetized values of the GHG reductions. If appropriate, these values could consider a range of benefit estimates per ton to give policymakers an understanding of the sensitivity (or insensitivity) of the results to different assumptions.

4. <u>What would be the net benefit, social equity, public health, and other characteristics of considering an option to parallel the more stringent rules adopted by California and several other states</u>? While the current proposed rule and regulatory impact analysis

mention the California rule, they do not present a clear and transparent analysis—including tables and figures with air quality, public health, and economic effects—of expanding the California rule nationwide. Among other things, EPA should consider the regulatory and zero-emission vehicle market development benefits of having a common national standard. The State of Maryland Department of the Environment, for example, submitted comments (EPA-HQ-OAR-2019-0055- 1025) to this Docket supporting adoption of the California rule on a national basis on April 22, 2022.

5. <u>If deemed necessary, what adjustments could be considered to the California framework to best extend it to a nationwide mandate if there are concerns about the extent of vehicle availability in specific model classes and years</u>? If EPA determines there are practical uncertainties that suggest considering variants of the California rule, such as a longer phase in for certain specific classes of vehicles, those options could be discussed.

6. <u>Would anticipated or potential co-investments, such as build-out of a nationwide system of electric vehicle charging stations, change the feasibility of any options</u>? For example, does the enactment of the Infrastructure Investment and Jobs Act (P.L. 117-58) on November 15, 2021, increase the expected availability of a nationwide network of charging stations in a manner that would facilitate adoption of zero-emission long-haul trucks?

My expectation is that these additional analyses would support a stronger regulatory framework than Option 1 and serious consideration of a framework similar to the one adopted by California and, in turn, several other states. Thank you for preparing the proposals and analyses shared to date and for seeking these comments. [EPA-HQ-OAR-2019-0055-1100, p. 1-2]

Organization: *Repair Association/Repair.org*

These comments are made in support of making repair more accessible in an environment where increased use of digital components is extending control of the vehicles by the manufacture and limiting agricultural producers repair service providers or indeed the ability to self-repair the equipment they own. [EPA-HQ-OAR-2019-0055-1036-A1, p.1]

Organization: *Retail Industry Leaders Association (RILA)*

In conclusion, RILA appreciates the invitation to submit comments on the proposed rule. We welcome further opportunities for input and dialogue, where the transporation practitioners of the retail industry can be a resource to help facilitate commonsense and realistic approaches to reducing transporation emissions. We share the goal of developing a final rule that will not create or increase barriers to emissions reduction, but will help industry pave the way for a zero emissions future.[EPA-HQ-OAR-2019-0055-1189-A2, p.9]

Organization: *Rivian Automotive, LLC (Rivian)*

While the options considered by the agency move in the right direction, Rivian believes EPA should consider its current lineup of alternatives and proposals as a floor and demonstrate greater ambition in the final rule. [EPA-HQ-OAR-2019-0055-1229-A1, p.1]

In 2020, approximately 60 percent of those NOx and PM emissions occurred in urban areas.2 Electrifying MHD vehicles has particular benefits for neighborhoods and populations of concern in and around America’s major cities. [EPA-HQ-OAR-2019-0055-1229-A1, p.2]

The NPRM rightly describes an “historic opportunity” for bold action as the industry embarks on a “significant transition” to zero-emissions vehicles (“ZEVs”).3 Rivian applauded Executive Order 14,037, which identified several potential regulatory actions for EPA to consider in accelerating progress toward a zero-emission MHD sector.4 The agency’s proposal for new criteria pollutant standards and revised GHG standards was well received and comes as a growing list of product launches and manufacturer commitments underscores the readiness of the MHD sector to electrify more quickly than previously thought.[EPA-HQ-OAR-2019-0055-1229-A1, p.2]

> 3 Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, 87 Fed. Reg. 59, 17,419 (Mar. 28, 2022) (revising 40 C.F.R. Parts 2, 59, 60, 80, 85, 86, 87, 600, 1027, 1030, 1033, 1036, 1037, 1039, 1042, 1043, 1045, 1048, 1051, 1054, 1060, 1065, 1066, 1068, and 1090).
>
> 4 Exec. Order No. 14,037, 86 Fed. Reg. 151 (Aug. 10, 2021).

EPA’s proposed rule raises the bar. Rivian welcomes the increased stringency identified in Option 1 for criteria emissions and appreciates the tighter GHG standards proposed. We also recognize that the EPA and the Biden Administration more broadly view this rule as just the first regulatory action among several, including a fresh look at MD standards for MY27 and later as well as HD GHG standards for MY30 and beyond. Certainly, Rivian agrees that more ambitious regulatory action will be necessary for EPA’s rules to proactively move the market forward and deliver emissions reductions that protect public health and the climate. We look forward to those future proposals.[EPA-HQ-OAR-2019-0055-1229-A1, p.2]

However, important steps to strengthen this proposal can also be taken now. Our analysis of the proposed rule found that EPA likely underestimated the pace of electrification that is feasible over the timeframe in question. We have also identified provisions in the rule that appear likely to soften the regulation’s impact and result in delays to the stated goals of this administration. These proposed provisions are not necessary given the rapidly growing availability of ZEVs in the MHD market. A simpler regulatory framework aligned with industry’s recent investments and commitments will make the proposed rule even stronger, reducing emissions from the transportation sector at a faster pace to better protect our climate and public health. [EPA-HQ-OAR-2019-0055-1229-A1, p.3]

Rivian views both the NOx and GHG proposals in the NPRM as a floor for EPA's deliberations on a final rule. EPA should consider strengthening both standards to ensure the agency is doing more than just keeping pace with trends toward electrification and maximizing the environmental and public health benefits of this rule. In addition, we also encourage EPA to take a different approach to the amendments proposed regarding LDV GHG and fuel economy testing procedures, allowing manufacturers more time and flexibility. [EPA-HQ-OAR-2019-0055-1229-A1, p.7]

Organization: *Richard Leeds*

Kudos to the EPA for issuing regulations to reduce pollution from trucks and buses, and that advance the transition to zero-emissions transportation. [EPA-HQ-OAR-2019-0055-1333]

While the proposed level of regulation, and the rate of implementation are an improvement over prior regulations, they will permit the continued use of poorly maintained vehicles for too long, where research has shown that poorly maintained vehicles generate 10 to 100 times as much unhealthy exhaust as a well maintained vehicle. Permitting poorly maintained vehicles to continue operating in cities and highway will deny healthy lives to millions of people. [EPA-HQ-OAR-2019-0055-1333]

Further, delaying changeover to electric vehicles will exacerbate the climate crisis, desertification, severe weather, fresh water shortages, fire disasters, sea level rise, and the climate refugees that we are already seeing. Our failure to act at this time will cause longterm damage the global habitat for humans and the variety of species on this planet, in perpetuity. [EPA-HQ-OAR-2019-0055-1333]

I ask that the EPA adopt the Alternative Option with stricter emission standards and earlier implementation. [EPA-HQ-OAR-2019-0055-1333]

If the EPA determined that it is not possible to adopt the Alternative Option, I ask that the EPA adopt Option 1 as a minimum to begin to exercise the EPA's governmental responsibilities to provide for a healthy future.

Organization: *Rocknaks Hardware Plus*

I own a business that depends on the trucking company. One of our deliveries this past week was three days late do to a breakdown. The breakdown resulted in another truck and driver to come from Minnesota to Montana to pick up the trailer and complete the delivery. This was caused by the original truck shutting down to an emissions program that failed. This country depends on our trucks, if we continue to handcuff and require more complex circuitry we will have bigger issues to deal with in the future. [EPA-HQ-OAR-2019-0055-1019, p.1]

Organization: *Roush CleanTech (Roush)*

ROUSH appreciates the EPA's thoughtful efforts to develop a strategy to best mitigate emissions from internal combustion engines. Specifically, we recognize the importance of granting eligibility to a wide array of advanced technologies to provide the best options for fleets, and flexible regulatory structure for compliance. By doing so, we believe the overall air quality benefits are maximized, as manufacturers can provide cost-effective solutions which consumers are most likely to adopt and utilize. [EPA-HQ-OAR-2019-0055-1276-A1, p.1]

Organization: *Royal Plastics, Inc.*

I understand that there is concern for air pollution, etc. However, there needs to be a balance between both the regulations and what is going to be economical for the trucking industry. There is a lot of transportation in the US that is dependent upon truck drivers that are either individual drivers or drivers that work for a small operation. If the expenses outweigh profitability for these small businesses, they will close, and we will be even shorter on transportation in an already short industry. And trying to subsidize with government funding is not the answer either. We are already way overspending taxpayer dollars with fewer people working and paying into the tax system. So, if there needs to be standards imposed, then they need to phase them in over an extended period of time so the cost burden will be reasonable for the smaller operations to handle. [EPA-HQ-OAR-2019-0055-1017, p.1]

Organization: *RV Industry Association (RVIA)*

RVIA has reviewed the proposal published March 28 and has serious concerns about the cost impact of the proposed regulations as they apply to motorhomes. Whereas EPA recognized in the Phase 2 GHG rule2 that certain segments of the medium- and heavy-duty vehicle sector deserve to be assigned unique standards, the agency has does not propose to address the implications of its proposal for motorhomes and other vehicle types that were included in the so-called 'custom vocational chassis' category in the GHG rule. We request the agency either retain existing standards for motorhomes or create new standards that are commensurate with the benefits that are to be derived from more stringent standards for motorhomes. We ask that the agency avoid a 'one-size fits all' approach that has the potential to seriously harm the RV community. [EPA-HQ-OAR-2019-0055-1270-A1, p. 1]

> 2. EPA/NHTSA joint final rule establish Phase 2 GHG / Fuel Consumption standards for medium- and heavy-duty trucks, 81 FR 73478, Oct. 25, 2016.

For a diesel motorhome costing $150,000 today, this would represent a massive cost increase of over 10%. Unfortunately, motorhomes are subject to other EPA and NHTSA regulations that will result in other price increases in the same 2027 timeframe (e.g., EPA’s Phase 2 GHG rule and NHTSA’s forthcoming automatic emergency braking mandate). Motorhome costs are also subject to other inflationary price pressures, not the least of which today is the ongoing chip shortage. Cumulatively, regulatory changes like those proposed, when stacked on top of other inflationary pressures, will result in product prices that are likely to significantly reduce the percentage of people that can afford a motorhome. Being the discretionary purchases that they are, motorhome sales are likely to be substantially reduced from current levels. This reduction in sales will have a deleterious impact on jobs tied to the production, distribution, and sale of motorhomes. The ability of average Americans to afford an alternative means of recreation that became increasingly popular with the advent of the Covid-19 virus will be diminished. Operators of campgrounds and recreation areas such as our National Parks will be negatively impacted. [EPA-HQ-OAR-2019-0055-1270-A1, p. 3]

EPA can and should do what it did in the Phase 2 GHG rule. It should go beyond setting 'one-size fits all' standards that will significantly harm the motorhome community and instead, either maintain the existing standards or establish standards that are commensurate with the benefits to be derived from regulating motorhomes. Looking at the Phase 2 GHG as an example, EPA established custom vocational vehicles standards which it projected would incrementally increase the cost of 2027 model year motor home chassis by approximately $900. This contrasted to an estimated cost increase of $5,670 for other categories of 2027 model year heavy duty trucks (a savings of $4,770 per vehicle)12. [EPA-HQ-OAR-2019-0055-1270-A1, p. 4]

> 12. Table 7 - Summary of Final 2027 Custom Chassis Vocational Standards Including Average Per Vehicle Costs and Projected Improvement, Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles - Phase 2 Regulatory Impact Analysis, EPA-420-R-16-900, August 2016, page ES-16.

RVIA believes that a program like what was established in 2016 for custom vocational chassis is necessary and appropriate. We ask that the EPA either retain its existing standards for motorhomes or modify its proposal and establish standards for motorhomes that have costs that are fitting with the benefits to be derived and not unduly harm the motorhome community. [EPA-HQ-OAR-2019-0055-1270-A1, p. 5]

Organization: *S&P Global Mobility*

S&P Global Mobility supports the Environmental Protection Agency’s (EPA) Notice of Proposed Rulemaking for Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards (NPRM), specifically the provisions related to production volume data being considered emissions data not subject to confidential treatment. This letter is only intended to comment on the treatment of production volume data. [EPA-HQ-OAR-2019-0055-1273-A1, p. 1]

Organization: *Saahil Pasha*

Air pollution and ground-level ozone are a major problem for all people living the United States. Moreover, people living in urban communities are more impacted by heavy traffic. These communities are disproportionately affected and consist of minority and low-income individuals. The trucking and freight industries increase the level of risk as the vehicles emit large amounts of pollutants. Nitrogen oxide emissions pose a significant threat to the lung and airway health for many people. When exposed to these pollutants consistently, these issues further lead to chronic conditions and a significant burden on the healthcare industry and economy. [EPA-HQ-OAR-2019-0055-1206]

Although Air North Texas encourages every individual to contribute towards reducing emissions and air pollution, it is necessary for the EPA, as an executive agency, to enforce an industry wide standard and uphold its mission of protecting the environment and public welfare. [EPA-HQ-OAR-2019-0055-1206]

I firmly support the proposed rules by the EPA. To reduce emissions, Air North Texas recommends that North Texans should try to bike or walk, reduce engine idling, work from home, carpool, use local transit system, and limit outdoor activities during high pollution times of the day ("How to take action | Air north Texas," n.d.). Therefore, the proposal put forth by the EPA to reduce nitrogen oxide, greenhouse gas, and particulate matter emissions would significantly reduce pollution and improve pollution related health outcomes in the North Texas area. In the proposed rule the EPA has provided information about the various projected health benefits that are expected in 2045, when the program is fully implemented. [EPA-HQ-OAR-2019-0055-1206]

While the transportation industry may have reservations regarding the proposed rule, the EPA is acting within its granted authority to propose regulations that contribute to improved air standards and the protection of public health. Furthermore, the EPA has conducted cost benefit analyses and considered the viability of the options to the trucking industry (EPA-HQ-OAR-2019-0055-0983, p. 17,415 - 17,416). Nonetheless, a collaborative approach to proposing a rule may encourage stronger compliance from industry partners to transition towards vehicles that work to achieve the goal of reduced emissions. [EPA-HQ-OAR-2019-0055-1206]

Organization: *Sage Lincoln*

As a member of the Bicycle Coalition of Greater Philadelphia, I am submitting comments in response to the EPA’s proposed changes to the heavy-duty emission control program. I strongly support strengthening emissions standards and urge you to select Option 1 and implement the most stringent standards possible. [EPA-HQ-OAR-2019-0055-1073]

Organization: *San Joaquin Valley Air Pollution Control District (District)*

Given the importance of reducing heavy-duty truck emissions in meeting federal air quality standards in the San Joaquin Valley (Valley), the District submitted a petition to EPA on June 22, 2016, requesting that EPA undertake rulemaking to establish new national standards for heavy-duty trucks, and we appreciate and support EPA’s response and efforts through the proposed rule to address this important issue. [EPA-HQ-OAR-2019-0055-1291-A1, p.1]

It has been nearly six years since the District petitioned EPA to begin rulemaking for onroad heavy-duty trucks, and we appreciate the opportunity to support your action on this today. [EPA-HQ-OAR-2019-0055-1291-A1, p.3]

Organization: *SEAM Group*

SEAM Group supports the adoption of heavy duty electric vehicles as a replacement for Class 2b-8chassis [EPA-HQ-OAR-2019-0055-2574, p.1]

Organization: *Sierra Club, NJ Chapter*

This proposed rule has monumental implications because it sets the stage for trucks and buses that will be on the road for the next 20 years. To put that into a clearer perspective, that is after 2050. We all know the immediate and drastic action required by all of us on a national, state and local scale in order to tackle climate change, and to try to mitigate as much as possible of the already incoming disastrous environmental and community impacts. Thus, clean buses and trucks policy, which has not seen a change since 20 years ago, will have a massive impact on this necessary climate action. [EPA-HQ-OAR-2019-0055-2558, p. 1]

Organization: *Sophia Dowd*

The proposed rule is sufficient for the reduction of air pollutants, specifically NOx.

While reviewing the proposed rule, it is clear the efforts to amend standards of heavy-duty vehicles to reduce emission impact are satisfactory. Our environment is now in crisis and the toxic air pollutants that are emitted by these heavy-duty vehicles directly impact the ozone layer while also having an immediate impact on human health. [EPA-HQ-OAR-2019-0055-1043]

According to the University of Toronto near-road air pollution study, “If we were able to reduce emissions of pollutants like black carbon, we would also see an immediate climate benefit”.1 This is critical to understanding the stakes of this proposed rule for the environment. The proposed rule acknowledges the implications of heavy-duty vehicles on air pollutants and the immediate benefits of reducing pollutants from these vehicles. The climate crisis has been avoided for far too long, and this proposal is a sufficient remedy regarding the issue of heavy-duty vehicle pollution. [EPA-HQ-OAR-2019-0055-1043]

The proposal takes into consideration the implications of these new standards on the trucking and agricultural industry as well. While these proposals are focused on transitioning to reduce vehicle emissions, this will not have an adverse effect on companies or small business vehicles. The timeline provided allows for ample time to replace the vehicles and even notes that many vehicles will need to be replaced before the proposed timelines. [EPA-HQ-OAR-2019-0055-1043]

Implementing this rule will create a nationwide standard for heavy-duty vehicles which will aid in regulations regarding future manufacturing of these vehicles. This is essential when looking at nationwide standards that will translate to the largest emission reduction we currently know of. [EPA-HQ-OAR-2019-0055-1043]

This proposal reflects on the NOx emissions, which are not emitted as frequently as CO2 but are still responsible for warming. Effects of warming from emissions include temperature rises, water shortages, increased fire threats, drought, weed and pest invasions, intense storm damage and, salt invasion, etc.2 By 2045, when the proposal will be in full effect, the net benefits would outweigh the costs. While there are some concerns from those who believe the vehicles have no chance of being replaced without economic sacrifices, the plan properly relies on equity to allow for these vehicles to reach a specific mileage and allow for replacement time. [EPA-HQ-OAR-2019-0055-1043]

The other portion of this proposed rule looks at the impact on human health. According to the European Environment Agency (EEA), fine particulate matter causes the most substantial impact of all air pollution- the same pollution these vehicles emit. These impacts include stroke, chronic obstructive pulmonary disease, trachea, bronchus, lung cancers, aggravated asthma and lower respiratory infections.3 This does not include the exacerbated impact of already diagnosed diseases as well: chronic exposure can affect every organ in the body. This is a critical public health issue that is being addressed by reducing air pollutants from heavy-duty vehicles. The European Commission set a goal of 2030 to reduce PM (particulate matter) by 55%. This is comparable to this proposed rule, and premature deaths attributed to PM exposure fell by 33%.4 [EPA-HQ-OAR-2019-0055-1043]

The need for standards that reflect the urgency of the climate situation is present within this proposed rule. By comparing the repair costs and operating costs of heavy-duty vehicles, it is clear that the benefits will outweigh the costs. Concerns about how this rule's implementation will affect the current industries that rely on heavy-duty vehicles are ignoring the equitable timeline this rule has in place so companies and small business owners are able to financially afford the transition to vehicles that follow the standards. It is vital these propositions turn into regulations that help reduce climate change for future generations. [EPA-HQ-OAR-2019-0055-1043]

Organization: *Southern Environmental Law Center (SELC)*

The proposed standards are an important step to promote cleaner cars and trucks, and we welcome EPA's plans to update the current standards.2 Under the Clean Air Act, the medium and heavy-duty vehicle emissions standards are 'technology-forcing' standards and technology that eliminates, not just minimizes, tailpipe pollution from these vehicles already exists.3 Yet EPA's proposal fails to accelerate the transition to zero-emission vehicle (ZEV) technology in this key part of the transportation sector. Vehicles sold while this rule is in effect will be on the road for decades. Given the serious public health and environmental impacts of tailpipe pollution from medium- and heavy-duty vehicles and the availability of technology that eliminates this pollution, we urge EPA to adopt the strongest possible standards under the Clean Air Act and to finalize the rule by the end of this calendar year. [EPA-HQ-OAR-2019-0055-1247-A1, p.1]

2 Exec. Order No. 14037 (Aug. 5, 2021).

3 '[Clean Air Act] section 202(a)(3)(A) is a technology-forcing provision and reflects Congress' intent that standards be based on projections of future advances in control capability, considering costs and other statutory factors.' Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, 87 Fed. Reg. at 17436.

Organization: *State Soybean Associations*

The State Soybean Associations approve of EPA's intention to reduce NOx and GHG emissions from heavy-duty transportation industry. Yet EPA must not to rely on electrification at the expense of the biodiesel and renewable diesel industries, and EPA should use alternative authorities, such as the Energy Policy and Conservation Act, if it wishes to force a mandate for EVs; it should not perpetuate the fiction that it is setting tailpipe emission standards under the Clean Air Act. We hope EPA will acknowledge the value of using biodiesel and renewable diesel as an immediately available strategy to address GHG emissions, particularly while EV technologies continue to evolve. [EPA-HQ-OAR-2019-0055-2035-A1, p.3]

Organization: *States of California, et al. (The States)*

The States commend EPA's efforts to strengthen criteria pollutant emission standards for heavy-duty engines for the first time in almost 20 years. Heavy-duty engines are a significant source of pollutants that contribute to ambient levels of ozone and particular matter that are linked to premature death, respiratory illness including childhood asthma, cardiovascular problems, and other adverse health impacts.2 Indeed, on-road heavy duty vehicles are the largest mobile-source contributor of emissions of nitrogen oxides (NOx)—an ozone precursor—in the country.3 [EPA-HQ-OAR-2019-0055-1255-A1, pp. 1 - 2]

2. 87 Fed. Reg. at 17,444.

3. Id. at 17,418. Ozone is created by a chemical reaction in the presence of sunlight between NOx and volatile organic compounds.

Finally, due to statutory lead time requirements for model year 2027, the States note the importance of finalizing the Proposed Rule as soon as possible but by the end of this year at the latest. [EPA-HQ-OAR-2019-0055-1255-A1, p. 3]

Organization: *Straights Lawn & Garden*

WE SHOULD NOT BE CONSIDERING ANY NEW AIR POLLLUTION CONTROLS. WE ARE IN ATERRIBLE INFLATION AND FUEL SHORTAGE, WE SHOULD ADDRESS THE REOPENING OFOUT PIPE LINES AND ADDRESSING INFLATION INSTEAD OF TRYING TO MAKE MORECOSTLY RULES AND REGULATIONS, [EPA-HQ-OAR-2019-0055-1723, p.1]

Organization: *Taxpayers Protection Alliance (TPA)*

The proposed changes would significantly alter the program by introducing new requirements relating to test procedures, emission-related warranties, and underlying standards. While TPA believes that Nitrogen Oxide emissions pose long-term health hazards for the U.S. population, increasing regulatory costs will only succeed in creating unintended consequences that will ultimately hamper the Environmental Protection Agency (EPA) and Biden administration's goals. Therefore, TPA opposes the proposed rule and urges a more measured and holistic approach to abate emissions and keep costs under control. [EPA-HQ-OAR-2019-0055-1102-A1, p.1]

Organization: *Tesla, Inc. (Tesla)*

Given the acceleration of public health and welfare impacts associated with climate change, it is incumbent upon the EPA to recognize the appropriate role battery electric vehicle (BEV) technology plays today and how widespread commercial availability of BEVs in the U.S. today should inform the implementation of far more stringent finalized standards as part of this rulemaking. As provided below, Tesla strongly supports efforts to address the significant public health and community impacts of air pollution associated with the current heavyduty vehicle fleet and encourages the agency to finalize nitrogen oxide (NOx) and greenhouse gas (GHG) standards that are far more stringent than contained in Option 1 of the proposal by, at a minimum, aligning with the stringency of the California Heavy-Duty Omnibus NOx Rule beginning in MY 2027.4 [EPA-HQ-OAR-2019-0055-1219-A1, p.1]

4 See, California Air Resources Board, Heavy Duty Omnibus Regulation.

Tesla believes these changes will significantly reduce emissions, result in increased deployment of the best available emissions reduction technology (BEVs), maintain U.S. manufacturing leadership in medium and heavyduty BEV technology, and ensure the Administration is meeting it statutory mandate to protect the public health and welfare from the significant and accelerating impacts from criteria air pollution and climate change. [EPA-HQ-OAR-2019-0055-1219-A1, p.24]

In sum, electrifying the medium- and heavy-duty sector will provide significant improvements in air quality and benefits to all Americans through reduced NOx, PM and GHG emissions. Tesla believes it is essential for EPA to establish longer-term medium- and heavy-duty emission standards that actively embrace a more wholesale transition to BEVs, and that the time for doing so is now. EPA's failure to finalize a NOx and GHG rule that substantially puts the heavy-duty sector on a path to full electrification and sufficiently reduces U.S. emissions commensurate with the country's commitment to holding global warming to well below 2 degrees Celsius would not meet the legal benchmark of protecting the public health and welfare. [EPA-HQ-OAR-2019-0055-1219-A1, p.8]

As the agency discusses, the ACT regulation will drive significant emission reductions and medium- and heavy-duty vehicle electrification through Model Year (MY) 2035.77 Additionally, five states – Massachusetts, New Jersey, New York,78 Oregon, and Washington – have already adopted the standards starting in MY 2025. Several additional states are expected to adopt the rule starting in MY 2026. In California alone, the ACT rule is estimated to require the deployment of 100,000 heavy-duty ZEVs in 2030 and 300,000 by 2035.79 There is simply no justification for not including this deployment of vehicles into the NOx proposal baseline. If the seventeen states80 that have adopted the current California light duty ZEV standards also adopt California's ACT rule, it is estimated that 1 in 8 trucks sold in 2030 will be electric.81 Moreover, this adoption would yield significant NOx, PM, and CO2 emission benefits.82 Importantly, the ACT rule incentivizes early action from manufacturers, further supporting a significant increase in deployment of zero emissions trucks in the near term in states that adopt the ACT rule. [EPA-HQ-OAR-2019-0055-1219-A1, p.10]

82 ICCT, Update: Benefits of Adopting California Medium- and Heavy-Duty Vehicle Regulations Under Clean Air Act Section 177 (December 2021).

While the agency also notes the multi-state NESCAUM Memorandum of Understanding (MOU),83 it should ensure that the deployment of BEV technology envisioned under the agreement is included in the NOx (and GHG) baseline assessment. More specifically, in July 2020,84 fifteen states and the District of Columbia announced that they entered the joint MOU wherein they committed to working together the advance and accelerate the market for electric medium- and heavy-duty trucks. The parties agreed to a goal that 100% of new medium- and heavy-duty vehicle sales would be zero emission by 2050, with an interim goal of 30% sales by 2030. A recent analysis found that expanding the MOU nationally would result in more than half of the fleet being electric by 2045 and reduce annual GHG emission reductions 5% of U.S. truck emissions in 2035 increasing to an 18% reduction in U.S. truck emissions in 2045.85 Another found that these states adopting the ACT rule would lead to over 756,000 medium- and heavy-duty ZEVs deployed between 2024 and 2035.86 [EPA-HQ-OAR-2019-0055-1219-A1, p.10]

83 87 Fed. Reg. at 17598 (This effort was organizing by the Northeast States for Coordinated Air Use Management (NESCAUM). The state signing on to the MOU were California, Connecticut, Colorado, Hawaii, Maine, Maryland, Massachusetts, New Jersey, New York, North Carolina, Oregon, Pennsylvania, Rhode Island, Vermont, and Washington.).

84 NESCAUM, 15 States and the District of Columbia Join Forces to Accelerate Bus and Truck Electrification (July 14, 2020).

85 Rhodium Group, States Pave the Way for a Zero-Emission Vehicle Future (Aug. 13, 2020).

86 CALSTART, Zeroing in on Zero Emission Trucks (Jan. 2022) at 21.

Interest in the MOU and its goals continues to expand. 87 In September 2021, the Province of Quebec signed on to the MOU. Virginia followed suite in December 2021, and Nevada just joined at the end of March 2022, bringing the total number of signatories to 17 states, one province, and the District of Columbia. The signatory states have committed to working together through the existing multi-state ZEV Task Force88 to develop and implement an Action Plan to help states meet these ambitious goals. In March, the Draft Multi-State Medium and Heavy-Duty Zero-Emission Vehicle Action Plan was released for public comment.89 Notably, the first recommendation in the draft Action Plan called for the signatory states to adopt the ACT regulation. As noted in the plan: While market-enabling programs such as incentives are also important, regulatory requirements mandating MHD ZEV sales provide market certainty needed to drive investments in zero emission technologies and charging and fueling infrastructure at the pace and scale required for rapid electrification. Indeed, the ZEV sales mandate for passenger vehicles, established by California and adopted by other states, has prompted unprecedented investment in light-duty zero-emission technologies and substantial growth in the market share of light-duty ZEVs. The ACT regulation may be an even more important driver of electrification of the MHD vehicle sector given the costs and characteristics of trucks and buses.90 [EPA-HQ-OAR-2019-0055-1219-A1, p.11]

87 Transport Dive, States band together to push for nationwide fleet electrification (May 5, 2022)

88 NESCAUM, ZEV Task Force, Multi-State ZEV Action Plan (2018).

90 NESCAUM, Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Action Plan (March 10, 2022) at 25.

Moreover, a new analysis indicates adoption of the ACT rule in these states would significantly expand the BEV market and lead to 36% of all new medium- and heavy-duty vehicles being powered by zero-emission engines in 2030.91 [EPA-HQ-OAR-2019-0055-1219-A1, p.11]

91 ICCT, Benefits of the 2020 Multi-State Medium- and Heavy-Duty Zero-Emission Vehicle Memorandum of Understanding (Apr. 27, 2022).

Additionally, the EPA should also consider the plans and tenor of the Regional Electric Vehicle Midwest Coalition (REV Midwest). In September 2021, five midwestern states – Illinois, Indiana, Michigan, Minnesota, and Wisconsin – entered this MOU. According to the agreement, the states will ‘work together to enable an equitable transition to electric vehicles for all with specific consideration for communities that are historically disadvantaged. REV Midwest will position states in the Midwest region to leverage and collectively increase public and private investment in electric vehicles and electric vehicle infrastructure.’92 Specifically, in terms of accelerating medium and heavy- duty fleet electrification, the states will remove barriers to adoption by coordinating on optimizing charging infrastructure, and deployment strategies. [EPA-HQ-OAR-2019-0055-1219-A1, p.11]

92 Regional Electric Vehicle Midwest Coalition, Memorandum of Understanding Between Illinois, Indiana, Michigan, Minnesota, and Wisconsin (Sept. 30, 2021) at 1-2.

The agency’s NOx proposal baseline also does not consider the role electrification of the federal medium- and heavy-duty fleet will play in driving the transition to electrification. In late 2021, the President issued Executive Order 14057 directing all federal agencies, inter alia, to maximize acquisition and deployment of zero emission medium- and heavy-duty vehicles.93 In seeking to decarbonize the federal fleet, the President directed the U.S. Government to procure ‘100 percent zero-emission vehicle acquisitions by 2035.’94 Turning over the U.S. Government fleet will require the transition of 103,00 medium-duty trucks and 39,000 heavy duty trucks.95 Not only will this significantly reduce the fleets’ cost per mile to operate the vehicles and the fleet’s collective GHG emissions, these procurement policies will further accelerate the deployment of BEV medium- and heavy-duty technologies.96 [EPA-HQ-OAR-2019-0055-1219-A1, pp.11-12]

93 President Biden, E.O. 14057, 'Catalyzing Clean Energy Industries and Jobs Through Federal Sustainability,' 86 Fed. Reg. 70935 (Dec. 13, 2021) at 204.

94 Id. at 102(a)(ii).

95 McKinsey, Net-zero emissions in US government fleets (April 18, 2022).

96 Id.

Under Clean Air Act 202(a)(3)(A), EPA is directed to set the proposed NOx emission standard based upon the ‘greatest degree of emission reduction achievable . . .’ Simply put, BEVs – with zero NOx and PM emissions – represent the best available technology upon which to base the standard and provide the greatest achievable reduction in NOx emission by removing diesel from the heavy-duty equation altogether. As discussed supra, the rapid electrification of the heavy-duty fleet will demonstrably reduce NOx emissions and at a far greater pace than conventional technologies.129 [EPA-HQ-OAR-2019-0055-1219-A1, p.14]

> 129 Utility Dive, Cleaner by the mile: Electric trucks can have outsized environmental and health benefits (April 14, 2021); Texas A&M, Tailpipe Emission Benefits of Medium- and Heavy-Duty Truck Electrification in Houston, TX (Apr 14, 2021).

Despite the clear advantages that BEVs offer in terms of NOx mitigation, EPA’s proposed standard does not include BEVs in the baseline130 and does not set the emission standards and limits in the proposal commensurate with the expected level of BEV uptake in the coming years. EPA’s final rule should correct this omission. Failure to include a role for BEVs in setting the NOx standard both ignores the agency’s statutory directive and results in a proposal that is far less stringent and protective of public health and welfare than is feasible. [EPA-HQ-OAR-2019-0055-1219-A1, pp.14-15]

> 130 See 87 Fed. Reg. at 17561, fn. 707.

To address this shortcoming, Tesla strongly encourages EPA to finalize the proposed option for BEVs to be included in the NOx emission standards baseline and to prevent backsliding by substantially increasing the stringency in the NOx standards well beyond levels proposed in Option 1. In accurately reflecting the expected penetration of BEVs in the baseline, the agency can act to deliver a standard with the maximum health benefits. Accordingly, the family emission limit (FEL)131 cap should be lowered, and levels set substantially below Option 1 and be harmonized as close as possible with the stringency established in the recent California Heavy-Duty Omnibus NOx rules.132 [EPA-HQ-OAR-2019-0055-1219-A1, p.15]

> 131 See generally, 87 Fed. Reg. at 17552; 87 Fed. Reg. at 17560-61 (discussion on FEL caps).

> 132 See, California Air Resources Board, Heavy-Duty Engine and Vehicle Omnibus Regulation (establishing NOx standards that cut below current standards 90 percent below current standards in 2027.)

Tesla welcomes the proposal to reduce GHG emission standards in many sub-categories. Further, it encourages the agency to quickly develop more stringent Phase 3 GHG emissions standards for heavy-duty engines and vehicles implement standards well-before MY 2030. To that end, Tesla encourages the agency to amend the current GHG emission standards to reach stringency levels that ensure BEV deployment reaches the levels in California’s ACT rule for MY 2027-2029.144 [EPA-HQ-OAR-2019-0055-1219-A1, p.18]

144 See generally, CARB, Advanced Clean Trucks Fact Sheet (Aug. 20, 2021) (Zero-emission truck sales: Manufacturers who certify Class 2b-8 chassis or complete vehicles with combustion engines would be required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales would need to be 55% of Class 2b – 3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales).

In its proposal, EPA lays out several factors it utilizes when assessing the 'requisite technology' that will support establishing a level of stringency in the standard. When analyzing feasibility and these factors, it should be clear that electrification technology – which is already commercialized – should form the basis for the agency implementing a far stronger GHG standard than proposed. As discussed *supra*, in considering all these factors, the agency should recognize that its proposed increases to the various sub-category stringency levels are inadequate and need to be strengthened. [EPA-HQ-OAR-2019-0055-1219-A1, p.18]

Tesla believes these changes will significantly reduce emissions, result in increased deployment of the best available emissions reduction technology (BEVs), maintain U.S. manufacturing leadership in medium and heavyduty BEV technology, and ensure the Administration is meeting it statutory mandate to protect the public health and welfare from the significant and accelerating impacts from criteria air pollution and climate change. [EPA-HQ-OAR-2019-0055-1219-A1, p.24]

Organization: *Todd Snyder*

As a stakeholder, I urge the EPA A to act aggressively on the toxic tailpipe emissions from heavy trucks choking our communities and changing our climate.

EPA's proposed rule, option one, requiring all new heavy trucks cut NOx pollution by 90% by 2031 and cut greenhouse gas emissions is a critical first step toward the 100% electric truck system we need to protect our communities' health and the planet we share.

We know we can move even faster and do even better.

As you know, several states require new heavy trucks reach this 90% benchmark by 2027. Pairing this goal with strong GHG standards, we can accelerate the electrification of trucking already happening in the market and reach 100% clean trucking by 2035

Robust national standards will not only help reduce greenhouse gas emissions at a critical time, but prevent thousands of asthma cases – especially among children – hospital visits, and even deaths.

Even more important, accelerating the transition to 100% electric trucks would help protect the 72 million Americans who live by freight routes not just from NOx but also from soot and other pollutants spewing out of tailpipes. As you know, those affected are overwhelmingly people of color and poor families, making this not just about climate action and public health, but about basic justice for Americans.

Yes, the timeline is aggressive. But the health of millions depends on it, and with more and more electric trucks options entering the market, we know we can do it.

Most important, we call on you to reject option two for the rule, which will not meaningfully cut either emissions or the NOx pollution poisoning our communities.

You've made fighting for climate action and environmental justice a cornerstone of EPA's work and I stand with millions of Americans in honoring and applauding that effort. Now I'm calling for you to take the next step and adopt a standard reducing NOx 90% by 2027 and working to reach 100% clean trucks by 2035. [EPA-HQ-OAR-2019-0055-1391]

Organization: *Toyota Motor North America, Inc. (Toyota)*

Toyota supports EPA's efforts to reduce emissions from HD vehicles and supports this rule. [EPA-HQ-OAR-2019-0055-1224-A1, p.1]

Organization: *Truck Renting and Leasing Association (TRALA)*

Furthermore, Option 1 can only be viewed as inflationary for the supply chain. As we are currently seeing, many of the issues that are leading to inflation are related to transportation and it is unlikely that all of those issues will be gone by the time these rules take effect. TRALA members, and the trucking industry at large, are having to wait longer to receive new trucks once being ordered due to labor and chip shortages. Additionally, the longer-term impact of the driver shortage has increased the cost of moving goods across this country, and it is unlikely that the trucking industry will be able to increase the supply of drivers in order to meet the demand for goods. If EPA adopts Option 1, it will cause artificial increases to the cost of a new diesel truck through the regulatory process. Federal and state governments are enacting environmental policies that will lead to even greater inflation while also creating a patchwork of conflicting rules for the industry to comply. The cost of shipping goods will inevitably increase for all consumers. [EPA-HQ-OAR-2019-0055-1180-A1, pp. 2 - 3]

Organization: *Truckload Carriers Association (TCA)*

TCA consistently advocates that the trucking community continue to work to reduce greenhouse gas emissions to address the developing climate crisis. However, TCA is disappointed with the proposed standards put forth by the EPA because the measure does not fully appreciate current market and technology constraints within the trucking industry. TCA believes the regulations would limit equipment options for carriers, as well as worsen environmental outcomes in the long run by applying unmanageable pressure on pricing and disincentivizing fleet turnover. [EPA-HQ-OAR-2019-0055-1160-A1, p. 1]

The proposed standards would require considerable expenditure by motor carriers to invest in newer-model vehicles and engines. However, problems affecting the supply chain, like labor and semiconductor chip shortages1, are already causing a lack of availability that is hindering the reasonable purchase of technology and parts. Recent data found that a Class 8 power unit order placed in December 2021 would not be delivered until February 20232, compelling many motor carriers to rely on older model engines, either by maintaining their current fleets or buying used. In fact, as of now, only 50 percent of fleets have acquired 2010-or-newer model engines3 – highlighting the need to improve access to newer, lower-emitting equipment, rather than restrict availability with the new proposed standards. [EPA-HQ-OAR-2019-0055-1160-A1, pp. 1 - 2]

1. United States, Department of Commerce, "Results from Semiconductor Supply Chain Request for Information", January 25, 2022, https://www.commerce.gov/news/blog/2022/01/results-semiconductor-supply-chain-request-information

3. David Shepardson, "U.S. EPA proposing rules to cut emissions from heavy trucks", March 7, 2022, Reuters, https://www.reuters.com/article/us-usa-autos-emissions-idTRNIKBN2L41Y9

TCA stresses that it is a precarious time to risk motor carrier operations by applying upward influence on pricing and not adequately considering the present limitations on availability. Trucking companies, 97 percent of which are small business5, are working tirelessly to serve the nation, already in the face of expanding market pressures, with the industry currently over 80,000 drivers short of demand6 and freight projected to grow 25.6 percent by 20307. [EPA-HQ-OAR-2019-0055-1160-A1, p. 2]

5. American Trucking Association (ATA), "Economics and Industry Data", https://www.trucking.org/economics-and-industry-data

6. ATA, "Driver Shortage Update", October 25, 2021, https://www.trucking.org/sites/default/files/2021-10/ATA%20Driver%20Shortage%20Report%202021%20Executive%20Summary.FINAL_.pdf

7. ATA, "ATA Freight Transportation Forecast: 2019 to 2030", August 21, 2019, https://www.trucking.org/news-insights/latest-freight-forecast-projects-256-increase-tonnage-2030

TCA is concerned that the proposed standards could potentially disrupt the pathway to a zero-emissions future, by prematurely diverting industry investment into incremental, short-term fleet transitions and away from long-term solutions. As it stands now, considerable investment, innovation, and testing is required to lower costs and expand capacity for zero-emission trucks, as well as strengthen our national charging infrastructure to ensure accessible and reliable power. TCA holds that a more comprehensive strategy is needed to guide fleet advancements that realistically accounts for and encourages solution-maximizing technology in the long run. [EPA-HQ-OAR-2019-0055-1160-A1, p. 3]

In sum, moving forward with these inadvisable standards would worsen market conditions, harm carrier operations, and, in practice, disincentivize fleet turnover. TCA appreciates the effort of the EPA to protect the environment and our association hopes to work together to put standards in place that move the industry forward by reducing emissions and advancing climate-positive outcomes in a progressive, but manageable manner that roundly considers material and financial limitations. [EPA-HQ-OAR-2019-0055-1160-A1, p. 3]

Organization: *United Methodist Church - General Board of Church and Society*

The United Methodist Church understands 'climate justice not simply as an environmental or economic concern but rather as a deep ethical and spiritual concern that the Church must address so that abundant life is ensured for our children and future generations' (2016 Book of Resolutions #1035 Climate Change and the Church’s Response). Grounded in this belief, and in response to the ongoing harm and future threats posed by greenhouse gas emissions, the General Board of Church and Society - the agency of our church entrusted with the responsibility to advocate for the official positions of The United Methodist Church - supports the Environmental Protection Agency’s proposed rule: Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards (EPA–HQ–OAR–2019–0055; FRL–7165–03– OAR). [EPA-HQ-OAR-2019-0055-1042-A1, p.1]

The General Board of Church and Society supports standards set at a pace that would achieve 100 percent zero-emission truck sales by 2035. We believe it is our moral responsibility to address the adverse effects of greenhouse gasses from the transportation industry on our planet and those people and communities that are most vulnerable to climate change's worst effects. We believe these regulations are a critical step on the path to protect the basic right of clean air that God has given us and more fully live into Jesus’ command to love our neighbor as we love ourselves. [EPA-HQ-OAR-2019-0055-1042-A1, p.1]

Organization: *United Motorcoach Association (UMA)*

While UMA is not speaking to the technological feasibility of further NOx emissions reductions, we do question the impact of diverting research and development resources of alternative and zero emissions fuels and power. [EPA-HQ-OAR-2019-0055-1311-A1, p.2]

We recommend EPA consider the disruptions to the overall economy, job loss, and impact to the supply chain. [EPA-HQ-OAR-2019-0055-1311-A1,p.2]

Organization: *U.S. Chamber of Commerce*

As the agency proceeds with this rulemaking, we encourage adherence to the following objectives that should serve as the foundation of an effective rulemaking:

• Regulatory certainty and durability are key not only to achieving sustained emissions reductions over the proposed rule’s implementation timeline, but also to creating a stable business environment needed for large investments to meet these types of regulatory requirements.

• Cost-effective, technologically achievable standards that facilitate fleet turnover necessary to drive real-word emissions reductions.

• National harmonization that avoids a patchwork of requirements and compliance obligations among states will help reduce unnecessary regulatory burdens on manufacturers, ultimately speeding implementation.

• Sufficient lead-time and compliance flexibility to allow manufacturers and other stakeholders to plan, adapt, and invest in heavy-duty engine and vehicle technologies in a manner that does not divert resources away from the longer-term transition to zero-emissions vehicles. [EPA-HQ-OAR-2019-0055-1245-A1, p. 2]

By EPA's own admission, implementing the framework described in Option 2 would also drive more emissions reductions sooner compared with Option 1, helping increase the associated health benefits of the rule to the communities that need it most. This not only would further support the administration's goals to improve air quality, but is expected to reduce the exposure of underserved groups living near areas with large numbers of medium- and heavy-duty traffic. [EPA-HQ-OAR-2019-0055-1245-A1, p. 8]

Organization: *U.S. Partnership for Education for Sustainable Development and National Clean Energy Workforce Alliance*

[*From Hearing Testimony, April 13, 2022, Debra Rowe*] As a life-long resident of Detroit and a professor of sustainable energies for 44 years, I know the technology is available for the EPA to create the strongest possible standards to reduce air pollution and diesel fumes. Many analyses have supported the cost-effectiveness of these zero-emission trucks as the cheaper alternative for the U.S., as we build a healthier population and a stronger economy. I am also here today because I have worked with environmental justice organizations in Detroit and I have been a convener and facilitator of the Detroit Green Skills Alliance, where we came together across NGOs, government corporations, small businesses, and neighborhoods to create the environmental and climate action plan for Detroit to reduce the existing pollution that is highlighted in our famous Toxins Tour, and advocate for the necessary policies. This hearing is about those necessary policies, a key portion of them. If you create the strongest possible standards you will improve our economy and our environment simultaneously. So my main requests are two key items in the standards. Reduce the deadly NOx pollution by 90 percent by 2027, and move the whole national bus and truck fleet to 100 zero-emission, all-electric vehicles by 2035. This is doable. It is smart. Just some additional points. The trucks regulated by this rule will be on the road for decades, so now is the time. They have to be cleaned up as soon as possible. And today I have a son who runs a manufacturing facility that builds these electric trucks. These electric trucks and buses are already capable of supporting the majority of freight, delivery, transit use and needs, and they are cost-effective. So another couple key points. Your proposed Option 1 is a start, but it should be significantly strengthened. And Option 2 should not be seriously considered. I won't go into the details why but glad to talk to you more about it if you want. I'm sure you know. On the greenhouse gas rule, the agency's minor adjustments to the existing Phase 2 greenhouse gas standards, they are just weak. They are just not strong enough. It wouldn't get a passing grade if I was teaching the class. And they reflect neither the urgency of the climate crisis nor the rapid advancement in zero-emission truck technology. [EPA-HQ-OAR-2019-0055-2867]

Organization: *Ute Mountain Ute Tribe Environmental Programs Department*

The Ute Mountain Ute Environmental Programs Department urges the U.S. EPA, Congress and States to do more to protect the health and quality of life of our members. Concurrently, Tribes are doing their part to reduce emissions including the many harmful pollutants from heavy-duty vehicles. For example, 119 Tribes and Alaska Native Villages have reduced diesel emissions through use of the VW settlement fund. Even more have participated, and continue to participate, in EPA's Diesel Emissions Reduction Act (DERA) program. [EPA-HQ-OAR-2019-0055-1259-A1, p. 2]

The Ute Mountain Ute Environmental Programs Department 1s encouraged by EPA' s commitment expressed on March 7, 2022, that 'This proposal would ensure the heavy-duty vehicles and engines that drive American commerce and connect people across the country are as clean as possible ... ' We support this important goal and the necessary actions to protect our health and quality of life. [EPA-HQ-OAR-2019-0055-1259-A1, p. 2]

While this specific regulation is an important step in reducing emissions of the many harmful pollutants from these vehicles, it would not achieve all that is possible. For example,

- Given that proposed requirements begin with vehicle model year 2027, emissions reduction technologies and strategies should mandate those that are most current and rapidly developing. [EPA-HQ-OAR-2019-0055-1259-A1, p. 2]
- While acknowledging emerging engine technologies including electric and fuel cell, (see FR pages 17 417 through 17 418), the proposed rule is focused on promoting emissions reduction technologies, operation, and maintenance of diesel-fueled and, to a lesser extent gasoline-fueled, vehicles. [EPA-HQ-OAR-2019-0055-1259-A1, p. 2]

Climate change stimulated by emissions of greenhouse gases from many sources including heavy-duty vehicles and engines threatens our fundamental way of life. The Ute Mountain Ute Environmental Programs Department supports Executive Order 14037, the Clean Trucks Plan and EPA's commitment to requirements that heavy-duty engines and vehicles be 'as clean as possible'. This rule should be promulgated consistent with the commitments. [EPA-HQ-OAR-2019-0055-1259-A1, p. 3]

Organization: *Valero Energy Corporation*

Valero urges EPA not to revise the heavy-duty truck standards as proposed. Instead, EPA should adopt standards that will provide a level playing field in which different vehicle designs, fuel types, and technologies can compete fairly to meet an appropriate performance target. [EPA-HQ-OAR-2019-0055-1328-A2, p.9]

Organization: *Victoria D’Amico*

I am writing in strong support of EPA-HQ-OAR-2019-0055. I appreciate the Biden administration’s commitment to cleaner energy. It’s also appreciated how the administration is committed to aiding in environmental justice issues as climate change will disproportionately affect lower income families and POC. Climate change is an alarming threat to public health and safety and the environment. We should be doing all we can to address climate change to lessen the effects it will have. I have two criticisms of the rule: 2027 is too long to wait to address this issue and small businesses should receive some sort of aid for the expenses of transitioning their parts. [EPA-HQ-OAR-2019-1214]

The year 2027 is too far off for these changes to be implemented. Time is of the essence in regards to climate change action. According to BBC News (2022), the latest IPCC report states that in order to avoid catastrophic climate events, temperatures must remain under 1.5C in this century. Doing this requires immediate reduction of CO_2 emissions. I understand time is needed to get through some red tape and ensure the safety standards are met, but this action must be the highest priority to lessen the drastic effects of climate change. [EPA-HQ-OAR-2019-1214]

I support the overall goal of this proposal and hope to see it implemented in the near future. Combatting climate change immediately is imperative to ensuring a better world for people and the environment. Moving up the timeline this is enforced is significant in lowering emissions in a timely manner. Assisting small businesses is important for maintaining public support and looking out for our fellow citizens. I look forward to seeing this rule in action. [EPA-HQ-OAR-2019-1214]

Organization: *Volvo Group*

We urge EPA to take a holistic view of the regulation's implications. If the goal is to improve air quality while simultaneously addressing climate change and moving towards a ZEV future, the final regulation must not:

- lead fleets to massively pre-buy trucks to avoid technology they do not trust and cannot afford, thereby repeating the nearly 50% production workforce reduction the Volvo Group experienced because of the EPA's last technology-forcing regulation in 2007;
- encourage fleets to hold on to older trucks and impede the integration of new generation trucks in the marketplace, similar to what we see today, with approximately 50% of previous generation trucks still operating more than 12 years after the beginning of the last NOx regulation in 2010; nor
- force truck manufacturers like the Volvo Group to divert limited investment dollars away from the accelerated development of battery-electric and hydrogen fuel cell trucks, which environmental justice advocates want to see across a broad range of applications in their local communities. [EPA-HQ-OAR-2019-0055-1324-A1, p. 2]

In addition to these technological challenges, an ultra-low emission level will impose excessive costs on fleets, due primarily to the extended emission warranty and useful life provisions. As past is prologue, we can expect these higher costs to bring even graver economic and environmental consequences than what was experienced in 2006-2008 during the last major technology forcing regulation. In 2006, the year before the new EPA Particulate Matter regulation came into force, the trucking market hit its historical high for truck sales as fleets anticipated technology forcing solutions and accelerated their purchases to forgo new technology vehicle purchases until the technology was proven. [EPA-HQ-OAR-2019-0055-1324-A1, p. 4]

Truck sales plummeted in 2007 and 2008 because of the regulation and this behavior led to a reduction in force for Volvo Group UAW-represented production workers in our three truck and engine plants from more than 4600 jobs in 2006 down to only 2300 jobs in June 2008 (before the great recession began) representing a 50% loss of good paying union jobs. These production job losses were not fully recouped until seven years later (i.e., 2014). [EPA-HQ-OAR-2019-0055-1324-A1, p. 4.]

From an environmental perspective, we are still bearing the ramifications of this situation as evidenced by the fact that approximately 50% of the fleet on the road today have the previous generation NOx technology more than 12 years after it was mandated by regulation. The reduction in emissions that could be realized by accelerating the turnover of these older vehicles would far exceed that which will be achieved by the delta between a 75% reduction and a 90% reduction of the last remaining 1-2% of NOx emissions.[EPA-HQ-OAR-2019-0055-1324-A1, p. 5]

I am opposed to the new rules for Heavy-Duty engines. This rule will only increase inflation and harm the middle class even more. This appears to be virtue signaling for the sake of the left wing of the political spectrum. If the Biden administration truly cared about emissions and pollution they would be going after China and India - the world's biggest polluters, not hard working American citizens. This rule is just one more layer of regulations that will hurt the average American citizen. [EPA-HQ-OAR-2019-0055-1405]

Organization: *WE ACT for Environmental Justice*

Our communities have contended with the cumulative exposure and impacts of pollution for far too long.13 Eliminating tailpipe emissions from medium- and heavy-duty vehicles is required to deliver much needed health benefits from reductions in harmful NOx and particulate matter exposures. Zero-emission, electric trucks and buses are ready and available now and can replace more than 50% percent of vehicles in each category of vehicle14 on the road today. With ever improving economics and capabilities,15 electric models can reach cost parity with conventional diesel vehicles by 2035, even without incentives.16 The shift to all-electric trucks and buses is inevitable and will occur rapidly. The clean trucks rule is a prime opportunity to reduce truck pollution, safeguard the lives of communities adversely affected by truck pollution, and fulfill federal commitments to the climate, cleaner vehicles, and environmental justice. [EPA-HQ-OAR-2019-0055-1347-A1, p.2]

16 https://www.nrel.gov/docs/fy22osti/82081.pdf

We commend the EPA for taking steps to update the Heavy Duty Vehicle standards for the first time in 20 years. While the Agency's modeling estimates that by 2045, the largest improvements in ozone and particulate matter emissions and public health benefits from the proposed rule will occur in communities of color with the worst air quality,17 our communities need the associated public health benefits of these standards sooner rather than later. We cannot allow dirty diesel tricks to be sold for another decade. **We urge the Agency to expeditiously finalize and issue the strongest and most protective emissions reduction standards by the end of 2022 and to put us on a fast track towards the transition to zero-emission, electric trucks and buses by 2035**. [EPA-HQ-OAR-2019-0055-1347-A1, pp.2-3]

17 https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10144K0.pdf

Reducing NOx and greenhouse gas emissions from the medium- and heavy-duty vehicle sector and transitioning away from dirty, diesel- and gasoline- trucks and buses is essential to tackling climate change and protecting environmental justice communities throughout the country. Once again, we urge the EPA to finalize the strongest possible rule and to continue meaningful engagement, early and often with overburdened communities and environmental justice advocates in its implementation and as the Agency begins to think about greenhouse gas standards for the truck manufacturing industry for model year 2030. [EPA-HQ-OAR-2019-0055-1347-A1, p.6]

Organization: *Wendy*

Zero emission trucks of all classes should be included in this rule with a start date no later than 2025. California and 5 other states have already adopted Advanced Clean Truck rules requiring zero emission trucks. The federal government should follow suit. The regulations must drive the market. People are dying and the planet is warming. We can't wait for the market to come up with solutions. [EPA-HQ-OAR-2019-0055-1578]

Organization: *Western Transport Logistics Inc.*

The EPA is looking to overstep common sense and logic with the proposed NOx regs. This nation runs on diesel and is powered by 18 wheelers. Not only would the proposal hurt small businesses in the trucking industry, but that pain would cause further inflation and goods shortages due to less trucks running on the roads. This is not good policy for our nation. [EPA-HQ-OAR-2019-0055-2236, p.1]

Organization: *Westport Fuels Systems (WFS)*

Westport supports EPA finalizing regulations that encourage much needed emission reductions. We believe these reductions must be based on realistic expectations about the pace and cost of technology and encourage engine makers and vehicle manufacturers to deploy a variety of available, scalable, and cost-effective technologies. [EPA-HQ-OAR-2019-0055-1278-A1, p.1]

Key WFS commentary/observation highlights include:

- A tailpipe only perspective on CO2 emissions does not directly correlate to the true CO2 emissions reductions of technologies, nor is it a reliable method for guiding climate change mitigation policies. [EPA-HQ-OAR-2019-0055-1278-A1, p.6]

Organization: *White Pine Construction Corporation*

While we are behind the push for better air quality, we have concerns over the costs the new regulations will bring. We need to ensure that new rules won't lead to hurting the reliability of the trucks and trailers we purchase, nor imposing unreasonable or unworkable costs on our industry. The trucking industry has been hit hard enough with covid regulations and fuel prices we cannot afford to continue to take hits to our bottom line. [EPA-HQ-OAR-2019-0055-1012, p.1]

Organization: *World Resources Institute (WRI)*

We applaud the Biden administration for acting swiftly to address pollution from trucks and buses and urge EPA to strengthen and finalize the strongest rule possible for reducing pollution from medium- and heavy-duty vehicles while taking into consideration two underlying factors:

- The urgency of addressing transportation inequities for communities long overburdened by air and climate pollution, and
- The opportunities electrification offers to transform our fleets, particularly for school and transit buses where electrification is advancing at a more rapid pace. [EPA-HQ-OAR-2019-0055-1298-A1, p.1]

EPA has the opportunity — and the responsibility — to finalize and implement the strongest rule possible to (1) mitigate the disproportionate health impacts that air toxics, particulate matter, and climate-changing greenhouse gas pollution from medium- and heavy-duty vehicles have on low-income communities and communities of color and to (2) accelerate our transition to zero-emission light-, medium- and heavy-duty vehicles that offer a plethora of benefits while providing relief from the volatility of gas prices that are hurting everyday Americans. [EPA-HQ-OAR-2019-0055-1298-A1, p.4]

We support EPA's proposal to tighten the Phase 2 GHG standards for the subcategories of vehicles that reflect the rapid market shifts to zero-emission technologies. Additionally, given the commercial viability of both electric school and transit buses, we urge EPA to further increase the stringency of the GHG standards and CO2 standards for these vehicle classes for MYs 2027 through 2029 based on the technologies available. [EPA-HQ-OAR-2019-0055-1298-A1, p.4]

The World Resources Institute commends the EPA for its efforts to promote clean air and reduce pollution from medium- and heavy-duty vehicles and engines with stricter, new standards and stands ready to offer our assistance and staff expertise in further strengthening this rule. [EPA-HQ-OAR-2019-0055-1298-A1, p.4]

Organization: *Worldwide Equipment Enterprises, Inc.*

Regulated businesses simply hope for consistent and reality-based regulatory proposals when regulations by the federal government are warranted. Unfortunately, proposed regulations such as this one is prepared by government bureaucrats with no business experience within this or other businesses that they regulate. That creates the unfortunate situation of unrealistic proposals, no regard to either the cost of these regulations to the regulated businesses or consumers or determining whether what is pointed to as the new requirement is even available or not. [EPA-HQ-OAR-2019-0055-1275-A1, p.2]

Organization: *Yellowstone Integrated Architecture and Construction*

The EPA must not delay in the adoption of their proposed rule to regulate pollution from Heavy Duty Vehicles or standards or the next round starting in 2030. [EPA-HQ-OAR-2019-0055-2816, p.1]

These changes will drive a green economic boom that will help out our country get back on top as leaders in electrification, including battery production. [EPA-HQ-OAR-2019-0055-2816, p.1]

Our future generation depends on our actions for their health and economic stability. [EPA-HQ-OAR-2019-0055-2816, p.1]
