EPA-420-R-24-005
March 2024

Introduction

EPA's Proposed Rule, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles," was signed by Administrator Michael Regan on April 11, 2023. A pre-publication version of the proposal was made available on EPA's website on April 12, 2023, after Administrator Regan's announcement of the program but prior to publication of the proposal in the Federal Register on May 5, 2023 (88 FR 29184 et seq.). The proposal indicated that the rule would be open for public comment until July 5, 2023. The Docket ID No. for the rule is EPA-HQ-OAR-2022-0829.

This Response to Comments (RTC) document is a compilation of public comments submitted to the public docket for this rule as well as EPA responses to those comments. Some aspects of our responses appear in the preamble to the final rule or other documents in this rule's docket and are incorporated by reference in this document.

This RTC document is organized by category of comment topic. The original documents submitted by commenters, including any attachments, footnotes, tables, and figures are included in the docket.

More than 252,400 written comments on the proposal were submitted to the public docket. The vast majority of these, nearly 248,000 comments, were submitted in the form of 46 mass comment campaigns. Some of these are identical letters submitted by many individuals, while others consist of a petition with many signatures. The vast majority of comments submitted in the form of mass comment campaigns express general support for the proposed rule or urge EPA to adopt even more stringent standards to reduce air emissions from light- and medium-duty vehicles, although some other mass comment campaign commenters urged EPA not to adopt the proposal. More information about the mass comment campaigns can be found in Appendix B to this RTC document. Mass comment campaigns that provided comments on specific aspects of the proposal are reproduced verbatim in this RTC document.

There were about 4,600 other, individual comments on the proposal submitted to the public docket by individuals, organizations, companies, or government entities. Many of these comments express support for the proposal or urge EPA to adopt more stringent standards, although some express concern with or opposition to its adoption.

Of these comments, approximately 240 comments provide specific views on elements of the proposal, information and feedback about particular data or assumptions used in EPA's analysis supporting the proposal, or other aspects of the proposal. A list of these comments can be found at the beginning of this RTC document. They are reproduced verbatim, in excerpts, in the following sections, organized by issue topic. Each section includes a summary of the comments received on that topic and EPA's response. Note that an individual comment or part of an individual comment submitted by a particular commenter may be reproduced in more than one section of this document if it contains observations on more than one aspect of an issue. It is worth noting that if a comment has been reproduced in more than one section it may be addressed in only one of those sections. Conversely, an individual comment that touches on several issues may not be duplicated verbatim across this document if the same issues were raised by other commenters. In other words, the responses contained in this document reply to the comments raised in the public process and are not solely to the specific commenters' verbatim comments that precede the responses in the document. Finally, if several commenters submit an identical comment, only one comment is included verbatim in the document; the others are noted on the list of comments for the included comment.

An additional 4,300 individual comments on the proposal express general support for or opposition to the proposal and/or contain opinions or statements about issues but without detailed data, information, or comment relating to specific provisions of the proposal or EPA's supporting analysis. These comments are not reproduced verbatim in this document because they do not raise issues with reasonable specificity. However, we note that we have provided a detailed rationale for the final rule in the preamble and that, to the extent the same issues were raised by other commenters with reasonable specificity, they are addressed in our responses in this document. These comments are listed in Appendix A along with a brief description of their overall nature.

EPA held a public hearing on the proposal, and the transcript of that hearing is included in the docket (EPA-HQ-OAR-2022-0829-5115). During the 3-day public hearing (May 9-11, 2023), 217 individuals testified. Appendix C contains a list of the testifiers and a brief description of the overall nature of the testimony. If public testimony provides information that is specific in nature and was not subsequently included in written comments submitted by the testifier or the testifier's organization, that statement is included verbatim in this RTC document. Additional comments received after the comment period closed and through December 15, 2023, were considered to the extent practicable. See Section 29 for these comments and EPA responses.

The responses presented in this RTC document are intended to augment the rationale and responses to comments that appear in the preamble to the final rule and to address comments not discussed in the preamble to the final rule. To the extent there is any confusion or apparent inconsistency between this RTC document and the preamble, the preamble itself remains the definitive statement of the rationale for the final rule. This document, together with the preamble to the final rule and the information contained in the Regulatory Impact Analysis, and related technical support documents, should be considered collectively as EPA's response to all of the significant comments submitted on the proposal.

1 - General comments in support of or opposing the rulemaking

1.1 - General support for the program as proposed or more stringent standards

Comments by Organizations

Organization: Advanced Energy United

Transportation is the largest source of domestic emissions. In 2021, 28% of emissions came from the transportation sector, 21% of which came from passenger vehicles.1 We have a unique opportunity to not only decarbonize this sector, but improve public health, create good paying jobs, and produce technologically advanced vehicles for consumers and businesses in the process. The EPA's promulgation of the new emissions reductions rule on light-duty vehicles provides a pathway to meet emissions reductions targets and expand the adoption of zero-emissions vehicles on our roads. [EPA-HQ-OAR-2022-0829-0695, p. 1]

1 EPA. (28 April, 2023). Sources of Greenhouse Gas Emissions. https://www.epa.gov/ghgemissions/sources-greenhouse-gas-emissions

IV. Conclusion

By providing a predictable business and regulatory environment, EPA's proposed vehicle rules can help not only decarbonize US transportation, but also bolster a critical segment of the American economy: automakers. [EPA-HQ-OAR-2022-0829-0695, pp. 5-6]

EVs present a critical lifeline for the U.S. automotive industry, as total car sales have declined since 2017. As industry analysts have noted, "[EVs] are the only growth area in the automotive market."12 The EPA's rule can simultaneously sustain this growth and accelerate EV adoption, revitalizing automakers and creating good paying, high-skilled jobs in the process. As such, EPA's proposed rules complement key parts of the Inflation Reduction Act (IRA) - namely the 30D and 45W tax credits that incentivize the purchase of electric vehicles, and the host of industry incentives, such as the manufacturing tax credit (45X) that support the buildout of a domestic EV industry. [EPA-HQ-OAR-2022-0829-0695, p. 6]

Organization: American Council for an Energy-Efficient Economy (ACEEE)

The U.S. needs the strongest vehicle standards

The United States will need to greatly reduce light-duty vehicle (LDV) greenhouse gas emissions if it is to have any chance of meeting the Biden Administration's economy-wide emissions reduction goal of 50% by 2030 and stave off the worst impacts of climate change. Transportation is now the largest source of greenhouse gas emissions in the United States and the light-duty sector makes up 58% of those emissions.1 Reducing carbon emissions is critical to tackling climate change but increasing LDV efficiency will also have significant benefits to air quality and will reduce driver fueling costs. Vehicles are a significant contributor to local air pollution and the associated health impacts, leading to increased rates of asthma, increased risk of heart attacks, strokes, and lung cancer.2 These impacts are particularly bad in low-income communities and communities of color, which bear a disproportionate air pollution burden.3 Greater efficiency can also provide significant cost savings for drivers when they refuel their vehicles. Low-income households are especially burdened by fueling costs, paying three times more than their higher-income counterparts on gasoline, as a percent of their total income.4 [EPA-HQ-OAR-2022-0829-0642, pp. 1-2]

EPA should adopt Alternative 1

EPA's GHG vehicle standards have historically been instrumental in advancing emissions reduction technology beyond what the market would otherwise deliver. Given the activity already taking place in the light-duty vehicle market as a result of IRA and IIJA investments and automaker commitments to fully electrifying their lineups, we urge EPA to adopt Alternative 1, at a minimum, to deliver the strongest emissions reduction and advance emissions reduction technologies in the market. [EPA-HQ-OAR-2022-0829-0642, pp. 2-3]

Organization: American Lung Association (ALA) et al.

On behalf of the undersigned health and medical organizations, we write to call on the United States Environmental Protection Agency's (EPA) to adopt the strongest possible standards to curb emissions from new passenger vehicles and spur the transition to zero-emission technologies. Health and medical organizations have long advocated for strong emissions standards as a crucial intervention to protect regional air quality, address disparities in pollution burdens and reduce the health impacts of the climate crisis. [EPA-HQ-OAR-2022-0829-0745, p. 1]

We urge EPA to act in 2023 to finalize the most stringent possible standards for new vehicles to reduce and eliminate emissions that harm Americans' health. [EPA-HQ-OAR-2022-0829-0745, p. 1]

Health Benefits of Zero-Emission Technologies

EPA's proposals note the significant clean air benefits of the proposed rule and illustrate the increased benefits of the stronger Alternative 1. The American Lung Association's recent "Driving to Clean Air" report highlighted that approaching a 100 percent zero-emission sales scenario by 2035, along with a non-combustion electricity generation grid, could result in major health benefits. The report found that the cumulative health benefits could reach $978 billion by 2050, including nearly 90,000 premature deaths avoided, over 2 million asthma attacks avoided and more than 10 million lost workdays avoided due to cleaner air.4 EPA's analysis shows that a potential compliance pathway for the proposal could result in nearly 70 percent of new vehicle sales being battery electric vehicles by 2032. We call on EPA to continue the trajectory of a stronger Alternative 1 to include more stringent GHG standards through 2035. [EPA-HQ-OAR-2022-0829-0745, p. 3]

4 American Lung Association. “Driving to Clean Air.” June 2023. https://www.lung.org/clean-air/electric-vehicle-report/driving-to-clean-air.

Organization: Arizona Department of Environmental Quality (ADEQ)

One of Arizona's largest emission categories is mobile sources (on-road and off-road). In 2022 alone, emissions from highway vehicles in Arizona were over 450,000 tons.1 While Arizona has many control measures in place to reduce emissions from mobile sources – such as our reformulated gasoline program. These control measures are simply not enough to significantly reduce emissions from transportation. Therefore, ADEQ supports EPA's goal to further reduce criteria pollutants and greenhouse gas emissions from the transportation sector. The proposed rule would improve the nation's overall air quality by reducing emissions through the proposed control technology. [EPA-HQ-OAR-2022-0829-0533, p. 1]

1 https://www.epa.gov/system/files/other-files/2023-04/state_tier1_caps_05Apr2023_Ktons.xlsx (Last accessed Jun. 1, 2023).

Organization: California Air Resources Board (CARB) (Part 1 of 5)

Reducing emissions from motor vehicles is urgently needed to combat climate change and reduce exposure to harmful air pollution, especially in the nation’s most vulnerable communities. The California Air Resources Board (CARB) commends the U.S. Environmental Protection Agency (U.S. EPA) for proposing to adopt multi-pollutant emissions standards for the 2027 and later model years (MY) for light- and medium-duty vehicles. [EPA-HQ-OAR-2022-0829-0780, p. 7]

The emission standards of both the proposal and a more stringent alternative are achievable, technically feasible, and cost-effective and will significantly reduce emissions from light- and medium-duty vehicles across the country. U.S. EPA’s analysis demonstrates that both its proposal and the more stringent alternative would result in significant net benefits to society—benefits like improvements in public health, reduced climate impacts, and cost savings to consumers. Adopting the most stringent emission standards feasible is a critical step that U.S. EPA must take to fulfill its mandate to achieve National Ambient Air Quality Standards (NAAQS) and protect the environment, climate, and public health from motor vehicle pollution. [EPA-HQ-OAR-2022-0829-0780, p. 7]

Organization: California Attorney General's Office, et al.

EPA has long recognized that GHG and criteria pollutant emissions from new motor vehicles and new motor vehicle engines endanger public health and welfare, and, under Section 202(a) of the Clean Air Act, this recognition triggers a mandatory duty to reduce such emissions. The technologies necessary to reduce GHGs and criteria pollutants from new motor vehicles already exist and are widely in use in the market today. The costs of these technologies are reasonable and declining, and the application of these technologies generally results in consumers saving money over the life of a new vehicle. Moreover, the societal benefits of more stringent standards significantly exceed the costs of those standards. EPA thus has every reason to adopt stronger emissions standards to satisfy its statutory mandate to reduce emissions of harmful air pollution. [EPA-HQ-OAR-2022-0829-0746, p. 1]

In the Proposal, EPA set forth four alternative sets of GHG standards: the proposed standards, a more stringent alternative (Alternative 1), a less stringent alternative (Alternative 2), and an alternative similar in stringency to the proposed standards on a different timeline (Alternative 3). [EPA-HQ-OAR-2022-0829-0746, pp. 1-2]

We believe that the record before the agency supports the adoption of standards more stringent than the proposed standards and accordingly set forth potential improvements to EPA's models and compliance program below. As EPA recognizes in the Proposal, the necessary emission control technologies have already been developed and brought to market, and automakers have been planning for substantially more stringent standards in large portions of the global market. In addition, the crediting flexibilities already built into the program (which EPA has not reopened)—including the ability to trade, carry-forward, and carry-back credits—place automakers in even better positions to craft strategies to comply with more stringent standards. [EPA-HQ-OAR-2022-0829-0746, pp. 1-2]

As discussed below, the need for more stringent standards is critical, and the industry's ability to meet stronger standards and to cost-effectively reduce dangerous pollution is clear. We urge EPA to adopt standards more stringent than the proposed standards. [EPA-HQ-OAR-2022-0829-0746, pp. 1-2]

Organization: CALSTART

CALSTART strongly supports EPA's proposed multi-pollutant emission standards for light- and medium-duty vehicles for model years 2027-2032 standards. The multi-pollutant emissions standard represents a critical and seminal point to mitigate the worse impacts from the climate crisis and requires a clear and strong signal of the nation's needed direction and pace. [EPA-HQ-OAR-2022-0829-0618, p. 1]

We appreciate this opportunity to provide comments to help shape an effective and productive multi-pollutant emission standard and welcome the on-going potential to engage and explain our recommendations in more detail and assist EPA staff as the rule is finalized. [EPA-HQ-OAR-2022-0829-0618, p. 1]

The multi-pollutant emissions standard represents a critical and seminal point to mitigate the worse impacts from the climate crisis and requires a clear and strong signal of the nation's needed direction and pace. CALSTART desires to serve as an on-going resource to EPA staff in finalizing the most effective light-duty vehicle standard. For more than 30 years, CALSTART has been at the forefront of working with industry, fleets, and the public sector to understand, develop, and accelerate advanced transportation technology needed to address clean air, energy, and economic goals. [EPA-HQ-OAR-2022-0829-0618, p. 2]

We have developed significant knowledge of the status of zero-emission technologies and closely track technology readiness levels, vehicle product availability, and infrastructure deployment status. This experience arises from decades of managing technology demonstration field projects, administering and shaping two of the world's largest commercial vehicle and infrastructure incentive programs, and preparing effective commercialization strategies and implementation roadmaps in our work supporting California and other global governments through Drive to Zero. Utilizing this experience, CALSTART is urging EPA to finalize a regulation that meets our climate obligations while driving U.S. technology leadership and competitiveness forward. [EPA-HQ-OAR-2022-0829-0618, p. 2]

2. Adopt the strongest possible option, providing stringency which is at least as strong as Alternative 1. [EPA-HQ-OAR-2022-0829-0618, p. 2]

At a high level, strong standards maintain the recent positive momentum in the light duty sector and provide a regulatory framework that complements the historic incentives of the Bipartisan Infrastructure Law (BIL) and Inflation Reduction Act (IRA) and is consistent with the current market. We applaud EPA staff for its ambitious and highly necessary Phase 2 stringency and encourage EPA to adopt a Phase 3 at least as stringent as Alternative 1. Below, we describe our justification for Recommendation 1 (closing the footprint loophole) and then discuss the drivers, barriers, and possible solutions to Recommendations 2-4 (adopting standards at least as stringent as Alternative 1, and extending the standards through 2035, and sending clear market signals). [EPA-HQ-OAR-2022-0829-0618, p. 2]

1. Ecosystem-Supportive Activities

This regulation represents a historic step in transitioning the automotive industry toward 100% sales of ZEVs. The proposed rule works in concert with IIJA, IRA, ACC II, LCFS, and other critical clean transportation programs that will reduce tailpipe emissions and increase the number and quality of light-duty ZEVs and plug-in hybrid electric vehicles (PHEVs) on the road. With game changing federal incentives now in place and stringent California regulations leading the way, the EPA now has the opportunity to match these incentives and guide the nation towards accelerated light-duty vehicle decarbonization with a Phase 3 standard at least as stringent as Alternative 1. Transitioning light-duty vehicles to electric power will dramatically improve air quality as well as substantially reduce greenhouse gas emissions due to the progressively cleaner energy generation portfolio of the nation’s electrical grid. [EPA-HQ-OAR-2022-0829-0618, p. 3]

Organization: Center for American Progress (CAP)

CAP urges EPA to adopt the strongest possible standard by the end of the year, finalizing the proposed Alternative 1, with modifications, which are discussed below. Alternative 1 should form the baseline for EPA’s final rule as it makes significant achievable improvements to the proposed rule that are critical for protecting public health and the climate. Alternative 1 features emissions targets on average 10 g/mi lower than the proposed rule. This results in a $20 billion increase in net benefits for calendar year 2055 over the proposed rule.8 In EPA’s DRIA, Alternative 1 is expected to result in 69 percent BEV penetration by 2032. This rate of BEV penetration is possible and indeed likely given the current policy landscape of incentives for manufacturing and purchasing batteries and electric vehicles. [EPA-HQ-OAR-2022-0829-0658, p. 2]

8 U.S. Environmental Protection Agency, “Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles Draft Regulatory Impact Analysis,” April 2023, available online: https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10175J2.pdf

Organization: Ceres BICEP (Business for Innovative Climate and Energy Policy) Network

BICEP members recognize that stronger LDV emissions standards and associated fuel cost savings have clear economic benefits: they mitigate the economic risks of volatile fuel prices, spur U.S. job creation,9 and reduce transportation costs.10 ICCT found that the net consumer benefits of BEVs outweigh their costs as soon as 2024 for passenger vehicles,11 and between 2023-2025 for commercial vans and pickups with a 200 mile range,12 even when IRA incentives are not taken into account. Electric vehicle sales are increasing rapidly,13 and auto manufacturers Ford and General Motors have committed to 100% light- duty electric vehicle (EV) sales in leading markets by 2035.14 While manufacturer commitments and consumer demand demonstrate the growing momentum toward electric cars, it is critical that EPA provide a strong market signal to support those commitments by adopting stringent standards. Further, strong standards will ensure billions of dollars in savings from fuel, health, and climate costs.15 [EPA-HQ-OAR-2022-0829-0600, p. 2]

14 https://theicct.org/wp-content/uploads/2023/05/The-Global-Automaker-Rating-2022_final.pdf.

15 https://theicct.org/publication/ev-cost-benefits-2035-oct22/.

Thus, on behalf of the companies in the BICEP network, I urge EPA to adopt light-duty vehicle (LDV) GHG emissions standards at least as strong as Alternative 1 through 2030, and stronger thereafter. I also urge EPA to adopt LDV criteria pollutant standards and medium-duty vehicle (MDV) multi-pollutant emissions standards at least as strong as those currently proposed to mitigate climate risk, strengthen U.S. economy, and address public health and equity concerns. [EPA-HQ-OAR-2022-0829-0600, p. 3]

Organization: Ceres Corporate Electric Vehicle Alliance (CEVA)

The Alliance applauds the Environmental Protection Agency (EPA) for its commitment to adopting multi-pollutant emissions standards for Model Years (MY) 2027 and later light- and medium- duty vehicles and greenhouse gas (GHG) emissions standards for heavy-duty vehicles, and urges EPA to align these standards with U.S. climate and public health goals.1 Specifically, the Alliance supports: [EPA-HQ-OAR-2022-0829-0511, p. 1]

1 https://www.energy.gov/sites/default/files/2023-01/the-us-national-blueprint-for-transportation-decarbonization.pdf

-Light-duty vehicle GHG emissions standards aligned with Alternative 1, the strongest standard proposed in this rulemaking, which will result in a 59% reduction in average fleetwide carbon dioxide emissions by MY2032 from a MY2026 baseline. The Alliance also encourages EPA to move forward with its proposed criteria pollutant emissions standards for light-duty vehicles, reducing fleetwide average MY2032 criteria pollutant emissions 60% from MY2025 levels.2 [EPA-HQ-OAR-2022-0829-0511, p. 1]

2 https://www.epa.gov/system/files/documents/2023-04/lmdv-multi-pollutant-emissions-my-2027-nprm-2023-04.pdf (p.42)

-Medium-duty vehicle (Class 2b and 3) multi-pollutant emissions standards aligned with its current proposal, which will ensure a 44% reduction in average fleetwide GHG emissions by MY2032 from a MY2026 baseline, and a 66 76% reduction in criteria pollutant emissions by MY2032 from a MY2025 baseline.3 [EPA-HQ-OAR-2022-0829-0511, p. 1]

3 Ibid. (p.42)

- Heavy-duty vehicle phase 3 GHG emissions standards that are at least as strong as those proposed, but ideally are stronger to ensure at least 50% zero-emissions vehicle (ZEV) sales across all market segments by 2032. California's Advanced Clean Trucks (ACT) rule,4 manufacturer commitments,5 and the Inflation Reduction Act (IRA) funding are all consistent with such a goal.6 [EPA-HQ-OAR-2022-0829-0511, p. 1]

Organization: Colorado Energy Office, Colorado Department of Transportation, and Colorado Department of Public Health and Environment

We appreciate the Administration's efforts to re-establish the United States as a leader on clean air and climate, and to regain ground on clean transportation. The President's agenda, including the goal to ensure half of all new vehicles sold in 2030 are zero emission and investments from the Bipartisan Infrastructure Law and Inflation Reduction Act, are already having transformational effects and can help support a successful transition to light- and medium-duty zero emission vehicles. We now urge the Administration to take the next step and codify this action by adopting the strongest national air pollution and GHG standards possible for light- and medium-duty vehicles. We appreciate the Administration's leadership, and are looking forward to collaborating to reach our ambitious collective goals with respect to reducing emissions from the light- and medium-duty vehicle sector. [EPA-HQ-OAR-2022-0829-0694, p. 3]

Colorado has demonstrated a strong commitment to accelerating adoption of light- and medium-duty zero emission vehicles, including hosting a robust stakeholder process to update and publish our most recent state electric vehicle plan [Embedded Hyperlink: https://energyoffice.colorado.gov/transportation/ev-education-resources/2023-colorado-ev-plan], and implementing three new transportation electrification enterprises funded by fees on retail deliveries and transportation network company rides that are forecast to invest over $700M in transportation electrification over the next decade. Some of the key advancements in the state's light- and medium-duty electrification efforts include: [EPA-HQ-OAR-2022-0829-0694, pp. 1-2]

- Adoption of the Advanced Clean Cars, Advanced Clean Trucks, and Low NOx Omnibus rules at our Air Quality Control Commission (AQCC), and a commitment to complete a rulemaking in 2023 to adopt the Advanced Clean Cars II rule through 2032 in our most recent state EV Plan. [EPA-HQ-OAR-2022-0829-0694, pp. 1-2]

- Implementation of the state's National Electric Vehicle Infrastructure (NEVI) plan [Embedded Hyperlink: https://www.codot.gov/programs/innovativemobility/electrification/nevi-plan to construct DC fast-charging sites along federally designated EV corridors. [EPA-HQ-OAR-2022-0829-0694, pp. 1-2]

- Developing the Vehicle Exchange Colorado [Embedded Hyperlink: https://energyoffice.colorado.gov/vehicle-exchange-colorado] program to incentivize low- and moderate-income Coloradans to retire and replace high-emitting vehicles with electric vehicles (EVs). [EPA-HQ-OAR-2022-0829-0694, pp. 1-2]

- Recently passed legislation that includes an extension and expansion of the state's tax credit for light, medium- and heavy-duty zero emission vehicles (HB23-1272 [Embedded Hyperlink: https://leg.colorado.gov/bills/hb23-1272]). [EPA-HQ-OAR-2022-0829-0694, pp. 1-2]

- Transportation Electrification Plans (TEPs) from the state's investor-owned utilities, including Xcel Energy's 2024-2026 TEP, which proposes over $400 million in investment in programs to reduce barriers to adoption of EVs, and Black Hills Energy's 2024-2026 TEP, which proposes more than $2.6 million for programming to support transportation electrification. [EPA-HQ-OAR-2022-0829-0694, pp. 1-2]

- EV CO [Embedded Hyperlink: https://evco.colorado.gov/], a public awareness campaign designed to promote the convenience and financial and environmental benefits of driving electric, and answer common questions about incentives and charging. [EPA-HQ-OAR-2022-0829-0694, pp. 1-2]

-Recently passed legislation (HB23-1233 [Embedded Hyperlink: https://leg.colorado.gov/bills/hb23-1233]) and state minimum building energy codes [Embedded Hyperlink: https://energyoffice.colorado.gov/climate-energy/energy-policy/building-energy-codes/energy-code-board] that require a minimum level of EV readiness in new construction for multi-family housing and other building types. [EPA-HQ-OAR-2022-0829-0694, pp. 1-2]

Organization: Consumer Reports (CR)

The proposed EPA rule would increase the supply of cleaner, cost-saving transportation options, such as EVs and hybrids, available to consumers. This proposal, particularly the more stringent Alternative 1, would support the transition to a cleaner transportation sector, providing cost savings, as well as other benefits that go beyond the pocketbook. This proposal would save consumers money on fuel and vehicle maintenance. It would also reduce emissions, thus contributing to reduced spending on healthcare costs tied to air pollution, and disaster recovery tied to GHG emissions. [EPA-HQ-OAR-2022-0829-0728, p. 6]

These savings are particularly important for overburdened communities who overwhelmingly bear the brunt of the negative impacts of air pollution. Not only do these communities face a disproportionate exposure to vehicle tailpipe emissions,4 but lower income households also spend a greater percentage of their income on transportation costs than their wealthier counterparts, making them more sensitive to fluctuation and uncertainty in fuel prices.5 Thus, policies such as the proposed rule, which reduce pollutant exposure and increase accessibility to clean, reliable modes of transportation, are needed. [EPA-HQ-OAR-2022-0829-0728, p. 6]

1.3. Consumer Petitions in Support of Proposed Rule

Consumer Reports collected 18,817 signatures from consumers in support of strengthening EPA's current proposal for greenhouse gas standards.6 [EPA-HQ-OAR-2022-0829-0728, Attachment 1, p. 6]

6 Petition: More Clean Vehicles = Better Climate Future, Consumer Reports, 2023, https://action.consumerreports.org/nb-20230425-epa-cleancars-petition.

Petition Text:

"We're urging the EPA and NHTSA to adopt the strongest possible rules to reduce climate- and health-damaging vehicle emissions and greatly reduce fuel consumption, while helping consumers save an estimated $12,000 over the lifetime of a new vehicle. The rules will rapidly accelerate the number of cleaner vehicles like EVs and hybrids in production over the next decade; save lives due to a dramatic decrease in tailpipe pollution; and put us on the route towards a zero emissions future. These rules are a win-win for the climate, consumers' wallets, and our health." [EPA-HQ-OAR-2022-0829-0728, p. 6]

Organization: Dana Incorporated

Dana supports the underlying goals of the proposed Multi-Pollutant Emissions Standards and appreciates EPA's receptiveness in receiving stakeholder input. [EPA-HQ-OAR-2022-0829-0538, p. 2]

Organization: Doug Peterson

I appreciate the opportunity to comment on the EPA's proposed standards for 2027-2032 light and medium duty tailpipe emissions. The regulatory effort to accelerate the transition away from internal combustion vehicles is commendable, given the grave threat of climate change. The historic stringency increases are clearly feasible, and they reflect an appropriate, urgent response to the escalating crisis. There is growing optimism that the electrification of the transportation sector will succeed, and the agency's bold proposal is consistent with similar efforts enacted by other proactive nations. [EPA-HQ-OAR-2022-0829-0500, pp. 1-2]

Organization: Electrification Coalition (EC)

We urge this Administration to adopt the Alternative 1 Scenario, as we support the strongest policies that will accelerate our path to transportation electrification. [EPA-HQ-OAR-2022-0829-0588, p. 1]

In addition to our national security challenges, the U.S. also faces the rapidly growing threat of climate change. The latest National Climate Assessment4, which Congress mandated in 1990 under the Global Change Research Act, shows that the U.S. has been observing the impacts of climate change for decades and that more frequent and extreme weather and climate-related events are creating new and increasing risks across U.S. communities – which we have recently seen with wildfires that have ravaged the country, more powerful hurricanes causing loss of lives and immense destruction, more intense tornadoes destroying communities, and extreme weather events in areas that we should not expect to see these weather events in. [EPA-HQ-OAR-2022-0829-0588, p. 2]

To overcome these national security concerns from climate change, the U.S. must reduce carbon emissions. The EPA notes that the transportation sector is the largest source of greenhouse gas emissions, representing 27% of total greenhouse gas emissions.5 [EPA-HQ-OAR-2022-0829-0588, p. 2]

Organization: Energy Innovation

Energy Innovation appreciates the opportunity to submit these comments to the U.S. Environmental Protection Agency (EPA) regarding its Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles (proposed rule). Energy Innovation is a nonpartisan energy and climate policy firm. We provide independent analysis and science-based research to policymakers and other decision-makers seeking to understand which policies are most effective to ensure a climate-safe future for all. Our team has expertise in modeling climate policy, including policies that support a cleaner power grid and electrify transportation, buildings, and industry. Our recommendations are data-driven and informed, in part, by our peer-reviewed Energy Policy Simulator (EPS) model. [EPA-HQ-OAR-2022-0829-0561, p. 1]

We appreciate the EPA's extensive work to develop these proposed emissions standards for criteria pollutants and greenhouse gases for light-duty and medium-duty vehicles (LDVs and MDVs, respectively) for model years 2027 (MY 2027) and later. We commend the EPA's diligent analysis in its development of the proposed rule, which reflects the impact of new federal and state policies and advances in clean vehicle technologies. The EPA has set forth a proposed rule that aligns with its statutory directive in Section 202(a)(1) of the CAA to enhance the stringency of LDV and MDV vehicle tailpipe standards needed to reduce emissions that endanger public health and welfare: "'the Administrator shall by regulation prescribe (and from time to time revise)…standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles … which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.'"1 We concur with the EPA's analysis that the proposed rule and Alternative 1 are aligned with its statutory directive—the proposed more stringent standards offer technologically feasible and cost-effective options to reduce harmful GHG and other air polluting emissions over the timeframe the standards would be in place. [EPA-HQ-OAR-2022-0829-0561, p. 1]

1 U.S. EPA, "Proposed Rules: Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles (EPA–HQ–OAR–2022–0829; FRL 8953–03– OAR)," Federal Register 88, no. 87 (May 5, 2023), https://www.govinfo.gov/content/pkg/FR-2023-05-05/pdf/2023-07974.pdf, 29231-2.

CONCLUSION

We commend the EPA for undertaking such a thorough investigation into the myriad factors underpinning the proposed tailpipe rules. The stringency of the final rules will have an outsized impact on climate and public health, and the EPA is the agency with statutory authority under the CAA to adopt the most stringent standards feasible to mitigate harmful vehicle emissions. The combination of new federal policies, ongoing state leadership, increased private sector engagement, and the imperative to address climate change this decade are converging at the right moment to support the adoption of strong rules for the LDV and MDV sectors. We look forward to continued engagement with the EPA through this important process, and we invite its full consideration of our comments in its final decision-making. [EPA-HQ-OAR-2022-0829-0561, p. 27]

Organization: Environmental Defense Fund (EDF) (1of 2)

Environmental Defense Fund (EDF) respectfully submits the following comments in support of Environmental Protection Agency's (EPA) Proposed Rule, Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 29184 (May 5, 2023) ("Proposal" or "Proposed Standards"). These comments highlight the importance and urgency of finalizing health protective standards for new light- and medium-duty vehicles by the end of the year that ensure deep reductions in greenhouse gas (GHG) and criteria pollution by leveraging a range of zero emitting technologies and internal combustion engine vehicle (ICEV) improvements that automakers have available, including battery electric vehicles (BEVs), plug- in hybrid electric vehicles (PHEVs), hybrid vehicles, fuel cell vehicles, and internal combustion engine and vehicle technologies. Near-term emissions reductions are vital to mitigating the effects of climate change and to protecting public health, especially the health of low-income communities and communities of color, which are disproportionately impacted by transportation air pollution. [EPA-HQ-OAR-2022-0829-0786, pp. 1-2]

EPA's proposal is a vital step forward toward addressing the largest source of greenhouse gas emissions and a significant source of health-harming particulate matter (PM) and smog-forming nitrogen oxide (NOx) pollution in the United States. EDF urges EPA to finalize protective light- and medium-duty standards, consistent with and building from the proposals the agency has put forward, that account for the progress already underway thanks to manufacturer and fleet investments and commitments, federal investments, and state policies like the Advanced Clean Cars II (ACC II) rule. EDF supports EPA's finalization of the most protective multipollutant standards possible that deliver pollution reductions at least at the level of the proposal and that result in about two-thirds of new light-duty vehicles and 40% of new medium-duty vehicles sold in 2032 are zero-emitting, putting us on the path to zero emissions from new vehicles in 2035. We encourage EPA to secure even greater pollution reductions by providing for a voluntary (but once chosen, enforceable) alternative leadership pathway that, for manufacturers choosing the pathway, would ensure ACC II levels of ZEV deployment nationwide. We also recommend that the agency consider strengthening the standards in the 2031-32 timeframe, which is especially vital if EPA finalizes standards that are less protective than the proposal in the early years of the program. Doing so could potentially increase cumulative benefits relative to the proposal (and, at minimum, must offset any loss in cumulative benefits). [EPA-HQ-OAR-2022-0829-0786, pp. 1-2]

The historic investments in the Inflation Reduction Act (IRA) and Bipartisan Infrastructure Law (BIL) have rapidly accelerated an American electric vehicle manufacturing renaissance, dramatically advanced purchase price parity for passenger ZEVs, and accelerated already declining costs for vehicles at the same time. Leveraging these trends, most manufacturers have made commitments consistent with and even greater than the levels of ZEV deployment EPA projects in this rule and leading states have continued to adopt California's ACCI and ACC II rules. These factors strongly support EPA's proposed standards and, as outlined below, our comments provide additional analysis and information to support standards that deliver even greater pollution reductions. [EPA-HQ-OAR-2022-0829-0786, p. 2]

Organization: Gabrielle Lawrence

I and all the children that I see say thank you to the EPA and President Biden for supporting new and stronger regulations on USA cars. trucks , buses. Hopefully, these regulations will significantly eliminate the poisons in our air and help those who are deeply impacted to be healthy – of body and mind. [EPA-HQ-OAR-2022-0829-0455, p. 2]

Organization: General Motors, LLC (GM)

In August 2021, GM was proud to participate in the Administration's event for Executive Order 14037 with a goal of 50% EV share by 2030,9 with an associated goal of a 60% GHG reduction from model year 2020 to 2030.10 At that time, we shared our aspiration of achieving 40-50% of annual U.S. sales volumes of all EVs by 2030, with the high end of the 40-50% range enabled by supportive policies.11 [EPA-HQ-OAR-2022-0829-0700, p. 3]

Organization: GreenLatinos et al.

For Multi-Pollutant L/MDV standards, we urge the U.S. EPA to finalize the strongest possible standards by the end of 2023. In the proposed rulemaking, Alternative 1 is a good start, but we need to increase the pace after 2030 to stay on route to achieve a zero emissions transportation future. We urge the EPA to continue to create standards that make gas cars cleaner and more efficient. [EPA-HQ-OAR-2022-0829-0789, p. 1]

Organization: Greg Dotson

In seeking to spur the development and deployment of electric vehicles in its recently proposed rule, the U.S. EPA is not acting in isolation or conflict with Congress. Instead, Congress has insisted on the development of electric vehicles since 1976 and has provided many billions of dollars for EV research, development, demonstration, and deployment. With recent enactment of the IIJA and the IRA, Congress has clearly demonstrated its support for the widespread adoption of electric vehicles in the years to come. Given the substantial public resources devoted to developing mature electric vehicle technology and bringing those electric vehicles to market, it would be absurd for EPA to finalize emissions standards for light- and medium-duty vehicles that do not fully realize the opportunity and benefits of zero emission vehicles. [EPA-HQ-OAR-2022-0829-0685, p. 20]

One needs only to assess the growing importance of EVs to the automotive industry prior to EPA's proposal or the agency's most recent final rule strengthening standards through model year 2026 [1] to see the momentum in this transition. Prior to EPA's issuance of its proposed rule in August 2021 – [EPA-HQ-OAR-2022-0829-0685, pp. 2-3]

10 Letter to President Joe Biden from John Bozzella, Alliance for Automotive Innovation, Rory Gamble, United Autoworkers International Union, and Bill Long, Motor & Equipment Manufacturers Association (Mar. 29, 2021).

At the same time that automakers were making these announcements, national and subnational jurisdictions around the world were announcing policies to eliminate sales of emitting vehicles. For example, the United Kingdom had announced in November 2020 that it would ban fossil fuel powered vehicles by 2030.11 Dozens of other jurisdictions had also announced commitments to electrification.12 [EPA-HQ-OAR-2022-0829-0685, pp. 2-3]

11 Henry Edwardes-Evans, SPG PLatts, UK government brings forward ban on new ICE cars 10 years to 2030 (Nov. 18, 2020) https://www.spglobal.com/platts/en/market-insights/latestnews/electric-power/111820-uk- government-brings-forward-ban-on-new-ice-cars-10-years-to-2030.

12 Hongyang Cui, Dale Hall, and Nic Lutsey, International Council on Clean Transportation, Update on the global transition to electric vehicles through 2019 (July 2020) https://theicct.org/sites/default/files/publications/update-global-EV-stats-sept2020-EN.pdf.

All of these developments, again, predated EPA's even proposing its rule regarding Model Year 2023-2026 standards. [EPA-HQ-OAR-2022-0829-0685, pp. 2-3]

These developments were not attributable to any one government policy, technological breakthrough, or private sector action. Instead, momentum for these developments swelled in national parliaments, corporate boardrooms, research laboratories, and automakers' showrooms. [EPA-HQ-OAR-2022-0829-0685, pp. 2-3]

Organization: Interfaith Power & Light

As faith leaders from diverse religious and spiritual traditions, we speak with one voice in support of bold and just climate solutions. Climate change is a moral issue that is most harmful to those least responsible for creating the problem. People of faith and conscience recognize the need for bold, new transportation solutions, and clean cars and light trucks are an integral step towards addressing the climate crisis. Today we write to ask you to move swiftly to enact robust light-duty vehicle multi-pollutant emissions standards. As a nation, we have a moral imperative to enact the most stringent light-duty vehicle standards in order to address our historically unsafe pollutant emissions and to protect our public health and Shared Home. [EPA-HQ-OAR-2022-0829-0530, p. 1]

It is of the utmost importance that standards require tighter limits on internal combustion engine vehicles in order to continually make these vehicles cleaner as manufacturers transition to zero-emission cars. [EPA-HQ-OAR-2022-0829-0530, p. 2]

Now is the time to maximize the impact of our national clean car standards—the most effective policy that the federal government has to reduce dangerous air pollution, lower greenhouse gas emissions, and save consumers money at the pump. As policymakers, you have a critical and sacred role in helping to achieve these goals. As faith leaders, we urge you to establish strong light-duty vehicle multi-pollutant emissions standards that put our nation on a trajectory to a zero-emissions transportation future, and we ask you to redouble efforts to announce the draft rule before the end of 2023. For more than a decade, people of faith and conscience have advocated for strong safeguards on greenhouse gas pollution from transportation. Since then, the climate crisis has only accelerated, taking an enormous toll on human life, our communities, and our world. We have a moral responsibility to act right now as a nation to do all we can to address climate change for our communities, future generations, and our Sacred Earth. [EPA-HQ-OAR-2022-0829-0530, p. 2]

Organization: International Council on Clean Transportation (ICCT)

ICCT strongly supports EPA's proposed multi-pollutant emission standards for light- and medium-duty vehicles for model years 2027-2032. The proposed standards are critical to achieving the pace and scale of needed transportation emission reductions in the United States, where there is a clear and urgent need to rapidly transition to cleaner vehicles. Continued and strengthened standards are necessary to protect public health and deliver on national environmental obligations. We support the proposed standards that would dramatically reduce climate and air pollution from new passenger and medium-duty vehicles and deliver trillions of dollars in net benefits. [EPA-HQ-OAR-2022-0829-0569, p. 3]

ICCT strongly supports the proposed multi-pollutant emission standards for light- and medium- duty vehicles for model years 2027-2032 and recommends its finalization as quickly as possible. Doing so will provide a clear long-term signal that automakers, suppliers, charging companies, and utilities need to make needed investments with confidence. [EPA-HQ-OAR-2022-0829-0569, p. 5]

Organization: Lillian Davey

I believe this form of legislation is in the best interests of the people. Regulation on pollutants and greenhouse gases is vital in ensuring public health and safety as well as limiting environmental damage. The Environmental Protection Agency enforces the vehicle and engine provisions of Title II of the Clean Air Act and regulations at 40 C. F. R. Parts 85, 86, 88 through 94, 600, and 1033 through 1068., to which this legislation is directly related. The Clean Air Act, as well as the EPA are responsible for ensuring that motor vehicles are not emitting a certain amount of pollutants that can be responsible for the damage of human health, as well as environmental health. The Clean Air Act has been used several times to attack the EPA and demand for more stringent guidelines. One major case being Massachusetts v. EPA (2007), which changed the entire framework for the Clean Air Act and how it has been applied and monitored since. This legislation is a direct stem from that case. [EPA-HQ-OAR-2022-0829-0489, p. 1]

Greenhouse gases as well as other emitters are the most detrimental to the environment, and the list only keeps growing as more scientific evidence continues to arise. [EPA-HQ-OAR-2022-0829-0489, p. 1]

Organization: Lucid Group, Inc.

Response to the Proposed Rulemaking

Lucid Applauds EPA's Forward Thinking in Setting Cleaner, More Stringent Emissions Standards

Lucid strongly supports EPA's proposed rule on Multi-Pollutant Emissions Standards for Model Years (MYs) 2027 and Later in Light-Duty and Medium-Duty Vehicles. We applaud the agency for proposing stringent standards that would reduce tailpipe pollutants and accelerate EV adoption, ultimately addressing global warming and other air pollutants. [EPA-HQ-OAR-2022-0829-0664, p. 2]

Cleaner tailpipe standards for criteria pollutants and greenhouse gases are critical to protect public health and welfare and to combat the climate crisis. As demonstrated in its 2021 revision to the GHG standards for MYs 2023-20261, EPA has made significant strides under its authority to both set and revise standards based on updates to climate-related findings. Even with this progress, our national and international decarbonization goals require aggressive policies and standards to ramp up the shift to EVs sooner. [EPA-HQ-OAR-2022-0829-0664, p. 2]

1 86 FR 74434, December 30, 2021, "Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards."

Under section 202 of the Clean Air Act, EPA has clear authority to regulate sources of air pollutants from all mobile sources, including carbon dioxide (CO2), non- methane organic gases (NMOG) plus oxides of nitrogen (NOx) or NMOG+NOx, particulate matter (PM), carbon monoxide (CO), and formaldehyde (HCHO) from vehicle tailpipes. Lucid applauds EPA's continued efforts under this authority to improve the nation's air quality. [EPA-HQ-OAR-2022-0829-0664, p. 2]

Organization: Maryland Department of the Environment (MDE)

The Maryland Department of the Environment (MDE) is writing to express our support for the above proposed rule to establish Multi-Pollutant Standards for Model Years 2027 and Later Light- Duty and Medium-Duty Vehicles. MDE agrees that this comprehensive federal program would achieve significant greenhouse gas (GHG) and criteria pollutant emissions reductions, improve air quality, and result in substantial public health benefits while helping us meet our climate and air quality goals. MDE urges the Environmental Protection Agency (EPA) to adopt the proposed criteria pollutant standards. MDE also urges EPA to adopt the most stringent, technologically feasible Alternative 1 GHG emissions standards. Alternative 1 is the closest to being in alignment with the California Advanced Clean Cars II (ACC II) regulations, which Maryland is in the process of adopting. [EPA-HQ-OAR-2022-0829-0698, pp. 1-3]

Maryland has made a lot of progress over the past few decades towards clean air. The improvements have been so substantial that the EPA has proposed to determine that the Washington, District of Columbia-Maryland-Virginia nonattainment area has clean data for the 2015 8-hour ozone national ambient air quality standard (2015 ozone NAAQS). A Clean Data Determination (CDD) is the first step in being redesignated from nonattainment to attainment. The Baltimore nonattainment area will also be eligible for a CDD in the near future if the area continues to stay at or below the ozone standard. Nitrogen oxides (NOx) are a precursor pollutant of ground-level ozone and are also precursors to secondary small particulate matter (PM2.5). Exposures to these two pollutants are associated with premature death, increased hospitalizations, and emergency visits due to exacerbation of chronic heart and lung diseases and other serious health impacts. Some areas of the state experience higher rates of illnesses such as asthma than average, and these illnesses are aggravated by these pollutants. [EPA-HQ-OAR-2022-0829-0698, pp. 1-3]

While significant progress has been made statewide, continuing to reduce NOx emissions, especially those from the transportation sector, is critical to our efforts to attain and maintain the ozone NAAQS. Regional modeling shows that a significant portion of the ozone-forming pollutants are transported into Maryland from upwind states. EPA estimates that strengthening these standards will reduce NOx and PM2.5 emissions nationally by 41% and 35% in 2055, respectively, which combined with state reductions can provide cleaner air for Marylanders. [EPA-HQ-OAR-2022-0829-0698, pp. 1-3]

Maryland is working hard to reduce in-state emissions from the transportation sector. Efforts include the Maryland Clean Cars Act that instructed MDE to adopt the California Advanced Clean Car (ACC I) regulations that require manufacturers of passenger cars and light-duty trucks to sell increasing percentages of zero-emission vehicles (ZEVs). The regulations also include low-emission vehicle (LEV) standards to reduce criteria pollutants and GHG emissions from new gasoline powered vehicles. As noted above, Maryland is in the process of adopting California's ACC II regulations. The ACC II regulations require auto manufacturers to sell an increasing percentage of ZEVs over time, with a phase in of a 100 percent sales target by 2035. ACC II also established increasingly more stringent exhaust and evaporative emissions standards for criteria pollutants from these vehicles. Maryland's recently enacted Clean Trucks Act of 2023 requires MDE to adopt California's Advanced Clean Trucks (ACT) regulations that require manufacturers of medium- and heavy-duty vehicles to sell increasing percentages of ZEVs by 2035. Maryland is also a signatory to both the 2013 Multi-State Zero-Emission Vehicle Memorandum of Understanding and the 2020 Multi-State Medium- and Heavy-Duty ZEV Memorandum of Understanding under which the signatory states are working collaboratively to accelerate ZEV adoption, coordinate ZEV policy, develop the ZEV market, and build out infrastructure. The recently enacted Bipartisan Infrastructure Law (BIL) and the Inflation Reduction Act (IRA) will provide significant funding to advance electrification and charging infrastructure that will enable the widespread electrification of this vehicle market. [EPA-HQ-OAR-2022-0829-0698, pp. 1-3]

Adopting the most stringent, technically technical feasible Alternative 1 GHG emissions standards at the federal level will provide considerable support for Maryland's efforts to meet our GHG reduction goals. Transportation accounts for almost half of all GHG emissions generated in the State. The Climate Solutions Now Act of 2022 (CSNA) established a statewide goal of a 60 percent reduction in GHG emissions from 2006 levels by 2031. The CSNA requires more stringent GHG emission reductions economy wide and requires state agencies execute plans, programs, and policies in order to achieve these goals. Enacting the most stringent GHG emissions standards that are technologically feasible will complement the many strategies being implemented under the CSNA. [EPA-HQ-OAR-2022-0829-0698, pp. 1-3]

Maryland has implemented emissions reduction measures across all sectors, including on-road transportation to reduce the state's GHG and NOx emissions. Federal programs such as these standards are needed to provide significant additional reductions of these pollutants as they also provide benefits across the economy. The EPA's leadership in strong regulatory GHG limits from motor vehicles could also help reduce ozone and PM2.5 precursors, providing further reductions to help meet our climate and air quality goals. [EPA-HQ-OAR-2022-0829-0698, pp. 1-3]

For these reasons, MDE supports the EPA's proposal to adopt the proposed criteria pollutant standards and the most stringent, technologically feasible Alternative 1 GHG emissions standards for model year 2027 and later light-duty and medium-duty vehicles. [EPA-HQ-OAR-2022-0829-0698, pp. 1-3]

Organization: Mayor Becky Daggett, City of Flagstaff, Arizona et al.

Critical pollution reductions

In 2020, the transportation sector contributed 27 percent of total GHG emissions in the United States—more than any other single sector. Transport also contributes over 55 percent of our nation's total nitrogen oxide (NOx) emissions. NOx and particulate matter pollution pose serious health risks, leading to devastating human health impacts including asthma, other respiratory issues, and even premature death. [EPA-HQ-OAR-2022-0829-0732, p. 2]

Fast-tracking robust car and truck standards is critical for the United States to meet its GHG targets over the coming decade, meet Clean Air Act requirements and provide long-overdue protections for environmental justice communities. We believe that such standards would be consistent with the U.S. nationally determined contribution to the Paris Agreement, under which the United States committed to cut economy-wide GHG emissions by 50 to 52 percent in 2030, compared to 2005 levels. [EPA-HQ-OAR-2022-0829-0732, p. 2]

Outcomes

The final standards should:

- Ensure the LDV and HDV standards support greater zero-emission vehicle adoption by considering market growth expected from IRA and IIJA investments (which will surpass existing commitments outlined in Executive Order 14037);

- Put the nation on a trajectory to ensure 100 percent of all LDVs and HDVs sold in 2035 are zero-emission vehicles including pathway milestones assuring continuous progress; and

- Reflect recently adopted state LDV and HDV emissions standards, consistent with state authority under the Clean Air Act. [EPA-HQ-OAR-2022-0829-0732, p. 2]

By implementing these recommendations, we believe that the resultant standards will not only meet the Clean Air Act's statutory command to protect public health, but will also help lower fuel costs for consumers, create good, green jobs, and reduce burden on frontline communities. [EPA-HQ-OAR-2022-0829-0732, p. 2]

Organization: Mercedes-Benz AG

Mercedes-Benz supports the Administration's electrification goals.

The EPA has undertaken a monumental task with this NPRM, setting ambitious and challenging greenhouse gas and criteria emissions standards into the next decade. Mercedes-Benz proudly supports EPA's goal to advance vehicle electrification and protect the environment and public health. [EPA-HQ-OAR-2022-0829-0623, p. 1]

Organization: Metropolitan Washington Air Quality Committee (MWAQC) et al.

On behalf of the Metropolitan Washington Air Quality Committee (MWAQC), the Metropolitan Washington Council of Governments' (COG) Climate, Energy and Environment Policy Committee (CEEPC), and the National Capital Region Transportation Planning Board (TPB), we are writing to express our support for the proposed rule to establish Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles. [EPA-HQ-OAR-2022-0829-0503, p. 1]

The EPA's current proposal to establish multi-pollutant emissions standards for model years 2027 and later light-duty and medium-duty vehicles would provide the critical leadership needed for our region to work towards meeting adopted environmental goals and standards. We agree that this comprehensive federal program would achieve significant greenhouse gas emissions reductions and would result in substantial public health and welfare benefits. As noted in the Metropolitan Washington 2030 Climate and Energy Action Plan, underserved communities have been disproportionately affected by ambient air pollution and climate-change-related health impacts. Therefore, more stringent greenhouse gas emissions standards and subsequent emissions reductions have the potential to help the most vulnerable populations. [EPA-HQ-OAR-2022-0829-0503, p. 1]

Organization: National Association of Clean Air Agencies (NACAA)

NACAA strongly supports EPA's proposal of these multipollutant emission standards – for LDVs and Class 2b and Class 3 MDVs (and we specifically support moving MDVs from the heavy-duty vehicle program to a LDV-program-like structure and the expansion of the definition of medium-duty "passenger" vehicles) – and the agency's use of its authority under CAA section 202(a) to prescribe "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicles engines, which. . .cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." NACAA concurs with EPA that, consistent with the requirements of CAA section 202(b), the proposed standards "permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance." [EPA-HQ-OAR-2022-0829-0559, p. 6]

The proposal is based on the same regulatory framework that EPA has used for past vehicle rulemakings, and NACAA agrees with EPA that, "[t]he levels of stringency proposed in this rule for both light- and medium-duty vehicles continue the trend over the past fifty years for criteria pollutants, and over the past decade for GHGs, of EPA establishing numerically lower emissions standards based on continued advancements in emissions control technology that make it possible to achieve important emissions reductions at a reasonable cost."26 [EPA-HQ-OAR-2022-0829-0559, p. 6]

26 Supra note 1, at 29,196

Organization: National Tribal Air Association (NTAA)

As described and documented in the analysis of this proposed rule, when fully implemented, the U.S. will accomplish reductions in greenhouse gas emissions from motor vehicles, the largest source of these pollutants. Although the proposed rule and anticipated reduction in emissions of greenhouse gases (specifically carbon dioxide) are characterized as "ambitious" and “significant”5, Alternative 1 to the proposed standards will increase the cost of new vehicles as projected for Alternative 1 requirements. These costs for vehicle purchasers will be mitigated by increased savings in vehicle operating costs. [EPA-HQ-OAR-2022-0829-0504, p. 2]

5 Biden-Harris Administration Proposes Strongest-Ever Pollution Standards for cars and trucks to Accelerate Transition to a Clean – Transportation Future, USEPA News Release, April 12, 2023

The ravages of climate change continue to be of utmost concern to the NTAA. Alternative 1 to the proposed rule calls for more aggressive carbon monoxide emissions standards. We recommend its adoption. [EPA-HQ-OAR-2022-0829-0504, p. 2]

Conclusions

The NTAA appreciates this opportunity to comment on the proposed rule regarding “Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles.” We agree with the EPA’s stated urgency to improve our air quality and to mitigate climate change5. The proposed vehicle emissions standards and related provisions can be important elements in addressing these critical needs. We support the proposed rule including Alternative 1 to the proposed greenhouse gas emissions standards. The anticipated shift to electric vehicle fleets must, however, be coincident with greatly enhanced electric infrastructure in many Tribal communities. [EPA-HQ-OAR-2022-0829-0504, p. 3]

5 Biden-Harris Administration Proposes Strongest-Ever Pollution Standards for cars and trucks to Accelerate Transition to a Clean – Transportation Future, USEPA News Release, April 12, 2023

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

NESCAUM and the OTC strongly support EPA’s proposal to establish new and more stringent criteria pollutant and greenhouse gas (GHG) emissions standards for model years (MYs) 2027 and later light-duty vehicles (LDVs) and Class 2b and 3 medium-duty vehicles (MDVs). Such standards have the potential to substantially reduce emissions of GHGs, NOx, fine particulate matter (PM2.5), VOCs, and air toxics, and help states across the country to achieve attainment with National Ambient Air Quality Standards (NAAQS) and state and federal climate goals. NESCAUM and the OTC urge EPA to adopt the proposed criteria pollutant standards and the most stringent GHG emissions standards that are technologically feasible. [EPA-HQ-OAR-2022-0829-0584, pp. 1-2]

II. State Policies and Federal Funding have Primed the Market for Rapid Electrification.

Recognizing the urgent need for action, most of the NESCAUM and OTC states have established ambitious economy wide or transportation sector specific GHG emission reduction targets for 2050 and interim targets that require aggressive emissions reductions by as soon as 2030. Transportation electrification is also critical to attaining the NAAQS in large metropolitan areas like the CSA. For decades, these states have worked individually and collaboratively to develop and implement a wide range of strategies to accelerate ZEV deployment, priming the market for increasingly stringent federal emissions standards. [EPA-HQ-OAR-2022-0829-0584, pp. 3-4]

A. Section 177 State LDV and MDV Emissions Standards

Under the CAA, California is the only state permitted to establish emissions standards for new motor vehicles. However, CAA Section 177 authorizes other states to adopt California's emissions standards, which are generally more stringent than comparable federal requirements. States first began to utilize this tool over 30 years ago to address smog and more than 15 years ago to curb GHG emissions. Since 1990, California and a growing number of "Section 177 states," including most of the NESCAUM and OTC states, have adopted regulations designed to increase production of on-road ZEVs. Adoption of these standards by Section 177 states enables economies of scale and sends clear market signals to industry and investors. These states also serve as a proving ground for advanced technologies and provide the foundation for strong federal standards like those proposed in the NPRM. [EPA-HQ-OAR-2022-0829-0584, pp. 3-4]

Organization: Oregon Department of Environmental Quality (DEQ)

The Oregon Legislature in 2007 found that "Global warming poses a serious threat to the economic well- being, public health, natural resources and environment of Oregon." It is important that the standards set by EPA continue to reduce greenhouse gases and other air pollutants from new vehicles through at least 2032. In Oregon, motor vehicles are the largest contributor of greenhouse gas emissions and the adoption of stringent vehicle standards is a foundational strategy to decarbonize Oregon's transportation sector. As a Section 177 state, Oregon has adopted regulations, namely California's Advanced Clean Cars program to increase production of ZEVs and reduce criteria air pollutant emissions from gasoline powered vehicles. The adoption of this program is one of many significant actions taken toward Oregon's goal of reducing greenhouse gas emissions 75 percent below 1990 levels by 2050. Additionally, the Advanced Clean Cars ZEV sales requirements provide the regulatory certainty needed to drive public and private investment in deployment of ZEVs and charging infrastructure. These requirements have propelled Oregon into one of the top five states selling light-duty ZEVs. Federally mandated requirements ensure the entire nation would move towards a cleaner transportation future. [EPA-HQ-OAR-2022-0829-0751]

These rules also provide numerous other environmental, economic and health benefits. Given that mobile sources contribute over half of the anthropogenic NOx emissions in the U.S.,1 it is essential to establish standards that lower the emissions from these sources. The proposed rules would reduce more than 400,000 tons of harmful NOx, PM2.5, and hazardous air pollutant emissions through 2055, significantly improving public health across America. EPA also estimates that these standards will result in approximately a 95% reduction in particulate matter (PM) emissions. These reductions are significant and ensures that Oregon, who has several ozone and PM maintenance areas, to continue to attain and maintain the existing PM and ozone standards as well as any revised, more stringent standards EPA may set in the future. [EPA-HQ-OAR-2022-0829-0751]

1 U.S. Environmental Protection Agency, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles," Govinfo, https://www.govinfo.gov/content/pkg/FR-2023-05-0S/pdf/2023- 07974.pdf

In the proposed rules, EPA is also requesting comment whether these new standards should be extended to MY 2035. DEQ recommends EPA extend and increase the GHG standards through MY 2035, to better align with those states that have already adopted California's Advanced Clean Cars Rule. [EPA-HQ-OAR-2022-0829-0751]

The proposed standards would meaningfully reduce emissions from the largest source of mobile emissions and provide substantial public health and climate benefits, helping Oregon achieve its greenhouse gas reduction goals. It also accelerates our efforts to decarbonize the transportation sector. In particular, for those states that lack the authority to address GHG emissions from on-road vehicles, EPA's action to update these standards is needed to ensure other states can meet their climate objectives. [EPA-HQ-OAR-2022-0829-0751]

Organization: Plug In America

We applaud the Environmental Protection Agency (EPA) for proposing the most stringent auto emissions standards in U.S. history. To meet the Paris Climate Agreement, 67% of vehicles sold in 2030 need to be electric vehicles (EVs).1 In addition to the significant climate and health benefits these standards will provide, we expect to see an increase in energy security, improved resilience of the electric power system, and a decrease in transportation fuel price volatility for American families. These emissions standards and the corresponding increase in electric vehicles have the potential to create a more just, equitable transportation system. [EPA-HQ-OAR-2022-0829-0625, p. 1]

1 https://theicct.org/us-ghg-standard-paris-agreement-dec22/.

EVs make ambitious GHG emissions standards achievable. There are parties who argue that these standards force a shift to electric transportation before the technology and infrastructure are ready. With 10 million EVs sold globally in 2022 and operating daily on roads worldwide, the EV future is here. [EPA-HQ-OAR-2022-0829-0625, p. 1]

In closing, we commend the EPA and the Biden - Harris administration for developing an elegant policy solution to address the climate change impacts of transportation through both regulation and incentives. Regulations drive manufacturers to innovate, incentives build the market, and infrastructure investments build consumer confidence. Together, these elements will drive change toward cleaner transportation and economic development. [EPA-HQ-OAR-2022-0829-0625, p. 3]

Organization: POET, LLC

POET thanks the Environmental Protection Agency (“EPA”) for the opportunity to submit this comment on the proposed rule, “Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles” (the “Proposed Rule”). POET generally supports standards, like those in the Proposed Rule, that will significantly curb greenhouse gas (“GHG”) emissions from cars and light- and medium-duty trucks covered by the Proposed Rule. However, EPA must broaden the range of technologies the Proposed Rule relies upon to include renewable fuels, such as bioethanol, in setting standards for reducing GHG and other emissions. Renewable fuels will be critical to decarbonizing and reducing other air pollutant emissions from these vehicles. POET urges EPA to credit renewable fuels, including their significant lifecycle carbon emissions reductions, and adopt POET’s other recommendations in these comments. [EPA-HQ-OAR-2022-0829-0609, p. 1]

Organization: Pueblo of Santa Ana

The Pueblo of Santa Ana ("The Pueblo") is located along the Rio Jemez and Rio Grande in southeastern Sandoval County, New Mexico, about 15 miles north of Albuquerque and 45 miles south of Santa Fe. Santa Ana land encompasses 141,191 acres including original land grants, trust lands, and land purchased by the Tribe. The Pueblo is located in a major transportation corridor. One major interstate highway (I-25) bisects the Pueblo, and another state highway (NM-550) runs along the southern boundary, close to residential areas on the Pueblo. There are high traffic volumes and ongoing road construction in this area, producing heightened levels of emissions that have a significant impact on the Pueblo's air quality. [EPA-HQ-OAR-2022-0829-0556]

From the latest Level 2 emissions inventory the Pueblo has conducted, the percentage of criteria pollutants contributed by the Pueblo when totaling all sources on-Pueblo and within 50 miles of the Pueblo's boundaries stayed well below 3%. Because of this, the area emissions, including those from vehicles, that impact Santa Ana are contributed minimally by the Pueblo. This proposed regulation, along with EPA's other efforts to reduce ozone-causing pollutants, PM2s, and multiple hazardous air pollutants would benefit Santa Ana which is subject to these emissions coming from off the Pueblo. [EPA-HQ-OAR-2022-0829-0556]

The acute and continuous impacts of climate change on the Pueblo of Santa Ana are well documented. Unfortunately, new consequences of this global crisis continue to be revealed. As described and documented in the analysis of this proposed rule, when fully implemented, the U.S. will accomplish reductions in greenhouse gas emissions from motor vehicles, the largest source of these pollutants. Although the proposed rule and anticipated reduction in emissions of greenhouse gases (specifically carbon dioxide) are characterized as “significant” and “stringent”5, Alternative 1 to the proposed standards will achieve more substantial reductions. We are mindful of the expected additional costs of new vehicles as projected for Alternative 1 requirements. These costs for vehicle purchasers will be mitigated by increased savings in vehicle operating costs. We recommend Alternative 1. [EPA-HQ-OAR-2022-0829-0556]

5 No footnote provided.

The Pueblo of Santa Ana supports the proposed emissions standards for new light-duty and medium-duty vehicles for non-methane organic gases plus nitrogen oxides (NMOG+ NOx). When fully implemented, this will be an important step in reducing the impacts from the largest source of these ozone-precursor pollutants. Concurrently, reduced emissions of NMOG+ NOx will reduce ambient air concentrations of particulate matter, and PM2.s more specifically. Reducing these tailpipe emissions will further reduce the release of multiple toxic air pollutants including benzene - a known human carcinogen. [EPA-HQ-OAR-2022-0829-0556]

In conclusion, the Pueblo of Santa Ana supports this important set of proposed regulations regarding air pollution emissions from new light-duty and medium-duty vehicles. This support is contingent upon EPA and other federal agencies' assurances that infrastructure is in place to support the transition to an electric vehicle fleet nationwide. [EPA-HQ-OAR-2022-0829-0556]

As our light-duty and medium-duty vehicle populations become more electrified, battery durability and warranty will be increasingly important. The Pueblo of Santa Ana supports the proposed requirements regarding battery performance. [EPA-HQ-OAR-2022-0829-0556]

The anticipated transition from gasoline-powered vehicles to partial or total electric power trains will require greatly enhanced systems and convenient vehicle charging units. We are aware that programs are emerging to build this infrastructure. Such initiatives by the EPA, the Department of Energy (DOE), and others must be operational and reliable for the proposed emissions standards to be achievable and acceptable. [EPA-HQ-OAR-2022-0829-0556]

Organization: Rivian Automotive, LLC

EPA Proposed Strong Standards but More Stringent Requirements are Feasible

Rivian's mission to Keep the World Adventurous Forever is made manifest in its commitment to the environment and addressing climate change. We strongly support a program of ambitious GHG regulation in the transportation sector as core to our values and vision for the world. Given transportation's role as the country's number one source of GHG emissions at a time when the urgency of the climate crisis has never been clearer, a program such as this proposal is also vitally necessary. Rivian strongly supported EPA's revision in 2021 of the U.S. emissions standards for passenger cars and light trucks through MY26. But we stressed in our comments at the time that additional action would be necessary to meet the country's broader climate protection goals. [EPA-HQ-OAR-2022-0829-0653, pp. 2-7]

EPA's current proposal fundamentally meets the moment. Collectively, automakers' have officially announced EV investments totaling hundreds of billions of dollars to support EV production goals that, if achieved, would result in 43 million annual EV sales globally by 2030.2 In the U.S. market specifically, independent analyses find that business as usual—including the impact of government incentives—now points toward an EV sales share in 2032 of 56-67 percent.3 Similarly, the agency's own sensitivity analysis finds that the central "No Action" scenario results in 54 percent BEV sales in MY32, while a "faster BEV acceptance" case results in 66 percent BEV sales on the same timeframe.4 Therefore, EPA's proposal reflects the industry's new paradigm and ensures that the investments and commitments of the private sector are matched by the regulatory framework in which they operate. With these rules in place, the L/MDV sector will be well on its way to a full transition to electrification no later than MY35. [EPA-HQ-OAR-2022-0829-0653, pp. 2-7]

2 BloombergNEF, Zero-Emission Vehicles Factbook: A BloombergNEF Special Report Prepared for COP27 (November 2022), available at www.assets.bbhub.io/professional/sites/24/2022-COP27-ZEV-Transition_Factbook.pdf.

3 Peter Slowik et al., The International Council on Clean Transportation, and Robbie Orvis and Sara Baldwin, Energy Innovation Policy & Technology LLC, Analyzing the Impact of the Inflation Reduction Act on Electric Vehicle Uptake in the United States (January 2023), available at https://theicct.org/wp-content/uploads/2023/01/ira-impact-evs-us-jan23-2.pdf.

4 Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 87 (May 5, 2023) (revising 40 C.F.R. Parts 85, 86, 600, 1036, 1037, and 1066), Table 129, 29,340.

The headline target—82 g/mi on a fleet-average basis in MY32—shows the agency's ambition to remain among the global leaders in emissions regulation. The BEV sales share projected to result from the target generally keeps pace, at least through MY30, with the broader ZEV sales requirements of Advanced Clean Cars II ("ACCII") and Canada's newly proposed amendments to its own GHG standards.5 The climate and public health benefits of this are clear but setting strong standards also positions the U.S. to compete for the automotive jobs of the future and hedges against potential component cost increases. For example, EPA's sensitivity analysis shows that a high battery cost scenario paired with no regulatory action results in industry achieving just 159 g/mi and roughly 29 percent BEV sales in MY32.6 While industry's investments and product plans today undoubtedly favor electrification, the pace of the transition must align with the world's midcentury decarbonization imperative. Leaving carbon reduction solely to the market, even in one now firmly oriented toward an EV future, risks stalled progress in the face of potential economic headwinds and uncertainty. A strong regulatory driver like EPA's proposal will ensure that industry moves forward at the pace and scale necessary to avoid the worst impacts of climate change. [EPA-HQ-OAR-2022-0829-0653, pp. 2-7]

5 EPA did not include PHEVs in its initial analysis of the proposal's impact on technology penetrations. Nevertheless, we find the comparison with ACCII and Canada's proposal illustrative.

6 Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 87 (May 5, 2023) (revising 40 C.F.R. Parts 85, 86, 600, 1036, 1037, and 1066), Table 129, 29,337.

See original attachment for: Figure 1. BEV sales rates projected under EPA's proposal largely keep pace with the ZEV sales requirements of ACCII and Canada (proposed), at least through MY30. [EPA-HQ-OAR-2022-0829-0653, pp. 2-7]

Organization: Scott Wilson

By now, you will have read in public comments that this proposed regulation will transform the way people have lived, worked, and played for over 100 years" (Alliance for Automotive Innovation) and "If finalized as proposed, the proposals would have a very significant impact on all segments of the fuels and vehicle industries and the entire U.S. economy" (American Petroleum Institute). While these statements are hyperbolic, the rule will indeed lead to significant changes to our vehicle fleet, spread over many years. That's the whole point. We've just begun taking the first few steps needed to eventually bring the Gasoline Age to an end. We have a long way to travel on this road. But, it's clear that the best way to achieve the emission targets, which even the Texas Public Policy Foundation acknowledges are under EPA's authority, is to take the combustion out of vehicles. [EPA-HQ-OAR-2022-0829-0515, p. 1]

The automaker's position (Alliance for Automotive Innovation) is that the proposed rule is overly-ambitious and that it requires "stepped-up efforts at the state and local level when it comes to building codes, permitting, and approval from public utility commissions". That is true, and is an ongoing effort, however, we cannot wait until the entire EV ecosystem is in place before ramping up vehicle production. Vehicles and their supporting social and physical infrastructure must develop together, hand-in-hand, just like the fuel, repair, and dealer systems did for gasoline vehicles. We would do well to learn from societies that are successfully transitioning to EVs, like Norway, and the EU more broadly. [EPA-HQ-OAR-2022-0829-0515, p. 1]

Assuming the rule is adopted, opponents will turn to the legal system and rely on an alleged bedrock (but actually recently invented) legal concept called the "major questions doctrine". "Major" is in the eye of the beholder. Whether or not a particular trade group is impacted is not a major question, even if it is offset by an economic bonanza for another trade group. Climate change is a major question. Particulate air pollution affecting human health is a major question.

Economic cost due to climate impacts is a major question. As far as major questions, this rule will be a major win for Americans. [EPA-HQ-OAR-2022-0829-0515, p. 1]

In summary, while change can be challenging, it can also contain opportunity. Wise implementation can manage the former and harvest the latter. [EPA-HQ-OAR-2022-0829-0515, p. 1]

Organization: Sierra Club et al.

On behalf of the 32 undersigned advocacy groups, we thank the Environmental Protection Agency for its leadership in reducing harmful vehicle pollution. We urge the agency to protect public health and address the climate crisis by finalizing the strongest possible emissions standard for light and medium-duty vehicles before the end of 2023. [EPA-HQ-OAR-2022-0829-0668, p. 1]

The final emissions standard should put us on the path to ensuring that all new vehicles sold in 2035 are zero-emission vehicles (ZEVs). This transition is critical to reducing not only GHG emissions, but smog-forming pollution and particulate matter as well. Passenger vehicles produce more than one million tons of nitrogen oxide (NOx) emissions and 33,400 tons of particulate matter (PM) pollution every year.1 These emissions disproportionately harm people in low-income communities and communities of color. [EPA-HQ-OAR-2022-0829-0668, p. 1]

1 Zeroing in on Healthy Air, American Lung Association, https://www.lung.org/getmedia/13248145-06f0-4e35-b79b-6dfacfd29a71/zeroing-in-on-healthy-air-report-2022.

Organization: Southern Environmental Law Center (SELC)

Light- and medium-duty vehicles are a major source of greenhouse gases (GHGs) and other harmful pollutants that have serious environmental, public health, and economic impacts. These adverse impacts are particularly significant in the South. While the proposed standards are an important step towards cleaning up tailpipe emissions from light- and medium-duty vehicles, more should be done to accelerate the transition to zero-emission vehicle (ZEV) technology. We therefore support the adoption of standards at least as stringent as the Alternative 1 standards and urge EPA to consider adopting even stronger standards that would achieve 100 percent ZEV sales in the transportation sector by 2035. These strengthened standards should be adopted as soon as possible and take effect no later than model year 2027. In addition, as part of its effort to strengthen the standards, we support EPA’s proposals to close compliance loopholes, accurately account for tailpipe emissions, and implement stronger certification, durability, and warranty provisions. [EPA-HQ-OAR-2022-0829-0591, p. 1]

Organization: Strong Plug-in Hybrid Electric Vehicle (PHEV) Coalition

We believe this rule when finalized as proposed will send a strong signal to car and truck manufacturers to produce strong PHEVs. We really appreciate the technology neutral approach that you have produced. [EPA-HQ-OAR-2022-0829-0646, p. 10]

Organization: Tesla, Inc.

Foundationally, the primary dynamics that have driven progress in the development of EPA's program in the past and its fundamental architecture remain and, if anything, have become even clearer and more imperative, including: the ongoing need to achieve significant additional emissions reductions from the motor vehicle sector, including for conventional pollutants and greenhouse gases; the increasingly capable role of advanced vehicle technologies, led by zero-emissions BEVs, in providing those reductions; the benefits to the automotive industry of achieving a uniform national program integrating California-led and Federal authorities and operating seamlessly across EPA, the Department of Transportation (DOT), and state authorities; and the importance of regulatory stability to the industry -- and of standards of sufficiently long duration -- to foster the significant investment needed to cement this transformation to advanced technology vehicles. The continuation and amplification of these trends provide a sound legal basis for an even more stringent set of standards than EPA's current proposal. [EPA-HQ-OAR-2022-0829-0792, p. 2]

6 See, 40 C.F.R. §1037.150(f) (Electric vehicles. Tailpipe emissions of regulated pollutants from electric vehicles . . . are deemed to be zero.).

as the carbon intensity of domestic electricity generation continues to decline, BEV emission performance becomes better and better over time.43 In short, consistent with Clean Air Act Section 202(a), BEVs represent a completely designed system to fully prevent and control air pollution.44 [EPA-HQ-OAR-2022-0829-0792, p. 7]

43 See e.g., IPCC, AR 6, Working Group III, Climate Change 2022: Mitigation of Climate Change (April 4, 2022) at 98 available at h ttps://www.ipcc.ch/report/ar6/wg3/.

44 42 U.S.C. §7521(a).

147 Id., at 29232.

Organization: Transport Evolved LLC (Transportation Consultancy)

On behalf of Transport Evolved (Transportation Consultancy), I am writing to express broad support for the updated calculations for the proposed "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles". [EPA-HQ-OAR-2022-0829-0453, p. 1]

It is vitally important, as we see the substantial health and climate impacts from pollution resulting from automakers who knew their product was harmful, that they are no longer artificially relieved of the burden of reducing pollution.1,2 The average age of the US fleet is approximately 12 years, and urgently reducing fleet emissions must be a priority if we are to reduce the impacts on the climate and on the health of the population.3 [EPA-HQ-OAR-2022-0829-0453, p. 1]

Organization: The Mobility House et al.

We, the undersigned businesses and organizations support the Biden Administration's new EV emissions standards as proposed. As leaders in transportation electrification, vehicle-grid integration, and power control systems (PCS) implementation, the signatories are uniquely positioned to recognize not only the significance of the Environmental Protection Agency's (EPA's) new proposals, but also the context in which they are made. We urge the EPA and other implementing agencies to prioritize strategies to enable use of PCS to facilitate coherent and efficient secondary and primary upgrade planning. [EPA-HQ-OAR-2022-0829-0657, p. 1]

Under the Biden Administration, the United States has embraced new technologies and begun the process of scaling both the manufacture and sale of electric vehicles. We are excited to participate in the successful integration of millions of new light, medium, and heavy-duty vehicles, and stand ready to work with you to allow the electric vehicle revolution to continue and succeed. [EPA-HQ-OAR-2022-0829-0657, p. 2]

Organization: Volkswagen Group of America, Inc.

Ambitious and Stringent Standards Proposed

EPA's NPRM proposes historically ambitious and stringent targets towards carbon neutrality for the light-duty and medium-duty transportation sector. Significantly noted by AFAI, the automotive industry is committing resources and investments of $1.2 trillion by 2030, while Volkswagen estimates our worldwide digitalization and electrification investment around $130 billion1 between 2023 and 2027. The ambition must be met equally by commitment of segments outside the automotive Industry. [EPA-HQ-OAR-2022-0829-0707, pp. 89-91]

1 120 Billion Euro; Exchange rate: 1.09 USD to 1 EUR

To that end, Volkswagen supports continuous reductions in vehicle fleet average GHG emissions and criteria pollutants. Volkswagen is committed to work with U.S. agencies, utilities, charging infrastructure providers, raw material suppliers and additional stakeholders in partnership with AFAI on reasonable and achievable pathways for all manufacturers for 2027 and beyond. Sustained, complementary and supportive policy is paramount in forming a cross-sector foundation required to scale up growth and infrastructure. To achieve the shared vision of zero emission mobility, solutions must be instituted in these sectors to allow Volkswagen to provide customers with a "People's Car" of superior utility and affordability. [EPA-HQ-OAR-2022-0829-0669, p. 2]

Organization: Volvo Car Corporation (VCC)

Electrification

VCC shares the Biden administration goals to advance sustainability and electrification. VCC wants to be a leader in the transition to zero tailpipe emission mobility and our plan is to be a fully electric car company by 2030. Our goal is to be climate neutral by 2040, in line with the Paris Agreement. Therefore, VCC supports the Administration's goals of an electric vehicle future and lower emissions year over year. [EPA-HQ-OAR-2022-0829-0624, p. 2]

Organization: Washington State Department of Ecology

The Washington State Department of Ecology is pleased to submit comments on EPA's Notice of Proposed Rulemaking for Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, Docket ID No. EPA-HQ-OAR-2022-0829. Ecology is encouraged by EPA's proposal to significantly increase the deployment of electric vehicles throughout the nation using increasingly stringent motor vehicle emissions standards through 2032. We urge EPA at minimum to adopt the proposed standards. We encourage the agency to consider increasing the stringency beyond the proposed level, which we believe is economically and technically feasible and would maximize greenhouse gas and criteria pollutant reductions. Adoption of any standard less stringent than existing requirements will not serve the purpose of the Clean Air Act. [EPA-HQ-OAR-2022-0829-0541]

The transportation sector represents the most significant source of greenhouse gas emissions nationally, and accounts for around 40% of greenhouse gas emissions in Washington State. Like many of our peer states, Washington has set necessarily ambitious decarbonization requirements that cannot be achieved without aggressive and innovative transportation policies. [EPA-HQ-OAR-2022-0829-0541]

Washington is one of the 18 states that have adopted California's Advanced Clean Cars II regulation, which requires automakers to sell an increasing percentage of zero-emission vehicles each year through 2035, when 100% of new light-duty vehicle sales will need to be zero-emission. It is clear from the automaker response to this regulation that the zero-emission vehicle trend is here to stay. Automakers and battery manufacturing companies are spending tens of billions of dollars to build and retrofit factories across the country and around the world to produce zero-emission vehicles. Congress and the White House have also recognized the importance of converting the nation's motor vehicle fleet to zero-emission technology, with billions of dollars being invested in battery manufacturing, electric vehicle purchase rebates, and charging infrastructure development through the Infrastructure Investment and Jobs Act and the Inflation Reduction Act. [EPA-HQ-OAR-2022-0829-0541]

Since the passage of the Inflation Reduction Act in August 2022, over $49 billion of new private investment has been announced in North America for battery-related minerals mining, minerals processing, battery manufacturing, and zero-emission vehicle manufacturing, according to the EV Supply Chain Dashboard.1 These investments are projected to create over 37,000 new jobs, most of them in the U.S. [EPA-HQ-OAR-2022-0829-0541]

1 Data from EV Supply Chain Dashboard at https://www.charged-the-book.com/na-ev-supply-chain-map, accessed Mav 19 2023

With automakers now ramping up their offerings of mass-market zero-emission vehicles, electric vehicle sales have recently reached a market share of 10% nationwide, a five-fold increase in just the past couple of years. Zero-emission vehicle options are available in every segment of the light-and medium-duty market, and more models are being offered every year. According to the Automaker Dashboard at Atlas EV Hub, there are currently 127 models of zero-emission vehicles from 33 manufacturers either currently available or projected to be by the end of this year.2 Yet demand for new electric vehicles still outstrips available supply. A recent Sierra Club study revealed that two-thirds of auto dealerships nationwide did not have a single electric vehicle for sale on their lot, mostly due to supply chain, inventory issues, and automaker allocations.3 There simply aren't enough electric vehicles being produced to meet demand. However, by the time the proposed Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles take effect, most of the new investments in minerals mining, minerals processing, battery manufacturing, and electric vehicle manufacturing will result in dramatically increased supply chain capacity. [EPA-HQ-OAR-2022-0829-0541]

2 Data from Atlas EV Hub Automaker Dashboard at https://www.atlasevhub.com/materials/automakers-dashboard/, accessed May 19. 2023

3 Sierra Club, A Nationwide Study of the Electric Vehicle Shopping Experience, May 2023.

There is no longer any reason to delay the rapid acceleration of the zero-emission vehicle transition, and we encourage EPA to increase the stringency of emission standards to help promote this transition and help automakers meet market demand. The climate crisis demands the most aggressive policies to decarbonize our nation's transportation system as quickly as possible. [EPA-HQ-OAR-2022-0829-0541]

In summary, Ecology urges EPA to at a minimum adopt the emissions standards proposed in this rulemaking and to consider increasing the stringency beyond the proposed level. These rigorous standards will put the nation on the right path for achieving the ambitious greenhouse gas reduction targets that we committed to in the Paris Agreement, create Joos in the clean transportation sector and ensure that all Americans benefit from reduced transportation emissions in their neighborhoods. [EPA-HQ-OAR-2022-0829-0541]

Organization: Western States Air Resources Council (WESTAR)

WESTAR applauds EPA for its past efforts to reduce emissions from the transportation sector, and this proposed rule is another step in the right direction toward further reducing criteria pollutant and GHG emissions from this sector. Given that mobile sources are the primary contributor to GHG emissions and contribute over half of the anthropogenic NOx emissions in the U.S.,1 setting standards that lower the emissions from these sources is paramount. EPA projects that CO2 would be reduced by 26 percent relative to the no-action scenario.2 By 2055, EPA also projects a 35-40 percent reduction in PM2.5, NOx, and SOx, and over 40% reduction in VOC emissions.3 WESTAR members support regulations that reduce emissions. [EPA-HQ-OAR-2022-0829-0676]

1 U.S. Environmental Protection Agency, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles," Govinfo, https://www.govinfo.gov/content/pkg/FR-2023-05-05/pdf/2023- 07974.pdf (accessed June 8, 2023).

2 U.S. Environmental Protection Agency, Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles Draft Regulatory Impact Analysis (“DRIA”), EPA-420-D-23-003, Section VI and Chapter 9 (April 2023), https://www.epa.gov/system/files/documents/2023-04/420d23003.pdf.

3 See DRIA Section VII and Chapter 9

EPA’s action not only yields advantages at the national level but also provides significant benefits to states, local air agencies, and Tribes in the West who face challenges in meeting criteria pollutant standards in part due to significant emissions from federally regulated mobile sources. In terms of ozone formation, many areas in the West are NOx-limited and therefore focus emissions reduction efforts on NOx reductions, as they are most effective in reducing ozone concentrations. The proposed emissions standards for light-duty and medium-duty vehicles will reduce emissions in these areas and assist these agencies in achieving their ozone attainment planning goals. [EPA-HQ-OAR-2022-0829-0676]

In addition, EPA's approach to addressing multiple pollutants simultaneously simplifies the regulatory landscape and supports the paradigm shift from single to multi-pollutant policies, a shift many western states, local air agencies, and Tribes appreciate. Beyond regulatory simplification, the holistic approach to emissions standards outlined in the proposed rule acknowledges the interconnectedness of different pollutants and their cumulative impacts. This approach will help to improve overall air quality and protect the health and well-being of communities in the West. [EPA-HQ-OAR-2022-0829-0676]

Organization: World Resources Institute (WRI)

We applaud the Biden administration for acting swiftly and using the full force of Clean Air Act authorities to propose new, more stringent vehicle emissions standards to reduce criteria pollutants and greenhouse gas (GHG) emissions from passenger (and other) vehicles to address climate pollution and public health impacts. [EPA-HQ-OAR-2022-0829-0544, pp. 1-3]

Transportation accounted for the largest portion (29%) of total U.S. greenhouse gas emissions in 2021, and light duty vehicles [Link: https://www.epa.gov/greenvehicles/fast-facts-transportation-greenhouse-gas-emissions] (including passenger cars and light-duty trucks) represent the largest category with 58% of the transportation sector's GHG emissions. Furthermore, studies (such as the recent 'Zeroing in on Healthy Air' [Link: https://www.lung.org/getmedia/13248145-06f0-4e35-b79b-6dfacfd29a71/zeroing-in-on-healthy-air-report-2022.pdf] from the American Lung Association) show that regulations and policies designed to reduce GHG emissions, such as through accelerating electric transportation, will have the added benefit of reducing other forms of pollution - including air toxics and particulate matter - that impact public health and disproportionately impact overburdened communities. [EPA-HQ-OAR-2022-0829-0544, pp. 1-3]

EPA Summary and Response

Summary

The above comments are some of the many general statements of support for EPA's proposed program to reduce GHG and criteria emissions from light- and medium-duty vehicles included in the detailed comments reproduced verbatim in this RTC document and the additional comments described in Appendix A. Many of the commenters note the need for these standards to address air pollution and climate change, reduce the impacts of emissions on human health, and/or for environmental justice. While there is support for the standards as proposed, some of the commenters urge EPA to adopt Alternative 1, or even more stringent standards or the California standards, and/or encourage EPA to finalize these standards as soon as possible. Some commenters also provide general statements about battery performance the availability of electric infrastructure, and the need to make the standards technology neutral so alternative fuels may be used.

Response

EPA acknowledges the comments received expressing general support for EPA's rulemaking. Some of these commenters provided detailed comments about specific aspects of the proposed program; those comments are reproduced verbatim in other parts of this RTC document. Regarding the general comments above relating to issues such as battery performance, warranties, electric infrastructure, and other issues, please see the respective sections of the RTC and preamble that address those aspects of the program in detail.

1.2 - General opposition to the proposed standards

Comments by Organizations

Organization: A. Longo

Considering the potential economic consequences, the lack of direct evidence supporting improved health conditions, and the complex nature of the relationship between regulatory measures and health outcomes, I urge the Environmental Protection Agency to reassess the proposed restrictions on transportation. It is crucial to strike a balance that achieves environmental goals while minimizing the financial burden on consumers and businesses. Additionally, I encourage the EPA to conduct further research and analysis, incorporating inputs from independent experts, to gather robust scientific evidence directly linking these regulations to substantial and quantifiable improvements in public health outcomes. [EPA-HQ-OAR-2022-0829-0517, p. 2]

Organization: Ad Hoc Tier 4 Light-Duty Small Manufacturer Group

EPA should reconsider its proposed provisions and finalize Small OEM rules that are consistent with the principles of an incremental phase-in with periods of stability, that are reflective of both the function and limited emissions contribution of Small OEM products, and that do not force Small OEMs to be overly-reliant on purchasing credits from other manufacturers. [EPA-HQ-OAR-2022-0829-0509, p. 3]

Organization: Alliance for Automotive Innovation

VII. Consideration of Standards Beyond 2032

EPA requests comment on potential light- and medium-duty greenhouse gas and criteria pollutant standards beyond MY 2032.322 [EPA-HQ-OAR-2022-0829-0701, p. 214]

322 NPRM at 29239

The standards that EPA is proposing through MY 2032 are already subject to massive uncertainties. The automotive industry is currently undergoing the single most transformative period in its history. We are essentially rebuilding and redesigning an entire industrial sector of the economy. EPA is already making projections and assumptions about this transformation that must come to fruition in a perfect, or almost perfect, manner to meet the proposed standards. [EPA-HQ-OAR-2022-0829-0701, p. 214]

Predicting the state of the EV market and its supporting conditions beyond MY 2032 is even more uncertain. If everything goes as hoped for by EPA, there may be an opportunity to continue further reductions in transportation emissions beyond MY 2032. However, now is much too soon to set specific standards. Incentives like those of the IRA are scheduled to sunset by 2032. Even this one factor alone may lead to a fattening of EV market share growth. Other enabling conditions may also falter or flourish. [EPA-HQ-OAR-2022-0829-0701, p. 214]

Auto manufacturers and suppliers are already transitioning to EVs, and this transformation will continue without the need to further extend specific regulatory standards at this time. We believe that EPA's Proposed Rule already stretches beyond the limits of what is practicable and feasible to accomplish between now and 2032. Attempting to propose standards beyond 2032 could further jeopardize the fragile drive to electrification with all the variables and stakeholders involved. EPA should not introduce even greater uncertainty by attempting to set standards beyond 2032 at this time. [EPA-HQ-OAR-2022-0829-0701, p. 214]

Organization: Alliance for Consumers (AFC)

Alliance for Consumers, by way of its Executive Director, O.H. Skinner, files this comment to highlight the ways in which the proposed rule fails to serve the interests of everyday consumers and how EPA's proposal is procedurally and substantively deficient and should not be finalized. [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

The current EPA proposal is best understood as yet another attempt to weaponize the agency rulemaking process, and the power of the federal government, to wipe away things that everyday consumers overwhelmingly like, use, and rely upon for life's essential needs. [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

EPA is proposing to replace a majority of the cars on the market today with EVs that are currently unpopular with everyday consumers in most parts of the country and do not work within the household budgets of those who need cars to help their families thrive. And that is before considering how EPA's proposed rule is premised on speculative, wholesale changes to other parts of the economy and our national infrastructure outside the purview of EPA (e.g., the energy grid). [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

Make no mistake, this is a proposal to forcibly remove from the market a majority of the cars that everyday consumers currently buy and use. The EPA Fact Sheet for the proposal focuses throughout on electric vehicle technology as the critical aspect of the proposed rule, from how it was conceived, through how it would be complied with. See, e.g., EPA Fact Sheet, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles," Apr. 2023, at 1 (highlighting EV technologies and support for a "rapid shift away from" "internal combustion engine (ICE) technologies"); id. at 2 (focusing on "vehicle electrification technologies" as central to proposed standards); id. at 6 (emphasizing electric vehicle costs and benefits throughout cost-benefit analysis section).1[EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

1 Fact Sheet available at https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1017626.pdf.

Indeed, the path to compliance that EPA chose to highlight features nearly 70% of the passenger car market shifting to battery electric vehicles (and 40% or so of medium duty vans and pickup trucks). See EPA Fact Sheet, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles," Apr. 2023, at 5. This despite only about 1% of the current cars on the road being electric vehicles. [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

The current EPA proposal is an unlawful EV mandate masquerading as a tailpipe regulation. That is the only conclusion that a disinterested observer or everyday consumer could reach, given how the proposal was promulgated, the limits that have been proposed, and the commentary surrounding its release. [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

While an extreme EV mandate might be popular in progressive enclaves, and with federal employees who live in Washington, D.C., a rapid shift to electric vehicles along the lines proposed by EPA here will make lives worse for everyday consumers while costing them more for the privilege of having their lives inconvenienced. [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

Early indications from places like California back up this conclusion and provide warning signs that were not properly addressed by EPA in the proposed rule. [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

For the reasons set forth below, and those contained in other comments filed to date, EPA should not finalize the proposal; rather, it should address the deficiencies identified herein. [EPA-HQ-OAR-2022-0829-0534, p. 2]

EPA's proposal—entitled Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles—is procedurally and substantively deficient and should not be finalized. [EPA-HQ-OAR-2022-0829-0534, p. 3]

EPA should not finalize the proposal; rather, it should address the deficiencies identified herein and instead promulgate a proposal that properly considers the issues here and sets standards that better serve everyday consumers. [EPA-HQ-OAR-2022-0829-0534, p. 5]

Organization: American Coalition for Ethanol (ACE)

From the perspective of tailpipe-focused emissions, EPA's proposal represents the most ambitious standards ever for light-duty vehicles, effectively requiring 60% of all vehicle sales to be battery electric vehicles (BEVs) only by 2030, ramping up to BEVs representing 67% of all vehicle sales just two years later (2032). The Agency is seeking comment on alternative compliance scenarios; Alternative 1 would require BEVs to represent 69% of all vehicle sales by 2032 and Alternative 2, the "least stringent," would require BEVs to make up 64% of all vehicle sales by 2032. [EPA-HQ-OAR-2022-0829-0613, p. 1]

While ACE members share EPA's goal to significantly reduce lifecycle greenhouse gas (GHG) emissions from U.S. passenger vehicles, we know there is a better way than arbitrarily regulating a solution which merely focuses on the tailpipe and is practically unachievable. Therefore, ACE does not support the proposal nor either alternative. [EPA-HQ-OAR-2022-0829-0613, p. 1]

To be clear, ACE members recognize BEVs can play a meaningful role in decarbonizing the transportation sector. We also support technology-neutral policies which enable electric vehicles to compete on a level playing field with other low carbon technology solutions such as ethanol.

We oppose policies which tilt the scale in favor of BEVs and ignore the lifecycle GHG emissions associated with them. [EPA-HQ-OAR-2022-0829-0613, p. 1]

Our comments will 1) discuss the practical, technical and legal problems associated with arbitrarily regulating BEVs as the only solution to reduce GHGs from the transportation sector, and 2) how EPA can fix its proposal to develop a practical and achievable technology-neutral final rule which achieves the goals we share to meaningfully reduce carbon pollution from transportation emissions. [EPA-HQ-OAR-2022-0829-0613, p. 1]

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

We are deeply concerned about the federal government's ongoing push to mandate the electrification of the American vehicle fleet. Through an ever-expanding list of agency action's, the Biden Administration is unilaterally attempting to mandate electrification rather than to improve efficiency and re- duce emissions through realistic, technology-neutral standards is both bad policy and, in many instances, contrary to law. This proposal exemplifies both problems. [EPA-HQ-OAR-2022-0829-0683, p. 2]

Through this proposed rule, EPA seeks to transform production of light- and medium-duty motor vehicles (from passenger cars and SUVs, to large pickups and vans) by forcing manufacturers to replace a substantial portion of their conventional-vehicle fleets with electric alternatives—in less than a decade. The agency does so by setting emissions standards for model years 2027- 2032 that EPA knows internal-combustion-engine vehicles could never satisfy. EPA itself projects that compliance would compel supplanting roughly 67 percent of light-duty vehicles and 46 percent of medium-duty vehicles with battery models. Combined with its parallel proposed rule for heavy-duty vehicles, EPA's proposed light- and medium-duty rule would radically reshape the American automotive industry. [EPA-HQ-OAR-2022-0829-0683, pp. 2-3]

EPA should not press forward with finalizing an unlawful, irrational rule that cannot succeed and is unlikely to survive judicial scrutiny. The transformation EPA seeks to work on all sectors of the automotive industry at once— including through this rule and the proposed Heavy-Duty rule—is infeasible, unworkable, and almost certain to fail, particularly given EPA's arbitrary and unrealistic timeline for compliance. Rather than pursue these rules, the agency should engage meaningfully with all affected stakeholders to develop sound, workable measures to address vehicle emissions that are technology-neutral and can also help to reduce life-cycle greenhouse-gas ("GHG") emissions in the currently existing vehicle fleet, which the proposed regulation ignores. [EPA-HQ-OAR-2022-0829-0683, pp. 5-6]

Organization: American Freedom and America First Policy Institute (AFPI)

Electric Vehicle Mandate

On May 5, 2023, the EPA proposed regulations that would significantly increase fuel economy and vehicle emission standards. As the EPA knows, it is physically impossible for conventional gasoline-powered vehicles to meet these proposed requirements. The rule would effectively force automakers to shift production to electric vehicles, which do not use fossil fuels or directly emit pollutants (although the power plants from which electric vehicles draw electricity typically do).1 The Biden Administration expects this rule to require EVs to make up 67% of new vehicles sold by 2032 (Environmental Protection Agency, 2023) (Link:

https://www.epa.gov/newsreleases/biden-harris-administration-proposes-strongest-ever-pollution-standards-cars-and). This is a substantial increase from the Biden Administration's prior target of 50% of EV sales by 2030 (Executive Order 14037, 2021) (Link: https://www.federalregister.gov/documents/2021/08/10/2021-17121/strengthening-american-leadership-in-clean-cars-and-trucks). [EPA-HQ-OAR-2022-0829-0699, p. 2]

1 Obtaining the minerals necessary to produce a single (EV) battery requires mining about 250 tons of rock—an energy-intensive process (Mills, 2022, p. 21) (Link: https://media4.manhattan-institute.org/sites/default/files/the-energy-transition-delusion_a-reality-reset.pdf). As a result, between 8 and 20 tons of carbon dioxide are emitted during the production of each EV. If battery production becomes even more energy intensive as mining shifts to lower-grade ores, EVs could emit more carbon dioxide over their full lifespan than do conventional vehicles (Mills, 2022, p. 21).

EVs currently make up only 5.6% of U.S. vehicle sales. One company—Tesla—accounts for almost two-thirds of those sales (Mihalascu, 2023) (Link: https://insideevs.com/news/653395/evs-made-up-5point6-percent-of-overall-us-car-market-in-2022-driven-by-tesla/). If this rule is finalized as proposed (and withstands legal challenges) it would force automobile manufacturers to replace conventional vehicle production with EVs en masse—irrespective of what cars Americans want to buy. [EPA-HQ-OAR-2022-0829-0699, p. 2]

Organization: Arizona State Legislature

EPA's proposed rule for light-duty and medium-duty vehicles will cost jobs, increase the price of goods, hurt families, threaten our electric grid's reliability, and endanger our national security. We are both elected representatives of the people of Arizona, and citizens of Arizona who purchase and operate vehicles and participate in the Arizona economy on the same footing as other Arizonans. In both capacities, we have grave concerns about this reckless proposed rule. EPA should reject the proposed rule for at least the ten reasons set forth in this comment. [EPA-HQ-OAR-2022-0829-0537, p. 2]

EPA should reject the proposed rule to avoid these and many other terrible consequences. The people of Arizona and America deserve better. [EPA-HQ-OAR-2022-0829-0537, p. 3]

Conclusion

EPA's proposed rule will hurt Arizona families and workers by forcing them to buy vehicles they cannot afford, increasing the cost of goods they need, costing them jobs, decreasing the reliability of the electricity they depend on, and weakening our national security by making us dependent on China. EPA's green dream will be a nightmare for Arizona. EPA should reject the proposed rule and begin acting in the best interests of Arizonans and Americans. [EPA-HQ-OAR-2022-0829-0537, p. 32]

Organization: BMW of North America, LLC (BMW NA)

Under the circumstances and the high uncertainties outlined herein we join the Alliance of Automotive Innovators in their comments and expressed concerns about the Proposed Rule's GHG targets. It is not evident to BMW NA that the Agency has aptly considered the significance of these external factors, most of which are not under the control of the auto industry to resolve. [EPA-HQ-OAR-2022-0829-0677, p. 2]

Organization: Charles Gordon

INTRODUCTION and SUMMARY

I recommend that EPA withdraw this rulemaking. The earlier rules and the subsidies of the Inflation Reduction Act will lead to a greater reduction of CO2 with less controversy. In addition, the proposal is attempting to force faster adoption of electric cars than the infrastructure can support. Natural gas power plants cannot be replaced by solar and wind fast enough and more importantly transmissions line cannot be built quickly enough because of local opposition. [EPA-HQ-OAR-2022-0829-0747, p. 3]

The EPA has been reducing airborne particulates from gas engines since 1968. Currently the levels produced by gas engines are so low that they are in the same range as dirt particles, tire particles, cooking fumes and clothes rubbing together. [EPA-HQ-OAR-2022-0829-0747, p. 3]

The proposed rules are highly controversial. One half of citizens and politicians bitterly oppose them. They are likely to be repealed or worse. The auto companies and industry will not be supportive like they are of the earlier rules and IRA. [EPA-HQ-OAR-2022-0829-0747, p. 3]

Even if the rules are implemented, the effects on global warming will be inconsequential, perhaps a 0.01 deg. C reduction in global warming from the earlier rules and subsidies. This is not enough to justify continued inconvenience to citizens and controversy. [EPA-HQ-OAR-2022-0829-0747, p. 3]

The prior regulations and the IRA subsidies will substantially reduce CO2 and particulates and improve health with much less controversy. The Auto companies and industry support them and have based their tens of billions of dollars investment on them. Citizens, industry and even some Republicans love subsidies and the US is good at doling them out. In addition, private citizens are more likely to go along with a rule that leaves them a choice. The value of freedom of choice should be taken into account by EPA. [EPA-HQ-OAR-2022-0829-0747, p. 3]

To make the point again, the earlier rule and IRA subsidies will lead to lower CO2 levels and greater health benefits than the theoretical benefits of the proposed rule. [EPA-HQ-OAR-2022-0829-0747, p. 3]

Organization: Clean Fuels Development Coalition et al.

Commentors submit this letter to urge EPA to withdraw its unlawful and unreasonable proposal, and to try a different approach. [EPA-HQ-OAR-2022-0829-0712, p. 3]

B. The non-binding company commitments and projections EPA cites do not prove feasibility.

The non-binding company commitments and projections EPA cites do not prove feasibility. See 88 Fed. Reg. 29,190-93 ("While manufacturer announcements such as these are not binding, and often are conditioned as forward-looking and subject to uncertainty, they indicate that manufacturers are confident in the suitability of PEV technology as an effective and attractive option that can serve the functional needs of a large portion of light-duty vehicle buyers."). The auto manufacturers' statements are not binding, and these companies could change their mind at any time. Many of these statements were made in response to the in direct response to the Biden

Administrations urging.16 Further, many of these statements were made with the expectation that EPA would continue to provide various compliance flexibilities—like multipliers—that reduce the real-world stringency of the standards. As noted, the proposed rule would cut these avoidance strategies. [EPA-HQ-OAR-2022-0829-0712, p. 27]

16 Compare FACT SHEET: President Biden Announces Steps to Drive American Leadership Forward on Clean Cars and Trucks, White House Briefing Room (Aug. 5, 2021), https://www.whitehouse.gov/briefing-room/statements-releases/2021/08/05/fact-sheet-president- biden-announces-steps-to-drive-american-leadership-forward-on-clean-cars-and-trucks/ ("[T]he Presi dent will sign an Executive Order that sets an ambitious new target to make half of all new vehicles sold in 2030 zero-emissions vehicles, including battery electric, plug-in hybrid electric, or fuel cell electric vehicles…. That is why today, American automakers Ford, GM, and Stellantis and the United Auto Workers (UAW), will stand with President Biden at the White House with aligned ambition.") with Fred Lambert, Ford, GM, and Stellantis announce joint 40-50% EV sale goal in 2030, Electrek (Aug. 5, 2021), https://electrek.co/2021/08/05/ford-gm-stellantis-joint-40-50-ev-sale-goal-2030/. ("To- day, Ford, GM and Stellantis announce their shared aspiration to achieve sales of 40-50% of annual U.S. volumes of electric vehicles (battery electric, fuel cell and plug-in hybrid vehicles) by 2030 in order to move the nation closer to a zero-emissions future.").

As John Bozzella, president and CEO of Alliance for Automotive Innovation has explained, "Requiring 60+ percent of U.S. vehicles sales to be pure battery electric vehicles (BEVs) by 2030 leapfrogged the administration's own 2021 executive order that called for 50 percent electric vehicles –including plug-in hybrid and fuel cell EVs – by 2030." John Bozzella, EPA's EV Rules are Out of Whack: Five Ways to Fix Them, Alliance for Automotive Innovation (June 28, 2023), https://www.autosinnovate.org/posts/blog/epas-rules-are-out-of-whack-five-ways-to-fix-them. "[T]he administration's 50 percent target [by 2030] was always a stretch goal. It was ambitious and challenging by any measure." Mike Hartrick, Testimony from the Alliance for Automotive Innovation, Before the U.S. Environmental Protection Agency EPA Multi Pollutant Proposed Rule, EPA-HQ-OAR-2022-0829, https://www.autosinno- vate.org/posts/agency-comments/05-09%20EPA%20Multi-Pollutant%20NPRM.pdf. "The 60+ percent BEVs by 2030 plan, on the other hand, is a house of cards…. It rolls up rosy forecasts (like EV batteries will eventually cost automakers nothing) and other hopeful assumptions." John Bozzella, supra. [EPA-HQ-OAR-2022-0829-0712, pp. 27-28]

The 50 percent goal "was also predicated on several conditions, most significantly: supportive public policies including the bipartisan Infrastructure Investment and Jobs Act with funding for national public charging (installation not started yet); the manufacturing incentives and consumer purchase incentives in the Inflation Reduction Act to support EV purchases and affordability (becoming more, not less constrained); and the supply of critical minerals (projected to be woefully short of demand and largely controlled by China)." Mike Hartrick, supra. "If implemented, EPA's proposal will require 60 percent battery electric vehicles by 2030 (a 20 percent increase over the President's goal, which also included PHEVs), and two out of every three vehicles sold to be BEVs just two years later. These levels are substantially higher than what the auto industry indicated was achievable even after application of the supportive policies." Id. [EPA-HQ-OAR-2022-0829-0712, pp. 27-28]

Organization: Letter Campaign, Ethanol Producers (7)

[The following letter was submitted by seven commenters; it is reproduced only once: Commonwealth Agri-Energy LLC (EPA-HQ-OAR-2022-0829-0739). The other commenters are: Highwater Ethanol, LLC (EPA-HQ-OAR-2022-0829-0552), Heartland Corn Products (EPA-

HQ-OAR-2022-0829-0622), Absolute Energy, LLC (EPA-HQ-OAR-2022-0829-0716), Trenton Agri Products LLC (EPA-HQ-OAR-2022-0829-0755), Western New York Energy LLC (EPA-HQ-OAR-2022-0829-0753), Southwest Iowa Renewable Energy LLC (EPA-HQ-OAR-2022-0829-0582)]

Commonwealth Agri-Energy, LLC appreciates the Biden administration's goals of increasing vehicle efficiency and reducing carbon emissions. That's why two years ago, we committed to achieving a net-zero carbon footprint for our ethanol plant by 2050 or sooner.1 [EPA-HQ-OAR-2022-0829-0739, p. 1]

1 Letter from RFA Member Companies to President Joe Biden. July 27, 2021. See more at https://ethanolrfa.org/pledge.

However, we firmly oppose regulatory approaches that arbitrarily favor certain technologies over others, which regrettably seems to be the case with this proposed rule. EPA's proposal would effectively force automakers to produce more battery electric vehicles and discourage them from pursuing other technologies that could achieve the same, or even better, environmental performance at a lower cost to American consumers. [EPA-HQ-OAR-2022-0829-0739, p. 1]

Organization: Competitive Enterprise Institute

The proposed rule is the latest phase of a longstanding unlawful agenda of market-rigging interventions. It should be withdrawn. [EPA-HQ-OAR-2022-0829-0611, p. 19]

Organization: Consumer Energy Alliance (CEA)

We appreciate the Agency's commitment to reducing greenhouse gas emissions from the transportation sector. However, we are concerned about the ramifications of the proposed Multi Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles Rule. [EPA-HQ-OAR-2022-0829-0788, p. 1]

Should this rule be adopted in its current form - lacking both technological feasibility and economic practicality - the result will be limiting consumer options and thwarting environmental progress through depressing innovation. [EPA-HQ-OAR-2022-0829-0788, p. 2]

While there are clearly many reasons to pursue EVs as a mobility option, there are many realworld economic, social, and practical considerations the U.S. ERA should fully review before adopting overly restrictive transportation policies. Consumer impacts — especially the impacts imposed on those with low- and fixed-incomes — need to be front and center in these discussions. [EPA-HQ-OAR-2022-0829-0788, p. 2]

Organization: Daniel Hellebuyck

I am writing to voice my opposition to this draconian rule proposal.

I have been associated with the American auto industry for 30 plus years. In these years, some regulations were for the benefit of society, consumers, and the industry. However, many of these regulations worked toward the detriment of the industry, consumers, and/or society. This proposal is certainly one of them. [EPA-HQ-OAR-2022-0829-0526, p. 1]

This proposal as written needs a serious overhaul. The political posturing and virtue signaling of proposals such as these often are not based in reality. This proposal does little to balance the needs of reducing carbon emissions with jobs, a strong auto industry, and a strong American economy. [EPA-HQ-OAR-2022-0829-0526, p. 2]

Organization: Darius

I write in opposition to the U.S. Environmental Protection Agency's proposed multipollutant standards for light-and medium-duty vehicles (Docket ID No. EPA-HQ-OAR-2022-0829). I have serious concerns with all three of the options included in the draft rulemaking, as the EPA seeks to lower carbon emissions under timelines that effectively make electric vehicles the only option for automakers to meet the pollution limits from 2027 through 2032. [EPA-HQ-OAR-2022-0829-0519, p. 1]

The future of automotive technology matters to consumers, millions of automotive enthusiasts, and all the men and women who work in the industry. Accordingly, I ask that the EPA does not follow through on any of the three options outlined in this proposed rulemaking and instead pursues a rulemaking for light and medium-duty vehicles that embrace a technology-neutral approach that factors in the infrastructure that exists, the innovation we are all capable of, consumer preferences, and the lifecycle emissions of the technology that powers our vehicles. [EPA-HQ-OAR-2022-0829-0519, p. 1]

Organization: David Hallberg

The most disturbing thing about this NPRM is that, unless it is substantially revised, it will dramatically increase the most harmful mobile source emissions that are the predominant cause of a wide range of adverse health endpoints, from pre-term births and IQ loss to pulmonary disorders and cancers. [EPA-HQ-OAR-2022-0829-0548, p. 1]

Many of us were encouraged during your confirmation hearing when you pledged that you would be “driven by the science and rule of law”. However, your advisers—particularly Office of Transportation and Air Quality (OTAQ) experts, some of whom have been in their positions for more than 30 years—are giving you bad counsel, as this proposed rule falls far short of the mark on both counts. [EPA-HQ-OAR-2022-0829-0548, p. 1]

Organization: David Manley III

And, as you plan to penalize Americans, China is increasing its construction of coal-fired power plants to produce supplies for batteries for EVs and other components and, therefore, it’s carbon emissions. America has 225 coal-fired power plants and China has 1,118 (half of all the coal-fired plants in the world). [EPA-HQ-OAR-2022-0829-0513, p. 1]

There are many other ways than the proposed regulations to control pollution that may actually be effective if China, India, and Russia reduce their emissions, which they show no signs of doing. [EPA-HQ-OAR-2022-0829-0513, p. 1]

The bottom line is that the proposed rules will not significantly affect climate change, will penalize American consumers without significant benefit, and will significantly benefit our polluting competitor, Communist China. [EPA-HQ-OAR-2022-0829-0513, p. 1]

We oppose the proposed rule for the following reasons. [EPA-HQ-OAR-2022-0829-0513, p. 1]

You acknowledged that the proposed rule is such that carmakers will have to make up to 67% of new vehicles electric in order to comply with it while the result will be an additional 10-fold sales increase in electric vehicles (EVs) in a mere eight years. Yet completely eliminating all fossil fuels from the United States would result in less than 0.2 degrees Celsius in temperature mitigation by 2100 while benefiting our rival, communist China, that has no such regulations, continues to pollute negating our efforts, and either directly makes or controls the production of the lithium and rare-earth minerals required for EV batteries. [EPA-HQ-OAR-2022-0829-0513, p. 1]

Organization: Delek US Holdings, Inc.

VII. Conclusion

Given EPA's Proposed Rule is based on speculative and unsupported data, fails to analyze the potential impacts on domestic supply chains and foreign reliance, and overinflates the potential benefits while underinflating a majority of the costs, we urge EPA to abandon its proposal and reconsider the emissions standards necessary and feasible in accordance with its directive pursuant to the CAA and, at the very least, complete a comprehensive analysis of the effects of its Proposed Rule. [EPA-HQ-OAR-2022-0829-0527, p. 10]

Organization: East Kansas Agri-Energy (EKAE)

EKAE appreciates the Biden administration's goals of increasing vehicle efficiency and reducing carbon emissions. However, we firmly oppose regulatory approaches that arbitrarily favor certain technologies over others, which regrettably seems to be the case with this proposed rule. EPA's proposal would force automakers to produce more battery electric vehicles and discourage them from pursuing other technologies that could achieve the same, or even better, environmental performance at a lower cost to American consumers. [EPA-HQ-OAR-2022-0829-0734, p. 1]

Organization: Elizabeth Boynton

Also, the EPA is to be concerned about the environment as a whole, not just the air quality. As that is the case, EPA needs to realize that encouraging the manufacture, purchase and use of EVs is not actually that great for the environment. You're just cleaning the air from gas exhaust pollution by encouraging environmental destruction in the mining of rare earth minerals and creation of electricity to charge the EV batteries. [EPA-HQ-OAR-2022-0829-0568, p. 1]

Organization: Fred Reitman

I submit these comments on the EPA Proposed Rule, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles", Docket ID No. EPA-HQ-OAR-2022-0829. I oppose this proposed rule and am submitting these comments to explain the basis for my opposition. [EPA-HQ-OAR-2022-0829-0432, p. 1]

Electricity comes from fossil fuel combustion. Most of the electricity generated in the U.S. is from combustion of fossil fuels, which of course means that most of the electricity being used to charge EVs derives from fossil fuel combustion. Mandating that new cars manufactured and sold must be EVs will not change this. According to the US Energy Information Agency, in 2021, 60% of electricity generated in the US came from combustion of fossil fuels, primarily coal (22%) and natural gas (38%). Another 19% came from nuclear power. The remaining 20% electrical power is sourced from renewables, primarily from wind (9.2%), hydroelectric plants (6.3%), and solar (2.8%). [EPA-HQ-OAR-2022-0829-0432, p. 1]

Electricity explained - U.S. Energy Information Administration (EIA) [Link: https://www.eia.gov/energyexplained/electricity/] [EPA-HQ-OAR-2022-0829-0432, p. 1]

This is EPA Overreach. This regulation would have far-reaching ramifications on the economy and the American people. The EPA has no business imposing this on the American people via regulation. [EPA-HQ-OAR-2022-0829-0432, pp. 1-2]

For this reason it is Congress via elected representatives that should debate and possibly pass this initiative as a law. [EPA-HQ-OAR-2022-0829-0432, pp. 1-2]

This rule would have no impact on climate. Any reduction in CO2 emissions would be negligible as compared to emissions from the two largest CO2 emitters, China and India. China is rapidly building coal-fired power plants, currently at the rate of 2-3 every week, which also illustrates they do not share our concern about climate change due to CO2 emissions. [EPA-HQ-OAR-2022-0829-0432, p. 2]

I close with a statement on my opinion. I have thoroughly investigated the subject of anthropogenically- caused climate change during the past several years. Based on my investigation I do not believe that is occurring. Nor do I believe the intent of those advancing this proposal is to somehow mitigate climate change. Rather I believe this administration is beholden to the radical environmental left and the actual intent of this rule is to drag down our quality of life of the American people. [EPA-HQ-OAR-2022-0829-0432, p. 2]

Organization: George White

Regulating CO2 emissions has absolutely no foundation in legitimate science, where only science conforming to the scientific method can be considered legitimate. Furthermore, CO2 is not a pollutant, but is at the base of the food chain and that our very existence depends on there being sufficient atmospheric CO2. To justify this level of disruption based on a scientific conclusion, the science behind it must be bulletproof and what is passed of as the science demonizing CO2 emissions is demonstrably wrong in many ways. Einstein famously said "No amount of experimentation can prove me right; a single experiment can prove me wrong" where he articulated the concept of falsification which implies that the only thing in science that can be settled is that something is wrong. The absurdly large effect from CO2 emissions claimed by the IPCC and its self serving consensus can be unambiguously falsified in many ways and even violates basic physics like Conservation of Energy and the immutable Stefan-Boltzmann Law. It's also important to recognize that the rate of change seen in the climate system since the end of the Little Ice Age that corresponds roughly with the start of the Industrial Revolution and increasing CO2 emissions is well within the bounds of the natural variability observed in the ice cores,sediments and other data. If the climate wasn't changing, it would be broken and besides, a slight warming is far more beneficial to life than an ice age that no amount of CO2 will prevent from occurring again. [EPA-HQ-OAR-2022-0829-0426, p. 1]

We saw what happens when conclusions are based on rotten science with the draconian response to COVID that was more harmful than the disease itself that by now, many Americans have already had regardless of their vaccination status. We can not allow this kind of policy driven science to completely destroy the integrity of science and take our freedom away with it. Science is the only objective arbiter of truth we have and politics must not be allowed to subvert it. [EPA-HQ-OAR-2022-0829-0426, p. 1]

I've included several documents in support of my position and all of the references cited can be found on-line.

fail.pdf -> This is a top level summary of some of the issues with the IPCC's broken climate science [See original attachment A3 for summary of failures with IPCC's broken climate science] feedback.pdf -> This explains why feedback has no relevance to the climate system, yet without it, the IPCC's house of cards science collapses [See original attachment A5 for "Why Feedback is Fubar"] [EPA-HQ-OAR-2022-0829-0426, p. 1]

balance.pdf -> This explains how the radiant balance and consequential climate sensitivity emerges and what math and physics constrains it [See original attachment A4 for "The Radiant Balance and Sensitivity"] [EPA-HQ-OAR-2022-0829-0426, p. 1]

co2forcing.pptx -> A power point presentation about the ice core data. There are significant notes explaining each slide. [See original attachment A2 for CO2 Forcing: Fact or Fiction] [EPA-HQ-OAR-2022-0829-0426, p. 1]

comment_fod.xlxs -> Some of my comments as an official expert reviewer of the latest IPCC report [See original attachment A1 for "Working Group I contribution to the IPPP sixth assessment report"] [EPA-HQ-OAR-2022-0829-0426, p. 1]

I strongly suggest looking at this web site: http://climatechangereconsidered.org to see what some other scientists are saying. If you can't accept that climate science is the most controversial science of the modern age, I suggest you look at the articles and comments on http://wattsupwiththat.com [EPA-HQ-OAR-2022-0829-0426, p. 1]

Organization: Growth Energy

While Growth Energy supports efforts to reduce emissions in the transportation sector, it cannot support the Proposed Rule. The Proposed Rule presents an unnecessarily constraining, binary choice between a static future of fossil-fuel-only vehicles and an improbable future of precipitously ramped-up electric vehicle ("EV") production, sale, and use by 2032. But as EPA should already know, expanding the use of ethanol and other biofuels is a realistic and achievable third option that does not leave GHG emission reductions on the table. [EPA-HQ-OAR-2022-0829-0580, p. 3]

So, while EVs should be a part of the solution to decarbonizing the transportation sector, they are not the complete answer and need additional time to develop. It is neither cost-effective nor optimal to reduce emissions by shifting almost all new cars to EV technologies at the rate contemplated in the Proposed Rule when biofuels are a proven, effective solution. EPA should not ignore the significant role that biofuels can play in both the near- and long-term as part of a low-carbon transportation system. [EPA-HQ-OAR-2022-0829-0580, p. 6]

Organization: HF Sinclair Corporation

HF Sinclair Corporation ("HF Sinclair") submits these comments opposing the United States Environmental Protection Agency's ("EPA") proposed rule setting multi-pollutant emissions standards for model years 2027 and later light-duty ("LD") and medium-duty ("MD") vehicles, Docket EPA-HQ-OAR-2022-0829 (hereinafter, "Proposed Rule").1 Additionally, we support comments separately filed by the American Fuel and Petrochemical Manufacturers ("AFPM"), the trade association representing substantially all of the United States' refining capacity, of which we are a member [EPA-HQ-OAR-2022-0829-0579, p. 1]

1 88 Fed. Reg. 29,184 (May 5, 2023) [hereinafter "Proposed Rule"].

HF Sinclair urges EPA to abandon its misguided approach and instead ensure that any forthcoming regulation adopts a holistic approach, which is technology-neutral, recognizes consumer choice, and enables the U.S. transportation industry to continue its efforts to produce safe, affordable, reliable, and clean vehicles. [EPA-HQ-OAR-2022-0829-0579, p. 2]

IV. Conclusion

For the reasons set forth above, EPA should immediately abandon its misguided approach to force consumers into a product American consumers do not want. By eliminating consumer choice and forgoing a single technology solution to GHG emissions, EPA is putting U.S. jobs, industrial base, and economy at serious risk as highlighted above. Additionally, it is concerning that EPA would prioritize a policy that significantly benefits the Chinese industrial base which does not nearly have the environmental oversight as domestic manufacturing. It is also clear that EPA has not completed the appropriate environmental analysis on PEVs – there is clearly an environmental impact in the manufacturing these vehicles that EPA fails to account. Finally, the proposed rule does not account for Congressional intent, if EPA wishes to create such a significant change in the automobile market EPA should work with Congress. [EPA-HQ-OAR-2022-0829-0579, p. 18]

Organization: Illinois Farm Bureau (IFB)

For the reasons stated herein, IFB has significant concerns regarding several aspects of the proposed rule. In light of these concerns, IFB recommends USEPA reconsider the proposed rule and go back to the drawing board to draft a new and improved proposed rule. In fact, as of the date of this filing, over 2,000 individual IFB farmer members have also voiced their serious concern regarding the proposed rule in the above-referenced docket. [EPA-HQ-OAR-2022-0829-0532, p. 1]

Organization: John Noble

As a manager of over 270 vehicles for a public agency providing public safety services and as a consumer this ruling puts undue hardship on public agencies, small business and middle class Americans. The rule as proposed will drive prices up on conventional and zero emission vehicles. There are already numerous supply chain issues and the ruling will add unnecessary strain and make it extremely difficult for small public agencies and consumers to afford adequate fleet resources to serve our public safety needs. Current emission standards have increased maintenance costs and fuel consumption, this ruling will increase these costs even more. The aggressive timeline for implementation ignores the impact to average person and small public agency/business as well as increasing our reliance on off-shore manufacturing and supply chain. Extending the timeline for implementation by 10 or more years would allow natural market forces and the consumer to adjust and embrace the changes being promulgated. As the rules are currently written many people, and small agencies/businesses will suffer from lack of adequate resources to maintain levels of service required because they cannot afford new vehicles.

As I write this the sky is hazy from the smoke of wildfires hundreds if not thousands of miles from my home, causing me to ponder if vehicle emissions are the most effective target or our GHG reduction strategies - it is early in the fire season and already we have seen impacts across the nation. Prior to the last 10 years it was a rare occurrence to have widespread issues with smoke from fires and now it is common every summer. Unlike volcanoes, we can mitigate rather significantly the impacts from wildland fires. [EPA-HQ-OAR-2022-0829-1648]

Organization: Landmark Legal Foundation

Landmark Legal Foundation ("Landmark") advocates for the immediate revocation of this rule, Proposed Rule, Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light- Duty and Medium-Duty Vehicles ("Proposed Rule"). [EPA-HQ-OAR-2022-0829-0547, p. 1]

There are three major shortcomings Landmark has identified with the Proposed Rule:

1. The Proposed Rule uses a metric established by an entity with no constitutional or statutory authority. The Interagency-Working Group ("IWG") is not vested with any statutory authority to act as an executive agency. Therefore, the President did not have the authority to implement the IWG in the first place.

2. The IWG nonetheless acts as an agency and is therefore subject to the Administrative Procedures Act ("APA").

3. The APA requires agencies to follow a proscribed rulemaking process that provides opportunities for the public to comment on agency actions. The IWG bypassed this process when it established new metrics for the Social Costs of Greenhouse Gas ("SCGHG"). [EPA-HQ-OAR-2022-0829-0547, p. 1-2]

Organization: Matthew DiPaulo

I write in opposition to the U.S. Environmental Protection Agency's proposed multipollutant standards for light-and medium-duty vehicles (Docket ID No. EPA-HQ-OAR-2022-0829). I have serious concerns with all three of the options included in the draft rulemaking, as the EPA seeks to lower carbon emissions under timelines that effectively make electric vehicles the only option for automakers to meet the pollution limits from 2027 through 2032. [EPA-HQ-OAR-2022-0829-1514, p. 1]

The future of automotive technology matters to consumers, millions of automotive enthusiasts, and all the men and women who work in the industry. Accordingly, I ask that the

EPA does not follow through on any of the three options outlined in this proposed rulemaking and instead pursues a rulemaking for light and medium-duty vehicles that embrace a technology-neutral approach that factors in the infrastructure that exists, the innovation we are all capable of, consumer preferences, and the lifecycle emissions of the technology that powers our vehicles. [EPA-HQ-OAR-2022-0829-1514, p. 1]

Organization: Mazda North American Operations

Mazda North American Operations (Mazda) appreciates the opportunity to comment on the proposed rule "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light Duty and Medium-Duty Vehicles". Mazda is a smaller independent automaker not owned by a larger brand, and sells light duty vehicles globally with US operations headquartered in Irvine, CA. Mazda has been selling vehicles in the United States since 1970 and opened a new joint venture manufacturing facility with Toyota employing approximately 4000 persons in Huntsville, AL, in 2020. Despite being a smaller company, Mazda was able to achieve the highest fleet average fuel economy of all OEMs for five years in a row, according to EPA's Fuel Economy Trends Report. As a smaller OEM, we are particularly challenged by these proposals. Overall, we feel the rule is neither reasonable nor achievable for a variety of reasons that we will touch on below. [EPA-HQ-OAR-2022-0829-0595, p. 1]

Organization: Minnesota Corn Growers Association (MCGA)

As producers of the feedstock for low carbon ethanol, corn growers are a part of the solution to reduce emissions from transportation vehicles. Unfortunately, the proposal from EPA doesn’t enable low carbon fuel producers to be recognized in the draft multi-pollutant emission standards since the proposed regulation focuses on one solution to emissions reductions from the transportation sector: electric vehicles. Instead, we believe EPA should focus on outcomes and opening pathways for all low carbon fuels and technologies that enable more stringent vehicle emission standards, taking advantage of not only the low carbon benefits high ethanol blends, but also cuts in toxic emissions, greater fuel efficiency and consumer costs savings of increased renewable fuel blending. [EPA-HQ-OAR-2022-0829-0612, p. 1]

Higher octane fuel is an essential top for automakers to meet stringent standards. For automakers to use new technologies and enhanced engines to meet emission standards, they need updated fuel that enables new vehicles and fuels to work as a system to enhance carbon and other tailpipe emissions reductions. Higher ethanol blends used with advanced engines optimized for higher octane would provide a much-needed pathway for low-carbon, low-emission fuels. [EPA-HQ-OAR-2022-0829-0612, p. 1]

EPA failed to use the proposed rule to broaden the solutions that reduce transportation emissions by beginning a transition to low-carbon, high-octane fuels to advance goals with these and future standards. [EPA-HQ-OAR-2022-0829-0612, p. 1]

Organization: Missouri Corn Growers Association (MCGA)

As producers of feedstocks for low-carbon biofuels, MCGA strongly opposes the proposed emissions standards within this rulemaking. We estimate this rule may cost the U.S. corn industry nearly one-billion bushels annually in lost demand. This would deal a potentially devastating blow to corn farmers across the country. But the rule's negative impact will ripple beyond the corn industry. [EPA-HQ-OAR-2022-0829-0578, p. 1]

MCGA recognizes electric-powered vehicles play a growing role in tomorrow's transportation needs, yet strongly disagrees with EPA's approach. The aggressive timeline and, more importantly, EPA's false narrative that electric vehicles are the only way to reduce emissions is shortsighted in advancing emission reduction goals. [EPA-HQ-OAR-2022-0829-0578, p. 2]

Organization: Missouri Farm Bureau (MOFB)

We write today to express our opposition to the proposed rule. MOFB's member-adopted policy states:

"We oppose increased restrictions on vehicle emissions, including mandates on greenhouse gas emissions." [EPA-HQ-OAR-2022-0829-0590, p. 1]

As MOFB commented previously in response to EPA's proposed rule Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles – Phase 3 (HD rule)1, this proposal affects the production of later-light duty and medium duty vehicle emissions by usurping the marketplace's role in developing the most efficient and lowest-cost technologies that can protect the environment, keep our nation's economy running at full speed and provide affordable transportation for working families. [EPA-HQ-OAR-2022-0829-0590, p. 1]

1 EPA-HQ-OAR-2022-0985-1584_attachment_1.pdf, June 16, 2023.

In conclusion, MOFB believes EPA's proposed rule is ill-conceived, and, as currently written, will not achieve its purported purpose. We call upon EPA to immediately withdraw the proposed rule and to work with transportation stakeholders, like MOFB, to better allow for emission reductions from a variety of vehicles and fuels technologies that will support the American economy, rather than those of foreign countries, and not force heavy-handed mandates on the vast majority of Americans who will be affected by this proposal. [EPA-HQ-OAR-2022-0829-0590, p. 3]

Organization: National Propane Gas Association (NPGA)

The Proposed Rule is flawed in how quickly it seeks to transform the light- and medium-duty vehicle market to a zero-emission vehicle market. The goal of 67% of the total vehicle market becoming battery electric vehicles (BEVs) in by 20323 is unrealistic given sales and available vehicles in the United States. Further, it ignores consumer preference and fuel choice. [EPA-HQ-OAR-2022-0829-0634, p. 1]

Organization: Nebraska Corn Board (NCB) and Nebraska Corn Growers Association

On behalf of the nearly 2,500 Nebraska Corn Growers Association (NeCGA) dues paying members and the over 21,000 corn farmers in Nebraska who contribute to the state's corn checkoff program through the Nebraska Corn Board (NCB), we appreciate the opportunity to comment on the Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles. [EPA-HQ-OAR-2022-0829-0583, p. 1]

Nebraska corn farmers and ethanol producers have worked diligently in reducing greenhouse gas emissions while supplying the fuels industry with a low carbon, high octane alternative. However, the EPA seemingly overlooks the contribution that biofuels, such as ethanol, can provide to reducing carbon emissions through tailpipes and internal combustion engines. [EPA-HQ-OAR-2022-0829-0583, p. 1]

In closing, we strongly urge the EPA to remove this proposal completely and investigate having a cost- effective, rural friendly approach involving biofuels. Additionally, we refer you to and support the technical comments submitted by the National Corn Growers Association. [EPA-HQ-OAR-2022-0829-0583, p. 2]

Organization: Nebraska Farm Bureau Federation (NEFB)

On behalf of the Nebraska Farm Bureau Federation (NEFB) and our more than 55,000 member families, I am writing to you today to express our concerns over the U.S. Environmental Protection Agency's (EPA) proposed Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles rule. Our concerns center on the proposal's clear attempt to push additional electric vehicles onto our nation's roads, while at the same time increasing regulations on liquid fuel vehicles. In our opinion, this proscriptive policy move is not in the interest of U.S. consumers, farmers, ranchers, or the economies of our state and nation as a whole. [EPA-HQ-OAR-2022-0829-0660, p. 1]

Organization: Nissan North America, Inc.

While Nissan understands and supports the Administration's efforts to push for progress in EV penetration, the current proposal goes well beyond the already aggressive goals set in President Biden's Clean Cars EO. The current proposal is not achievable for numerous reasons, including technology and resource limitations, limited availability of safe and responsibly-sourced critical minerals, supply chain and manufacturing constraints, insufficient charging and energy infrastructure, and significantly lagging consumer adoption, among other reasons. In order to allow for a safe, reliable, and equitable transition to EVs, the proposal must be modified to take these factors into consideration. [EPA-HQ-OAR-2022-0829-0594, pp. 9-10]

Organization: North American Subaru, Inc.

The EPA's 2023 NRPM sets a far more challenging path for the U.S. auto industry, going well above the Administration's 2021 ZEV target, aiming to achieve 67 percent BEV by 2032. In its comments to the agency, the Alliance for Automotive Innovation ("Auto Innovators"), of which Subaru is a member, the association provides a detailed analysis of the Proposed Rule and recommends areas of improvement. Subaru aligns itself with the comments submitted by Auto Innovators. [EPA-HQ-OAR-2022-0829-0576, p. 2]

The Proposed Rule requires transformative change in the U.S. auto industry. Automakers, including Subaru, are making significant investments toward electrification, but just as no automaker is alike, no electrification strategy is alike. A variety of factors including scale and business model can affect decision-making. Caution should be exercised toward a one-size-fits-all regulatory approach to electrification, particularly when applied to a dynamic U.S. automotive industry. [EPA-HQ-OAR-2022-0829-0576, p. 3]

Organization: North Dakota Farmers Union (NDFU)

EPA should not focus on one technology. While BEVs may be part of the solution, a balanced approach to emissions reductions using BEVs and other technologies is needed.11 It is important that EPA utilize lifecycle analysis to create a level playing field that encourages speedy adoption of flex-fuel vehicles, hybrid electric vehicles, plug-in hybrid electric vehicles and other technologies, to achieve the most rapid, affordable, robust, and practical GHG emissions reductions in a wide range of vehicle segments, while satisfying diverse customer needs and preferences. Furthermore, EPA should revise the proposed standards to a level which can be achieved using more realistic estimates for future penetration of vehicle technologies and that incorporates low carbon fuels. [EPA-HQ-OAR-2022-0829-0586, p. 5]

> 11 Pratt, G. (2021, August 23). (More) straight talk about Toyota's electric vehicle strategy. Medium. Retrieved from https://medium.com/toyotaresearch/more-straight-talk-about-toyotas-electric-vehicle-strategy- f0aba4be40.

Organization: Office of Wyoming Governor Mark Gordon

Wyoming has a vested interest in the proposed rule. Wyoming stands to feel significant negative impacts from this rule, including: consumer costs, supply chain effects, our nation's energy security, highway funding shifts, electric vehicle (EV) charging infrastructure realities, rural population accessibility, and state vehicle fleets. It is important that the EPA not mandate that the personal vehicle and transportation market move to EVs through a rushed and backdoor emissions approach. Programs such as the Federal Highway Administration's National Electric Vehicle Infrastructure (NEVI) program illustrates how difficult a compulsory shift to EVs is to implement in rural states such as Wyoming. [EPA-HQ-OAR-2022-0829-0675, p. 1]

Organization: Paul Bonifas and Tim Considine

The EPA's proposed EV Rule is a classic example of government intervention in markets; the government is trying to "push on a string" using heavy-handed top-down market control tactics. Governments do not have success when attempting to control markets, and the results of rules such as this one have been catastrophic and expensive. The EPA's Rule and corresponding RIA are riddled with contradictions, purposeful omissions, and government double-speak. [EPA-HQ-OAR-2022-0829-0551, p. 2]

Organization: POET, LLC

Summary

EPA's Proposed Rule on LDV emissions has significant shortcomings in achieving its stated goal of reducing GHG emissions. By treating only tailpipe emissions for compliance purposes, the Proposed Rule yields a narrow set of alternatives to reach compliance. In particular, the difference between zero tailpipe emission BEVs and all other ICE's is so great that only a narrow range of BEV penetration pathways can allow compliance. While the Proposed Rule's target is fixed, if the proposal's high projections of BEV deployments are not met, no combination of improved technology on ICEs in the model is sufficient to compensate for slower growth in BEVs. [EPA-HQ-OAR-2022-0829-0609, p. 50]

Organization: Roy Littlefield IV

I am writing to express my opposition to the proposed tailpipe emissions rule outlined in EPA-HQ-OAR-2022-0829. As proposed, I believe these regulations for light-duty vehicles go too far, reduce consumer choice, and fail to include safeguards to address serious infrastructure, resource, and funding shortfalls. [EPA-HQ-OAR-2022-0829-0793, p. 1]

In conclusion, I strongly urge the EPA to reconsider the proposed tailpipe emissions rules. It is crucial that the EPA engage in meaningful collaboration with Congress, automotive manufacturers, and other stakeholders to develop a comprehensive approach that accounts for the current limitations in charging infrastructure, safeguards consumer choice, promotes domestic energy security, and ensures the continued funding of our vital transportation infrastructure. [EPA-HQ-OAR-2022-0829-0793, p. 1]

Organization: Senator Shelley Moore Capito et al.

We request the Environmental Protection Agency (EPA) withdraw two recent proposals to regulate tailpipe greenhouse gas emissions from light-, medium-, and heavy-duty vehicles (Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles and Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles - Phase 3). These proposals effectively mandate a costly transition to electric cars and trucks in the absence of congressional direction, and the Agency should immediately rescind both proposals. [EPA-HQ-OAR-2022-0829-5083, p. 1]

Since these proposals are legally flawed, divorced from reality with regard to the associated costs and domestic capacity to implement them, and would be devastating for American consumers and workers already burdened by sustained levels of historically high inflation, we respectfully ask the EPA to rescind these two proposals immediately. [EPA-HQ-OAR-2022-0829-5083, p. 5]

Organization: Specialty Equipment Market Association (SEMA)

Conclusion

While the automobile's roots are tied to the internal combustion engine, SEMA prides itself on maintaining a forward-looking vision that embraces innovative technology, including EVs and other zero-emissions vehicles. The specialty automotive aftermarket has led the way on alternative fuel innovations from replacing older engine technologies with newer, cleaner versions to converting older ICE vehicles to new electric, hydrogen, and other alternative-fuel vehicles. Sadly, the EPA's plans to reduce greenhouse gases and criteria pollutants do not factor this in. SEMA and its members have serious concerns with this proposal, which aggressively seeks to lower carbon emissions under timelines that effectively make electric vehicles the de facto choice for automakers to meet the requirements. [EPA-HQ-OAR-2022-0829-0596, p. 6]

Clean air and the reduction of greenhouse gases are goals everyone can acknowledge. That said, when governments arbitrarily pick technology winners and losers, the marketplace is deprived of choices and the public suffers. Instead of forcing this transition, the EPA should put in place incentives to support a diversified, zero-emissions approach that takes advantage of breakthrough technologies across the spectrum. [EPA-HQ-OAR-2022-0829-0596, p. 6]

Organization: Stellantis

These are ambitious targets that will require a comprehensive, multi-stakeholder strategy to build a robust market. Stellantis is committed to do its part to execute an unprecedented transformation of our products to support the U.S. electrification targets, and other stakeholders need to do their part to help drive consumer demand and remove barriers to electric vehicle (EV) market success. [EPA-HQ-OAR-2022-0829-0678, p. 2]

Stellantis is unwavering in its commitment to an all-electric portfolio and building an EV dominated market that can achieve the Biden administration's target of 40-50% by 2030. However, EPA's proposed greenhouse gas (GHG) requirements exceed what is feasible, and the proposed criteria emissions standards drive a distracting and costly focus on a shrinking internal combustion engine (ICE) fleet. [EPA-HQ-OAR-2022-0829-0678, p. 2]

The Proposed Rule exceeds the joint commitments of industry and the Biden administration, relying heavily on overly optimistic assumptions of EV market growth to meet GHG and criteria emissions standards. EPA is also proposing changes to the criteria emissions rules that go well beyond the recently completed CARB ACC II LEV IV standards that are both very challenging and deliver significant criteria emissions reductions from today. [EPA-HQ-OAR-2022-0829-0678, p. 2]

Organization: Steven G. Bradbury

Second, I will explain how the EPA has failed adequately to acknowledge and con- sider the true scope of the colossal costs and burdens these proposals, if finalized, would impose on American families, the U.S. economy, and our nation's security, and how, at the same time, the Agency has wildly overestimated the benefits it claims will result from these proposed rules. Because the key analyses and assumptions on which these proposals are based are so faulty and ill-considered, if the rules were finalized in the form proposed, they would be arbitrary and capricious in violation of the APA.7 [EPA-HQ-OAR-2022-0829-0647, pp. 2-3]

7 See id. § 706(2)(A) (providing that the reviewing court shall strike down a final rule found to be "arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law").

Conclusion

If and when the American people feel the true effects of these rules—when they lose the vehicle options they love at the local dealership and find themselves stuck driving older and less safe cars, when the bottom falls out of the job market in the U.S. auto industry, when drivers cannot find convenient charging stations for their electric vehicles—in sum, when American voters realize what the EPA's far-reaching regulatory enterprise has wrought for the nation, they will be angry. [EPA-HQ-OAR-2022-0829-0647, p. 24]

At issue are matters of life, liberty, and prosperity, and the considerations involved are fundamentally political in nature. That is exactly why, under our constitutional republic, it is for Congress, and Congress alone, to make the monumental decisions that EPA is purporting to take upon itself in these proposed rules. For these reasons, EPA should with- draw its proposed tailpipe rules and reconsider the wisdom of these proposals. [EPA-HQ-OAR-2022-0829-0647, p. 24]

Organization: T. Becker Power Systems

3- EPA has illegally refused to consider alternatives to the motor vehicle emission standards of this proposed rule. If implemented, those alternatives can meet the air quality goals of the proposed rule without the new motor vehicle emission standards found in the proposed rule. [EPA-HQ-OAR-2022-0829-0567, p. 1]

4- Most areas of the United States are already meeting EPA air quality standards. Only a few areas violate EPA “serious” or “severe” air quality standards. Those “serious” and “severe” areas are mostly located in California. Those areas can achieve EPA air quality standards by implementing emission reduction strategies that are specific to the area, and do not require increasingly stringent motor vehicle emission standards. [EPA-HQ-OAR-2022-0829-0567, p. 1]

6- 90%+ of the population of the USA live in areas that do not require increasingly stringent motor vehicle emission standards to meet EPA air quality standards. However, that 90% of the US population will be negatively impacted by this proposed regulation, with higher vehicle purchase costs, higher repair costs (battery replacement costs) and lower vehicle safety. [EPA-HQ-OAR-2022-0829-0567, p. 1]

7- Every issue in items 1-6 has been presented to both EPA and CARB in numerous documents submitted to EPA and CARB by myself and others over the years. [EPA-HQ-OAR-2022-0829-0567, p. 1]

Organization: TCW Inc.

The proposal for requiring "ZEV" purchases on a percentage basis is too early, not attainable and cost restrictive. Let alone, our studies have shown that our net carbon footprint would be worse with a Battery Electric Vehicle (BEV) fleet, compared to our modern diesel fleet today. [EPA-HQ-OAR-2022-0829-0452, p. 1]

"ZEV" is a misleading acronym. While electric vehicles may not have tailpipe emissions, approximately 60% of our electricity today is generated by fossil fuels. Cobalt, Lithium, etc., required to manufacture batteries for BEV's are primarily sourced overseas, with poor environmental standards, mined with equipment with no emission standards and/or with child and slave labor. [EPA-HQ-OAR-2022-0829-0452, p. 1]

While admirable in nature, the goal of converting a significant portion or our new commercial truck production over to BEV in a decade is not cost effective, is not achievable and will likely have a worse environmental impact than focusing on realistic alternatives, such as R99 and hydrogen power. Interestingly enough, American Transportation Research Institute (ATRI) data was used in the calculation of maintenance expense on Internal Combustion Engine (ICE) commercial motor vehicles, but no reference of the valuable studies above was made in the subject NPRM. We believe strongly that the EPA needs to not only focus on greenhouse gas emissions (GHG), but the true, net carbon footprint involved with ZET/BEV commercial motor vehicles. Focusing solely on GHG and neglecting the overall global carbon impact fails to truly make the best decisions for our environment. [EPA-HQ-OAR-2022-0829-0452, pp. 1-2]

Organization: Texas Public Policy Foundation (TPPF)

These proposed rules are ill-advised, statutorily impermissible, and likely unconstitutional. They are based on faulty science and an impermissible reading of the Clean Air Act ("CAA"). Together, they will likely devastate the American trucking industry and harm American automobile and truck buyers. [EPA-HQ-OAR-2022-0829-0510, pp. 1-2]

Organization: Travis Fisher

Considering the deficiencies in the Proposed Rule, EPA should decline to move forward with a final rule in this matter. If EPA chooses to move forward, it should first issue a new proposal that provides an analytically sound DRIA as the basis for reasoned decision-making by the EPA Administrator. [EPA-HQ-OAR-2022-0829-0655, p. 1]

Organization: U.S. Chamber of Commerce

For regulatory measures seeking to accelerate this transition to be successful, they must be technologically achievable, flexible, cost-effective and attentive to practical market and real-world considerations that affect consumer interest in and support for electric vehicles. They also must recognize the vital importance of a healthy auto sector to the national economy. According to the Alliance for Automotive Innovation, auto manufacturing, sales and service supports a total of 9.6 million American jobs and generates more than $1 trillion of economic activity each year. The Chamber has strong concerns that the proposed rule fails to meet these criteria by going too far, too fast, particularly in light of challenges associated with outside-the-vehicle factors that are critical to facilitating broad consumer support for EVs. [EPA-HQ-OAR-2022-0829-0604, p. 2]

Organization: United Steelworkers (USW)

Our union supports reasonable and well-researched regulations to ensure that our shared environment and communities are protected. However, EPA's proposed rule on emission standards for light- and medium-duty vehicles is far-reaching and recklessly hits the accelerator on the transition to Zero Emission Vehicles (ZEVs). [EPA-HQ-OAR-2022-0829-0587, p. 1]

Organization: Western Energy Alliance

Western Energy Alliance is struck by the magnitude of the proposed rule on tailpipe emissions standards and the breathtaking assumption of power as EPA seeks to transform a major portion of the transportation sector fundamentally with this rule along with its heavy-duty companion. Further, EPA is rushing forward even as a related rule on Corporate Average Fuel Economy (CAFE) from the National Highway Traffic Safety Administration (NHTSA), which has a substantially similar scope, has not yet been released. The public is being denied the opportunity to comment holistically on both rules in tandem to understand how the Biden Administration is attempting to so radically change the mobility choices of all Americans as well as the foundation for the delivery of goods and services throughout the entire economy in an unrealistically disruptive amount of time. [EPA-HQ-OAR-2022-0829-0679, p. 1]

Market Assessment: Likewise in I.A.ii EPA's justification follows the logic that because EV market penetration has increased and carmakers are increasing their investments and innovating, therefore EPA needs to regulate. EPA even makes the absurd statement that, “The proposed standards will also provide regulatory certainty to support the many private automaker announcements and investments in zero-emission vehicles that have been outlined in the preceding paragraphs.” (p. 29195) The absurd logic is that because the private sector is making advancements and investments, the government needs to support them with regulation. [EPA-HQ-OAR-2022-0829-0679, pp. 9-10]

Government’s role with regulation is to correct so-called market flaws, not promote markets. Insofar as there are opportunities for businesses to benefit from subsidies, federal loans, tax credits, and grants for EVs, such as those contained in BIL and IRA, carmakers that are so inclined can tap into those taxpayer resources. They do not need another agency to force them to use them. It’s simply the nature of an incentive. EPA should not go down the path of regulating for the supposed benefit of carmakers to help them increase their EV market share, as they already have government incentives to do so. Unlike government assistance and grants, EPA regulation is inherently contradictory to the task of promoting carmakers’ self interest. [EPA-HQ-OAR-2022-0829-0679, pp. 9-10]

Likewise, if EPA’s analysis is correct and, “The year-over-year growth in U.S. PEV sales suggests that an increasing share of new vehicle buyers are concluding that a PEV is the best vehicle to meet their needs” then why is the rule necessary? If the market is working, the rule is unnecessary by EPA’s own unwitting admission. [EPA-HQ-OAR-2022-0829-0679, p. 10]

We appreciate the opportunity to comment but strongly urge EPA to desist with this rule as exceeding its authority based on arbitrary and capricious legal and technical justification. At a minimum, we urge EPA to keep this comment period open until the close of the companion NHTSA CAFE rule. Thank you. [EPA-HQ-OAR-2022-0829-0679, p. 10]

Organization: Winnebago Industries (Winnebago Industries)

Winnebago Industries opposes the Proposed Rule in so far as it forces zero emission vehicle (ZEV) technologies upon Winnebago Industries’ motorhomes and recreational vehicles (RV) in an unreasonably short period of time, and because of the potentially serious negative impacts the Proposed Rule will have on Winnebago Industries’ critical recreational vehicle (RV) business. As provided below, Winnebago Industries requests that EPA include exemptions or other relief to prevent potential serious negative impacts to a critical area of our business. [EPA-HQ-OAR-2022-0829-0636, p. 1]

Organization: Wisconsin Automobile and Truck Dealers Association

To force this more expensive, inferior technology on Americans now is an act of blind political folly. While Americans may utilize electric powered vehicles at some point in the future, that point in time should be as a result of the technology meeting the demands of everyday life and not because it was shoved down the throats of Americans at their own peril. [EPA-HQ-OAR-2022-0829-0494, p. 2]

Bill Lear designed the popular cartridge of the eight-track tape. Ten years later the compact cassette arrived on the scene. The music industry went all in with the eight-track tape, only to create an aftermarket for radios and receivers that would accept a compact cassette. The EPA is forcing eight-track tape technology on the American public while not allowing research, development, and the free market to advance hydrogen fuel cell or other emerging technologies. [EPA-HQ-OAR-2022-0829-0494, p. 2]

When proposed rules disrupt commerce and the way Americans fundamentally travel, this is immense. When these rules also change how gigantic manufacturers produce products and limit availability across the nation, this is distressing. It is not the EPA's mission to pick transportation winners and losers. It is not the EPA's mission to reimagine transportation in United States. The EPA can facilitate change, but it should be a manageable transition, based on proven technology that functions and enhances a strong economy and quality of life. The Wisconsin Automobile and Truck Dealers Association implores you to reconsider Cost, Affordability, Network Build-out, Feasibility of Electrical Generation, Range, Climate, National Security, Impact on Americans, Impact on Climate for ROI, and more. [EPA-HQ-OAR-2022-0829-0494, p. 2]

This is well intentioned and ill-timed. [EPA-HQ-OAR-2022-0829-0494, p. 2]

EPA Summary and Response

Summary

The above comments are some of the many general statements in opposition to EPA's proposed program to reduce GHG and criteria emissions from light- and medium-duty vehicles included in the detailed comments reproduced verbatim in this RTC document and the additional comments described in Appendix A. Many of these commenters voiced concerns about the legal basis for the program, the impacts on the automotive manufacturing sectors, and on jobs and households. Other commenters express concerns about costs and supply chain impacts. Some commenters stated that EPA fails to include lifecycle emissions leading it to favor one technology solution. These commenters request EPA to consider allowing other technologies and low carbon fuel solutions. Some commenters also mention potential impacts on energy and national security, or question whether the energy grid can support these changes. Other commenters are skeptical that the program will reduce emissions or affect global climate change.

Response

EPA acknowledges these comments expressing general opposition to the proposed rule. Some of these commenters provided detailed comments about specific aspects of the proposed program; those comments are reproduced verbatim in other parts of this RTC document. Regarding the general comments above relating to issues such as legal authority, technology solutions, fuel-based solutions, energy and national security, and electric infrastructure, please see those sections of the RTC and preamble that address those aspects of the program in detail.

2 - Appropriateness/legal justification of standards under Clean Air Act

Comments by Organizations

Organization: 25x'25 Alliance, et al.

The undersigned parties offer the following comments on EPA's proposed rule, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles." We write these comments because we believe that the proposed rules would establish an overly aggressive, high-risk program that would be counterproductive in achieving the agency's environmental and health objectives. [EPA-HQ-OAR-2022-0829-0573, pp. 1-4]

In establishing or revising Clean Air Act Section 202(a) standards, EPA must consider issues of technological feasibility, cost of compliance, and lead time. Among other things, that means the agency must look closely at the impact of its proposed standards on net emissions of air pollutants and their associated public health effects, impacts on the automotive industry, impacts on the vehicle purchasers/consumers, energy security, and safety, and how the proposed approach would compare to other possible rulemakings. [EPA-HQ-OAR-2022-0829-0573, pp. 1-4]

Organization: Alliance for Automotive Innovation

Additionally, regulations issued under section 202 of the Clean Air Act must not be arbitrary and capricious, a standard identical to the one imposed by the Administrative Procedure Act.16 This standard requires that EPA consider all "important aspect[s] of the problem" and engage in "reasoned decision making," and that it "consider[] the relevant factors and articulate[] a rational connection between the facts found and the choice made.'"17 [EPA-HQ-OAR-2022-0829-0701, pp. 24-25]

16 See 42 U.S.C. § 7607(d)(9)(A); see also Nat'l Petrochem. & Refiners Ass'n v. E.P.A., 287 F.3d 1130, 1135 (D.C. Cir. 2002).

17 Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43, 53 (1983); Nat'l Ass'n of Clean Air Agencies v. E.P.A., 489 F.3d 1221, 1229 (D.C. Cir. 2007).

2. Statutory Authority

Auto Innovators shares EPA's goal of addressing climate change by achieving a net-zero carbon transportation future, as part of an ambitious, comprehensive, and national strategy. The Proposed Rule, however, contemplates a rapid and transformative nationwide shift to electrification that may be well beyond what the industry or market can bear now or in the foreseeable future. Given the significant policy and economic consequences that would flow from this restructuring of the nation's vehicle market, and the breadth and unprecedented nature of EPA's proposed action, clear congressional authorization is required for the Proposed Rule. EPA lacks this clear authorization. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

The Proposed Rule seeks to use Clean Air Act section 202 rulemaking to force an extraordinary transformation of the nation's vehicle fleet away from ICE-based vehicles to BEVs, and it is not at all clear that the level of consumer demand and infrastructure that exists now and is expected in the future can support the expedited, aggressive timeline in the Proposed Rule. The Proposed Rule does not include an explicit electrification target, and EPA states that "a compliant fleet under the proposed standards will include a diverse range of technologies."152

But in practice, the stringency of the proposed standards is such that automakers will have no choice but to convert to BEV fleets on a massive scale. This is the result not only of the Proposed Rule's GHG emissions standards, but also its criteria pollutant standards and its tightening of credit programs and other flexibilities. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

152 NPRM at 29187.

In other words, the Proposed Rule is enormously consequential for the automobile industry, and for the economy and consumers as a whole. The Proposed Rule's provisions insert EPA into crucial policy tradeoffs and debates, such as concerns about the extraction and supply of critical minerals overseas, or the need to maintain a reliable, efficient electric grid.159 These considerations range far afield from the traditional ambit of section 202 rulemaking, delving into areas that are the subject of other regulatory schemes, or within the unique purview and authority of other agencies and other branches and levels of government. In short, the dramatic shift toward electrification required by the Proposed Rule implicates issues of tremendous political, economic, and social significance. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

159 See, e.g., NPRM at 29311-24.

Nor is such a transformative rule, with such wide-ranging implications, a typical feature of section 202 rulemaking. We acknowledge that some past EPA section 202 rules, most notably the MY 2023-2026 rule, have contemplated greater deployment of EVs as one of many options for complying with emissions standards. The Proposed Rule, however, is different not merely in degree but in kind, seeking to impose what is, at bottom, a mandate toward nationwide electrification. Such a proposal amounts to an unprecedented assertion of power on the part of EPA. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

"[A]n enormous and transformative expansion in EPA's regulatory authority" such as this necessitates "clear congressional authorization," as Congress is expected to "speak clearly if it wishes to assign to an agency decision of vast 'economic and political significance.'"160 But section 202 does not confer such clear authority. Section 202 authorizes EPA to promulgate "standards applicable to the emission of any air pollutant" from vehicles; it does not empower EPA to force a historic shift in the makeup of the nation's entire vehicle fleet. In the absence of plain statutory authorization, such a decision, and the tradeoffs and consequences it entails, properly belongs to Congress. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

160 Utility Air Regulatory Group v. E.P.A., 573 U.S. 302, 324 (2014) (quoting FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120, 160 (2000)).

The Proposed Rule frequently cites to the IIJA, also known as the "Bipartisan Infrastructure Law,"161 and the Inflation Reduction Act.162 To the extent EPA purports to rely on either statute as providing a legal basis for the Proposed Rule,163 it should not do so. No provision of the IIJA or the IRA expands or modifies EPA's regulatory authority under section 202 or the Clean Air Act more broadly. Nor can these laws be considered to have implicitly altered EPA's authority. After all, "implied amendments require 'clear and manifest' evidence of congressional intent,"164 and "neither courts nor federal agencies can rewrite a statute's plain text to correspond to its supposed purposes."165 Those conditions are not satisfied here. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

161 Pub. L. 117-58, 135 Stat. 429 (2021).

162 Pub. L. 117-169, 136 Stat. 1818 (2022). See, e.g., NPRM at 29187-90, 29195-96, 29233, 29300, 29308, 29313, 29318, 29322-24, 29341 (referencing the IIJA and/or IRA).

163 See, e.g., NPRM at 29233 ("The recently enacted Inflation Reduction Act 'reinforces the longstanding authority and responsibility of [EPA] to regulate GHGs as air pollutants under the Clean Air Act'") (quoting floor statement by Rep. Pallone).

164 Sackett v. E.P.A., 598 U.S , 2023 WL 3632751, at *13 (U.S. May 25, 2023) (internal quotation omitted).

165 Landstar Exp. America, Inc. v. Fed. Maritime Comm'n, 569 F.3d 493, 498 (D.C. Cir. 2009).

We reaffirm that we are fundamentally supportive of EPA's goals of reducing GHG emissions and transitioning to a net-zero carbon transportation future. Section 202 standards have a place in this effort, as we have previously expressed. We remain concerned, however, that the extraordinary and unprecedented nature of the Proposed Rule places it outside the bounds of EPA's statutory authority. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

2. Statutory Authority

Auto Innovators shares EPA's goal of addressing climate change by achieving a net-zero carbon transportation future, as part of an ambitious, comprehensive, and national strategy. The Proposed Rule, however, contemplates a rapid and transformative nationwide shift to electrification that may be well beyond what the industry or market can bear now or in the foreseeable future. Given the significant policy and economic consequences that would flow from this restructuring of the nation's vehicle market, and the breadth and unprecedented nature of EPA's proposed action, clear congressional authorization is required for the Proposed Rule. EPA lacks this clear authorization. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

The Proposed Rule seeks to use Clean Air Act section 202 rulemaking to force an extraordinary transformation of the nation's vehicle fleet away from ICE-based vehicles to BEVs, and it is not at all clear that the level of consumer demand and infrastructure that exists now and is expected in the future can support the expedited, aggressive timeline in the Proposed Rule. The Proposed Rule does not include an explicit electrification target, and EPA states that "a compliant fleet under the proposed standards will include a diverse range of technologies."152 But in practice, the stringency of the proposed standards is such that automakers will have no choice but to convert to BEV fleets on a massive scale. This is the result not only of the Proposed Rule's GHG emissions standards, but also its criteria pollutant standards and its tightening of credit programs and other flexibilities. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

152 NPRM at 29187.

As EPA notes, BEVs accounted for 5.8% of the new U.S. light-duty passenger vehicle market in 2022.153 Moreover, EPA's MY 2023-2026 GHG emissions standards that were finalized at the end of 2021 projected only a 17% light-duty penetration rate for both BEVs and PHEVs by MY 2026.154 Despite this low rate of consumer acceptance, the Proposed Rule projects a light-duty BEV penetration rate of 67% by MY 2032, up from 36% in MY 2027.155 Importantly, in the absence of these and other strict regulatory programs (such as California's ZEV mandate), EPA projects a significantly lower MY 2032 BEV penetration rate of only 39%.156 It is unclear from EPA's analysis how the regulations alone justify a 28 percentage point increase in BEV market between having regulations versus not. This is particularly concerning given that EPA's no-action analysis presumably includes the same level of existing supportive mechanisms such as the IRA and IIJA, assumptions for infrastructure development, and other market-enabling features. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

153 Id. at 29189

154 See Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 Fed. Reg. 74434, 74485, Table 33 (Dec. 30, 2021).

155 NPRM at 29329, Table 80.

156 Id. at 29329, Table 81.

In other words, a staggering increase in the implementation and adoption of BEV technology underpins the Proposed Rule and is the central means by which the rule effectuates its contemplated emissions reductions. But this shift to electrification is not a simple matter of swapping one technology for another. The mass adoption of BEVs on the scale required for compliance with the Proposed Rule's standards requires a much broader transformation in the way vehicles are manufactured, purchased, fueled, serviced, and disposed of. Indeed, the Proposed Rule would reorder much of the U.S. automobile industry—which supports roughly 10.3 million American jobs and $558 billion in annual car sales, and about 6% of the U.S.'s Gross Domestic Product (GDP).157 Consumers must be willing to purchase BEVs at mass scale; the power sector must be able to generate and deliver adequate electricity158—which itself will contribute to emissions—while maintaining grid reliability and otherwise meeting consumer and industrial demand; adequate charging infrastructure must be available; batteries and other components must be manufactured at an increasing rate, critical minerals sourced, and supply chains developed. These needs must be met not only for light-duty vehicles, but also for medium-and heavy-duty vehicles. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

157 See Economic Insights, Alliance for Automotive Innovation, https://www.autosinnovate.org/resources/insights.

158 In addition to increasing electricity capacity, utilities are also facing a transition in technology types and more renewable sources, as proposed under the "Greenhouse Gas Standards and Guidelines for Fossil Fuel-Fired Power Plants" [88 FR 33240, May 23, 2023].

As expressed throughout this comment, we have serious concerns that the market will not be able to bear the requirements of the Proposed Rule and that those requirements will not be feasible given these considerations. Compliance will impose significant costs, and require extraordinary effort, on the part of regulated parties—costs which will be passed along to consumers. Setting such stringent standards has the potential to create a significant market disruption, with consequences not only for the automobile industry but for the entire U.S. economy. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

In other words, the Proposed Rule is enormously consequential for the automobile industry, and for the economy and consumers as a whole. The Proposed Rule's provisions insert EPA into crucial policy tradeoffs and debates, such as concerns about the extraction and supply of critical minerals overseas, or the need to maintain a reliable, efficient electric grid.159 These considerations range far afield from the traditional ambit of section 202 rulemaking, delving into areas that are the subject of other regulatory schemes, or within the unique purview and authority of other agencies and other branches and levels of government. In short, the dramatic shift toward electrification required by the Proposed Rule implicates issues of tremendous political, economic, and social significance. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

159 See, e.g., NPRM at 29311-24.

Nor is such a transformative rule, with such wide-ranging implications, a typical feature of section 202 rulemaking. 165 Landstar Exp. America, Inc. v. Fed. Maritime Comm'n, 569 F.3d 493, 498 (D.C. Cir. 2009).

We reaffirm that we are fundamentally supportive of EPA's goals of reducing GHG emissions and transitioning to a net-zero carbon transportation future. Section 202 standards have a place in this effort, as we have previously expressed. We remain concerned, however, that the extraordinary and unprecedented nature of the Proposed Rule places it outside the bounds of EPA's statutory authority. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

7. Modeling of Plug-In Hybrid Electric Vehicles

In the Proposed Rule, EPA acknowledges that plug-in hybrid electric vehicles "can provide significant reductions in GHG emissions and that some vehicle manufacturers may choose to utilize this technology as part of their technology offering portfolio" and, in particular, that a "PHEV pickup architecture would provide several benefits."210 This is consistent with EPA's analysis in the MY 2023-2026 GHG emissions standards rulemaking, in which the Agency noted that "our updated analysis projects that about 17% of vehicles meeting the MY 2026 final standards will be BEVs or PHEVs," and projected that "BEVs and PHEVs can play a significant role in complying with the final standards."211 [EPA-HQ-OAR-2022-0829-0701, pp. 115-117]

210 NPRM at 29298; see also Drati Regulatory Impact Analysis at 2-75 (same).

211 Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 Fed. Reg. 74434, 74493-94 (Dec. 30, 2021) (emphasis added).

Despite recognizing the importance of PHEVs in meeting GHG emissions standards, EPA has not attempted to model any PHEVs as part of manufacturers' compliance pathways to meet the proposed standards or alternatives under consideration. Auto Innovators believes that this omission of technology that will indisputably be an important part of the transition to a net-zero carbon transportation future is a significant oversight that should be rectified in the final rule. [EPA-HQ-OAR-2022-0829-0701, pp. 115-117]

A number of manufacturers are already building PHEVs or have announced plans to do so. S&P Global Mobility estimates a 5% U.S. market share for PHEVs in 2030.212 Auto Innovators' commitment to reaching 40-50% EV sales by 2030 was inclusive of PHEVs. Likewise, President Biden's Executive Order 14037 Specifically set "a goal that 50% of all new passenger cars and light trucks sold in 2030 be zero-emission vehicles, including battery electric, plug-in hybrid electric, or fuel cell electric vehicles." (Emphasis added.)213 [EPA-HQ-OAR-2022-0829-0701, pp. 115-117]

212 S&P Global Mobility, U.S. light vehicle sales forecast by propulsion system design, January 2023.

213 E.O. 14037 of Aug 5, 2021.

EPA asks for comments on whether PHEVs should be modeled and what type of PHEV technology should be incorporated. Auto Innovators believes EPA should include PHEVs in their modeling and it would be appropriate to model both the typical strong PHEVs (accounting for stronger electrification needed to meet US06 high power cold starts), as well as the range-extending type that EPA is modelling at SwRI. [EPA-HQ-OAR-2022-0829-0701, pp. 115-117]

Moreover, assuming EPA includes PHEVs in the final rule, it should not use PHEV technology as a justification to further increase greenhouse gas stringency. Rather, EPA should treat PHEVs in the context that manufacturers consider them – as a component of EV technology, not as a means to further improve ICE vehicle emissions in addition to rapidly increasing BEV model availability and production. PHEVs offer unique utility, and because some consumers are not ready for a BEV, we do not believe the inclusion of PHEVs should increase the combined ZEV share that EPA has modeled as BEVs in the Proposed Rule. Rather, a PHEV is a preferred EV to a BEV for some vehicle buyers and should be considered as a substitute for a BEV. Additionally, the California ZEV mandate allows for PHEVs, meeting certain criteria, to meet requirements, and treats them as it treats BEVs. At a minimum, EPA could borrow CARB's assumptions regarding PHEV sales and characteristics and apply them for states that follow California's rules only. [EPA-HQ-OAR-2022-0829-0701, pp. 115-117]

PHEVs are well suited to some applications, especially for more capable SUVs and pickup trucks. Specifically, EPA has modeled 60% BEV light-duty pickup trucks in the Proposed Rule, see Figure 34 below. [EPA-HQ-OAR-2022-0829-0701, pp. 115-117]

Figure 34: EPA Omega model output – Pickup BEV share percentage 214 [EPA-HQ-OAR-2022-0829-0701, pp. 115-117]

214 OMEGA output abs_share_frac_pickup_BEV divided by abs_share_frac_pickup significant effort to model battery capacity constraints, but it is only a model, which carries uncertainty.

In addition to consumer demand (for utility or as a bridge to full electrification), another reason that EPA should include PHEVs in their modeling is the potential for PHEVs to provide clean electric miles while reducing the amount of battery material needed. EPA has devoted. [EPA-HQ-OAR-2022-0829-0701, pp. 115-117]

Further, PHEVs can be very useful to sustain the transition to electrification in the case of unforeseen disruptions in the development of battery manufacturing capacity due to constraints in mineral availability, processing, or other supply chain challenges. Using MY 2023 EPA Fuel Economy Guide data, a 300-mile BEV requires a battery of approximately 109kW-hr on average. Accounting for energy efficiency differences, the same battery material could be used to make between four and six PHEVs with 50 miles of all-electric range. Fifty miles exceeds what most Americans drive on most days, enabling significant all-electric driving. Due to battery supply chain concerns, EPA should include PHEVs in their modeling as a substitute for some BEVs so that PHEVs comprise at least 20% of the combined BEV plus PHEV share consistent with California and other ZEV states. [EPA-HQ-OAR-2022-0829-0701, pp. 115-117]

Organization: Alliance for Consumers (AFC)

Consumers deserve better, especially given that EPA's proposal is arbitrary and capricious under the APA because it fails to consider all aspects of the problem. [EPA-HQ-OAR-2022-0829-0534, p. 2]

The Proposed Rule Is Pretextual And Therefore Cannot Be Finalized

The proposed rule is pretextual. It is transparently outcome driven: a poorly disguised attempt to mandate electric vehicles, a power that otherwise does not lie within the ambit of what EPA may do. It is therefore not the product of reasoned decision-making and cannot be finalized as proposed. [EPA-HQ-OAR-2022-0829-0534, pp. 3-4]

"[I]n order to permit meaningful judicial review, an agency must 'disclose the basis' of its action." Dep't of Commerce v. N.Y.], 139 S. Ct. 2551, 2573 (2019). Here, the administration's longstanding goal of forcing EV adoption has every appearance of being the driving force behind the strenuousness of the proposed standards, not the underlying statutory requirements or other more relevant considerations. The framing of this proposal in the press, as informed by briefing sheets and background briefings done by EPA and White House personnel, as well as the contents of the surrounding EPA documents all point to the proposal being an attempt to enforce an EV mandate through other means; it is clear that the goal here was requirements so strict that they could only be met by replacing nearly all gas-powered cars with EVs, with cross-references in the agency materials to other efforts by the administration to ensure EV penetration. See page 1, supra. In other words, the rationale for the proposal and its justification in the context of the tailpipe emissions program is “pretextual,” and thus the proposal itself in its current form is unlawful. Id. at 2573–76. [EPA-HQ-OAR-2022-0829-0534, pp. 3-4]

“Reasoned decisionmaking under the Administrative Procedure Act calls for an explanation for agency action. What was provided here was more of a distraction.” Dep’t of Commerce v. N.Y., 139 S. Ct. at 2576. [EPA-HQ-OAR-2022-0829-0534, pp. 3-4]

Failure To Adequately Consider All Aspects Of The Problem

An agency rule is arbitrary and capricious if “the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.” Motor Vehicle Mfrs. Ass’n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983). [EPA-HQ-OAR-2022-0829-0534, p. 4]

Here, EPA has failed to adequately consider all aspects of the problem and adequately address crucial consideration that go to the validity of the proposal. This includes failure to properly consider the rising price of electric vehicles in the wake of the Inflation Reduction Act, the limits on credits and subsidies that have resulted from this surge in electric vehicle pricing, and the true cost of repairing electric vehicles over a relevant time horizon. [EPA-HQ-OAR-2022-0829-0534, p. 4]

Organization: American Coalition for Ethanol

Other legal questions have been raised given recent court rulings with respect to “major questions” doctrine. Some have suggested this proposal’s effect of forcing the production of BEVs to phase out internal combustion engines is similar to EPA’s Clean Power Plan to force changes in electric power generation, which was struck down by the Supreme Court in West Virginia v. EPA. And, just days ago, the Supreme Court used the ‘major questions doctrine” to nullify the Administration’s student loan forgiveness plan in Biden v. Nebraska. The Agency risks inviting litigation given the vast and political significance of this rule without clear congressional authorization to mandate BEVs. In the end, litigation surrounding this rule could forestall meaningful GHG reductions from liquid transportation fuels simply because EPA unnecessarily put its thumb on the scale for a preferred outcome that doesn’t survive legal scrutiny. [EPA-HQ-OAR-2022-0829-0613, pp. 3-4]

Even if the U.S. somehow reaches 50% BEV sales by 2030 (President Biden’s original executive order), the U.S. will consume over 1 trillion gallons of motor gasoline in the next decade. As stated earlier, ACE shares EPA’s goal to significantly decarbonize transportation related GHG emissions in the U.S. We strongly urge the Agency to rework its proposal to develop a more practical technology-neutral approach discussed below. [EPA-HQ-OAR-2022-0829-0613, pp. 3-4]

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

This attempt to overhaul motor-vehicle manufacturing is unlawful, unworkable, and unjustified. EPA lacks legal authority to mandate this shift to- ward electric vehicles. Its proposed rule is doomed to fail in any event. Satisfying the proposed standards would require a massive, abrupt transformation of the light- and medium-duty vehicle sector that would be impossible in the compressed timeline given. EPA's analysis of costs, benefits, and alternative approaches is deeply flawed in multiple respects. Its misguided proposal should be abandoned. [EPA-HQ-OAR-2022-0829-0683, p. 3]

EPA's proposed light- and medium-duty rule is unlawful most centrally because the agency has no statutory authority to impose it. EPA must have con- gressional authorization for any action it undertakes. No such authority exists in the Clean Air Act (or anywhere else in the U.S. Code). And, under the major- questions doctrine, EPA's claim of power to regulate an enormous segment of the Nation's economy—especially on a matter of great political significance— must be unmistakably clear in the statute. But far from conferring sweeping authority on EPA to effectively mandate electrification, the Clean Air Act for- bids EPA's overreach. The Clean Air Act directs EPA to set emissions levels that individual motor vehicles must meet. EPA's proposed rule flouts that statutory directive. It dictates electrification of light- and medium-duty vehicles by setting emissions standards that manufacturers must meet on a fleetwide-average basis; and unlike previous rules, averaging is used as much more than a regulatory flexibility to allow for greater manufacturer choice and experimentation. Only by employing that fleetwide-averaging approach can EPA reverse-engineer its admitted aim of driving manufacturers to replace a significant portion of their conventional fleets with electric vehicles. If that sounds like the Clean Power Plan, that's because it's essentially the same kind of scheme. The Clean Air Act, however, does not authorize fleetwide averaging at all, let alone as a means to mandate electrification. [EPA-HQ-OAR-2022-0829-0683, p. 3]

EPA should not and cannot lawfully adopt the Light- and Medium-Duty rule it has proposed. EPA lacks statutory authority to remake the motor-vehicle industry, a massive segment of the Nation's economy and daily life, by forcing manufacturers to produce electric and other zero-emission vehicles. Even if EPA had such authority, the approach it has proposed in the Light- and Medium-Duty rule is arbitrary and irrational at every turn. The transformation it would mandate is not feasible, especially on the proposed truncated timeline. EPA's projections of resulting emissions reductions are unreliable, and its ap- proach to assessing compliance is illogically selective and sets the rule up for failure. EPA's cost-benefit analysis also suffers multiple fatal defects, and the proposed rule fails to address obvious, more workable alternatives. Finally, by relying on a California program that EPA has not yet approved—and that it might never approve, or might not approve in time to support EPA's forecasts for the period covered by its proposed Light- and Medium-Duty rule—EPA has both overstated the case for forcing a shift toward electric vehicles and improp- erly signaled that it has prejudged California's request for a waiver authorizing that program. EPA should not press forward with its unlawful and unrealistic Light- and Medium-Duty rule. It should instead engage meaningfully with stakeholders to develop permissible, viable solutions to GHG emissions. [EPA-HQ-OAR-2022-0829-0683, p. 8]

the proposed rule wades deep into issues of "political significance" that are "the subject of an earnest and profound debate across the country." West Virginia, 142 S. Ct at 2613–14 (citations omitted). Congress is currently considering vehicle electrification. See, e.g., Pub. L. No. 117-58, §§ 25006, 40435, 40436, 135 Stat. 429, 845–49, 1050 (2021) (requiring reports on "the cradle to grave environmental impact of electric vehicles" and supply-chain im- pacts). Proposals have been introduced, for example, to impose electric-vehicle mandates, but none thus far has made it out of committee. See, e.g., Zero-Emis- sion Vehicles Act of 2019, H.R. 2764, 116th Cong.; Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. That Congress has "considered and rejected” such proposals is a sign that EPA is “attempting to ‘work around’ the legislative process to resolve for itself a question of great political significance.” West Vir- ginia, 142 S. Ct. at 2620–21 (Gorsuch, J., concurring) (brackets and citations omitted). Just recently, 151 members of the U.S. House of Representatives, led by the Energy and Commerce Committee Chair, joined a letter urging EPA to rescind these proposed emissions standards—calling them an effort to “com- mandeer America’s transportation sector and force its complete vehicle electri- fication under the guise of mitigating climate change.” Letter from Rep. Cathy McMorris Rodgers et al. to Adm’r Michael S. Regan, at 1 (May 22, 2023). [EPA-HQ-OAR-2022-0829-0683, pp. 10-11]

The proposed rule also implicates other issues that are the subjects of vigorous public debate, such as grid reliability and national security. For example, as discussed below, most of the supply of critical components of batteries and motors for electric vehicles is controlled by foreign nations, and in particular by China. See 86 Fed. Reg. 49,602, 49,797 (Sept. 3, 2021) (noting that the United States “has very little capacity in mining and refining any of the key raw mate- rials” for electric vehicles); IEA, The Role of Critical Minerals in Clean Energy Transitions, at 11–12 (Mar. 2022) (“Role of Critical Minerals”). These broader im- plications of the proposed rule provide even more reason to doubt that Con- gress would obliquely confer on EPA sweeping authority over this area. [EPA-HQ-OAR-2022-0829-0683, pp. 10-11]

The Clean Air Act Does Not Permit Fleetwide Averaging

Nothing in the text of Section 202 authorizes a fleetwide-averaging approach. To the contrary, Section 202’s relevant provision authorizes emissions standards for “any class or classes of new motor vehicles or new motor vehicle engines” that EPA determines “cause, or contribute to, air pollution.” 42 U.S.C. § 7521(a)(1) (emphases added). Those standards must “be applicable to such vehicles and engines for their useful life.” Id. The text thus permits EPA to adopt a standard applicable to all of the vehicles (or engines) in a particular class. Whatever discretion EPA may exercise in defining a “class” of vehicles, the text requires standards for the vehicles in that class, not for the class as a collective. [EPA-HQ-OAR-2022-0829-0683, p. 14]

The absence of any affirmative authorization for fleetwide averaging should come as no surprise because, as EPA acknowledged four decades ago, “Con- gress did not specifically contemplate an averaging program when it enacted the Clean Air Act.” 48 Fed. Reg. 33,456, 33,458 (July 21, 1983). EPA’s entire averaging edifice is based on the purported fact that the Act “does not explicitly preclude standards” based on fleetwide averaging. 54 Fed. Reg. 22,652, 22,665 (May 25, 1989) (emphasis added). Under the major-questions doctrine, how- ever, the absence of a statutory prohibition on the approach the agency seeks authority to pursue is categorically insufficient: EPA needs “‘clear congres- sional authorization’ for the power it claims,” West Virginia, 142 S. Ct. at 2609 (citation omitted), not congressional silence on the subject. Even outside of ma- jor-questions cases, congressional silence is not an invitation to make things up. See Entergy Corp. v. Riverkeeper, Inc., 556 U.S. 208, 223 (2009) (“statutory silence, when viewed in context,” often is “best interpreted as limiting agency discre- tion”); Marx v. Gen. Revenue Corp., 568 U.S. 371, 381 (2013) (“[I]t is fair to sup- pose that Congress considered the unnamed possibility and meant to say no to it[.]” (citation omitted)); Univ. of Tex. Sw. Med. Ctr. v. Nassar, 570 U.S. 338, 353 (2013). [EPA-HQ-OAR-2022-0829-0683, p. 14]

EPA must “test . . . any new motor vehicle or new motor vehicle engine” to determine whether “such vehicle or engine” conforms with Sec- tion 202 emissions standards. 42 U.S.C. § 7525(a)(1). If the “vehicle or en- gine conforms to such regulations,” EPA must issue the manufacturer a “certificate of conformity.” Id. And a manufacturer may not sell a vehicle or engine not “covered by a certificate of conformity.” Id. § 7522(a)(1). These provisions are not compatible with fleetwide-averaging for at least two reasons: first, the use of singular terms “vehicle” and “engine”—along with “any” and “such”—indicates that testing individual vehicles is re- quired; and second, EPA cannot determine compliance with Section 202 standards before issuing a certificate of conformity—as the statute contem- plates—under a fleetwide-averaging approach. (Instead, conformity is de- termined at “the end of each model year,” when the manufacturer knows the quantity and model of “vehicles produced and delivered for sale.” 40 C.F.R. §§ 86.1818-12(c)(2), 86.1865-12(i)(1), (j)(3).) [EPA-HQ-OAR-2022-0829-0683, pp. 15-16]

Title II’s warranty provisions require a manufacturer to “war- rant to the ultimate purchaser and each subsequent purchaser” “at the time of sale” that each new vehicle complies with applicable Section 202 stand- ards. 42 U.S.C. § 7541(a)(1). Under an averaging approach, however, a manufacturer cannot determine compliance “at the time of sale,” because actual compliance with an average standard can be determined only at year’s end. Manufacturers may be able to make a rough predictive judgment ex ante, but they would be effectively warranting an unknown. [EPA-HQ-OAR-2022-0829-0683, p. 16]

Under 42 U.S.C. § 7524(a), any violation of applicable standards “shall constitute a separate offense with respect to each motor vehicle or motor vehicle engine,” with each offense subject to a civil penalty of up to $25,000. But under a fleetwide-averaging approach, “each motor vehicle or motor vehicle engine” cannot violate applicable emissions standards—only the fleet as a whole. [EPA-HQ-OAR-2022-0829-0683, p. 16]

EPA also finds no quarter for fleetwide averaging in the case law. The best it can muster is a single decision that found no “clear evidence that Congress meant to prohibit averaging.” Thomas, 805 F.2d at 425 (emphasis added); see 88 Fed. Reg. at 29,245 & n.417. But as explained above, under the major-questions doctrine, the absence of a “clear” prohibition is irrelevant: on the contrary, Congress must have specifically and clearly authorized the action. See West Vir- ginia, 142 S. Ct. at 2609. Moreover, the Thomas court recognized inconsisten- cies between averaging and other statutory provisions, including Title II’s “test- ing and certification provision, 42 U.S.C. § 7525,” discussed above. 805 F.2d at 425 n.24. The court reserved judgment on that issue only because “it was not raised by any party before the agency.” Id. EPA’s best (indeed, only cited) case thus provides no support for construing Section 202 to authorize averaging. [EPA-HQ-OAR-2022-0829-0683, p. 16]

EPA Cannot Use Fleetwide Averaging To Mandate Electrifica- tion

Even if Section 202 authorized fleetwide averaging in some circumstances, that approach cannot be used, as EPA proposes, to blend together the emissions levels of conventional, pollutant-emitting vehicles with vehicles that (according to EPA) emit zero pollutants. By its terms, Section 202(a)(1) authorizes EPA to promulgate “standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in [its] judgment cause, or contribute to, air pollution.” 42 U.S.C. § 7521(a)(1) (em- phases added). The text’s focus on the “emission” of pollutants that “cause . . . air pollution” demonstrates that Congress intended to cover only vehicles that actually emit the relevant pollutant—and to authorize EPA to set standards for the quantity of pollutants those vehicles may acceptably emit. Nothing in the text authorizes EPA to dragoon light- and medium-duty vehicle manufacturers into producing a separate line of vehicles that do not themselves emit the regulated pollutant at all. [EPA-HQ-OAR-2022-0829-0683, p. 17]

EPA has elsewhere contended that the statute's reference to "classes" of vehicles or engines permits it to treat polluting and non-polluting vehicles on the same footing. See EPA Br. 76–78, Texas. v. EPA, No. 22-1031 (D.C. Cir. Feb. 24, 2023). But that term cannot rescue EPA's flawed interpretation. The relevant feature of a "class" of "motor vehicles" that "cause, or contribute to, air pollution" is that the vehicles in the class all emit the relevant pollutant. 42 U.S.C. § 7521(a)(1). A vehicle that emits zero pollutants is necessarily not part of that class. Given EPA's own assumption that electric vehicles do not emit pollutants, electric vehicles cannot be among the "class or classes of new motor vehicles or new motor vehicle engines" that EPA may consider in setting Sec- tion 202 standards and they therefore may not be factored into a fleetwide av- erage. If EPA were right, the relevant "category" EPA purports to be regulating would vanish at the point when EPA reaches the President's goal that 50 per- cent of the light- and medium-duty fleets be "zero-emissions vehicles." [EPA-HQ-OAR-2022-0829-0683, p. 17]

Beyond exceeding EPA's statutory authority, the proposed Light- and Me- dium-Duty rule also violates the Clean Air Act's mandate (echoing the Admin- istrative Procedure Act, 5 U.S.C. §§ 551 et seq., 701 et seq.) that agency action be the product of reasoned decisionmaking. 42 U.S.C. § 7607(d)(9)(A) (reviewing "court may reverse" EPA action "found to be . . . arbitrary, capri- cious, an abuse of discretion, or otherwise not in accordance with law"); cf. 5 U.S.C. § 706(2)(A). The proposed rule's feasibility, net emissions, compliance, and cost-benefit analyses all ignore the facts on the ground and are plagued with unrealistic assumptions and arbitrary modeling decisions. And the rule does not address potential alternatives to achieve EPA's stated goals. Even if EPA's interpretation of the Clean Air Act were otherwise permissible, its pro- posed rule is still arbitrary, capricious, and unlawful. [EPA-HQ-OAR-2022-0829-0683, pp. 17-18]

Section 202(a) requires EPA to consider whether compliance with the pro- posed emissions standards is feasible, giving appropriate consideration to the cost of compliance. 42 U.S.C. § 7521(a)(2) ("Any regulation prescribed . . . shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period."). While the agency may take future advances into account, it may not promulgate rules on the basis of "crystal ball" prognostications. NRDC v. EPA, 655 F.2d 318, 328 (D.C. Cir. 1981) (internal quotation marks omitted). Instead, the agency must explain why its projections are "reason[able]" and defend "its methodology for arriving at numerical estimates." Id. Here, that includes answering theoretical objec- tions to widespread electrification, identifying the major steps necessary to achieve that objective, and offering plausible reasons for believing that each of those steps can be completed in the time available. Id. at 331–32. [EPA-HQ-OAR-2022-0829-0683, p. 18]

Courts deem rules arbitrary and capricious where a single source underlying large swathes of the rule is flawed in this manner. Cf. Tex. Oil & Gas Ass'n v. EPA, 161 F.3d 923, 935 (5th Cir. 1998) ("A regulation cannot stand if it is based on a flawed, inaccurate, or misapplied study.");

Desoto Gen. Hosp. v. Heckler, 766 F.2d 182, 186 (5th Cir. 1985) ("We find arbitrary and capricious the adop- tion of the Malpractice Rule based on 'a single study criticized extensively by its authors in its particular application.'" (quoting Walter O. Boswell Mem'l Hosp. v. Heckler, 749 F.2d 788, 803 (D.C. Cir. 1984)); Almay, Inc. v. Califano, 569 F.2d 674, 682 (D.C. Cir. 1977) (agency action arbitrary and capricious where it was promulgated "on the basis of [a] flawed survey"). EPA should withdraw the rule and permit more reviewers ample time to review OMEGA, make any changes necessary to incorporate those reviewers' comments, and then recon- sider whether the proposed emissions standards are appropriate. [EPA-HQ-OAR-2022-0829-0683, pp. 54-55]

In addition, the Interagency Working Group's estimates include global ben- efits from reducing GHG pollution. See 88 Fed. Reg. at 29,372.8 This led EPA to rely on factors not authorized by Congress, because the purpose of the Clean Air Act is to "enhance the quality of the Nation's air resources," not the world's air resources. 42 U.S.C. § 7401(b)(1) (emphasis added); see Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983) (hold- ing that agency action is arbitrary and capricious if "the agency has relied on factors which Congress has not intended it to consider"). At minimum, if EPA intends to consider global benefits, then it must also consider global costs to the rule—including its potential effects on global supply chains, upstream emis- sions in foreign countries, and the environmental effects on local communities of extracting critical minerals. The lithium-extraction process, for instance, has reportedly led to environmental harms in South American countries like Chile, Argentina, and Bolivia, none of which are accounted for in EPA's analysis.9 [EPA-HQ-OAR-2022-0829-0683, p. 64]

8 See also Interagency Working Grp. on Soc. Cost of Greenhouse Gases, Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide, at 3 (Feb. 2021).

9 See James Blair et al., Exhausted: How We Can Stop Lithium Mining from Depleting Water Resources, Draining Wetlands, and Harming Communities in South America, at 4, Nat'l Res. Def. Council (Apr. 2022), https://tinyurl.com/524rsm86; Victoria Flexer et al., Lithium Recovery from Brines: A Vital Raw Material for Green Energies with a Potential Environmental Impact in Its Mining and Processing, 639 Sci. of Total Env't 1188 (2018), https://tinyurl.com/9fz6jwah.

EPA's Reliance On California's ACC II Program Is Improper

The Light- and Medium-Duty rule is also arbitrary and capricious because it repeatedly relies on California's Advanced Clean Cars II ("ACC II") program—which requires, but has not received, EPA's approval before it could become operational in California or elsewhere. [EPA-HQ-OAR-2022-0829-0683, p. 66]

Although the Clean Air Act generally preempts state motor-vehicle air-pollution standard, Section 209(b) of the Act authorizes EPA to waive that preemption for emissions standards adopted by California (which other States may then copy) if EPA makes certain findings. 42 U.S.C. § 7543(b). In 2022, California adopted its ACC II program, which generally would require all new cars and light trucks sold in California to be zero-emissions vehicles by 2035, and establishes increasingly stringent emissions criteria in the years leading up to 2035. In May 2023—after the proposed rule here was published—California submitted to EPA a request for a waiver for ACC II. [EPA-HQ-OAR-2022-0829-0683, p. 66]

EPA has not acted on California's waiver request. It has not even proposed action on the request for public comment. But in the Light- and Medium-Duty rule, EPA nevertheless relies on the ACC II program, for three main purposes: (1) as evidence of a purported trend toward vehicle electrification, see 88 Fed. Reg. at 29,188–89; (2) as a real-world driver of technological innovation and "increased consumer technology familiarity" with electric vehicles, id. at 29,254, 29,334; and (3) to show that the stringent standards imposed by the rule are "aligned with" existing state policies and thus reasonable, id. at 29,275, 29,284. This reliance is incurably improper. [EPA-HQ-OAR-2022-0829-0683, p. 66]

It is arbitrary and irrational for EPA to rely on ACC II and the effects of its implementation in California and beyond because that program is not, and may never be, operative anywhere. Although California has unilaterally "adopted" ACC II, and other States have indicated that they plan to implement the pro- gram if approved, no State—including California—can actually implement ACC II unless and until California receives a waiver from EPA under Section 209(b). California had not even requested EPA approval at the time EPA pub- lished the proposed rule. A grant of the requested waiver is far from a foregone conclusion: to do so, EPA must first conclude that California needs its own standards "to meet compelling and extraordinary conditions" specific to the State. 42 U.S.C. § 7543(b)(B). EPA must also conclude that ACC II is "fea- sib[le]," a rigorous standard that the program may not meet. Motor & Equip. Mfrs. Ass'n v. Nichols, 142 F.3d 449, 463 & n.13 (D.C. Cir. 1998) ("EPA . . . must deny a waiver for California if the state's regulations provide inadequate lead time to permit the development of the technology necessary to implement the new procedures, giving appropriate consideration to the cost of compliance within the time frame." (internal quotation marks omitted)). In- deed, twice in recent memory, EPA has rejected or withdrawn waivers sought by California. See 84 Fed. Reg. 51,310 (Sept. 27, 2019); 73 Fed. Reg. 12,156 (Mar. 6, 2008). Even if EPA ultimately grants the waiver for ACC II, it may not do so in time for that program to produce the effects for which EPA relies upon it. Whether as evidence of a current trend, a driver of consumer familiar- ity with and adoption of new technology, or as an indicator that EPA's pro- posed rule aligns with existing policies, EPA's reliance on that embryonic pro- gram is premature. [EPA-HQ-OAR-2022-0829-0683, pp. 66-68]

Yet by relying on ACC II, the Light- and Medium-Duty rule appears to ignore all these considerations and to presuppose that the waiver will be granted—and soon enough to provide support for adopting EPA's proposed Light- and Medium-Duty rule. In so doing, EPA has disregarded "an important aspect of the problem" without "reasonabl[e] expla[nation]." Am. Clinical Lab. Ass'n v. Becerra, 40 F.4th 616, 624 (D.C. Cir. 2022). Denial of the waiver would negate each of the three purposes for which EPA arbitrarily relies on ACC II. Deferral of action by EPA on the waiver could have the same result. It is also doubtful that an agency is permitted to justify one regulatory action with some other regulatory action that it has not yet taken and might never take. [EPA-HQ-OAR-2022-0829-0683, pp. 66-68]

EPA purports not to be "prejudging the outcome" of that "waiver process," 88 Fed. Reg. at 29,334, but it protests too much. The "effect of state adoption" of the ACC II model would not even be a relevant consideration—much less an "important" one," id.—in EPA's analysis of the proposed rule unless the ACC II program takes effect. EPA could not rationally treat ACC II as proba- tive of anything, when that program cannot take effect in any State without EPA's own signoff, unless EPA either has prejudged the waiver issue or at a minimum believes that approving the waiver is likely. For the same reason, EPA's effort to disclaim reliance on ACC II in its modeling, Id. at 29,296, is belied by its substantive reliance on the program in the proposed rule's actual reasoning, see, e.g., id. at 29,254, 29,275. 29,284, 29,334. [EPA-HQ-OAR-2022-0829-0683, pp. 66-68]

These indications of EPA's ostensible prejudgment of the ACC II waiver will likely have significant consequences for the validity of any eventual decision by EPA formally granting the requested waiver. See Cinderella Career & Finishing Schs., Inc. v. FTC, 425 F.2d 583, 591 (D.C. Cir. 1970) (holding that decisionmaker may be disqualified where "a disinterested observer may con- clude that the agency has in some measure adjudged the facts as well as the law of a particular case in advance of hearing it" (cleaned up)). For present pur- poses, EPA's choice to rely on a state-level program that is not and may never be operative, at least in the period relevant to the proposed rule, is irrational. See Appalachian Power Co. v. EPA, 249 F.3d 1032, 1053 (D.C. Cir. 2001) (per curiam) (noting that an agency's "model assumptions must have a rational re- lationship to the real world" (internal quotation marks omitted)). [EPA-HQ-OAR-2022-0829-0683, pp. 66-68]

EPA's reliance on the ACC II as a driver or reflection of circumstances out- side California is especially unjustified. There is no guarantee that any of the other States that EPA believes might implement ACC II (including Colorado, Maine, and New Jersey), see 88 Fed. Reg. at 29,334, will do so. At least one State that previously adopted ACC II has attempted (unsuccessfully) to repeal that adoption, backed by the newly elected governor. See Sarah Rankin, Va. Senate Democrats Kill Effort to Repeal Electric Car Rule, AP News (Jan. 17, 2023). A State's policy preferences tomorrow may not match its preferences today, especially in an area subject to vigorous debate and disagreement like climate policy. That's especially true here, given the many obstacles to rapid electric vehicle adoption discussed above. [EPA-HQ-OAR-2022-0829-0683, p. 68]

More fundamentally, EPA has no "special expertise" in state politics, Ass'n of Priv. Sectors Colls. & Univs. v. Duncan, 70 F. Supp. 3d 446, 452–53 (D.D.C. 2014), and its unreasoned speculation about States' future environmental poli- cies is arbitrary and capricious, cf. In re Aiken Cnty., 725 F.3d 255, 260 (D.C. Cir. 2013) (agencies "may not rely on political guesswork about future congres- sional appropriations"); New York v. DHS, 969 F.3d 42, 83 (2d Cir. 2020) (agen- cies may not rely on "unsupported speculation" that "run[s] counter to the re- alities" of the situation); N.M. Farm & Livestock Bureau v. U.S. Dep't of Interior, 952 F.3d 1216, 1227 (10th Cir. 2020) (reliance on "speculative" finding was arbitrary and capricious). EPA cannot justify its sweeping, profoundly mis- guided attempt to overhaul the motor-vehicle industry based on conjecture about hypothetical state-law developments. [EPA-HQ-OAR-2022-0829-0683, p. 68]

Organization: American Fuel & Petrochemical Manufacturers

There are several issues included in the Proposal with impacts that go well beyond EPA's expertise, and the Agency is not positioned to fully grapple with the consequences that such a rapid push for ZEVs will have across the nation. Beyond the obvious impacts to consumer automotive markets, the Proposed Rule will also eliminate American jobs in the refining sector that will not be offset by the "projected" job growth in the automotive sector.67 It will significantly strain the electric grid, requiring utilities to rapidly increase generation, transmission, and distribution capacity to a degree not fully contemplated by EPA. And it will have profound impacts on national security by forcing the American automotive industry and a large share of the domestic transportation market to depend on critical minerals from foreign suppliers—most notably, China—rather than a domestically-abundant and secure resource. The fact that mandating ZEVs forces EPA to wade into all these areas outside of vehicle tailpipe emissions—as EPA must, to appropriately quantify emissions reductions and other impacts of the Proposal—shows that mandating a wholesale switch to vehicles for which the bulk of emissions occur upstream, rather than at the tailpipe, was not contemplated or provided for by Congress. Because the Proposed Rule raises a major question, EPA can only proceed if Congress clearly authorized EPA to do so. But Congress did not. [EPA-HQ-OAR-2022-0829-0733, p. 19]

> 67 Proposed Rule at 29,393; DRIA at 4-59 (EPA admits that its proposal may affect employment for firms providing fuels: "Reduced consumption of petroleum represents cost savings for purchasers of fuel, as well as a potential loss in value of output for the petroleum refining industry, fuel distributors, and gasoline stations, which could result in reduced employment in these sectors.").

EPA proposed unachievable standards for light- and medium-duty ICEVs. This attempt to force an unprecedented transformation of the national transportation system to ZEVs goes far beyond the authority delegated to the Agency by Congress. The Proposal—which will likely require hundreds of billions of dollars, dictate what vehicles are permissible for automakers to sell, and has significant ramifications for the U.S. energy sector, national security, and consumers—clearly addresses questions of major economic and political significance that EPA is neither authorized nor equipped to address. [EPA-HQ-OAR-2022-0829-0733, p. 2]

EPA also misinterprets its authority to establish feasible efficiency improvements by proposing standards that cannot be achieved with ICEV technologies. First, EPA is not permitted to rely on averaging, banking, and trading mechanisms as a means to establish the relevant standards. Second, because ZEVs do not have tailpipe emissions, they do not directly "cause or contribute to" air pollution within the construct of a tailpipe emissions standard, and therefore any standard applicable to "any class or classes" of vehicles "which . . . cause, or contribute" to air pollution cannot include ZEVs. [EPA-HQ-OAR-2022-0829-0733, p. 2]

Even if EPA had Congressional authority to promulgate the proposed standards, the proposal is arbitrary and capricious due to the Agency's reliance on incomplete facts, overly optimistic or outright mistaken assumptions, and failure to use reason-based decision-making. The Agency significantly overestimates environmental benefits and feasibility, underestimates costs, and relies on little more than unsupported hope that consumer preferences will change to enable the Agency's intended policy. EPA's decision to not only ignore lifecycle emissions of ZEVs, but to explicitly propose removing the requirement for automakers to account for them, serves neither consumers nor the environment. EPA's reasoning, that its policy of not accounting for these emissions serves its goal of promoting the use of EVs, is the definition of arbitrary and capricious biased decision-making. Unfortunately, the Agency also ignored significant issues related to energy security and U.S. national security. [EPA-HQ-OAR-2022-0829-0733, p. 2]

II. Banning the Internal Combustion Engine is a "Major Question" that Congress did not Delegate to EPA.

The Proposed Rule goes beyond imposing regulations that represent appropriate and feasible technological improvements in the efficiency of ICEVs; rather, it requires the manufacturing of ZEVs and ultimately phasing out ICEVs. Though EPA contends the proposed standards do not mandate a specific technology (e.g., ZEVs), the proposed standards are a de facto ZEV mandate requiring auto manufacturers to shift production away from ICEV and to ZEVs.57 Consequently, the Proposed Rule obligates OEMs to increase the percentage of ZEVs they sell well more than market forces. EPA predicts that for MY 2032, the Proposed Rule will result in ZEV adoption rates between 62–78 percent across all body styles (sedans, crossovers/SUVs, and pickups).58 This is a tremendous jump from the 8.4 percent of LDV production that was plug-in electric in 2022.59 As a result, implementing this Proposal "requires massive changes from all sectors of the U.S. economy: from automotive suppliers to home builders to utilities, labor to mining to mineral processing."60 [EPA-HQ-OAR-2022-0829-0733, pp. 17-18]

57 Alliance for Automotive Innovation, Comments to the Environmental Protection Agency, Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, Proposed Rule, Docket No. EPA-HQ-OAR-2022-0829 (hereinafter AAI Comments) at iii.

58 Proposed Rule at 29,329; U.S. Environmental Protection Agency, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles Draft Regulatory Impact Analysis" (April 2023) pg. 13-36, 13-37, available at https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10175J2.pdf [hereinafter, "DRIA"].

59 Proposed Rule at 29,189 (identifying the percentage that was PEV, which included PHEVs and ZEVs).

60 AAI Comments at iv.

But the question of whether this shift is necessary and, if so, how to accomplish this shift, is a "major question" reserved for Congress, not EPA. [EPA-HQ-OAR-2022-0829-0733, pp. 17-18]

EPA's Proposed Rule here presents an analogous situation, albeit one with substantially greater costs. Mandating a rapid shift from ICEV to ZEV will reshape the American automotive market with profound collateral effects, making clear that EPA is encroaching upon an issue of "vast economic and political significance." As further discussed herein, the Proposal's direct compliance costs are enormous—even in the face of numerous errors and oversights in its analysis that materially understate these costs. EPA estimates that the cost of vehicle technology (not including the vehicle or battery tax credits) would be approximately $180 billion–$280 billion in addition to greater than $7 billion in electric vehicle supply equipment ("EVSE") costs through 2055. These figures do not include the transformation of the electric power sector and grid updates needed to meet the electricity demand created by the Proposed Rule, which is estimated to cost trillions of dollars.66 EPA acknowledges that auto manufacturers are spending over a trillion dollars by 2030, mainly for manufacturing facilities. By setting emissions standards requiring production of a different product, the Proposed Rule undoubtedly forces OEMs to meet production deadlines that would not exist but for EPA's new ZEV mandate. [EPA-HQ-OAR-2022-0829-0733, pp. 18-19]

66 Dan Shreve and Wade Schauer, Deep decarbonization requires deep pockets (June 2019), https://www.decarbonisation.think.woodmac.com/ (The U.S. needs to invest $4.5 trillion to fully transition the U.S. power grid to renewables during the next 10-20 years, annual investments exceeding the U.S. defense budget).

There are several issues included in the Proposal with impacts that go well beyond EPA's expertise, and the Agency is not positioned to fully grapple with the consequences that such a rapid push for ZEVs will have across the nation. Beyond the obvious impacts to consumer automotive markets, the Proposed Rule will also eliminate American jobs in the refining sector that will not be offset by the "projected" job growth in the automotive sector.67 It will significantly strain the electric grid, requiring utilities to rapidly increase generation, transmission, and distribution capacity to a degree not fully contemplated by EPA. And it will have profound impacts on national security by forcing the American automotive industry and a large share of the domestic transportation market to depend on critical minerals from foreign suppliers—most notably, China—rather than a domestically-abundant and secure resource. The fact that mandating ZEVs forces EPA to wade into all these areas outside of vehicle tailpipe emissions—as EPA must, to appropriately quantify emissions reductions and other impacts of the Proposal—shows that mandating a wholesale switch to vehicles for which the bulk of emissions occur upstream, rather than at the tailpipe, was not contemplated or provided for by Congress. Because the Proposed Rule raises a major question, EPA can only proceed if Congress clearly authorized EPA to do so. But Congress did not. [EPA-HQ-OAR-2022-0829-0733, p. 19]

67 Proposed Rule at 29,393; DRIA at 4-59 (EPA admits that its proposal may affect employment for firms providing fuels: "Reduced consumption of petroleum represents cost savings for purchasers of fuel, as well as a potential loss in value of output for the petroleum refining industry, fuel distributors, and gasoline stations, which could result in reduced employment in these sectors.").

Congress clarified that it, not EPA, must make the important policy decisions affecting if, when, and how the American automotive industry will transition from ICEVs to ZEVs. In the 116th Congress, for example, Congress introduced 44 bills seeking to reduce petroleum-based fuel consumption and GHG emissions from the transportation sector through customer rebates, vehicle and fuel producer incentives, local funding, development of standards, and research and development. Congress rejected bills that would have banned the sale of new light duty ICEVs by 204070 and it has consistently disapproved of EPA's efforts to hamstring the automotive sector with more stringent air pollution standards than are feasible.71 [EPA-HQ-OAR-2022-0829-0733, pp. 20-21]

70 See Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. (2018); see also 116 Cong. Rec. 19238-40 (1970) (proposed amendment to Title II that would have banned ICEVs by 1978).

71 See, e.g., S. J. Res. 11, 118th Cong. (2023) (Although passed only by the Senate thus far, the joint resolution calls for disapproval of a similar rule submitted by the Administrator of the Environmental Protection Agency relating to "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards," 88 Fed. Reg. 4296 (Jan. 24, 2023)).

It should be no surprise then that in the wake of the Proposed Rule, members of Congress requested that the Agency rescind the proposals, asserting they "effectively mandate a costly transition to electric cars and trucks in the absence of congressional direction."72 That Congress intended for it, not EPA, to direct these policy decisions is made all the more clear by the passage of the IRA and the BIL whereby Congress identified the policy levers it deemed appropriate. Congress could have, but did not, delegate the authority to (or otherwise direct) EPA to establish a fleet-wide credit trading regime to further drive ZEV development and rapid adoption. [EPA-HQ-OAR-2022-0829-0733, pp. 20-21]

72 Letter from Senator Shelley Capito, et al. to Administrator Michael S. Regan, EPA (May 25, 2023); see also Senate Resolution S.J. Res. 11, 118th Congress (Apr. 26, 2023) (Although related to heavy duty vehicles ("HDVs"), Congress has expressed its disapproval of EPA's overreach in this space. For example, in April of this year both houses of Congress passed a Congressional Review Act resolution to rescind EPA's December 2022 heavy duty NOx standards, sending a strong signal that Congress views EPA's efforts in this space as unnecessary, infeasible, and uniformed in light of economic and energy security concerns); House Resolution H2523 (May 23, 2023); see also Congressional Record, H2523 (May 23, 2023) at 1444, Statement from Mr. Walberg (R-MI) ("From tailpipe emissions regulations that will force people to buy expensive and less practical EVs to new rules on power plants that will threaten the

reliability of our electric grid. It seems like the EPA has not even thought about the economic and energy security of our constituents.”).

The Proposed Rule stands in direct contrast to other legislation, such as the Renewable Fuel Standard Program (“RFS”), whereby Congress mandated that “gasoline sold or introduced into commerce in the United States” must contain renewable fuels73 and, in 2022, must include billions of gallons of renewable fuel.74 In fact, EPA’s Proposal directly conflicts with the statutory framework that Congress provided in the RFS for lowering GHG emissions from the transportation sector. In the proposed rule, EPA cites only its authority under section 202(a) of the Clean Air Act and Executive Order 14037 as the basis for requirements that will extend from MY 2027 to 2032.75 Because Executive Orders have no force of law,76 EPA at bottom contends that a few general paragraphs of the Clean Air Act, enacted over 50 years ago, provides sufficient legislative authority and direction for the entirety of its proposed rule. But Congress demonstrated in the RFS that when it wants to transform the transportation sector, and specifically, when it desires to address GHGs associated with that sector, it does so with precision and within the context of a prescribed statutory framework. [EPA-HQ-OAR-2022-0829-0733, p. 21]

73 42 U.S.C. § 7545(o)(2)(A)(i).

74 Id., § 7545(o)(2)(B); 87 Fed. Reg. 39,600 (July 1, 2022).

75 88 Fed. Reg. at 29,186.

76 Rather, Executive Orders “simply serve as presidential directives to agency officials to consider certain policies when making rulemaking decisions.” State of California v. EPA, No. 21-1018 (D.C. Cir. 2023), Slip Op. at 17.

IV. The Proposed Rule is Arbitrary and Capricious

Even if EPA had Congressional authority to promulgate the Proposed Rule, which it does not, the Proposal is substantively deficient and based on illogical reasoning and incomplete analysis. Therefore, it constitutes arbitrary and capricious decision-making. [EPA-HQ-OAR-2022-0829-0733, p. 28]

A. Advanced Clean Cars II (“ACC II”) Cannot be a Basis for this Rulemaking

EPA points to California’s ACC II program and adoption by Section 177 states to support its projections of increased PEV penetration,122 but the ACC II has not received a waiver, and EPA did not even have the waiver application when the Proposed Rule was published.123 The CAA requires EPA to evaluate California’s waiver request to ensure that California did not arbitrarily determine that it needs “ZEV mandates” to address compelling and extraordinary circumstances. As Principal Deputy Administrator for the Office of Air and Radiation Joe Goffman testified on June 21, 2023, EPA just received the waiver request. Given that the EPA official responsible for overseeing the California waiver request publicly acknowledged that EPA has not determined whether it will grant a waiver for ACC II, the Agency cannot rely on ACC II as a basis for this Proposal. Moreover, because California concedes that ACC II will not meaningfully address the impacts of climate change in California and ACC II will slow fleet turnover and retard California’s progress toward meeting the NAAQS, California is NOT eligible for a waiver and ACC II is preempted. EPA’s reliance on ACC II as support for this rule is pre-decisional and another example of arbitrary and capricious decision-making. [EPA-HQ-OAR-2022-0829-0733, p. 28]

122 Proposed Rule at 29,118.

123 88 Fed. Reg. 29,189; See, e.g., Initial Br. For Private Petitioners, State of Ohio, et al. v. Envt'l Prot. Agency, et al., No. 22-1081 (D.C. Cir. Oct. 24, 2022).

D. EPA Cannot Adequately Substantiate the Need for Regulatory Action

EPA has not demonstrated a compelling need to accelerate emissions reductions within the time frame for which MY27–32 vehicles/engines are already being designed. EPA points primarily to the emissions associated with motor vehicles, presumably tailpipe emissions, but provides no information supporting the need for such an accelerated schedule beyond what is currently known. Rather, EPA makes conclusory assertions that the "need for regulatory action" is supported by the BIL and the IRA, which "together provide further support for a government-wide approach to reducing emissions by providing significant funding and support for air pollution and GHG reductions across the economy, including specifically, for the component technology and infrastructure for the manufacture, sales, and use of electric vehicles."193 EPA notes that under the current standards, ZEV demand is doubling each year, from 2.2 percent of U.S. light-duty vehicle production in MY 2020, to 4.4 percent in MY 2021 and projected to reach 8.4 percent in MY 2022.194 Congressional spending on EV charging or vehicle subsidies does not confer new authority on EPA to mandate EVs. For example, within the IRA, Congress merely appropriated additional funds "[i]n addition to amounts otherwise available" to the EPA for certain fiscal years to carry out various activities195 and Congress did not amend or refer to section 202 of the Clean Air Act or any of the provisions of that Act on which EPA bases its proposed rule.196 Thus, EPA's reliance on these enactments to justify and underwrite proposed standards' feasibility is arbitrary and capricious. [EPA-HQ-OAR-2022-0829-0733, p. 42]

193 Proposed Rule at 29,187.

194 Proposed Rule at 29,189.

195 See, e.g., sections 60106-60111 of the Inflation Reduction Act

196 In contrast, section 60107 references in the title to that section funding "for Section 211(o) of the Clean Air Act."

As discussed above, because EPA may only prescribe standards applicable to vehicles that "cause or contribute" to air pollution, its standards cannot account for ZEVs with no tailpipe emissions. However, if EPA is authorized to promulgate such standards, those standards must account for any upstream emissions from upstream electric generating units, the mining of battery materials, and the production of the vehicle.197 Without consideration of upstream and full life-cycle impacts (e.g., frequent battery replacements), EPA has failed to inform the public of the comparative costs of emission reductions, whether from ZEVs, ICEVs, energy efficiency, or other sectors. EPA's continued failure to address this "major aspect of the problem" is another example of EPA moving toward its predetermined outcome—the forced electrification of U.S. transportation.198 AFPM has continually put EPA on notice of the need to include a LCA to avoid an arbitrary comparison—the agency continues to ignore this issue of central relevance to EPA's benefit analysis. [EPA-HQ-OAR-2022-0829-0733, pp. 42-44]

197 Proposed Rule at 29,353–55.

Organization: American Petroleum Institute

h. Legal Concerns.

The aggressive push to electrify the LDV and MDV fleet is the defining characteristic of the Proposed Rule from a legal standpoint. EPA explains that its "feasibility assessments in past rulemaking were predominantly based on ICE-based technologies that provided incremental tailpipe GHG reductions." 88 Fed. Reg. at 29238. Here, in contrast, EPA projects that the Proposed Rule at full implementation would result in the electrification of 67% of the LDV fleet – over 25% more than the 39% penetration rate that EPA projects in the no action base case. Id. at 29329. EPA similarly projects that 46% of the MDV fleet will be electrified, reflecting 98% electrification of all vans. Id. at 29331. These numbers make it clear that the Proposed Rule would establish a legal mandate effectively requiring that electric vehicles must comprise a significantly greater proportion of the LDV and MDV fleet than otherwise would be the case. [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

While BEVs can and should be a choice available to manufacturers and vehicle purchasers, we disagree that EPA should impose a binding mandate for the production of BEVs and outline why such a mandate exceeds EPA's authority under the Clean Air Act (CAA). [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

i. EPA does not have authority to impose standards that are only achievable through the use of BEV technology because there is no clear statement in the Clean Air Act authorizing EPA to mandate a shift away from internal combustion engines.

The Proposed Rule marks a shift in EPA's approach to regulating emissions from LDVs and MDVs. EPA, consistent with the Clean Air Act, has traditionally established standards based on technology that can control the amount of emissions from LDVs and MDVs. EPA deviated from this approach in its 2021 GHG standards, setting standards based on a formula that the agency estimated would increase the market share for electric vehicles from 3.6% to 7% for model year 2023 and 17% for model year 2026. But even then, EPA contended that its "assessment, consistent with past EPA assessments, shows that the final standards can largely be met with increased sales of advanced gasoline vehicle technologies, and projects modest (17 percent) penetration rates of electrified vehicle technology" by 2026. 86 Fed. Reg. 74434, 74484 (Dec. 30, 2021). And EPA argued that it relied on advances in internal combustion engine ("ICE") powertrains to achieve the required GHG reductions and purported not to push for a shift from ICE powertrains to electrified vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

Here, EPA goes even further and seeks to totally transform the transportation sector. It proposes standards that would effectively require that BEVs must comprise two-thirds of the LDV fleet and nearly half of the MDV fleet at full implementation, which is a substantially greater proportion of the fleet any prediction of the market demand would support. Indeed, according to EPA, "[in] MY 2032 when the proposed standards reach the lowest level, it is possible that only BEVs and PHEVs are generating positive credits, and all ICE vehicles generate varying levels of deficits." 88 Fed. Reg. at 29342. In other words, EPA predicts that manufacturers will not be able to comply with the proposed rule without producing significant numbers of electric vehicles. EPA thus seeks to require a fundamental transformation of the LDV fleet from ICE powertrain technology to electric vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

Such a shift from ICE powertrains to electric powertrains would be truly transformative. BEVs require fundamentally different vehicle technologies than those used on conventionally fueled vehicles – e.g., electric motors instead of internal combustion engines, batteries to store power rather than on-board fuel tanks. Moreover, BEVs rely on a wholly different infrastructure (e.g., electric power generation and distribution, charging stations, battery manufacturing) – much of which does not yet exist or exists only in limited form. Additionally, switching to BEVs will fundamentally change the manner in which vehicles are used, for example requiring careful scheduling of vehicle operations to accommodate the long periods needed to adequately charge the vehicles. Lastly, a BEV mandate would produce widespread effects on the national economy, such as the reduced need for oil and gas production, gas processing, changes to petroleum refining, and distribution. Such changes are extraordinary and far more expansive than those caused by EPA's LDV and MDV GHG standards up to now. [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

vii. The proposed emissions standards are unfounded because EPA fails to explain its rationale for selecting the proposed emissions control levels.

EPA provides an expansive explanation of the Proposed Rule in the 263-page Federal Register notice. But noticeably missing is any explanation of how EPA derived the numeric emissions standards that the Proposed Rule would establish. The "footprint-based standard curve coeffcients" for cars and light trucks are clearly presented in the proposal. 88 Fed. Reg. at 29236. While EPA describes these curves as "targets, rather than standards," the curves effectively represent the emissions standards because the enforceable obligation for each manufacturer is derived by summing the actual sales-weighted values derived through application of the curves. Id. at 29236 n. 405. Because of the ABT compliance provisions, a manufacturer can demonstrate compliance for its fleet even if each of its vehicles does not meet the emissions limit applicable to that vehicle according to the curves. But each manufacturer must meet an enforceable in-use emissions standard for each vehicle type based on the level of emissions to which the vehicle is certified. [EPA-HQ-OAR-2022-0829-0641, pp. 32-33]

In presenting the curves, EPA discusses a wide variety of relevant factors --including the upper and lower cutpoints, the slope of the curve, incentives/disincentives for consumer choice of larger vehicles (and the resulting impact on overall GHG emissions reductions), the impact of BEVs, and the relationship between the car and truck curves (the later Including consideration of load and towing capacity). In addition, the preamble includes extensive discussion of the predicted costs of the Proposed Rule and technical feasibility. But nowhere does EPA explain how the numeric values of the curves (i.e., the actual GHG emissions rate that would be applied to each vehicle upon application of the curve) were derived and how those particular values are justified. [EPA-HQ-OAR-2022-0829-0641, pp. 32-33]

It is bedrock administrative law that an "agency must examine the relevant data and articulate a satisfactory explanation for its action including a rational connection between the facts found and the choice made." Motor Vehicle Mfrs. Assn. of the United States, Inc. v. State Farm Mut. Automobile Ins. Co., 463 U.S. 29, 43 (1983). EPA's failure to do so here renders the Proposed Rule fatally arbitrary and capricious. [EPA-HQ-OAR-2022-0829-0641, pp. 32-33]

Additionally, the lack of explanation violates EPA's procedural obligation to develop a statement of basis and purpose that, among other things, explains "the factual data on which the proposed rule is based" and "the methodology used in … analyzing the data." CAA § 307(d)(3). Unless that failure is corrected, API and other interested parties do not have adequate notice of and opportunity to comment on one of the most fundamental aspects of the Proposed Rule. [EPA-HQ-OAR-2022-0829-0641, pp. 32-33]

Organization: Arizona State Legislature

1. The proposed rule violates the Major Questions Doctrine. EPA has not identified a clear congressional delegation of the authority to transform the automotive industry through rulemaking, and none exists. [EPA-HQ-OAR-2022-0829-0537, p. 2]

I. The proposed rule violates the Major Questions Doctrine

EPA touts this rule for passenger vehicles and its companion for heavy-duty vehicles as the “strongest-ever pollution standards for cars and trucks to accelerate transition to a clean-transportation future.”4 Numerous media reports recognize that the goal of the proposed rules is not to reduce emissions on existing vehicles, but to force a transition to new types of vehicles. Or, as the EPA administrator put it, “usher in a new generation” of clean cars.5 For example: [EPA-HQ-OAR-2022-0829-0537, pp. 3-4]

4 U.S. EPA, “Biden-Harris Administration Proposes Strongest-Ever Pollution Standards for Cars and Trucks to Accelerate Transition to a Clean-Transportation Future,” Apr. 12, 2023, available at https://www.epa.gov/newsreleases/biden-harris-administration-proposes-strongest-ever-pollution-standards-cars- and.

5 Camila Domonoske, The big reason why the U.S. is seeking the toughest-ever rules for vehicle emissions, NPR, Apr. 12, 2023, available at https://www.npr.org/2023/04/12/1169269936/electric-vehicles-emission-standards-tailpipes- fuel-economy.

- The proposed rules “could require as much as 67% of all new vehicles sold in the U.S. by 2032 to be all-electric, representing the country’s most aggressive climate regulations to date.”6 [EPA-HQ-OAR-2022-0829-0537, pp. 3-4]

6 Emma Newburger, Biden proposes toughest auto emissions rules yet to dramatically boost EV sales, CNBC, Apr. 12, 2023, available at https://www.cnbc.com/2023/04/12/epa-proposes-auto-pollution-limits-to-aggressively-boost- ev-sales-.html.

- “The Biden administration is proposing stiff new automobile pollution limits that would require up to two-thirds of new vehicles sold in the U.S. to be electric by 2032, a nearly tenfold increase over current electric vehicle sales.”7 [EPA-HQ-OAR-2022-0829-0537, pp. 3-4]

7 Matthew Daly and Tom Krisher, Stiff EPA emission limits to boost US electric vehicle sales, ASSOCIATED PRESS, Apr. 12, 2023, available at https://apnews.com/article/biden-electric-vehicles-epa-tailpipe-emissions-climate-406d74e18459bc135f089c681ba9e224.

- “The proposal for light- and medium-duty vehicles was accompanied by a proposal for heavy-duty fleets to electrify 25 percent of their trucks and half of all new buses to be electric by 2032.”8 [EPA-HQ-OAR-2022-0829-0537, pp. 3-4]

8 Aaron Cole, Proposed vehicle emissions standards would be America’s toughest yet, POPULAR SCIENCE, Apr. 12, 2023, available at https://www.popsci.com/technology/epa-electric-vehicle-emissions-targets/.

- “The overarching goal is not just cleaner cars, but the transformation of the auto industry: The EPA would essentially impose regulatory penalties on companies that do not move quickly enough toward electric cars.”9 [EPA-HQ-OAR-2022-0829-0537, pp. 3-4]

9 Domonoske, supra note 5.

The former head of EPA’s Office of Transportation and Air Quality recognized the significance of EPA’s proposed rules as “the single most important regulatory initiative by the Biden administration to combat climate change and to really reduce the worst outcomes of climate change.”10 [EPA-HQ-OAR-2022-0829-0537, pp. 3-4]

10 Matthew Daly and Tom Krisher, Stiff EPA emission limits to boost US electric vehicle sales, ASSOCIATED PRESS, Apr. 12, 2023, available at https://apnews.com/article/biden-electric-vehicles-epa-tailpipe-emissions-climate-

They are intended to radically transform America's entire automotive industry. [EPA-HQ-OAR-2022-0829-0537, pp. 3-4]

The West Virginia Court also focused on the technology-based approach to individual sources. "A technology-based standard, recall, is one that focuses on improving the emissions performance of individual sources." Id. at 2611. But "[r]ather than focus on improving the performance of individual sources, [EPA] would 'improve the overall power system by lowering the carbon intensity of power generation.' And it would do that by forcing a shift throughout the power grid from one type of energy source to another." Id. at 2611-12 (internal citation omitted) (emphasis original). With this position, "EPA can demand much greater reductions in emissions based on a very different kind of policy judgment: that it would be 'best' if coal made up a much smaller share of national electricity generation. And on this view of EPA's authority, it could go further, perhaps forcing coal plants to 'shift' away virtually all of their generation—i.e., to cease making power altogether." Id. at 2612. [EPA-HQ-OAR-2022-0829-0537, pp. 5-6]

EPA's proposed standards here require another massive shift away from current market operations. EPA projects that its proposed standards could be satisfied through a mix of nearly 70% battery electric vehicles for passenger cars, SUVs, and light-duty pickup trucks, and about 40% battery electric vehicles for medium duty vans and pickup trucks by model year 2032.12 But in 2021, less than 1% of the 250 million passenger cars, SUVs, and light-duty trucks in the United States were electric.13 [EPA-HQ-OAR-2022-0829-0537, pp. 5-6]

12 U.S. EPA Fact Sheet, supra note 11.

13 Feilding Cage, The long road to electric cars, REUTERS, Feb. 7, 2022, available at https://www.reuters.com/graphics/AUTOS-ELECTRIC/USA/mopanyqxwva/.

In West Virginia, "EPA decides, for instance, how much of a switch from coal to natural gas is practically feasible by 2020, 2025, and 2030 before the grid collapses, and how high energy prices can go as a result before they become unreasonably 'exorbitant.'" West Virginia, 142 S. Ct. at 2612. Here, EPA is deciding how much of a switch from internal combustion engine trucks to zero-emission vehicles or hydrogen-powered vehicles is practically feasible by model years 2027 to 2032. The West Virginia Court found it "highly unlikely that Congress would leave to agency discretion the decision of how much coal-based generation there should be over the coming decades." Id. at 2613. Instead, "[t]he basic and consequential tradeoffs involved in such a choice are ones that Congress would likely have intended for itself." Id. [EPA-HQ-OAR-2022-0829-0537, p. 6]

The magnitude of EPA's proposed rule implicates the Major Questions Doctrine. EPA is attempting to use emissions standards for vehicles to force a shift from gasoline-powered vehicles to electric-and hydrogen-powered vehicles. The shift will impact energy production by dropping demand for oil exploration and refineries and increasing demand for electricity generation and mining for rare earth minerals. The rule will cost billions of dollars. 88 Fed. Reg. 29,200. [EPA-HQ-OAR-2022-0829-0537, p. 6]

Organization: California Air Resources Board (CARB) (Part 1 of 5)

Under the Clean Air Act, California retains certain authority to regulate vehicle emissions, which has allowed California to function as a policy and technology incubator to address the State's air quality challenges. California's history of reducing pollution from motor vehicles has demonstrated that strong emission standards will spur innovation and technological advancements that reduce costs and improve public health. California's experience also demonstrates that cleaning the air and protecting the climate are good for the economy— while pursuing ambitious climate and air quality policies, California has grown to be the largest sub-national economy in the world. [EPA-HQ-OAR-2022-0829-0780, pp. 8-9]

In 2022, California adopted the Advanced Clean Cars (ACC) II program, which establishes a pathway towards 100 percent zero-emission new passenger car and light-duty truck sales by 2035 and incorporates a suite of assurance measures to help ensure that ZEVs are capable of fully replacing their conventional counterparts. 5 The ACC II regulations also established more stringent criteria air pollutant emission standards for vehicles with internal combustion engines (including PHEVs) to continue reducing harmful emissions from these vehicles. [EPA-HQ-OAR-2022-0829-0780, pp. 8-9]

> 5 The Advanced Clean Cars (ACC) II Regulations consist of the following new sections of the California Code of Regulations (Cal. Code Regs.), title 13: 1961.4, 1962.4, 1962.5, 1962.6, 1962.7, and 1962.8; and amendments to the following sections of tit. 13: 1900, 1961.2, 1961.3, 1962.2, 1962.3, 1965, 1968.2, 1969, 1976, 1978, 2037, 2038, 2112, 2139, 2140, 2147, 2317, and 2903; and incorporated test procedures. On May 22, 2023, California requested the Administrator of U.S. EPA grant a waiver for the ACC II Regulations under Clean Air Act Section 209(b), 42 U.S.C. § 7543(b).

California's standards, and their implementation in states that choose to adopt them under Section 177 of the Clean Air Act, lay a strong technical and policy foundation for U.S. EPA to adopt more stringent standards nationwide. While the requirements of ACC II and U.S. EPA's proposed standards differ somewhat, CARB expects that manufacturers will be able to use the same technologies to comply with both sets of regulations. [EPA-HQ-OAR-2022-0829-0780, pp. 8-9]

Organization: California Attorney General's Office, et al.

In 2009, EPA concluded that "greenhouse gases in the atmosphere may reasonably be anticipated both to endanger public health and to endanger public welfare." 74 Fed. Reg. 66,496, 66,497 (Dec. 5, 2009); see Massachusetts v. EPA, 549 U.S. 497 (2011) (holding that GHGs are within the scope of air pollution covered by Section 202(a) of the Clean Air Act). And, in 2010, EPA promulgated its first set of GHG emission standards applicable to light-duty vehicles model years 2012 through 2016. 75 Fed. Reg. 25,324 (May 7, 2010). Since then, EPA has promulgated and amended GHG emission standards for light-duty vehicles multiple times, most recently tightening the standards for model years 2023 through 2026. 77 Fed. Reg. 62,624 (Oct. 15, 2012); 85 Fed. Reg. 24,174 (Apr. 30, 2020); 86 Fed. Reg. 74,434 (Dec. 30, 2021). [EPA-HQ-OAR-2022-0829-0746, pp. 17-18]

Throughout the more than fifty years that it has been translating technological progress into increasingly stringent standards for various pollutants, EPA's standards have generally anticipated a wider use of existing emission control technologies and application of new or emerging emission control technologies across vehicle classes. See, e.g., 44 Fed. Reg. 6,650, 6,552 (Feb. 1, 1979) (trap-oxidizers), 66 Fed. Reg. 5,002, 5,049-54 (Jan. 18, 2011) (NOx adsorbers), 75 Fed. Reg. at 25,454-55 (hybrid technologies); see 88 Fed. Reg. at 29,187-88. This long-standing practice is consistent with Congress's "expect[ation that EPA] press for the development and application of improved technology rather than be limited by that which exists today.” NRDC v. EPA, 655 F.2d 318, 328 (D.C. Cir. 1981); see 42 U.S.C. § 7521(a)(2). Accordingly, EPA has routinely analyzed a wide array of technologies—from aerodynamic and air conditioning technologies to hybrid and zero-emission-vehicle technologies—in its rulemakings to simulate manufacturers’ compliance with alternative stringency levels. [EPA-HQ-OAR-2022-0829-0746, pp. 17-18]

A. Section 202(A) Requires EPA to Reduce Threats to Public Health and Welfare from Harmful Air Pollution

Under Section 202(a)(1) of the Clean Air Act, EPA “shall by regulation prescribe . . . standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles . . . , which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” 42 U.S.C. § 7521(a)(1). “By employing the verb ‘shall,’ Congress vested a non-discretionary duty in EPA,” Coalition for Responsible Regulation, Inc. v. EPA, 684 F.3d 102, 126 (D.C. Cir. 2012), rev’d in part on other grounds, Utility Air Regulatory Grp. v. EPA, 573 U.S. 302 (2014), the purpose of which is clear: reduce or eliminate the threats to public health and welfare of deleterious air pollutants. 42 U.S.C.§ 7521(a)(1); see also id. § 7401(b)(1) (declaring a goal of the Clean Air Act “to protect and enhance the quality of the Nation’s air resources so as to promote the public health and welfare and the productive capacity of its population”); Massachusetts, 549 U.S. at 532 (explaining that “EPA has been charged with protecting the public’s ‘health’ and ‘welfare’” in Section 202(a)). [EPA-HQ-OAR-2022-0829-0746, pp. 27-28]

D. EPA’s Proposal to Retire or Limit Credits Is Consistent with Section 202(a)’s Focus on Real-World Emission Reductions

Finally, the States and Cities support EPA’s Proposal to retire certain compliance flexibilities associated with the light- and medium-duty vehicle emissions program. In particular, EPA’s rationales for limiting air-conditioning efficiency credits, 88 Fed. Reg. at 29,246-48, and for phasing out off-cycle credits and the MDV multipliers, id. at 29,243-45, 29,249-52, are consistent with the agency’s responsibility to ensure the emissions program’s environmental integrity by tying credits and other flexibilities to real-world emission reductions as closely as possible. [EPA-HQ-OAR-2022-0829-0746, p. 37]

Organization: Clean Fuels Development Coalition et al.

I. EPA Lacks Statutory Authority to Electrify the Fleet.

Under the major questions doctrine, agencies may not construe a statute to “authoriz[e] [them] to exercise powers of ‘vast economic and political significance’” unless the statute does so in “clea[r]” terms. Alabama Ass’n of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021) (quoting Utility Air Regul. Grp. v. EPA, 573 U.S. 302, 324 (2014)). Thus, an agency seeking to exercise significant powers must identify “something more than a merely plausible textual basis for the agency action.” West Virginia EPA, 142 S. Ct. 2587, 2609 (2022) (quoting Utility Air, 573 U.S. at 324). “The agency instead must point to ‘clear congressional authorization’ for the power it claims.” Id. Whether and how to transition the vehicle fleet away from internal combustion engines to electric motors and thousand-pound batteries is a major question of economic and political importance. EPA therefore needs clear statutory authority. Section 202(a) of the Clean Air Act, which authorizes the agency to issue “standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles," does not provide this clear authority, and that is the end of the matter. 42 U.S.C. § 7521(a). [EPA-HQ-OAR-2022-0829-0712, pp. 3-4]

Indeed, EPA's proposal is very similar to the Clean Power Plan. Just as in West Virginia v. EPA, the agency is claiming the power to shift the nation's energy policy by reverse-engineering its preferred balance of fuel sources through emission standards. In the Clean Power Plan, EPA attempted to force a shift from coal-fired plants to gas-, wind-, and solar-powered plants. Here, EPA attempts to force a shift from liquid-fuel vehicles to electric vehicles. [EPA-HQ-OAR-2022-0829-0712, pp. 3-4]

As this proposal shows, there's no stopping point to EPA's claim of authority. As in West Virginia, with this power EPA "could go further, perhaps forcing [automakers] … to cease making [conventional vehicles] altogether." 142 S. Ct. at 2612. Whether "[t]he future of the auto industry is electric"3 is—pace President Biden— very much an open question. But whether it is open or not, it is not a future that the Executive Branch can mandate by reimagining a decades-old statute. [EPA-HQ-OAR-2022-0829-0712, p. 4]

3 FACT SHEET: Biden-Harris Administration Ensuring Future is Made in America, White House Briefing Room (February 8, 2022), https://www.whitehouse.gov/briefing-room/statements-releases/2022/02/08/fact-sheet-biden-harris-administration-ensuring-future-is-made-in-america/.

A. The proposal claims a power of vast economic and political significance.

In assessing the economic and political significance of a rule, courts look to both a rule's direct effects and the implications of the agency's underlying claim of authority. For example, in West Virginia, although EPA's Clean Power Plan only incrementally shifted power generation, the Court reasoned that EPA had asserted the "highly consequential power" to "announc[e] what the market share of coal, natural gas, wind, and solar must be, and then requir[e] plants to reduce operations or subsidize their competitors to get there." 142 S. Ct. at 2609 & 2613 n.4; see Alabama Ass'n of Realtors, 141 S. Ct. at 2489 (considering the "sheer scope of the [agency's] claimed authority" in addition to the rule's "economic impact"). [EPA-HQ-OAR-2022-0829-0712, pp. 4-5]

The proposal candidly indicates that that is exactly what EPA is doing here. See 88 Fed. Reg. 29,329 ("as the proposed standards become more stringent … the penetration of BEVs increases by almost 30 percentage points over this 6-year period, from 36 percent in MY 2027 up to 67 percent of overall vehicle production in MY 2032."). This regulatory transformation is exactly the sort of "highly consequential power" that the Supreme Court had in mind in West Virginia. [EPA-HQ-OAR-2022-0829-0712, pp. 4-5]

To begin with, the "economic impact" of the proposal raises it to a level of significance capable of triggering major question scrutiny. The proposal estimates $86 billion in costs over the first six years alone.4 This is comparable to the economic cost of the Clean Power Plan, which triggered the major-questions doctrine in West Virginia. See 142 S. Ct. at 2610; EPA, Regulatory Impact Analysis for the Clean Power Plan Final Rule 3-22 (projecting up to $3 billion in 2025 rising to $8.4 billion in costs in 2030). And, as will be discussed later in this comment, the proposal's listed costs grossly underestimate the rule's true costs. The proper metric is aggregate cost because the major-questions doctrine asks about the rule's significance to the "national economy." West Virginia, 142 S. Ct. at 2609 (2022); see also Biden v. Nebraska, 600 U.S. , , slip op. 21 (2023) (looking to projections of total costs to taxpayers). [EPA-HQ-OAR-2022-0829-0712, pp. 4-5]

4 This includes EPA's calculated vehicle technology costs, Table 160, id. at 29,364–65 , Electric Vehicle Supply Equipment (EVSE) costs, Table 165, id. at 29,367, and refueling costs, Table 166, id. at 29,367–68.

The proposal's political significance is equally vast. The target of EPA's proposal is "the subject of an earnest and profound debate across the country." West Virginia, 142 S. Ct at 2614. The Biden Administration and a small number of states favor an aggressive transition away from the internal combustion engine, while many other states are actively opposing it. See, e.g., State of Texas v. EPA, No. 22-1031 (D.C. Cir. 2022) (where sixteen states are challenging EPA's current light-duty standards). While Congress has provided certain taxpayer subsidies, grants, and loans to incentivize electric vehicles, it has never clearly authorized a transition away from the internal combustion engine by agency fiat. Indeed, proposals to impose electric vehicle mandates have never even made it out of committee. See, e.g., Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018,S. 3664, 115th Cong. (2018). Just last month, 151 members of the U.S. House of Representatives joined a letter urging EPA to withdraw its proposed emissions standards—calling them an attempt to "commandeer America's transportation sector and force its complete vehicle electrification under the guise of mitigating climate change." Letter from Rep. Cathy McMorris Rodgers et al. to Adm'r Michael S. Regan, at 1 (May 22, 2023), https://d1dth6e84htgma.cloudfront.net/DRAFT_05_22_23_ EPA_Tailpipe_Letter_af5a5b04a5.pdf?updated_at=2023-05-19T17:01:36.343Z. [EPA-HQ-OAR-2022-0829-0712, pp. 7-8]

That Congress has consistently rejected forced electrification is also evident from the way in which it would conflict with its broader legislative schemes it has enacted. For example, Congress has consistently sought to address greenhouse-gas emissions from the transportation sector by promoting corn ethanol and other renewable fuels, which can be amply supplied domestically. See e.g., Renewable Fuel Standard, 42 U.S.C. § 7545(o)(2)(A)(i); Inflation Reduction Act of 2022, Pub. L. No. 117-169, §§ 13202, 13404, 22003, 136 Stat. 1818, 1932–1935, 1966–1969, 2020 (2022). And it has granted EPA separate—and limited and procedurally cabined—authority to regulate fuels and fuel additives, further indicating that Section 202 is not a broad delegation of authority to phase out liquid-fueled internal combustion engines. See 42 U.S.C. § 7545. [EPA-HQ-OAR-2022-0829-0712, pp. 7-8]

The proposal is also a novel assertion of agency authority. The Supreme Court has explained that skepticism is warranted when an agency asserts an "unheralded power representing a transformative expansion in its regulatory authority." West Virginia, 142 S. Ct. at 2610 (cleaned up). Until this administration, EPA never claimed the authority to mandate even partial electrification. Now it claims the power to transform the entire fleet in just a few years' time. Cf. Nebraska, Slip Op. 22 (Imagine "asking the enacting Congress … 'Can the Secretary use his powers to abolish $430 billion in student loans, completely canceling loan balances for 20 million borrowers, as a pandemic winds down to its end?' We can't believe the answer would be yes."). It is irrelevant that setting mobile-source emissions standards falls within the agency's "wheelhouse"; the "sweeping and unprecedented impact" of these standards is not. Id. The "'basic and consequential tradeoffs' inherent in a mass [electrification] pro- gram 'are ones that Congress would likely have intended for itself.'" Id. at 24–25 (quoting West Virginia, 142 S. Ct. at 2613). [EPA-HQ-OAR-2022-0829-0712, p. 8]

B. EPA lacks clear authority to use fleetwide averaging.

Congress has expressly precluded EPA from using Section 202(a) to phase out internal-combustion vehicles. EPA achieves that result only by misconstruing the standard-setting tools at its disposal. The text and structure of Section 202, and of Title II more broadly, unambiguously require that emission standards under Section 202(a) apply to individual vehicles, not to manufacturers' fleets on average. EPA claims to find authority for fleetwide averaging in Section 202(a), which authorizes the agency to issue "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles ... which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a)(1). This says nothing about averaging across fleets. [EPA-HQ-OAR-2022-0829-0712, pp. 8-9]

EPA has already conceded as much. When the agency first adopted fleetwide averaging, it recognized that "Congress did not specifically contemplate an averaging program when it enacted the Clean Air Act." 48 Fed. Reg. 33,456, 33,458 (July 21, 1983). And "[j]ust as the statute does not explicitly address EPA's authority to allow averaging, it does not address the Agency's authority to permit banking and trading." 54 Fed. Reg. 22,652, 22,665 (May 25, 1989); see also 55 Fed. Reg. 30,584, 30,593 (July 26, 1990) (same). That is the end of the analysis. The statute does not "explicitly" allow averaging and so EPA lacks "clear congressional authorization" to enact the proposal. [EPA-HQ-OAR-2022-0829-0712, pp. 8-9]

This statutory silence means that even if the phasing out of the internal combustion engine were not a major question, EPA would have no power to use averaging. [EPA-HQ-OAR-2022-0829-0712, pp. 8-9]

When a statute "says nothing about" a potential regulatory power, it "would be improper to conclude that what Congress omitted from the statute is nevertheless within its scope." Univ. of Texas Sw. Med. Ctr. v. Nassar, 570 U.S. 338, 353 (2013); see also Entergy Corp. v. Riverkeeper, Inc., 556 U.S. 208, 223 (2009) ("statutory silence, when viewed in context," is in many situations "best interpreted as limiting agency discretion," not creating it). After all, "[a]n agency … 'literally has no power to act' … unless and until Congress authorizes it to do so by statute." FEC v. Cruz, 142 S. Ct. 1638, 1649 (2022). And agencies no less than courts have a "duty to respect not only what Congress wrote but, as importantly, what it didn't write." Va. Uranium, Inc. v. Warren, 139 S. Ct. 1894, 1900 (2019) (plurality op.). "And supplying the extra words 'on average' would have a significant substantive effect: 'roller coaster riders must be 48 inches tall' means something very different from 'roller coaster riders must be 48 inches tall on average.'" Initial Brief for Private Petitioners at 41, Texas v. EPA, No. 22-1031 (D.C. Cir., Nov. 3, 2022). [EPA-HQ-OAR-2022-0829-0712, pp. 9-10]

The inference against EPA's claim to be able to write into its authority a fleet- wide averaging power is especially strong because Congress knows full well how to create such a program—it did so not only in EPCA, but also in other provisions of Title II of the Clean Air Act. See 42 U.S.C. § 7545(k)(l)(B)(v)(II) (directing EPA to take certain actions if "the reduction of the average annual aggregate emissions of toxic air pollutants in a [designated district] fails to meet" certain standards). Simply put: "if Congress had wanted to adopt [an averaging] approach" for motor vehicle standards under Section 202(a), "it knew how to do so." SAS Inst., Inc. v. lancu, 138 S. Ct. 1348, 1351 (2018). That Congress didn't is dispositive. See Marx v. Gen. Revenue Corp., 568 U.S. 371, 381 (2013) ("[I]t is fair to suppose that Congress considered the unnamed possibility and meant to say no to it[.]"); Russello v. United States, 464 U.S. 16, 23 (1983); Rotkiske v. Klemm, 140 S. Ct. 355, 360–361 (2019) ("Atextual judicial supplementation is particularly inappropriate when, as here, Congress has shown that it knows how to adopt the omitted language or provision.").6 To quote Justice Frankfurter: "It is quite impossible…when Congress did specifically address itself to a problem…to find secreted in the interstices of legislation the very grant of power which Congress consciously withheld." Youngstown Sheet & Tube Co. v. Sawyer, 343 U.S. 579, 609 (1952) (Frankfurter, J., concurring) [EPA-HQ-OAR-2022-0829-0712, pp. 9-10]

6 At the very least, EPA should await the Supreme Court's decision in Loper Bright Enterprises v. Raimondo (22-451), which will consider "[w]hether the Court should overrule Chevron or at least clarify that statutory silence concerning controversial powers expressly but narrowly granted elsewhere in the statute does not constitute an ambiguity requiring deference to the agency."

Add to this that the "silence" argument is simply not correct. That fleet-wide averaging is forbidden can be seen in several parallel provisions of the Clean Air Act. For example, the plain text of the testing requirements that accompany the Section 202(b) standards require those standards apply to all vehicles individually. EPA must "test any emission control system incorporated in a motor vehicle or motor vehicle engine . . . to determine whether such system enables such vehicle or engine to conform to the standards required to be prescribed under [Section 202(b)]." 42 U.S.C. § 7525(a)(2). If the system complies with the testing, then EPA must issue a "'verification of compliance with emission standards for such system." Id. These provisions plainly require standards that apply to individual vehicles.7 The fundamental premise of this testing regime is that a vehicle can meet individually applied emission standards. Thus "the broader context of the statute as a whole," Robinson v. Shell Oil Co., 519 U.S. 337, 341 (1997), confirms that EPA is out over its skis here. [EPA-HQ-OAR-2022-0829-0712, p. 10]

7 See also, Initial Brief for Private Petitioners, Texas v. EPA, No. 22-1031 at 51–62 (D.C. Cir., Nov. 3, 2022) (detailing myriad ways in which statutory text, structure, and related provisions confirm that fleetwide averaging is not authorized).

C. Even if EPA could use fleetwide averaging, this cannot be used to force electrification.

Part of the reason EPA has traditionally been granted deference in its averaging schemes is because the agency has historically used averaging as an accommodation to regulated parties, allowing them additional flexibility that the statute does not in fact authorize. In prior rules, the use of fleet-wide averaging meant that a vehicle manufacturer could comply by making some vehicles that emitted more and others that emitted less. Thus, while some commentors have pointed out the illegality of this scheme, vehicle manufacturers have not opposed EPA's averaging approach because it provided them with the flexibility necessary to achieve in a more cost-effective way otherwise impractical standards. [EPA-HQ-OAR-2022-0829-0712, pp. 10-11]

Thus, when considering EPA's authority to use averaging, the D.C. Circuit has always noted that it was critical that the averaging serve as merely a flexibility. See NRDC v. Thomas, 805 F.2d 410, 425 (D.C. Cir. 1986) ("EPA's argument that averaging will allow manufacturers more flexibility in cost allocation while ensuring that a manufacturer's overall fleet still meets the emissions reduction standards makes sense.") (emphasis added); cf. White Stallion Energy Ctr., LLC v. EPA, 748 F.3d 1222, 1253 (D.C. Cir. 2014) (permitting averaging across multiple utility units under 42 U.S.C. § 7412(d) because averaging is a "'more flexible, and less costly alternative.'"). [EPA-HQ-OAR-2022-0829-0712, pp. 10-11]

But in this new proposal EPA is not offering an extrastatutory accommodation to a regulated party, but is instead taking an additional step away from the statutory text by using fleetwide averaging to mandate electrification. The proposal would set emissions standards in such a way that no fleet of internal combustion engine vehicles can meet the standards. This means that averaging no longer provides flexibility about which kinds of internal-combustion vehicles a manufacturer may sell, but instead amounts to a de facto mandate to incorporate electric vehicles to comply with its proposed standards. Much as in the Clean Power Plan, crediting is deployed as a tool for reverse engineering a share of preferred technologies by setting targets that cannot be achieved by disfavored technologies. Thus, even if the agency was properly entitled to deference in its previous averaging schemes, this deference evaporates when the scheme is used coercively, rather than permissively. [EPA-HQ-OAR-2022-0829-0712, pp. 10-11]

Of course, EPA freely admits that electric vehicles do produce upstream emissions, and that these upstream emissions matter. This is true and very important. And the proposal does consider upstream emissions when determining the rule's impact on total emissions. EPA's position is that this inconsistent approach to electric vehicles' upstream emissions is reasonable because it treats upstream emissions of all vehicles, electrified or not, the same way for compliance purposes. 88 Fed. Reg. 29,252 ("EPA proposes to include only emissions measured directly from the vehicle in the vehicle GHG program for MYs 2027 and later (or until EPA changes the regulations through future rulemaking) consistent with the treatment of all other vehicles. Electric vehicle operation would therefore continue to be counted as 0 g/mile, based on tailpipe emissions only.") [EPA-HQ-OAR-2022-0829-0712, pp. 11-12]

But this "consisten[cy]" is precisely what makes the rule unreasonable. Electric vehicles are not like "all other vehicles." EPA has previously recognized that "that for each EV that is sold, in reality the total emissions off-set relative to the typical gasoline or diesel powered vehicle is not zero, as there is a corresponding increase in up-stream CO2 emissions due to an increase in the requirements for electric utility generation." 74 Fed. Reg. 49,454, 49,533 (Sept. 28, 2009). EPA only chose the initial "zero grams/mile compliance value [a]s an incentive," Response to Comments, EPA-420-R-10-012a at 5-237 (Apr. 2010),), and explained that in future standards it "would at-tribute a pro rata share of national CO2 emissions from electricity generation to each mile driven under electric power minus a pro rata share of upstream emissions associated with from gasoline production," 88 Fed. Reg. 29,252. [EPA-HQ-OAR-2022-0829-0712, pp. 11-12]

D. EPA lacks the statutory authority to ignore upstream emissions for electric vehicles.

EPA has statutory authority to prescribe "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a)(1). This presents an interpretive dilemma. On the one hand, if electric vehicles are not "vehicles" "which cause[ ] or contribute to" a given type of air pollution, then EPA may not set standards for them. Id. On the other, if electric vehicles are "vehicles" "which cause, or contribute to" a given type of air pollution, then EPA must set "standards applicable to the[ir] emissions." Id. [EPA-HQ-OAR-2022-0829-0712, p. 11]

The proposal tries to solve this problem by splitting the baby.8 EPA reasons that electric vehicles are vehicles that "cause or contribute to air pollution," but EPA just chooses to set their contribution to zero. This cannot be right. Cf. C.S. Lewis, That Hideous Strength 291 (Samizdat ed., 2015) ("Just imagine a man who was too dainty to eat with his fingers and yet wouldn't use forks!"). If electric vehicles truly emit no emissions, then they are not the sort of vehicle EPA can regulate. [EPA-HQ-OAR-2022-0829-0712, p. 11]

8 Of course, the point of the story about Solomon is that the baby wasn't split. See 1 Kings 3:16– 28 ("Give the living child to the first woman, and by no means put him to death; she is his mother.").

EPA never had authority to incentivize electric vehicles in this way. Section 202(a) requires the agency to "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles." Because it acknowledged that these emissions are "not zero," it is arbitrary to treat them as such. Indeed, as EPA previously acknowledged, treating upstream emissions of all vehicles, electrified or not, the same way puts a thumb on the scale against conventional vehicles in favor of electric vehicles. An agency's bare preference for one technology cannot satisfy the requirement that it "reasonably consider[] the relevant issues and reasonably explain[] the decision." FCC v. Prometheus Radio Project, 141 S. Ct. 1150, 1158 (2021). [EPA-HQ-OAR-2022-0829-0712, pp. 12-13]

At the very least, the agency is not permitted to change its position on the future inclusion of upstream emissions in compliance calculations without explanation. When an agency makes a decision, it must articulate a "satisfactory explanation for its action including a 'rational connection between the facts found and the choice made.'" Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983). If the agency fails to "cogently explain why it has exercised its discretion in a given manner," its action will be held invalid. Id. at 48. In addition, the agency must "provide a more detailed justification than what would suffice for a new policy created on a blank slate . . . when, for example, its new policy rests upon factual findings that contradict those which underlay its prior policy." FCC v. Fox Television Stations, Inc., 556 U.S. 502, 515 (2009); see also Perez v. Mortg. Bankers Ass'n, 135 S. Ct. 1199, 1209 (2015). EPA previously thought that the zero grams-per-mile compliance value was only viable as a temporary incentive because "in reality" the total emissions were not zero. Failure to consider and adequately explain departure from this finding would render the entire rulemaking arbitrary and capricious. Fox Television Stations, 556 U.S. at 515. [EPA-HQ-OAR-2022-0829-0712, pp. 12-13]

E. Nothing in the Inflation Reduction Act grants EPA additional authority to mandate electrification.

The proposal also suggests that the Inflation Reduction Act ("IRA") provides some additional reinforcement to its claims of statutory authority for these sweeping changes. "The recently-enacted Inflation Reduction Act 'reinforces the longstanding authority and responsibility of [EPA] to regulate GHGs as air pollutants under the Clean Air Act,' and 'the IRA clearly and deliberately instructs EPA to use' this authority by 'combin[ing] economic incentives to reduce climate pollution with regulatory drivers to spur greater reductions under EPA's CAA authorities.'" 88 Fed. Reg. 29,233 (quoting 168 Cong. Rec. E868–02 (daily ed. Aug. 12, 2022) (statement of Rep. Pallone) and 168 Cong. Rec. E879–02, at 880 (daily ed. Aug. 26, 2022) (statement of Rep. Pallone)).

Not so. [EPA-HQ-OAR-2022-0829-0712, pp. 13-14]

The words in a statute must be read in their context to understand how they fit into an overall statutory scheme. Davis v. Michigan Dept. of Treasury, 489 U.S. 803, 809 (1989). In making this determination, consideration must be given to the overall type and purpose of the statute. Dolan v. U.S. Postal Service, 546 U.S. 481, 486 (2006). Here, the relevant context is that the IRA was passed through the reconciliation process under the Congressional Budget and Impoundment Control Act. That act established the congressional budget process giving Congress an expedited process by which it can pass by a majority vote legislation pertaining to revenue, spending, or the debt limit levels. This reconciliation process was intended to be used to reduce the deficit through some combination of spending reductions or revenue increases. Cong. Rsch. Serv., RL30862, The Budget Reconciliation Process: The Senate's “Byrd Rule” (updated Sept. 28, 2022), at 1, available at https://crsreports.con gress.gov/product/pdf/RL/RL30862. Legislation passed under this process does not alter other substantive obligations and it must be related to spending, revenue, or the federal debt limit. In other words, “If Congress wants to assign this authority to EPA or any other federal agency, it cannot do so by way of a budget reconciliation bill such as the IRA.” John Dixon, et al., No Inflation Act Boost For EPA Power Over Greenhouse Gases, Law360 (Sep. 19, 2022), https://www.law360.com/arti- cles/1531794/no-inflation-act-boost-for-epa-power-over-greenhouse-gases. [EPA-HQ-OAR-2022-0829-0712, pp. 13-14]

Indeed, nothing in the IRA grants any regulatory authority “under the Clean Air Act” at all. Instead, the IRA provides several section-specific definitions of green house gases, that apply only to that section for the purposes of grantmaking. For example, “Definition of Greenhouse Gas.—In this section, the term ‘greenhouse gas’ means the air pollutants carbon dioxide, hydrofluorocarbons, methane, nitrous oxide, perfluorocarbons, and sulfur hexafluoride.” 136 Stat. 2069. And none of these various definitional provisions address EPA’s authority under Section 202. See, e.g., 136 Stat. 2069 (applying the term to grants to address air pollution at schools under Section 103 and 105); id. (grants to states under Section 177); id. (grants for “education” and “outreach” about low-emissions electricity generation); id. at 2070 (grants for biofuels under Section 211); id. at 2072 (grants for corporate reporting); id. at 2077–78 (grants for labeling of construction materials); id. at 2083 (same for federal buildings). [EPA-HQ-OAR-2022-0829-0712, p. 14]

These provisions do nothing to change EPA’s ability to regulate greenhouse gas emissions and do not alleviate the many problems the proposal already has under the major questions doctrine. Rather, they highlight the problem: Congress just legislated in this area and failed to pass anything like the transformative program EPA now seeks to impose by its own ukase. [EPA-HQ-OAR-2022-0829-0712, p. 14]

As John Bozzella, president and CEO of Alliance for Automotive Innovation has explained, “Requiring 60+ percent of U.S. vehicles sales to be pure battery electric vehicles (BEVs) by 2030 leapfrogged the administration’s own 2021 executive order that called for 50 percent electric vehicles –including plug-in hybrid and fuel cell EVs – by 2030.” John Bozzella, EPA's EV Rules are Out of Whack: Five Ways to Fix Them, Alliance for Automotive Innovation (June 28, 2023), https://www.autosinnovate.org/posts/blog/epas-rules-are-out-of-whack-five-ways-to-fix-them. “[T]he administration’s 50 percent target [by 2030] was always a stretch goal. It was ambitious and challenging by any measure.” Mike Hartrick, Testimony from the Alliance for Automotive Innovation, Before the U.S. Environmental Protection Agency EPA Multi Pollutant Proposed Rule, EPA-HQ-OAR-2022-0829, https://www.autosinno-vate.org/posts/agency-comments/05-09%20EPA%20Multi-Pollutant%20NPRM.pdf. “The 60+ percent BEVs by 2030 plan, on the other hand, is a house of cards…. It rolls up rosy forecasts (like EV batteries will eventually cost automakers nothing) and other hopeful assumptions." John Bozzella, supra. [EPA-HQ-OAR-2022-0829-0712, pp. 27-28]

The 50 percent goal "was also predicated on several conditions, most significantly: supportive public policies including the bipartisan Infrastructure Investment and Jobs Act with funding for national public charging (installation not started yet); the manufacturing incentives and consumer purchase incentives in the Inflation Reduction Act to support EV purchases and affordability (becoming more, not less constrained); and the supply of critical minerals (projected to be woefully short of demand and largely controlled by China)." Mike Hartrick, supra. "If implemented, EPA's proposal will require 60 percent battery electric vehicles by 2030 (a 20 percent increase over the President's goal, which also included PHEVs), and two out of every three vehicles sold to be BEVs just two years later. These levels are substantially higher than what the auto industry indicated was achievable even after application of the supportive policies." Id. [EPA-HQ-OAR-2022-0829-0712, pp. 27-28]

C. EPA cannot rely on California's Advanced Clean Cars program to justify feasibility.

EPA also points to the adoption of California's Advanced Clean Cars II program to justify the feasibility of the rule. The agency asserts that California's program makes the rule more feasible because it: provides as evidence of a trend toward vehicle electrification, 88 Fed. Reg. 29,188–89; serves as a driver of technological innovation and "increased consumer technology familiarity" with electric vehicles, id. at 29,254, 29,334; and that the impossible standards imposed by the proposal are "aligned with" existing state policies and thus reasonable, id. at 29,275, 29,284. This is improper. These standards have not yet received a waiver—California only applied for a waiver after the rule was proposed, and EPA has not yet determined whether a waiver is warranted—and the presence of a second regulation cannot make the first more feasible. See 88 Fed. Reg. 29,189. [EPA-HQ-OAR-2022-0829-0712, pp. 28-29]

To make matters worse, Advanced Clean Cars II is unlawful. Advanced Clean Cars I is already being challenged in court, as is its companion regulation for heavy- duty vehicles, Advanced Clean Trucks. See State of Ohio, et al. v. EPA, No. 22-1081 (D.C. Cir. 2022). According to EPA, California's standards are permitted under Section 209 of the Clean Air Act. Section 209(a) preempts states from setting emission standards for new cars and new engines. 42 U.S.C. § 7543(a). There are two exceptions. First, § 209(b) allows EPA to give California—and only California—a waiver allowing it to set emission standards more stringent than the federal standards. § 7543(b)(1). Second, the Act allows states, in some circumstances, to adopt emission standards "identical to the California standards." Id. § 7507(1). In other words, "the 49 other states" may depart from the federal standard if and only if they adopt "a standard identical to an existing California standard." Am. Auto. Mfrs. Ass'n v. Cahill, 152 F.3d 196, 201 (2d Cir. 1998). [EPA-HQ-OAR-2022-0829-0712, pp. 28-29]

As petitioners in those lawsuits make clear, California's standards violate the constitution's structural guarantee of equal sovereignty to all states, are forbidden by the plain text of the Clean Air Act, are preempted by EPCA, and fail to properly account for costs and technology limitations.17 EPA cannot rely on these illegal rules to justify its own rule. [EPA-HQ-OAR-2022-0829-0712, p. 29]

17 For the same reasons, the proposed rule would be contrary to law if finalized in anything resembling its current form.

At the very least, EPA is improperly commenting on an impending adjudication that it has not yet evaluated or even made available for public comment. While EPA purports not to be “prejudging the outcome” of that “waiver process,” 88 Fed. Reg. 29,334, it is difficult to see how EPA can expect ACC II to have any impact at all unless it has already concluded the waiver is a fait accompli. Such prejudgment would jeopardize the waiver process itself, threatening it vacatur, and thus undermining EPA’s reliance on that decision here. Cinderella Career & Finishing Schs., Inc. v. FTC, 425 F.2d 583, 591 (D.C. C970) (a decisionmaker is disqualified where “a disinterested observer may conclude that the agency has in some measure adjudged the facts as well as the law of a particular case in advance of hearing it” (cleaned up)); United Steelworkers of Am. v. Marshall, 647 F.2d 1189, 1209 (D.C. Cir. 1980) (courts vacate standards where a decisionmakers has “demonstrably made up [its] mind about important and specific factual questions and [is] impervious to contrary evidence.”). [EPA-HQ-OAR-2022-0829-0712, p. 29]

But EPA also has the authority to consider the impact of these fuels in its consideration of life-cycle emissions under the agency’s Section 202 powers. The agency has done so in the past, and acknowledging these benefits again would incentivize the use of more renewable fuels, and allow automakers to achieve greater emissions reductions, in a shorter time frame, and at a net savings to consumers. Agencies are required, as part of any reasoned decision making process, to consider all “‘significant and viable and obvious alternatives’” to their proposed action. Dist. Hosp. Partners, L.P. v. Burwell, 786 F.3d 46, 59 (D.C. Cir. 2015); see Spirit Airlines, Inc. v. DOT, 997 F.3d 1247, 1255 (D.C. Cir. 2021) (“‘[T]he failure of an agency to consider obvious alternatives has led uniformly to reversal.”’). Ignoring the benefits of renewable fuels— and of ethanol in particular—violates EPA’s duty to give “appropriate consideration to the cost of compliance” with the proposed regulations, 42 U.S.C. § 7521(a)(2), and would render the rule arbitrary and capricious. [EPA-HQ-OAR-2022-0829-0712, pp. 38-39]

A. EPA has authority to consider the lifecycle emissions from different fuels in its standard setting.

Section 202(a)(3)(A)(ii) authorizes EPA to look beyond the basic engine to set its engine or vehicle emission standards. Specifically, it states that, “[i]n establishing classes or categories of vehicles or engines for purposes of regulations under this paragraph, the [agency] may base such classes or categories on gross vehicle weight, horsepower, type of fuel used, or other appropriate factors.” 42 U.S.C. § 7521(a)(3)(A)(ii) (emphasis added). To account for the “type of fuel used,” EPA would need to engage in lifecycle emissions analysis. EPA has often eschewed lifecycle analysis because of the nature of the pollutants it regulates, but it is the obvious best fit for greenhouse gas regulations. Section 202(a)(1) gives EPA’s authority to issue rules setting emissions standards for “air pollutants” that it finds may reasonably be anticipated to endanger public health or welfare. And while most air pollutants work on the local and regional level, which makes lifecycle analysis a poor fit, greenhouse gases’ harms are all at the global level. Except in truly extreme concentrations, CO2 emissions do not lead to adverse health effects if breathed in. [EPA-HQ-OAR-2022-0829-0712, pp. 39-40]

Clean Air Act Section 202(a)(4)(A) and (B) require that EPA consider whether its proposed standards “will cause or contribute to an unreasonable risk to public health, welfare or safety”, including whether the proposed standard “causes, increases, reduces, or eliminates emissions of any unregulated pollutants” and to assess “the availability of other devices, systems, or elements of design which may be used to conform to requirements prescribed under this subchapter without causing or contributing to such unreasonable risk." Neglecting lifecycle greenhouse gas emissions incentivizes compliance options that increase upstream carbon emissions at the expense of measured tailpipe emissions. This is exactly the sort of "other … element[ ] of design" that Congress imagined might "increase[ ] emissions." [EPA-HQ-OAR-2022-0829-0712, pp. 39-40]

Organization: Competitive Enterprise Institute

III. The Proposed Standards Trigger the Major Questions Doctrine

West Virginia v. EPA

The EPA's plan to drive gasoline-powered cars out of the marketplace is highly controversial and sure to be litigated. In fact, as the agency knows, plaintiffs in State of Texas v. Environmental Protection Agency, who include the Competitive Enterprise Institute (CEI) among other private petitioners, are suing to overturn the agency's milder electrification mandates for MY 2023-2026 motor vehicles.25 [EPA-HQ-OAR-2022-0829-0611, pp. 6-7]

25 Texas v. EPA, Docket Numbers: 22-1031, 22-1032, D.C. Cir., http://climatecasechart.com/case/texas-v-epa-2/.

Private petitioners' initial brief 26 and initial reply brief, 27 which have been submitted to the U.S. Court of Appeals for the D.C. Circuit, are pertinent to the current rulemaking. As the briefs explain, the EPA's proposal triggers the major-questions doctrine that was the basis of the Supreme Court's decision, in West Virginia v. EPA, 28 to vacate the Obama administration's Clean Power Plan (CPP). [EPA-HQ-OAR-2022-0829-0611, pp. 6-7]

26 Initial Brief for Private Petitioners, Texas v. EPA, November 3, 2022, http://climatecasechart.com/wp-content/uploads/sites/16/case-documents/2022/20221103_docket-22-1031_brief-2.pdf (hereafter "Petitioners' Initial Brief").

27 Initial Reply Brief for Private Petitioners, Texas v. EPA, April 18, 2023, https://cei.org/wp-content/uploads/2022/09/Filestamped-Texas-v.-EPA-Private-Pet-Reply-Br-1.pdf (hereafter "Petitioners' Reply Brief").

28 W. Virginia v. EPA, 142 S. Ct. 2587 (2022).

The major-questions doctrine is a jurisprudence of political accountability. Under Article I, Section 1, all legislative powers granted by the Constitution are vested in Congress. Accordingly, agencies have only such rulemaking power as Congress delegates to them. The major-questions doctrine focuses judicial (and public) attention on the big picture through a set of interrogatories. [EPA-HQ-OAR-2022-0829-0611, pp. 6-7]

- Does the agency's rulemaking affect a significant portion of the U.S. economy?
- Does it have significant political implications?
- Does it attempt to settle an issue Congress is still debating?
- Does it adopt a policy Congress has considered and rejected?
- Does it entail a "transformative expansion" of the agency's power? [EPA-HQ-OAR-2022-0829-0611, pp. 6-7]

If the answer to one or more of those queries is “yes” (it is “yes” to all five queries for both the CPP and the EPA’s proposal), a final interrogatory is considered: Does the agency’s purported statutory authority clearly authorize the rule? [EPA-HQ-OAR-2022-0829-0611, pp. 6-7]

If there is no “clear statement” of congressional authorization, the agency’s action is very likely unlawful. [EPA-HQ-OAR-2022-0829-0611, pp. 6-7]

The CPP was a plan to restructure a significant portion of the U.S. economy—the electric power sector. The CPP established CO2 performance standards for existing coal and natural gas combined cycle (NGCC) power plants that none could meet via affordable modifications made at and by the regulated facilities. A coal or NGCC power plant could comply only by averaging its emissions with those of lower- or non-emitting power plants elsewhere on the grid to which it cedes production and market share. For example, the owner of a coal power plant could buy power from an NGCC power plant, invest in renewables, or buy emission credits from lower- or non-emitting facilities in a carbon cap-and-trade program. [EPA-HQ-OAR-2022-0829-0611, pp. 6-7]

The EPA claimed that such “generation shifting” is the adequately demonstrated “best system of emission reduction” (BSER), and encouraged States to establish or join cap-and-trade programs as the most efficient way to implement generation shifting. The CPP was fundamentally a plan to herd States into the sorts of carbon cap-and-trade programs Congress had debated for years and declined to enact. No clear statement authorizing such a plan could be found in CAA Section 111(d), the CPP’s putative statutory basis. [EPA-HQ-OAR-2022-0829-0611, pp. 6-7]

More fundamentally, the CPP would make the EPA a de-facto industrial policy czar for electricity, coercing a national shift from fossil to renewable generation despite States’ traditional authority over electricity fuel mix within their borders. Congress was still debating how to tackle climate change, and much of the country did not support regulating or taxing fossil generation out of existence. A clear statement authorizing the EPA to take charge of the nation’s electric grid and resolve the climate policy debate was also nowhere to be found in CAA Section 111(d). [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

West Virginia should be the starting point for all subsequent EPA climate policy planning. Yet the words “major questions” and “West Virginia” occur nowhere in the proposal’s 225-page preamble. [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

West Virginia applies directly to the current rulemaking. Once again, the EPA seeks to regulate a “significant portion of the American economy.” Indeed, the EPA projects the vehicle technology investments required to meet the proposed MY 2027 and later standards will cost $280 billion by 2055, with annual costs rising from $6.8 billion in 2028 to $22 billion in 2035.29 Those expenditures are substantially larger than the CPP’s projected compliance costs (estimated at up to $3.0 billion in 2025 and up to $8.4 billion in 2030).30 [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

29 88 FR 29365.

30 EPA Carbon Pollution Emission Guidelines for Existing Stationary Sources: Electric Utility Generating Units, Final Rule, 80 FR 64662, 64679, October 23, 2015, https://www.govinfo.gov/content/pkg/FR-2015-10-23/pdf/2015- 22842.pdf.

Like the CPP, the proposed standards would settle energy and climate policy issues Congress is still debating. The EPA would once again wield the powers of an industrial policy czar, "restructuring" the automotive sector with huge knock-on effects for the U.S. oil, gas, and biofuel industries,31 as well as for the electric power sector. 32 As private petitioners in Texas v. EPA put it: [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

31 Petitioners' Initial Brief, pp. 25-29.

32 "Assuming an immediate scenario of 100% EV usage and projecting electricity requirements, the U.S. electricity grid would need to generate 33%, or 1.4 trillion kWhs, more of electricity," according to the Energy Policy Research Foundation (EPRINC). The impacts of the EPA's mandates on utilities, reliability, and ratepayers could be severe, EPRINC cautions: "Historically, U.S. electricity generation has grown at an annualized rate of 0.4% over the last ten years. At this rate, it would require 79.8 years to accommodate a full EV transition of the U.S. fleet." The historic growth rate must increase rapidly to accommodate vehicle electrification on the EPA's schedule. Yet, at the same time, the EPA is proposing GHG standards for power plants projected to retire 42 gigawatts of coal generation capacity and 37 percent less generation from natural gas. See Max Pyziur, EPRINC Chart of the Week, #2023-2026 EV Electricity Requirements and EPA's Changing Rules, July 5, 2023, https://fxc6e4.p3cdn1.secureserver.net/wp-content/uploads/2023/07/EPRINC-Chart2023-26-EVElectricityRequirementsAndChallengingEPARules-Version1.pdf.

Just as in West Virginia, EPA is claiming the power to shift the Nation's energy policy by reverse-engineering its preferred balance of technologies through emission standards. In West Virginia, it attempted to force a shift from coal-fired plants to wind- and solar- powered plants; here, it attempts to force a shift from liquid-fuel vehicles to electric vehicles.33 [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

33 Petitioners' Reply Brief, p. 13.

The EPA is even using the same CPP regulatory tactic—setting standards the targeted vehicles cannot meet except by averaging their emissions with those of non-emitting vehicles, to which they must cede market share. [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

Congress has considered legislation to compel vehicle electrification. Such proposals have garnered far less support than cap-and-trade. For example, a bill introduced in the 116th Congress, H.R. 2764, the Zero-Emission Vehicles Act of 2019, would establish a national ZEV mandate requiring 50 percent of all new vehicles sold to be EVs by 2030. The House Energy and Commerce Committee took no action on the bill beyond referral to the appropriate subcommittee.34 [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

34 H.R. 2764, Zero-Emission Vehicles Act of 2019, https://www.congress.gov/bill/116th-congress/house-bill/2764/all-actions?overview=closed#tabs.

Most critically, private petitioners observe, "Congress nowhere provided clear authorization for EPA to effectively mandate electrification of the Nation's vehicles." Hence, they conclude, the MY 2023-2026 standards "cannot stand." 35 The same reasoning applies to the more aggressive standards the EPA now proposes. [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

35 Petitioners' Initial Brief, p. 17.

The EPA claims the 2021 rule raises no major questions requiring clear direction from Congress because it "broke no new legal ground." Rather, the rule merely "tighten[ed] existing emission standards under its longstanding and oft-invoked authority."36 Private petitioners rebut that claim: [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

36 EPA's Answering Brief, February 24, 2023, p. 48, http://climatecasechart.com/wp-content/uploads/sites/16/case- documents/2023/20230224_docket-22-1031_brief.pdf (hereafter "EPA's Answering Brief").

Before the [2021] rule, EPA set greenhouse gas vehicle emission standards for vehicles, and some automakers chose to comply in part by producing electric vehicles. Now, EPA has set standards that—by design— "[d]rive" electric-vehicle production and promote a market penetration rate double what it would be without the rule…. Petitioners do not argue that EPA can require some, but lower, electric-vehicle penetration; they challenge EPA's authority to set standards that, for the first time, require the substitution of electric vehicles for liquid-fuel vehicles—a difference in kind, not degree.37 [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

37 Petitioners' Reply Brief, pp. 13-14.

The EPA denies there is any such qualitative difference. Mandating electric vehicles is just another way to prescribe emission controls, whether "designed as complete systems" or "devices to prevent or control such pollution," the agency argues.38 But that is tantamount to saying that an EV is a pollution control device for gasoline-powered vehicles, which is nonsensical. [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

Petitioners explain:

38 EPA's Answering Brief, p. 40.

The component parts of an electric vehicle, such as their batteries, are not add-in devices that block the emission of pollution or minimize pollution that would otherwise occur. [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

They are integral to the basic functioning of the vehicle, which does not emit the relevant pollutant in the first place.39 [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

39 Petitioners' Reply Brief, pp. 28-29.

Although not mentioned by petitioners, the claim that EVs are pollution control devices for gasoline-powered vehicles bears a striking resemblance to the EPA's claim in 2012 that natural gas combined cycle (NGCC) power plants are the "best system of emission reduction" (BSER) for coal power plants. Based on that determination, the EPA proposed to establish CO_2 emission standards that no commercially-viable coal power plant could meet.40 [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

40 EPA, Standards of Performance for Greenhouse Gas Emissions for New Stationary Sources: Electric Utility Generating Units, Proposed Rule, 77 FR 22392, April 13, 2012, https://www.govinfo.gov/content/pkg/FR-2012-04- 13/pdf/2012-7820.pdf. For new coal power plants, the EPA proposed "a standard of 1,000 pounds of CO_2 per megawatt-hour (lb. CO_2/ MWh), based on the performance of widely used natural gas combined cycle (NGCC) technology." The emission rate of new efficient ("supercritical") coal power plants was much higher—1,800 lbs. CO_2/MWh (77 FR 22394). New coal plants could comply only by installing carbon capture and storage (CCS) technology. However, the levelized cost of a new coal power plant was already higher than that of a new NGCC unit (77 FR 22413). The standards seemed contrived to render new coal generation uneconomic.

The EPA had to drop that proposal because it effectively banned investment in new coal generation—a policy Congress had not approved and which would have been dead on arrival if proposed in legislation. Classifying EVs as pollution control devices for gasoline-powered cars is as contorted as classifying NGCC power plants as emission reduction systems for coal power plants. [EPA-HQ-OAR-2022-0829-0611, pp. 7-10]

The IRA Does Not Override West Virginia

One week after President Biden signed the IRA,41 Senate Environment and Public Works Chairman Tom Carper (D-Del.), Harvard Law professor Jody Freeman, and other unnamed "experts" told the New York Times that "Democrats designed" certain IRA provisions to undercut West Virginia. Supposedly, those provisions supply "clear" language authorizing "aggressive" GHG regulations, including California's ZEV mandates. 42 [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

41 Public Law 117–169, August 16, 2022, https://www.congress.gov/117/plaws/publ169/PLAW-117publ169.pdf.

42 Lisa Friedman, "Democrats Designed the Climate Law to be a Game Changer. Here's How," New York Times, August 22, 2022, https://www.nytimes.com/2022/08/22/climate/epa-supreme-court-pollution.html,

To its credit, the proposal does not affirm that viewpoint, but perhaps because it says nothing about West Virginia. The proposal details the "clean vehicle" "incentives" in the BIL 43 and IRA, and touts those statutes as "pivotal milestones in the creation of a broad-based infrastructure instrumental to the expansion of clean transportation, including light-and medium-duty zero-emission vehicles."44 Careless readers may infer that the EPA is simply proposing to effectuate congressional intent. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

43 Public Law 117–58, November 15, 2021, https://www.congress.gov/117/plaws/publ58/PLAW-117publ58.pdf.

44 88 FR 29196.

For the record, the BIL and IRA do not enlarge the scope of the EPA's regulatory authorities under the Clean Air Act. The BIL mentions the Clean Air Act three times: [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

-BIL Section 11115 establishes a "Congestion mitigation and air quality improvement program" (CMAQI) and stipulates that eligible projects must use "verified technologies" as "defined in section 216 of the Clean Air Act." [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

-BIL Section 11516 requires the Comptroller General to report on the CMAQI program's progress with "respect to attainment or maintenance of national ambient air quality standards under section 109 of the Clean Air Act." [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

-BIL Section 71101 amends the 2005 Energy Policy Act's Clean School Bus program to define a zero-emission school bus as one that has zero exhaust emissions of "any air pollutant that is listed pursuant to section 108(a) of the Clean Air Act (42 U.S.C. 7408(a)) (or any precursor to such an air pollutant.)" [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

Clearly, the BIL does not amend the Clean Air Act.

Six IRA provisions expressly amend the Clean Air Act, lending a superficial plausibility to Carper's theory. However, all those provisions are fiscal in nature; none expands or otherwise modifies existing CAA regulatory authority: [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

-IRA Section 60101 establishes a "Clean heavy-duty vehicles" program, authorizing up to $600 million in grants, rebates, and contracts for zero-emission heavy-duty vehicles, infrastructure, and workforce training. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

-IRA Section 60102 authorizes grants to reduce air pollution at ports—up to $2.25 billion through 2027 for the purchase and installation of zero-emission port equipment. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

-IRA Section 60103 establishes a "Greenhouse gas reduction fund," authorizing billions of dollars in support for States, municipalities, and tribal governments to "deploy or benefit from zero-emission technologies, including distributed technologies on residential rooftops, and to carry out other greenhouse gas emission reduction activities." [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

-IRA Section 60107 establishes a Low Emission Electricity Program, authorizing $17 million in grants and technical assistance to each of four groups—households, low-income communities, industries, and State and Tribal governments—for the purpose of reducing electricity-related emissions. The provision also authorizes $1 million for program monitoring, and $18 million for EPA efforts to ensure reductions are achieved. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

-IRA Section 60113 establishes the "Methane emissions reduction program," authorizing up to $850 million in "grants, rebates, contracts, loans, and other activities of the Environmental Protection Agency for the purposes of providing financial and technical assistance to owners and operators of applicable facilities." [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

-IRA Section 60114 authorizes billions of dollars in "greenhouse gas air pollution planning grants" to state governments. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

-IRA Section 60201 authorizes billions of dollars in "environmental and climate justice block grants." [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

In short, where the IRA amends the CAA, it authorizes subsidies, not mandates. The amending provisions create new carrots, but no new sticks.45 [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

45 For example, the IRA Low Emission Electricity Program is a non-regulatory substitute for policies President Biden could not persuade Congress to enact: a national clean energy standard, mandating a nationwide transition to 100 percent zero-emission electricity, and a Clean Electricity Performance Program, imposing tax penalties on utilities that fail to decarbonize according to a national schedule. See Ashley J. Lawson, "Clean Energy Standards: Selective Issues for the 117th Congress," Congressional Research Service, November 2, 2021, https://crsreports.congress.gov/product/pdf/R/R46691, and Ben Adler, "Biden's emission pledge hanging by a thread after Manchin's climate budget cut," October 21, 2021, Yahoo News, https://news.yahoo.com/biden-emissions-pledge-hanging-by-a-thread-after-manchins-climate-change-budget-cut-090056653.html.

Sen. Carper, Prof. Freeman, and the other "experts" interviewed by the Times surely know that post-enactment elucidation of a statute's meaning carries little to no weight in ascertaining congressional intent. 46 As it happens, the actual legislative history Carper made on August 6, 2022 when debating the IRA on the Senate floor before passage, contradicts the post-hoc spin he later shared with the Times. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

46 And whatever interpretive force one attaches to legislative history, the Court normally gives little weight to statements, such as those of the individual legislators, made after the bill in question has become law." Barber v. Thomas, 560 U.S. 474, 486 (2010). "The Court has previously found the post-enactment elucidation of the meaning of a statute to be of little relevance in determining the intent of the legislature contemporaneous to the passage of the statute." Edwards v. Aguillard, 482 U.S. 578, 596 n.19 (1987). "This is a good example of why floor statements by individual legislators rank among the least illuminating forms of legislative history." N.L.R.B. v. SW Gen., Inc., 580 U.S. 288, 137 S. Ct. 929, 943 (2017).

Only once during the day-long Vote-A-Rama, in a two-minute exchange between Sens. Shelley Capito (R-W.Va.) and Carper, did senators debate the IRA's potential impact on West Virginia v. EPA. The exchange occurs on page 4178 of the Congressional Record.47 [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

47 Congressional Record, Senate, August 6, 2022, p. 4178, https://www.congress.gov/117/crec/2022/08/06/168/133/CREC-2022-08-06-senate.pdf.

Sen. Capito offered an amendment to strike what was then IRA Sec. 60105(g), which would appropriate $45 million for the EPA "to carry out" CAA Section 111 and eight other sections "with respect to greenhouse gases." Here is the text:
(G) OTHER ACTIVITIES – In addition to amounts otherwise available, there is appropriated to the Administrator of the Environmental Protection Agency for fascial year 2022, out of any money in the Treasury not otherwise appropriated, $45,000,000, to remain available until September 30, 2031, to carry out, with respect to greenhouse gases, sections 111, 115, 163, 177, 202, 211, 213, 231, and 612 of the Clean Air Act (42 U.S.C. 7411, 7415, 7475, 7507, 7521, 7545, 7547, 7571, and 7671k). [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

Capito warned that Sec. 60105(g) would create talking points for EPA lawyers and environmental groups "when they try and convince courts to uphold future overreaching climate regulations," such as the CPP. Sen. Carper countered that Section 60105(g) "would fund the EPA to use its existing narrow Clean Air Act authorities to address greenhouse gas emissions."48 [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

48 Emphasis added.

In short, before passage, Sen. Carper effectively denied Sec. 60105(g) would reverse or undercut West Virginia. Rather, the IRA language would fund the EPA's use of "existing narrow" CAA authorities. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

Although Capito's amendment lost on a 50-50 vote, Section 60105(g) was later deleted on a point of order. That means the final IRA does not even contain a section authorizing the EPA to use "existing narrow" regulatory authorities with respect to greenhouse gases. And, as noted above, all the CAA amendments in the IRA are fiscal policy provisions, which as such cannot create or expand any CAA regulatory authority. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

Congress Prohibits NHTSA, the Only Agency Authorized to Establish Fleetwide-Average Standards, from Regulating Gasoline-Powered Vehicles Out of the Market. [EPA-HQ-OAR-2022-0829-0611, p. 18]

In 1992, Congress prohibited NHTSA from considering the fuel economy of EVs and other alternative vehicles when promulgating CAFE standards. The clear intent was to ensure that NHTSA does not set fleet-average standards that no gasoline-powered vehicle can meet. Petitioners explain: [EPA-HQ-OAR-2022-0829-0611, p. 18]

In the Energy Policy Act of 1992, Congress directed NHTSA to set fuel-economy standards based on averages, but prohibited NHTSA from setting fuel-economy standards that average in the fuel economy of electric vehicles. See Pub. L. No. 102-486 §§ 302,403, 106 Stat. 2776, 2870-2871, 2876 (later codified at 49 U.S.C. § 32902(h)). [EPA-HQ-OAR-2022-0829-0611, p. 18]

Petitioners spotlight the key point:

This prohibition bars NHTSA from doing exactly what EPA is doing here: misusing its regulatory authority to force a transition from conventional vehicles to electric vehicles by artificially tightening the “average” standard a fleet must meet. Of course, when Congress finalized the language of Section 202(a)(l) in 1977, it had no need to explicitly block EPA from considering electric vehicles, because it did not contemplate that EPA would set emission standards using averaging in the first place (or that EPA would be setting standards for greenhouse gases). The prohibition on NHTSA nevertheless underscores just how far EPA is reaching here: it is straining statutory language to seize a power that Congress expressly denied to a sister agency that actually has authority to promulgate fleetwide-average standards.71 [EPA-HQ-OAR-2022-0829-0611, p. 18]

71 Petitioners’ Initial Brief, pp. 61-62.

V. Conclusion

The EPA observes that the “levels of stringency in this proposal continue the trend of increased emissions reductions which have been adopted by prior EPA rules.”72 However, that does not rescue the proposal from legal peril. If petitioners’ argument is correct, the EPA’s MY 2023- 2026 standards are also de-facto EV mandates, which as such trigger the major questions doctrine. Moreover, the proposed standards, being fleetwide-average standards, are impermissible under the Clean Air Act. [EPA-HQ-OAR-2022-0829-0611, p. 18]

72 88 FR 29188.

Organization: Elders Climate Action

B. Failure to Consider Relevant Factors is Arbitrary and Capricious and Inconsistent with Law.

EPA refers to the Administrator’s 2009 Endangerment Finding as the basis for promulgating standards for GHG emissions, but makes no reference to U.S. obligation to achieve its NDC under the U.N. Framework Climate Convention, or the declaration by the President to achieve a net zero economy by 2050. In fact, EPA makes passing reference to the IPCC report as a source of science that supports the need for GHG reductions from the transport sector, but identifies no environmental objective and no GHG emission reduction target as the motivating factor underlying the rulemaking goal of its rulemakings for either the multi-pollutant L/MD vehicle rule or the GHG rule. [EPA-HQ-OAR-2022-0829-0737, p. 6]

We contend that the proposed rule is arbitrary, capricious and inconsistent with law because – [EPA-HQ-OAR-2022-0829-0737, p. 6]

1. The failure to explain the environmental and/or air quality objective of the rule violates the obligation to describe the purpose of the rule under the APA. [EPA-HQ-OAR-2022-0829-0737, p. 6]

2. The failure to consider –[EPA-HQ-OAR-2022-0829-0737, p. 6]

a) the extent that GHG emissions from the transport sector contribute to the endangerment that the Administrator determined is the basis for conducting the rulemaking, [EPA-HQ-OAR-2022-0829-0737, p. 6]

b) the extent to which those emissions must be reduced to protect the public health and welfare from the risks identified in the endangerment finding; [EPA-HQ-OAR-2022-0829-0737, p. 6]

c) the extent that the proposed rule will achieve the reductions needed to protect public health and the general welfare from the dangerous effects of GHGs that underlie the endangerment finding; and [EPA-HQ-OAR-2022-0829-0737, p. 6]

d) the failure to consider and evaluate alternatives that could achieve the GHG emission reductions needed to protect the public health and welfare from adverse effects; [EPA-HQ-OAR-2022-0829-0737, p. 6]

is a failure to consider relevant factors required by the CAA. [EPA-HQ-OAR-2022-0829-0737, p. 6]

3. It is also arbitrary and capricious to –[EPA-HQ-OAR-2022-0829-0737, p. 6]

a) not identify the NOx and VOC reductions from the transport sector that are needed to attain the NAAQS in all nonattainment areas by the attainment deadline; [EPA-HQ-OAR-2022-0829-0737, p. 6]

b) not identify and consider alternative NOx and PM emission standards that would be needed to attain the ozone and PM2.5 NAAQS in all nonattainment areas by the attainment deadline; and [EPA-HQ-OAR-2022-0829-0737, p. 6]

c) not analyze the availability of vehicle control technologies capable of achieving zero NOx and PM emissions with respect to the economic and technological factors prescribed in the Act for the purpose of determining the feasibility of setting standards under CAA section 202 that would be adequate to achieve the statutory goal of attainment by the statutory deadlines, and thereby informing the Administrator so that he could properly exercise his statutory obligation to determine what standards are necessary and appropriate under the Act. [EPA-HQ-OAR-2022-0829-0737, p. 6]

B. Needed GHG Reductions Cannot Be Achieved Without Zero Emission Standard.

EPA does not investigate a ZEV sales mandate for the years 2027-2029 with respect to GHG emissions reductions, but the Rhodium Group estimates that light duty ZEV sales would need to reach 99% of total LDV sales by 2030 to achieve a zero emission fleet by 2045 (Fig. 2). Since L/MDVs have longer useful lives than LDVs, converting the L/MDV fleet to zero emission will require more aggressive regulatory approaches. Assuming the electric power sector achieves zero emissions by 2035 as President Biden has proposed, the L/MDV portion of the transport sector could achieve zero emissions by 2050 if a zero emission standard applies to all new L/MDVs by 2031. [EPA-HQ-OAR-2022-0829-0737, pp. 19-20]

In its Regulatory Impact Assessment for the SAFE 2 rule, at 2-15, EPA acknowledges that -- … long-term GHG reduction goals will require a far greater penetration of ZEVs than this proposal would require through MY2026. The need for substantial increases in fleet penetration of ZEVs over the long term is supported by the recommendations of the National Academy of Sciences, which states in its 2021 Light-duty Vehicle Technology Assessment: "The agencies should use all their delegated authority to drive the development and deployment of ZEVs, because they represent the long-term future of energy efficiency, petroleum reduction, and greenhouse gas emissions reduction in the light-duty fleet". [EPA-HQ-OAR-2022-0829-0737, pp. 19-20]

But EPA does not disclose what its “long-term GHG reduction goals” are for either LDVs or L/MDVs, how it intends to achieve them, or whether and how the current rulemaking contributes to achieving those goals. The reasonableness of the current proposal turns on whether EPA 1) is committed to achieving the GHG reductions identified by the IPCC as necessary to avoid the dire public health and environmental consequences of warming greater than 1.5°C, 2) recognizes that zero emissions from on-road vehicles are a necessary component of the President’s national policy of transforming the U.S. into a zero emission economy by 2050, and 3) can establish how the current proposal contributes to a strategy designed to achieve those objectives. [EPA-HQ-OAR-2022-0829-0737, pp. 19-20]

In the absence of any consideration of these factors and an explanation by the Agency of how it has addressed those factors in developing its proposed decision in this rulemaking, the current proposal fails to consider relevant factors, fails to provide a rational basis for the proposal, and is arbitrary and capricious. [EPA-HQ-OAR-2022-0829-0737, pp. 19-20]

Action requested:

Elders Climate Action requests that EPA revise the standards for HDVs to set a zero emission standard for nitrogen oxides (NOx), PM2.5 and CO2 for the classes of L/MDVs or types of L/MDVs that operate in duty cycles for which zero emission power trains are currently in use or which EPA expects will be available by 2027. [EPA-HQ-OAR-2022-0829-0737, pp. 1-2]

ECA requests that EPA use its authority to set emission standards to –

1) respond meaningfully to the urgency of the climate crisis that threatens to destroy the future for our children and grandchildren by destroying or disrupting the natural systems upon which all life, including human civilization, relies to thrive and survive, to avoid turning the planet into an unsustainable Hell on Earth; [EPA-HQ-OAR-2022-0829-0737, pp. 1-2]

2) optimize the emission reductions needed from L/MD on-road vehicles to ensure attainment of the ozone and PM2.5 NAAQS within the deadlines established by the CAA rather than delaying attainment until 2045 for some areas, and not attaining at all in the New

York/Connecticut?New Jersey, Houston, South Coast and San Joaquin Valley nonattainment areas; and [EPA-HQ-OAR-2022-0829-0737, pp. 1-2]

3) to end the inequitable and unlawful disparate impact on BIPOC and low income frontline communities who are most exposed to emissions from L/MDVs in violation of Title VI of the Civil Rights Act and thereby suffer "disproportionately high and adverse human health or environmental effects on minority populations and low-income populations" in violation of EO 12,898. [EPA-HQ-OAR-2022-0829-0737, pp. 1-2]

A. EPA's Proposed Standards Fail to Meet the Global Climate, and National Air Quality and Public Health Emergencies.

EPA's proposed light and medium duty vehicle (L/MDV) rule will allow millions of polluting light and medium duty vehicles to be sold in the U.S. in 2027 and beyond without requiring any manufacturer to sell a single zero emission vehicle. The proposed standards fail to – [EPA-HQ-OAR-2022-0829-0737, p. 2]

1) implement the call from the Intergovernmental Panel on Climate Change for immediate action to transform the transportation sector to zero CO2 emissions as soon as possible to achieve a net zero economy by 2050, with half of that reduction by 2030 to avoid the worst impacts of the looming climate disaster; [EPA-HQ-OAR-2022-0829-0737, p. 2]

2) Implement the President's commitment in E.O. 14008 to transform the U.S. to a "net zero" economy by 2050; [EPA-HQ-OAR-2022-0829-0737, p. 2]

3) fulfill the U.S. "nationally declared contribution" (NDC) submitted at COP 26 to achieve a 50-52% reduction in CO2 by 2030; and [EPA-HQ-OAR-2022-0829-0737, p. 2]

4) achieve the reductions in ozone forming precursors (nitrogen oxides (NOx) and volatile organic compounds (VOCs)) needed to attain the ozone NAAQS in all ozone nonattainment areas by the deadline enacted in the CAA. [EPA-HQ-OAR-2022-0829-0737, p. 2]

1. CO2 Reductions Fall Far Short of the Reductions Needed to Stabilize the Climate.

The transportation sector is the leading source of climate pollution in the US, but between now and 2030 the proposal fails to make any significant progress toward ending CO2 emissions from transport to avoid the worst consequences of a warming climate. The IPCC reports make clear that the global mean temperature will rise much more than 1.5o C above the pre-industrial baseline if we fail to reduce CO2 emissions by half in 2030 on the path to "net zero" by 2050. [EPA-HQ-OAR-2022-0829-0737, pp. 2-4]

Together, the proposed L/MD rule and HD rule will reduce on-road emissions in 2030 by less than 4% from 2021 levels. The L/MD rule claims to achieve only a 47% reduction by 2055. Both rules guarantee that the US will fail to meet its 50% CO2 reduction target by 2030 that was submitted as our NDC, and will make it impossible for the President to fulfill his promise to achieve a "net zero" economy by 2050. [EPA-HQ-OAR-2022-0829-0737, pp. 2-4]

Reflecting the science reported by the IPCC, the U.S. NDC commits to reducing CO2 economy- wide 50-52% from 2005 levels by 2030. To meet the 2030 economy-wide 50% reduction target, and assuming that the electric power sector achieves the 80% reduction target in 2030 set by the President, U.S. transport emissions must be reduced about 800 million MT from

1800 million MT in 2021 to 1000 million MT by 2030. [EPA-HQ-OAR-2022-0829-0737, pp. 2-4]

Nearly all of the CO2 reductions from the transportation sector must be achieved by replacing on-road internal combustion engine (ICE) vehicles with zero emission vehicles (ZEVs) because zero emission technologies are not yet commercially available for aviation or ocean-going vessels, and rail is too small a contributor to national CO2 to achieve meaningful reductions. EPA's CO2 emissions inventory shows that Heavy duty (on-road diesel) vehicles emitted 430 million MT (24%), and LD (on-road gasoline) vehicles about 1020 million MT (57%) of CO2 from the transport sector, for a total of 1450 million MT from on-road vehicles in 2021. To reduce on-road CO2 emissions by close to 800 million MT by 2030, more than half of HD vehicles (215 MMT) and 70% of LD vehicles (714 MMT) need to be replaced with ZEVs by 2030, and 80% of the electric power used to charge the vehicles must be zero emissions (215 + 714 = 929 x .8 = 743 MMT). [EPA-HQ-OAR-2022-0829-0737, pp. 2-4]

Estimates reported by EPA in the proposed HD show that the rule will reduce CO2 from trucks about 12 million MT by 2030, or by 2.9% from 2021 levels. EPA estimates that the proposed L/MD rule will induce (but not require) manufacturers to achieve 67% ZEV sales by 2032, with about 60% of new vehicle sales by 2030. But when increased fleet size is accounted for, new ZEVs will replace only about 5% of ICE vehicles by 2030, and reduce CO2 from LD and MD vehicles by 42 million MT (EPA NPR, Table 135), or 4% below 2021 levels. Alternative 1, the only more stringent option proposed for comment, would reduce CO2 49 million MT by 2030, or nearly 5% below 2021 emissions. [EPA-HQ-OAR-2022-0829-0737, pp. 2-4]

Together, the HD rule and the LD/MD rules in 2030 would reduce CO2 from on-road vehicles by 54 MMT compared to no action, for a total reduction of (54/1450) 3.7% from 2021 emissions. Your proposal allows millions more new gasoline and diesel cars and medium duty trucks and buses to be added to the U.S. vehicle fleet between 2027 and 2032 that will remain on the road for twenty years locking-in billions of tons of additional CO2. [EPA-HQ-OAR-2022-0829-0737, pp. 2-4]

The effect of these emissions will be to prevent the U.S. from honoring its obligation under the U.N. Climate Framework Convention to achieve the CO2 reductions promised in its NDC [EPA-HQ-OAR-2022-0829-0737, pp. 2-4]

In its 2022 heavy duty rule, EPA acknowledged that the proposed rule reduces CO2 emissions by only 221,000 metric tons (MT) (0.75%) compared to the current rule (from 29.088 million MT to 28.867 million MT in 2027), allowing new L/MDVs sold in 2027, 2028 and 2029 to emit an estimated 86.6 million MT annually after 2029, totaling 1.78 billion metric tons of CO2 over the 20 year useful life of those L/MDVs. CO2 from these vehicles would be equivalent to adding 21 new large coal-fired power plants. [EPA-HQ-OAR-2022-0829-0737, pp. 2-4]

The proposed L/MD rules for the 2027-2032 MYs, will still allow more than 90% of the CO2 that would be emitted under the current GHG standards for those model years. Total CO2 emissions from future vehicles will double these emissions for each additional three to four model years that these standards continue to apply after 2032. [EPA-HQ-OAR-2022-0829-0737, pp. 2-4]

CO2 from these model years will effectively prevent the US from achieving the IPCC's call for a 50% cut in CO2 by 2030, and make it impossible to achieve the zero emission economy promised by President Biden by 2050. These vehicles will remain on the road for at least 20 years, add to CO2 and prevent the U.S. from achieving the CO2 reductions identified by the Intergovernmental Panel on Climate Change (IPCC) as necessary to keep within the 1.5o C target to avoid a climate catastrophe. [EPA-HQ-OAR-2022-0829-0737, pp. 2-4]

A. To Stabilize the Climate as Quickly as Possible, EPA Must Set a Zero Emissions Standard for GHG Emissions from New L/MDVs, and Begin Phasing in the Standard With the 2027 Model Year. [EPA-HQ-OAR-2022-0829-0737, p. 11]

As discussed above in section II, the Clean Air Act requires EPA to set emission standards for L/MDVs that "reflect the greatest degree of emission reduction achievable…."[EPA-HQ-OAR-2022-0829-0737, p. 11]

Given the science informing the world that the climate cannot be stabilized short of achieving "net zero" GHG emissions, and the President's commitment to achieving a net zero economy by 2050, we ask the Administrator to make the determination that emissions of both GHGs and precursors to the criteria pollutants PM and ozone emitted from light duty vehicles must be reduced to zero to protect the public health and welfare from the many adverse effects of climate warming. [EPA-HQ-OAR-2022-0829-0737, p. 11]

The Act provides that "[a]ny such [standard] under this subchapter may provide for a phase-in of the standard."3 We ask the Administrator to begin phasing in a zero emission standard by establishing a sales mandate that requires each manufacturer to achieve ZEV sales during the 2027 MY that are comparable to CARB's ACT rule with the goal of achieving 100% L/MDV ZEV sales by 2035 in order to achieve zero emissions from on-road vehicles by 2050. [EPA-HQ-OAR-2022-0829-0737, p. 11]

3 Id.

B. Needed GHG Reductions Cannot Be Achieved Without Zero Emission Standard.

EPA does not investigate a ZEV sales mandate for the years 2027-2029 with respect to GHG emissions reductions, but the Rhodium Group estimates that light duty ZEV sales would need to reach 99% of total LDV sales by 2030 to achieve a zero emission fleet by 2045 (Fig. 2). Since L/MDVs have longer useful lives than LDVs, converting the L/MDV fleet to zero emission will require more aggressive regulatory approaches. Assuming the electric power sector achieves zero emissions by 2035 as President Biden has proposed, the L/MDV portion of the transport sector could achieve zero emissions by 2050 if a zero emission standard applies to all new L/MDVs by 2031. [EPA-HQ-OAR-2022-0829-0737, pp. 19-20]

In its Regulatory Impact Assessment for the SAFE 2 rule, at 2-15, EPA acknowledges that --

… long-term GHG reduction goals will require a far greater penetration of ZEVs than this proposal would require through MY2026. The need for substantial increases in fleet penetration of ZEVs over the long term is supported by the recommendations of the National Academy of Sciences, which states in its 2021 Light-duty Vehicle Technology Assessment: "The agencies should use all their delegated authority to drive the development and deployment of ZEVs, because they represent the long-term future of energy efficiency, petroleum reduction, and greenhouse gas emissions reduction in the light-duty fleet". [EPA-HQ-OAR-2022-0829-0737, pp. 19-20]

But EPA does not disclose what its “long-term GHG reduction goals” are for either LDVs or L/MDVs, how it intends to achieve them, or whether and how the current rulemaking contributes to achieving those goals. The reasonableness of the current proposal turns on whether EPA 1) is committed to achieving the GHG reductions identified by the IPCC as necessary to avoid the dire public health and environmental consequences of warming greater than 1.5°C, 2) recognizes that zero emissions from on-road vehicles are a necessary component of the President’s national policy of transforming the U.S. into a zero emission economy by 2050, and 3) can establish how the current proposal contributes to a strategy designed to achieve those objectives. [EPA-HQ-OAR-2022-0829-0737, pp. 19-20]

In the absence of any consideration of these factors and an explanation by the Agency of how it has addressed those factors in developing its proposed decision in this rulemaking, the current proposal fails to consider relevant factors, fails to provide a rational basis for the proposal, and is arbitrary and capricious. [EPA-HQ-OAR-2022-0829-0737, pp. 19-20]

Organization: Energy Innovation

The EPA’s statutory authority under Section 202(a)(1) of the CAA supports and enables the adoption of the most stringent standards feasible: “‘the Administrator shall by regulation prescribe (and from time to time revise)…standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles… which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.’”19 We concur with the EPA’s analysis that the proposed rule (and Alternative 1) are aligned with this statutory directive, offering technologically feasible and cost-effective options to reduce harmful emissions over the timeframe the standards would be in place. [EPA-HQ-OAR-2022-0829-0561, p. 8]

19 U.S. EPA, “Proposed Rules,” May 5, 2023, 29231-2 and 29186.

Organization: Environmental. and Public Health Organizations

In addition, Congress affirmed its commitment to achieving ambitious reductions in GHG and criteria pollutant emissions from motor vehicles in the Bipartisan Infrastructure Law (BIL)2 and the Inflation Reduction Act (IRA),3 which provide unprecedented financial support for ZEV technology and infrastructure. [EPA-HQ-OAR-2022-0829-0759, p. 8]

2 Infrastructure Investment and Jobs Act of 2021, Pub. L. No. 117–58, 135 Stat. 429 (2021), www.congress.gov/bill/117thcongress/house-bill/3684/text.

3 Inflation Reduction Act of 2022, Pub. L. No. 117–169, 136 Stat. 1818 (2022), www.congress.gov/bill/117th-congress/house-bill/5376/text.

II. EPA Must Establish Strong Emission Standards to Meet Its Obligations Under the Clean Air Act. [EPA-HQ-OAR-2022-0829-0759, p. 9]

To carry out its statutory mandate, EPA must promulgate emission standards that protect public health and welfare by minimizing harmful air pollution. In passing the Clean Air Act, Congress found that “the growth in the amount and complexity of air pollution brought about by urbanization, industrial development, and the increasing use of motor vehicles, has resulted in mounting dangers to the public health and welfare."5 Congress thus declared that the express purpose of the Clean Air Act is to "protect and enhance the quality of the Nation's air resources so as to promote the public health and welfare."6 As detailed throughout this comment letter, EPA must use this clear statutory authority to meet its mandate to protect public health and welfare by finalizing standards more stringent than it proposed. [EPA-HQ-OAR-2022-0829-0759, p. 9]

5 42 U.S.C. § 7401(a)(2).

6 Id. § 7401(b)(1). Congress affirmed this goal in the 1977 amendments to the Clean Air Act, which "emphasize[d] the preventive or precautionary nature of the act, i.e., to assure that regulatory action can effectively prevent harm before it occurs; [and] emphasize[d] the predominant value of protection of public health." Lead Industries Ass'n v. EPA, 647 F.2d 1130, 1152 (D.C. Cir. 1980) (quoting H.R. Rep. No. 95-294, 95th Cong., 1st Sess. 49 (1977)); see also 74 Fed. Reg. 66496, 66507 (Dec. 15, 2009).

A. Section 202 requires EPA to set standards that protect public health and welfare from the dangers of GHGs, criteria pollutants, and air toxics. [EPA-HQ-OAR-2022-0829-0759, p. 9]

Section 202(a)(1)7 of the Clean Air Act directs EPA to promulgate motor vehicle standards that "prevent or control" emissions of air pollutants that "cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare."8 The criteria and toxic pollutants at issue in this Proposal9 have long been subject to regulation based on their harmful effects. And the Supreme Court held in Massachusetts v. EPA that Congress clearly provided EPA with "the statutory authority to regulate the emission of [greenhouse] gases from new motor vehicles" pursuant to Section 202(a)(1)–(2).10 In response to this decision, in 2009 EPA found that greenhouse gas emissions from motor vehicles "contribute to the total greenhouse gas air pollution, and thus to the climate change problem, which is reasonably anticipated to endanger public health and welfare."11[EPA-HQ-OAR-2022-0829-0759, p. 9]

7 EPA's specific statutory authority to set standards for emissions of criteria pollutants from medium-duty vehicles is addressed in Section VIII.B.

8 42 U.S.C. § 7521(a)(1).

9 The terms "Proposal" and "Proposed Standards" are used interchangeably to refer to this proposed rulemaking and the standards that EPA is proposing to establish.

10 549 U.S. 497, 532 (2007).

11 74 Fed. Reg. at 66499.

Given that the danger to public health and welfare from GHG emissions continues to intensify, and in light of the ongoing harm from criteria pollutant and air toxics emissions, EPA must use its authority under Section 202(a) to set strong emission standards. Section 202(a)(2) provides that standards promulgated pursuant to Section 202(a)(1) "shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology."17 As the D.C. Circuit has recognized, this language embodies Congress's intent that EPA "press for the development and application of improved technology rather than be limited by that which exists today."18 Here, adopting more stringent standards would not require EPA to press for the development of new technologies; zero-emission and combustion vehicle technologies have reached technological maturation and are on the market for light- and medium-duty vehicles. Because greater deployment of those technologies within the fleet is feasible and readily achievable, EPA must go further to address the dangers to public health and welfare wrought by GHG, criteria pollutant, and air toxics emissions from these vehicles—specifically, by finalizing Alternative 1 with a steeper increase in stringency after 2030.19 As detailed in Section III below, greenhouse gas emissions from light- and medium-duty vehicles contribute massively to the worsening climate crisis, while criteria pollutant and air toxics emissions from those vehicles continue to threaten public health. EPA should therefore choose a regulatory response that will better address the pollution responsible for the "endanger[ment]" that these vehicles pose to public health and welfare.20 [EPA-HQ-OAR-2022-0829-0759, pp. 10-11]

17 Id. § 7521(a)(2).

18 NRDC v. EPA, 655 F.2d 318, 328 (D.C. Cir. 1981) (quoting S. Rep. No. 91-1196 (1970)).

19 Granted, Section 202(a) provides discretion to EPA as to the exact manner of "prevent[ing] or control[ing]" emissions of dangerous air pollutants. And Section 202 places certain limitations on EPA in setting standards. EPA's standards pursuant to Section 202(a) must allow lead time for technical feasibility and must give "appropriate consideration to the cost of compliance." 42 U.S.C. § 7521(a)(2). Accounting for these requirements, EPA must promulgate standards that adequately address the danger to public health and welfare caused by the pollutant at issue.

20 See Massachusetts, 549 U.S. at 532; 74 Fed. Reg. at 66525–26.

Congress directed EPA, the expert agency with authority over air pollution from vehicles and engines, to develop a record and apply the Section 202(a) criteria to the facts to develop standards.21 In doing so, the Agency is "not obliged to provide detailed solutions to every engineering problem, but ha[s] only to identify the major steps for improvement and give plausible reasons for its belief that the industry will be able to solve those problems in the time remaining."22 Indeed, courts have consistently upheld EPA's vehicle and engine regulations over manufacturers' objections about technological readiness.23 And manufacturers have consistently risen to the challenge, complying with the very standards they previously claimed were impossible to meet.24). [EPA-HQ-OAR-2022-0829-0759, p. 11]

21 See Coal. for Responsible Regulation, 684 F.3d at 126.

22 Nat'l Petrochemical & Refiners Ass'n v. EPA, 287 F.3d 1130, 1136 (D.C. Cir. 2002) (cleaned up).

23 Id. at 1136–41 (upholding NOx and PM regulations predicated on future developments in pollution control technology); NRDC v. Thomas, 805 F.2d at 428–34 (upholding PM regulation over manufacturers' concerns about the feasibility of trap-oxidizer technology); NRDC v. EPA, 655 F.2d at 331–36 (same).

24 See, e.g., 87 Fed. Reg. 17414, 17536 (explaining that manufacturers deployed technologies that EPA had not predicted to meet the 2001 heavy-duty criteria pollutant standards, which they had unsuccessfully challenged in National Petrochemical & Refiners Association

B. The Clean Air Act authorizes EPA to rely on zero-emission technologies in standard-setting. [EPA-HQ-OAR-2022-0829-0759, p. 11]

We agree with EPA's assessment of its statutory authority to set vehicle emission standards that rely on the full spectrum of technologies to prevent and control tailpipe pollution, including both zero-emission and combustion vehicle technologies.25 As set forth in detail in the Proposal, the Clean Air Act authorizes EPA to consider zero-emission technologies when setting emission standards and to finalize standards at levels that will lead to greater deployment of ZEVs.26 Section 202(a) does not give preference to any particular emission control technology, propulsion system, or powertrain type.27 And far from enshrining the status quo or protecting the market share of polluting vehicles, Congress intended that EPA set standards that drive improvements in emission control technologies.28 Indeed, Congress was intensely interested in electrification and other emerging vehicle technologies as far back as the 1960s and 1970s, and it expected EPA to consider emission reductions that could be achieved through the use of alternative fuels and propulsion systems (including electrification) that control air pollution more effectively than combustion vehicle technologies.29 As “complete systems…to prevent” air pollution,30 ZEVs fall well within the scope of Section 202(a)(1).31 [EPA-HQ-OAR-2022-0829-0759, pp. 11-12]

25 See 88 Fed. Reg. at 29232-33.

26 See id. at 29231–33 (relying on statutory language, legislative materials, case law, and regulatory history).

30 42 U.S.C. § 7521(a)(1).

31 Section 202(a)(4), which references an “emission control device, system, or element of design,” 42 U.S.C. § 7521(a)(4)(A) (emphasis added), provides further evidence that Congress envisioned that EPA may consider, and that manufacturers may use, a wide variety of emission control technologies and approaches. Electrification is a “system” and an “element of” motor vehicle “design.”

Accelerating the deployment of zero-emission technologies through this rulemaking would also build on EPA’s long and consistent practice of both considering and incentivizing these technologies in its Section 202(a) rulemakings.32 EPA began doing so more than two decades ago when it finalized the “Tier 2” criteria pollutant standards.33 That rule required manufacturers to certify all new light-duty vehicles into one of eight emissions profiles, or “bins.”34 A sales-weighted average of those bins determined the manufacturer’s compliance with the fleet-average NOx standard.35 Bin 1 was designated for ZEVs.36 EPA recognized that including ZEVs in the fleet average would “provide a strong incentive” for manufacturers to develop and introduce ultra-clean vehicle technologies, serving as “a stepping stone to the[ir] broader introduction.”37 (EPA’s prediction has proven correct, as ZEVs have grown to comprise ever-greater portions of the light-duty38 and heavy-duty fleets39 since that time.) Later, in a series of GHG emission rulemakings spanning three presidential administrations, the Agency continued to include ZEVs in fleet average standards for light- and heavy-duty vehicles, as shown in the table below. EPA took the same approach in 2014 for its Tier 3 criteria pollutant standards for light-duty vehicles.40 [EPA-HQ-OAR-2022-0829-0759, pp. 12-13]

SEE ORIGINAL COMMENT FOR Table II.B-1: Electrification, fleet-average standards, and averaging, banking, and trading in prior GHG rulemakings41[EPA-HQ-OAR-2022-0829-0759, p. 13]

41 Reproduced from EPA Br. at 16.

Finally, we agree with EPA that recent actions by Congress reinforce the Agency’s authority to set emission standards that rely on and accelerate the deployment of zero-emission vehicle technologies.42 As members of Congress have emphasized, the BIL and IRA provide “a clear signal of Congress’ intent to support vehicle electrification and robust EPA authority to accelerate it.”43 By increasing the market penetration of ZEVs44 and significantly lowering the cost of zero-emission technologies, the BIL and IRA assist EPA in setting standards that will achieve ambitious reductions in GHG, criteria pollutant, and air toxics emissions.45 EPA should use its clear authority under the Clean Air Act to do so here by finalizing standards more stringent than it has proposed. [EPA-HQ-OAR-2022-0829-0759, pp. 13-14]

42 See 88 Fed. Reg. at 29233.

43 Carper & Pallone Amicus Br. at 29; see generally id. At 29-35.

44 As EPA notes, pre-IRA projections predicted that PEVs would make up nearly 40% of U.S. market share by 2030. 88 Fed. Reg. at 29189. In contrast, post-IRA projections by the International Council on Clean Transportation (ICCT) estimate that battery-electric vehicles will increase to 56 to 67% of market share in the U.S. by 2032. Id. at 29189 n.40.

Organization: Environmental Defense Fund (EDF) (1of 2)

II. EPA has authority to set standards under the Clean Air Act that ensure deep reductions in harmful pollution based on the availability of ZEV technologies.

EPA has clear authority to establish performance-based emission standards under Section 202(a)(1). EPA's approach, including setting performance-based standards, considering ZEVs, and continuing the longstanding use of averaging, banking, and trading (ABT), is consistent with the text and structure of the CAA and the history of EPA regulation of vehicular emissions under CAA Section 202(a). Moreover, the recent enactment of the IRA strongly reaffirms EPA's authority under the CAA and removes any doubt that EPA's actions here are fully consistent with Congress's will. [EPA-HQ-OAR-2022-0829-0786, p. 9]

The IRA and BIL both include myriad provisions that seek to support a transition to ZEV technology through funding of credits for vehicles, components, and critical infrastructure. These laws were passed with the knowledge that EPA was already setting standards under Section 202(a) that would increase ZEV proliferation and an intent to support those regulations.15 Congress' aim with the funding was to "combine[] new economic incentives to reduce climate pollution with bolstered regulatory drivers that will allow EPA to drive further reduction under its CAA authorities,"16 with the expectation that "future EPA regulations will increasingly rely on and incentivize zero-emission vehicles as appropriate."17 [EPA-HQ-OAR-2022-0829-0786, pp. 10-11]

15 The BIL was passed after EPA's 2023-2026 light-duty GHG standards, which rely on ZEV technology, had been proposed and the IRA was passed 9 months after they were finalized. Brief of Senator Thomas R. Carper and Representative Frank Pallone, Jr. as Amici Curiae in Support of Respondents, Texas v. EPA, No. 22-1031, 29 (D.C. Cir, Mar. 2, 2023), https://www.edf.org/sites/default/files/2023-03/Texas%20-%20Members%20of%20Congress%20%28Sen.%20Carper%20and%20Rep.%20Pallone%29.pdf (Attachment J).

17 168 Cong. Rec. at 880-02 (daily ed. Aug. 12, 2022) (statement of Rep. Pallone); see also Greg Dotson and Dustin J. Maghamfar, The Clean Air Act Amendments of 2022: Clean Air, Climate Change, and the Inflation Reduction Act, 53 ENV'T L. REP. 10017, 10030 (2023) ("The IRA directs EPA to support zero emission technologies for heavy-duty vehicles and port equipment, to reduce emissions in low-income and disadvantaged communities, as well as to support state ZEV requirements. This is a recognition of the evolving importance and availability of zero emission technologies."), https://www.eli.org/sites/default/files/files-pdf/53.10017.pdf (Attachment K).

Additionally, several provisions in the IRA directly affirm EPA's authority to consider ZEVs under Section 202(a). Section 60106 of the law provides $5 million for EPA "to provide grants to States to adopt and implement greenhouse gas and zero-emission standards for mobile sources pursuant to section 177 of the [CAA]."18 Section 177 allows other states to adopt California's vehicle emission standards, which must be at least as protective as the federal standards and meet certain other statutory requirements.19 As members of Congress explained in an amicus brief supporting EPA's MY 2023-2026 light-duty GHG standards, "Congress's explicit endorsement of states' use of Section 177 to enact 'greenhouse gas and zero-emission standards' clearly demonstrates its comfort with and support for state and federal standards that contemplate compliance through zero-emission vehicle manufacturing."20 [EPA-HQ-OAR-2022-0829-0786, p. 11]

18 Inflation Reduction Act of 2022, P.L. 117-1698 ,136 Stat. 2068-69 (2022).

19 42 U.S.C. § 7507, 7543(b).

20 Brief of Senator Thomas R. Carper and Representative Frank Pallone, Jr. as Amici Curiae in Support of Respondents, Texas v. EPA, No. 22-1031, 33 (D.C. Cir, Mar. 2, 2023); see also Greg Dotson and Dustin J.

Maghamfar, The Clean Air Act Amendments of 2022: Clean Air, Climate Change, and the Inflation Reduction Act, 53 ENV'T L. REP. 10017, 10030 (2023) ("[I]t is a necessary precondition [of the IRA's funding for zero-emission standards under section 177] that . . . EPA can establish zero emission standards pursuant to the CAA.").

The IRA also made amendments to the CAA affirming that Congress regards programs incorporating ZEV technology as an important aspect of EPA's mission to reduce air pollution under the law.21 Those amendments include adding a definition of "zero-emission vehicle" into the newly added CAA Section 132, which consists of a program of EPA grants and rebates towards the purchase of zero-emission heavy duty vehicles.22 In passing the IRA, Congress made clear that it "recognizes EPA's longstanding authority under CAA Section 202 to adopt standards that rely on zero emission technologies."23 [EPA-HQ-OAR-2022-0829-0786, p. 11]

21 Brief of Senator Thomas R. Carper and Representative Frank Pallone, Jr. as Amici Curiae in Support of Respondents, Texas v. EPA, No. 22-1031, 32 (D.C. Cir, Mar. 2, 2023) ("By incorporating these new programs into the Act's existing air pollution control framework, Congress clearly demonstrated that clean energy and zero- emission vehicle programs are central to the Act's implementation going forward.").

22 42 U.S.C. § 7432(d)(5); see also Inflation Reduction Act of 2022, P.L. 117-1698, 136 Stat. 2064-65 (2022) (creating new CAA section 133 to provide grants for "zero-emission port equipment or technology.").

23 168 Cong. Rec. E879–02, at 880 (daily ed. Aug. 26, 2022) (statement of Rep. Pallone).

Organization: Governing for Impact and Evergreen Action (GFI)

Our comment explains why the Proposed Rule, if finalized, would not implicate the Major Questions Doctrine ("MQD") under West Virginia v. E.P.A., the doctrine's landmark case.4 Some opponents to the regulation have argued otherwise, pointing in particular to the Proposed Rule's projected impact on electric vehicle ("EV") sales.5 However, such claims rest on mischaracterizations of the Proposed Rule's effects and mistaken readings of West Virginia (and related cases). [EPA-HQ-OAR-2022-0829-0621, pp. 1-2]

4 See generally, West Virginia v. Environmental Protection Agency, 142 S.Ct. 2587 (2022).

5 See, e.g., Press Release, "The EPA Is At It Again: Attorney General Morrisey Blasts Biden Rule Forcing EV on American Consumers," West Virginia Attorney General's Office (April 12, 2023) ("the EPA likely doesn't have the statutory authority to do what it proposes to do, and the whole exercise may run afoul of the major-questions doctrine recognized in West Virginia v. EPA."), https://mailchi.mp/2c52bdb49f71/the-epa-is-at-it-again-wva-agblasts-biden-rule- forcing-ev-on-american-consumers-713977; Texas Public Policy Foundation, "RE: Docket Numbers EPA-HQ-OAR- 2022-0985 and EPA-HQ-OAR2022-0829; Comments," 2 (June 15, 2022) (available here: https://www.regulations.gov/comment/EPA-HQ-OAR-2022-0829-0510). Opponents, including the West Virginia attorney general, to the most recent greenhouse gas emissions tailpipe rule, finalized in December 2021, have already challenged that regulation on MQD grounds. See, e.g., Private Petitioners' brief, Texas v. E.P.A., D.C. Cir. No. 22-1031.

Much has been made of the EPA's projection that, under the Proposed Rule, EV sales will increase to 67 percent of new vehicle sales by model year ("MY") 2032.6 Pointing to this projection, commentators have described the proposal as "a major step toward a ban on the vehicles Americans rely on," "nothing short of a complete transformation of the automotive industrial base," and "requiring nothing short of a revolution."7 [EPA-HQ-OAR-2022-0829-0621, pp. 1-2]

6 Proposed Rule at 29329.

7 Jennifer Hijazi, “Biden Tailpipe Emission Rules Face ‘Major Questions’ Legal Wave,” Bloomberg Law (April 14, 2023), https://news.bloomberglaw.com/environment-and-energy/biden-tailpipe-emission-rules-face-major-questions-legal- wave; Coral Davenport, “E.P.A. Is Said to Propose Rules Meant to Drive Up Electric Car Sales Tenfold,” N.Y. Times (April 8, 2023), https://www.nytimes.com/2023/04/08/climate/biden-electric-cars-epa.html?smid=nytcore-ios-share&referringSource=articleShare; Coral Davenport, “E.P.A. Lays Out Rules to Turbocharge Sales of Electric Cars and Trucks,” N.Y. Times (April 12, 2023), https://www.nytimes.com/2023/04/12/climate/biden-electric-cars-epa.html.

Yet it is important to appreciate that, according to both the EPA and outside analysts, the primary drivers of projected EV growth are market trends and the Inflation Reduction Act’s (2022) new tax incentives—not the Proposed Rule.8 For example, according to a new analysis of EPA modeling data by the Institute for Policy Integrity, the rule would only boost the EV-share of the total auto fleet by 6 percentage points in 2032.9 Nor is the Proposed Rule’s compliance burden out of step with past tailpipe emissions rules.10 [EPA-HQ-OAR-2022-0829-0621, pp. 1-2]

8 See discussion infra at 7–10. Specific Infrastructure Investment and Jobs Act (2021) funding programs for EV charging also contribute to expected growth.

9 See infra at 9.

10 See discussion infra at 10–12.

An accurate accounting of the Proposed Rule’s EV impacts and compliance costs will favor the agency in any forthcoming MQD legal challenge. Indeed, a survey of the Supreme Court’s MQD cases reveals a number of distinctions between the regulatory schemes at issue in those cases, including the Clean Power Plan, and the Proposed Rule. [EPA-HQ-OAR-2022-0829-0621, p. 2]

In short, and as this comment will demonstrate, the Proposed Rule’s legal vulnerabilities under the MQD have been grossly exaggerated—mostly due to misunderstandings about the rule’s impact and the doctrine’s contours. [EPA-HQ-OAR-2022-0829-0621, p. 2]

According to West Virginia, the MQD operates by subjecting “certain extraordinary cases” to a more demanding legal standard, in which regulations must demonstrate “something more than a merely plausible textual basis” in a statute in order to avoid invalidation.29 In West Virginia, the majority refers to this heightened legal bar as “clear congressional authority”—but whatever its name, it marks a break from the past several decades of judicial practice. Under the once-regnant Chevron Doctrine,30 courts deferred to agency legal interpretations about ambiguous statutes so long as those interpretations were reasonable. In other words, demonstrating “a merely plausible textual basis” was once all that an agency needed to do in order to survive legal challenge; now, if a court deems a rule to be a “major question,” that is no longer true.31 [EPA-HQ-OAR-2022-0829-0621, p. 4]

29 W. Virginia at 2609.

30 Chevron U.S.A., Inc. v. Natural Resources Defense Council, Inc., 467 U.S. 837 (1984). The Supreme Court may limit or overturn Chevron in a case it will consider next term, Loper Bright Enterprises v. Raimondo. And even though Chevron formally remains good law, the Supreme Court has declined to invoke the doctrine for several years. See Thomas W. Merrill, “The Major Questions Doctrine: Right Diagnosis, Wrong Remedy,” 3 (January 2023) (working paper available here: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4437332).

31 As noted above (see supra at fn. 28), many have criticized this development for effectively shifting core policy making functions from the politically accountable branches — Congress and the presidency — to the unelected judiciary.

A. The Major Questions Doctrine

The Major Questions Doctrine ("MQD") traces its lineage to a pair of cases at the turn of the millennium, but has taken on a more aggressive (and controversial27) form in recent years—culminating in last summer's landmark decision, West Virginia v. E.P.A.28 [EPA-HQ-OAR-2022-0829-0621, p. 4]

27 See, e.g., Jody Freeman and Matthew Stephenson, "The Anti-democratic Major Questions Doctrine," The Supreme Court Review (forthcoming) (explaining that "the new MQD is more likely to weaken democratic accountability by shifting power from the elected branches to the courts, undermining transparency, and exacerbating the already excessive tendency toward minoritarian obstruction in Congress") (available here: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4409630); Dan Deacon and Leah Litman, "The New Major Questions Doctrine," Virginia Law Rev. (forthcoming) ("The Court's new approach allows political parties and political movements more broadly to effectively amend otherwise broad regulatory statutes outside of the formal legislative process by generating controversy surrounding an agency policy… It supplies an additional means for minority rule in a constitutional system that already skews toward minority rule. And it operates as a powerful deregulatory tool that limits or substantially nullifies congressional delegations to agencies in the circumstances where delegations are more likely to be used, and more likely to be effective.") (available here: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4165724). Criticism of the doctrine has spanned the political spectrum, and includes those sympathetic to the doctrine's apparent goals. See infra at fn. 37.

28 See MCI Telecommunications Corp. v. AT&T, 512 U.S. 218 (1994); FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120 (2000); Alabama Ass'n of Realtors v. Dep't of Health & Hum. Servs., 141 S. Ct. 2485 (2021); Nat'l Fed'n of Indep. Bus. v. Dep't of Lab., Occupational Safety & Health Admin., 142 S. Ct. 661 (2022); and West Virginia. For a thorough review of the MQD up until West Virginia, see Natasha Brunstein & Donald L. R. Goodson, "Unheralded and Transformative: The Test for Major Questions After West Virginia," 47 Wm. & Mary Env't L. & Pol'y Rev. (forthcoming 2023) (working paper available here: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4300622).

Specifically, Chief Justice John Roberts, who authored the West Virginia majority opinion, articulated a two- step test for resolving MQD cases. First, a court will determine whether a given exercise of regulatory power poses a "major question"—a task accomplished by assessing "the history and breadth of the authority that [the agency] has asserted, and the economic and political significance of that assertion."32 Put differently: a "major question" exists, the Court suggested, when an agency (a) claims "to discover in a long-extant statute an unheralded power" that (b) represents "a transformative expansion in its regulatory authority."33 Second, and only if a court decides the first inquiry in the affirmative, an agency regulation will only survive if the government can point to "clear congressional authorization" for its interpretation.34 [EPA-HQ-OAR-2022-0829-0621, p. 5]

32 W. Virginia at 2608 (internal citations omitted).

33 Id. at 2610 (internal citations omitted).

34 Which, as noted above, requires "something more than a merely plausible textual basis." Id. at 2609 (internal citations omitted).

With a single exception, noted below, every regulation that the Supreme Court has deemed to be a "major question" has also failed to meet the "clear congressional authority" standard (and so has been invalidated).35 As a consequence, most MQD challenges hinge primarily on the first inquiry: whether the regulation at issue poses a "major question." [EPA-HQ-OAR-2022-0829-0621, p. 5]

35 That exception came in King v. Burwell, 576 U.S. 473 (2015). Of the twenty-one lower court decisions to grapple with the doctrine since last June, only one upheld the agency action at issue under the second, "clear congressional authorization" step of the MQD inquiry. See Natasha Brunstein, "Taking Stock of West Virginia on its One-Year Anniversary," Yale J. Reg., https://www.yalejreg.com/nc/taking-stock-of-west-virginia-on-its-one-year-anniversary-by- natasha-brunstein/ (June 18, 2023).

Given the MQD's infancy,36 a degree of uncertainty remains about how future courts will conduct that threshold inquiry.37 However, Natasha Brunstein and Donald L. R. Goodson have persuasively argued that "major question" status under West Virginia depends on a court concluding that both of two features are present: (1) the agency is effecting a "transformative expansion in its regulatory authority,"38 in a manner reminiscent of past MQD cases; and (2) the agency is deploying its authority in an "unheralded"39 or "unprecedented"40 manner that strays from the agency's own past practice.41 [EPA-HQ-OAR-2022-0829-0621, p. 5]

36 No Supreme Court majority opinion had ever used the phrase "Major Questions Doctrine" until West Virginia.

37 Even some sympathetic to the doctrine's apparent goals have criticized Roberts's West Virginia opinion for articulating a "problematic" standard. See, e.g., Merrill at 24; Randolph J. May, "A Critique of the 'Congressional Dysfunction' Critique of the Major Questions Doctrine," The Federalist Society (Jan. 23, 2023), https://fedsoc.org/commentary/fedsoc-blog/a-critique-of-the-congressional-dysfunction-critique-of-the-major- questions-doctrine ("I admit there are many aspects of the major questions doctrine worthy of debate, including, perhaps foremost, the feasibility of distinguishing, on a principled basis, between major and non-major questions").

38 W. Virginia at 2610.

39 Ibid.

40 Id. at 2611.

41 See Brunstein & Goodson, "Unheralded and Transformative: The Test for Major Questions After West Virginia," 47 Wm. & Mary Env't L. & Pol'y Rev. (forthcoming 2023) (working paper available here: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4300622).
For one thing, as EPA itself admitted when requesting special funding, 'Understand[ing] and project[ing] system-wide ... trends in areas such as electricity transmission, distribution, and storage' requires 'technical and policy expertise not traditionally needed in EPA regulatory development.' … 'When [an] agency has no comparative expertise' in making certain policy judgments, we have said, 'Congress presumably would not' task it with doing so").

As to the first, "transformative expansion" prong, the Supreme Court's MQD line of cases provide a sense of the relevant indicia for concluding that an agency has overstepped, including: whether the agency is acting outside of its traditional area of expertise;42 whether the agency is seeking to exert control over a new or greatly expanded class of private entities or persons;43 whether the agency is relying on a little-used statutory provision;44 whether the rule creates a program that Congress has "conspicuously and repeatedly declined to enact itself";45 and whether the regulation at issue is of vast "economic and political significance."46 [EPA-HQ-OAR-2022-0829-0621, pp. 5-6]

42 See Gonzales v. Oregon, 546 U.S. 243, 274 (2006) ("The Government's interpretation of the prescription requirement also fails under the objection that the Attorney General is an unlikely recipient of such broad authority, given the Secretary's primacy in shaping medical policy under the CSA, and the statute's otherwise careful allocation of decisionmaking powers"); NFIB at 665 ("The Act empowers the Secretary to set workplace safety standards, not broad public health measures… And no provision of the Act addresses public health more generally, which falls outside of OSHA's sphere of expertise"); W. Virginia at 2612–13 ("There is little reason to think Congress assigned such decisions to the Agency.

43 See Utility Air Regulation Group v. E.P.A., 573 U.S. 302, 322 (2014).

44 W. Virginia at 2609–10.

45 W. Virginia at 2610.

46 See, e.g., Alabama Assoc. at 2489; W. Virginia at 2608. Some commentators prefer to conceive of this as a third prong in the "major question" status inquiry. See Merrill at 6.

The second feature that determines a regulation's "major question" status, as various legal commentators have observed, is its novelty relative to past agency practice.47 For example, the Supreme Court invalidated the Centers for Disease Control's Covid-19 eviction moratorium under the MQD partly because "no regulation premised on [the statutory provision] has even begun to approach the size or scope of the eviction moratorium," since that provision's enactment.48 By contrast, a past pattern of analogous agency conduct — in which the agency has previously deployed comparable regulatory mechanisms or imposed similar compliance costs on private entities — weighs in the agency's favor under the MQD. [EPA-HQ-OAR-2022-0829-0621, p. 6]

47 See, e.g., Dan Deacon and Leah Litman, "The New Major Questions Doctrine," Virginia Law Rev. (forthcoming) 49 (available here: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4165724); Richard L. Revesz and Max Sarinsky, "Regulatory Antecedents and the Major Questions Doctrine," Gtown Enviro. L. Rev. (forthcoming) (available here: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4291030).

48 Alabama Assoc. at 2489.

It is also important to appreciate what West Virginia (and its predecessors) did not say—especially about the role of a rule's "economic and political significance" in the MQD analysis. As one forthcoming law review article keenly observes, "in no case has economic significance or political controversy alone been enough to trigger application of the MQD."49 Justice Gorsuch perhaps argues for such a standard in his West Virginia concurrence, but that opinion was joined by only one other justice (and so does not constitute binding legal precedent).50 Rather, the case law makes clear that in order to implicate the doctrine, a rule must be of vast economic and political significance and meet the MQD's other "contextual factors," described above.51 [EPA-HQ-OAR-2022-0829-0621, p. 6]

49 Brianne J. Gorod et al., "Major Questions Doctrine: An Extraordinary Doctrine for 'Extraordinary' Cases," 19 Wake Forest L. Rev. (forthcoming) 19 (available here: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4419602) (emphasis added).

50 W. Virginia at 2620–21 (Gorsuch, J., concurring) ("First, this Court has indicated that the doctrine applies when an agency claims the power to resolve a matter of great 'political significance,' … Second, this Court has said that an agency must point to clear congressional authorization when it seeks to regulate 'a significant portion of the American economy'").

51 See Gorod et al. at 18.

Nor did West Virginia hold that any regulation touching on climate change constitutes a major question.52 In fact, that decision never suggested that the EPA lacks the power to regulate carbon emissions from power plants under the relevant section of the CAA—it merely held that the Clean Power Plan's particular method for doing so was impermissible.53 [EPA-HQ-OAR-2022-0829-0621, pp. 6-7]

52 Commentators have suggested as much across various regulatory proposals. See e.g., Letter from Attorney General Patrick Morrisey, West Virginia, et al. to Chair Rostin Behnam, CFTC, re: Comments on the CFTC's "Climate-Related Financial Risk RFI" by the Attorneys General of the States of West Virginia, Alabama, Alaska, Arizona, Arkansas, Georgia, Indiana, Kansas, Kentucky, Louisiana, Mississippi, Montana, Nebraska, North Dakota, Ohio, Oklahoma, South Carolina, Texas, Utah, Virginia, and Wyoming (Oct. 7, 2022), comments.cftc.gov/PublicComments/ViewComment.aspx?id=70868&SearchText=. In comments to a Federal Acquisition Regulatory Council proposal requiring certain large federal contractors to make limited disclosures about carbon emissions, the Washington Legal Foundation cited West Virginia for the proposition that "climate policy is the exclusive prerogative of Congress"—concluding that executive action touching on the issue therefore poses a "major question." Comment of Washington Legal Foundation, "FEDERAL ACQUISITION REGULATION: DISCLOSURE OF GREENHOUSE GAS EMISSIONS AND CLIMATE-RELATED FINANCIAL RISK," 1 (Feb. 13, 2023), https://www.regulations.gov/comment/FAR-2021-0015-0158.

53 See W. Virginia at 2615 ("the only interpretive question before us, and the only one we answer, is more narrow: whether the 'best system of emission reduction' identified by EPA in the Clean Power Plan was within the authority granted to the Agency in Section 111(d) of the Clean Air Act. For the reasons given, the answer is no").

Finally, note that even if a court concludes that an agency action constitutes a "major question," the court's work is not complete. The regulation can still survive if the agency can demonstrate "clear congressional authority" for its interpretation that goes beyond "a merely plausible textual basis."54 To date, most regulations that the Supreme Court has characterized as "major questions" have failed to meet this standard. But in King v. Burwell, a majority of the Court led by Chief Justice Roberts upheld an Internal Revenue Service interpretation concerning Affordable Care Act tax credits, even after finding that the action effectively qualified as a major question.55 [EPA-HQ-OAR-2022-0829-0621, pp. 6-7]

54 W. Virginia at 2609.

55 King at 485 ("In extraordinary cases, however, there may be reason to hesitate before concluding that Congress has intended such an implicit delegation… This is one of those cases") (internal citations omitted).

II. The Proposed Rule, if finalized, will survive scrutiny under the Major Questions Doctrine.

As explained below, the Proposed Rule does not pose a major question under the Supreme Court's MQD precedents. But even if a court found otherwise, the Proposed Rule should still survive because the EPA can demonstrate "clear congressional authority" for its proposal. [EPA-HQ-OAR-2022-0829-0621, p. 7]

A. The Proposed Rule does not pose a "major question" under West Virginia.

Above we explained that whether a rule poses a major question hinges on two main inquiries: (1) whether the action seeks to transform the nature of the agency's regulatory power; and (2) whether the action represents a stark departure from past regulatory practice. Here, both inquiries weigh against a finding of "major question" status. [EPA-HQ-OAR-2022-0829-0621, p. 7]

1. The Proposed Rule does not seek to transformatively expand the EPA's authority.

A likely source of MQD objections to the Proposed Rule stems from the EPA's projections about EV uptake in the rule's wake.56 According to the agency, if the Proposed Rule were to go into effect, EVs could comprise 67 percent of new light- and medium-duty vehicle production for Model Year ("MY") 2032, based on the EPA's modeling of automakers' possible cost-effective compliance pathways.57 [EPA-HQ-OAR-2022-0829-0621, pp. 7-8]

56 See Jennifer Hijazi, "Biden Tailpipe Emission Rules Face 'Major Questions' Legal Wave," Bloomberg Law (April 14, 2023), https://news.bloomberglaw.com/environment-and-energy/biden-tailpipe-emission-rules-face-major-questions- legal-wave (quoting a statement from the American Petroleum Institute that the "deeply flawed proposal is a major step toward a ban on the vehicles Americans rely on").

57 Proposed Rule at 29329.

But it is crucial to recognize that projection does not attribute this uptick exclusively (or even primarily) to the Proposed Rule. In fact, according to the EPA and outside analysts, most of the projected progress on EV uptake will result from market demand and the IRA's historic set of tax incentives, which are already catalyzing private sector action.58 Consequently, any claim that the Proposed Rule's impact on future EV sales will qualify it for MQD scrutiny must contend with the fact that most of the likely boost to EV sales described in the rule is due mainly to factors beyond the forthcoming regulation. [EPA-HQ-OAR-2022-0829-0621, pp. 7-8]

58 As discussed below, predictable technological adoption dynamics will also contribute.

According to EPA estimates, if the agency declines to finalize any new tailpipe emissions regulations at all — under what the agency calls its central "No Action" baseline — EV sales will nonetheless comprise approximately 39 percent of new car sales by MY 2032.59 As the EPA itself acknowledges, this may prove a conservative estimate of IRA and other non-rule impacts on EV adoption.60 For example, a synthesis of automakers' public EV commitments to date compiled by the International Energy Agency, which the EPA declined to incorporate into its projections, suggested that EVs would comprise 50 percent of new car sales by 2030 (again, even in the Proposed Rule's absence).61 Nor, in reaching its central No Action baseline, did the EPA take into account certain new state level policies, like California's, which may drive EV penetration even further.62 [EPA-HQ-OAR-2022-0829-0621, p. 8]

59 Proposed Rule at 29329, "Fleet BEV Penetration Rates, by Body Style, Under the No Action Case," Table 81. As discussed below, the EPA also conducted alternate No Action sensitivity cases.

60 Proposed Rule at 29296.

61 See Proposed Rule at 29296 ("[F]or purposes of this proposal we have not integrated manufacturer announcements directly into our modeling of the No Action baseline") (citing International Energy Agency, "Global EV Outlook 2022," p. 107, May 2022, https://iea.blob.core.windows.net/assets/e0d2081d-487d-4818-8c59-69b638969f9e/ GlobalElectricVehicleOutlook2022.pdf).

62 Proposed Rule at 29296 ("[O]ur analysis does not include the effect of state-level policies whereas projections from other sources may include those policies. We did not include these policies because many are still not in effect; however, we do anticipate that in the next decade, state level policies may play an important role in driving BEV penetration.").

Moreover, as other advocates have noted elsewhere, adoption of innovative technologies does not follow a linear trajectory, but rather "an S-shaped curve, with the adoption rate increasing more rapidly once a critical mass is reached—as we are now seeing with electric vehicles."63 As a result, now that the United States has crossed the EV "tipping point,"64 we would expect steep growth over the next several years regardless of the EPA's regulatory path. [EPA-HQ-OAR-2022-0829-0621, p. 8]

63 See Proof Brief of the Institute for Policy Integrity, Texas v. E.P.A., D.C. Cir. No. 22-1031 8 (Mar. 3, 2023), https://policyintegrity.org/documents/Amicus_Brief_of_the_Institute_for_Policy_Integrity_4.pdf (citing Everett M. Rogers, Diffusion of Innovations 344 (5th ed. 2003) and Tom Randall, US Crosses the Electric-Car Tipping Point for Mass Adoption, Bloomberg (July 9, 2022), https://www.bloomberg.com/news/articles/2022-07-09/us-electric-carsales- reach-key-milestone (discussing the S-shaped technology adoption curve and noting that the United States has crossed the 5% market share "tipping point" that triggers "rapidly accelerating demand")).

64 See Randall.

Isolating the Proposed Rule's contribution to EV penetration projections reveals that the Proposed Rule follows a well-marked trail. Past GHG tailpipe standards have also projected boosts to EV uptake. The 2012 GHG tailpipe regulations, for example, were projected to boost EV production from 0 percent to 2 percent.70 And the EPA estimated that the 2021 GHG emissions rule for passenger vehicles would yield an increase of 11 points for EV production as a share of overall auto manufacturing by MY 2026 (from a "no action" projection of 6 percent penetration to a projected 17 percent under the standards).71 [EPA-HQ-OAR-2022-0829-0621, p. 9]

70 EPA, "Regulatory Impact Analysis: Final Rulemaking for 2017–2025 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards," 3-48 tbl.3.5-19, 3-54 tbl.3.5-25 (Aug. 2012), https://nepis.epa.gov/Exe/ZyPDF.cgi/P100EZI1.PDF?Dockey=P100EZI1.PDF (hereafter "2012 Final Rule RIA").

71 EPA, "Regulatory Impact Analysis: Final Rulemaking for Revised 2023 and Later Model Year Light-Duty Vehicle GHG Emissions Standards," 4–29, Table 4-31 (2021), https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1013ORN.pdf (hereafter "2021 Final Rule RIA").

Other metrics offer a fuller sense of the Proposed Rule's relative modesty. New York University School of Law's Institute for Policy Integrity ("IPI") used the data presented in Figures 9–1 and 9–2 of the draft Regulatory Impact Assessment to calculate how the proposal will affect the makeup of the total motor vehicle fleet on the road (as opposed to just that of new car sales in a given model year).72 The analysis concludes that under a No Action baseline, EVs will comprise 15 percent of automobiles on the road in 2032; by comparison, a finalized version of the Proposed Rule, IPI calculates, will result in EVs comprising 21 percent of the on-road fleet that year—an increase of just 6 points.73 [EPA-HQ-OAR-2022-0829-0621, p. 9]

72 The full analysis will be available in the Institute for Policy Integrity's forthcoming comment to the rulemaking docket; see also EPA, "Draft Regulatory Impact Analysis: Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles," 9–2, Figures 9–1, 9–2 (April 2023), https://www.regulations.gov/document/EPA-HQ-OAR-2022-0829-0360 (hereafter "Proposed Rule RIA").

73 Ibid.

In short, the Proposed Rule hardly represents the harbinger of revolution that its critics claim. This is true beyond the headline-grabbing EV-growth estimates as well. Recall that the Supreme Court's MQD jurisprudence has identified a set of characteristics that suggest an agency is impermissibly seeking to expand its regulatory authority, including: straying outside of the agency's sphere of expertise; seeking to exert agency authority over a new class of regulated entities; or relying on a little-used statutory provision.74 None of those features apply to the Proposed Rule, which concerns a subject of core EPA expertise (vehicle emissions standards, which Congress has tasked the agency with setting since the 1970s), applies to a traditional set of regulated entities (automakers), and is premised on one of the landmark provisions of the Clean Air Act (Section 202(a)). [EPA-HQ-OAR-2022-0829-0621, p. 9]

74 See discussion supra at 5–6.

B. Even if the Proposed Rule does pose a "major question," Congress has provided clear authorization affirming the EPA's action.

For all the above reasons, the Proposed Rule does not pose a "major question." But even if a court found otherwise, the Proposed Rule would still survive scrutiny at the final step of the MQD inquiry: whether the agency can demonstrate "clear congressional authority" that goes beyond a "merely plausible textual basis."100 [EPA-HQ-OAR-2022-0829-0621, p. 12]

100 W. Virginia at 2609.

As a preliminary matter, the plain text of the CAA appears to unambiguously suggest that the EPA can rely on electrification in setting Section 202(a) regulations for "new motor vehicles."101 The statute defines "motor vehicle," as "any self-propelled vehicle designed for transporting persons or property on a street or highway."102 Note that definition omits any reference to a specific type of technology, like the internal combustion engine. Section 202 also makes clear that the standards are to apply to vehicles whether they are "designed as complete systems or incorporate devices to prevent or control" pollution—language that clearly anticipates vehicles, like EVs, designed as complete systems to prevent pollution.103 Indeed, given Section 202(a)'s charge to protect the "public health and welfare," it would arguably be arbitrary (and therefore unlawful) for EPA to fail to facilitate the adoption of zero-emission technology. [EPA-HQ-OAR-2022-0829-0621, p. 12]

101 See 42 U.S.C. §7521.

102 42 U.S.C. §7550(2).

103 42 U.S.C. §7521(a)(1)

In addition to this plain-faced textual basis for EPA's authority, Congress has provided clear authorization affirming the EPA's action in at least two additional ways. [EPA-HQ-OAR-2022-0829-0621, p. 12]

First, legislative history from the 1970 CAA amendments suggests Congress anticipated that the EPA would use its authorities to reduce air quality hazards, including by encouraging the development and adoption of technologies beyond the internal combustion engine.104 As the agency notes in its Proposed Rule, the Senate Report accompanying those amendments explained that the EPA "is expected to press for the development and application of improved technology rather than be limited by that which exists."105 That report further added that motor vehicle emissions standards should be "a function of the degree of [emission] control required, not the degree of technology available today."106 And so Congress also eventually granted the EPA the power to fund "low emission alternatives to the present internal combustion engine."107 It additionally, in Section 202(e), permitted the EPA to certify new types of motor vehicles based on "new power source[s] or propulsion system[s]."108 Indeed, electric vehicles, which had proved popular among early car consumers during the first years of the 20th century, were a topic of renewed national interest (thanks to oil price spikes and resulting gas shortages) during the period that Congress was debating the CAA.109 As a D.C. Circuit panel summarized in 1973, "[i]t is clear from the legislative history that Congress expected the Clean Air Amendments to force the industry to broaden the scope of its research–to study new types of engines and new control systems."110 [EPA-HQ-OAR-2022-0829-0621, p. 12]

As a result, 202(a) standards have historically served a technology-forcing function, pushing the market to develop and adopt innovative technologies that will better serve the public health and welfare. In the 1970's and 1980's, for example, the EPA used its Section 202(a) authority to facilitate uptake of a then-nascent technology: catalytic converters, now commonplace.111 The fact that, some forty-plus years later, the innovation has shifted to zero emissions engines does not change the fundamental tenor of the legal analysis or EPA's core statutory responsibilities. [EPA-HQ-OAR-2022-0829-0621, p. 13]

111 See "Timeline of Major Accomplishments in Transportation, Air Pollution, and Climate Change," U.S. Enviro. Prot. Agency, https://www.epa.gov/transportation-air-pollution-and-climate-change/timeline-major-accomplishments- transportation-air (last visited June 15, 2023).

Second, as the EPA also notes in its Proposed Rule, the IRA includes language reaffirming the core holding of Massachusetts v. E.P.A. and the agency's subsequent scientific conclusions: that the EPA is obligated to regulate GHGs as air pollutants under the CAA, and specifically to regulate such emissions from mobile sources.112 In the IRA, Congress appropriated funds for states "to adopt and implement greenhouse gas and zero-emission standards for mobile sources pursuant to §177 of the Clean Air Act (42 U.S.C. 7507)."113 The CAA cross-reference in this IRA provision holds important implications. CAA §177 allows states, which are normally preempted from setting their own motor vehicle emissions standards under the CAA, to adopt California's standards (for which the EPA must waive pre-emption unless specific findings are made).114 So to expressly fund "greenhouse gas and zero emission" activities under §177 necessarily implies that these are the types of standards states would normally be preempted from pursuing because the CAA reserves their regulation to EPA. The IRA, then, necessarily implies that GHGs are regulable under the CAA.115 Indeed, during consideration and passage of the IRA, key drafters explicitly stated on the record their understanding that the IRA's provisions statutorily affirmed the Supreme Court's Mass v. EPA decision.116 [EPA-HQ-OAR-2022-0829-0621, p. 13]

115 See Dotson and Maghamfar at 10030 (“If GHGs were not considered to be air pollutants or EPA could not regulate GHGs from motor vehicles pursuant to the CAA, then §177 would not apply to state GHG and zero emission standards because such standards for motor vehicles would not be preempted by §209(a)”).

116 See Lisa Friedman, “Democrats Designed the Climate Law to Be a Game Changer. Here’s How,” N.Y. Times, https://www.nytimes.com/2022/08/22/climate/epa-supreme-court-pollution.html (Aug. 22, 2022) (quoting Senate Environmental and Public Works Chairman Tom Carper, a lead drafter, explaining that “[t]he language, we think, makes pretty clear that greenhouse gases are pollutants under the Clean Air Act”). See also Proposed Rule at 29233 (quoting House Energy and Commerce Chairman Frank Pallone explaining that the IRA “reinforces the longstanding authority and responsibility of [EPA] to regulate GHGs as air pollutants under the Clean Air act” and “the IRA clearly and deliberately instructs EPA to use” this authority by “combin[ing] economic incentives to reduce climate pollution with regulatory drivers to spur greater reductions under EPA’s CAA authorities”); 168 Cong. Rec. E868–02 (daily ed. Aug. 12, 2022) (statement of Rep. Pallone); 168 Cong. Rec. E879–02, at 880 (daily ed. Aug. 26, 2022) (statement of Rep. Pallone).

III. Conclusion

Suggestions that the Proposed Rule, if finalized, will pose a “major question” are misguided. The Proposed Rule’s impact on the motor vehicle fleet, especially as concerns projected EV uptake, has been overblown. And its compliance costs and regulatory mechanisms closely follow in the footsteps of past 202(a) rulemakings. As a result, we urge the EPA, at minimum, to finalize the rule as proposed. [EPA-HQ-OAR-2022-0829-0621, p. 14]

Organization: HF Sinclair Corporation

By mandating the rapid electrification of the U.S. LD and MD passenger fleet, EPA’s Proposed Rule exceeds its statutory and Congressional authority and severely constrains consumer choice. In so doing, EPA fails to fully account for the total carbon footprint of PEVs. [EPA-HQ-OAR-2022-0829-0579, p. 2]

Notably, EPA’s assumption that PEVs produce zero GHGs – coupled with its failure to account for the overall carbon intensity associated with not only powering PEVs but also the emissions tied to mining, processing, and manufacturing of critical minerals necessary for PEV batteries – impedes the agency’s ability to conduct a complete comparison of the GHG emissions resulting from different vehicle technologies. [EPA-HQ-OAR-2022-0829-0579, p. 2]

EPA’s regulations also have a chilling effect on additional investments by companies, such as HF Sinclair, in carbon reducing technologies like carbon capture and sequestration projects, green hydrogen, renewable fuels and other low-carbon liquid fuel technologies that can reduce emissions from ICE vehicles. In addition, HF Sinclair has voluntarily announced a target to reduce its net greenhouse gas emissions intensity by 25% by 2030 compared to a 2020 baseline. [EPA-HQ-OAR-2022-0829-0579, p. 2]

The “major questions doctrine” holds that Congress must “speak clearly when authorizing an agency to exercise [such] powers” of “vast economic and political significance.”4 As EPA is aware, this doctrine applies in the context of environmental regulation. Last year, in West Virginia v. EPA, the Supreme Court relied on the major questions doctrine in holding that the EPA exceeded its statutory authority in adopting the Clean Power Plan. That regulation sought to impose caps on GHG emissions by requiring utilities and other providers to shift electricity production from coal-fired power plants to natural gas and then to renewable energy in place of imposing source-specific requirements reflective of the application of state-of-the-art emission reduction technologies.5 [EPA-HQ-OAR-2022-0829-0579, p. 3]

Ct. 2485, 2489 (2021); Utility Air Regulatory Group v. EPA, 573 U.S. 302, 324 (2014); U.S. Telecom Assoc. v. FCC, 855 F.3d 381, 419-21 (D.C. Cir. 2017) (Kavanaugh, J., dissenting from denial of rehearing en banc) (explaining provenance of "major rules doctrine").

5 West Virginia v. EPA, 597 U.S. (2022).

As noted by the Court, EPA "announc[ed] what the market share of coal, natural gas, wind, and solar must be, and then require[d] plants to reduce operations or subsidize their competitors to get there."6 EPA's attempt to devise GHG emissions caps based on a generation-shifting approach would have had major economic and political significance impacting vast swaths of American life and substantially restructuring the American energy market; however, EPA's purported authority was only based on a "vague statutory grant" within Section 111(d) of the Clean Air Act—far from the "clear authorization required by [Supreme Court] precedents."7 [EPA-HQ-OAR-2022-0829-0579, p. 3]

6 Id., slip op. at 33, n.4.

7 Id., slip op. at 24. EPA's Proposed Rule here presents an analogous, if not identical, situation. Mandating a shift from ICE to PEV will reshape the American automotive market with profound collateral effects, making clear that EPA is encroaching upon an issue of "vast economic and political significance." As further discussed herein, the direct compliance costs are enormous—EPA estimates that the cost of vehicle technology (not including the vehicle or battery tax credits) would be approximately $180 billion–$280 billion respectively, in addition to over $7 billion in electric vehicle supply equipment ("ESVE") costs through 2055, and these figures do not include the complete transformation of the electric power sector.8 The Proposed Rule will go above and beyond natural market forces to change what consumers are able to purchase by requiring the production of a different product. The Proposed Rule undoubtedly forces OEMs to meet production lead times that would not exist but for EPA's new PEV mandate.

8 Proposed Rule at 29,199.

As discussed in further detail below, the Proposed Rule will have significant impacts beyond the traditional automotive market. It will eliminate American jobs in the refining sector, which directly employs more than 100,000 individuals across the United States – it is also widely accepted that every refinery job is a job multiplier of ten. It will significantly strain the electric grid, requiring utilities to rapidly increase generation, transmission, and distribution capacity to a degree not fully contemplated by EPA. [EPA-HQ-OAR-2022-0829-0579, pp. 3-4]

And it will have profound impacts on national security by forcing the American automotive industry to depend on critical minerals from foreign suppliers, with geopolitical challenges—most notably, China—rather than a domestically-abundant and secure resource. These issues go well beyond EPA's expertise, and the Agency is not positioned to fully grapple with the consequences that such a rapid push for PEV will have across the nation. As a result, EPA can only proceed with the Proposed Rule if Congress bestowed upon EPA clear authorization to do so. But Congress did not. [EPA-HQ-OAR-2022-0829-0579, p. 4]

II. EPA's Proposed Rule Exceeds its Statutory Authority and Contravenes Federal Law

a. Phasing out the Internal Combustion Engine (ICE) is a "Major Question" that Congress did not Delegate to EPA

The Proposed Rule does not represent appropriate and feasible technological improvements in the efficiency of ICE vehicles; rather, it requires the manufacturing of PEVs and ultimately replacement of ICE vehicles in the U.S. transportation sector. Though EPA contends the proposed standards do not mandate a specific technology (e.g., PEVs), OEMs cannot comply with the proposed standards unless they drastically shift production away from ICE and to PEVs. Consequently, the Proposed Rule obligates OEMs to increase the percentage of PEVs in their fleets and to do so at rates well in excess of market forces. EPA predicts that for MY 2032, PEV adoption rates will be between 62–78% across all body styles (sedans, crossovers/SUVs, and pickups).2 This is an exponential increase from the roughly 4.4 percent of the LD market share by PEVs in 2021.3 The Proposed Rule will introduce a transformational shift in the automotive industry far beyond that which EPA is able to mandate under the authority delegated to it by Congress. But the question of whether this shift is necessary and, if so, how to accomplish this shift, is a "major question" reserved for Congress, not EPA. [EPA-HQ-OAR-2022-0829-0579, pp. 2-3]

2 Proposed Rule at 29,329; U.S. Environmental Protection Agency, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles Draft Regulatory Impact Analysis" (April 2023) pg. 13-36, 13-37, available at https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P10175J2.pdf [hereinafter, "RIA"].

3 Proposed Rule at 29,189 (identifying the percentage that was plug in electric ("PEV"), which included plug-in hybrid electric vehicles ("PHEV") and BEVs).

As with the Clean Power Plan, EPA lacks Congressional authorization in the Clean Air Act to impose a manufacturing shifting standard to a preferred powertrain and effectively order regulated parties to phase out combustion engine technologies. EPA's standard-setting tools are limited to those which Congress provided in Section 202(a) of the Clean Air Act. Here, EPA is only authorized to set "standards" for "emission[s]" from "any class or classes of new motor vehicles or new motor vehicle engines, which . . . cause, or contribute to," potentially harmful air pollution. EPA has elected to focus solely on tailpipe emissions and not the entire lifecycle analysis. But PEVs do not have tailpipe emissions of carbon dioxide, the pollutant of concern here, so the operation of such vehicles alone cannot "cause, or contribute to," air pollution within the constructs of a tailpipe emissions regulation, especially when EPA does not require vehicle manufactures to account for the upstream emissions from PEVs in their compliance calculations. [EPA-HQ-OAR-2022-0829-0579, pp. 4-5]

Far from "clear congressional authorization," Section 202(a) provides EPA no authority to set standards that go above and beyond that which could be achieved by improvements to ICE vehicles alone such that OEMs must completely cease to produce the underlying technology governed at the time the Clean Air Act was adopted and amended. Nor does it permit EPA to establish a fleet averaging and credit trading program as a mechanism to limit ICE sales.9 Notably, Congress instituted a clean fuel vehicles program with reference to "clean alternative fuel" vehicles, which includes BEVs, in its 1990 updates to the Clean Air Act. In doing so, Congress explicitly distinguished such vehicles from "conventional gasoline-fueled or diesel-fueled vehicles of the same category and model year," dispelling the notion that BEVs and ICE vehicles can be lumped together to set standards that will enable the former to eventually displace the latter.10 EPA does not—and cannot—explain how such authority can be read to regulate PEVs and ICE vehicles under a common standard. It is no surprise then that up until the current Administration, EPA has never claimed the authority to mandate even partial electrification. [EPA-HQ-OAR-2022-0829-0579, pp. 4-5]

9 See supra, II.B.

10 42 U.S.C. §§ 7581, 7582(b); see also § 7585(a) (defining NOx and non-methane hydrocarbon emission standards for heavy-duty clean-fuel vehicles as a percentage of conventional heavy-duty vehicles).

Congress clarified that it, not EPA, must make the important policy decisions affecting if, when, and how the American automotive industry will transition from ICE vehicles to BEVs. In the 116th Congress, for example, Congress introduced 44 bills seeking to reduce petroleum-based fuel consumption and GHG emissions from the transportation sector through customer rebates, vehicle and fuel producer incentives, local funding, development of standards, and research and development. But none went so far as to propose requiring adoption, let alone mass adoption of heavy duty PEVs through the phase-out of ICE vehicles.11 In fact, Congress rejected bills that would have banned the sale of new LD ICE vehicles by 2040,12 and it has consistently disapproved of EPA's efforts to hamstring the automotive sector with more stringent air pollution standards than are feasible.13 [EPA-HQ-OAR-2022-0829-0579, pp. 4-5]

11 "Alternative Fuel and Vehicles: Legislative Proposals," Congressional Research Service (July 28, 2021).

12 See Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. (2018); see also 116 Cong. Rec. 19238-40 (1970) (proposed amendment to Title II that would have banned ICE vehicles by 1978).

13 See, e.g., S. J. Res. 11, 118th Cong. (2023) (Although passed only by the Senate thus far, the joint resolution calls for disapproval of the rule submitted by the Administrator of the Environmental Protection Agency relating to "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards," 88 Fed. Reg. 4296 (January 24, 2023).).

It should be no surprise then in the wake of the Proposed Rule, members of Congress have requested that the Agency rescind the proposals, asserting they "effectively mandate a costly transition to electric cars and trucks in the absence of congressional direction."14 That Congress intended for it, not EPA, to direct these policy decisions is made all the more clear by the passage of the IRA and BIL whereby Congress identified the policy levers it deemed appropriate. Congress could have, but did not, delegate the authority to (or otherwise direct) EPA to establish a fleet-wide credit trading regime to further drive PEV development and rapid adoption. Instead, the Proposed Rule stands in direct contrast to other legislation, such as the Renewable Fuel Standard Program, whereby Congress mandated that "gasoline sold or introduced into commerce in the United States" must contain a year-over-year increasing share of renewable fuels15 and, in 2022, must include tens of billions of gallons of renewable fuel.16 An EPA-mandated shift in transportation technology from vehicles that can operate on increasing volumes of renewable fuel to PEVs does not square with such requirements. Consequently, Congress, not EPA, should determine how to regulate electrification of transportation.17 [EPA-HQ-OAR-2022-0829-0579, pp. 4-5]

14 Letter from Senator Shelley Capito, et al. to Administrator Michael S. Regan, EPA (May 25, 2023); see also Senate Resolution S.J. Res. 11, 118th Congress (April 26, 2026) (Although related to heavy duty vehicles ("HDVs"), Congress has expressed its disapproval of EPA's overreach in this space. For example, in April of this year both houses of Congress passed a Congressional Review Act resolution to rescind EPA's December 2022 heavy duty NOx standards, sending a strong signal that Congress views EPA's efforts in this space as unnecessary, infeasible, and uniformed in light of economic and energy security concerns); House Resolution H2523 (May 23, 2023); see also Congressional Record, H2523 (May 23, 2023) at 1444, Statement from Mr. Walberg (R-MI) ("From tailpipe emissions regulations that will force people to buy expensive and less practical EVs to new rules on power plants that will threaten the reliability of our electric grid. It seems like the EPA hasn't even thought about the economic and energy security of our constituents.").

15 42 U.S.C. § 7545(o)(2)(A)(i).

16 Id., § 7545(o)(2)(B); 87 Fed. Reg. 39,600 (July 1, 2022).

17 See "Grassley-Cornyn Bill Pulls Plug on Latest Biden Boon for EVs," (May 18, 2023), https://www.grassley.senate.gov/news/news-releases/grassley-cornyn-bill-pulls-plug-on-latest-biden-boon-for-evs (discussing proposed legislation entitled "No Fuel Credits for Batteries Act" introduced to "preserve the integrity of the Renewable Fuels Standard" in light of EPA's proposed E-RINS rule").

III. The Proposed Rule is Arbitrary and Capricious

a. EPA Fails to Properly Account for All GHG Emissions from PEVs

In an attempt to hinder consumer choice and penalize specific forms of technology, EPA's proposed rule fails fully account for the lifecycle GHG emissions that come from PEVs, creating a disparity between how ICE and PEV vehicle emissions are treated. While EPA purports to have considered the GHG emissions attributed to upstream emissions impacts from fuel production at refineries and electricity generating units,27 EPA assumes – without any factual basis – that the power sector will become cleaner over time through the increased use of wind and solar generation and electricity storage (i.e., more batteries). This in turn will purportedly mitigate EPA's recognized concern that, as a result of the proposed rule, "increases in emissions from [Electric Generating Units] . . . would lead to changes in exposure for people living in communities near these facilities."28 But, EPA glosses over this analysis, and instead only focuses on tailpipe emissions. And even if EPA's assumptions on a cleaner electric grid are correct, EPA fails to account for the increased GHG emissions that will come from an increasing effort to mine, process, and manufacture the critical minerals that will be required to both deliver batteries to power an all-electric future fleet as well as deliver "zero-emission" power to the grid. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

27 Proposed Rule at 29,252.

28 Proposed Rule at 29,327.

Moreover, EPA's proposal to remove upstream emissions from vehicle compliance determinations will incentivize vehicle manufacturers to produce PEVs without having to account for any of the associated emissions impact while ignoring labor and environmental standards of other nations. Preferentially accounting for certain air pollutant emissions over others within the same regulated vehicle class flies in the face of both EPA's statutory authority to prescribe "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles…"29 and its purported regulatory objective to reduce GHG emissions. If PEVs are vehicles which cause or contribute to air pollution, then all associated pollution must be accounted for. If not, EPA may not include PEVs in the regulated "class" of motor vehicles along with comparable ICE vehicles. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

29 42 U.S.C. § 7521(a)(1).

For instance, the power source of a PEV—a battery composed of carbon intensive minerals and the electricity generated to power the battery—produces emissions. The fact such emissions occur 100% upstream of the vehicle's operation and therefore fall outside of the tailpipe emissions calculation stacks the deck in favor of this technology. In fact, according to the International Energy Association, PEVs require six times the raw materials as a traditional ICE vehicle.30 There is no logical basis for this omission because, as EPA is aware, concerns about GHG emissions relate to their longer term global concentrations. Consequently, air pollutant emissions should be an important consideration regardless of where such emissions occur and, by myopically prioritizing PEVs, EPA fails to look at all technologically feasible options that may provide commensurate GHG reductions in a more cost-efficient manner. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

30 IEA, "In the transition to clean energy, critical minerals bring new challenges to energy security," (June 2023), available at https://www.iea.org/reports/the-role-of-critical-minerals-in-clean-energy-transitions/executive-summary.

The flaw in EPA's approach is illustrated by the fact that emissions standards easily become meaningless by changing the engine's location. The proposed rule would treat a PEV charged by a diesel-powered generator as if it had zero tailpipe emissions, notwithstanding the fact that it remains "powered" by a diesel engine located outside the vehicle. A light-duty vehicle directly powered by a diesel engine inside the vehicle, however, is credited with the emissions produced by that engine. Thus, the source of the "fuel" matters. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

Finally, EPA has not considered the foreseeable, indirect impacts the Proposed Rule will have on ambient air quality. First, with the high purchase price of new PEVs, consumers will likely hold on to their older, higher-emitting ICE vehicles to avoid the increased purchase price of a PEV. Second, PEVs are heavier, and will increase particulate matter emissions through increased brake, tire, and road wear. Ultimately, EPA arbitrarily ignores the full scope of emissions that will come from PEVs, and a full lifecycle analysis of all potential vehicle technologies must be conducted to fully understand the environmental impacts of the Proposed Rule. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

b. EPA Cannot Adequately Substantiate the Need for Regulatory Action

EPA has not demonstrated a compelling need to accelerate emissions reductions within the timeframe for which MY27–32 vehicles are subject to the Proposed Rule. PEVs accounted for less than 5% of light-duty vehicles sold in the U.S. in 2021, yet EPA's proposal would require PEVs to account for over 60% of light-duty vehicle sales by 2030 despite the White House setting a goal of 50% in this same timeframe.31 EPA provides no information supporting the need for such an accelerated schedule and instead makes conclusory assertions that the "need for regulatory action" is supported by the Bipartisan Infrastructure Law32 ("BIL") and the Inflation Reduction Act33 ("IRA"),34 which "together provide further support for a government-wide approach to reducing emissions by providing significant funding and support for air pollution and GHG reductions across the economy, including specifically, for the component technology and infrastructure for the manufacture, sales, and use of electric vehicles."35 But far from capturing the automotive industry's current pace of electrification, the Proposed Rule exceeds rational projections on the rate of electrification, which expect PEVs (including plug-in hybrid vehicles) to account for only 13-29% of new light-duty vehicle sales in 2050.36 [EPA-HQ-OAR-2022-0829-0579, pp. 9-10]

31 Executive Order 14037, "Strengthening American Leadership in Clean Cars and Trucks," 86 Fed. Reg. 43583 (Aug. 5, 2021).

32 Public Law 117-58, Nov. 15, 2021.

34 EPA, Draft Regulatory Impact Analysis for Proposed Rule, 3-19–29 (Apr. 2023) [hereinafter "DRIA"]. Notably, EPA concludes that U.S. oil consumption is projected to be fairly steady for the time period from 2027 to 2050" and will actually increase gradually over that time. Id. at 11-26 (Table 11-1). EPA also concludes that the Proposed Rule will result in a 90.7% reduction in oil imports.

35 Proposed Rule at 29,187.

36 EIA, "Incentives and lower costs drive electric vehicle adoption in our Annual Energy Outlook," (May 15, 2023) available at https://www.eia.gov/todayinenergy/detail.php?id=56480.

In fact, during a House Energy and Commerce Hearing on June 22, 2023, Joseph Goffman, Principal Deputy Assistant Administrator for U.S. EPA's Office of Air and Radiation, testified that he had not reviewed the petition from the state of California requesting a Clean Air Act Waiver that ultimately seeks to ban ICE vehicles.37 This is concerning given the fact that the justification provided for the Proposed Rule was that same petition by the state of California, further demonstrating EPA's incomplete analysis and lack of preparedness to compel consumers into a single technology solution to combat climate change. [EPA-HQ-OAR-2022-0829-0579, pp. 9-10]

37 Testimony of Joseph Goffman, Principal Deputy Assistant Administrator, Office of Air and Radiation, U.S. EPA before the House Energy and Commerce Subcommittee for Environment, Manufacturing, and Critical Materials Legislative Hearing: ""Driving Affordability: Preserving People's Freedom to Buy Affordable Vehicles and Fuel," (June 22, 2023) available at https://energycommerce.house.gov/events/environment-manufacturing-and-critical- materials-subcommittee-legislative-hearing-driving-affordability-preserving-people-s-freedom-to-buy-affordable-vehicles-and-fuel.

Moreover, EPA's reliance on the BIL and IRA is further problematic because Congress could have, but did not, choose to mandate PEVs directly through these actions. Congress provided subsidies, not mandates, and EPA cannot rely on these subsidies as a basis for the feasibility of its mandates. Furthermore, 66% of Americans do not support policies and regulations that ban the sale of new ICE vehicles, while only 23% support such mandates.38 Doing so contravenes Congress's intent and results in a regulatory structure premised on federal funding that can easily vanish under a new Administration or Congress.39 [EPA-HQ-OAR-2022-0829-0579, pp. 9-10]

38 RFA, "New Poll: Voters Support Ethanol and RFS, Oppose EV Mandates," (Jan. 9, 2023), available at https://ethanolrfa.org/media-and-news/category/news-releases/article/2023/01/new-poll-voters-support-ethanol-and- rfs-oppose-ev-mandates.

39 The BIL and IRA themselves are at risk of recission under a new Administration or Congress. See, e.g., Josh Siegel and Kelsey Tamborrino, Politico, GOP's debt-limit plan would gut Biden's climate law. White House's response: 'Jobs' (Apr. 20, 2023), available at https://www.politico.com/news/2023/04/20/house-gop-debt-limit- plan-inflation-reduction-act-00092891 ("The GOP proposal would revive a prior $7,500 tax

credit for qualifying electric vehicles, but would restore that tax break's per-manufacturer limit of 200,000 vehicles. It would entirely repeal the IRA's new incentives for critical battery minerals that are extracted from the U.S. or a close trading partner, and for batteries manufactured or assembled in North America.").

Organization: Institute for Energy Research (IER)

EPA's claimed authority contradicts recent Supreme Court precedent

EPA's asserted power to force a transition is an impermissible claim of new authority. The Supreme Court made clear in the various cases around the Clean Power Plan, culminating with West Virginia v. EPA, that such forced shifting (in that case from coal to natural gas or renewables) is a claim of new authority, and thus needs clear statutory mandate from Congress Just like in the West Virginia case, EPA is seeking to force a shift from one product to another. Thus this rulemaking raises the same major question issues as the Clean Power Plan. Absent express authorization from Congress, EPA cannot claim this power to shift the motor vehicle industry from internal combustion-powered to electric-powered engines. [EPA-HQ-OAR-2022-0829-0673, p. 3]

Organization: Institute for Policy Integrity at NYU School of Law et al.

I. Extensive Justification Supports EPA's Reliance on Global Climate Damage Valuations

In the Proposed Rule, EPA appropriately focuses on a global estimate of climate benefits, continuing its historical approach and once again rejecting its temporary and arbitrary practice during the Trump administration of disregarding all climate effects that occur outside the physical borders of the United States. While EPA offers persuasive justifications for this decision, many additional justifications—some of which EPA itself provides in the Draft SC-GHG Update12—further support this approach.13 In particular, EPA could emphasize the concern for the impacts of U.S. pollution on foreign welfare in the Clean Air Act and other sources of law, further highlight the significance of U.S. strategic interests and reciprocity, further emphasize the importance of extraterritorial impacts and spillovers, and highlight the inconsistency that would occur if the agency considered only domestic benefits while focusing on global costs. [EPA-HQ-OAR-2022-0829-0743, p. 3]

12 Draft SC-GHG Update, supra note 9, at 10–15.

13 See generally Jason A. Schwartz, Inst. for Pol'y Integrity, Strategically Estimating Climate Pollution Costs in a Global Environment (2021), https://policyintegrity.org/files/publications/Strategically_Estimating_Climate_Pollution_Costs_in_a_Glob al_Envir onment.pdf.

A. Relevant Statutes and Executive Orders Compel, and Certainly Permit, a Global Perspective on Climate Damages

The Clean Air Act, National Environmental Policy Act, Administrative Procedure Act, and other key sources of law not only permit, but in fact require, EPA to consider international effects. EPA should highlight these legal requirements as justification for its focus on global climate impacts. [EPA-HQ-OAR-2022-0829-0743, pp. 3-4]

Section 202 of the Clean Air Act, under which EPA issues the Proposed Rule, charges EPA with regulating "air pollutant[s] which may be reasonably anticipated to endanger public health or welfare,"14 where "welfare" is defined to include "effects on . . . weather . . . and climate."15 When interpreting Section 202, the Supreme Court found "there is nothing counterintuitive to the notion that EPA can curtail the emission of substances that are putting the global climate out of kilter."16 And when industry challenged another EPA climate program under Title I of the Clean Air Act by arguing that the statute "was concerned about local, not global effects," the U.S. Court of Appeals for the D.C. Circuit had "little trouble disposing of Industry Petitioners' argument that the [Clean Air Act's prevention of significant deterioration] program is specifically focused solely on localized air pollution," finding instead that the statute was "meant to address a much broader range of harms," including "precisely the types of harms caused by greenhouse gases."17 [EPA-HQ-OAR-2022-0829-0743, pp. 3-4]

14 42 U.S.C. § 7521(a)(1).

15 42 U.S.C. § 7602(h); Massachusetts v. EPA, 127 S. Ct. 1438, 1447 (2007).

16 Massachusetts, 127 S. Ct. at 1461 (emphasis added). This case concerned Section 202 of the Clean Air Act, which similarly permits EPA to regulate "any air pollutant . . . which may reasonably be anticipated to endanger public health or welfare." Id. at 1454 (quoting 42 U.S.C. § 7521(a)(1)).

17 Coalition for Responsible Regulation v. EPA, 684 F.3d 102, 137-38 (D.C. Cir. 2012), aff'd in part, rev'd in part sub nom. Util. Air Regulatory Grp. v. EPA, 134 S. Ct. 2427 (2014).

A recent law-review article exhaustively reviewed the legislative history of the Clean Air Act's definition of "welfare" and concluded that "when Congress included the 'effects on . . . climate' language in the statute, it understood that adverse climate effects could occur on a global scale."18 For instance, Senator Caleb Boggs, a Republican from Delaware and ranking minority member of the Public Works Subcommittee on Air and Water Pollution, which was considering the Clean Air Act in 1970, entered a report into the record stating that air pollution "alters climate and may produce global changes in temperature."19 Senator Jennings Randolph of West Virginia likewise submitted a statement into the record explaining that U.S. air pollution could "produce unacceptable worldwide climate changes."20 Congress's clear concern for the effects of domestic pollution on the global climate—many more examples of which are discussed in this law-review article—demonstrates that a global perspective is appropriate, if not required, when EPA regulates under the Clean Air Act. [EPA-HQ-OAR-2022-0829-0743, p. 4]

19 Id. at 32–33.

20 Id. at 3

This interpretation is further compelled by the National Environmental Policy Act (NEPA). Though best known for requiring agencies to prepare environmental impact statements before taking certain actions (a requirement that does not apply to Clean Air Act actions),21 NEPA also much more broadly declares a national environmental policy and requires of all agencies that "to the fullest extent possible[,] the policies, regulations, and public laws of the United States shall be interpreted and administered in accordance with the policies set forth in this chapter,"22 including the need to "recognize the worldwide and long-range character of environmental problems" and to "lend appropriate support" to help "maximize international cooperation."23 In other words, especially because adopting a global perspective on climate damages will advance U.S. foreign policy goals (see the next subsection), NEPA requires EPA to interpret all of its laws, including the Clean Air Act, in ways that recognize the worldwide character of environmental problems. As EPA recognizes in the Draft SC-GHG Update,24 using global social cost of greenhouse gas estimates helps fulfill that requirement. Likewise, in a recent guidance document, the Council on Environmental Quality highlighted this very statutory language to conclude that "it is most appropriate for agencies to focus on [social cost of greenhouse gases] estimates that capture global climate damages."25 [EPA-HQ-OAR-2022-0829-0743, pp. 4-5]

21 While actions taken under the Clean Air Act "shall [not] be deemed a major Federal action significantly affecting the quality of the human environment within the meaning of [42 U.S.C. § 4332(2)(C)]," 15 U.S.C. § 793(c)(1), the other provisions of NEPA—including those quoted and cited in this paragraph—continue to apply.

22 42 U.S.C. § 4332(1) (emphasis added).

23 Id. § 4332(2)(I); see also EDF v. Massey, 986 F.2d 528, 536 (D.C. Cir. 1993) ("Section 102(2)(F) further supports the conclusion that Congress, when enacting NEPA, was concerned with worldwide as well as domestic problems facing the environment . . . Compliance with one of the subsections can hardly be construed to relieve the agency from its duty to fulfill the obligations articulated in other subsections."); NRDC v. NRC, 647 F.2d 1345, 1387 (D.C. Cir. 1981) (J. Robinson, concurring; J. Wilkey wrote for the Court, but there was no majority opinion) (concluding that even if a conflict with another statute prevents the agency from conducting an environmental impact statement, that "does not imply that NRC may ignore its other NEPA obligations," including the "provision for multinational cooperation" and the "policy of the United States with respect to the ecological well-being of this planet"; rather, the agency "should remain cognizant of this responsibility"); Greene County Planning Bd. v. Federal Power Comm'n, 455 F.2d 412, 424 (2d Cir. 1972) ("The Commission's 'hands-off' attitude is even more startling in view of the explicit requirement in NEPA that the Commission 'recognize the worldwide and long-range character of environmental problems' and interpret its mandate under the Federal Power Act in accordance with the policies set forth in NEPA.").

I. EPA Should More Extensively Document Why the Proposed Rule Does Not Trigger the Major Questions Doctrine

Litigation over the 2021 Rule has focused primarily on the major questions doctrine, and some opponents of the Proposed Rule have raised similar objections. Petitioners in the ongoing D.C. Circuit litigation argue that the 2021 Rule triggered the major questions doctrine primarily because, in their words, "[t]he rule effectively mandates that a decreasing percentage of the fleet be gasoline-powered, and an increasing percentage be electric." [EPA-HQ-OAR-2022-0829-0601, pp. 5-6]

22 Brief for Private Petitioners at 24, Texas v. EPA (D.C. Cir. filed Nov. 3, 2022).

Challenges to both the 2021 Rule and this rule under the major questions doctrine lack merit. Nonetheless, as explained in this section, EPA could provide more extensive legal analysis rebutting these challenges. Specifically, EPA should catalog regulatory antecedents for its approach to considering vehicle electrification and provide additional context about the economic significance of the Proposed Rule. We begin, however, with a brief description of the major questions doctrine. [EPA-HQ-OAR-2022-0829-0601, pp. 5-6]

A. Economic and Political Significance Are Not Sufficient to Trigger the Major Questions Doctrine—The Agency's Action Must Also Be Unlike Anything It Has Done Before and Represent a "Transformative Expansion" of Its Authority

Litigants and commenters invoking the major questions doctrine—including challengers in the ongoing litigation over the 2021 Rule—often invoke the major questions doctrine without properly describing its contours. To provide legal context, this section describes how the Supreme Court has articulated the doctrine. [EPA-HQ-OAR-2022-0829-0601, pp. 5-6]

In West Virginia v. EPA, the Supreme Court stressed that only "extraordinary cases" trigger the major questions doctrine—"cases in which the 'history and the breadth of the authority that the agency has asserted,' and the 'economic and political significance' of that assertion, provide a 'reason to hesitate before concluding that Congress' meant to confer such authority."23 The bulk of West Virginia's legal analysis of the doctrine's triggers examined whether EPA had "'claim[ed] to discover in a long-extant statute [1] an unheralded power' [2] representing a 'transformative expansion in [its] regulatory authority.'"24 In other words, the Supreme Court focused on (1) regulatory history and (2) the transformative nature of the agency's asserted authority. In Biden v. Nebraska, the Supreme Court again reiterated the importance of "the 'history and the breadth of the authority that the agency had asserted,'" in addition to "the 'economic and political significance' of that assertion."25 For example, the Court stressed that "[t]he Secretary [of Education] has never previously claimed powers of this magnitude under" the statute at issue in Nebraska and, "[u]nder the Government's reading of [that statute], the Secretary would enjoy virtually unlimited power to rewrite" it.26 Both West Virginia and Nebraska reveal that an agency action does not trigger the major questions doctrine unless its history and breadth and economic and political significance provide a reason for a court to be skeptical of the agency's action. [EPA-HQ-OAR-2022-0829-0601, pp. 5-6]

23 West Virginia v. EPA, 142 S. Ct. 2587, 2608 (2022) (quoting FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120, 159–60 (2000)) (alteration omitted).

24 Id. at 2610 (quoting Util. Air Regul. Grp. v. EPA (UARG), 573 U.S. 302, 324 (2014)).

25 Biden v. Nebraska, --- S. Ct. ---, 2023 WL 4277210, at *12 (June 30, 2023) (quoting West Virginia, 142 S. Ct. at 2608) (alterations omitted).

26 Id. at *12–*13.

To trigger the major questions doctrine, regulatory history must reveal that an agency action is unlike anything the agency has ever done. Of course, the agency need not identify an identical regulatory antecedent, because new regulations will rarely, if ever, be identical to previous ones as they would then be unnecessary. Rather, West Virginia's and Nebraska's analyses suggest that the relevant regulatory antecedent must be an analogous exercise of authority. The cases cited in West Virginia similarly focus on the unprecedented nature of the agency's action.27 And the Court reaffirmed the centrality of "past practice under the statute" in Nebraska, both in terms of the "scope" of prior agency actions and the "size" of those actions' effects.28 [EPA-HQ-OAR-2022-0829-0601, pp. 5-6]

27 For example, UARG notes that EPA's newfound statutory interpretation would have "swept" many sources under the agency's control that it had "not previously regulated." 573 U.S. at 310. Alabama Association of Realtors v. Department of Health and Human Services (Alabama Realtors)] also highlights that the "expansive authority" asserted was "unprecedented." 141 S. Ct. 2485, 2489 (2021) (per curiam). And National Federation of Independent Business v. Occupational Safety & Health Administration

likewise focused on the “lack of historical precedent” for the agency’s action. 142 S. Ct. 661, 666 (2022) (per curiam) (cleaned up). In contrast, the Supreme Court rejected a challenge to a vaccine mandate from the Department of Health and Human Services for certain healthcare workers because “the Secretary routinely imposes conditions of participation that relate to the qualifications and duties of healthcare workers.” Biden v. Missouri, 142 S. Ct. 647, 653 (2022) (per curiam).

28 Nebraska, 2023 WL 4277210, at *12 (quoting Alabama Realtors, 141 S. Ct. at 2489)); see also id. at *14 (describing the action as “unprecedented”).

To trigger the major questions doctrine, the breadth of the agency action must also suggest the agency is dramatically changing its authority. In West Virginia, the Supreme Court explained that the challenged Clean Power Plan represented a “transformative expansion [of EPA’s] regulatory authority.”29 In other words, the Supreme Court concluded that it “effected a ‘fundamental revision of the statute, changing it from [one sort of] scheme of . . . regulation’ into an entirely different kind.”30 In discussing this factor, the Court focused on whether the challenged action transformed the role of the regulator (i.e., EPA), not the regulated sector.31 Nebraska32 and the major questions cases cited in West Virginia33 contain similar analyses of whether the agency action represented a transformation of the agency’s authority. [EPA-HQ-OAR-2022-0829-0601, pp. 6-8]

29 West Virginia, 142 S. Ct. at 2610.

30 Id. at 2612 (citation omitted).

31 See id.; see also Mayes v. Biden, 67 F.4th 921, 934–35 (9th Cir. 2023) (focusing not on whether the government sought “to regulate a significant portion of the American economy,” but on whether its action “represent[ed] an ‘enormous and transformative expansion in [its] regulatory authority’” (quoting UARG, 573 U.S. at 324)).

32 Nebraska, 2023 WL 4277210, at *13 (“[The Government’s reading of the [statute] . . . would ‘effect a “fundamental revision of the statute, changing it from one sort of scheme of regulation” into an entirely different kind ’” (quoting West Virginia, 142 S. Ct. at 2596) (alterations omitted)).

33 See, e.g., UARG, 573 U.S. at 312, 325 (noting that EPA’s action “would radically expand” the programs at issue, “making them both unadministrable and ‘unrecognizable to the Congress that designed’ them” (citation omitted)); MCI Telecom. Corp. v. Am. Tel. & Tel. Co., 512 U.S. 218, 225, 229, 234 (1994) (finding that the agency action had effected a “basic and fundamental” change that went to the “heart” of the statute and constituted “effectively the introduction of a whole new regime of regulation”).

The economic and political significance of an agency’s action is necessary but insufficient to trigger the major questions doctrine. Although the Supreme Court often references economic and political significance in its major questions cases, these indicators alone have never sufficed to trigger the doctrine. For example, West Virginia’s legal analysis omits any references to economic significance, such as regulatory costs or the number of persons or entities affected. Moreover, the Supreme Court has decided numerous recent cases under sizable government programs without resort to the major questions doctrine, including cases involving gargantuan programs like Medicare34 and myriad other agency actions implicating the energy, utility, and telecommunications industries.35 And although Nebraska discusses economic and political significance, it does so only after reviewing regulatory antecedents and the transformation of the regulatory scheme.36 Much of Nebraska’s economic discussion also focused on the relative costs of the challenged action compared to prior agency actions under the same statute, highlighting how this aspect of the regulatory history demonstrated the action was unlike anything the Secretary of Education had done before.37 [EPA-HQ-OAR-2022-0829-0601, pp. 6-8]

34 See, e.g., Becerra v. Empire Health Found., 142 S. Ct. 2354 (2022); Am. Hosp. Ass'n v. Becerra, 142 S. Ct. 1896 (2022); Azar v. Allina Health Servs., 139 S. Ct. 1804 (2019).

35 See, e.g., EPA v. EME Homer City Generation, L.P., 572 U.S. 489 (2014); Nat'l Cable & Telecomms. Ass'n v. Brand X Internet Servs., 545 U.S. 967 (2005); New York v. FERC, 535 U.S. 1 (2002).

36 Nebraska, 2023 WL 4277210, at *12–*13.

37 Id. at *12 (noting that "past waivers and modifications issued under the Act have been extremely modest and narrow in scope").

In short, economic significance38 and political significance are sometimes relevant but have never been sufficient by themselves to trigger the major questions doctrine, which instead also requires examining whether the agency action at issue is of sufficient novelty and breadth to counsel skepticism. Only when the doctrine is so triggered must the agency point to "clear congressional authorization" for the agency's approach.39 But this is not the same as a "clear statement rule"—a phrase found nowhere in the majority opinions in either West Virginia or Nebraska (or any the Court's other major question precedents).40 Or, as Justice Barrett explained in her concurrence in Nebraska, the necessary clear congressional authorization should not be equated with "'an "unequivocal declaration"' from Congress authorizing the precise agency action under review, as [the Court's] clear-statement cases do in their respective domains."41 This explanation of "clear Congressional authorization" reflects the Court's interpretive approach in West Virginia.42 [EPA-HQ-OAR-2022-0829-0601, pp. 6-8]

38 As discussed above, relative economic significance as compared to regulatory antecedents is also relevant and is most appropriately considered when evaluating whether the action is sufficiently novel in scope or size.

39 West Virginia, 142 S. Ct. at 2614 (quoting UARG, 573 U.S. at 324).

40 Natasha Brunstein & Donald L. R. Goodson, Unheralded and Transformative: The Test for Major Questions After West Virginia, 47 WM. & MARY ENV'T L. & POL'Y REV. 47, 95–100 (2022).

41 Nebraska, 2023 WL 4277210, at *17 (Barrett, J., concurring) (quoting Financial Oversight and Management Bd. for P. R. v. Centro De Periodismo Investigativo, Inc., 143 S. Ct. 1176, 1183 (2023)).

42 Brunstein & Goodson, supra note 40, at 99–100 ("[A]lthough a court must approach an agency's assertion of authority with 'skepticism' after having determined it is 'unheralded' and represents a 'transformative' change, if the most natural reading of the statute would permit the agency action, the agency has 'clear congressional authorization' for the action.").

B. EPA Should More Thoroughly Document Regulatory Antecedents for Vehicle Electrification

EPA thoroughly documents antecedents for certain aspects of the Proposed Rule, such as the treatment of upstream emissions and the application of averaging, banking, and trading.43 But EPA should do more to emphasize that its current treatment of vehicle electrification (the issue at the heart of the major questions challenge to the 2021 Rule) is not of sufficient novelty or breadth to trigger the doctrine. Although it is not legally required for EPA to provide regulatory antecedents to survive a major questions challenge, relevant antecedents provided in the regulation itself would assist in a future defense of the rule.44 [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

43 Proposed Rule, 88 Fed. Reg. at 29,245 (averaging, banking, and trading); id. at 29,252 (treatment of upstream emissions).

44 See Richard L. Revesz & Max Sarinsky, Regulatory Antecedents and the Major Questions Doctrine, GEO. ENV'T L. REV. (forthcoming 2023) (manuscript at 29).

The Proposed Rule includes only a limited discussion of how EPA's current approach to electrification continues that of prior rulemakings.45 EPA should say more. EPA's brief in the D.C. Circuit defending the 2021 Rule presents a table of greenhouse gas vehicle regulations that considered electrification, complete with pincites.46 At a minimum, EPA should incorporate this table by reference (as the Proposed Rule already does for the same brief's discussion of the regulatory antecedents for averaging, banking, and trading47). [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

45 E.g., Proposed Rule, 88 Fed. Reg. at 29,297 (noting that "[i]n EPA's 2021 rule that set GHG emission standards for MYs 2023 through 2026, we projected that manufacturers would comply with the 2026 standards with about 17 percent PEVs at the industry-wide level"); id. at 29,243 (describing the history of advanced technology credits for hybrid powertrains, all-electric vehicles, and fuel cell electric vehicles for heavy-duty vehicles).

46 Brief for EPA at 16 tbl.1, Texas v. EPA (D.C. Cir. filed Feb. 24, 2023).

47 See Proposed Rule, 88 Fed. Reg. at 29,233 n.393.

EPA could also provide more detail on these antecedents. For instance, EPA might describe specific features and provide quotations demonstrating that EPA has consistently exercised its power to consider and incentivize electrification.48 For example, the 2012 Rule was projected to increase electric vehicle penetration from 0% to 2% by model year 2025,49 and to increase penetration of mild hybrid electric vehicles from 0% to 26%.50 And the 2020 Rule was projected to increase fleetwide electric vehicle sales to 7.9% by model year 2029, as compared to 6.9% had EPA not required emissions reductions.51 (These increases are relatively small in absolute numbers because these rules covered model years in which electric vehicles were at the bottom of an S-shaped curve, which is how adoptions rates are typically represented.52 But the adoption rate for electric vehicles is now increasing more rapidly after a critical mass has been reached.53) In addition to greenhouse gas rules, EPA may also discuss the Tier 2 criteria pollutant standards from 2000, in which the agency established a zero-emissions-vehicles bin and weighted these vehicles double when calculating a manufacturer's fleet average NOX emissions.54 EPA retained a zero-emissions bin for the Tier 3 standards in 2014.55 [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

48 See Revesz & Sarinsky, supra note 44, at 24–25.

49 EPA, REGULATORY IMPACT ANALYSIS: FINAL RULEMAKING FOR 2017–2025 LIGHT-DUTY VEHICLE GREENHOUSE GAS EMISSION STANDARDS AND CORPORATE AVERAGE FUEL ECONOMY STANDARDS 3-48 tbl.3.5-19, 3-54 tbl.3.5-25 (2012) [hereinafter 2012 RIA].

50 Compare id. 3-48 at tbl.3.5-19 with id. at 3-54 tbl.3.5-25.

54 Brief of Amicus Curiae Margo Oge & John Hannon at 25, Texas v. EPA (D.C. Cir. filed Mar. 8, 2023) (citing 65 Fed. Reg. 6,698, 6,734 tbl. IV.B.–2A, 6,746 (Feb. 10, 2000)).

55 Id. at 27 (citing 79 Fed. Reg. 23,414, 23,714 tbl. 2 of § 86.1811-17(b)(4)(i) (Apr. 18, 2014)).

Finally, EPA should provide more historical examples of how its standards have caused manufacturers to adopt emerging technologies. For example, just looking at the 2010 and 2012 rules reveals numerous potentially helpful examples: [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

- The 2010 Rule was projected to boost the penetration of six-speed dual-clutch transmission from 7% to 55% by model year 2016.56 [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

- The 2010 Rule was projected to boost the penetration of 42-volt stop-start hybrid system technology from 3% to 42%.57 [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

- The 2012 Rule was projected to boost the penetration of high-efficiency gearbox technology from 0% to 95% by model year 2025.58 [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

- The 2012 Rule was projected to boost the penetration of exhaust gas recirculation technology from 6% to 68%.59 [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

- The 2012 Rule was projected to boost the penetration of lower rolling resistance tires from 0% to 97%.60 [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

- The 2012 Rule was projected to boost the penetration of engine friction reduction technology from 0% to 95%.61 [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

The Proposed Rule's discussion of legal authority already mentions how "EPA's CAA Title II emissions standards have been based on and stimulated the development of a broad set of advanced automotive technologies, such as on-board computers and fuel injection systems."62 But EPA could further plumb these and other examples to demonstrate that the Proposed Rule's treatment of vehicle electrification would not transform EPA's authority as a regulator. To the extent that EPA regulations have previously considered the adoption of electronic/computerized updates of once-analog vehicle components,63 EPA should document these especially relevant examples as further support for its current consideration of electric motors. [EPA-HQ-OAR-2022-0829-0601, pp. 8-10]

62 Proposed Rule, 88 Fed. Reg. at 29,233.

63 See Oge & Hannon, supra note 54, at 21–22 (describing how "[m]anufacturers transformed the combustion process from a mechanical one to a sophisticated system with feedback loops, run by computers with electronic sensors and controls," and "[e]lectronic controls were developed to optimize the [catalytic] converter's efficiency"); 2012 Rule, 77 Fed. Reg. at 62,672 (noting that EPA tailpipe standards have "stimulated the development of a much broader set of advanced automotive technologies, such as on-board computers and fuel injection systems, which are the building blocks of today's automotive designs and have yielded not only lower pollutant emissions, but improved vehicle performance, reliability, and durability").

C. EPA Should Better Contextualize the Proposed Rule's Economic Significance, in Both Relative and Absolute Terms

EPA could better insulate the Proposed Rule from a future major questions challenge by providing a more nuanced discussion of economic effects, both as compared to prior EPA tailpipe rules and in absolute terms.64 In terms of relative costs, the Proposed Rule already notes that the estimated average cost to manufacturers per vehicle is within the range of costs projected in prior tailpipe rules.65 EPA could strengthen this point by also providing a table that comprehensively describes annualized costs of prior tailpipe rules updated for inflation.66 This table would bolster EPA's conclusion that the costs of the Proposed Rule are not exceptional. [EPA-HQ-OAR-2022-0829-0601, pp. 10-12]

64 EPA does make clear that the projected BEV penetration rate of 67% by 2032 should be compared to the projected 39% penetration under the No Action case, not today's penetration rate. Compare Proposed Rule, 88 Fed. Reg. at 29,329 tbl. 80, with id. tbl. 81.

65 Proposed Rule, 88 Fed. Reg. at 29,343.

66 Governing for Impact & Evergreen Action, Comment Regarding NPRM "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles" 10–12 (July 5, 2023).

EPA should further underscore this point by explaining that this cost similarity with prior regulations obtains even though the Proposed Rule would simultaneously establish GHG and criteria pollutant standards, instead of only one or the other. [EPA-HQ-OAR-2022-0829-0601, pp. 10-12]

In terms of absolute economic significance, EPA discusses BEV adoption primarily in terms of the annual percentage of new vehicle sales,67 but an even more useful statistic would be the percentage of BEVs out of all the vehicles on the road at a given time. First and foremost, doing so would help the public better comprehend the rule's anticipated effects. It may be easier to conceptualize increased vehicle electrification in terms of the percentage of vehicles on the road, rather than the percentage of new sales. Presenting the data in this way would also help the public to better understand how the Proposed Rule would affect transportation emissions, the need for charging infrastructure, the demand for gasoline, and the demand for vehicle repair and maintenance services. [EPA-HQ-OAR-2022-0829-0601, pp. 10-12]

67 Proposed Rule, 88 Fed. Reg. 29,329 tbl.80.

In terms of the major questions doctrine, reporting such data would provide compelling context regarding economic significance. For example, under the proposed program, in 2032, new vehicle sales would be 67% BEVs compared to 39% under the No Action case.68 But BEVs would comprise only 21.2% of the total fleet compared to 15% for the No Action case.69 [EPA-HQ-OAR-2022-0829-0601, pp. 10-12]

68 Id. & id. at 29,329 tbl.81.

69 This presentation would also enable a more apt comparison to the stock numbers of electricity generation that the Supreme Court noted in West Virginia's background section. West Virginia, 142 S. Ct. at 2593.

The RIA provides two figures that relate to this issue: Figure 9-1 depicts the total number of internal combustion engine (ICE) vehicles on the road every year under the proposed program, and Figure 9-2 does the same for BEVs.70 Using EPA's data underlying these two figures,71 Policy Integrity generated the table below showing percentage rates by year for the No Action case, EPA's proposed program, and Alternative 1. (For brevity, this table provides figures annually from 2027–2032, and then every five years beginning in 2035.) EPA should provide such a table or similar information in the regulation. [EPA-HQ-OAR-2022-0829-0601, pp. 10-12]

70 RIA at 9-2 tbls. 9-1, 9-2.

71 Optimization Model for Reducing Emissions of Greenhouse Gases from Automobiles, EPA (Apr. 2023), https://www.epa.gov/regulations-emissions-vehicles-and-engines/optimization-model-reducing-emissions- greenhouse-gases (download "Light- and medium-duty effects (zip); select "20230315_091353_effects_central"; select "20230315_091353_cost_effects_annual.csv"; refer to "registered_count").

Table 1: Share of BEVs in U.S. Fleet by Year

Year	No Action BEV %	Proposed Program BEV %	Alt. 1 BEV %
2027	5.2%	5.7%	5.7%
2028	6.9%	8.1%	8.3%
2029	8.9%	11.1%	11.2%
2030	11.0%	14.3%	14.6%
2031	13.1%	17.7%	18.0%
2032	15.0%	21.2%	21.6%
2035	19.2%	30.8%	31.7%
2040	24.6%	44.1%	46.0%
2045	27.4%	52.6%	55.3%
2050	28.4%	56.6%	59.8%
2055	29.2%	58.1%	61.5%

[EPA-HQ-OAR-2022-0829-0601, pp. 10-12]

As Table 1 illustrates, under both the proposed program and Alternative 1, the share of BEVs out of all cars in the U.S. vehicle fleet compared to the No Action case increases gradually, reaching less than seven percentage points higher than the No Action case by 2032. This difference increases in later years. This relatively slow growth—particularly when viewed in comparison to the share of all vehicles sold per year, which EPA provides in the Proposed Rule—is not surprising given that cars remain on the road for many years, and the new cars sold in a single year reflect a small percentage of vehicles on the road at that time. [EPA-HQ-OAR-2022-0829-0601, pp. 10-12]

Monetizing climate impacts may also be legally required. In 2007, the U.S. Court of Appeals for the Ninth Circuit held that the federal government must monetize climate impacts when it conducts a cost-benefit analysis. In Center for Biological Diversity v. National Highway Traffic Safety Administration, the Ninth Circuit remanded a fuel economy rule to the Department of Transportation (DOT) for failing to monetize the benefits of carbon dioxide reductions in its regulatory analysis.153 The Court recognized the presence of uncertainty in the valuation of climate damages, but explained that "the value of carbon emissions reduction is certainly not zero."154 By failing to value the benefit of greenhouse gas emission reductions in its analysis, the Court continued, DOT effectively ignored the adverse impacts of greenhouse gas emissions and thus "put a thumb on the scale by undervaluing the benefits . . . of more stringent standards."155 [EPA-HQ-OAR-2022-0829-0743, p. 23]

153 Ctr. for Biological Diversity, 538 F.3d at 1198–1203 (9th Cir. 2008).

154 Id. at 1200.

155 Id. at 1198.

In the Proposed Rule, EPA monetizes not only the expected benefits of the proposal but also the expected compliance costs from industry. EPA then compares quantified cost and benefit estimates in determining whether and how to regulate, as instructed by federal guidance and executive order.158 Capturing climate benefits is thus essential to ensuring a balanced analysis. As the Ninth Circuit has recognized, "failure to monetize the most significant benefit of more stringent standards: reduction in carbon emissions"—while continuing to value estimated compliance costs—would "put a thumb on the scale by undervaluing the benefits and overvaluing the costs of more stringent standards."159 [EPA-HQ-OAR-2022-0829-0743, p. 24]

158 Exec. Order No. 12,866 § 1(a), 58 Fed. Reg. 51,735 (Oct. 4, 1993) (directing that "in choosing among alternative regulatory approaches, agencies should select those approaches that maximize net benefits").

159 Ctr. for Biological Diversity, 538 F.3d at 1198–99.

2. The Working Group Did Not Bias Its Estimates by Ignoring Positive Impacts of Climate Change

Critics sometimes claim that the Working Group's social cost values ignore important positive impacts of a warming climate. Examples that have been offered to support this argument include alleged agricultural benefits from higher temperatures and decreased wintertime mortality. But these arguments are legally and factually dubious, and miss the forest for the trees. [EPA-HQ-OAR-2022-0829-0743, pp. 26-27]

Mere omission of some impacts does not counsel for abandoning the social cost estimates, particularly since independent experts—and EPA's Draft SC-GHG Update—widely agree that those estimates likely undervalue true climate damages because they omit far more negative effects than positive ones. For instance, the Working Group has explained that several of the underlying economic models omit certain major damage categories such as catastrophic damages and certain cross-regional spillover effects.176 These effects can be massive: One paper, for instance, finds that the inclusion of tipping points doubles the social cost estimates,177 with another paper concluding that the effect is even greater and thus the Working Group's existing values “may be significantly underestimating the needs for controlling climate change.”178 The current consensus of experts puts damages for a 3°C increase at roughly 5% to 10% of gross domestic product,179 which is substantially higher than the damages estimated by the IAMs.180 And as the Ninth Circuit has explained, the presence of some omitted damages does not provide a legal basis to ignore established methodologies to monetize climate damages, since while “there is a range of [plausible] values, the value of carbon emissions reduction is certainly not zero.”181 [EPA-HQ-OAR-2022-0829-0743, pp. 26-27]

176 2010 TSD, supra note 171, at 26, 32.

179 See, e.g., Peter Howard & Derek Sylvan, Inst. for Pol’y Integrity, Gauging Economic Consensus on Climate Change 25 (2021) (reporting mean estimate of 8.5% GPD loss and median estimate of 5% loss, based on elicitation of over 700 climate-policy experts).

180 2010 TSD, supra note 171, at 9 fig.1A (showing range of GDP loss below 5% for 3°C temperature increase).

181 Ctr. for Biological Diversity, 38 F.3d at 1200.

For the reasons discussed in supra Section I and elsewhere in this letter, Alternative 1 would not substantially increase legal risk under the major questions doctrine. Alternative 1 relies on the same regulatory approaches that have considerable precedent in prior EPA tailpipe rules.212 It also has similar effects on BEV penetration.213 [EPA-HQ-OAR-2022-0829-0601, pp. 30-31]

212 See generally supra Part I.B.

213 See supra p. 10 tbl.2.

Accordingly, barring a compelling reason otherwise, EPA should select the regulatory alternative that maximizes net benefits—according to EPA’s current analysis, Alternative 1. [EPA-HQ-OAR-2022-0829-0601, pp. 30-31]

Organization: Job Creators Network Foundation (JCNF)

EPA’s Proposed Rule Is Illegal

To begin, JCNF does not believe that EPA has the legal authority to issue these proposed regulations. Although it claims authority under the Clean Air Act to promulgate such a transformative rule, recent decisions issued by the United States Supreme Court indicate that the CAA does not give EPA such broad authority. In what has come to be known as the “major questions doctrine,” the Court has rejected agency claims of authority to act when the claim of authority concerns an issue of “vast ‘economic and political significance’” and Congress has not expressly delegated such vast power to the agency.2 While the doctrine has “arisen from all corners of the administrative state,”3 in West Virginia v. EPA the Court applied it to EPA’s power under the CAA.3 In that case the Court rejected EPA’s attempt to use the CAA to “substantially restructure the American energy market.”5 [EPA-HQ-OAR-2022-0829-0709, pp. 1-2]

2 Congressional Research Service, “The Major Questions Doctrine,” (Link: https://crsreports.congress.gov/product/pdf/IF/IF12077) In Focus (Nov. 2, 2022).

3 Biden v. Nebraska, Slip Op. at 24 (June 30, 2023).

4 West Virginia v. EPA, 142 S. Ct. 2587 (2022).

5 Id. at 2610.

By requiring that sixty-seven percent of new vehicle sales be electric by 2032, with this proposed rule the agency would restructure the entire automobile industry. Absent express authorization from Congress, EPA does not have the legal authority to issue this rule. [EPA-HQ-OAR-2022-0829-0709, pp. 1-2]

Organization: John Graham

EPA’s Response to Comments document for the 2023-2026 light-duty standards dismissed lifecycle arguments as irrelevant since the Agency has not proposed to address a possible change in the “form” of the standard. However, lifecycle emissions are not a “form of the standard”, they are part of what determines the total amount of CO2 emissions caused by vehicles. It is disingenuous to suggest that, for example, selecting between footprint- and weight-based adjustments to the standards, which is well accepted as a change in the form of the standards, is the same as ignoring CO2 emissions equivalent to 40% of 2021 ICEV emissions. Delaying indefinitely a move to a lifecycle standard is not technology-neutral, as it retards HEV deployment and innovation, while hurting the environment and the economy. [EPA-HQ-OAR-2022-0829-0585, p. 38]

Therefore, we are requesting that EPA also consider our comment as a petition for rulemaking (under the APA and CAA) to adopt a lifecycle emissions standard for vehicles. If necessary, the agency could go final with the 2027 standards with the tailpipe metric and hold on finalization of the 2028-2032 standards until the lifecycle rulemaking is completed. This would ensure that automakers have ample lead time (4-5 years) to adjust to the new lifecycle metric and the new lifecycle performance standards. [EPA-HQ-OAR-2022-0829-0585, p. 38]

Organization: Kentucky Office of the Attorney General et al.

The Proposed Rule tries to expand EPA’s authority under Section 202 of the CAA to force automobile manufacturers to build fewer vehicles with internal combustion engines and make more EVs instead—many more, and quickly. The numbers are staggering: EPA expects that the proposal will create enough EVs to penetrate 67% and 46% of overall light- and medium-duty vehicle sales respectively in less than a decade. 88 Fed. Reg. at 29,329, 29,331. Forcing that market transformation goes far beyond the statutory limits Congress set. And it is bad policy. [EPA-HQ-OAR-2022-0829-0649, p. 3]

The Agency points to no textual hook for the Proposed Rule in Section 202—much less a connection clear enough to support the hefty political and economic issues at stake. [EPA-HQ-OAR-2022-0829-0649, p. 3]

The Proposed Rule also generates tension with the regulatory efforts of agencies in other areas. As described above, the Department of Transportation, through NHTSA, has the authority to set average fuel economy standards for automobiles. 49 U.S.C. § 32902(a). EPA and NHTSA have previously acted in concert. Now that those efforts have been bifurcated, EPA's proposals could limit dramatically not just the effect of NHTSA's regulatory scheme, but also automakers' ability to comply with the suite of regulations. It seems this may have been the plan all along. See Private Pet'r Opening Br., Texas v. EPA, No. 22-1031 (D.C. Cir. Apr. 27, 2023), ECF No. 1996915, at 9-10 ("Before joining the administration, the heads of the Council on Environmental Quality and EPA's Office of Air and Radiation (which wrote this rule) advocated this 'decoupling' precisely so that EPA could take 'a bolder approach on light duty vehicle electrification.'" (quoting Climate 21 Proj., Transition Memo: Environmental Protection Agency 11 (2021))). But EPA has no authority to wield this kind of power and reduce NHTSA's role in this way, especially considering that Congress has spoken clearly that NHTSA "may not consider" EV fuel economy in setting its own standards. 49 U.S.C. § 32902(h)(1). EPA's apparent attempt to expand its own authority under the CAA ignores the broader statutory context. [EPA-HQ-OAR-2022-0829-0649, p. 5]

The Proposed Rule also does not grapple with the fact that EPA needs more than a "plausible textual basis" to issue rules that, as here, implicate significant political and economic issues. West Virginia v. EPA, 142 S. Ct. 2587, 2610 (2022). Indeed, the proposal is long on explaining that climate change "threatens human health." 88 Fed. Reg. at 29,207. And it does not hide the ball that the Agency is "forc[ing] the industry to" make EVs that it would not otherwise. Id. at 29,233 (quoting International Harvester Co. v. Ruckelshaus, 478 F.2d 615, 634-35 (D.C. Cir. 1973)). But the Proposed Rule is short on explaining how Congress made it "clea[r]" that the CAA "authoriz[es] [the] agency to exercise powers of [such] 'vast economic and political significance." [EPA-HQ-OAR-2022-0829-0649, pp. 5-6]

Alabama Ass'n of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021) (quoting Utility Air Regul. Grp. v. EPA, 573 U.S. 302, 324 (2014) ("UARG")). [EPA-HQ-OAR-2022-0829-0649, pp. 5-6]

So the reality is that the Proposed Rule is another EPA attempt to "substantially restructure" an important sector of the American economy. West Virginia, 142 S. Ct. at 2610. Yet in the 263 Federal Register pages the Proposed Rule spans, the Agency does not reckon with the Supreme Court's recent rebuke of a similarly "transformative expansion" of "regulatory authority," UARG, 573 U.S. at 324, nor explain where Congress clearly delegated EPA power to remake the nation's car fleets. [EPA-HQ-OAR-2022-0829-0649, p. 6]

In fact, many of the same indicators that made West Virginia "a relatively easy case for the [major questions] doctrine's application," are present here, too. 142 S. Ct. at 2621 (Gorsuch, J., concurring). The "serious[ness] [of] the problem"—in both cases, climate change policy—does not excuse an attempt to exert "authority in a manner that is inconsistent with the administrative structure that Congress enacted into law." FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120, 125 (2000) (cleaned up). Rather, regulating in an area that remains "the subject of an earnest and profound debate across the country" should counsel more restraint, not less. West Virginia, 142 S. Ct at 2614. Yet the Proposed Rule shifts a longstanding scheme to regulate internal combustion engine vehicles into one that erases most of those same cars from the market. Major questions often follow "transformative expansion[s]" of agency power like these. West Virginia, 142 S. Ct. at 2614 (cleaned up); see also id. at 2612 (describing agency interpretations that "effect a fundamental revision of [a] statute, changing it from [one sort of] scheme of . . . regulation into an entirely different kind"). [EPA-HQ-OAR-2022-0829-0649, p. 6]

Organization: Kentucky Office of the Attorney General et al.

EPA first regulated GHG emissions from motor vehicles following the Supreme Court's decision in Massachusetts v. EPA, which held that EPA had certain authority under the CAA to regulate greenhouse gas emissions from new motor vehicles. 549 U.S. 497 (2007). Following the Massachusetts decision, EPA issued an endangerment finding for "six well-mixed greenhouse gases," including carbon dioxide ("CO2"). 74 Fed. Reg. 66,496 (Dec. 15, 2009). EPA then promulgated its initial standards for these gases through joint rulemaking with the National Highway Traffic Safety Administration ("NHTSA"). NHTSA is authorized to set corporate average fuel economy standards under the Energy Policy and Conservation Act, Pub. L. No. 94-163, 89 Stat. 871 (1975). [EPA-HQ-OAR-2022-0829-0649, pp. 2-3]

The first of these joint EPA-NHTSA rulemakings occurred in 2010. At that time, EPA and NHTSA set initial CO2 emissions standards for model years 2012–2016 and later. 75 Fed. Reg. 25,234 (May 7, 2010). In 2012, EPA and NHTSA set new, more stringent CO2 emissions standards for model years 2017–2025 and later. 77 Fed. Reg. 62,624 (Oct. 15, 2012). In 2020, EPA and NHTSA issued a rule ("the 2020 Rule") that revised the standards for model years 2022– 2025, making those standards less stringent and setting a new standard for model years 2026 and later. 85 Fed. Reg. 24,174 (Apr. 30, 2020). [EPA-HQ-OAR-2022-0829-0649, pp. 2-3]

Then President Biden took office and began instituting his climate agenda. By executive order, he required the whole of the federal government to commit the full extent of its authority to reducing GHG emissions. Executive Order on Tackling the Climate Crisis at Home and Abroad, Exec. Order No. 14008 of January 27, 2021 ("[W]e must combat the climate crisis with bold, progressive action that combines the full capacity of the Federal Government with efforts from every corner of our Nation, every level of government, and every sector of our economy."). In response, EPA revised the CO2 emissions standard for model years 2023 and later (the "2021 Rule"). 86 Fed. Reg. 74,434 (Dec. 30, 2021). [EPA-HQ-OAR-2022-0829-0649, pp. 2-3]

The 2021 Rule fundamentally changed EPA's approach to the regulation of motor vehicle emissions. Previously, emissions standards occurred via joint rulemaking with NHTSA and were set in concert with its promulgation of fuel economy standards. This approach made sense because emissions and fuel economy standards are inextricably linked. But the President's climate agenda made joint rulemaking with NHTSA problematic. NHTSA is statutorily prohibited from considering the fuel economy of EVs when setting fuel economy standards. 49 U.S.C. § 32902(h)(1). Consequently, to avoid legal impediments to the President's climate agenda, the 2021 Rule decoupled EPA emissions standards from NHTSA fuel economy standards. The State of Texas, the Commonwealth of Kentucky, and other state and private petitioners challenged the 2021 Rule in the United States Court of Appeals for the D.C Circuit. Texas, et al. v. EPA, et al., Case No. 22-1031. Those challenges remain pending. [EPA-HQ-OAR-2022-0829-0649, pp. 2-3]

In December 2021, President Biden issued yet another executive order, stating that "America must lead the world on clean and efficient cars and trucks" by "bolstering our domestic market by setting a goal that 50 percent of all new passenger cars and light trucks sold in 2030 be zero-emission vehicles, including battery electric, plug-in hybrid electric, or fuel cell electric vehicles." Strengthening American Leadership in Clean Cars and Trucks, Exec. Order 14037 of August 5, 2021. In support of this policy, the President specifically dictated that "[t]he Administrator of the Environmental Protection Agency (EPA) shall, as appropriate and consistent with applicable law, consider beginning work on a rulemaking under the [CAA] to establish new multi-pollutant emissions standards, including for greenhouse gas emissions, for light- and medium-duty vehicles beginning with model year 2027 and extending through and including at least model year 2030." Id. [EPA-HQ-OAR-2022-0829-0649, pp. 2-3]

The Proposed Rule is the result of the President's mandate. The Proposed Rule sets "increasingly stringent" standards for CO2. 88 Fed. Reg. at 29,240. For light-duty passenger cars, the proposal would require a reduction in emissions from 152 grams of CO2 emitted per mile traveled ("g/mile") for model year 2026 to 73 g/mile for model years 2032 and later—a reduction of 52%. 88 Fed. Reg. at 29,239. For light-duty trucks, the Proposed Rule would require a reduction from 207 g/mile for model year 2026 to 89 g/mile for model years 2032 and later—a reduction of 57%. Id. Fleet-wide for all light-duty vehicles, the Proposed Rule would require a reduction in emissions from 186 g/mile for model year 2026 to 82 g/mile for model years 2032 and later—a reduction of 56%. Id. at 29,239-29,240. For medium-duty vehicles, the Proposed Rule would require a reduction in CO2 emissions from 438 g/mile for model year 2027 to 275 g/mile for model years 2032 and later—a reduction of 37%. Id. at 29,243. In addition to the revised CO2 standards, EPA's proposal establishes more stringent emissions standards for non-methane organic gases plus nitrogen oxides, particulate matter, carbon monoxide, and formaldehyde. [EPA-HQ-OAR-2022-0829-0649, pp. 2-3]

I. The Proposed Rule Exceeds EPA's Statutory Authority.

The Proposed Rule violates EPA's statutory limitations in several ways. EPA may "prescribe . . . standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a)(1). Such standards "shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period." Id. § 7521(a)(2). [EPA-HQ-OAR-2022-0829-0649, p. 4]

A vehicle must be tested to determine whether it complies with emissions standards. The administrator "shall test, or require to be tested in such a manner as he deems appropriate, any new motor vehicle or new motor vehicle engine submitted by a manufacturer to determine whether such a vehicle or engine conforms with the regulations prescribed under section 7521 of this title." 42 U.S.C. § 7525(a)(1). If a vehicle or engine complies, each manufacturer must "indicate by means of a label or tag permanently affixed to such a vehicle or engine that such vehicle or engine is covered by a certificate of conformity issued for the purpose of assuring achievement of emissions standards prescribed under section 7521 of this title." Id. § 7541(c)(3)(C). [EPA-HQ-OAR-2022-0829-0649, p. 4]

The Proposed Rule exceeds EPA's authority because EPA is permitted to set emissions standards only for classes of new motor vehicles that "cause, or contribute to, air pollution." 42 U.S.C. § 7521(a)(1). But EPA asserts that EVs do not emit CO2. 88 Fed. Reg. at 29,252 ("Electric vehicle operation would therefore continue to be counted as 0 g/mile."). If EVs are not subject to the Agency's emissions standards, then it follows that EPA cannot include EVs in any calculations that determine those emissions standards. By allowing EVs to help set standards for internal combustion engines, the Proposed Rule puts its thumb on the scale of free markets. This preference for EVs goes well beyond EPA's statutory role, as it contemplates a wholesale substitution of a new vehicle or engine rather than the mere "application" of a "technology" to an existing vehicle or engine type. 42 U.S.C. § 7521(a)(2). [EPA-HQ-OAR-2022-0829-0649, p. 4]

And even if a shift to EVs could be termed the "development and application of [a] requisite technology," EPA has failed to recognize the "period" that will be "necessary" to develop and implement that technology, as required. 42 U.S.C. § 7521(a)(2). [EPA-HQ-OAR-2022-0829-0649, p. 4]

But as for EVs, EPA does not adequately explain how it can expand its authority to designate certain batteries and other "associated electric powertrain components" in the same way. Id. at 29,286-29,287. It says only that the expansion is an important one, and that these components "were not in general use prior to 1990" and exceed the necessary cost threshold. Id. Missing, of course, is an adequate explanation of how these batteries and other nameless associated electric powertrain components qualify as "pollution control device[s] or component[s]" under the statute. 42 U.S.C. § 7541(i)(2). And given the robust body of state warranty law already in place, a power grab this bold—and in an area (consumer protection) that is typically under the purview of other agencies—needs a much more thorough explanation than the passing one EPA provided. [EPA-HQ-OAR-2022-0829-0649, pp. 4-5]

Congress has also "conspicuously and repeatedly declined to enact" legislation targeting the precise issues the Proposed Rule presses, West Virginia, 142 S. Ct. at 2610, making EPA's "claimed delegation all the more suspect," Gonzales v. Oregon, 546 U.S. 243, 267 (2006); cf. Private Pet'r Opening Br., Texas v. EPA, No. 22-1031 (D.C. Cir. Apr. 27, 2023), ECF No. 1996915, at 28-29, 31-33 (noting that Congress "remains in factfinding mode" on the issue of electrification and has "previously considered and rejected multiple bills with effects similar to EPA's rule"); see also Letter to the EPA Administrator of May 25, 2023, https://bit.ly/42EwSBI (letter from 27 U.S. Senators asking EPA to withdraw the Proposed Rule because, among other things, it "violates the separation of powers"); Letter to the EPA Administrator of May 22, 2023, https://bit.ly/43AvMs7 (letter from over 150 members of the U.S. House of Representatives expressing concern about the "unworkable and impractical" standards in the Proposed Rule). [EPA-HQ-OAR-2022-0829-0649, pp. 7-8]

So there is a strong potential that reviewing courts will conclude that whether EPA can force electrification of the vast majority of the nation's automobile industry is a major question that only Congress can answer, or else it must delegate in exceedingly clear terms. And just as in West Virginia, the Proposed Rule fails to identify the necessary textual hook. It is not enough to say that the proposal just "prescribe[s] . . . standards" for a "class" of vehicles. 42 U.S.C. § 7521(a)(1). When the rule deliberately forces car dealers to take two-thirds of the most common types of vehicles off showroom floors to meet those "standards," the rule has morphed into something else. Under the Proposed Rule's approach, for instance, EPA could "demand much greater reductions in emissions based on a very different kind of policy judgment" than what technology allows for existing fleets: "that it would be 'best' if" internal combustion engine vehicles "made up a much smaller share of" automobile manufacturing and sales. West Virginia, 142 S. Ct. at 2612. What, after all, would stop EPA from "go[ing] further, perhaps forcing" automakers "to cease making [internal combustion engine vehicles] altogether"? Id. [EPA-HQ-OAR-2022-0829-0649, pp. 7-8]

And recall that Congress went out of its way to recognize that rules under this portion of the CAA may need waiting periods "to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance." 42 U.S.C. § 7521(a)(2). Again, and as detailed below, EPA is ignoring this requirement by putting automakers in the impossible position of trying to satisfy the Proposed Rule's fast-and-furious production demands with a supply chain that is not ready for it, and at the cost of innovation that would have otherwise improved EV efforts in the short and long term. Clearly, Congress was concerned with not outpacing existing technology. In other words, though EPA can put a thumb on the scale to speed developments along, it cannot use its standard-setting power to will new fleets into existence that the market cannot deliver. [EPA-HQ-OAR-2022-0829-0649, pp. 7-8]

II. The Proposed Rule Is Arbitrary And Capricious.

The Administrative Procedure Act requires EPA "to engage in reasoned decisionmaking, and directs that agency actions be set aside if they are arbitrary or capricious." Dep't of Homeland Sec. v. Regents of the Univ. of Cal., 140 S. Ct. 1891, 1905 (2020) (cleaned up). Courts will evaluate whether the Proposed Rule "was based on a consideration of the relevant factors and whether there has been a clear error of judgment." Id. (cleaned up). So among other things, EPA must show that it "examined the relevant data and articulated a satisfactory explanation for [its] decision, including a rational connection between the facts found and the choice made." Dep't of Com. v. New York, 139 S. Ct. 2551, 2569 (2019) (cleaned up). "Unsubstantiated or bare assumptions" are not enough. Nat. Res. Def. Council v. EPA, 31 F.4th 1203, 1207 (9th Cir. 2022) (cleaned up). [EPA-HQ-OAR-2022-0829-0649, p. 8]

The Proposed Rule would not survive this review for several reasons. EPA built it on faulty premises and inaccurate cost-benefit projections. And EPA ignored critical aspects of the problem that make the Proposed Rule's world unrealistic and dangerous. [EPA-HQ-OAR-2022-0829-0649, p. 8]

Organization: Landmark Legal Foundation

Further exacerbating its affronts against the separation of powers, the Proposed Rule also violates the Major Questions Doctrine. According to the EPA's own projections, this regulation could incur up to $565 billion in costs to industry. 88 Fed. Reg. 29,199n130 (see: Table 156) (May 5, 2023). This figure comes from the "present future value" of repair, maintenance, and refueling time costs that this regulation imposes. [EPA-HQ-OAR-2022-0829-0547, pp. 4-5]

In just the past two years, the U.S. Supreme Court struck down several economically overreaching agency actions. In 2021, the Justices upheld a stay on a nationwide eviction moratorium instituted by the HHS, concerned by economic costs that could be estimated at "nearly $50 billion." Alabama Assoc. of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021). Last year, the Court struck down an EPA program which would have raised nationwide electricity costs by "over $200 billion." West Virginia v. EPA, 142 S. Ct. 2587, 2623 (2022) (Gorsuch, J., concurring). In both cases, the tremendous economic burden factored heavily into their rulings. A government program costing the public over $565 billion would fall well within the totals established by these earlier Major Questions Doctrine cases. [EPA-HQ-OAR-2022-0829-0547, pp. 4-5]

Levying such dramatic economic impacts via a federal regulation, and without a clear delegation from Congress, is not within the prerogatives of the executive branch. The government may not justify hundreds of billions in costs to the public by accounting for the “benefits” of reducing SC-GHGs, which totals themselves were estimated in a manner that lacked public comment. At best, to do so is a colossal regulatory mistake. At worst, it is an intentional deception of the American public. [EPA-HQ-OAR-2022-0829-0547, pp. 4-5]

Organization: Mario Loyola

Discussion

A. Statutory Background

In the Proposed Rule, EPA proposes to set standards for multiple pollutants from multiple classes and categories of vehicles and engines in MYs 2027-2032, under multiple provisions of the CAA. With respect to “Light Duty Vehicles” (“LDVs”), which includes cars and light trucks, the Proposed Rule would promulgate standards under Section 202(a)(1) of the CAA. With respect to “Medium Duty Vehicles” (“MDVs”), which includes heavy-duty pickups and vans, the Proposed Rule would promulgate standards under Section 202(a)(3). [EPA-HQ-OAR-2022-0829-0689, pp. 2-3]

Section 202(a)(1) is the general standard-setting provision for mobile sources, while Section 202(a)(3) provides further specificity for heavy-duty vehicles (which includes MDVs) with respect to emissions of hydrocarbons and certain criteria pollutants, and does not apply to most GHGs . The two sections differ with respect to how standards are set and what factors EPA must consider in setting them. Section 202(a)(1) authorizes the EPA’s Administrator to set “standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” Section 202(a)(2) provides that any regulation promulgated under the basic provision of (a)(1) can only take effect “after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period.” For heavy duty vehicles (including MDVs), Section 202(a)(3) further requires that emissions standards must “reflect the greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply, giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology.” [EPA-HQ-OAR-2022-0829-0689, pp. 2-3]

Both sections refer to standards applicable to “classes or categories” of vehicles. For LDVs, EPA has used a system of “footprint” classification, with different standards applicable to different classes of vehicle depending on the surface area covered by the vehicle, in square feet. For MDVs, by contrast, EPA relies on a “work factor” classification that it has used for heavy-duty vehicles, with different standards applicable to different vehicles depending on a weighting of factors that include payload and towing capacity. Importantly, Section 202(a)(3)(A)(ii), which provides that the Administrator “may base such classes or categories on gross vehicle weight, horsepower, type of fuel used, or other appropriate factors,” applies only to the classes or categories of heavy-duty vehicles mentioned in paragraph (a)(3)(A), which in turn applies mostly to criteria pollutants, and does not apply to most GHGs. [EPA-HQ-OAR-2022-0829-0689, pp. 2-3]

It is important to highlight that the Proposed Rule's GHG emission standards for both LDVs and MDVs would be promulgated under Section 202(a)(1). [EPA-HQ-OAR-2022-0829-0689, pp. 2-3]

B. Battery Electric Vehicles Do Not Belong to Any Class of Vehicle Subject to Regulation under Title II of the CAA.

EPA is explicit about its purpose in the Proposed Rule: "Our analysis projects that for the industry overall, 65 percent of new vehicles in MY 2032 would be BEVs,"7 referring to fully electrical vehicles.8 That compares to less than six percent of new vehicle registrations for fully electric vehicles last year.9 As EPA says in the Proposed Rule: [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

7 88 Fed. Reg. at 29,342.

8 EPA distinguishes between Batery Electric Vehicles ("BEVs"), which are fully electric, and other sorts of electric vehicles, such as hybrids.

9 Ana Faguy, "Planned EPA Rules Could Make 67% of New U.S. Cars Electric by 2032," Forbes, April 12, 2023.

Among the range of technologies that have been demonstrated over the past decade, electrification technologies have seen particularly rapid development and lower costs, and as a result the number of PEVs projected across all the policy alternatives considered here is much higher than in any of EPA's prior rulemaking analyses. In particular, BEVs have zero tailpipe emissions and so are capable of supporting rates of annual stringency increases that are much greater than were typical in earlier rulemakings.10 [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

10 88 Fed. Reg. at 29341

The Proposed Rule is designed to accomplish its mission by imposing emissions standards on new motor vehicles so strict that no vehicle powered by an internal combustion engine would be able to comply with them. Hence, if the Proposed Rule applied only to vehicles with emissions subject to regulation under the CAA, the rule would not satisfy statutory requirements, which include feasibility and reasonable cost-of-compliance. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

EPA gets around this by what amounts to a clever accounting trick. It defines the "classes" of vehicles subject to Title II as including EVs, even though, according to EPA, they have zero emissions and should therefore be excluded from regulation under the CAA entirely. EPA then sets "emission standards" that reflect not its estimate of how much time manufacturers of regulated vehicles would need to develop and adopt any emissions-control technology on the vehicles subject to regulation—the determination required by Section 202 of the CAA—but rather only its estimate of the average emissions from vehicles of various sizes that would result from its guestimate of the extent to which EVs will displace combustion engine vehicles during the MYs in question. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

Because Title II of the CAA provides no guidance on how the Administrator is to define the "class or classes" of vehicles subject to Section 202(a)(1), the phrase "any class or classes of new motor vehicles" must be given its natural, plain meaning. While the Administrator doubtless has wide latitude to define the classes subject to regulation under Section 202(a)(1), and no federal court has ruled on this precise question, the phrase "class or classes of new motor vehicles" cannot mean whatever the Administrator wants it to mean. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

The phrase could not, for example, include both electric scooters and gasoline-powered cars, even though both are "motor vehicles" under the Clean Air Act.11 The structure of Title II clearly precludes that possibility. Section 202(a)(2) provides that any standard issued under Section 201(a) can only take effect after "such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period." Common sense dictates that this could not be read as authorizing EPA to force car manufacturers to produce electric scooters instead of cars in order to comply with emissions standards under Title II. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

11 The CAA defines "motor vehicle" as "any self-propelled vehicle designed for transporting persons or property on a street or highway." Section 216, 42 U.S.C. Sec. 7550.

Section 202(a)(1) obviously contemplates that a "class or classes of new motor vehicles" will share a common configuration, such that "the requisite technology" can be developed and applied to all vehicles of a future MY of that vehicle class. In that sense, "class or classes of new motor vehicles" is akin to the source categories under the New Source Performance Standards program of Section 111. Clearly, EPA could not define Portland Cement Manufacturing to include artisanal pottery for the purpose of imposing the latter's emissions rates on the former. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

One further observation bears mentioning in this connection. Section 202(a) authorizes EPA to regulate emissions "from any class or classes of new motor vehicles." EPA has made no effort to study the emissions from battery EVs, because, as it explains in the Proposed Rule, "BEVs have zero tailpipe emissions." But Section 202 is not limited to "tailpipe emissions." Its purview is much broader, referring to emissions "from" new motor vehicles. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

That the word "from" is susceptible of a broader meaning becomes clear when one considers that in the Proposed Rule, EPA continues the practice, introduced in the 2014 "Tier 3" final rule, of "considering the vehicle and its fuel as an integrated system."12 As the Proposed Rule explains, "The Tier 3 standards achieved reductions of up to 80 percent in tailpipe criteria pollutant emissions by treating the engine and fuel as an integrated system and requiring cleaner fuel as well as improved catalytic emissions control systems."13 [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

12 Control of Air Pollution From Motor Vehicles: Tier 3 Motor Vehicle Emission and Fuel Standards",79 Fed. Reg. 23414, 23416 (April 28, 2014).

13 88 Fed. Reg. at 29188.

EPA's practice of treating "the engine and fuel as an integrated system" is fully in keeping with the general scope of Section 202(a). There is no reason, and no reasonable basis, for EPA not to follow this same practice with EVs that EPA insists on including EVs in its definition of "classes" of new motor vehicles subject to Title II. EVs are not perpetual motion machines. Like all other motor vehicles, they use fuel, namely the fuel needed to produce the electricity needed to charge them. And that fuel—only a small fraction of which is renewable—produces significant emissions, including carbon emissions. The difference between EVs and combustion engine vehicles is not that EVs have zero emissions, but rather that their emissions occur elsewhere than at the tailpipe. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

This is particularly important considering the massive increases in electrical grid capacity that would be required by a transition to widespread EV use. There is a limit to how much renewable energy can be put on a grid while still maintaining grid reliability, and under current technology the limit appears to be quite low: At 30 percent renewable, the California grid is beset by a massive excess of solar electricity in the middle of the day and is often on the verge of blackouts by evening, particularly in summer months.14 Hence, in the near term, the Proposed Rule will result in a massive increase in the need for dispatchable power, which (given the long construction and permitting lead-times of nuclear power) can only come from coal and natural gas. That puts the Proposed Rule on a collision course with the EPA's proposed new power plant rule,15 which will require many coal and natural gas plants to cease operations at the same time as the Proposed Rule on vehicle emissions will require many more such plants to be built. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

14 Mario Loyola, "Unleashing America's Energy Abundance Permitting Reform Is Vital for Affordable Clean Energy," Competitive Enterprise Institute, September 27, 2022.

15 New Source Performance Standards for Greenhouse Gas Emissions from New, Modified, and Reconstructed Fossil Fuel-Fired Electric Generating Units; Emission Guidelines for Greenhouse Gas Emissions from Existing Fossil Fuel-Fired Electric Generating Units; and Repeal of the Affordable Clean Energy Rule, 88 Fed. Reg. 33240 (May 23, 2023).

EPA's failure to recognize that power plant emissions associated with EVs should be considered "emissions from" such vehicles is understandable, given that Title II of the CAA was clearly not designed with EVs in mind. That only highlights the absurdity of including them in the same "classes of new motor vehicles" as combustion engine vehicles subject to regulation under Title II. It also highlights the great political significance of the choices that EPA is taking upon itself to make, on the basis of sweeping powers that it claims to have found in a long-extant provision of the Clean Air Act that explicitly delegates no such power. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

C. EPA's Interpretation of Section 202(a) Would Give it Sweeping Powers to Reorganize the American Economy.

The Supreme Court recently struck down a rule very similar to the Proposed Rule, namely the 2015 Clean Power Plan. In West Virginia v. EPA,16 the Court took a close look at EPA's authority to set emissions limits for existing stationary sources under Section 111(d) of the CAA. Section 111(d) provides that EPA may set, for particular source categories, the emissions limits that are achievable by application of the "best system of emissions reduction" that has been adequately demonstrated in that source category. [EPA-HQ-OAR-2022-0829-0689, pp. 6-7]

16 142 S. Ct. 2587 (2022).

That standard, known as "BSER," had always been interpreted to refer to technologies, such as scrubbers, that sources like coal plants could feasibly install within the facility to reduce emissions. But in a move at least as clever as defining "classes" of gasoline vehicles to include EVs, EPA decided that the BSER could extend beyond the fence line to the whole economy, encompassing utilities' choice of power sources for generating electricity—a matter that the Federal Power Act specifically leaves to the states and, in certain situations, to the Federal Energy Regulatory Commission.17 Under its power to regulate emissions from coal plants, the Clean Power Plan would have forced states to switch to natural gas and eventually renewables. Indeed, as originally proposed the Clean Power Plan would have established EPA's authority to control how and when people are allowed to use electricity in their own homes.18 [EPA-HQ-OAR-2022-0829-0689, pp. 6-7]

17 16 U.S.C. §§ 791-828c (1940), as amended.

18 See, Block 4 (demand side) BSER, "Carbon Emissions Guidelines for Existing Stationary Sources: Electrical Utility Generating Units," 79 Fed. Reg. 34,830 (June 18, 2014) (proposed rulemaking).

As the Supreme Court explained, once EPA expanded the concept of "BSER" from power plants to utilities' choice of power sources, it could set the emission standard at whatever level it liked:

The Agency recognized that—given the nature of generation shifting—it could choose from "a wide range of potential stringencies for the BSER." 80 Fed. Reg. 64730. Put differently, in translating the BSER into an operational emissions limit, EPA could choose whether to require anything from a little generation shifting to a great deal.19 [EPA-HQ-OAR-2022-0829-0689, pp. 6-7]

19 142 S. Ct. at 2603.

The standards in the Clean Power Plan "resulted in numerical emissions ceilings so strict that no existing coal plant would have been able to achieve them without engaging in [generation-shifting]."20 The Court went on to note, "Rather than focus on improving the performance of individual sources, it would improve the overall power system by lowering the carbon intensity of power generation. And it would do that by forcing a shift throughout the power grid from one type of energy source to another":21 [EPA-HQ-OAR-2022-0829-0689, pp. 6-7]

20 142 S. Ct. at 2604.

21 142 S. Ct. at 2611 (quotations and citations omitted).

On EPA's view of Section 111(d), Congress implicitly tasked it, and it alone, with balancing the many vital considerations of national policy implicated in deciding how Americans will get their energy. EPA decides, for instance, how much of a switch from coal to natural gas is practically feasible by 2020, 2025, and 2030 before the grid collapses, and how high energy prices can go as a result before they become unreasonably "exorbitant." There is little reason to think Congress assigned such decisions to the Agency.22 [EPA-HQ-OAR-2022-0829-0689, pp. 6-7]

22 142 S. Ct. at 2612.

"We presume that Congress intends to make major policy decisions itself, not leave those decisions to agencies."23 The same may be said of the Proposed Rule. Its emissions limits are so strict that no manufacturer of combustion engine vehicles will be able to comply with it except by switching to the production of a completely different type of vehicle. The switch from traditional cars to renewable cars is the definition of a major policy decision, and nowhere in the

CAA does it say that Congress wanted EPA to make the choice of where, how, and when that switch should happen. [EPA-HQ-OAR-2022-0829-0689, pp. 6-7]

23 142 S. Ct. at 2609 (quotations and citations omitted).

"In arguing that Section 111(d) empowers it to substantially restructure the American energy market," the Supreme Court held, "EPA claimed to discover in a long-extant statute an unheralded power representing a transformative expansion in its regulatory authority."24 That is virtually indistinguishable from what EPA is trying to do in the Proposed Rule: It is claiming to have found in a long-extant statute the power to substantially restructure the transportation sector, and with it, a major part of the American economy. [EPA-HQ-OAR-2022-0829-0689, pp. 6-7]

24 142 S. Ct. at 2610 (quotations and citations omitted).

In West Virginia v. EPA, the Court held that the EPA's sudden discovery of a "transformative expansion" in its regulatory authority based on an obscure provision of "a long-extant statute" raised a "major question" about the agency's authority, requiring Congress to speak with far greater clarity than it had in the statute. The EPA's expansive definition of BSER entailed impacts of great political significance and sought to regulate a significant portion of the American economy. [EPA-HQ-OAR-2022-0829-0689, pp. 6-7]

Just so, EPA's infinitely elastic interpretation of its authority under Title II of the CAA presents a major question. The claimed power entails impacts of great political significance and would regulate a significant portion of the American economy. [EPA-HQ-OAR-2022-0829-0689, pp. 6-7]

Organization: Mayor Becky Daggett, City of Flagstaff, Arizona et al.

Outcomes

The final standards should:

- Ensure the LDV and HDV standards support greater zero-emission vehicle adoption by considering market growth expected from IRA and IIJA investments (which will surpass existing commitments outlined in Executive Order 14037);
- Put the nation on a trajectory to ensure 100 percent of all LDVs and HDVs sold in 2035 are zero-emission vehicles including pathway milestones assuring continuous progress; and
- Reflect recently adopted state LDV and HDV emissions standards, consistent with state authority under the Clean Air Act. [EPA-HQ-OAR-2022-0829-0732, p. 2]

By implementing these recommendations, we believe that the resultant standards will not only meet the Clean Air Act's statutory command to protect public health, but will also help lower fuel costs for consumers, create good, green jobs, and reduce burden on frontline communities. [EPA-HQ-OAR-2022-0829-0732, p. 2]

Organization: National Association of Clean Air Agencies (NACAA)

Importance of More Protective Federal Standards for Light-Duty Vehicle and Medium-Duty Vehicle Emissions of Multiple Pollutants [EPA-HQ-OAR-2022-0829-0559, p. 2]

The U.S. transportation sector has surpassed the manufacturing and power generation sectors as the largest source of GHG emissions in the country, representing over 27 percent of total GHG emissions nationwide. However, in numerous areas of the country the contribution of the transportation sector is far greater – 40 percent or more. Light-duty vehicles (LDVs) alone, not even considering the medium-duty vehicles (MDVs) also addressed by this rule, are the largest contributor nationwide to transportation-sector GHG emissions at 57 percent and are responsible for 15.5 percent of total U.S. GHG emissions. LDVs are also responsible for an overwhelming portion of pollutants that cause or contribute to ozone and soot and cancer-causing pollutants, particularly in disadvantaged communities, reinforcing the need for continuously strengthened standards to cut, and eventually eliminate, emissions from these vehicles.6 [EPA-HQ-OAR-2022-0829-0559, p. 2]

6 Supra note 1, at 29,186

In its March 20, 2023, "AR6 Synthesis Report: Climate Change 2023," the United Nations Intergovernmental Panel on Climate Change concludes, among many other things, that 1) "Human activities, principally through emissions of greenhouse gases, have unequivocally caused global warming, with global surface temperature reaching 1.1°C above 1850–1900 in 2011–2020. Global greenhouse gas emissions have continued to increase, with unequal historical and ongoing contributions arising from unsustainable energy use, land use and land-use change, lifestyles and patterns of consumption and production across regions, between and within countries, and among individuals"; 2) "Policies and laws addressing mitigation have consistently expanded since AR5. Global GHG emissions in 2030 implied by nationally determined contributions (NDCs) announced by October 2021 make it likely that warming will exceed 1.5°C during the 21st century and make it harder to limit warming below 2°C. There are gaps between projected emissions from implemented policies and those from NDCs and finance flows fall short of the levels needed to meet climate goals across all sectors and regions"; and 3) "For any given future warming level, many climate-related risks are higher than assessed in AR5, and projected long-term impacts are up to multiple times higher than currently observed. Risks and projected adverse impacts and related losses and damages from climate change escalate with every increment of global warming. Climatic and non-climatic risks will increasingly interact, creating compound and cascading risks that are more complex and difficult to manage."7 [EPA-HQ-OAR-2022-0829-0559, p. 2]

Organization: National Association of Convenience Stores (NACS) et al.

V. EPA's Proposed Rule Is a "Major Question" Reserved for Congress.

EPA's proposed standards should not favor one technology over another. The Proposed Rule, however, goes beyond favoritism and signals the Agency's intention to phase out non-EV technologies, such as ICE vehicles. Despite EPA's assertions to the contrary, the Proposed Rule mandates non-ICE technologies because auto manufacturers cannot comply with the standards through the sale of ICE vehicles alone. And EPA explicitly anticipates EV adoption rates high and above current market rates to achieve these standards. By MY2032, EPA predicts an EV adoption rate between 62–78 percent across all subcategories of vehicles to achieve compliance with the proposed standards.44 The Proposed Rule will therefore introduce a transformational shift in the automotive industry—including the fuel retail industry—far beyond that which EPA has authority to mandate as delegated by Congress. Whether this shift is necessary and how best to achieve such a shift are "major questions" reserved for Congress and Congress alone.45 [EPA-HQ-OAR-2022-0829-0648, pp. 14-15]

44 Proposed Rule at 29,329.

45 Importantly, the U.S. Supreme Court reaffirmed the "major questions" doctrine just one week ago, concluding that the tradeoffs "inherent in a mass debt cancellation program 'are ones that Congress would likely have intended for itself." Biden v. Nebraska, No. 22-506, slip op. at 24–25 (Jun. 30, 2023) (internal citations omitted) (applying major questions doctrine to strike down student loan repayment program that will cost taxpayers approximately $500 billion and affects nearly every student loan borrower). Similarly, the tradeoffs inherent in a mass EV-adoption program are those that Congress would have intended for itself, not EPA.

Consistent with the "major questions doctrine," Congress must "speak clearly" to authorize an agency to exercise powers of "vast economic and political significance."46 Overreaching environmental regulatory programs like the Proposed Rule fit precisely into this doctrine. In West Virginia v. EPA, the Supreme Court invoked the doctrine when it held that EPA had exceeded its statutory authority in adopting the Clean Power Plan.47 Through the Clean Power Plan, EPA sought to reduce emissions by requiring utilities and other power generators to transition from coal-fired power to natural gas and, ultimately, renewable energy sources rather than by imposing source- specific requirements reflective of the best available emission reduction technologies, as it had done in the past.48 EPA announced the Clean Power Plan would dictate "what the market share of coal, natural gas, wind, and solar must be, and then require[e] plants to reduce operations or subsidize their competitors to get there."49 The Supreme Court struck down the proposed program, concluding that EPA's relied upon "vague statutory grant" within the Clean Air Act was far from the "clear authorization required" for a regulatory program that would have major economic and political significance, impacting vast swaths of American life, and substantially restructuring the American energy market.50 [EPA-HQ-OAR-2022-0829-0648, pp. 14-15]

46 Nat'l Fed. Of Indep. Bus. v. Dep't of Labor, 595 U.S. , slip op. at 6 (Jan 13, 2022); see also Ala. Assoc. of Realtors v. Dep't of Health & Human Servs., 141 S. Ct. 2485, 2489 (2021); Utility Air Regulatory Group v. EPA, 573 U.S. 302, 324 (2014); U.S. Telecom Assoc. v. FCC, 855 F.3d 381, 419-21 (D.C. Cir. 2017) (Kavanaugh, J., dissenting from denial of rehearing en banc) (explaining provenance of "major rules doctrine").

49 Id., slip op. at 33, n. 4.

50 Id., slip op. at 24.

EPA's Proposed Rule presents an analogous situation. Mandating a rapid shift from ICE to EV technology will reshape the American automotive market with profound and far-reaching collateral effects, thus encroaching on an issue of "vast economic and political significance." These standards are contrary to natural market forces and would vastly alter what consumers are able to purchase by indirectly requiring the production of a product different from that currently being purchased (e.g., ICE vehicles). The Proposed Rule forces both the manufacturers' and consumer's hand in requiring rapid scaling to meet production lead times and adoption rate requirements that would not exist but for EPA's electrification mandate. [EPA-HQ-OAR-2022-0829-0648, pp. 14-15]

Further evidencing EPA's lack of authority, the Proposal attempts to sidestep regulatory requirements established by the Energy Policy and Conservation Act of 1975 ("EPCA") and the Energy Independence and Security Act ("EISA"). Pursuant to these authorities, NHTSA has the authority to issue Corporate Average Fuel Economy (CAFE) standards, but may not consider the fuel economy of EVs in doing so.58 Notably, this restricts how NHTSA evaluates the technological feasibility of fuel economy standards. Thus, joint rulemakings by EPA and NHTSA for complementary emissions and CAFE requirements ensure that manufacturers can comply with both agencies' standards with the same fleet. Foregoing a joint rulemaking, as EPA does here, ignores Congress's determination that EVs cannot be taken into account when considering what the maximum feasible fuel economy level from which to develop regulations. Importantly, this directly contravenes the underlying premise of the Supreme Court's holding in Massachusetts v. EPA—"[EPA and NHTSA] obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency."59 That EPA ignores these directives undercuts Congress' intent in EPCA and regulating in a way that is inconsistent with NHTSA's authority as well as its own.60 [EPA-HQ-OAR-2022-0829-0648, pp. 16-17]

58 49 U.S.C. § 32902(h). Here, NHTSA may not consider the fuel economy of "dedicated automobiles," which are defined as those that operate only on "alternative fuel." Alternative fuel, in turn, includes electricity. 49 U.S.C. § 32901(j).

59 Massachusetts v. EPA, 549 U.S. 497, 532 (2007) ("The [EPA and NHTSA] obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency.").

60 Id.

Moreover, EPA has never before claimed authority to mandate even partial electrification—similar to EPA's reliance on Section 111(d) of the Clean Air Act for promulgation of the Clean Power Plan. Congress has made clear that it, not EPA, must make policy decisions— or, rather, answer the "major question"—regarding if, when, and how the American automotive industry will transition from ICE vehicles to EVs. In the 116th Congress (2019–21), Congress introduced 44 bills seeking to reduce petroleum-based fuel consumption and GHG emissions from the transportation sector through customer rebates, vehicle and fuel producer incentives, local funding, development of standards, and research and development.61 But none went so far as to propose the mass adoption of EVs through the phase-out of ICE vehicles.62 In fact, Congress rejected one bill that would have banned the sale of new light-duty ICE vehicles by 2040,63 and it has continuously disapproved of EPA's efforts to hamstring the automotive sector with more stringent air pollution standards than are feasible.64 [EPA-HQ-OAR-2022-0829-0648, pp. 16-17]

63 See Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. (2018); see also 116 Cong. Rec. 19238-40 (1970) (proposed amendment to Title II that would have banned ICE vehicles by 1978).

64 See, e.g., S. J. Res. 11, 118th Cong. (2023). (Although passed only by the Senate thus far, the joint resolution calls for disapproval of the rule submitted by the Administrator of the Environmental Protection Agency relating to "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards," 88 Fed. Reg. 4296 (January 24, 2023).)

More telling, in the wake of the Proposed Rule and EPA's parallel proceedings proposing new standards for light-duty vehicles,65 members of Congress have requested that the Agency rescind the proposals, asserting they "effectively mandate a costly transition to electric cars and trucks in the absence of congressional direction."66 That Congress intended for it, not EPA, to direct these policy decisions is made all the more clear by the passage of the Bipartisan Infrastructure Law67 and the Inflation Reduction Act68 whereby Congress identified the policy levers it deemed appropriate. Congress could have, but did not, direct EPA to establish a fleet-wide credit trading regime to further drive EV development and rapid adoption. Instead, the Proposed Rule stands in direct contrast to other legislation, such as the RFS, whereby Congress mandated that "gasoline sold or introduced into commerce in the United States" must contain a year-over-year increasing share of renewable fuels69 and, in 2022, must include tens of billions of gallons of renewable fuel.70 An EPA-mandated shift in transportation technology from vehicles that can operate on increasing volumes of renewable fuel to EVs does not square with such requirements. Consequently, Congress, not EPA, should determine how to regulate electrification of transportation and the many industries affected thereby.71 [EPA-HQ-OAR-2022-0829-0648, pp. 16-17]

70 Id., § 7545(o)(2)(B); 87 Fed. Reg. 39,600 (July 1, 2022).

71 See "Grassley-Cornyn Bill Pulls Plug on Latest Biden Boon for EVs" (May 18, 2023), available at https://www.grassley.senate.gov/news/news-releases/grassley-cornyn-bill-pulls-plug-on-latest-biden-boon-for-evs (discussing proposed legislation entitled "No Fuel Credits for Batteries Act" introduced to "preserve the integrity of the Renewable Fuels Standard" in light of EPA's proposed E-RINS rule").

Similar to the Supreme Court's finding in West Virginia, EPA lacks congressional authorization in the Clean Air Act to impose a shifting manufacturing standard to a preferred powertrain and effectively require regulated manufacturers to phase out combustion engine technology. EPA's authority to impose emissions standards is limited to that provided in Section 202(a) of the Clean Air Act. The Proposed Rule results in fleet-wide standards that cannot be met by ICE vehicles alone; however, under the Clean Air Act, EPA's authority is limited to setting individual vehicle-level "standards" for "emission[s]" from "any class or classes of new motor vehicles or new motor vehicles engines, which … cause or contribute to," potentially harmful air pollution.51 The plain language of this provision authorizes EPA to set standards for classes of individual vehicles or engines that emit air pollutants. EVs do not have tailpipe emissions, however. Thus, operating such vehicles alone cannot "cause, or contribute to," air pollution. In stark contrast to "clear congressional authorization," Section 202(a) of the Clean Air Act provides EPA no authority to set fleet-wide standards, and certainly not standards beyond that which could be achieved by improvements to the tailpipe emissions of ICE vehicles. Even if EPA had such authority, it could not lawfully use it to force electrification by including vehicles that have no tailpipe emissions in the fleetwide average standard for ICE vehicles. [EPA-HQ-OAR-2022-0829-0648, pp. 15-16]

51 42 U.S.C. § 7521(a)(1).

EVs are simply not the "technology" contemplated by Congress. Instead, Congress enabled EPA to increase emission standard stringency through cleaner fuels and improved emissions-related systems to be incorporated into ICE vehicles such as advances in fuel injection, exhaust gas combustion management, and advances catalysts to neutralize pollutants of concern.52 By factoring in EV performance as a part of its averaging scheme, EPA is ignoring the technological feasibility of emissions-related systems and simply requiring the production of fewer ICE vehicles. EPA does not consider advances to ICE technologies under the Proposed Rule. [EPA-HQ-OAR-2022-0829-0648, pp. 15-16]

52 For example, Section 202(m) requires the monitoring of "emission-related systems" such as the "catalytic converter and oxygen sensor." 42 U.S.C. § 7521(m)(l).

The Clean Air Act similarly says nothing about averaging across fleets or banking and trading credits across different model years, different vehicle classes, and manufacturers for criteria pollutants emitted from ICE vehicles. Despite EPA previously adopting fleetwide averaging, it acknowledges that "Congress did not specifically contemplate an averaging program when it enacted the Clean Air Act."53 And "[j]ust as the statute does not explicitly address EPA's authority to allow averaging, it does not address the Agency's authority to permit banking and trading."54 By definition, then, the Act does not address—let alone clearly authorize—the use of averaging, banking, and trading in a manner that mandates electrification of the national vehicle fleet of motor vehicles and motor vehicle engines. [EPA-HQ-OAR-2022-0829-0648, pp. 15-16]

53 48 Fed. Reg. 33,456, 33,458 (July 21, 1983)

54 54 Fed. Reg. 22,652, 22,665 (May 25, 1989); see 55 Fed. Reg. 30,584, 30,593 (July 26, 1990) (same).

The structure of the Clean Air Act and its regulatory provisions for standard setting, certification, compliance enforcement, warranties, and penalties also directly conflict with a fleet- wide averaging regulatory regime. Notably, under Section 202(a), EPA "shall test, or require to be tested in such manner as [it] deems appropriate, any new motor vehicle or new motor vehicle engine submitted by a manufacturer" and issue a certificate of conformity "if such vehicle or engine" complies with the standards.55 And EPA must "test any emission control system incorporated in a motor vehicle or motor vehicle engine . . . to determine whether such a system enables such vehicle or engine to conform to the standards required to be prescribe under [Section 202(b)] of the Act.56 Section 202(b)(3) further authorizes EPA to grant waivers from certain nitrogen-oxide emission standards-which, again, are standards "under" Section 202(a), for no "more than five percent of [a] manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater."57 This provision would be nonsensical under a fleetwide-averaging regime where, if applied, a manufacturer could essentially give itself a waiver for large swaths of its fleet by electrifying certain product lines. Taken together, the Clean Air Act regulatory framework contemplates EPA regulating vehicles on an individual basis according to the powertrain of those vehicles. This cannot be accomplished if there is not a clear emission standard applicable to a single vehicle at the start of a model year. Thus, EPA lacks clear authorization from Congress to impose a regulatory program restructuring the American automotive market. [EPA-HQ-OAR-2022-0829-0648, pp. 15-16]

55 42 U.S.C. § 7525(a)(1).

Organization: Our Children's Trust (OCT)

The Earth's Energy Is Imbalanced and thus the EPA's Must Cease Infringing the Constitutional Rights of Youth. EPA has Public Trust and Constitutional Obligations to use its Authority to Protect the Atmosphere. [EPA-HQ-OAR-2022-0829-0542, p. 3]

Under the 5th Amendment to the U.S. Constitution, the government is restrained from engaging in conduct that infringes upon fundamental rights to life, liberty, and property, and equal protection of the law, all of which includes a climate system that sustains human life and liberty. Under the Public Trust Doctrine, embedded in our Constitution and other founding documents, and in the very sovereignty of our Nation, U.S. residents (both present and future, i.e., Posterity) have a right to access and use crucial natural resources, like air and water. The U.S. government, and its executive agencies, have fiduciary duties as trustees to manage, protect, and prevent substantial impairment to our country's vital natural resources which the government holds in trust for present and future generations. 20 [EPA-HQ-OAR-2022-0829-0542, p. 5]

20 Juliana v. United States, 217 F. Supp. 3d 1224, 1254 (D. Or. 2016).

Given the fact that U.S. government conduct has resulted in a quarter of all global GHG emissions that are causing the current climate catastrophe, it is well past time for the EPA to take all steps within its power to ensure its GHG emission standards for cars and trucks are aligned with the best available science and are eliminating tailpipe GHG emissions from all new vehicles by 2030, which is technically feasible and economically beneficial, and at minimum by 2035. EPA must set a national ambient air quality standard for greenhouse gases immediately, including a CO_2 standard of 350 ppm, as it has been petitioned to do, which will protect children and require climate stabilization. Without immediate effective action, our children and future generations will continue to suffer injury with long-lasting and potentially irreversible consequences. 21 [EPA-HQ-OAR-2022-0829-0542, p. 6]

21 See Assessing "Dangerous Climate Change"; James Hansen et al., Ice Melt, Sea Level Rise and Superstorms: Evidence from Paleoclimate Data, Climate Modeling, and Modern Observations that 2°C Global Warming Could be Dangerous, 16 Atmos. Chem. & Phys. 3761 (2016); U.S. Global Change Research Program, Fourth National Climate Assessment, Vol. II (2018).

Organization: Pacific Legal Foundation (PLF)

PLF offers comments to highlight the serious separation-of-powers problems with the Proposed Tailpipe Rule. The American people delegated to Congress the legislative power to make the laws and policies governing society. And for good reason: the Constitution's lawmaking process provides checks and balances to protect against arbitrary government and ensure the government will not restrict freedom without broad consensus.1 Indeed, the Constitution's structural provisions reflect the founding generation's deep conviction that lawmaking should be hard and that “checks and balances were the foundation of a structure of government that would protect liberty.”2 The Proposed Tailpipe Rule contravenes this fundamental first principle and should be withdrawn. [EPA-HQ-OAR-2022-0829-0680, pp. 1-2]

1 See Bond v. United States, 564 U.S. 211, 222–23 (2011) (finding the Constitution’s “checks and balances” protect individual liberty); Myers v. United States, 272 U.S. 52, 293 (1926) (Brandeis, J., dissenting) (“The doctrine of the separation of powers was adopted by the convention of 1787 not to promote efficiency but to preclude the exercise of arbitrary power.”).

2 Bowsher v. Synar, 478 U.S. 714, 722 (1986).

First, the Proposed Tailpipe Rule violates the major questions doctrine. That doctrine establishes that executive agencies cannot assert unheralded regulatory power over issues of vast political and economic significance without clear congressional authorization. Yet that is what the Proposed Tailpipe Rule seeks to do. At the President’s direction, EPA is attempting to phase out the internal combustion engine and alter the automobile market without clear authority from Congress. Congress did not give EPA the power to reshape the entire auto industry through the Clean Air Act’s broad language. [EPA-HQ-OAR-2022-0829-0680, pp. 1-2]

Second, if Congress gave EPA the unfettered discretion to alter the automobile market— with no limiting principle on its power to do so—then the Clean Air Act violates the Constitution’s nondelegation doctrine. Article I of the Constitution delegates only to Congress the power to enact legislative policy, and it cannot delegate that power to the executive branch. Yet under the EPA’s reading of the Act, Congress has given EPA unbounded authority to set emissions standards at a level forcing automobile manufacturers to shift to electric vehicles. [EPA-HQ-OAR-2022-0829-0680, pp. 1-2]

* * * * *

There is a national debate about what, if any, balance needs to be struck between economic policies and environmental regulation. In our constitutional system, this debate must take place in the legislative branch, but the President and EPA have removed that debate from the American people and are illegally exercising legislative power to strike that balance in the Proposed Tailpipe Rule. If the federal government will revamp an entire industry and force automobile manufacturers to transition their fleets, that policy must come from Congress. Accordingly, EPA should withdraw the proposed rule. [EPA-HQ-OAR-2022-0829-0680, pp. 1-2]

B. The Tailpipe Rule is a sweeping regulation with vast economic and political consequences that Congress has not clearly authorized.

The Proposed Tailpipe Rule’s requirement that the automobile industry “shift” their fleets from the internal combustion engine to electric vehicles is, in effect, a rerun of West Virginia. Indeed, just like West Virginia, the Tailpipe Rule is an example of “presidential administration” seeking to alter an entire sector of the economy under the Clean Air Act with no clear authority from Congress. In this way, it is almost on all fours with West Virginia. [EPA-HQ-OAR-2022-0829-0680, pp. 6-7]

Rather than persuade Congress to enact legislation to regulate automobile emissions and mandate electric vehicles, President Biden issued an executive order. In doing so, he announced his administration’s “goal that 50 percent of all new passenger cars and light trucks sold in 2030 be zero-emission vehicles, including battery electric, plug-in hybrid electric, or fuel cell electric vehicles."21 To put this policy into practice, he directed EPA to consider suspending, revising, or rescinding the automobile emissions standards issued by his predecessor administration.22 [EPA-HQ-OAR-2022-0829-0680, pp. 6-7]

21 86 Fed. Reg. 43,583, 43,583 (Aug. 5, 2021).

22 86 Fed. Reg. 7037, 7037–38 (Jan. 20, 2021).

EPA responded by issuing substantially more stringent emissions standards for vehicle carbon dioxide emissions in 2022.23 That regulation sought to force the nationwide vehicle fleet to reach 17% electrification by 2026.24 In doing so, EPA attempted to expand its power into new territory: functionally forcing vehicle manufacturers to start shifting their fleet production to an ever-increasing share of electric vehicles. They did that by measuring not whether an individual vehicle complies with the emission standards but whether a manufacturer's fleet as a whole complies after averaging the emissions from vehicles fleet-wide. And that averaging counted electric vehicle emissions as zero. So stringent were those standards that, in EPA's own words, they would "necessitate" that manufacturers "further deploy[]" electric vehicles to comply under the fleet-averaging.25 By some estimates, that rule was the most expensive regulation in the nation's history.26 [EPA-HQ-OAR-2022-0829-0680, pp. 6-7]

23 86 Fed. Reg. 74,434 (Dec. 20, 2021) (effective date Feb 28, 2022).

24 Id. at 74,485.

25 Id. at 74,493.

26 https://www.heritage.org/government-regulation/commentary/the-biden-administrations- electric-vehicle-gambit-illegal-and

That rule is now being challenged by state governments and various industry petitioners as unconstitutional in the U.S. Court of Appeals for the District of Columbia Circuit.27 Yet rather than wait for the outcome of that litigation, EPA is now, less than a year later, seeking to exponentially compound the costs to the American public by mandating that the automobile industry shift to 67% electrification by 2032—which is neither reasonable nor achievable in the time frame mandated by the Proposed Tailpipe Rule.28 [EPA-HQ-OAR-2022-0829-0680, pp. 6-7]

27 Texas v. EPA, Dkt. No. 22-1031 (D.C. Cir. 2022).

28 Comment submitted by Alliance for Automotive Innovation, https://www.regulations.gov/comment/EPA-HQ-OAR-2022-0829-0481.

But it is not just the price tag that makes the Proposed Tailpipe Rule a major question; the proposed rule, like the 2022 rule, is also an unprecedented agency action that would significantly expand EPA's authority.29 EPA is attempting to issue a rule setting emissions standards without the National Highway Transportation and Safety Administration (NHTSA). Why? Because NHTSA operates under a statutory restraint on its discretion to factor electric vehicles into its decision-making.30 By "decoupling" itself from NHTSA, the EPA is expanding its purported authority to transform the automobile market through the forced adoption of electric vehicles. Of course, other factors abound. Directing the automobile market is not within the EPA's expertise and mandating the transition to electric vehicles is a policy that Congress has repeatedly considered but declined to enact into law. [EPA-HQ-OAR-2022-0829-0680, pp. 6-7]

29 The major questions doctrine not only applies for claims of authority specific to an issue addressed in a single case, but also to future uses an agency can use with the power it is claiming. See The Past and Future of the Major Questions Doctrine, supra note 12, at 33 (citing Daniel T. Deacon & Leah M. Litman, The New Major Questions Doctrine, 109 Va. L. Rev. at 3 (forthcoming 2023)).

30 49 U.S.C. § 32902(h)(l).

At bottom, the Tailpipe Rule's attempt to set emissions standards to require manufacturers to shift to electric vehicles—and thus transform the automobile market— is a major question that Congress has not enacted into law. And like West Virginia, its attempt violates the major questions doctrine. [EPA-HQ-OAR-2022-0829-0680, pp. 6-7]

II. If Congress subdelegated the EPA the extraordinary legislative power to alter the entire automobile market through a vague delegation, then the Clean Air Act violates the nondelegation doctrine. [EPA-HQ-OAR-2022-0829-0680, pp. 7-9]

The alternative is that Congress violated the nondelegation doctrine by delegating EPA open-ended legislative authority through a vague provision in the Clean Air Act. But Congress cannot delegate EPA the power in broad, open-ended language to legislate— which is what it is doing by altering the automobile market by mandating manufacturers transition to electric vehicles. Yet under the EPA's reading of the statute, Congress did just that. Indeed, under the agency's reading, "the law would afford it almost unlimited discretion—and certainly, impose no 'specific restrictions' that 'meaningfully constrai[n]' the agency."31 [EPA-HQ-OAR-2022-0829-0680, pp. 7-9]

31 Nat'l Fed'n of Indep. Bus., 142 U.S. at 669 (Gorsuch, J., concurring) (citing Touby v. United States, 500 U.S. 160, 166–67 (1991)).

It is a fundamental rule of the Constitution's Separation of Powers that Congress cannot delegate its lawmaking power to the executive branch.32 That fundamental principle is enforced through the nondelegation doctrine—which requires that Congress resolve fundamental policy issues and provide a governing standard enabling courts to judge whether the executive has faithfully executed, and not made, the law.33 In other words, legislation must provide a governing standard to limit and channel the executive's exercise of discretion; Congress must decide the "important subjects," and the executive is left to merely "fill in the details."34 [EPA-HQ-OAR-2022-0829-0680, pp. 7-9]

32 See U.S. Const. art. I, § 1 ("[a]ll legislative Powers herein granted shall be vested in a Congress of the United States"). See also Gundy v. United States, 139 S. Ct. 2116, 2123 (2019) ("Congress, this Court explained early on, may not transfer to another branch 'powers which are strictly and exclusively legislative.'" (quoting Wayman v. Southard, 23 U.S. (10 Wheat.) 1, 42–43 (1825))); Mistretta, 488 U.S. at 371–72 (quoting U.S. Const. art. 1, § 1).

33 E.g., Caha v. United States, 152 U.S. 210 (1894) (finding that Congress had decided the important subject).

34 Wayman v. Southard, 23 U.S. (10 Wheat.) 1, 43 (1825); see also Gundy v. United States, 139 S. Ct. 2116, 2136 (2019) (Gorsuch, J., dissenting).

Put into practice, the Supreme Court has distilled this precept into a requirement that legislation provide an "intelligible principle" to properly direct the executive branch when it implements statutes.35 For example, in Panama Refining v. Ryan, the Court found a provision of the National Recovery Act (NRA) unconstitutional because it gave unfettered discretion to the

President to decide whether and under what conditions to prohibit the transport of hot oil.36 Even though the statute had the general goal of improving American economic conditions, the NRA was unconstitutional because Congress made no policy decision governing when the proscription applied.37 In other words, the President was not merely left to fill in the details but was simply free to weigh competing policy considerations as he deemed "fit."38 [EPA-HQ-OAR-2022-0829-0680, pp. 7-9]

35 See Whitman v. American Trucking Ass'n, 531 U.S. 457, 472–73 (2001). See also Mistretta, 488 U.S. at 371–72 (1989) (finding that the nondelegation doctrine "is rooted in the principle of separation of powers" and the Constitution's provision that "[a]ll legislative Powers . . . shall be vested in . . . Congress" (quoting U.S. Const. art. 1, § 1)).

Under the Clean Air Act, EPA has the power to promulgate "standards which reflect the greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply, giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology."39 Yet nothing in this grant of authority allows the EPA to regulate in a way that pushes the use of electric vehicles over internal-combustion vehicles. Put another way, under EPA's assertion of authority in the Proposed Tailpipe Rule, the Clean Air Act is essentially a blank check under which the President and EPA may fill in their preferred policy, and Congress will have effectively enacted a law that is "nothing except a raw delegation to enact rules."40 It will have "designated a lawmaker, not a law interpreter."41 [EPA-HQ-OAR-2022-0829-0680, pp. 7-9]

39 42 U.S.C. § 7521(a)(3)(A)(i).

41 Id.

In short, if Congress delegated EPA the authority to legislate under the Clean Air Act and set emissions standards at a level forcing automobile manufacturers to shift to electric vehicles—despite that being near if not downright impossible—there is simply no limiting, much less intelligible, principle in the statutory scheme. [EPA-HQ-OAR-2022-0829-0680, pp. 7-9]

Conclusion

For these reasons, PLF requests EPA withdraw the Proposed Tailpipe Rule. [EPA-HQ-OAR-2022-0829-0680, pp. 7-9]

Organization: POET, LLC

Incorporating renewable fuels could also shore up the rule against a challenge that it violates precedent of the U.S. Supreme Court in West Virginia v. EPA. That case overturned EPA's Clean Power Plan because the Court determined that EPA's regulatory program went too far toward requiring a shift from conventional sources of electricity generation to renewables, which in the Court's view would have substantially restructured the American energy market.61 Crediting biofuels in the Proposed Rule would have the opposite effect. Biofuels are already a key component of the American transportation sector. This is not the case in which, as the Supreme Court stated in West Virginia v. EPA, the "history and the breadth of the authority that [EPA] has asserted, and the economic and political significance of that assertion, provide a reason to hesitate before concluding that Congress meant to confer such authority."62 Congress has given EPA plain authority to incentivize biofuels under the Clean Air Act and RFS. Those preexisting programs have encouraged producers to make billions of gallons of renewable fuels every year. Congress' mandate was clear. The RFS was meant to encourage the production of renewable fuels that are "used to replace or reduce the quantity of fossil fuel present in a transportation fuel."63 EPA must interpret its § 202 authority in a manner that is consistent with the other directives that Congress has imposed on the transportation sector. [EPA-HQ-OAR-2022-0829-0609, pp. 18-19]

Assuming the rule is adopted, opponents will turn to the legal system and rely on an alleged bedrock (but actually recently invented) legal concept called the "major questions doctrine". "Major" is in the eye of the beholder. Whether or not a particular trade group is impacted is not a major question, even if it is offset by an economic bonanza for another trade group. Climate change is a major question. Particulate air pollution affecting human health is a major question. Economic cost due to climate impacts is a major question. As far as major questions, this rule will be a major win for Americans. [EPA-HQ-OAR-2022-0829-0515, p. 1]

Organization: Senator Shelley Moore Capito et al.

Forcing a transition to battery electric vehicles (BEVs) through regulation without explicit delegated authority from Congress violates the separation of powers, as reaffirmed by the Supreme Court's decision in West Virginia v. Environmental Protection Agency, 142 S. Ct. 2587 (2022). Under that precedent, the EPA cannot force a wholesale change to "substantially restructure the American energy market" without explicit congressional authorization. According to the EPA' s own analysis for the light- and medium-duty rule, the proposal will require approximately 67 percent of new vehicles sold in model year 2032 to be BEV s - a dramatic shift away from internal combustion engine vehicles, which made up around 95 percent of the new light-duty vehicle market in 2022.1 The heavy-duty vehicle rule will require 40-percent sales of zero-emission vehicles by 2032, up from a mere 0.1 percent globally for heavy-duty trucks and 4 percent globally for bus fleets.2 If finalized, these proposals will effectively require a wholesale conversion from powering vehicles with widely available liquid fuel to charging BEVs off our nation's electric grid. This is a major, multi-billion dollar, policy-driven technology transition mandate to be imposed on American consumers by your Agency, without any semblance of the clear and direct statutory authority required by the ruling in West Virginia v. EPA. [EPA-HQ-OAR-2022-0829-5083, p. 1]

1 Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 29,329.

2 Trends in electric heavy-duty vehicles, IEA (2022).

Organization: Steven G. Bradbury

Congress has not delegated to EPA the power to force the conversion to elec- tric vehicles. [EPA-HQ-OAR-2022-0829-0647, p. 6]

EPA is very candid about the goal of its proposed rules: The Agency is trying to use tailpipe emissions limits on carbon dioxide and criteria pollutants as a tool to coerce the automotive industry to build far more electric vehicles (EVs) than market demand would currently support. [EPA-HQ-OAR-2022-0829-0647, p. 6]

Right now, EVs account for less than 6 percent of new light-duty vehicle sales in the United States and an even lower percentage of medium- and heavy-duty commercial truck sales. Following the script laid down by President Biden in an executive order,12 the EPA is aiming to force those percentages way up—to 60 percent of light-duty vehicle sales by 2030 and 67 percent by 2032. [EPA-HQ-OAR-2022-0829-0647, p. 6]

12 See Executive Order 14037 ("Strengthening American Leadership in Clean Cars and Trucks"), August 5, 2021 (setting goal of 50 percent of U.S. new vehicle sales to be zero-emission vehicles by 2030).

And through these rulemakings, the Agency is proposing to align its regulatory objec- tives with the zero-emission vehicle, or ZEV, mandates recently issued by CARB, the Cali- fornia Air Resources Board, which are designed to phase out the sale of all gas-powered passenger cars and light trucks by 2035 and all medium- and heavy-duty trucks by 2045. The EPA now appears to be committed to a similar trajectory. [EPA-HQ-OAR-2022-0829-0647, p. 6]

It is not surprising the Agency would act to conform its policies to CARB's, since CARB was able to issue its mandates only because the EPA has granted California a special waiver from preemption under the Clean Air Act. Both sets of rules flow from the policy decisions of the EPA in accordance with directions from the White House. [EPA-HQ-OAR-2022-0829-0647, p. 6]

Where does EPA purport to find this authority in the Clean Air Act?

The logic is as follows:

Because most automakers have announced ambitious timetables for transitioning to the production of EVs going forward and have pledged to make large capital investments to finance this gradual switchover,13 and because Congress has recently approved generous federal subsidies for some EV purchases and charging infrastructure,14 EPA says it can now declare that battery-electric vehicle technology is a "feasible" alternative to the tradi- tional internal-combustion engine (ICE) powertrain.15 And on that basis, EPA is proposing to treat EVs as an available "control technology" for achieving compliance with the tailpipe emissions restrictions under Clean Air Act section 202.16 [EPA-HQ-OAR-2022-0829-0647, pp. 6-8]

13 See 88 FR at 29191, Figure 1 (reproducing a chart prepared by the Environmental Defense Fund depicting the automakers' announced goals for future electrified vehicle sales as a percentage of total sales); id. at 29193-94 (summarizing automakers' announced plans for investments in EV technology).

14 See id. at 29195-96; Infrastructure Investment and Jobs Act, Public Law 117–58, 135 Stat. 429 (2021), https://www.congress.gov/117/plaws/publ58/PLAW117publ58.pdf; Inflation Reduction Act of 2022, Public Law 117–169, 136 Stat. 1818 (2022), https://www.congress.gov/117/bills/hr5376/BILLS117hr5376enr.pdf.

15 See 88 FR at 29194 (light-duty and medium-duty vehicles); 88 FR at 25972 (heavy-duty trucks).

16 See 88 FR at 29284 (for light-duty and medium-duty vehicles); 88 FR at 26015 (for heavy-duty trucks).

This reasoning obviously depends on a kind of feedback loop. The automakers are pledging to invest in the transition to EVs because governments around the world—like China, the EU, the Biden White House, and Governor Gavin Newsom and his climate regulators in California—are demanding that they do so. But everyone knows there is a large looming impediment to this Green Dream: resistance from American consumers. [EPA-HQ-OAR-2022-0829-0647, pp. 6-8]

The American public is not jumping on the electric bandwagon. EVs are expensive— beyond the reach of many American families—and most Americans remain skeptical that EVs will reliably serve the full range of their needs, that quick and convenient charging stations will be widely available, that EVs will maintain their promised driving range over time or in cold weather, that they will have any significant resale or trade-in value down the road, and that insurance carriers will cover the huge costs of battery replacement when the battery wears out or is damaged in a minor accident.17 [EPA-HQ-OAR-2022-0829-0647, pp. 6-8]

17 See Nick Carey, Paul Lienert, and Sarah McFarlane, "Scratched EV battery? Your insurer may have to junk the whole car," Reuters, March 20, 2023, https://www.reuters.com/business/autos-transportation/scratched-ev-battery-your-insurer-may-have-junk-whole-car-2023-03-20/ ("For many electric vehicles, there is no way to repair or assess even slightly damaged battery packs after accidents, forcing insurance companies to write off cars with few miles—leading to higher premiums and under-cutting gains from going electric.").

To push the automakers to convert to EV production in the absence of sufficient mar- ket demand, EPA plans to ratchet down the emissions limits for carbon dioxide and for the traditional criteria and other pollutants associated with smog (such as unburned hydrocar- bons, particulate matter, oxides of nitrogen, and ozone) to super-stringent levels that are technologically impossible for gas-powered vehicles (even hybrids) to satisfy.18 At the same time, EPA is proposing to phase out certain regulatory buffers that allow automakers to report better emissions compliance results, such as "off-cycle credits" for the addition of onboard technologies that improve the fuel efficiency of ICE vehicles.19 [EPA-HQ-OAR-2022-0829-0647, pp. 6-8]

18 See, e.g., 88 FR at 29237-38; id. at 29257-61.

19 See id. at 29249-50.

The automakers' only recourse will be to replace more and more of the ICE vehicles in their fleets (including hybrids) with the "alternative control technology" of battery-elec- tric vehicles.

And here is the trick: For enforcement purposes, EPA applies the emissions limits to each automaker on a fleetwide average basis, and it proposes to reduce these fleetwide averages dramatically each model year from 2027 through 2032 on a ramp rate calculated to achieve the

Biden administration's desired percentage mix of EVs in the U.S. auto fleets. [EPA-HQ-OAR-2022-0829-0647, pp. 6-8]

In other words, EPA is now proposing to set fleetwide average tailpipe pollution limits that are intended by design to apply increasingly over time to vehicles that have no tailpipes and that EPA says emit none of the pollutants covered by the regulations.20 [EPA-HQ-OAR-2022-0829-0647, pp. 6-8]

20 Automakers can avoid violating the average emissions limits in certain circumstances with regulatory "credits," earned by producing vehicles, like EVs, that outperform the limits. Under the EPA's rules, credits can be "banked" from one model year to another within limits, "transferred" from one fleet to another (for example, from the automaker's light truck fleet to its passenger car fleet), or "traded" between automakers, which usually involves a privately negotiated purchase. Tesla, which manufactures nothing but EVs and accounts for approximately 70 percent of the U.S. EV market, receives a large portion of its income from selling emissions credits to the other automakers. Predictably, the EPA is proposing to retain this credit system to continue the subsidization of EV manufacturing. See 88 FR at 26245-46.

EPA should withdraw and reconsider these rulemaking proposals. [EPA-HQ-OAR-2022-0829-0647, pp. 21-22]

In light of the deficiencies in the cost analyses and underlying assumptions laid out above, EPA should withdraw and reconsider both of its proposed tailpipe rules. If EPA had more carefully considered its legal authorities under the Clean Air Act and more thoroughly accounted for the market realities and facts relevant to these proposals, I am confident EPA would not have proposed the radical and far-reaching approach to emissions control reflected in the current proposals. [EPA-HQ-OAR-2022-0829-0647, pp. 21-22]

Even if EPA persists in proposing something along the same lines, at a minimum, it should put these concepts out for public comment in a much more preliminary form—for example, in an advanced notice of proposed rulemaking, or ANPRM. By setting out the general ideas it plans to consider in an ANPRM, EPA could suggest its own preliminary supporting analysis and view of the relevant facts and considerations and then ask for meaningful input on all aspects of the issues, seeking recommendations for alternative approaches from interested parties and the public. That would be more respectful of the American people and all interested stakeholders and would be more accommodating of the need for and the value of greater public input and deliberation. [EPA-HQ-OAR-2022-0829-0647, pp. 21-22]

Such an alternative process would provide the opportunity for EPA to receive deeper and broader information on all sides of the issues raised by these regulatory proposals, as well as a more probing analysis of the scope of EPA's authority to set emissions limits for automobiles and commercial trucks. In that way, an ANPRM process would help redirect EPA's thinking about the true costs, market disruptions, and secondary consequences of its preferred approach and about its authority to undertake these transformational pro- posals. [EPA-HQ-OAR-2022-0829-0647, pp. 21-22]

Organization: Tesla, Inc.

Foundationally, the primary dynamics that have driven progress in the development of EPA's program in the past and its fundamental architecture remain and, if anything, have become even clearer and more imperative, including: the ongoing need to achieve significant additional emissions reductions from the motor vehicle sector, including for conventional pollutants and greenhouse gases; the increasingly capable role of advanced vehicle technologies, led by zero-emissions BEVs, in providing those reductions; the benefits to the automotive industry of achieving a uniform national program integrating California-led and Federal authorities and operating seamlessly across EPA, the Department of Transportation (DOT), and state authorities; and the importance of regulatory stability to the industry -- and of standards of sufficiently long duration -- to foster the significant investment needed to cement this transformation to advanced technology vehicles. The continuation and amplification of these trends provide a sound legal basis for an even more stringent set of standards than EPA's current proposal. [EPA-HQ-OAR-2022-0829-0792, p. 2]

> 6 See, 40 C.F.R. §1037.150(f) (Electric vehicles. Tailpipe emissions of regulated pollutants from electric vehicles . . . are deemed to be zero.).

II. Rapid Electrification of the Light-Duty Vehicle Sector Is Necessary to Protect the Public Health and Welfare

Tesla supports EPA's efforts to accelerate light-duty vehicle electrification as it is essential for reducing greenhouse gas (GHG) and criteria pollutants and addressing the rapidly escalating climate crisis. Regardless of the application, EPA has long considered BEVs to be the most effective mobile source pollution mitigating technology, stating over a decade ago, "From a vehicle tailpipe perspective, EVs are a game-changing technology."38 Additionally, study after study shows BEVs are a superior technology for reducing air pollution and GHG emissions over their lifetime.39 [EPA-HQ-OAR-2022-0829-0792, p. 7]

In short, electrifying the light-duty duty sector will provide significant improvements in air quality and benefits to all Americans through reduced GHG, NOX, PM, and other air pollutant emissions. Tesla believes it is essential for EPA to establish stringent longer-term light-duty multi-pollutant emission standards that actively embrace a more rapid transition to BEVs. A failure of the agency to finalize a performance standard that substantially puts the light-duty sector on a path to full electrification by at least 2035 and sufficiently reduces U.S. emissions commensurate with the country's commitment to holding global warming to well below 2 degrees Celsius would not meet the legal benchmark of the Clean Air Act to protect the nation's public health and welfare. [EPA-HQ-OAR-2022-0829-0792, p. 11]

The Clean Air Act (CAA), and Section 202(a), is directed at protecting public health and welfare. See 42 U.S.C. § 7401 (identifying the Act's purpose as to "protect and enhance the quality of the Nation's air resources so as to promote the public health and welfare and the productive capacity of its population."); 42 U.S.C. § 7521(a)(1) (providing that the Administrator shall prescribe and from time to time revise "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare."). The Proposed Rule recognizes that the purpose of adopting standards under CAA section 202 is to address air pollution that may reasonably be anticipated to endanger public health and welfare. Indeed, as EPA notes, "Since the earliest days of the CAA, Congress has emphasized that the goal of section 202 is to address air quality hazards from motor vehicles, not to simply reduce emissions from internal combustion engines to the extent feasible."124 As courts have recognized, given the overriding goal of the statute to protect public health and welfare, EPA may "plac[e] primary significance on the 'greatest degree of emission reduction achievable,'" and consider other factors such as "cost . . . energy and safety factors as important but secondary factors."125 [EPA-HQ-OAR-2022-0829-0792, p. 20]

124 88 Fed. Reg. at 29233.

125 Husqvarna AB v. EPA, 254 F.3d 195, 200 (D.C. Cir. 2001).

Further, there should be no doubt, in view of recent amendments to the Clean Air Act and Congressional ratification accomplished by the IRA,126 that EPA has ample authority to address the regulation of greenhouse gas pollutants, from motor vehicles, through electrification, and in the light-duty sector.127 [EPA-HQ-OAR-2022-0829-0792, p. 21]

126 Pub. L. No. 117-169, 136 Stat. 1818 (2022).

127 See, Greg Dotson and Dustin J. Maghamfar, The Clean Air Act Amendments of 2022: Clean Air, Climate Change, and the Inflation Reduction Act, 53 ELR 10017 at 10019, 10032 (2023) (discussing Clean Air Act sec. 137 and other revisions) available at https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4338903

The criteria referred to in §209(a) relate to the emission characteristics of a vehicle or engine. To meet them the vehicle or engine must not emit more than a certain amount of a given pollutant, must be equipped with a certain type of pollution-control device, or must have some other design feature related to the control of emissions.137 [EPA-HQ-OAR-2022-0829-0792, p. 22]

137 Id.

Certainly zero emissions technology capabilities are such a design feature, and should be factored into the overall fleet performance that manufacturers must meet. [EPA-HQ-OAR-2022-0829-0792, p. 22]

Likewise, other courts have held that full ZEV programs are appropriately considered to be standards under the Clean Air Act:

To be sure, the ZEV sales requirement does not impose precise overall quantitative limits on levels of emissions, as do the classification system and fleet averages. It mandates only that a specified percentage of the cars sold by a manufacturer in any model year be ZEVs. Nevertheless, the ZEV sales requirement must be considered a standard 'relating to the control of emissions.' ZEV, after all, stands for 'zero-emission vehicle,' and a requirement that a particular percentage of vehicle sales be ZEVs has no purpose other than to effect a general reduction in emissions.138 [EPA-HQ-OAR-2022-0829-0792, p. 22]

138 Am. Auto Mfrs. Ass'n v. Cahill, 152 F.3d 196, 200 (2d Cir. 1998); Ass'n of Int'l Auto. Mfrs. v. Comm'r, 208 F.3d 1, 6 (1st Cir. 2000)

If such a percentage designation of zero emissions vehicle targets is permissible under the Clean Air Act, EPA's approach merely incorporating consideration of that technology is a fortiorari an appropriate emissions standard setting exercise of authority. [EPA-HQ-OAR-2022-0829-0792, p. 22]

Nor is it a particularly large conceptual leap from EPA's well-established embrace of overall fleet emissions averages,139 a practice which has long departed from strict pollutant-by-pollutant numerical limits, to the concept of addressing such emissions at the federal level by recognizing the possibility that an increasingly large proportion of BEVs may become part of a manufacturer's compliance strategy and should be factored into the overall level of permissible emissions. As technology has evolved, the overriding Clean Air Act statutory command to set standards that reflect the greatest degree of emission reduction achievable through the application of such available technology, is fully consistent with this approach. [EPA-HQ-OAR-2022-0829-0792, p. 22]

139 See, e.g., 79 Fed. Reg. at 451 (EPA adoption of sales-weighted fleet averages for its Tier 3 emissions regulations).

For the U.S. to meet its decarbonization goals and to mitigate the public health and welfare impacts from climate change, EPA's proposal should be amended to meet increasingly more stringent regulatory requirements that incentivize all vehicle manufacturers to rapidly scale up delivery of high-quality BEVs. [EPA-HQ-OAR-2022-0829-0792, p. 23]

The Clean Air Act is designed to be "technology-forcing" and light- and medium-duty manufacturers are poised to meet significant new emission reduction performance standards.143 The Clean Air Act is "intended to be a 'drastic remedy to . . . a serious and otherwise uncheckable problem.' . . . Subsequent legislative history confirms that the technology-forcing goals of the 1970 amendments are still paramount in today's Act."144 As courts have recognized in the specific context of CAA section 202(a)(1) and as the preamble to the proposal appropriately acknowledges, "Congress intended the agency to project future advances in pollution control capability. It was 'expected to press for the development and application of improved technology rather than be limited by that which exists today.'"145 [EPA-HQ-OAR-2022-0829-0792, p. 23]

143 Union Elec. Co. v. EPA, 427 U.S. 246, 258 (1976); Train v. NRDC, 421 U.S. 60, 90 (1975).

144 Whitman v. American Trucking Ass'n, 531 U.S. 457, 491-92, (Breyer, J. concurring), citing Union Elec. 427 U.S. at 256.

145 NRDC v. EPA, 655 F.2d 318, 328 (D.C. Cir. 1981).

At the outset, nothing in the statute directs EPA to give great weight to infrastructure or similar considerations in evaluating whether a standard can be implemented in a time period the Administrator finds sufficient "to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period."184 This is in contrast to other portions of the statute, which specifically direct the agency to consider, for example, "the impact of renewable fuels on the infrastructure of the United States, including deliverability of materials, goods, and products other than renewable fuel, and the sufficiency of infrastructure to deliver and use renewable fuel."185 [EPA-HQ-OAR-2022-0829-0792, p. 30]

184 42 U.S.C. § 7521(a)(2).

185 42 U.S.C. § 7545(o)(2)(B)(ii)(IV).

Organization: Valero Energy Corporation

Finally, as discussed in detail below, EPA must consider the consequences of reduced demand for and production of renewable fuels such as ethanol and renewable diesel. By phasing out the vehicles that consume these fuels, the proposed rule stands in direct conflict to EPA's statutory obligations under the Energy Independence and Security Act of 2007 (EISA), which was designed to reduce greenhouse gas emissions from the domestic transportation sector while enhancing energy security by promoting increased volumes of renewable fuel production, including requirement that EPA provide for specific minimum volumes of advanced biofuel (including renewable diesel) and biomass-based diesel from 2022 onward.299 In response to the incentives created by the RFS as well as state programs like the California Low Carbon Fuel Standard, Valero as well as some of our competitors have responded by investing heavily in renewable fuel production capacity. EPA must consider the chilling effect the proposed action will have on production of ethanol and renewable diesel and the corresponding loss of jobs in the agricultural and fuel production sectors. [EPA-HQ-OAR-2022-0829-0707, pp. 54-55]

299 42 U.S.C. § 7545(o)(2)(B)(iii),(v).

H. EPA should consider the consequences of diminishing liquid fuel supplies as refineries and renewable fuel production facilities are shut down.

When proposing rules to implement the phase-out of liquid fuels, a foundational issue to address is the impact(s) of refinery shutdowns. In the proposed EV rules, EPA takes credit for reduced emissions from oil production and refinery operation and places points on the positive ledger for energy security in dollar amounts as a result of reduced reliance on oil. But EPA does not account for the loss of jobs or other impacts related to refinery shutdowns, reduced renewable fuel production, and the loss of liquid fuel supplies. [EPA-HQ-OAR-2022-0829-0707, p. 54]

EPA acknowledges that existing ICEs will continue to operate but has not accounted for any increased burden on those owners of ICEs related to fewer options for fuel or decreased competition in the fuel market. EPA must consider how reducing volumes of liquid fuels will change regional pricing and availability of fueling options for consumers as reducing reliance on liquid fuels will also lead to a direct decrease in both federal and state excise tax revenues from gasoline and diesel, as has been demonstrated in the numerous states that have already adopted ZEV mandates.297 This, in turn, will decrease state and federal funding for construction and maintenance of transportation infrastructure in the US, which is primarily funded from these tax revenues.298 Thus, not only will ZEV-centric policy destroy the domestic production of asphalt used primarily for road construction and repairs, it will also lead to a precipitous decline in each state's ability to pay for road maintenance. [EPA-HQ-OAR-2022-0829-0707, p. 54]

297 See Berkeley Research Group, Policy Briefs, The Effect of Zero-Emission Vehicle Policies on Dedicated Highway Infrastructure Funding in Maryland, Minnesota, New Jersey, Nevada, New York, Oregon, and Virginia, available at https://www.thinkbrg.com/insights/publications/effect-of- zev-policies-on-dedicated-highway-infrastructure-funding/.

298 Id.

Finally, as discussed in detail below, EPA must consider the consequences of reduced demand for and production of renewable fuels such as ethanol and renewable diesel. By phasing out the vehicles that consume these fuels, the proposed rule stands in direct conflict to EPA's statutory obligations under the Energy Independence and Security Act of 2007 (EISA), which was designed to reduce greenhouse gas emissions from the domestic transportation sector while enhancing energy security by promoting increased volumes of renewable fuel production, including requirement that EPA provide for specific minimum volumes of advanced biofuel (including renewable diesel) and biomass-based diesel from 2022 onward.299 In response to the incentives created by the RFS as well as state programs like the California Low Carbon Fuel Standard, Valero as well as some of our competitors have responded by investing heavily in renewable fuel production capacity. EPA must consider the chilling effect the proposed action will have on production of ethanol and renewable diesel and the corresponding loss of jobs in the agricultural and fuel production sectors. [EPA-HQ-OAR-2022-0829-0707, pp. 54-55]

299 42 U.S.C. § 7545(o)(2)(B)(iii),(v).

A. The proposed action addresses a major question for which EPA must have clear congressional authority.

Under the major-questions doctrine, a court may not construe a statute to "authoriz[e] an agency to exercise powers of 'vast economic and political significance'" unless the statute does so in "clea[r]" terms.352 Thus, an agency seeking to exercise such significant powers must identify "something more than a merely plausible textual basis for the agency action."353 "The agency instead must point to 'clear congressional authorization' for the power it claims." Id. [EPA-HQ-OAR-2022-0829-0707, pp. 66-68]

352 Alabama Ass'n of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021) (quoting Utility Air Regulatory Grp. v. EPA, 573 U.S. 302, 324 (2014)).

353 West Virginia v. EPA, 142 S. Ct. 2587, 2609 (2022) (quoting Utility Air, 573 U.S. at 324).

In assessing the economic and political significance of a rule, the Supreme Court has considered both the rule's direct effects and the implications of the agency's underlying claim of authority. For example, in West Virginia, although EPA's Clean Power Plan only incrementally shifted power generation, EPA had asserted the "highly consequential power" to "announc[e] what the market share of coal, natural gas, wind, and solar must be, and then requir[e] plants to reduce operations or subsidize their competitors to get there."354 An agency cannot avoid the need for clear backing from Congress by claiming an awesome power but exercising only a little of it in the first instance. [EPA-HQ-OAR-2022-0829-0707, pp. 66-68]

354 142 S. Ct. at 2609 & 2613 n.4; see Alabama Ass'n of Realtors, 141 S. Ct. at 2489 (considering the "sheer scope of the [agency's] claimed authority" in addition to the rule's "economic impact").

If EPA were to finalize this proposal, just as in West Virginia, EPA would be claiming the power to effect a wholesale shift in energy policy: moving the Nation's light and medium duty vehicle fleets from vehicles powered by internal-combustion engines ("ICEs") that use liquid fuels to vehicles powered by battery-operated electric motors. The only difference is that EPA is waving its wand over motor vehicles instead of power plants. At a more specific level, the Supreme Court in West Virginia identified several clues from the statutory and regulatory scheme indicating that EPA needed clear congressional authorization for its Clean Power Plan. Those same clues are present here in spades. The lesson should be unavoidable: EPA needs clear support from Congress to redefine the source and replace the kind of vehicles America drives on its roads and uses for work and delivery of goods that keep the economy running. In this proposal, EPA claims power to radically change numerous sectors in the economy that depend on LDVs and MDVs, including for every day personal transportation and for services that deliver goods, supplies and equipment throughout the country, as well as the numerous sectors that depend on the liquid fuels (and related byproducts) on which such vehicles currently run.355 [EPA-HQ-OAR-2022-0829-0707, pp. 66-68]

355 Of course, the proposed rule electrifying LD and MD vehicles is only part of the current administration's broader plan to electrify the entire fleet of the nation's vehicles. See E.O. 14307, 88 Fed. Reg. 43,583 (Aug. 5, 2021) ("50 percent of all new passenger cars and light trucks sold in 2030 be zero-emission vehicles, including battery electric, plug-in hybrid electric, or fuel cell electric vehicles.") ("Given the significant expertise and historical leadership demonstrated by the State of California with respect to establishing emissions standards for light-, medium-, and heavy-duty vehicles, the Administrator of the EPA shall coordinate the agency's activities … with the State of California as well as other States that are leading the way in reducing vehicle emissions, including by adopting California's standards."); EPA Finalizes Greenhouse Gas Standards for Passenger Vehicles, Paving Way for a Zero-Emissions Future (Dec. 20, 2021), https://bit.ly/3wJFsTD (EPA Administrator declaring the rule "a giant step forward" in "paving the way toward an all-electric, zero-emission transportation future."); https:joebiden.com/climate-plan/# (promising to "use the full authority of the executive branch to make progress and significantly reduce emissions" by "developing rigorous new fuel economy standards aimed at ensuring 100% of new sales for light- and medium-duty vehicles will be electrified." EPA's claimed authority to mandate EVs in place of ICE vehicles is the same for Light Duty, Medium Duty, and Heavy Duty vehicles; therefore, it is appropriate to consider (for purposes of the major question issue) not just the effects of this proposed rule but the effect of the entire "whole of government" approach to electrify all vehicles.

1. EPA claims a power of vast economic significance.

At the threshold, the rule's economic significance is staggering, in both its direct effects and the implications of the authority EPA claims. Several considerations underscore the rule's enormous economic cost. [EPA-HQ-OAR-2022-0829-0707, pp. 66-68]

Transformation of the LD and MD Vehicle Market. EPA makes no secret of its approach to setting the standards for LDVs and MDVs—the standards require replacing ICE vehicles with BEVs or FCEVs. The result of this transition has dramatic consequences, as described more fully in these comments and by others. Such consequences include increased consumer acquisition costs, lack of adequate public and personal charging infrastructure (e.g., multi-family housing and rural areas), increased charging times (particularly for those relying on public charging stations), increased demand for electricity, increased wear on public roads from heavier ZEVs, and increased tire wear, among others. And beyond personal, everyday use, there are also many other sectors that rely on LDVs and MDVs and the liquid fuels on which they currently run (and indeed, the byproducts of such fuels)—e.g., the refining, agriculture, and manufacturing industries—each with transition issues of their own. But EPA has not acknowledged the obstacles and burdens that will be on such industries or considered whether those obstacles or burdens can be reasonably overcome. [EPA-HQ-OAR-2022-0829-0707, pp. 66-68]

In West Virginia, the Court explained that EPA had sought to "substantially restructure the American energy market." 142 S. Ct. at 2611. With this proposal, EPA seeks to "substantially restructure" the American LD and MD vehicle markets, and with them, many sectors and supply chains in the U.S. economy. As discussed above, the overall cost and economic impact of this proposed restructure is staggering—despite EPA's gross understatements to the contrary. And EPA's failure to consider the full extent of this economic impact is indicative of its limited authority; if Congress truly meant to grant such an awesome power to EPA, it would not have restricted EPA's cost considerations to vehicle manufacturers only. [EPA-HQ-OAR-2022-0829-0707, pp. 66-68]

Indeed, the effects of EPA's rule would extend well beyond personal consumer use. As described previously in these comments, the rule will impact, among other sectors, the refining, agriculture, and manufacturing industries, how and to what extent they operate, where they source their supply chains, and how and whether they continue to produce products that are essential to modern life. This will have ripple effects throughout the economy, both with regard to supply chain costs and availability and, ultimately, increased costs to consumers. Moreover, many industries dependent upon the refining sector, such as the asphalt, petrochemical and sulfur industries (all of which are, ironically, essential to increased EV production), will see their supply chains reduced and prices increased to the extent the proposal reduces liquid fuel demand and, consequently, impacts refining. [EPA-HQ-OAR-2022-0829-0707, pp. 66-68]

By any relevant economic measure—"the amount of money involved for regulated and affected parties, the overall impact on the economy, [or] the number of people affected," U.S. Telecom Ass'n v. FCC, 855 F.3d 381, 422 (D.C. Cir. 2017) (Kavanaugh, J., dissenting from denial of rehearing en banc)—EPA's asserted power to force a transition from diesel- and gasoline-powered LD and MD vehicles to electric ones represents "an enormous and transformative expansion in [its own] regulatory authority," affecting "a significant portion of the American economy." Utility Air, 573 U.S. at 324. [EPA-HQ-OAR-2022-0829-0707, pp. 66-68]

2. EPA claims a power of vast political significance.

The rule's political significance is just as vast. In West Virginia, the Court identified several considerations that are equally present here. [EPA-HQ-OAR-2022-0829-0707, pp. 68-69]

Ongoing Policy Debate. The target of EPA's rule—to say nothing of climate change more generally356—is "the subject of an earnest and profound debate across the country." West Virginia, 142 S. Ct. at 2614. While California is moving aggressively to accelerate electrification by regulatory fiat,357 other States oppose efforts to shift energy-investment and generation from petroleum to other sources, see, e.g., Act Relating to Financial Institutions Engaged in Boycotts of Energy Companies, 2022 W. Va. Legis. Ch. 235. [EPA-HQ-OAR-2022-0829-0707, pp. 68-69]

356 See West Virginia, 142 S. Ct. at 2625 (Gorsuch, J., concurring) ("As the dissent observes, the agency's challenged action before us concerns one of 'the greatest … challenge[s] of our time.' If this case does not implicate a 'question of deep economic and political significance,' King, 576 U.S. at 486, 135 S. Ct. 2480 (internal quotation marks omitted), it is unclear what might."

357 See, e.g., Cal. Code Regs. Tit. 13, § 1962.4 (Zero-Emission Vehicle Standards for 2026 and Subsequent Model Year Passenger Cars and Light-Duty Trucks); California Air Resources Board Final Regulation Order, "Advanced Clean Fleets Regulation: 2036 100 Percent Medium and Heavy Duty Zero Emissions Vehicle Sales Requirements," https://ww2.arb.ca.gov/rulemaking/2022/acf2022.

Congress itself is debating this very issue, which makes EPA's claim to policymaking authority "all the more suspect." West Virginia, 142 S. Ct. at 2614; see FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120, 155 (2000). Congress has yet to reach an answer and instead remains in factfinding mode as it considers the benefits and risks of electrification. Congress enacted the Infrastructure Investment and Jobs Act of 2021, which requires several agencies— notably not EPA—to prepare three separate reports for Congress on the implications of electrifying the Nation's vehicle fleet. Pub. L. No. 117-58, §§ 25006, 40435, 40436, 135 Stat. 429, 845-49, 1050 (2021) (requiring reports on "the cradle to grave environmental impact of electric vehicles" and "the impact of forced labor in China on the electric vehicle supply chain," among other things). [EPA-HQ-OAR-2022-0829-0707, pp. 68-69]

Balancing National Policy Considerations. In West Virginia, the Court found it significant that EPA's rule would put the agency in the position of "balancing the many vital considerations of national policy implicated in the basic regulation of how Americans get their energy." 142 S. Ct. at 2612. The Court was concerned that the agency would decide "how much of a switch from coal to gas" the grid could tolerate, and "how high energy prices [could] go" before becoming "exorbitant." Id. Here, too, EPA's rule puts it in the position of deciding "how much of a switch" to electrification the nation's power grids can tolerate, and how high vehicle and electricity prices can climb without being "exorbitant." [EPA-HQ-OAR-2022-0829-0707, pp. 68-69]

EPA's asserted authority also implicates another key "consideration[] of national policy": national security. NHTSA has acknowledged that the United States "has very little capacity in mining and refining any of the key raw materials" for electric vehicles. 86 Fed. Reg. 49,602, 49,797 (Sept. 3, 2021). And unlike biofuels and petroleum, most of the supply of critical components of batteries and motors for electric vehicles is controlled by hostile or unstable foreign powers, in particular China. Shifting to electric vehicles would thus make the American automotive industry critically dependent on one of the Nation's primary geopolitical rivals. [EPA-HQ-OAR-2022-0829-0707, pp. 68-69]

Specifically, China is by far the largest source of graphite, which is used for lithium- ion batteries, and rare-earth elements like neodymium, which are used for permanent-magnet motors. By some estimates, a transition to electric vehicles would raise demand for graphite by 2500% and rare-earth elements by 1500%. International Energy Agency, The Role of Critical Minerals in Clean Energy Transitions 97 (March 2022). Another key component of lithium batteries, cobalt, is controlled by the Democratic Republic of the Congo, which is implicated in significant human-rights concerns (including child labor), and Chinese state-owned enterprises have a controlling interest in 70% of Congo's cobalt mines. [EPA-HQ-OAR-2022-0829-0707, pp. 68-69]

Lack of Agency Expertise. To force electrification, EPA would need to understand and weigh "many vital considerations of national policy." West Virginia, 142 S. Ct. at 2612. The policy judgments here involve not only climate impacts but millions of jobs, the restructuring of entire industries, the Nation's energy independence and relationship with hostile powers, and supply-chain and electric-grid vulnerabilities. EPA does not have any expertise in those matters. The judgments here are not ones "Congress presumably would" entrust to "an agency [with] no comparative expertise," but are "ones Congress would likely have intended for itself." West Virginia, 142 S. Ct. at 2612-13. [EPA-HQ-OAR-2022-0829-0707, pp. 69-71]

Prior Rejections by Congress of Similar Policies. As evidence that the judgments here belong to Congress rather than the Executive, both Houses of Congress have previously "considered and rejected" multiple bills with effects similar to EPA's rule. West Virginia, 142 S. Ct. at 2614 (quoting Brown & Williamson, 529 U.S. at 144). Congress even rejected one bill that would have mandated a level of electric- vehicle penetration roughly equal to the 50%-by-2030 target EPA embraces in this proposal. See, e.g., Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. (2018); see also 116 Cong. Rec. 19238-40 (1970) (proposed amendment to Title II that would have banned internal-combustion vehicles by 1978). Congress's "consistent judgment" against the very sorts of mandates imposed by EPA undercuts any claim of congressional authorization. Brown & Williamson, 529 U.S. at 147-48, 160; accord West Virginia, 142 S. Ct. at 2614. The fact that the current administration has been required to rely on executive actions to force electrification of the vehicle fleets demonstrates the lack of congressional authority. [EPA-HQ-OAR-2022-0829-0707, pp. 69-71]

Indeed, the U.S. House and Senate recently passed a joint resolution358 nullifying EPA's recent rule on HDVs relating to air pollution, including ozone and particulate matter. The resolution was subsequently vetoed by President Biden,359 which only further confirms that EPA's recent attempts to alter the Nation's vehicle fleet is unsupported by Congress and instead driven by the current administration's agenda. [EPA-HQ-OAR-2022-0829-0707, pp. 69-71]

358 Heavy Duty Truck rule Congressional Review Act joint resolution (S.J. Res. 11)("A Joint resolution providing for congressional disapproval under chapter 8 of title 5, United States Code, of the rule submitted by the Environmental Protection Agency relating to "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards").

359 https://www.whitehouse.gov/briefing-room/statements-releases/2023/06/14/message-to-the-senate- on-the-presidents-veto-of-s-j-res-11/

To be sure, with regard to this proposal on LDVs and MDVs, as well as EPA's related proposal for HDVs, 151 members of the House submitted a letter360 to EPA urging the rescission of the proposals, citing such concerns as the proposal being "unworkable," "impractical," a "deliberate market manipulation to prop up EVs," a benefit to the Chinese Communist Party ("as China has a stranglehold on the critical minerals supply chain and manufacturing of EV batteries"), "not necessarily better for the environment in terms of emissions reductions," and "worst of all," a burden on Americans and their families, forcing them to pay "an excessive amount for a car they do not want and cannot afford." Similarly, 26 senators issued a letter361 to EPA requesting withdrawal of the LDV, MDV, and HDV proposals, which "effectively mandate a costly transition to electric cars and trucks in the absence of congressional direction." (emphasis added). The Senate letter further cited the proposal's increased burden on the electric grid, the lack of supporting charging infrastructure, safety risks associated with EVs, roadway lifespan impacts and planning, consumer choice and affordability, domestic job losses, national security, and questionable cost metrics as concerns with, and flaws under, the proposal and also emphasized the application of the major questions doctrine and EPA's lack of clear authority: [EPA-HQ-OAR-2022-0829-0707, pp. 69-71]

360 https://d1dth6e84htgma.cloudfront.net/DRAFT_05_22_23_EPA_Tailpipe_Letter_af5a5b04a5.pdf?updated_at=2023-05-19T17:01:36.343Z; see also https://mccaul.house.gov/media-center/press-releases/mccaul-mcmorris-rodgers-demand-epa-end-effort-dictate-cars-americans.

361 https://www.epw.senate.gov/public/_cache/files/4/c/4c8a1ccf-a225-4e7b-b028-f4674c12bdaf/0EBFAF9F23EC0CCA86DDFCBBCF6044F8.05.25.2023-capito-letter-to-epa-on- tailpipe-standards.pdf; see also https://www.capito.senate.gov/news/press-releases/capito- colleagues-urge-epa-to-withdraw-recent-vehicle-emissions-rules-.

If finalized, these proposals will effectively require a wholesale conversion from powering vehicles with widely available liquid fuel to charging BEVs off our nation's electric grid. This is a major, multi-billion dollar, policy-driven technology transition mandate to be imposed on American consumers by your Agency, without any semblance of the clear and direct statutory authority required by the ruling in West Virginia v. EPA. [EPA-HQ-OAR-2022-0829-0707, pp. 69-71]

In short, Congress has rejected not only a mandatory shift to EVs in general, but also this precise proposal. [EPA-HQ-OAR-2022-0829-0707, pp. 69-71]

Conflict with Congress's Broader Design. EPA's rule is also inconsistent with the broader statutory scheme and Congress's plan for tackling climate change. See Utility Air, 573 U.S. at 321. When Congress has sought to address greenhouse-gas emissions from the transportation sector, it has done so by promoting corn ethanol and other biofuels, which are used in conventional vehicles and which—unlike electric-vehicle components—are in abundant domestic supply. See, e.g., Inflation Reduction Act of 2022, Pub. L. No. 117-169. §§ 13202, 13404, 22003, 136 Stat 1818, 1932, 1966-69, 2020 (2022). Indeed, Congress has consistently legislated against the background expectation that conventional vehicles powered by liquid fuels will remain on the market. The Renewable Fuel Standard program is designed to promote, not diminish, renewable fuel demand. [EPA-HQ-OAR-2022-0829-0707, pp. 69-71]

For example, in Title II's Renewable Fuel Standard Program, Congress mandated year-over-year increases in renewable fuel. EPA is thus working at cross-purposes with Congress, which has required increases in liquid renewable fuels at the same time that EPA is seeking to eliminate vehicles that use such fuels.362 The obvious reason for the mismatch is that Congress has not decided to mandate electrification—nor has it placed that power in EPA's hands. See West Virginia, 142 S. Ct. at 2633 (Kagan, J., dissenting) (noting that when the agency's "action, if allowed, would have conflicted with, or even wreaked havoc on, Congress's broader design" it should not be allowed based on normal statutory interpretation of a broad delegation of authority). [EPA-HQ-OAR-2022-0829-0707, pp. 69-71]

362 362 87 Fed. Reg. 80582, "Renewable Fuel Standard (RFS) Program: Standards for 2023-2025 and Other Changes" (December 30, 2022).

B. The Clean Air Act's general grants of authority and EPA's new interpretations of the same do not authorize the proposal's mandatory shift in the Nation's vehicle fleet. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

Not only does EPA lack the clear congressional authorization necessary to support the proposal's wholesale shift in energy policy pursuant to West Virginia, but the text, structure, and legislative history of the Clean Air Act demonstrate that it also lacks general statutory authority to force the electrification of LDVs and MDVs. The proposed standards thus exceed EPA's statutory authority, even absent application of the major-questions doctrine. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

1. EPA has incorrectly interpreted the text of the Clean Air Act provisions cited as a general authorization to mandate ZEVs.

EPA claims that Section 202(a) of the CAA authorizes it to force a change in technology. But the cases EPA cites as authoritative are not based on Section 202(a), and Section 202(a) does not provide EPA clear authority to force technology. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

EPA makes several additional critical errors in its interpretation of its authority to conclude that the Clean Air Act authorizes EPA to set standards that mandate increasing percentages of sales of ZEVs. To set these standards, EPA first assumes that the standards can regulate any "motor vehicles," including electric vehicles, even if it has deemed such vehicles to not emit the relevant pollutant. Second, EPA characterizes electrification, more specifically BEVs and

FCEVs, as a “pollution control device or system” that would apply to motor vehicles. Third, EPA assumes authority to use fleetwide averaging rather than to set standards for individual vehicles and engines. Fourth, EPA ignores other sections of the Clean Air Act, which are inconsistent with the proposal’s forced shift in energy. Finally, EPA relies on a novel and highly revisionist spin on legislative history to support its authority to mandate electrification. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

EPA errs with each of these steps.

a) The statutory text demonstrates that the vehicles covered by the standards must emit the relevant pollutant.

Section 202(a)(l) provides that EPA shall prescribe "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a)(l). The statute, of course, does not expressly specify which vehicles are to be included in any average emission standard because, as discussed below, it does not contemplate averaging in the first place. But to the extent averaging is permissible, the text makes clear that the vehicles included in such averaging must, in EPA's judgment, actually emit the relevant pollutant. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

To begin with, EPA improperly relies on a broad definition of “motor vehicle,” as the statute focuses on standards for the "emission" of an air pollutant, which immediately indicates Congress's focus on vehicles deemed to actually "emi[t]" the relevant pollutant. 42 U.S.C. § 7521(a)(l) (emphasis added). Here, EPA's proposal stipulates that electric vehicles are to be treated for averaging purposes as if they emit no carbon dioxide (even when they pull electricity from a grid that is powered by carbon-emitting sources and rely on batteries whose production, disposal, and recycling emits carbon) or criteria pollutants.364 EPA has thus decided that electric vehicles as a class do not "emi[t]" the relevant pollutants. 42 U.S.C. § 7521(a)(l). And given the textual focus on harmful emissions, EPA cannot include vehicles it determines to be non-emitting in the standards that EPA calculates and imposes. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

364 See, e.g., 88 Fed. Reg. 29,187.

Next, the statute is explicit that the things for which EPA sets standards must "in [EPA's] judgment, cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a)(l). The key textual question is thus what exactly EPA must "judg[e]" to "cause, or contribute to" potentially dangerous air pollution. The grammatical structure of the provision offers only two plausible options. Because the verbs "cause" and "contribute" are in the plural form, their subject must be plural as well. See Scalia & Garner, supra, at 140 ("Judges rightly presume . . . that legislators understand subject-verb agreement."). The only plural nouns that could plausibly "cause" or "contribute" to pollution are either the "new motor vehicles or new motor vehicle engines," or the "class or classes" of those vehicles or engines. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

Under either reading, all of the covered vehicles must emit the relevant pollutants. If it is the "vehicles" or "engines" that EPA must judge to "cause, or contribute to, air pollution," then Section 202(a) authorizes EPA to set standards only for "new motor vehicles or new motor vehicle engines which in [EPA's] judgment cause, or contribute to" potentially dangerous pollution. In other words, EPA may set standards only for motor vehicles that in its judgment actually emit the regulated pollutants—here, combustion-engine vehicles that emit greenhouse gases and criteria pollutants. The converse is equally true: Section 202(a) does not authorize EPA to set standards for vehicles that it deems not to cause or contribute to harmful pollution. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

That is the natural reading of the statute under the "grammatical 'rule of the last antecedent,'" which provides that a "limiting clause or phrase ... should ordinarily be read as modifying only the noun or phrase that it immediately follows." Barnhart v. Thomas, 540 U.S. 20, 26 (2003). Here, the relevant limiting phrase is: "which in [EPA's] judgment cause, or contribute, to air pollution." And the immediately antecedent phrase is "new motor vehicles or new motor vehicle engines." The rule of the last antecedent thus indicates that it is the "vehicles" in the class that must "cause, or contribute" to the pollution, and not the "class" as a whole. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

Courts have also adopted that natural reading. The D.C. Circuit Court of Appeals, for example, has observed that Section 202(a) "requires the EPA to set emissions standards for new motor vehicles and their engines if they emit harmful air pollutants." Truck Trailers Mfrs. Ass'n v. EPA, 17 F.4th 1198, 1201 (D.C. Cir. 2021) (emphasis added); see NRDC v. EPA, 954 F.3d 150, 152 (2d Cir. 2020) (Section 202(a) "requires EPA to regulate emissions from new motor vehicles if EPA determines that the vehicles 'cause, or contribute to,' [potentially dangerous] air pollution") (emphasis added). [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

Alternatively, if it is the "class or classes" of vehicles or engines that must "cause, or contribute to, air pollution," the result is the same. When we refer to a class of objects that does something, the ordinary and accurate meaning is that all the members of the class do that thing. For example, when a doctor warns a patient about a "class of medications that cause drowsiness," the class does not include non- drowsiness-inducing medicines. And that is the best way to read the statute here: a class that causes pollution is most naturally defined to include only those vehicles that cause pollution. EPA has broad leeway to group those pollution-emitting vehicles into classes how it sees fit. See NRDC v. EPA, 655 F.2d 318, 338 (D.C. Cir. 1981). But the vehicles must actually be pollution-emitting in EPA's judgment. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

In short, under either plausible reading of the statute, when EPA sets an emission standard for a pollutant, it must consider only the vehicles that it judges to emit the relevant pollutant. Even if fleetwide averaging were allowed as a general matter, averaging would be permissible only among types of vehicles that "emi[t]" the harmful pollutant and that, "in [EPA's] judgment cause, or contribute" to harmful air pollution. If EPA determines that a particular category of vehicle is not "emi[tting]" the relevant pollutant or "caus[ing], or contribut[ing] to" the resulting pollution, it makes no sense to include that category in calculating the emission standard. That is not really "averaging" at all, as it does not help EPA arrive at a technologically feasible threshold for pollutant-emitting vehicles. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

EPA has adopted such a faux "average" here. The agency proposes carbon- dioxide and criteria pollutant emissions targets for LDVs and MDVs that "average" in a category of vehicles that it deems not to emit either carbon dioxide or criteria pollutants. EPA treats electric vehicles as "zero-emission vehicles," and assumes they contribute "zero grams/mile" of carbon dioxide or criteria pollutants “from their tailpipes.”365 Setting aside the flaws in that assumption, if EPA chooses to treat electric vehicles as "zero emission," it must abide by the statutory consequences of that decision: the electric-vehicle category cannot textually or logically be "averaged" into the emission standards under Section 202(a). [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

365 88 Fed. Reg. 29,187, 29,197.

This error is not new. The Supreme Court recently rejected parallel reasoning in West Virginia. There, a similar provision of the Clean Air Act authorized EPA to guide States in "establish[ing] standards of performance for any existing [power plant] for any air pollutant." 42 U.S.C. § 7411(d)(l). The Court explained that authorization to "establish[] standards of performance for existing source[s]" does not equate to the power "to direct existing sources to effectively cease to exist." West Virginia, 142 S. Ct. at 2612 n.3 (quoting42 U.S.C. § 7411(d)) (second alteration in original). The same logic applies to Section 202(a): in empowering EPA to set emission standards for "vehicles" or "classes" of "vehicles" that "cause, or contribute to, air pollution," Congress did not permit EPA "to direct [conventional vehicles] to effectively cease to exist." Id. [EPA-HQ-OAR-2022-0829-0707, pp. 73-76]

b) EVs and ZEVs do not constitute “emission control devices or systems,” rather, they are different technologies altogether.

EPA next claims that Congress gave it clear authority to require automotive manufacturers to use ZEVs as “emission control devices or systems” to prevent or control the emission of greenhouse gases and criteria pollutants from LDV and MDV tailpipes.366 EPA first asserted this novel argument in response to litigation challenging its attempt to force electrification of LDVs in its Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 FR 74434. See EPA’s Answering Brief in Texas v. EPA (D.C. Cir. 22-1031), pp. 40-47. In that case, EPA claimed that when 42 U.S.C. §7521(a)(1), which allows it to prescribe pollution-emission standards to vehicles whether they are “designed as complete systems or incorporate devices to prevent or control such pollution,” is read in conjunction with subsection (a)(2), which prohibits EPA from prescribing such standards until “the requisite technology” can be developed and applied in a cost-efficient manner, Congress provided EPA “clear authorization” to mandate electric vehicles. EPA’s Answering Brief at pp. 40-41, 47. In other words, EPA reads the limiting language in (a)(2) to somehow expand the authority granted in (a)(1), which as described above does not apply to ZEVs deemed not to emit the relevant pollutant. But neither the plain language nor the statutory history provides EPA with newfound authority to replace ICEVs with ZEVs. [EPA-HQ-OAR-2022-0829-0707, pp. 76-78]

366 88 Fed. Reg. at 29,286.

Not only does the statute not mention EVs or any other type of purported ZEVs, which one would expect if Congress were providing EPA clear authority to force electrification of the nation’s vehicle fleet, but ZEVs are also not even “systems” or “devices” that “prevent or control” pollution; they are just different kinds of vehicles that EPA states do not emit the relevant pollutant in the first place. [EPA-HQ-OAR-2022-0829-0707, pp. 76-78]

ZEVs are not “designed as complete systems” to prevent or control harmful pollution, because they do not have “built-in pollution control” or prevention. Truck Trailer Mfrs. Ass’n, Inc. v. EPA, 17 F.4th 1198, 1202 (D.C. Cir. 2021). To “prevent” something means to “keep [it] from happening” or “impede” it. American Heritage Dictionary 1038 (1st ed. 1969). To “control” means to “hold in restraint” or “check.” Id. at 290. Thus, a vehicle with “built-in pollution control" or prevention is one that has a self-contained mechanism to block or capture pollution that would otherwise be emitted. This is consistent with EPA's own definition of "emission control system," as "a unique group of emission control devices, auxiliary emission control devices, engine modifications and strategies, and other elements of design designated by the Administrator used to control emissions of vehicles." 40 C.F.R. §86.1803-01 (emphasis added). ZEVs, on the other hand, are designed to run on an entirely different power system, not to limit or control pollution from a carbon- dioxide- or criteria-pollutant-emitting engine. To draw an analogy, it would not be natural to refer to an iPod as "a system that prevents or controls record skips." An iPod is not a record player with some built-in method of impeding or reducing record skips; it is a different technology altogether. [EPA-HQ-OAR-2022-0829-0707, pp. 76-78]

Nor do electric vehicles incorporate "add-in devices for pollution control" or prevention. Truck Trailer Mfrs., 17 F.4th at 1202. The component parts of ZEVs, such as their batteries, are not merely add-in devices that block the emission of pollution or minimize pollution that would otherwise occur. They are integral to the basic functioning of the vehicle, which does not emit the relevant pollutant in the first place. [EPA-HQ-OAR-2022-0829-0707, pp. 76-78]

EPA also notes that the statutory definition of "motor vehicles" is "broad" and includes the phrase "any self-propelled vehicle."367 But the statutory history refutes any implication that this definition was intended to cover EVs. The relevant "motor vehicle" definition was introduced to the Clean Air Act in 1965 and has remained unchanged since. Pub. L. No. 89-272, § 101, 79 Stat. 992, 995 (1965). In 1965, the ordinary vehicle on the road had an internal-combustion engine, so there was no need for Congress to specify that the term meant anything else. By contrast, for example, Congress added the reference to "nonroad vehicles" in 1990, when other types of power were being explored and it made sense to clarify which type of engine was covered. See Pub. L. 101-549, § 223, 104 Stat. 2399, 2503 (1990); see also id. § 229, 104 Stat. 2511 (establishing pilot program for "clean fuel vehicles" including those powered by "electricity"). There is nothing to read into Congress's omission of that qualifier 25 years earlier. [EPA-HQ-OAR-2022-0829-0707, pp. 76-78]

367 88 Fed. Reg. at 92,231.

2. The statutory structure of the Clean Air Act further confirms that EPA is not authorized to mandate the sale of ZEVs.

i. The statutory structure confirms Congress' focus on technologically achievable emission controls.

Several provisions of Section 202 of the Clean Air Act confirm that Congress focused on technologically feasible standards for vehicles deemed to emit pollutants that actually cause or contribute to pollution. Section 202(a)(2) requires EPA to provide manufacturers with lead time to comply with the standards, in order "to permit the development and application of the requisite technology." 42 U.S.C. § 7521(a)(2). Similarly, Section 202(a)(3)(A)(i) provides that EPA's HDV standards for certain criteria pollutants should reflect the "greatest degree of emission reduction achievable through the application of technology which the [EPA] determines will be available" during the relevant model year. Id. § 7521(a)(3)(A)(i). Those provisions contemplate that technological feasibility will meaningfully constrain the emission standards that EPA sets under Section 202(a). EPA cannot ignore technological feasibility and simply decide to require production of fewer internal combustion vehicles. [EPA-HQ-OAR-2022-0829-0707, p. 78]

Other provisions show the type of "technology" that Congress contemplated vehicle manufacturers would develop to meet those standards. Section 202(m) requires EPA to command manufacturers to install on "all" new light-duty vehicles and trucks "diagnostic systems" that identify "emission-related systems deterioration or malfunction ... which could ... result in failure of the vehicles to comply with emission standards established under this section." 42 U.S.C. § 7521(m)(l). The required diagnostic systems must monitor, "at a minimum, the catalytic converter and oxygen sensor." Id. [EPA-HQ-OAR-2022-0829-0707, p. 78]

In other words, to ensure compliance with emission standards under Section 202(a), Congress required "emissions-related systems" and accompanying "diagnostic systems" on each vehicle—again underscoring Congress's view that the vehicles subject to an emission standard actually emit the relevant pollutant in EPA's judgment. [EPA-HQ-OAR-2022-0829-0707, p. 78]

As the statutory structure demonstrates, EPA may set standards that are "technology-forcing," because they require manufacturers to adopt nascent technology that may not yet be "adequately demonstrated." NRDC, 805 F .2d at 419. EPA's rules thus have promoted the development of "automotive technologies, such as on-board computers and fuel injection systems" that improve emissions from combustion engines. 86 Fed. Reg. at 74,451. But the statute does not permit what EPA proposes here: enacting "average" standards divorced from technologically achievable limits on emitting vehicles, which instead force manufacturers to produce a different type of supposedly non-emitting vehicle altogether. [EPA-HQ-OAR-2022-0829-0707, p. 78]

a) The statutory structure confirms EPA lacks statutory authority to use fleetwide averaging to mandate ZEVs.

EPA’s proposal would require electrification by setting average emission standards for manufacturers' nationwide fleets and "averaging" in more and more zeros to represent the electric vehicles it wants to see in future years. Manufacturers that exceed the standards may bank credits and trade them to other manufacturers that fall short. [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

EPA relies on NRDC v. Thomas, 805 F.2d 410 (D.C. Cir. 1986), for the proposition that it is authorized to average vehicles. That case found EPA could average a manufacturer’s different engine families. Id. at 425. It did so, however, with some caveats. First, its reasoning was based on a deference to EPA’s interpretation of the statute “in the absence of clear evidence Congress meant to prohibit averaging.” This standard, of course, is directly contrary to the standard applicable in this case in which EPA is proposing regulations that affect a major question—clear Congressional authority to permit averaging to mandate electric vehicles. Second, the parties failed to raise a textual argument against averaging. Id. at n.24 (“Although it was not raised by any party before the agency, and accordingly cannot be dispositive here … there is an additional argument against emissions averaging. The Act’s testing and certification provision, 42 U.S.C. § 7525 [Link: https://1.next.westlaw.com/Link/Document/FullText?findType=L&pubNum=1000546&cite=42USCAS7525&originatingDoc=I80714eef94d311d9a707f4371c9c34f0&refType=LQ&originationContext=document&transitionType=DocumentItem&ppcid=0591cc222593448083058c4608d3c583&contextData=(sc.UserEnteredCitation)], speaks of ‘any,’ ‘a,’ or ‘such’ motor vehicle or engine being tested and certified. With averaging, some vehicles or engines would not be required to comply with the standards and would not be subject to NCPs for failing to so comply. This practice appears inconsistent with the requirement that 'any,' 'a,' or 'such' vehicle or engine be tested and required to comply with emissions standards."). [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

On the other hand, EPA has previously acknowledged that the Act is silent on the mechanisms of averaging, banking, and trading (ABT). When EPA first adopted fleetwide averaging, it recognized that "Congress did not specifically contemplate an averaging program when it enacted the Clean Air Act." 48 Fed. Reg. 33,456, 33,458 (July 21, 1983). And "[j]ust as the statute does not explicitly address EPA's authority to allow averaging, it does not address the Agency's authority to permit banking and trading." 54 Fed. Reg. 22,652, 22,665 (May 25, 1989); see 55 Fed. Reg. 30,584, 30,593 (July 26, 1990) (same). By definition, then, the Act does not address—let alone clearly authorize—the use of averaging, banking, and trading to electrify the Nation's vehicle fleet. [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

That should be the end of the analysis. Section 202 of the Clean Air Act does not itself "direct [conventional vehicles] to effectively cease to exist." West Virginia, 142 S. Ct. at 2612 n.3. EPA has instead relied on mechanisms that are not themselves spelled out in the statute and that have never before been used to mandate LD and MD electric vehicles. Just as in West Virginia, EPA has nothing "close to the sort of clear authorization" necessary for such a transformational policy shift. 142 S. Ct. at 2614. [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

But in truth, the problem is far worse for EPA than that. As explained below, the Act unambiguously precludes fleetwide-average emission standards under Section 202(a). And even if the statute permitted some fleetwide averaging, it does not allow EPA to take the additional step of incorporating non-emitting vehicles into emission averages and thus forcing the market toward electric vehicles. The proposal is not merely stretching vague statutory language. It is defying clear statutory text. [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

The text and structure of Section 202, and of Title II more broadly, unambiguously require that emission standards under Section 202(a) apply to individual vehicles, not manufacturers' fleets on average. EPA claims to find authority for fleetwide averaging in Section 202(a), which authorizes EPA to issue "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles ... which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a). [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

On its face, that provision authorizes EPA to set standards for vehicles that emit harmful air pollutants. It says nothing about averaging across fleets. As noted, when EPA first adopted fleetwide averaging, it acknowledged that "Congress did not specifically contemplate an averaging program when it enacted the Clean Air Act." 48 Fed. Reg. at 33,458. EPA claimed to have the authority because the Act "does not explicitly preclude standards" based on averaging. 54 Fed. Reg. at22,666 (emphasis added). EPA was wrong. "[T]he broader context of the statute as a whole," Robinson v. Shell Oil Co., 519 U.S. 337, 341 (1997), makes clear that Section 202(a) does not permit fleetwide averaging. And, even if EPA could somehow show that the statute tacitly or implicitly allows (or does not expressly preclude) averaging, that would still be insufficient to meet the necessary clear congressional authority to use fleetwide averaging as a means to force a transition from internal-combustion engines to ZEVs. [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

a. Other provisions in Section 202 demonstrate that emission standards may not be based on averaging.

Title II is replete with provisions that necessarily apply to vehicles individually, not to fleets on average. That is evident first in the emission standards prescribed by Section 202 itself. For example, in Section 202(b), the Act sets forth specific light-duty vehicle emission standards that EPA must promulgate in "regulations under" Section 202(a). 42 U.S.C. § 7521(b). For vehicles in model years 1977 to 1979, the standards must provide that "emissions from such vehicles and engines may not exceed 1.5 grams per vehicle mile of hydrocarbons and 15.0 grams per vehicle mile of carbon monoxide." Id. § 7521(b)(l)(A). [EPA-HQ-OAR-2022-0829-0707, pp. 80-81]

Those provisions require that the "regulations under [Section 202(a)]" apply to "vehicles and engines," not "vehicles and engines on an average basis across a fleet." Construing those provisions to allow averaging would, in effect, add words to the statute that change its meaning. Neither courts nor agencies may "supply words ... that have been omitted." Antonin Scalia & Bryan Garner, Reading Law: The Interpretation of Legal Texts 93 (2012); accord Rotkiske.v. Klemm, 140 S. Ct. 355, 360-361 (2019). And supplying the extra words "on average" would have a significant substantive effect: "roller coaster riders must be 48 inches tall" means something very different from "roller coaster riders must be 48 inches tall on average." [EPA-HQ-OAR-2022-0829-0707, pp. 80-81]

The testing requirements accompanying the Section 202(b) standards confirm that those standards apply to all vehicles. In particular, EPA must "test any emission control system incorporated in a motor vehicle or motor vehicle engine ... to determine whether such system enables such vehicle or engine to conform to the standards required to be prescribed under [Section 202(b) of the Act]." 42 U.S.C. § 7525(a)(2). If the system complies, EPA must issue a "verification of compliance with emission standards for such system." Id. Those requirements plainly contemplate standards that apply to individual vehicles and their emission-control systems. Not only does the statutory text frame the inquiry as whether an individual "vehicle" or "engine" conforms to the emission standards, but the provision's foundational premise-that an emission-control system can enable a vehicle to meet emission standards depends on individually applied standards. [EPA-HQ-OAR-2022-0829-0707, pp. 80-81]

Other parts of Section 202 further demonstrate that emission standards under Section 202(a) cannot rely on averaging. Section 202(b)(3), for example, authorizes EPA to grant waivers from certain nitrogen-oxide emission standards—which, again, are standards "under" Section 202(a), see 42 U.S.C. § 7521(b)(l)(B)—for no "more than 5 percent of [a] manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater." Id. § 7521(b)(3). This provision would be nonsensical under a fleetwide-averaging regime. It contemplates a default under which every vehicle meets a standard, then gives manufacturers a waiver from that default for up to 5% of the fleet. But under fleetwide averaging, no waiver is needed. Instead, a vast proportion of a manufacturer's fleet—perhaps 50% or more— effectively has a "waiver" so long as a sufficient number of vehicles outperform the standard. Likewise, Section 202(g), which specifies an increasing "percentage of each manufacturer's sales volume" of each model year's vehicles that must comply with specified emission standards, is fundamentally incompatible with averaging. Id. § 7521(g)(l). [EPA-HQ-OAR-2022-0829-0707, pp. 80-81]

Similarly, under Section 202(m), EPA must require manufacturers to install on "all" new light-duty vehicles and trucks "diagnostic systems" capable of identifying malfunctions that "could cause or result in failure of the vehicles to comply with emission standards established under this section." Id. § 7521(m)(l). As this requirement makes clear, individual vehicles must "comply with emissions standards established under [Section 202]." Id. Otherwise, requiring diagnostic equipment on "all" vehicles makes no sense. In a fleetwide-averaging regime, this requirement would be pointless, as the deterioration or malfunction of an individual vehicle's emission-related systems would provide virtually no information about whether the fleet as a whole is compliant. [EPA-HQ-OAR-2022-0829-0707, pp. 80-81]

b. Title II's compliance and enforcement provisions for emission standards confirm that EPA cannot use fleetwide averaging.

Fleetwide averaging also clashes with "the design and structure of [Title II] as a whole." Utility Air, 573 U.S. at 321 (citation omitted). Title II sets forth a comprehensive, interlocking scheme for enforcing emission standards through testing, certification, warranties, remediation, and penalties. Fleetwide-average standards are incompatible with these provisions, which are "designed to apply to" individual vehicles and "cannot rationally be extended" to fleets. Id. at 322. [EPA-HQ-OAR-2022-0829-0707, pp. 81-82]

Testing and Certification. Under Title II, EPA must "test, or require to be tested in such manner as [it] deems appropriate, any new motor vehicle or new motor vehicle engine submitted by a manufacturer to determine whether such vehicle or engine conforms with the regulations prescribed under [Section 202]." 42 U.S.C. § 7525(a)(l). If the "vehicle or engine conforms to such regulations," EPA must issue the manufacturer a "certificate of conformity." Id. EPA may later test a manufacturer's vehicles and engines, and if "such vehicle or engine does not conform with such regulations and requirements, [EPA] may suspend or revoke such certificate insofar as it applies to such vehicle or engine." Id. § 7525(b)(2)(A)(ii). A manufacturer may not sell a vehicle or engine not "covered by a certificate of conformity." Id. § 7522(a)(l). [EPA-HQ-OAR-2022-0829-0707, pp. 81-82]

Fleetwide averaging is incompatible with these requirements in at least two respects. First, by using the singular terms "vehicle" and "engine," along with "any" and "such," the statute contemplates that individual vehicles may be tested, determined to "not conform" with the standards, and have their certificates of conformity suspended or revoked. In a fleetwide-averaging regime, testing an individual vehicle or engine does not enable EPA to determine whether it "conforms with the regulations prescribed under [Section 202]," 42 U.S.C. § 7525(a)(l), because conformity turns not on an individual vehicle's emissions but on the fleet's average performance overall. Second, fleetwide averaging also makes it impossible to determine compliance with applicable emission standards before a vehicle is sold, as required to obtain the certificate of conformity needed for a sale. See 42 U.S.C. § 7522(a)(l). Under fleetwide-average standards, a vehicle's "conform[ity] with the regulations prescribed under [Section 202]" cannot be determined until the manufacturer calculates its production-weighted average at "the end of each model year," when the manufacturer knows the quantity and model of "vehicles produced and delivered for sale." 40 C.F.R. §§ 86.1818-12(c)(2)(2), 86.1865-12(i)(l), (j)(3). [EPA-HQ-OAR-2022-0829-0707, pp. 81-82]

For similar reasons, fleetwide averaging is inconsistent with the statutory definition of an "emission standard," which "limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis." 42 U.S.C. § 7602(k). It is impossible to know on a "continuous basis" whether a manufacturer's fleet complies with EPA's proposed average standards, because a manufacturer cannot calculate its production-weighted average until the end of the year. Simply put, an after-the-fact compliance regime is incompatible with the Act's testing and certification scheme. [EPA-HQ-OAR-2022-0829-0707, pp. 81-82]

c. The broader text and history of Title II confirm that the rule exceeds EPA’s authority through fleetwide averaging.

Other indicia of statutory meaning demonstrate that the proposed rule exceeds EPA's statutory authority under Section 202(a). Elsewhere in Title II, Congress showed that it knew how to legislate with respect to "average annual aggregate emissions." 42 U.S.C. § 7545(k)(l)(B)(v)(II) (directing EPA to take certain actions if "the reduction of the average annual aggregate emissions of toxic air pollutants in a [designated district] fails to meet" certain standards). [EPA-HQ-OAR-2022-0829-0707, pp. 83-84]

Thus, "if Congress had wanted to adopt an [averaging] approach" for motor vehicle standards under Section 202(a), "it knew how to do so." SAS Inst., Inc. v. Iancu, 138 S. Ct. 1348, 1351 (2018); see Rotkiske, 140 S. Ct. at 360-361 ("Atextual judicial supplementation is particularly inappropriate when, as here, Congress has shown that it knows how to adopt the omitted language or provision."). It did not choose that approach in Section 202(a). [EPA-HQ-OAR-2022-0829-0707, pp. 83-84]

The Energy Policy Conservation Act, enacted just two years before the 1977 Clean Air Act amendments, reinforces that conclusion. There, Congress directed the Secretary of Transportation to issue regulations setting "average fuel economy standards for automobiles manufactured by a manufacturer" in a given model year. 49 U.S.C. § 32902(a). That Congress has not used similar language in Section 202(a) of the Clean Air Act is a "telling clue" that the Act does not permit fleetwide averaging. Epic Sys. Corp. v. Lewis, 138 S. Ct. 1612, 1626 (2018). [EPA-HQ-OAR-2022-0829-0707, pp. 83-84]

The Clean Air Act's history also reflects Congress's understanding that emission standards would apply to all vehicles individually. Congress was so focused on reducing emissions at the level of the individual vehicle that, in the 1970 amendments, Congress permitted EPA to test any individual vehicle as it comes off the assembly line. See Pub. L. No. 91-601, § 8, 84 Stat. 1676, 1694-1696. Such a vehicle-by-vehicle test was meant to supplement the pre-1970 testing of prototypes. Congress explained that while testing of prototypes "will continue," "tests should require each prototype rather than the average of prototypes to comply with regulations establishing emission standards." H.R. Rep. No. 91-1146, at 6 (1970). And if Congress forbade averaging across prototypes, it certainly did not permit averaging across entire fleets. [EPA-HQ-OAR-2022-0829-0707, pp. 83-84]

d. Related provisions confirm that Section 202(a) does not authorize averaging of non-emitting electric vehicles.

Other provisions of the Clean Air Act drive home the lack of statutory authorization to mandate electrification as well. In the Clean Air Act Amendments of 1990, Congress spoke directly to the phase-in of electric vehicles on America's roads. Congress instructed EPA to establish standards for "clean-fuel vehicles" operating on "clean alternative fuel," including "electricity." Pub. L. No. 101-549, § 229, 104 Stat. 2399, 2513 (codified at 42 U.S.C. §§ 7581(2), (7), 7582(a)). Congress required that certain areas of the country with the worst pollution would have to "phase-in" a "specified percentage" of "clean-fuel vehicles" using "clean alternative fuels" (defined to include "electricity") in certain fleets. 42 U.S.C. § 7586; see id. § 758l(a). The 1990 amendments highlight that Congress knows how to clearly establish standards that apply to electric vehicles, and to directly require that such vehicles be phased into a particular fleet. But Congress chose to do so only on a targeted, regional basis. The contrast between the 1990 amendments and Section 202(a) highlights the absence of any statutory authority for EPA's rule. [EPA-HQ-OAR-2022-0829-0707, p. 84]

Other related statutes also suggest the same. In the Energy Policy Act of 1992, Congress directed NHTSA to set fuel-economy standards based on averages, but prohibited NHTSA from setting fuel-economy standards that average in the fuel economy of electric vehicles. See Pub. L. No. 102-486 §§ 302, 403, 106 Stat. 2776, 2870-2871, 2876 (later codified at 49 U.S.C. § 32902(h)). This prohibition bars NHTSA from doing exactly what EPA is doing here: misusing its regulatory authority to force a transition from conventional vehicles to electric vehicles by artificially tightening the "average" standard a fleet must meet. Of course, when Congress finalized the language of Section 202(a)(l) in 1977, it had no need to explicitly block EPA from considering electric vehicles, because it did not contemplate that EPA would set emission standards using averaging in the first place (or that EPA would be setting standards for greenhouse gases). The prohibition on NHTSA nevertheless underscores just how far EPA is reaching here: it is straining statutory language to seize a power that Congress expressly denied to a sister agency that actually has authority to promulgate fleetwide-average standards. [EPA-HQ-OAR-2022-0829-0707, p. 84]

e. EPA’s lack of authority for a credit-trading scheme further confirms its lack of authority to set fleetwide averages.

The proposal’s credit banking and trading program is critical to EPA's electrification mandate. But the agency also lacks authority under Title II to establish a credit scheme as part of its emission standards under Section 202(a). [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

As with fleetwide averaging, EPA has previously acknowledged that Title II says nothing about banking and trading credits in connection with motor-vehicle emission standards. See 54 Fed. Reg. at 22,665. What EPA has ignored, however, is that Title II is not silent regarding banking and trading in other contexts. Indeed, in multiple other provisions under Title II, Congress expressly authorized the use of bankable and tradable credits. See, e.g., 42 U.S.C. § 7545(k)(7) (reformulated gasoline credits); § 7545(o)(2)(A)(ii)(II)(cc), (5)(A)(i) (renewable fuel credits); id. § 7545(o)(2)(A)(ii)(II)(cc), (5)(A)(ii) (biodiesel credits); id. § 7545(o)(2)(A)(ii)(II)(cc), (5)(A)(iii) (small refineries credits); id. § 7586(f) (clean- fuel fleet-operator credits); id. § 7589(d) (California pilot test program's clean-fuel vehicle manufacturer credit). [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

Under EPA's proposed approach, those provisions would all be superfluous, because EPA already had the discretion to adopt a credit-trading regime for any program. If Congress had wanted to permit credits in connection with emission standards under Section 202(a), it knew how to and would have done so expressly. See SAS Inst., 138 S. Ct. at 1351. [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

For all these reasons, courts have cast substantial doubt on EPA's authority to set fleetwide-average emission standards. As the D.C. Circuit Court of Appeals explained in NRDC v. Thomas, 805 F.2d 410 (D.C. Cir. 1986), the "engine specific thrust" of Title II's "testing and compliance provisions" is evident both in Congress's choice to "spea[k] of 'any,' 'a,' or 'such' motor vehicle or engine" in the text of the statute and in the "troubling" legislative history recounted above. Id. at 425 n.24. The arguments were not dispositive in Thomas only because the parties there had failed to present them. Id. But the Court nevertheless recognized that the arguments were relevant to "future proceedings." Id.. [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

f. At a minimum, EPA may not use fleetwide averaging to require electrification.

Despite the absence of statutory authorization for fleetwide averaging, EPA has long employed that mechanism without significant industry pushback. That is likely because fleetwide averaging has generally been offered as an accommodation to regulated parties, allowing them flexibility that the statute does not in fact permit. In its current proposal, however, EPA is not offering an extrastatutory accommodation. It is taking an additional step away from the statutory text by using fleetwide averaging to mandate electrification. [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

To be clear, in prior rules EPA set an average emission standard and allowed manufacturers to make some vehicles that emitted more and some that emitted less. Here, EPA has set tailpipe emission standards at a level so stringent that manufacturers must incorporate an increasing percentage of LD and MD electric vehicles—which EPA treats as zero-emission vehicles—into their averages in order to comply with the "standards." See p. 13, supra. Put differently, the agency is proposing an emission standard that is artificially low because it incorporates electric vehicles, which EPA treats as emitting zero pollutants for averaging purposes. [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

Whatever the permissibility of fleetwide averaging, the text and structure of Title II make plain that EPA cannot manipulate averaging as a means to force production of an increasing market share of electric vehicles. Section 202 does not grant EPA the power to make the internal-combustion engine go the way of the horse and carriage. At the very least, Section 202 is hardly clear in granting that awesome power—which is what matters under West Virginia. For automobiles as for power plants, EPA has purported to discover in the Clean Air Act the authority to "forc[e]" manufacturers to "cease making" a particular type of energy "altogether." 142 S. Ct. at 2612. We have seen that play recently before, and it should end the same way. [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

C. EPA's action would undermine the Renewable Fuel Standard and Congress'goals for renewable fuels and energy security.

EPA's proposal and ZEV sales mandate are also inconsistent with the broader statutory scheme and Congress's plan for tackling climate change. When Congress sought to address greenhouse-gas emissions from the transportation sector, it did so by promoting renewable liquid fuels, which are used in conventional vehicles and which—unlike electric-vehicle components—are in abundant domestic supply. See, e.g., Inflation Reduction Act of 2022, Pub. L. No. 117-169. §§ 13202, 13404, 22003, 136 Stat 1818, 1932, 1966-69, 2020 (2022). Indeed, Congress has consistently legislated against the background expectation that conventional vehicles powered by liquid fuels will remain on the market. [EPA-HQ-OAR-2022-0829-0707, pp. 86-]

The Clean Air Act also includes the Renewable Fuel Standard (RFS) program, which "requires that increasing volumes of renewable fuel be introduced into the Nation's supply of transportation fuel each year." Americans for Clean Energy v. EPA (ACE), 864 F.3d 691, 697 (D.C. Cir. 2017). Two goals animate the RFS: (1) to "move the United States toward greater energy independence and security," and (2) to "increase the production of clean renewable fuels." Id. (quoting Pub. L. No. 110-140, 121 Stat. 1492, 1492 (2007)). To these ends, "Congress ordained the inclusion of 4 billion gallons of renewable fuel in the Nation's fuel supply" for calendar year 2006, and required that, "[b]y 2022, the number will climb to 36 billion gallons." HollyFrontier Cheyenne Refining, LLC v. Renewable Fuels Ass'n, 141 S. Ct. 2172, 2175 (2021). [EPA-HQ-OAR-2022-0829-0707, pp. 86-]

In other words, through the RFS, which is also in the Clean Air Act, Congress mandated that "fuel sold or introduced into commerce in the United States" must contain increasing shares of renewable fuels and specifically increasing shares of advanced biofuel, cellulosic biofuel, and biomass-based diesel. 42 U.S.C. § 7545(o)(2)(A)(i). For these fuels, Congress called for not simply a percentage of the fuel market but mandated a minimum volume of biofuel in the market. The proposed standards, on the other hand, would reduce the use of renewable fuels, particularly renewable diesel and other advanced biofuels, cellulosic biofuels, and biomass-based diesel, and make it impossible to meet the mandates of the RFS. EPA is thus working at cross-purposes with Congress, which has required a move toward increases in liquid renewable fuels at the same time that EPA is seeking to eliminate vehicles that use such fuels. Congress has never mandated, nor authorized, that EPA issue regulations to phase out the use of liquid fuels. [EPA-HQ-OAR-2022-0829-0707, pp. 86-]

The congressional intent underlying these mandated obligations under the RFS was to incentivize liquid fuels with lower lifecycle greenhouse gas emissions. For example, renewable diesel generates credits under the RFS, whereas traditional diesel generates an obligation. Here, however, treating renewable diesel and traditional diesel the same—giving no recognition of or benefit to manufacturers based on use of liquid fuels with lower lifecycle greenhouse gas emissions— underscores EPA's failure to read its statutory authority as a whole and emphasizes the conflict between the proposal and the RFS. [EPA-HQ-OAR-2022-0829-0707, pp. 86-]

Congress also cited national energy security as one of the primary reasons for implementing the RFS. In the proposal, EPA deigns to resolve energy security concerns by reducing use of liquid fuels without accounting for the impact on renewable fuels. EPA has also not adequately accounted for increased energy security risks associated with battery production and use in the transportation of the nation's commerce and in all the industries that use and rely on LDVs and MDVs. See supra at XX. [EPA-HQ-OAR-2022-0829-0707, pp. 86-]

With no apparent recognition that its proposed vehicle standards will reduce consumption of both nonrenewable and renewable fuels, EPA continues to mandate increasing volumes of renewable fuels consistent with its mandates under the RFS, proposing a 1.7 billion gallon increase in all renewable fuels by 2025 in its proposed "RFS Set" rule.368

368 Final Rule: Renewable Fuel Standard (RFS) Program: Standards for 2023-2025 and Other Changes, signed June 2023, pre-publication version available at https://www.epa.gov/renewable-fuel- standard-program/final-renewable-fuels-standards-rule-2023-2024-and-2025 .

i. Legislative History

Lacking in direct authority, EPA resorts to non-textual, legislative history, emphasizing that at various times Congress has made clear it "expected the Clean Air Amendments to force the industry to broaden the scope of its research—to study new types of engines and new control systems." Under the major questions doctrine, however, only a clear textual statement is sufficient to grant such sweeping and consequential authority as contemplated by the proposal. Yet even in the absence of the major questions doctrine, each source of legislative history relied on by EPA is irrelevant to the question of whether Congress authorized EPA to mandate electrification of the Nation's LDV and MDV fleets. [EPA-HQ-OAR-2022-0829-0707, pp. 87-88]

First, EPA cites five days of public hearings regarding "electric vehicles and other alternatives to the internal combustion engine" held by the Senate Committee on Commerce and Public Works in 1967 as evidence that "ICE vehicles might be inadequate to achieve the country's air quality goals." (emphasis added). These standalone statements regarding the potential benefits of the electric car as an additional technology are not only wholly unrelated to the enactment of the Clean Air Act and its amendments, but they also do not speak to EPA's emission standards, much less indicate a grant of authority to EPA to mandate such vehicles nationwide through such standards. [EPA-HQ-OAR-2022-0829-0707, pp. 87-88]

EPA's citation to a statement made by President Nixon in 1970 regarding a program to develop "an unconventionally powered, virtually pollution free automobile" likewise fails to support EPA's asserted authority to mandate vehicles that it purports to be zero-emitting. Not only is this statement made by the executive, rather than legislative, branch, but the mere announcement of a research program is also a far cry from a delegation of authority to mandate wholesale policy changes for the nation. For this same reason, EPA's claimed authority to "fund the development" of low emission alternatives, to certify low emission vehicles and encourage federal purchases of such vehicles, and to institute a clean fuel vehicles program are also irrelevant to EPA's authority for the proposed rule; researching and incentivizing electric vehicles is simply not equivalent to mandating them—far from it. [EPA-HQ-OAR-2022-0829-0707, pp. 87-88]

EPA next states that, in 1970, when Congress amended the Clean Air Act to target criteria pollutants, it considered "unconventional" technologies like steam and natural-gas piston. EPA relies on a Senate Report that addressed emissions associated with those sources. See S. Rep. No. 91-1196, at 27 (1970). But again, the report nowhere suggested that EPA would have authority to require automakers to shift to those technologies. Moreover, according to the report, all of those technologies emitted some pollutants. Id. So EPA's resort to legislative history as a means to replace ICE vehicles with vehicles it deems to have zero emissions proves nothing. [EPA-HQ-OAR-2022-0829-0707, pp. 87-88]

EPA's resurrection of 50-year-old dicta369 in International Harvester Co. v. Ruckelshaus, 478 F.2d 615 (D.C. Cir. 1973), as the basis for its authority to replace the combustion engine as an emission-control technology also fails, as the court was discussing legislative history, not text requiring electric vehicles. [EPA-HQ-OAR-2022-0829-0707, pp. 88-89]

> 369 EPA claims that International Harvester "held" that the legislative history indicates that Congress authorized EPA to replace ICEVs. The only holding in International Harvester was that EPA erred when it denied the automakers' request for a one-year suspension of the 1975 emissions standards prescribed by Congress. Id. at 649-50.

As a final attempt to find Congressional authorization, EPA turns to more recent legislation, which of course has nothing to do with any purported authority of EPA under the Clean Air Act. The Inflation Reduction Act, like all appropriations bills which "have the limited and specific purpose of providing funds," Tennessee Valley Auth. v. Hill, 437 U.S. 153, 190 (1978), cannot be construed to provide any agency authority and, even then, merely incentivized rather than mandated the use of electric vehicles. [EPA-HQ-OAR-2022-0829-0707, pp. 88-89]

Ultimately, Congress's limited approval of electric vehicles hurts EPA's position. Where Congress has sought to increase the usage of electric vehicles, it has done so only through incentives; as explained previously, each time a proposal to mandate the sale of electric vehicles has been presented in Congress, it has failed to even make it out of committee. And when Congress chose to set standards focused on electric vehicles, it did so on a regionally targeted, pilot basis only. It did not bury a nationwide program in Section 202, at EPA's sole discretion. [EPA-HQ-OAR-2022-0829-0707, pp. 88-89]

E. The proposal may violate other constitutional provisions and principles.

Finally, EPA's proposal may violate other constitutional provisions and principles, which EPA should consider in making its final rule. These include, but may not be limited to, the Takings Clause of the Fifth Amendment, which precludes the taking of private party (or the elimination of entire industries) for public use without just compensation, as contemplated by the proposal with regard to liquid fuels and related industries (e.g., asphalt, sulfur, etc.), as well as the following to the extent the final rule relies on and/or incorporates state ZEV mandates: the Dormant Commerce Clause, which prohibits state regulations that improperly discriminate against out-of-state commercial interests or that unduly burden interstate commerce (such as by increasing transportation and logistics costs, disrupting entire supply chains and industries, and effectively requiring other states to adopt electric vehicles that would not otherwise be adopted); the dormant foreign affairs preemption doctrine under the Supremacy Clause, which preempts state laws that intrude on the exclusive federal power to conduct foreign affairs (such as by increasing the Nation's reliance on foreign minerals and by creating two separate and incompatible vehicle fleets on either side of the U.S.-Mexico border, thereby increasing the cost of conducting international personal and business travel and disrupting international trade and supply chains); the equal sovereignty doctrine, which constrains the federal government from treating States disparately (such as by allowing California alone to dictate national transportation policy); the Import-Export Clause, which prohibits any State from imposing "any Imposts or Duties on Imports or Exports, except what may be absolutely necessary for executing" its "inspection Laws," Art. I, § 10, cl. 2, see Nat'l Pork Producers Council v. Ross, 143 S.Ct. 1142, 1175 (2023) (Kavanaugh, J., concurring in part and dissenting in part) ("In other words, if one State conditions sale of a good on the use of preferred farming, manufacturing, or production practices in another State where the good was grown or made, serious questions may arise under the Import-Export Clause."); the Privileges and Immunities Clause, which provides that the

“Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States,” Art. IV, § 2, cl. 1, see Nat’l Pork Producers Council, 143 S.Ct. 1175 (“Under this Court’s precedents, one State’s efforts to effectively regulate farming, manufacturing, or production in other States could raise significant questions under that Clause.”); and the Full Faith and Credit Clause, which requires each State to afford “Full Faith and Credit” to the “public Acts” of “Every other State,” Art. IV, § 1, and prevents States from adopting any policy of hostility to the public Acts of another State, see Nat’l Pork Producers Council, 143 S.Ct. 1175 (“A State’s efforts to regulate farming, manufacturing, and production practices in another State (in a manner different from how that other State’s laws regulate those practices) could in some circumstances raise questions under that Clause”). [EPA-HQ-OAR-2022-0829-0707, pp. 91-92]

Organization: Western Energy Alliance

Arbitrary and Capricious

The proposed rule is arbitrary and capricious because EPA relies on incomplete facts, biased studies, and mistaken assumptions in an attempt to restructure the entire vehicle market. The rule exposes the country to severe grid instability and increases the chances for electricity blackouts and brownouts. EPA’s reasoning and justification for the rule are similarly flawed, based on a market assessment that is faulty. [EPA-HQ-OAR-2022-0829-0679, p. 8]

However, with the generous assumption that the market penetration numbers are correct, then why does EPA need to move forward with this rule at all? If EPA is right and EV sales will increase to 67% by 2032 anyway, why is the rule necessary? We are inclined to think that a more robust market analysis would reach another conclusion, especially as market penetration increases and the effects from the strain on the electrical grid would become apparent. Given the fundamental lack of authority to force this transition, EPA’s own analysis of market penetration by 2032 suggests the rule is unwise. [EPA-HQ-OAR-2022-0829-0679, p. 8]

New Legislation: EPA also cites the impact of the Bipartisan Infrastructure Law (BIL) and Inflation Reduction Act (IRA) to show increased market penetration of EVs. While it is a simple statement of fact that, “These measures represent significant Congressional support for investment in expanding the manufacture, sale, and use of zero emission vehicles …” (p. 29195), the existence of these laws to fund EV infrastructure and subsidize their sale is not akin to giving EPA authority to compel carmakers to manufacture more EVs and consumers to buy them. [EPA-HQ-OAR-2022-0829-0679, p. 9]

Further, EPA unwittingly offers the counter argument for this rule. With the BIL and IRA, Congress spoken clearly on the desire specifically to incentivize EVs, not compel their use. Coupled with the lack of authority in the Clean Air Act to reorient an entire industry and with the Supreme Court’s ruling in West Virginia v. EPA, EPA must reverse the justification in Section I. A. iii for the proposed rule that relies on these two laws. The reasoning is arbitrary and capricious. [EPA-HQ-OAR-2022-0829-0679, p. 9]

Organization: Wisconsin Automobile and Truck Dealers Association

Just one year ago, the U.S. Supreme Court ruled in West Virginia v. EPA that agencies do not have unfettered authority to make sweeping rule changes that have major economic impact without specific direction from Congress. Under this proposed Rule, the EPA is proposing to disrupt the world's largest transportation system. The astronomical cost of converting the U.S. transportation fleet and its power source is being loaded onto the backs of American taxpayers. Electric motor vehicles (be they passenger cars, buses, trucks, earth moving equipment, etc.) are an unproven and less efficient technology compared to internal combustion vehicles. [EPA-HQ-OAR-2022-0829-0494, p. 2]

EPA Summary and Response

EPA responds to these comments, together with the comments reprinted in sections 2.1 and 2.2, below in section 2.3.

2.1 - GHG standards

Comments by Organizations

Organization: A. Longo

I will continue to reiterate that clean air is important. However, the debate over what level of clean air is necessary to balance against the cost of regulation does not seem to be resolved, and the timeline and levels sought are very aggressive without much analysis of economic impact. Lastly, the Supreme Court ruled in West Virginia v. EPA, that the Environmental Protection Agency does not have broad authority to regulate greenhouse gas emissions from power plants. The six to three decision, written by Chief Justice John Roberts, was a major victory for states that had challenged the EPA's authority. The EPA had argued that it had broad authority under the Clean Air Act to regulate greenhouse gas emissions from power plants, analogous to the attempt here to regulate light to medium-duty vehicles. However, the Supreme Court ruled that the EPA's authority is limited to emissions that "contribute significantly" to air pollution. The Court found that the EPA's emissions standards for power plants went beyond what is allowed under the Clean Air Act. It is more than likely that this regulation would face similar scrutiny around the ability to prove that light to medium-duty vehicles reach the bar that they currently “contribute significantly” to air pollution. Instead of mandating emission standards, which will result in legal challenges I urge the EPA to use the carrot and not the stick approach by working with manufacturers and providing incentives to switch to alternative fuels or consider funding research to accelerate technology advancement making more fuel-efficient vehicles less costly to produce. [EPA-HQ-OAR-2022-0829-0517, p. 2]

Organization: Alliance for Automotive Innovation

2. Statutory Authority

Auto Innovators shares EPA’s goal of addressing climate change by achieving a net-zero carbon transportation future, as part of an ambitious, comprehensive, and national strategy. The Proposed Rule, however, contemplates a rapid and transformative nationwide shift to electrification that may be well beyond what the industry or market can bear now or in the foreseeable future. Given the significant policy and economic consequences that would flow from this restructuring of the nation’s vehicle market, and the breadth and unprecedented nature of EPA's proposed action, clear congressional authorization is required for the Proposed Rule. EPA lacks this clear authorization. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

The Proposed Rule seeks to use Clean Air Act section 202 rulemaking to force an extraordinary transformation of the nation's vehicle fleet away from ICE-based vehicles to BEVs, and it is not at all clear that the level of consumer demand and infrastructure that exists now and is expected in the future can support the expedited, aggressive timeline in the Proposed Rule. The Proposed Rule does not include an explicit electrification target, and EPA states that "a compliant fleet under the proposed standards will include a diverse range of technologies."152 But in practice, the stringency of the proposed standards is such that automakers will have no choice but to convert to BEV fleets on a massive scale. This is the result not only of the Proposed Rule's GHG emissions standards, but also its criteria pollutant standards and its tightening of credit programs and other flexibilities. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

152 NPRM at 29187.

As EPA notes, BEVs accounted for 5.8% of the new U.S. light-duty passenger vehicle market in 2022.153 Moreover, EPA's MY 2023-2026 GHG emissions standards that were finalized at the end of 2021 projected only a 17% light-duty penetration rate for both BEVs and PHEVs by MY 2026.154 Despite this low rate of consumer acceptance, the Proposed Rule projects a light-duty BEV penetration rate of 67% by MY 2032, up from 36% in MY 2027.155 Importantly, in the absence of these and other strict regulatory programs (such as California's ZEV mandate), EPA projects a significantly lower MY 2032 BEV penetration rate of only 39%.156 It is unclear from EPA's analysis how the regulations alone justify a 28 percentage point increase in BEV market between having regulations versus not. This is particularly concerning given that EPA's no- action analysis presumably includes the same level of existing supportive mechanisms such as the IRA and IIJA, assumptions for infrastructure development, and other market-enabling features. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

153 Id. at 29189

154 See Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 Fed. Reg. 74434, 74485, Table 33 (Dec. 30, 2021).

155 NPRM at 29329, Table 80.

156 Id. at 29329, Table 81.

In other words, a staggering increase in the implementation and adoption of BEV technology underpins the Proposed Rule and is the central means by which the rule effectuates its contemplated emissions reductions. But this shift to electrification is not a simple matter of swapping one technology for another. The mass adoption of BEVs on the scale required for compliance with the Proposed Rule's standards requires a much broader transformation in the way vehicles are manufactured, purchased, fueled, serviced, and disposed of. Indeed, the Proposed Rule would reorder much of the U.S. automobile industry—which supports roughly 10.3 million American jobs and $558 billion in annual car sales, and about 6% of the U.S.'s Gross Domestic Product (GDP).157 Consumers must be willing to purchase BEVs at mass scale; the power sector must be able to generate and deliver adequate electricity158—which itself will contribute to emissions—while maintaining grid reliability and otherwise meeting consumer and industrial demand; adequate charging infrastructure must be available; batteries and other components must be manufactured at an increasing rate, critical minerals sourced, and supply chains developed. These needs must be met not only for light-duty vehicles, but also for medium- and heavy-duty vehicles. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

157 See Economic Insights, Alliance for Automotive Innovation, https://www.autosinnovate.org/resources/insights.

158 In addition to increasing electricity capacity, utilities are also facing a transition in technology types and more renewable sources, as proposed under the "Greenhouse Gas Standards and Guidelines for Fossil Fuel-Fired Power Plants" [88 FR 33240, May 23, 2023].

As expressed throughout this comment, we have serious concerns that the market will not be able to bear the requirements of the Proposed Rule and that those requirements will not be feasible given these considerations. Compliance will impose significant costs, and require extraordinary effort, on the part of regulated parties—costs which will be passed along to consumers. Setting such stringent standards has the potential to create a significant market disruption, with consequences not only for the automobile industry but for the entire U.S. economy. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

In other words, the Proposed Rule is enormously consequential for the automobile industry, and for the economy and consumers as a whole. The Proposed Rule's provisions insert EPA into crucial policy tradeoffs and debates, such as concerns about the extraction and supply of critical minerals overseas, or the need to maintain a reliable, efficient electric grid.159 These considerations range far afield from the traditional ambit of section 202 rulemaking, delving into areas that are the subject of other regulatory schemes, or within the unique purview and authority of other agencies and other branches and levels of government. In short, the dramatic shift toward electrification required by the Proposed Rule implicates issues of tremendous political, economic, and social significance. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

159 See, e.g., NPRM at 29311-24.

Nor is such a transformative rule, with such wide-ranging implications, a typical feature of section 202 rulemaking. We acknowledge that some past EPA section 202 rules, most notably the MY 2023-2026 rule, have contemplated greater deployment of EVs as one of many options for complying with emissions standards. The Proposed Rule, however, is different not merely in degree but in kind, seeking to impose what is, at bottom, a mandate toward nationwide electrification. Such a proposal amounts to an unprecedented assertion of power on the part of EPA. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

"[A]n enormous and transformative expansion in EPA's regulatory authority" such as this necessitates "clear congressional authorization," as Congress is expected to "speak clearly if it wishes to assign to an agency decision of vast 'economic and political significance.'"160 But section 202 does not confer such clear authority. Section 202 authorizes EPA to promulgate "standards applicable to the emission of any air pollutant" from vehicles; it does not empower EPA to force a historic shift in the makeup of the nation's entire vehicle fleet. In the absence of plain statutory authorization, such a decision, and the tradeoffs and consequences it entails, properly belongs to Congress. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

160 Utility Air Regulatory Group v. E.P.A., 573 U.S. 302, 324 (2014) (quoting FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120, 160 (2000)).

The Proposed Rule frequently cites to the IIJA, also known as the "Bipartisan Infrastructure Law,"161 and the Inflation Reduction Act.162 To the extent EPA purports to rely on either statute as providing a legal basis for the Proposed Rule,163 it should not do so. No provision of the IIJA or the IRA expands or modifies EPA's regulatory authority under section 202 or the Clean Air Act more broadly. Nor can these laws be considered to have implicitly altered EPA's authority. After all, "implied amendments require 'clear and manifest' evidence of congressional intent,"164 and "neither courts nor federal agencies can rewrite a statute's plain text to correspond to its supposed purposes."165 Those conditions are not satisfied here. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

161 Pub. L. 117-58, 135 Stat. 429 (2021).

163 See, e.g., NPRM at 29233 ("The recently enacted Inflation Reduction Act 'reinforces the longstanding authority and responsibility of [EPA] to regulate GHGs as air pollutants under the Clean Air Act'") (quoting floor statement by Rep. Pallone).

164 Sackett v. E.P.A., 598 U.S   , 2023 WL 3632751, at *13 (U.S. May 25, 2023) (internal quotation omitted).

165 Landstar Exp. America, Inc. v. Fed. Maritime Comm'n, 569 F.3d 493, 498 (D.C. Cir. 2009).

We reaffirm that we are fundamentally supportive of EPA's goals of reducing GHG emissions and transitioning to a net-zero carbon transportation future. Section 202 standards have a place in this effort, as we have previously expressed. We remain concerned, however, that the extraordinary and unprecedented nature of the Proposed Rule places it outside the bounds of EPA's statutory authority. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

d) EPA's Reliance on Credit Trading for SVMs to Meet the Proposed GHG Standards

Despite EPA's projections for rapid EV update and ICE improvement, EPA's modeling also suggests that SVMs will be required to heavily rely on credit trading flexibility to maintain compliance with GHG standards.320 We believe this is inappropriate for several reasons and demonstrates that the proposed alternative standards do not meet the requirements of CAA § 202(a) that standards "take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such a period." First, it is inappropriate to set a standard so stringent as to effectively require a manufacturer to entirely rely on another manufacturer to maintain compliance. Additionally, there is an inherent risk that even if a credit-generating manufacturer is willing to sell credits, the credits may be purchased by other parties before SVMs can access them. [EPA-HQ-OAR-2022-0829-0701, p. 211]

320 Credit purchase claim based on examination of EPA's proposal central analysis OMEGA output files for credit transactions, noting degree of credit balances listed as "PAST DUE". Such deficits would require credit purchases.

These proposed standards for SVMs do not meet the Clean Air Act's requirement to provide adequate time for the development and application of the necessary technologies (BEVs in the case of such rapid increases in stringency and overall stringency levels). They are also not equitable to those of other manufacturers given the significantly higher BEV market share required to meet them and the more rapid increases in stringency. [EPA-HQ-OAR-2022-0829-0701, p. 211]

2. Recommendations for SVM GHG Standards

Auto Innovators proposes the following approach to address these concerns:

We support EPA's proposal to sunset the individual application process for alternative standards. However, for the above reasons, we recommend that EPA maintain the approved MY 2021 individual standards through MY 2026. Such an approach would provide time to start implementing electrification-compatible technologies, help address lead-time concerns in general, and make the timing of later changes consistent with the model years EPA is focused on in this rulemaking. [EPA-HQ-OAR-2022-0829-0701, p. 211]

As described above, and related to overall industry concerns highlighted in Section I of these comments (EV Feasibility), SVMs are concerned with both the overall level of electrification likely required by EPA's proposed standards and the relatively greater improvements that EPA is proposing for SVMs relative to industry as a whole. For MY 2032 SVM alternative standards, we recommend that EPA address these concerns by requiring SVMs to improve their emissions levels by the same percentage as the primary standards require between MY 2026 (which would be based on MY 2021 for SVMs) and MY 2032. (E.g., 50% under the current proposal.) [EPA-HQ-OAR-2022-0829-0701, p. 211]

2. Classification of Batteries as "Major Emission Control Components"

Utilizing the Administrator's authority mandated in Section 207(i)(1) of the CAA, EPA is proposing under this NPRM to designate high-voltage battery systems and associated powertrain components as "specified major emission control components," thus imposing a warranty period of eight years or 80,000 miles of use, whichever first occurs. Such a designation for BEVs, however, is entirely inconsistent with the statute. [EPA-HQ-OAR-2022-0829-0701, pp. 225-226]

Section 207(i)(2) enumerates a discrete list of items that qualify as "specified major emission control components," and authorizes the Administrator to designate "any other pollution control device or component" as such if certain conditions are met.334 But a BEV produces zero emissions from its battery and associated electric powertrain components. It follows that no device or component of a BEV could logically be a "pollution control device or component" that can be designated as a "specified major emission control component" under section 207(i)(2), because there are no emissions from the BEV to control.335 [EPA-HQ-OAR-2022-0829-0701, pp. 225-226]

334 42 U.S.C. § 7541(i)(2).

335 We acknowledge that this designation for PHEVs is more consistent with the statutory authorization, because the battery-electric power displaces use of the vehicle's ICE, controlling the PHEV's emissions.

The NPRM attempts to justify its counter-textual reasoning in the NPRM, but its reasoning cannot cure the fundamental legal flaw in its proposal. For instance, the NPRM claims that its "proposed warranty requirements would be equivalent to those that EPA has the authority to require and has historically applied to other specified major emission control-related components for ICE vehicles under EPA's light-duty vehicle regulations..."336 But this is a false equivalency, because ICE vehicles produce emissions, and a component in the vehicle designed to reduce those emissions (such as, for example, a catalytic converter or an electronic emissions control unit) can be considered a "major emission control component." The same cannot be said of any component of a BEV that produced no emissions. [EPA-HQ-OAR-2022-0829-0701, pp. 225-226]

336 NPRM at 29286.

Recognizing that BEVs do not have any emission themselves, the NPRM nonetheless argues that BEV batteries can be considered a major emissions control component to the extent that BEVs are used to displace ICE vehicles. This portion of the NPRM refers back to the battery durability requirements,337 which argues that a "loss of a large portion of the original driving range capability as the vehicle ages could reduce total lifetime mileage and the ability for electric miles to displace conventional miles traveled."338 Not only does this argument find no support in the statute, but it proves way too much. Just about any component on a BEV that helps it run or that is important to the consumer will impact the extent to which the BEV will continue to displace conventional miles traveled. For instance, a consumer may elect to not to drive their BEV if that vehicle's infotainment system fails completely, but that certainly would not make the infotainment system a "major emissions control component." Simply put, there is absolutely no basis in the CAA for EPA to impose any battery warranty requirements on BEVs. [EPA-HQ-OAR-2022-0829-0701, pp. 225-226]

337 NPRM at 29286 – 87.

338 Id. At 29284

C. EPA Has the Authority to Regulate Fuels to Improve GHG Emissions

The Clean Air Act provides statutory authority for the EPA to regulate GHG emissions, which can "cause, or contribute to, air pollution which may reasonably be anticipated to endanger the public health or welfare."408 Section 211 of the Clean Air Act provides EPA with the authority to regulate motor vehicle fuels in furtherance of the Act's goals. Specifically, Section 211(c) of the Act grants EPA the authority to set new national fuel standards, including octane rating, under the following circumstances: [EPA-HQ-OAR-2022-0829-0701, pp. 261-262]

408 Massachusetts v. EPA, 549 U.S. 497 (2007).

- (1)(A) "if in the judgment of the Administrator, any fuel or fuel additive or any emission product of such fuel or fuel additive causes or contributes to air pollution or water pollution… that may reasonably be anticipated to endanger the public health or welfare," or

- (1)(B)"if emission products of such fuel or fuel additive will impair to a significant degree the performance of any emission control device or system which is in general use, or has been developed to a point where in a reasonable time it would be in general use were such regulations to be promulgated." [EPA-HQ-OAR-2022-0829-0701, pp. 261-262]

It is important to note that the addition of GHGs to the list of Clean Air Act "pollutants" is changing how one thinks of emissions control. For purposes of considering EPA's authority under 211(c)(1)(B), it is important to realize that the term "any emission control device or system" must be understood more broadly than it once was. With this realization, it is easy to see that engine efficiency improvements offer emission control benefits. However, low-octane fuel acts as a barrier to these efficiency benefits. EPA has the authority and must stand firmly on the side of removing these barriers and providing manufacturers with a full menu of options for striving to meet the future GHG standards. [EPA-HQ-OAR-2022-0829-0701, pp. 261-262]

In light of increasing GHG and CAFE requirements, it continues to be essential for vehicles and the fuels they operate on to be treated as a system and developed in tandem. Prospective fuels should enable greater vehicle efficiency and lower emissions, optimize the consumer experience, and fulfill societal values. Technology is in place to produce advanced engines. However, without a promulgated higher-octane fuel standard, the advanced engines cannot optimize their potential operational efficiency. It is now timely for EPA to undertake an accelerated process to implement and synchronize the market introduction of higher-octane gasoline that will enable the benefits of advanced technologies and support manufacturer investments. EPA has the authority to regulate national commercial gasoline octane specifications under the Clean Air Act. EPA should initiate a fast-track process to assure higher octane gasoline that meets the market and timing needs of new vehicle technologies for the U.S. commercial supply. [EPA-HQ-OAR-2022-0829-0701, pp. 261-262]

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

the proposed Light- and Medium-Duty rule would impose strict GHG and criteria-pollutant standards for model year 2027 through 2032, which become more stringent each year. 88 Fed. Reg. at 29,196. Although the proposed rule portrays those emission standards as “performance-based” and as allowing manufacturers to choose which emissions-control technologies to adopt, id. at 29,255, 29,257, EPA has stated openly that it expects manufactur- ers to shift from internal-combustion engines toward battery-electric vehicles, id. at 29,297–98. By 2032, EPA projects, for instance, that 78 percent of sedans, 62 percent of crossovers and SUVs, and 98 percent of vans will be battery-electric vehicles. See id. at 29,329–31. In a break from its historic practice, EPA now overtly proposes to wield its Section 202 authority over emission levels to mandate the adoption of alternatives to internal-combustion engines—replacing pollutant-emitting motor vehicles that Section 202 governs with other, non- emitting vehicles that the statute does not cover. The proposed Light- and Medium-Duty rule seeks to accomplish that unprecedented transformation on a highly compressed timeline, remaking the sectors within less than a decade. [EPA-HQ-OAR-2022-0829-0683, pp. 7-8]

I. The Proposed Rule Exceeds EPA’s Statutory Authority

Like every agency, EPA “‘literally has no power to act’ . . . unless and until Congress authorizes it to do so by statute.” FEC v. Ted Cruz for Senate, 142 S. Ct. 1638, 1649 (2022) (citation omitted). Moreover, under the major-questions doctrine, given the nature and breadth of the power EPA claims to reshape a large sector of the economy, congressional authorization would have to be unmistakably clear. But nothing in the Clean Air Act plausibly—let alone clearly— authorizes EPA to mandate replacing a particular percentage of internal-com- bustion-engine vehicles with a different category of vehicles that themselves emit no GHGs at all. [EPA-HQ-OAR-2022-0829-0683, pp. 8-9]

EPA cannot justify the proposed rule’s attempted transformation of the light-and-medium-duty-vehicle sector as an application of its fleetwide-averaging approach to emissions. Fleetwide averaging itself contravenes the Clean Air Act. At a minimum, it is not clearly and unmistakably authorized as a back- door means of remaking the auto industry, as the major-questions doctrine requires. [EPA-HQ-OAR-2022-0829-0683, pp. 8-9]

A. The Forced Electrification Of The Country's Light- and Medium- Duty Vehicles Is A Major Question

EPA recognizes that its proposed light- and medium-duty vehicle-emissions standards cannot be met by internal-combustion-engine vehicles alone. Instead, as EPA forthrightly admits, its proposed Light- and Medium-Duty rule (like its proposed Heavy-Duty rule) would compel manufacturers to transform their light- and medium-duty vehicle fleets. From a starting point roughly in the single digits, manufacturers would have to increase the percentage of electric vehicles in their light-duty fleets to 67 percent by 2032. See 88 Fed. Reg. at 29,189, 29,329. And they would have to increase the percentage of electric vehicles in their medium-duty fleets from virtually zero percent today to 46 percent by 2032. See 88 Fed. Reg. at 29,331; Draft RIA at 3-11. That is the proposed rule's purpose, consistent with the Administration's avowed goal "that at least 50 percent of all new passenger cars and light trucks sold in 2030 be zero-emission vehicles."2 [EPA-HQ-OAR-2022-0829-0683, pp. 9-10]

2 FACT SHEET: Biden-Harris Administration Proposes New Standards to Protect Public Health that Will Save Consumers Money, and Increase Energy Security, White House Briefing Room (Apr. 12, 2023) https://www.whitehouse.gov/briefing-room/statements-releases/2023/04/12/fact- sheet-biden-harris-administration-proposes-new-standards-to-protect-public-health-that-will- save-consumers-money-and-increase-energy-security/.

EPA's proposal "to substantially restructure" a major sector of the American economy implicates the major-questions doctrine, under which EPA must identify "'clear congressional authorization' for the power [EPA] claims." West Virginia v. EPA, 142 S. Ct. 2587, 2609–10 (2022) (citation omitted). The Supreme Court formally recognized and applied the major-questions doctrine last Term in West Virginia, which rejected a similarly aggressive assertion of regulatory power by EPA under the Clean Air Act. Under West Virginia and in a long line of cases predating it, the proposed rule here presents a major question, for at least three reasons. [EPA-HQ-OAR-2022-0829-0683, pp. 9-10]

First, EPA has claimed a power of "vast economic . . . significance," West Virginia, 142 S. Ct. at 2605 (citation omitted): the power, in effect, to phase out internal-combustion-engine light- and medium-duty vehicles in favor of electric vehicles. The financial consequences alone are staggering: EPA's own esti- mates project that the rule will have a net effect of $1.6 trillion, orders of mag- nitude more than in West Virginia. 88 Fed. Reg. at 29,361; cf. Ala. Ass'n of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021) (per curiam) (noting that the "sheer scope" of the agency's "claimed authority . . . counsel[s] against the Govern- ment's interpretation"). The economic significance of the proposed rule extends beyond those immediate financial effects. A shift of this scale would have spillover effects on the broader economy that EPA's projections do not even attempt to capture. For example, in addition to those who manufacture and purchase conventional vehicles, the proposed rule would affect those who fuel them (oil, natural-gas, and biofuel producers), and in turn other sectors that depend on those products (from asphalt to lubricants). These effects would also spread to industries that rely on light- and medium-duty vehicles, such as the passenger-transportation, delivery, and logistics industries. From any standpoint, the "magnitude" of the "'unprecedented power over American industry'" EPA has claimed reflects a major question. West Virginia, 142 S. Ct. at 2612 (quoting Indus. Union Dep't, AFL-CIO v. Am. Petroleum Inst., 448 U.S. 607, 645 (1980)). [EPA-HQ-OAR-2022-0829-0683, p. 10]

EPA’s assertion of authority here is an “unheralded power representing a transformative expansion in its regulatory authority.” West Virginia, 142 S. Ct. at 2610 (quotation marks omitted). Although EPA has long set emis- sions standards with which manufacturers must comply, until recently it has treated shifting to electric vehicles merely as one “option” manufacturers may select that provides them “flexibility” in meeting much less radical emissions standards. See, e.g., 77 Fed. Reg. 62,624, 62,917 (Oct. 15, 2012); NRDC v. Thomas, 805 F.2d 410, 425 (D.C. Cir. 1986) (“EPA’s argument that averaging will allow manufacturers more flexibility in cost allocation while ensuring that a manufacturer’s overall fleet still meets the emissions reduction standards makes sense.” (emphasis added)). Unlike the proposed rule, prior emissions standards “were predominantly based on advancements in [internal-combustion-engine] technologies that provided incremental emissions reductions,” not on a large- scale shift toward electric-vehicle technologies. 88 Fed. Reg. at 29,196. [EPA-HQ-OAR-2022-0829-0683, pp. 11-12]

Under the proposed rule, however, manufacturers will have no choice but to introduce a significant number of electric light- and medium-duty vehicles into their fleets to meet EPA’s stringent standards. EPA “anticipates that a compliant fleet under the proposed standards will include a diverse range of technologies, including higher penetrations of advanced gasoline technologies as well as zero-emission vehicles,” 88 Fed. Reg. at 29,187, and it projects that by 2032, in order for manufacturers to comply with the standards, electric vehicles will have to make up 67 percent of their light-duty fleets (78 percent of sedans, 62 percent of SUVs, and 68 percent of pickups) and 46 percent of their medium-duty fleets (98 percent of vans and 19 percent of pickups), id. at 29,329, 29,331. EPA’s projections of a massive shift to a new, purportedly non-emitting category of motor vehicles belie its suggestion that the proposed rule amounts to business as usual and merely continues a longstanding regulatory approach. See id. at 29,187. As in West Virginia, EPA has never previously claimed power to use emissions limitations to shift a significant portion of this industry from one technology to another. Its proposed rule thus embodies “an enormous and transformative expansion [of] EPA’s regulatory authority.” Util. Air Regul. Grp. v. EPA, 573 U.S. 302, 324 (2014). [EPA-HQ-OAR-2022-0829-0683, pp. 11-12]

Like EPA’s assertion of authority in West Virginia, its unprecedented claim of power in the proposed rule to reshape a major industry through emissions limitations presents a major question. EPA therefore lacks authority to promulgate the rule absent “‘clear congressional authorization’ for the power [EPA] claims.” West Virginia, 142 S. Ct. at 2609 (citation omitted). [EPA-HQ-OAR-2022-0829-0683, pp. 11-12]

EPA has no clear congressional authorization for the proposed rule’s electrification mandate. Under Section 202 of the Clean Air Act, EPA may “prescribe . . . standards” applicable to GHG emissions “from any class or classes of new motor vehicles or new motor vehicle engines” that EPA determines “cause, or contribute to, air pollution.” 42 U.S.C. § 7521(a)(1); see also Massa-chusetts v. EPA, 549 U.S. 497, 532 (2007); 74 Fed. Reg. 66,496 (Dec. 15, 2009). Section 202 specifies that “[s]uch standards shall be applicable to such vehicles and engines for their useful life . . . whether such vehicles and engines are de- signed as complete systems or incorporate devices to prevent or control such pollution.” 42 U.S.C. § 7521(a)(1). Nothing in the statutory text clearly author- izes EPA to mandate a compulsory shift toward zero-emission vehicles. [EPA-HQ-OAR-2022-0829-0683, pp. 12-13]

EPA has attempted to ground its electrification mandate in its standard- setting authority under Section 202 through fleetwide averaging. Averaging and its corollaries in EPA's ABT program—crediting (whereby manufacturers can use "credits" generated for one fleet that surpassed the emissions level to offset a deficit in another fleet), banking (saving credits earned one year to offset deficits in future years), and trading (selling credits to competitors for money)— are crucial to EPA's effort to mandate electrification. The proposed rule speci- fies emissions standards that would operate not as maximum-emission thresh- olds for particular pollutants that any individual vehicle must meet, but rather as fleetwide-average emission levels that manufacturers' fleets must collectively satisfy. See 88 Fed. Reg. at 29,196–97 ("EPA is not reopening its averaging, banking, and trading provisions, which continue to be a central part of its fleet average standards compliance program and which help manufacturers to em- ploy a wide range of compliance paths."). That averaging approach is essential to EPA's electrification mandate because it plainly would not be feasible for EPA to set maximum permissible GHG emissions at zero for individual vehi- cles: the "cost of compliance" with a zero-emissions mandate for every light- and medium-duty vehicle would doom such a requirement. 42 U.S.C. § 7521(a)(2). Instead, by allowing lower-emitting vehicles in a manufacturer's fleet to offset higher-emitting vehicles (in its own fleet or that of another man- ufacturer, through trading of credits), and by setting very stringent fleetwide- average GHG-emission standards that no conventional motor vehicle could satisfy, EPA's proposed rule forces manufacturers to produce a significant number of zero-emission (i.e., electric) vehicles. See 88 Fed. Reg. at 29,342; see also id. at 29,284 ("[V]ehicles of all types (including [internal-combustion-en- gine] vehicles as well as PEVs) are assessed on a fleet average basis in which credits that are generated by vehicles that over-comply with their footprint- based standard act to offset debits generated by vehicles that do not themselves meet the proposed standards, and these credits can also be traded among man- ufacturers."). [EPA-HQ-OAR-2022-0829-0683, pp. 12-13]

The Clean Air Act, however, does not authorize EPA to employ that fleet- wide-averaging approach at all—much less with the unmistakable clarity the major-questions doctrine demands. EPA's contrary interpretation has no foun- dation in the statutory text and would make a hash of the statutory structure, which repeatedly uses language that makes sense only in the context of emis- sions standards applicable to individual vehicles. Even if fleetwide averaging were permissible as a general matter, it cannot be exploited to shoehorn zero- emission vehicles—i.e., vehicles that do not "cause, or contribute to, air pollu- tion," 42 U.S.C. § 7521(a)(1), and thus fall outside Section 202 entirely—into the fleetwide-average calculation as a means of mandating electrification. [EPA-HQ-OAR-2022-0829-0683, pp. 12-13]

In any event, the Clean Air Act refutes EPA's view that Congress left the door open to fleetwide averaging. Other provisions in Section 202 itself and Title II as a whole make clear that fleetwide averaging is fundamentally incom- patible with the statutory structure and design. [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

Other portions of Section 202 confirm Section 202(a)(1)'s focus on emission standards applicable to individual vehicles. For example:

- Under 42 U.S.C. § 7521(b)(1)(A), the standards for light-duty vehicles and engines in model years 1977–79 must provide that "emissions from such ve- hicles and engines may not exceed 1.5 grams per vehicle mile of hydrocarbons and 15.0 grams per vehicle mile of carbon monoxide." Id. (emphasis added). This provision contemplates that "such vehicles"—i.e., individual light-duty vehicles—will not exceed these limits. Under an averaging ap- proach, however, individual vehicles would be permitted to exceed these statutorily mandated standards. [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

- Similarly, 42 U.S.C. § 7521(b)(3) authorizes EPA to grant waivers from cer- tain nitrogen-oxide emission "standards," see id. § 7521(b)(1)(B), for no "more than 5 percent of [a] manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater." Id. § 7521(b)(3). The provision thus provides a default rule under which every vehicle must meet a per-vehicle emissions standard, then permits a waiver from that default rule for up to 5 percent of the fleet. Averaging is inconsistent with this pro- vision, which depends on a set number of individual vehicles meeting the standards. [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

- And under 42 U.S.C. § 7521(m)(1), EPA must require manufacturers to in- stall "diagnostic systems" on "all" new light-duty vehicles and trucks that are capable of identifying malfunctions that "could cause or result in failure of the vehicles to comply with emission standards established under this section." Requiring diagnostic equipment on "all" vehicles makes no sense on an averaging approach; each vehicle must have a diagnostic system that ensures that vehicle's "compl[iance] with emission standards established un- der [Section 202]," id., yet under EPA's averaging approach, no particular vehicle need be in compliance. [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

Beyond Section 202 itself, averaging is also deeply in tension with "the de- sign and structure of [Title II] as a whole." Util. Air, 573 U.S. at 321 (citation omitted). Consider Title II's provisions addressing testing, warranties, and pen- alties: [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

Organization: American Fuel & Petrochemical Manufacturers

There is no doubt that if promulgated in its current form, the proposal would have major implications for consumers, our economy, and our national security. The Supreme Court made clear in a string of recent rulings that regulations of such magnitude require unambiguous Congressional authority. Congress has never come anywhere close to providing EPA with the authority it asserts here – the power to effectively ban internal combustion engine vehicles by setting emission standards that only battery electric vehicles can achieve. To comply with the Clean Air Act, EPA must set emission standards that individual, well-controlled ICEV can attain. [EPA-HQ-OAR-2022-0829-0733, p. 1]

EPA proposed unachievable standards for light- and medium-duty ICEVs. This attempt to force an unprecedented transformation of the national transportation system to ZEVs goes far beyond the authority delegated to the Agency by Congress. The Proposal—which will likely require hundreds of billions of dollars, dictate what vehicles are permissible for automakers to sell, and has significant ramifications for the U.S. energy sector, national security, and consumers—clearly addresses questions of major economic and political significance that EPA is neither authorized nor equipped to address. [EPA-HQ-OAR-2022-0829-0733, p. 2]

EPA also misinterprets its authority to establish feasible efficiency improvements by proposing standards that cannot be achieved with ICEV technologies. First, EPA is not permitted to rely on averaging, banking, and trading mechanisms as a means to establish the relevant standards. Second, because ZEVs do not have tailpipe emissions, they do not directly “cause or contribute to” air pollution within the construct of a tailpipe emissions standard, and therefore any standard applicable to “any class or classes” of vehicles “which . . . cause, or contribute” to air pollution cannot include ZEVs. [EPA-HQ-OAR-2022-0829-0733, p. 2]

Even if EPA had Congressional authority to promulgate the proposed standards, the proposal is arbitrary and capricious due to the Agency’s reliance on incomplete facts, overly optimistic or outright mistaken assumptions, and failure to use reason-based decision-making. The Agency significantly overestimates environmental benefits and feasibility, underestimates costs, and relies on little more than unsupported hope that consumer preferences will change to enable the Agency’s intended policy. EPA’s decision to not only ignore lifecycle emissions of ZEVs, but to explicitly propose removing the requirement for automakers to account for them, serves neither consumers nor the environment. EPA’s reasoning, that its policy of not accounting for these emissions serves its goal of promoting the use of EVs, is the definition of arbitrary and capricious biased decision-making. Unfortunately, the Agency also ignored significant issues related to energy security and U.S. national security. [EPA-HQ-OAR-2022-0829-0733, p. 2]

The “major questions doctrine” holds that Congress must “speak clearly when authorizing an agency to exercise [such] powers” of “vast economic and political significance.”61 And as EPA is aware, this doctrine applies in the context of environmental regulation. Last year, in West Virginia v. EPA, the Supreme Court relied on the major questions doctrine in holding that the EPA exceeded its statutory authority in adopting its Clean Power Plan. That regulation sought to impose caps on GHG emissions by requiring utilities and other providers to shift electricity production from coal-fired power to natural gas and then to renewable energy in place of imposing source-specific requirements reflective of the application of state-of-the-art emission reduction technologies.62 [EPA-HQ-OAR-2022-0829-0733, p. 18]

v. Dep’t of Health & Human Servs., 141 S. Ct. 2485, 2489 (2021); Utility Air Regulatory Group v. EPA, 573 U.S. 302, 324 (2014); U.S. Telecom Assoc. v. FCC, 855 F.3d 381, 419-21 (D.C. Cir. 2017) (Kavanaugh, J., dissenting from denial of rehearing en banc) (explaining provenance of “major rules doctrine”). [EPA-HQ-OAR-2022-0829-0733, p. 18]

62 West Virginia v. EPA, 142 S. Ct. 2587 (2022).

As noted by the Court, EPA “announc[ed] what the market share of coal, natural gas, wind, and solar must be, and then require[d] plants to reduce operations or subsidize their competitors to get there.”63 EPA’s attempt to devise GHG emissions caps based on a generation-shifting approach would have had major economic and political significance impacting vast swaths of American life and substantially restructured the American energy market; however, EPA’s purported authority was only based on a “vague statutory grant” within Section 111(d) of the Clean Air Act—far from the “clear authorization required by [Supreme Court] precedents.”64 The need for clear congressional authorization for such sweeping regulatory programs is nothing new – just last week the Supreme Court reaffirmed the major questions doctrine “as an identifiable body of law that has developed over a series of significant cases spanning decades.”65 [EPA-HQ-OAR-2022-0829-0733, p. 18]

65 Biden v. Nebraska, No. 22-506, slip op. at 23 (June 30, 2023) (internal quotations omitted) (applying major questions doctrine to strike down student loan repayment program that will cost taxpayers approximately $500 billion and affects nearly every student loan borrower). Just as the trade-offs inherent in a mass debt cancelation program are ones that Congress would likely have reserved for itself, id., slip op. at 25, so too are those that must be considered for the mass adoption of electric vehicles.

As with the Clean Power Plan, EPA lacks Congressional authorization in the Clean Air Act to impose a manufacturing-shifting standard to a preferred powertrain and effectively order regulated parties to phase out combustion engine technologies. EPA's standard-setting tools are limited to those which Congress provided in Section 202(a) of the Clean Air Act. Here, EPA is only authorized to set "standards" for "emission[s]" from "any class or classes of new motor vehicles or new motor vehicle engines, which . . . cause, or contribute to," potentially harmful air pollution. EPA has elected to focus solely on tailpipe emissions. But EPA acknowledges that ZEVs do not have tailpipe emissions of carbon dioxide, nitrogen oxides, non-methane organic gases, particulate matter, carbon monoxide, or formaldehyde, the pollutants of concern here, so the operation of such vehicles alone cannot "cause, or contribute to," air pollution within the constructs of a tailpipe emissions regulation, especially when EPA does not require vehicle manufactures to account for the upstream emissions from ZEVs in their compliance calculations. [EPA-HQ-OAR-2022-0829-0733, pp. 19-20]

Far from "clear congressional authorization," Section 202(a) provides EPA no authority to set standards that go beyond that which could be achieved by improvements to ICEVs alone such that OEMs are required to cease producing the underlying technology governed at the time the Clean Air Act was adopted and amended. Nor does it permit EPA to establish a fleet averaging and emission credit trading program as a mechanism to limit ICEV sales.68 Notably, in its 1990 updates to the Clean Air Act, Congress instituted a clean fuel vehicles program with reference to "clean alternative fuel" vehicles, which includes ZEVs. In doing so, Congress explicitly distinguished such vehicles from "conventional gasoline-fueled or diesel-fueled vehicles of the same category and model year," dispelling the notion that ZEVs and ICEVs can be lumped together to set standards that will enable the former to eventually displace the latter.69 EPA does not—and cannot—explain how such authority can be read to regulate ZEVs and ICEVs under a common standard, especially in light of the statutory language requiring EPA to set standards for any class or classes of vehicles. It is no surprise then that up until the current Administration, EPA has never claimed the authority to mandate even partial electrification. [EPA-HQ-OAR-2022-0829-0733, pp. 19-20]

68 See supra II.A.

69 42 U.S.C. §§ 7581, 7582(b).

Congress clarified that it, not EPA, must make the important policy decisions affecting if, when, and how the American automotive industry will transition from ICEVs to ZEVs. In the 116th Congress, for example, Congress introduced 44 bills seeking to reduce petroleum-based fuel consumption and GHG emissions from the transportation sector through customer rebates, vehicle and fuel producer incentives, local funding, development of standards, and research and development. Congress rejected bills that would have banned the sale of new light duty ICEVs by 204070 and it has consistently disapproved of EPA's efforts to hamstring the automotive sector with more stringent air pollution standards than are feasible.71 [EPA-HQ-OAR-2022-0829-0733, pp. 20-21]

70 See Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. (2018); see also 116 Cong. Rec. 19238-40 (1970) (proposed amendment to Title II that would have banned ICEVs by 1978).

71 See, e.g., S. J. Res. 11, 118th Cong. (2023) (Although passed only by the Senate thus far, the joint resolution calls for disapproval of a similar rule submitted by the Administrator of the Environmental Protection Agency relating to "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards," 88 Fed. Reg. 4296 (Jan. 24, 2023)).

It should be no surprise then that in the wake of the Proposed Rule, members of Congress requested that the Agency rescind the proposals, asserting they "effectively mandate a costly transition to electric cars and trucks in the absence of congressional direction."72 That Congress intended for it, not EPA, to direct these policy decisions is made all the more clear by the passage of the IRA and the BIL whereby Congress identified the policy levers it deemed appropriate. Congress could have, but did not, delegate the authority to (or otherwise direct) EPA to establish a fleet-wide credit trading regime to further drive ZEV development and rapid adoption. [EPA-HQ-OAR-2022-0829-0733, pp. 20-21]

72 Letter from Senator Shelley Capito, et al. to Administrator Michael S. Regan, EPA (May 25, 2023); see also Senate Resolution S.J. Res. 11, 118th Congress (Apr. 26, 2023) (Although related to heavy duty vehicles ("HDVs"), Congress has expressed its disapproval of EPA's overreach in this space. For example, in April of this year both houses of Congress passed a Congressional Review Act resolution to rescind EPA's December 2022 heavy duty NOx standards, sending a strong signal that Congress views EPA's efforts in this space as unnecessary, infeasible, and uniformed in light of economic and energy security concerns); House Resolution H2523 (May 23, 2023); see also Congressional Record, H2523 (May 23, 2023) at 1444, Statement from Mr. Walberg (R-MI) ("From tailpipe emissions regulations that will force people to buy expensive and less practical EVs to new rules on power plants that will threaten the reliability of our electric grid. It seems like the EPA has not even thought about the economic and energy security of our constituents.").

The Proposed Rule stands in direct contrast to other legislation, such as the Renewable Fuel Standard Program ("RFS"), whereby Congress mandated that "gasoline sold or introduced into commerce in the United States" must contain renewable fuels73 and, in 2022, must include billions of gallons of renewable fuel.74 In fact, EPA's Proposal directly conflicts with the statutory framework that Congress provided in the RFS for lowering GHG emissions from the transportation sector. In the proposed rule, EPA cites only its authority under section 202(a) of the Clean Air Act and Executive Order 14037 as the basis for requirements that will extend from MY 2027 to 2032.75 Because Executive Orders have no force of law,76 EPA at bottom contends that a few general paragraphs of the Clean Air Act, enacted over 50 years ago, provides sufficient legislative authority and direction for the entirety of its proposed rule. But Congress demonstrated in the RFS that when it wants to transform the transportation sector, and specifically, when it desires to address GHGs associated with that sector, it does so with precision and within the context of a prescribed statutory framework. [EPA-HQ-OAR-2022-0829-0733, p. 21]

73 42 U.S.C. § 7545(o)(2)(A)(i).

74 Id., § 7545(o)(2)(B); 87 Fed. Reg. 39,600 (July 1, 2022).

75 88 Fed. Reg. at 29,186.

76 Rather, Executive Orders "simply serve as presidential directives to agency officials to consider certain policies when making rulemaking decisions." State of California v. EPA, No. 21-1018 (D.C. Cir. 2023), Slip Op. at 17.

III. The Proposed Rule Contravenes or is Otherwise Contrary to the Clean Air Act and Energy Policy and Conservation Act

A. EPA Lacks Statutory Authority Under the Clean Air Act.

1. The Clean Air Act Requires Standards With Which All Vehicles In A Class Can Comply

As set forth in detail in the brief appended as Attachment 1, EPA lacks statutory authority under Section 202(a) of the Clean Air Act to set fleetwide emission standards, and even if it had such authority, it could not lawfully use it to force electrification by including vehicles that have no tailpipe emissions in the fleetwide average standard for ICEVs. While EPA purports to rebut arguments that it lacks such statutory authority, EPA's own search for its expansive authority turns into a circular argument. If "Congress's focus was on emissions from classes of motor vehicles and the 'requisite technologies' that could feasibly reduce those emissions" as EPA suggests, it follows that those "requisite technologies" must be applied to directly reduce emissions from the vehicles on which they are installed.77 And those technologies must remain with the vehicle for its useful life.78 [EPA-HQ-OAR-2022-0829-0733, p. 21]

77 Proposed Rule at 29,231 (emphasis added).

78 42 U.S.C. § 7521(a)(1).

The Proposed Rule results in fleet-wide standards that cannot be met by ICEVs alone; however, under the Clean Air Act, EPA may only set individual vehicle-level emission standards. Such standards must be for "emission[s]" from "any class or classes of new motor vehicles or new motor vehicle engines, which . . . cause, or contribute to," potentially harmful air pollution.79 The plain language of this provision authorizes EPA to set standards for classes of individual vehicles or engines that emit air pollutants. As EPA acknowledges, EPA's "rules have historically not required the use of any particular technology, but rather have allowed manufacturers to use any technology that demonstrates the engines or vehicles meet the standards over the applicable test procedures."80 This precedent is squarely at odds with the Proposed Rule, where "any technology" cannot be used to meet the proposed emission standards, which can only be met by phasing out ICEVs, distorting as well as exceeding EPA's authority to set standards to permit the "development and application of the requisite technology."81 [EPA-HQ-OAR-2022-0829-0733, pp. 21-22]

79 42 U.S.C. § 7521(a)(1).

80 Id. at 29,232. Moreover, while EPA suggests that the Clean Air Act's legislative history shows that Congress contemplated replacing the ICEV with ZEVs, id., such an interpretation is squarely at odds with the text of the statute. If EPA were to replace ICEVs with ZEVs – as the Proposed Rule would put it on track to do – each and every statutory reference to an "engine" would be meaningless as ZEVs do not have engines.

81 42 U.S.C. § 7521(a)(2).

The Clean Air Act does not provide EPA authority to regulate vehicles that have tailpipe emissions by including them within the same standards that apply to vehicles without tailpipe emissions. For LDVs specifically, emission standards must reflect "the greatest degree of emission reduction achievable through the application of technology which the [EPA] determines will be available" during the relevant model year.85 The Supreme Court noted that similar language in Section 111(d) of the Act generally refers to "measures that would reduce pollution by causing [sources] to operate more cleanly."86 Congress enabled EPA to increase emission standard stringency through cleaner fuels and improved emissions-related systems to be incorporated into ICEVs such as advances in fuel injection, exhaust gas combustion management, and advances in catalysts to neutralize pollutants of concern.87 ZEVs are not similarly situated "technology" originally contemplated by Congress. To ensure compliance with emission standards under Section 202(a), Congress required "emissions-related systems" and accompanying "diagnostic systems" on each vehicle, underscoring its view that the vehicles subject to an emission standard emit the relevant pollutant in EPA's judgment. [EPA-HQ-OAR-2022-0829-0733, p. 22]

85 42 U.S.C. § 7521(a)(3)(A)(i).

86 West Virginia, 142 S. Ct. at 2599.

87 For example, Section 202(m) requires the monitoring of "emission-related systems" such as the "catalytic converter and oxygen sensor." 42 U.S.C. § 7521(m)(l).

The structure of the Clean Air Act and its regulatory provisions for standard setting, certification, compliance enforcement, warranties, and penalties also directly conflict with a fleet- wide averaging regulatory regime. Notably, under Section 202(a), EPA "shall test, or require to be tested in such manner as [it] deems appropriate, any new motor vehicle or new motor vehicle engine submitted by a manufacturer" and issue a certificate of conformity "if such vehicle or engine" complies with the standards.94 And EPA must "test any emission control system incorporated in a motor vehicle or motor vehicle engine . . . to determine whether such a system enables such vehicle or engine to conform to the standards required to be prescribe under [Section 202(b)]" of the Act.95 EPA's use of a fleetwide averaging regulatory regime directly conflicts with the statutory provisions that Congress already included to provide manufacturers with compliance flexibility. For example, section 202(b)(3) provided compliance flexibilities for NOx, but only for no "more than 5 percent of [a] manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater."96 This provision would be nonsensical under a fleetwide-averaging regime where, if applied, an OEM could give itself a waiver for large swaths of its fleet by over-complying for certain product lines well beyond its 5 percent or 50,000 vehicle allotment.97 Together, the Clean Air Act regulatory framework contemplates EPA regulating vehicles individually. But this cannot be accomplished if there is not a clear emission standard applicable to a single vehicle at the start of a model year. [EPA-HQ-OAR-2022-0829-0733, pp. 23-24]

94 42 U.S.C. § 7525(a)(1).

95 42 U.S.C. § 7525(a)(2).

96 42 U.S.C. § 7521(b)(3).

97 While Clean Air Act Section 202(b)(3) is specific to legacy light-duty vehicles through model year 1985 subject to a 1.5 grams/mile NOx standard and no longer directly applicable, the provision is incongruent with fleet-wide averaging, and no associated amendments to Section 202(a) would support a different reading today.

Relatedly, Congress established the need to consider technology feasibility in establishing fuel economy regulations under the Energy Policy and Conservation Act ("EPCA"). Here, the National Highway Traffic Safety Administration ("NHTSA") "may not consider" the fuel economy of EVs in setting Corporate Average Fuel Economy (CAFE) standards.107 Conducting joint EPA- NHTSA rulemakings for complementary GHG and CAFE requirements helps OEMs comply with both agencies' standards. But in forgoing joint rulemaking, EPA ignores Congress' determination that EVs cannot be considered when determining what is the maximum feasible fuel economy level from which to develop regulations. Allowing EPA to consider EVs and, in turn, establish de facto ZEV mandates (and de facto average fuel economy standards) ultimately skews the new vehicle market and impede NHTSA's ability to establish its own CAFE standards that comport with EPCA. Most importantly, such an approach directly contravenes the underlying premise of the Supreme Court's holding in Massachusetts v. EPA that "[EPA and NHTSA] obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency."108 After implementing GHG standards jointly with NHTSA's fuel economy standards since 2012, and despite Government Accountability Office recommendations to the contrary,109 EPA separated the rulemaking to undo previously established MY 2023-2026 standards and, in this case, to avoid the direct statutory prohibition on consideration of EVs when establishing fuel economy standards. [EPA-HQ-OAR-2022-0829-0733, pp. 25-26]

107 49 U.S.C. § 32902(h). Here, NHTSA may not consider the fuel economy of "dedicated automobiles," which are defined as those that operate only on "alternative fuel." Alternative fuel, in turn, includes electricity. 49 U.S.C. § 32901(j).

108 549 U.S. 497, 532 (2007).

109 GOVERNMENT ACCOUNTABILITY OFFICE, "NHTSA and EPA's Partnership for Setting Fuel Economy and Greenhouse Gas Emissions Standards Improved Analysis and Should be Maintained" (February 2010) available at https://www.gao.gov/assets/gao-10-336.pdf

Organization: American Petroleum Institute (API)

EPA is Not Taking a Realistic Approach.

i. EPA's limits are not set on a realistic scientific based approach.

EPA's proposed standards are based on projected ZEV penetration rates based on OEM stated ambitions and on California ZEV mandates and states that follow California rules under Section 177 of the Clean Air Act. These ambitions are stretch goals that OEMs may not reach. [EPA-HQ-OAR-2022-0829-0641, p. 11]

h. Legal Concerns.

The aggressive push to electrify the LDV and MDV fleet is the defining characteristic of the Proposed Rule from a legal standpoint. EPA explains that its "feasibility assessments in past rulemaking were predominantly based on ICE-based technologies that provided incremental tailpipe GHG reductions." 88 Fed. Reg. at 29238. Here, in contrast, EPA projects that the Proposed Rule at full implementation would result in the electrification of 67% of the LDV fleet – over 25% more than the 39% penetration rate that EPA projects in the no action base case. Id. at 29329. EPA similarly projects that 46% of the MDV fleet will be electrified, reflecting 98% electrification of all vans. Id. at 29331. These numbers make it clear that the Proposed Rule would establish a legal mandate effectively requiring that electric vehicles must comprise a significantly greater proportion of the LDV and MDV fleet than otherwise would be the case. [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

While BEVs can and should be a choice available to manufacturers and vehicle purchasers, we disagree that EPA should impose a binding mandate for the production of BEVs and outline why such a mandate exceeds EPA's authority under the Clean Air Act (CAA). [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

i. EPA does not have authority to impose standards that are only achievable through the use of BEV technology because there is no clear statement in the Clean Air Act authorizing EPA to mandate a shift away from internal combustion engines. [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

The Proposed Rule marks a shift in EPA's approach to regulating emissions from LDVs and MDVs. EPA, consistent with the Clean Air Act, has traditionally established standards based on technology that can control the amount of emissions from LDVs and MDVs. EPA deviated from this approach in its 2021 GHG standards, setting standards based on a formula that the agency estimated would increase the market share for electric vehicles from 3.6% to 7% for model year 2023 and 17% for model year 2026. But even then, EPA contended that its "assessment, consistent with past EPA assessments, shows that the final standards can largely be met with increased sales of advanced gasoline vehicle technologies, and projects modest (17 percent) penetration rates of electrified vehicle technology" by 2026. 86 Fed. Reg. 74434, 74484 (Dec. 30, 2021). And EPA argued that it relied on advances in internal combustion engine ("ICE") powertrains to achieve the required GHG reductions and purported not to push for a shift from ICE powertrains to electrified vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

Here, EPA goes even further and seeks to totally transform the transportation sector. It proposes standards that would effectively require that BEVs must comprise two-thirds of the LDV fleet and nearly half of the MDV fleet at full implementation, which is a substantially greater proportion of the fleet any prediction of the market demand would support. Indeed, according to EPA, "[in] MY 2032 when the proposed standards reach the lowest level, it is possible that only BEVs and PHEVs are generating positive credits, and all ICE vehicles generate varying levels of deficits." 88 Fed. Reg. at 29342. In other words, EPA predicts that manufacturers will not be able to comply with the proposed rule without producing significant numbers of electric vehicles. EPA thus seeks to require a fundamental transformation of the LDV fleet from ICE powertrain technology to electric vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

Such a shift from ICE powertrains to electric powertrains would be truly transformative. BEVs require fundamentally different vehicle technologies than those used on conventionally fueled vehicles – e.g., electric motors instead of internal combustion engines, batteries to store power rather than on-board fuel tanks. Moreover, BEVs rely on a wholly different infrastructure (e.g., electric power generation and distribution, charging stations, battery manufacturing) – much of which does not yet exist or exists only in limited form. Additionally, switching to BEVs will fundamentally change the manner in which vehicles are used, for example requiring careful scheduling of vehicle operations to accommodate the long periods needed to adequately charge the vehicles. Lastly, a BEV mandate would produce widespread effects on the national economy, such as the reduced need for oil and gas production, gas processing, changes to petroleum refining, and distribution. Such changes are extraordinary and far more expansive than those caused by EPA's LDV and MDV GHG standards up to now. [EPA-HQ-OAR-2022-0829-0641, pp. 24-26]

EPA asserts that the BEV mandate is authorized under Clean Air Act ("CAA") Sections 202(a)(1) and (2). 88 Fed. Reg. at 29231. EPA claims that these provisions "are technology forcing when EPA considers that to be appropriate." Id. at 29232. EPA further asserts that "Section 202 does not specify or expect any particular type of motor vehicle propulsion system to remain prevalent." Id. The Agency also asserts that its extraordinary new interpretation of the statute is supported by legislative history claiming that Congress understood that powertrain technologies might evolve over time and quotes Representative Pallone as opining that the "recently enacted [Inflation Reduction Act] "reinforces the longstanding authority and responsibility of [EPA] to regulate GHGs as air pollutants under the Clean Air Act," 204 and "the IRA clearly and deliberately instructs EPA to use" this authority by "combin[ing] economic incentives to reduce climate pollution with regulatory drivers to spur greater reductions under EPA's CAA authorities."" Id. at 29233. [EPA-HQ-OAR-2022-0829-0641, pp. 26-27]

But the U.S. Supreme Court has concluded that such an "extraordinary" claim of authority exists only when there is "clear congressional authorization." West Virginia v. EPA, 142 S.Ct. 2587, 2609 (2022). CAA §§ 202(a)(1) and (2) contain no such clear authorization. At their core, CAA §§ 202(a)(1) and (2) authorize EPA to establish "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in [the Administrator's] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." Because this provision includes no clear statement that EPA may mandate a fundamental shift in propulsion technology, EPA lacks authority to impose emissions limitations that effectively will require the production and sale of electric vehicles. EPA cannot rely on the views of individual Members who participated in the CAA or the IRA to claim vast new authority from long extant statutory provisions. [EPA-HQ-OAR-2022-0829-0641, pp. 26-27]

The lack of a clear statement is particularly notable given that Congress's most recent efforts to address GHG emissions – the Inflation Reduction Act and the Bipartisan Infrastructure Act – almost exclusively consisted of economic incentives and pointedly gave EPA no new or expanded authority to substantively regulate GHG emissions. If Congress had intended to give EPA authority to mandate a fundamental shift in powertrain technology, surely it would have done more than create consumer facing incentives. Moreover, EPA's claim of authority plainly conflicts with other relevant statutes, such as the Renewable Fuel Program, under which Congress mandated that significant and increasing volumes of renewable fuels should be blended into that national motor fuel supply. In contrast, the Proposed Rule is designed to significantly reduce the amount of motor fuel consumed by the light and medium duty fleet. The Proposed Rule thus would frustrate Congressional intent by reducing rather than expanding the volume of renewable fuel consumed by motor vehicles in the U.S. [EPA-HQ-OAR-2022-0829-0641, pp. 26-27]

It also is telling that EPA has abandoned any pretense of "co-regulating" with NHTSA, the national regulatory authority that actually has been authorized by Congress to establish motor vehicle fuel effciency standards. Id. at 29227 n. 384. Among other things, this is a clear attempt to free EPA from unambiguous statutory obligations that otherwise would constrain a joint rulemaking (e.g., NHTSA ”may not consider “the fuel economy (i.e., the availability) of dedicated alternative fueled automobiles – including battery-electric vehicles – in any model year for which standards are being set.” 87 Fed. Reg. 25710, 25994 (May 2, 2022)). It is simply not plausible that the general standard-setting authority of CAA § 202(a) can be construed to confer omnibus authority for EPA to effectively rewrite directly relevant statutory directives. [EPA-HQ-OAR-2022-0829-0641, pp. 26-27]

ii. EPA’s authority under CAA §§ 202(a)(1) and (2) to prescribe emissions standards for vehicles and engines does not extend to a mandatory shift in powertrain technology. [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

As explained above, the Proposed Rule would effectively require that a significant proportion of new LDV and MDV must be powered by electric drivetrains. That proportion significantly exceeds the level of new vehicle electric vehicle sales that otherwise would occur. As a result, the Proposed Rule would constitute a mandate to produce electric vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

Moreover, electric vehicles are not just another form of conventional diesel or gasoline fueled ICE-driven vehicles. For example, a BEV cannot be produced by modifying a conventional ICE drivetrain (e.g., by changing combustion conditions) or by adding pollution control technology to a conventional ICE drivetrain (e.g., catalytic converter or gasoline particulate filter). Rather, BEVs employ wholly different propulsion technology as compared with conventional ICE drivetrains. BEVs use electricity and batteries rather than liquid fuels stored in fuel tanks and employ electric motors for propulsion rather than ICE engines. [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

EPA asserts that CAA §§ 202(a)(1) and (2) authorize the imposition of an electric vehicle mandate. But for the following four reasons, EPA does not have authority under CAA §§ 202(a)(1) and (2) or under any other CAA provision to impose such a fundamental and mandatory shift in powertrain technology. [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

First, EPA may regulate a class of motor vehicles under CAA § 202(a)(1) only if emissions from that class of vehicles “cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” EPA treats BEVs as if they do not have emissions for the purposes of this proposal. 88 Fed. Reg. at 29297. As a result, under EPA’s rationale, BEVs do not emit the pollutants that are the object of the Proposed Rule and cannot cause or contribute to the endangerment that EPA asserts as the basis for its authority to regulate here under CAA § 202(a)(1). Thus, it is beyond EPA’s authority to include electric vehicles in its regulations under § 202(a) or to impose an electrification mandate. [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

Second, CAA § 202(e) – entitled “New power sources or propulsion systems” – states that EPA may defer the certification for a new motor vehicle employing a new power source or propulsion system until after the Agency has “prescribed standards for any air pollutants emitted by such vehicle or engine which in [the Administrator’s] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger the public health or welfare but for which standards have not been prescribed under [CAA § 202(a)].” Thus, EPA must take two actions when assessing a new power source or propulsion system. EPA first must determine whether emissions from the new power source or propulsion system cause or contribute to air pollution that endangers public health or welfare. If the answer is yes, EPA must then establish new emissions standards for the new power source or propulsion system or, alternatively, determine that appropriate standards have already been established. [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

BEVs clearly constitute a new power source or propulsion system. As a result, before certifying any BEVs, CAA § 202(e) requires that EPA determine whether emissions from BEVs cause or contribute to air pollution that endangers public health or welfare. But, EPA treats BEVs as if they do not have emissions. Consequently, EPA cannot determine that emissions from BEVs cause or contribute to any endangerment caused by emissions and, therefore, the Agency has no need or authority to impose emissions standards on BEVs prior to certifying them. [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

Third, CAA § 202(a)(1) authorizes EPA to establish "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines." CAA § 202(a)(1) (emphasis added). This provision requires EPA to define appropriate classes of vehicles for purposes of making the cause/contribute finding and in subsequently establishing emission standards. [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

From the outset of its CAA-based motor vehicle regulatory program, EPA has properly distinguished between fundamentally different powertrain technologies – e.g., regularly developing and issuing separate standards for gasoline-powered vehicles and diesel-powered vehicles. In contrast, EPA here combines all powertrain types into the same classes for purposes of imposing emission standards. That is contrary to the statute, arbitrary, and capricious because conventionally powered vehicles have fundamentally different emissions characteristics than electric powered vehicles. See also CAA § 202(e) (requiring EPA to separately evaluate emissions from "a new power source or propulsion system.") [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

As demonstrated by EPA's prior LDV GHG standards, there is a wide variety of emissions control techniques that may be applied to conventionally powered LDV to reduce GHG emissions – including such things as improved engine effciency, better aerodynamics, and lower rolling resistance. Applying such measures to BEVs does not affect their GHG emissions profile because, by EPA's definition, BEVs do not emit GHGs. This shows that conventionally powered vehicles and BEVs should not occupy the same class under these rules because wholly different regulatory approaches are needed to appropriately control GHG emissions from these two fundamentally different types of vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

Fourth, EPA's regulatory approach is unlawful because it treats BEVs as if their powertrain were an emissions control technology and then mandates the use of that purported emission control technology. EPA claims throughout the proposed rule that its proposed standards do not require manufacturers to implement any specific technology and, instead, that they retain flexibility to comply with the rule in whatever manner they deem appropriate. See, e.g., 88 Fed. Reg. at 29232. But the proposed rule inescapably will require a significant industry- wide shift from internal combustion to BEVs. A particular manufacturer may avoid producing a BEV though creative use of the ABT provisions, but the industry as a whole will have no choice but to produce increasing numbers of BEVs over time. This is contrary to CAA § 202(a), which authorizes EPA to set emissions standards, but does not authorize EPA to mandate the use of any particular emissions control technology in meeting those standards. [EPA-HQ-OAR-2022-0829-0641, pp. 27-29]

iii. EPA has no authority under CAA §§ 202(a)(1) and (2) to establish emissions standards based on credit trading among manufacturers. [EPA-HQ-OAR-2022-0829-0641, p. 29]

The Proposed Rule is fundamentally different from prior LDV GHG rules in that EPA factors credit trading among manufacturers into its standard setting analysis. EPA explains that "[i]n light of the evidence of increased adoption of trading as a compliance strategy, EPA has included the ability of manufacturers to trade credits as part of our central case compliance modeling for this proposal, rather than as a sensitivity analysis as we did in the modeling for the 2021 rule." 88 Fed. Reg. at 29343. So, rather than allowing for credit trading as a "compliance flexibility" for purposes of implementing the standards, credit trading is included in setting the standards in the first instance. [EPA-HQ-OAR-2022-0829-0641, p. 29]

The use of credit trading in standard setting is legally flawed for two reasons. First, it is true that EPA has long used credit trading as a compliance method under its vehicle emissions standards. But here EPA is doing more – EPA uses credit trading in setting the standards themselves. EPA provides no explanation of its legal authority for this novel approach. [EPA-HQ-OAR-2022-0829-0641, p. 29]

Second, CAA § 202(a)(2) requires EPA to consider cost and technical feasibility in setting emissions standards. By factoring credit trading into standard setting, EPA unreasonably is diluting the cost impact of the Proposed Rule on manufacturers that opt not to engage in credit trading. As EPA notes, "trading is an optional compliance flexibility." 88 Fed. Reg. at 29343. And EPA acknowledges "that automakers may choose to use it in their compliance strategies to varying degrees." Id. But rather than assess the costs of compliance for manufacturers that choose not to engage in credit trading, EPA asserts without analysis or other support that "reduced use of credit trading may result in somewhat higher costs for the program, but we do not believe it would alter our conclusion that the standards are feasible." Id. An agency "belief" that is untethered to facts or analysis does not provide an adequate basis for EPA to conclude that the proposed emissions standards are cost effective in the absence of trading. EPA thus fails to satisfy its clear statutory obligation to factor costs into the proposed emissions standards. [EPA-HQ-OAR-2022-0829-0641, p. 29]

v. The use of BEV technology is not an emissions standard under CAA §§ 202(a)(1) and (2). [EPA-HQ-OAR-2022-0829-0641, pp. 30-31]

By factoring BEVs into the proposed emission standards, EPA effectively is treating BEVs as an emissions control technology that can form the basis of an emission standard. This exceeds EPA's authority under CAA § 202(a). [EPA-HQ-OAR-2022-0829-0641, pp. 30-31]

CAA § 202(a)(1) authorizes EPA to prescribe "standards applicable to emissions." In other words, EPA is authorized to prescribe emission standards for motor vehicles. The term "emission standard" means a requirement "which limits the quantity, rate, or concentration of emissions of air pollutants." CAA § 302(k). [EPA-HQ-OAR-2022-0829-0641, pp. 30-31]

The problem with EPA's regulatory approach here is that a BEV is not an emissions control technology for a conventionally powered vehicle. A BEV does not and cannot limit the "quantity, rate, or concentration" of air pollutant emissions from a conventionally powered vehicle. Rather, a BEV represents an entirely different type of propulsion system and powertrain. The existence of BEVs has no bearing on the relative emissions from conventionally powered vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 30-31]

Consequently, a BEV powertrain is not an emissions reduction technology applicable to conventionally powered vehicles and cannot form the basis of emission standards applicable to conventionally powered vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 30-31]

vi. The Clean Air Act already expressly provides a regulatory scheme for Clean Fuel Vehicles in Part C of Title II. That regulatory scheme precludes the regulation of BEVs together with internal combustion engines. [EPA-HQ-OAR-2022-0829-0641, pp. 31-32]

CAA § 242(a) requires EPA to "promulgate regulations under this part containing clean- fuel vehicle standards for the clean-fuel vehicles specified in this part." A clean fuel vehicle is one that is powered by a "clean alternative fuel," which is defined to include electricity. CAA § 241(2). The state implementation plan for areas designated in severe or greater nonattainment with ozone National Ambient Air Quality Standards must include a clean-fuel vehicle program. CAA § 182(c)(4). The program must apply to centrally fueled fleets. Id. at § 246. [EPA-HQ-OAR-2022-0829-0641, pp. 31-32]

EPA cities the Clean Fuel Vehicles program as an indication that Congress generally intended to "promote further progress in emissions reductions." 88 Fed. Reg. at 29233. EPA thus points to the Clean Fuel Vehicles program as supporting its proposed interpretation that CAA §§ 202(a)(1) and (2) authorize EPA to mandate the production and sale of BEVs. But in doing so, EPA fails to address the regulatory program required under the Clean Fuel Vehicles program and fails to reconcile the particular requirements of that program with the CAA § 202(a) general rulemaking authority on which it relies as the primary authority for the Proposed Rule. [EPA-HQ-OAR-2022-0829-0641, pp. 31-32]

The Clean Fuel Vehicles program plainly requires EPA to establish a separate regulatory scheme for clean fuel vehicles, including electric powered vehicles. "Clean-fuel vehicles . . . subject to standards set forth in this part shall comply with all motor vehicle requirements of this subchapter. . . which are applicable to conventional gasoline-fueled vehicles of the same category and model year . . . except to the extent that any such requirement is in conflict with the provisions of this part." CAA § 242(b), 42 U.S.C. § 7582(b). This provision clearly signals that Congress intended for EPA to develop specific standards for clean fuel vehicles (including BEVs) and also ensure that those clean fuel vehicles comply with the separate emissions standards set for ICE powered vehicles. In the very least, Congress's explicit inclusion of electric powered vehicles in the Clean Fuel Vehicles program and its exclusion of any mention of electric powered vehicles in Section 202 must be given meaning. Compare 42 U.S.C. § 7581 with 42 U.S.C. § 7521(a), (e); Bittner v. United States, 143 S. Ct. 713, 720 (2023) ("When Congress includes particular language in one section of a statute but omits it from a neighbor, we normally understand that difference in language to convey a difference in meaning (expressio unius est exclusio alterius).") This Clean Fuel Vehicles Program would be rendered meaningless if, as in the Proposed Rule, EPA were to consider conventionally fueled vehicles together with clean fuel vehicles (including BEVs) in developing and implementing emissions standards. [EPA-HQ-OAR-2022-0829-0641, pp. 31-32]

Moreover, the Clean Fuel Vehicles program is narrowly targeted to the worst ozone nonattainment areas and to the pollutants that contribute to ambient ozone levels. The program also imposes important constraints on how vehicles may be regulated (for example, as explained above, it dictates separate emissions standards for clean fuel vehicles). These detailed and prescriptive requirements demonstrate that Congress intended EPA to regulate clean fuel vehicles only in particular ways. EPA's claim in the Proposed Rule of omnibus authority to regulate clean fuel vehicles along with conventionally fueled vehicles cannot be reconciled with the targeted and carefully crafted regulatory scheme set out in the Clean Fuel Vehicles program. [EPA-HQ-OAR-2022-0829-0641, pp. 31-32]

In sum, the CAA clearly instructs EPA as to where and how clean fuel vehicles should be regulated. Those specific requirements displace any authority EPA might otherwise have had to regulate clean fuel vehicles under the general authority of CAA §§ 202(a)(1) and (2). EPA is thus mistaken in asserting that CAA §§ 202(a)(1) and (2) authorize the proposed LDV and MDV emissions standards. In addition, by failing to explain the legal basis on which EPA purports to fulfil its obligations under CAA §§ 202 and 242, the Proposed Rule fails to provide adequate notice and opportunity to commenters on the important legal questions surrounding the scope and extent of the Clean Fuel Vehicles program and how the specific regulatory scheme established under that program can be reconciled with EPA's claim of authority under CAA §§ 202(a)(1) and (2). [EPA-HQ-OAR-2022-0829-0641, pp. 31-32]

5. Statutory Authority

The proposed rule asks for comments on whether EPA should engage in a rulemaking to address potential limits on aromatics and high-boiling material as fuel standards under CAA § 211(c). Although EPA has not proposed to engage in a rulemaking at this time, API urges the agency to avoid a costly and burdensome rulemaking effort that would exceed its authority. [EPA-HQ-OAR-2022-0829-0641, p. 53]

The proposed rule acknowledges that fuel standards would not assist the new vehicle fleet to comply with the new standards, but suggests the agency is thinking about them to reduce particulate matter from the existing fleet. However, EPA lacks authority to set fuel standards to address vehicle emissions from the existing vehicles, which are already able to comply with their applicable particulate matter standards. [EPA-HQ-OAR-2022-0829-0641, p. 53]

EPA's authority to regulate vehicle emissions applies only prospectively. EPA may only set standards for classes of "new motor vehicles." CAA § 202(a)(1). In turn, EPA may only consider controlling or regulating fuel after it has determined there are no other "economically feasible means of achieving emissions standards under section [202]." Regulating fuel cannot be needed to achieve the Section 202 standards for existing vehicles because those vehicles already meet their applicable particulate matter standards without any additional fuel regulation. Any attempt to rely on the inability of existing vehicles to comply with the particulate matter standards for new vehicles because of lack of alternative controls would be contrary to the Act's focus on prospective standards. [EPA-HQ-OAR-2022-0829-0641, p. 53]

In any event, EPA may not issue standards under CAA § 211(c) at this time because, as the proposed rule readily admits, EPA has not "considered all relevant medical and scientific evidence available to [it], including consideration of other technologically or economically feasible means of achieving" the standards under section 202. See § 202(c)(2)(A). Unless and until EPA completes that analysis and allows stakeholders an opportunity to comment on it, EPA may not set new standards under CAA § 211(c). [EPA-HQ-OAR-2022-0829-0641, p. 53]

Please note that due to the compressed comment period for such a complex request for information, coupled with the lack of an extension, API may supplement the docket. [EPA-HQ-OAR-2022-0829-0641, p. 53]

Organization: Arizona State Legislature

A. The proposed rule violates the Major Questions Doctrine because Congress did not clearly delegate EPA this authority.

But Congress has not delegated to EPA the authority to transform the automotive industry. EPA relies on Clean Air Act section 202(a)(1)-(2) for its authority to issue the proposed regulation. See 88 Fed. Reg. 29,184, 29,186 (May 5, 2023). This portion of Section 202(a) provides in full: [EPA-HQ-OAR-2022-0829-0537, pp. 4-5]

(a) Authority of Administrator to prescribe by regulation Except as otherwise provided in subsection (b)--

(1) The Administrator shall by regulation prescribe (and from time to time revise) in accordance with the provisions of this section, standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare. Such standards shall be applicable to such vehicles and engines for their useful life (as determined under subsection (d), relating to useful life of vehicles for purposes of certification), whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution. [EPA-HQ-OAR-2022-0829-0537, pp. 4-5]

(2) Any regulation prescribed under paragraph (1) of this subsection (and any revision thereof) shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period. [EPA-HQ-OAR-2022-0829-0537, pp. 4-5]

42 U.S.C. § 7521(a).

EPA's proposal extends beyond this authority because it seeks to transform the automotive industry. EPA implicitly acknowledges that its emissions standards for carbon dioxide cannot be met exclusively with existing internal combustion engines. See, e.g., 88 Fed. Reg. 29,187 ("EPA anticipates that a compliant fleet under the proposed standards will include a diverse range of technologies, including higher penetrations of advanced gasoline technologies as well as zero-emission vehicles."). In addition, EPA's analysis of requisite technology and cost-benefit balancing focuses primarily on production and purchase of electric vehicles. See, e.g., id. at 29,199 ("Note EPA projects lower maintenance and repair costs for several advanced technologies (e.g., battery electric vehicles) and those societal maintenance and repair savings grow significantly over time, and by 2040 and later are larger than our projected new vehicle technology costs."); id. at 29,201 ("While the average purchase price of vehicles is estimated to be higher, this is attributable to the larger share of [battery electric vehicles] relative to [internal combustion engine] vehicles."). Although EPA uses averaging to avoid requiring a specific percentage of electric and hydrogen- powered vehicles, EPA "projects that one potential pathway for the industry to meet the proposed standards would be through" nearly 70% battery electric vehicles for passenger cars, SUVs, and light-duty pickup trucks, and about 40% battery electric vehicles for medium duty vans and pickup trucks in model year 2032.11 [EPA-HQ-OAR-2022-0829-0537, pp. 4-5]

11 U.S. EPA Fact Sheet, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles," Apr. 2023, 5, available at https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1017626.pdf.

The transformative nature of EPA's proposal is reminiscent of EPA's past attempt to transform power plants, which the Supreme Court struck down under the Major Questions Doctrine last year. See West Virginia v. Env't Prot. Agency, 142 S. Ct. 2587 (2022). As set forth in West Virginia, the Supreme Court presumes that "Congress intends to make major policy decisions itself, not leave those decisions to agencies." Id. at 2609 (internal citation omitted). In "extraordinary cases," like here with a regulation that seeks to transform the entire automotive industry and entire American vehicle fleet, "[t]he agency instead must point to 'clear congressional authorization' for the power it claims." Id. (internal citation omitted). [EPA-HQ-OAR-2022-0829-0537, p. 5]

The Court's description of what happened in West Virginia closely resembles what EPA proposes here. "Prior to 2015, EPA had always set emissions limits under Section 111 based on the application of measures that would reduce pollution by causing the regulated source to operate more cleanly," explained the Court. Id. at 2610 (internal citation omitted). EPA "had never devised a cap by looking to a 'system' that would reduce pollution simply by 'shifting' polluting activity 'from dirtier to cleaner sources.'" Id. (internal citation omitted). Shifting polluting activity from "dirtier" to "cleaner" sources is exactly what EPA proposes here by forcing a transition from internal combustion engines powered by fossil fuel to zero-emission vehicles powered by electricity or hydrogen fuel cells. [EPA-HQ-OAR-2022-0829-0537, p. 5]

The West Virginia Court also focused on the technology-based approach to individual sources. "A technology-based standard, recall, is one that focuses on improving the emissions performance of individual sources." Id. at 2611. But "[r]ather than focus on improving the performance of individual sources, [EPA] would 'improve the overall power system by lowering the carbon intensity of power generation.' And it would do that by forcing a shift throughout the power grid from one type of energy source to another." Id. at 2611-12 (internal citation omitted) (emphasis original). With this position, "EPA can demand much greater reductions in emissions based on a very different kind of policy judgment: that it would be 'best' if coal made up a much smaller share of national electricity generation. And on this view of EPA's authority, it could go further, perhaps forcing coal plants to 'shift' away virtually all of their generation—i.e., to cease making power altogether." Id. at 2612. [EPA-HQ-OAR-2022-0829-0537, pp. 5-6]

EPA's proposed standards here require another massive shift away from current market operations. EPA projects that its proposed standards could be satisfied through a mix of nearly 70% battery electric vehicles for passenger cars, SUVs, and light-duty pickup trucks, and about 40% battery electric vehicles for medium duty vans and pickup trucks by model year 2032.12 But in 2021, less than 1% of the 250 million passenger cars, SUVs, and light-duty trucks in the United States were electric.13 [EPA-HQ-OAR-2022-0829-0537, pp. 5-6]

12 U.S. EPA Fact Sheet, supra note 11.

13 Feilding Cage, The long road to electric cars, REUTERS, Feb. 7, 2022, available at https://www.reuters.com/graphics/AUTOS-ELECTRIC/USA/mopanyqxwva/.

In West Virginia, “EPA decides, for instance, how much of a switch from coal to natural gas is practically feasible by 2020, 2025, and 2030 before the grid collapses, and how high energy prices can go as a result before they become unreasonably ‘exorbitant.’” West Virginia, 142 S. Ct. at 2612. Here, EPA is deciding how much of a switch from internal combustion engine trucks to zero-emission vehicles or hydrogen-powered vehicles is practically feasible by model years 2027 to 2032. The West Virginia Court found it “highly unlikely that Congress would leave to agency discretion the decision of how much coal- based generation there should be over the coming decades.” Id. at 2613. Instead, “[t]he basic and consequential tradeoffs involved in such a choice are ones that Congress would likely have intended for itself.” Id. [EPA-HQ-OAR-2022-0829-0537, p. 6]

The magnitude of EPA’s proposed rule implicates the Major Questions Doctrine. EPA is attempting to use emissions standards for vehicles to force a shift from gasoline-powered vehicles to electric- and hydrogen-powered vehicles. The shift will impact energy production by dropping demand for oil exploration and refineries and increasing demand for electricity generation and mining for rare earth minerals. The rule will cost billions of dollars. 88 Fed. Reg. 29,200. [EPA-HQ-OAR-2022-0829-0537, p. 6]

Under the Major Questions Doctrine, EPA must point to “clear congressional authorization” to regulate in this manner. West Virginia, 142 S. Ct. at 2614. EPA relies exclusively on Section 202(a), which provides EPA with authority to set vehicle emissions standards for any air pollutant that causes or contributes to air pollution “which may reasonably be anticipated to endanger public health or welfare.” 42 U.S.C. § 7521(a). This terse provision does not vest EPA with authority to determine the types of vehicles manufactures can make or the proper vehicle energy mix in the country. “A decision of such magnitude and consequence rests with Congress itself, or an agency acting pursuant to a clear delegation from that representative body.” West Virginia, 142 S. Ct. at 2616. [EPA-HQ-OAR-2022-0829-0537, p. 6]

Accordingly, EPA should reject the proposed rule because it violates the Major Questions Doctrine. [EPA-HQ-OAR-2022-0829-0537, p. 6]

B. The proposed rule violates the Major Questions Doctrine because it conflicts with authority Congress delegated to another agency. [EPA-HQ-OAR-2022-0829-0537, p. 7]

In determining that the Clean Power Plan violated the Major Questions Doctrine, the West Virginia Court also emphasized EPA’s lack of expertise. West Virginia, 142 S. Ct. at 2612-13. “When an agency has no comparative expertise in making certain policy judgments, we have said, Congress presumably would not task it with doing so.” Id. (internal quotations omitted). [EPA-HQ-OAR-2022-0829-0537, p. 7]

For almost 50 years, Congress has looked to the U.S. Department of Transportation to set vehicle fuel efficiency standards. 49 U.S.C. § 32902. Indeed, as recently as 2007, Congress directed the Secretary of Transportation to set a fuel efficiency improvement program for heavy-duty trucks. Id. at § 32902(k). Congress prohibited the Department of Transportation from considering electric vehicles when it sets fuel efficiency standards. Id. at § 32902(h)(2). [EPA-HQ-OAR-2022-0829-0537, p. 7]

When EPA has previously proposed vehicle greenhouse gas emissions standards, it has done so in a joint rulemaking with the Department of Transportation's National Highway Traffic Safety Administration. See Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles, 76 Fed. Reg. 57106 (Sept. 15, 2011); Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2, 81 Fed. Reg. 73478 (Oct. 25, 2016). Yet this time, EPA only "coordinated" with the Department of Transportation and the National Highway Traffic Safety Administration and did not issue a proposed joint rulemaking. 88 Fed. Reg. 29,293. In the preamble, EPA states, "EPA has similarly concluded that it is not necessary for this EPA proposal to be issued in a joint action with NHTSA." Id. [EPA-HQ-OAR-2022-0829-0537, p. 7]

EPA does not explain why it did not issue a proposed joint rulemaking with the National Highway Traffic Safety Administration. EPA claims there is no "statutory requirement for EPA to consult with NHTSA" and that its charge to protect public health and welfare is "wholly independent" of the Department of Transportation's energy efficiency mandate. Id. However, EPA does not reconcile how its independent rulemaking will affect the Department of Transportation's energy efficiency standards. EPA even rejected a request to extend the public comment period "to align with the end of the soon to be released National Highway Safety Administration (NHTSA) Corporate Average Fuel Economy (CAFE) proposed rulemaking comment deadline since the intent of NHTSA's CAFE rulemaking and your greenhouse gas (GHG) rulemaking overlaps."14 [EPA-HQ-OAR-2022-0829-0537, p. 7]

14 Letter from Alliance for Automotive Innovation to EPA, May 25, 2023, available at https://www.epa.gov/system/files/documents/2023-06/lmdv-alliance-auto-inno-comment-period-ext-req-2023-05- 25_0.pdf; Letter from EPA to Alliance for Automotive Innovation, June 2, 2023, available at https://www.epa.gov/system/files/documents/2023-06/lmdv-alliance-auto-inno-comment-period-ext-req-response- 2023-06-02_0.pdf; see also Letter from National Automobile Dealers Association to EPA, May 30, 2023, available at https://www.epa.gov/system/files/documents/2023-06/lmdv-nada-comment-period-ext-req-2023-05-30_0.pdf (expressing full support for Alliance for Automotive Innovation's request to extend the public comment period to align with NHTSA's proposed CAFE rulemaking); Letter from Hyundai Motor America to EPA, June 1, 2023, available at https://www.epa.gov/system/files/documents/2023-06/lmdv-hyundai-motor-america-comment-period-ext-request- 2023-06-01.pdf (requesting extension to align with NHTSA's proposed CAFE rulemaking).

EPA's proposed rule intrudes upon the Department of Transportation's delegated authority to determine energy efficiency standards. Under EPA's stringent standards, manufacturers that are fully compliant with the Department of Transportation's standards will be unable to meet EPA's standards without changing production to non-fossil-fuel-powered vehicles. [EPA-HQ-OAR-2022-0829-0537, p. 8]

Congress charged the Department of Transportation with setting energy efficiency standards, not EPA. This is further evidence that the proposed rule exceeds EPA's authority and violates the Major Questions Doctrine. [EPA-HQ-OAR-2022-0829-0537, p. 8]

II. The proposed rule is arbitrary and capricious because it fails to rely on a cost- benefit analysis. [EPA-HQ-OAR-2022-0829-0537, p. 8]

The proposed rule also is arbitrary and capricious. An agency rule is arbitrary and capricious if "the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise." Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983). [EPA-HQ-OAR-2022-0829-0537, p. 8]

In a Clean Air Act case involving power plant regulation, the Supreme Court held that EPA "must consider cost—including, most importantly, cost of compliance—before deciding whether regulation is appropriate and necessary." Michigan v. E.P.A., 576 U.S. 743, 759 (2015). EPA had determined that the statute conferring authority to regulate if EPA found that "such regulation is appropriate and necessary" did not require EPA to consider costs. Id. at 750-51 (citing 42 U.S.C. § 7412(n)(1)(A)). The Supreme Court found EPA's interpretation unreasonable. Id. at 760. [EPA-HQ-OAR-2022-0829-0537, p. 8]

The law applicable to EPA's proposed rule here even more expressly requires consideration of costs than the law before the Court in Michigan v. EPA. Section 202(a) requires "appropriate consideration to the cost of compliance within such period." 42 U.S.C. § 7521(a)(2) (emphasis added). And when revising standards for heavy-duty trucks or other mobile sources, which would include light- and medium-duty vehicles, Congress specifically directed EPA to consider costs: "On the basis of information available to the Administrator concerning the effects of air pollutants emitted from heavy-duty vehicles or engines and from other sources of mobile source related pollutants on the public health and welfare, and taking costs into account, the Administrator may promulgate regulations under paragraph (1) of this subsection . . . ." Id. at § 7521(a)(3)(B)(i) (emphasis added). [EPA-HQ-OAR-2022-0829-0537, pp. 8-9]

Despite this clear direction, EPA openly admits that it did not rely on a cost-benefit analysis to set the standards in the proposed rule. According to EPA, "EPA's practice has been to set standards to achieve improved air quality consistent with CAA section 202, and not to rely on cost- benefit calculations, with their uncertainties and limitations, as identifying the appropriate standards." 88 Fed. Reg. 29,198; see also 29,347 ("We recognize the uncertainties and limitations in these estimates (including unquantified benefits), and the Administrator has not relied on these estimates in identifying the appropriate standards under section 202."). EPA provides no citation of statutory authority to support its "practice," and the applicable statutes instruct EPA to do the opposite. [EPA-HQ-OAR-2022-0829-0537, pp. 8-9]

By openly admitting that it did not rely on a cost-benefit analysis to set the standards in the proposed rule, EPA runs afoul of the clear statutory requirements in Section 202(a) and the reasoning in Michigan v. EPA requiring it to consider costs. EPA's failure to consider cost-benefit analysis to set the requirements in the proposed rule is thus arbitrary and capricious. [EPA-HQ-OAR-2022-0829-0537, pp. 8-9]

Organization: California Attorney General's Office, et al.

Standards more stringent than EPA's proposed standards would comport with its statutory mandate in Section 202(a) and further the statutory objective by reducing the threats from vehicle pollution to public health and welfare. EPA projects that the proposed standards will reduce GHG emissions by more than 7.3 billion metric tons of carbon dioxide (CO_2), 120,000 metric tons of methane (CH_4), and 130,000 metric tons of nitrous oxide (N_2O) through 2055, in addition to criteria pollutant reductions of 44,000 tons per year of nitrogen oxides (NO_x), 9,800 tons per year of fine particulate matter (PM2.5), 200,000 tons per year of non-methane organic gases (NMOG), 2,800 tons per year of sulfur oxides (SOx), and 1.8 million tons per year of carbon monoxide (CO) by 2055. 88 Fed. Reg. at 29,348 (Table 135); id. at 29,351 (Table 139). More emission reductions are feasible. See CARB Comment at 17-22. Given EPA's description of these emissions reductions as an "essential factor" in its determination of the appropriate level of the proposed standards, id. at 29,344, and the primacy Congress placed on addressing pollution's danger to public health and welfare in Section 202(a), 42 U.S.C. § 7521(a)(1), our States and Cities urge EPA to increase the stringency of its standards beyond those proposed. [EPA-HQ-OAR-2022-0829-0746, p. 28]

Organization: Competitive Enterprise Institute

The IRA Does Not Override West Virginia

One week after President Biden signed the IRA,41 Senate Environment and Public Works Chairman Tom Carper (D-Del.), Harvard Law professor Jody Freeman, and other unnamed "experts" told the New York Times that "Democrats designed" certain IRA provisions to undercut West Virginia. Supposedly, those provisions supply "clear" language authorizing "aggressive" GHG regulations, including California's ZEV mandates. 42 [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

41 Public Law 117–169, August 16, 2022, https://www.congress.gov/117/plaws/publ169/PLAW-117publ169.pdf.

42 Lisa Friedman, "Democrats Designed the Climate Law to be a Game Changer. Here's How," New York Times, August 22, 2022, https://www.nytimes.com/2022/08/22/climate/epa-supreme-court-pollution.html,

To its credit, the proposal does not affirm that viewpoint, but perhaps because it says nothing about West Virginia. The proposal details the "clean vehicle" "incentives" in the BIL 43 and IRA, and touts those statutes as "pivotal milestones in the creation of a broad-based infrastructure instrumental to the expansion of clean transportation, including light- and medium-duty zero- emission vehicles."44 Careless readers may infer that the EPA is simply proposing to effectuate congressional intent. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

43 Public Law 117–58, November 15, 2021, https://www.congress.gov/117/plaws/publ58/PLAW-117publ58.pdf.

44 88 FR 29196.

For the record, the BIL and IRA do not enlarge the scope of the EPA's regulatory authorities under the Clean Air Act. The BIL mentions the Clean Air Act three times: [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

- BIL Section 11115 establishes a "Congestion mitigation and air quality improvement program" (CMAQI) and stipulates that eligible projects must use "verified technologies" as "defined in section 216 of the Clean Air Act." [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

- BIL Section 11516 requires the Comptroller General to report on the CMAQI program's progress with "respect to attainment or maintenance of national ambient air quality standards under section 109 of the Clean Air Act." [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

- BIL Section 71101 amends the 2005 Energy Policy Act's Clean School Bus program to define a zero-emission school bus as one that has zero exhaust emissions of "any air pollutant that is listed pursuant to section 108(a) of the Clean Air Act (42 U.S.C. 7408(a)) (or any precursor to such an air pollutant.)" [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

Clearly, the BIL does not amend the Clean Air Act. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

Six IRA provisions expressly amend the Clean Air Act, lending a superficial plausibility to Carper's theory. However, all those provisions are fiscal in nature; none expands or otherwise modifies existing CAA regulatory authority: [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

- IRA Section 60101 establishes a "Clean heavy-duty vehicles" program, authorizing up to $600 million in grants, rebates, and contracts for zero-emission heavy-duty vehicles, infrastructure, and workforce training. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

- IRA Section 60102 authorizes grants to reduce air pollution at ports—up to $2.25 billion through 2027 for the purchase and installation of zero-emission port equipment. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

- IRA Section 60103 establishes a "Greenhouse gas reduction fund," authorizing billions of dollars in support for States, municipalities, and tribal governments to "deploy or benefit from zero-emission technologies, including distributed technologies on residential rooftops, and to carry out other greenhouse gas emission reduction activities." [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

- IRA Section 60107 establishes a Low Emission Electricity Program, authorizing $17 million in grants and technical assistance to each of four groups—households, low- income communities, industries, and State and Tribal governments—for the purpose of reducing electricity-related emissions. The provision also authorizes $1 million for program monitoring, and $18 million for EPA efforts to ensure reductions are achieved. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

- IRA Section 60113 establishes the "Methane emissions reduction program," authorizing up to $850 million in "grants, rebates, contracts, loans, and other activities of the Environmental Protection Agency for the purposes of providing financial and technical assistance to owners and operators of applicable facilities." [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

- IRA Section 60114 authorizes billions of dollars in "greenhouse gas air pollution planning grants" to state governments. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

- IRA Section 60201 authorizes billions of dollars in "environmental and climate justice block grants." [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

In short, where the IRA amends the CAA, it authorizes subsidies, not mandates. The amending provisions create new carrots, but no new sticks.45 [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

45 For example, the IRA Low Emission Electricity Program is a non-regulatory substitute for policies President Biden could not persuade Congress to enact: a national clean energy standard, mandating a nationwide transition to 100 percent zero-emission electricity, and a Clean Electricity Performance Program, imposing tax penalties on utilities that fail to decarbonize according to a national schedule. See

Ashley J. Lawson, "Clean Energy Standards: Selective Issues for the 117th Congress," Congressional Research Service, November 2, 2021, https://crsreports.congress.gov/product/pdf/R/R46691, and Ben Adler, "Biden's emission pledge hanging by a thread after Manchin's climate budget cut," October 21, 2021, Yahoo News, https://news.yahoo.com/biden- emissions-pledge-hanging-by-a-thread-after-manchins-climate-change-budget-cut-090056653.html.

Sen. Carper, Prof. Freeman, and the other "experts" interviewed by the Times surely know that post-enactment elucidation of a statute's meaning carries little to no weight in ascertaining congressional intent. 46 As it happens, the actual legislative history Carper made on August 6, 2022 when debating the IRA on the Senate floor before passage, contradicts the post-hoc spin he later shared with the Times. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

46 And whatever interpretive force one attaches to legislative history, the Court normally gives little weight to statements, such as those of the individual legislators, made after the bill in question has become law." Barber v. Thomas, 560 U.S. 474, 486 (2010). "The Court has previously found the post-enactment elucidation of the meaning of a statute to be of little relevance in determining the intent of the legislature contemporaneous to the passage of the statute." Edwards v. Aguillard, 482 U.S. 578, 596 n.19 (1987). "This is a good example of why floor statements by individual legislators rank among the least illuminating forms of legislative history." N.L.R.B. v. SW Gen., Inc., 580 U.S. 288, 137 S. Ct. 929, 943 (2017).

Only once during the day-long Vote-A-Rama, in a two-minute exchange between Sens. Shelley Capito (R-W.Va.) and Carper, did senators debate the IRA's potential impact on West Virginia v. EPA. The exchange occurs on page 4178 of the Congressional Record.47 [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

47 Congressional Record, Senate, August 6, 2022, p. 4178, https://www.congress.gov/117/crec/2022/08/06/168/133/CREC-2022-08-06-senate.pdf.

Sen. Capito offered an amendment to strike what was then IRA Sec. 60105(g), which would appropriate $45 million for the EPA "to carry out" CAA Section 111 and eight other sections "with respect to greenhouse gases." Here is the text:

(G) OTHER ACTIVITIES – In addition to amounts otherwise available, there is appropriated to the Administrator of the Environmental Protection Agency for fascial year 2022, out of any money in the Treasury not otherwise appropriated, $45,000,000, to remain available until September 30, 2031, to carry out, with respect to greenhouse gases, sections 111, 115, 163, 177, 202, 211, 213, 231, and 612 of the Clean Air Act (42 U.S.C. 7411, 7415, 7475, 7507, 7521, 7545, 7547, 7571, and 7671k). [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

Capito warned that Sec. 60105(g) would create talking points for EPA lawyers and environmental groups "when they try and convince courts to uphold future overreaching climate regulations," such as the CPP. Sen. Carper countered that Section 60105(g) "would fund the EPA to use its existing narrow Clean Air Act authorities to address greenhouse gas emissions."48 [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

48 Emphasis added.

In short, before passage, Sen. Carper effectively denied Sec. 60105(g) would reverse or undercut West Virginia. Rather, the IRA language would fund the EPA's use of "existing narrow" CAA authorities. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

Although Capito's amendment lost on a 50-50 vote, Section 60105(g) was later deleted on a point of order. That means the final IRA does not even contain a section authorizing the EPA to use “existing narrow” regulatory authorities with respect to greenhouse gases. And, as noted above, all the CAA amendments in the IRA are fiscal policy provisions, which as such cannot create or expand any CAA regulatory authority. [EPA-HQ-OAR-2022-0829-0611, pp. 10-13]

IV. The Proposed Standards Are Unlawful as a Matter of Statutory Law

Fleet Average Standards Are Incompatible with CAA Title II

Unlike emission standards that apply to individual vehicles, the EPA’s GHG standards are fleet- average standards. That has been the case since 2010, when the EPA first promulgated GHG motor vehicle standards. The EPA’s reliance on fleet-average standards was inevitable for two main reasons. [EPA-HQ-OAR-2022-0829-0611, p. 13]

First, CO2 emissions from motor fuel consumption constitute more than 95 percent of all tailpipe GHG emissions, and no practical onboard CO2 filtration or capture technology has ever been invented. 49 That means the only feasible method of reducing tailpipe CO2 emissions per mile is to reduce fuel consumption per mile—in other words, boost fuel economy.50 [EPA-HQ-OAR-2022-0829-0611, p. 13]

49 NHTSA, Average Fuel Economy Standards for Light Trucks Model Years 2008-2011, Final Rule, 71 FR 17566, 17670, https://www.govinfo.gov/content/pkg/FR-2006-04-06/pdf/FR-2006-04-06.pdf.

50 EPA and Department of Transportation, Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards, Final Rule, 75 FR 25324, 25327, May 7, 2010, https://www.govinfo.gov/content/pkg/FR-2010-05-07/pdf/2010-8159.pdf.

Apparently, the EPA got it right when it told the Court in Massachusetts v. EPA (2007) that motor vehicle GHG standards would either uselessly duplicate or supplant NHTSA’s CAFE standards.56 In any event, the EPA’s GHG standards are fleet-average standards. [EPA-HQ-OAR-2022-0829-0611, pp. 14-15]

56 Massachusetts v. EPA, 549 U.S. 497, 513 (2007).

That is a major problem, private petitioners in Texas v. EPA contend, because the Clean Air Act “unambiguously precludes fleetwide-average emission standards under Section 202(a).”57 Nor is that all: [EPA-HQ-OAR-2022-0829-0611, pp. 14-15]

57 Petitioners’ Initial Brief, p. 38.

Fleetwide averaging also clashes with “the design and structure of [Title II] as a whole.” Utility Air, 573 U.S. at 321 (citation omitted). Title II sets forth a comprehensive, interlocking scheme for enforcing emission standards through testing, certification, warranties, remediation, and penalties. Fleetwide-average standards are incompatible with these provisions, which are “designed to apply to” individual vehicles and “cannot rationally be extended” to fleets. Id. at 322.58 [EPA-HQ-OAR-2022-0829-0611, pp. 14-15]

58 Petitioners’ Initial Brief, pp. 43-44.

My comments will now excerpt and briefly summarize petitioners’ groundbreaking argument on this critical matter. [EPA-HQ-OAR-2022-0829-0611, pp. 14-15]

To begin with, CAA Section 202(a), the EPA’s putative statutory authority “says nothing about averaging across fleets.”59 Moreover, 202(a) specifies that the standards apply “to such vehicles and engines for their useful life (as determined under subsection (d) of this section, relating to useful life of vehicles for purposes of certification).” Useful life and certification are legal concepts that apply to individual vehicles, not fleets on average. [EPA-HQ-OAR-2022-0829-0611, pp. 14-15]

59 Petitioners’ Initial Brief, p. 39.

Certification and testing are addressed more broadly in CAA Section 206, hence the full meaning of 202(a) depends on the whole of interrelated parts to which it belongs.60 [EPA-HQ-OAR-2022-0829-0611, pp. 14-15]

60 Under the “whole-text cannon,” provisions should be read in the context of other provisions to which they are linked. See Antonin Scalia and Bryan A. Garner, Reading Law: The Interpretation of Legal Texts, pp. 145-149, https://jm919846758.files.wordpress.com/2020/09/rlilt.pdf.

CAA 202(a) is explicitly linked to CAA 202(b), which “sets forth specific light-duty vehicle emission standards that EPA must promulgate in ‘regulations under’ Section 202(a).”61 Such standards, which are required for carbon monoxide, hydrocarbons, and oxides of nitrogen, “necessarily apply to vehicles individually, not to fleets on average.”62 For example: [EPA-HQ-OAR-2022-0829-0611, pp. 14-15]

61 Petitioners’ Initial Brief, p. 40.

62 Petitioners’ Initial Brief, p. 40.

The regulations under subsection (a) of this section applicable to emissions of oxides of nitrogen from light-duty vehicles and engines manufactured during model years 1977 through 1980 shall contain standards which provide that such emissions from such vehicles and engines may not exceed 2.0 grams per vehicle mile. [EPA-HQ-OAR-2022-0829-0611, pp. 14-15]

There is no room in such language for averaging. Congress did not intend to allow automakers to produce some vehicles that emit more than the standard as long as other vehicles emit less. [EPA-HQ-OAR-2022-0829-0611, pp. 14-15]

Section 202(b) testing requirements confirm that those standards apply to individual vehicles, petitioners contend:

In particular, EPA must “test any emission control system incorporated in a motor vehicle or motor vehicle engine . . . to determine whether such system enables such vehicle or engine to conform to the standards required to be prescribed under [Section 202(b) of the Act].” 42 U.S.C. § 7525(a)(2). If the system complies, EPA must issue a "verification of compliance with emission standards for such system.” 63 [EPA-HQ-OAR-2022-0829-0611, pp. 15-17]

63 Petitioners’ Initial Brief, p. 41.

Petitioners draw the only reasonable conclusion:

Those requirements plainly contemplate standards that apply to individual vehicles and their emission-control systems. Not only does the statutory text frame the inquiry as whether an individual “vehicle” or “engine” conforms to the emission standards, but the provision’s foundational premise—that an emission-control system can enable a vehicle to meet emission standards—depends on individually applied standards.64 [EPA-HQ-OAR-2022-0829-0611, pp. 15-17]

64 Petitioners’ Initial Brief, p. 42.

Other parts Section 202 further demonstrate that emission standards under Section 202(a) cannot rely on averaging, petitioners argue:

Section 202(b)(3), for example, authorizes EPA to grant waivers from certain nitrogen- oxide emission standards—which, again, are standards “under” Section 202(a), see 42 U.S.C. § 7521(b)(l)(B)—for no “more than 5 percent of [a] manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater.” Id. § 7521(b)(3). This provision would be nonsensical under a fleetwide-averaging regime. It contemplates a default under which every vehicle meets a standard, then gives manufacturers a waiver from that default for up to 5% of the fleet. But under fleetwide averaging, no waiver is needed. Instead, a vast proportion of a manufacturer's fleet—perhaps 50% or more effectively has a “waiver” so long as a sufficient number of vehicles outperform the standard. Likewise, Section 202(g), which specifies an increasing “percentage of each manufacturer’s sales volume" of each model year’s vehicles that must comply with specified emission standards, is fundamentally incompatible with averaging. Id. § 7521(g)(l).65 [EPA-HQ-OAR-2022-0829-0611, pp. 15-17]

65 Petitioners’ Initial Brief, p. 42.

The same conclusion follows from Section 202(m), under which the EPA must require manufacturers to install on “all” new light-duty vehicles and trucks “diagnostic systems” capable of identifying malfunctions that “could cause or result in failure of the vehicles to comply with emission standards established under this section.” Id. § 7521(m)(l). Petitioners comment:

As this requirement makes clear, individual vehicles must “comply with emissions standards established under [Section 202].” Id. Otherwise, requiring diagnostic equipment on “all” vehicles makes no sense. In a fleetwide-averaging regime, this requirement would be pointless, as the deterioration or malfunction of an individual vehicle's emission-related systems would provide virtually no information about whether the fleet as a whole is compliant.66 [EPA-HQ-OAR-2022-0829-0611, pp. 15-17]

66 Petitioners’ Initial Brief, p. 43.

Petitioners go on to explain that “Title II sets forth a comprehensive, interlocking scheme for enforcing emission standards through testing, certification, warranties, remediation, and penalties,” and that “fleetwide-average standards are incompatible with these provisions, which are ‘designed to apply to’ individual vehicles and ‘cannot rationally be extended’ to fleets.” A few excerpts must here suffice. [EPA-HQ-OAR-2022-0829-0611, pp. 15-17]

Under Section 206, EPA must “test, or require to be tested in such manner as [it] deems appropriate, any new motor vehicle or new motor vehicle engine submitted by a manufacturer to determine whether such vehicle or engine conforms with the regulations prescribed under [Section 202]." 42 U.S.C. § 7525(a)(l).” Petitioners comment:

Fleetwide averaging is incompatible with these requirements in at least two respects. First, by using the singular terms “vehicle” and “engine,” along with “any” and “such,” the statute contemplates that individual vehicles may be tested, determined to “not conform” with the standards, and have their certificates of conformity suspended or revoked. In a fleetwide-averaging regime, testing an individual vehicle or engine does not enable EPA to determine whether it “conforms with the regulations prescribed under [Section 202],” 42 U.S.C. § 7525(a)(l), because conformity turns not on an individual vehicle's emissions but on the fleet's average performance overall. Second, fleetwide averaging also makes it impossible to determine compliance with applicable emission standards before a vehicle is sold, as required to obtain the certificate of conformity needed for a sale. See 42 U.S.C. § 7522(a)(l) … Simply put, an after-the-fact compliance regime is incompatible with the Act's testing and certification scheme. 67 [EPA-HQ-OAR-2022-0829-0611, pp. 15-17]

67 Petitioners' Initial Brief, pp. 45-46.

Fleetwide-average standards similarly clash with Section 207 warranty provisions. Petitioners explain:

Under Section 207, a manufacturer must "warrant to the ultimate purchaser and each subsequent purchaser" "at the time of sale" that each new vehicle complies with applicable regulations under [Section 202]. 42 U.S.C. § 7541(a)(l) (emphasis added). Yet, as with certificates of conformity, manufacturers cannot warrant conformity with fleetwide-average emission standards at the time of sale, because compliance can be determined only at the end of the year. See 40 C.F.R. § 86.1865-12(i)(l) (requiring manufacturers to compute their "production weighted fleet average" by "using actual production [data]" for the year in question).68 [EPA-HQ-OAR-2022-0829-0611, pp. 17-18]

68 Petitioners' Initial Brief, p. 46.

Fleetwide-average emission standards are also inconsistent with Section 207 remediation and notification provisions. Petitioners explain:

Those provisions state that if EPA "determines that a substantial number of any class or category of vehicles or engines . . . do not conform to the regulations prescribed under [Section 202]," the manufacturer must remedy "the nonconformity of any such vehicles or engines." 42 U.S.C. § 7541(c)(l). If "a motor vehicle fails to conform," the manufacturer bears the cost. Id. § 7541(h)(l). Further, "dealers, ultimate purchasers, and subsequent purchasers" must be given notice of any nonconformity, id. § 7541(c)(2), which requires identification of specific nonconforming vehicles. None of this is possible where the nonconformity is tied to a fleet on average.69 [EPA-HQ-OAR-2022-0829-0611, pp. 17-18]

69 Petitioners' Initial Brief, pp. 46-47.

Finally, fleetwide averaging is inconsistent with Section 205 penalty provisions. Petitioners explain:

Under Section 205, any violation "shall constitute a separate offense with respect to each motor vehicle or motor vehicle engine," with each offense subject to its own civil penalty of up to $25,000. 42 U.S.C. § 7524(a) (emphasis added). Under EPA's approach, however, no individual vehicle or engine violates the applicable standard, only the fleet as a whole. The statute provides no method for calculating penalties when a fleet fails to meet its fleetwide-average standard—because it does not authorize fleetwide-average standards.70 [EPA-HQ-OAR-2022-0829-0611, pp. 17-18]

70 Petitioners' Initial Brief, p. 47.

Organization: Elders Climate Action

C. EPA's Failure to Set Zero Emission Standards Violates the CAA.

The CAA declares that the primary purpose of the Act is "to protect and enhance the quality of the Nation's air resources so as to promote the public health and welfare and the productive capacity of its population." 42 U.S.C. §7401(b)(1). To implement this purpose, section 202(b)(1)(C) grants the Administrator discretion to commence a rulemaking to revise standards previously promulgated under subsection (a)(1), but once that rulemaking is commenced, as here, the Act requires that the Administrator determine what revisions are "needed to protect public health and welfare." That statutory benchmark has not been addressed in this rulemaking, either with respect to the emission reductions needed to prevent endangerment of the public health and welfare from the climate impacts of GHG emissions, or from the impacts of criteria pollutant violations of NAAQS on public health. The failure to undertake an analysis to determine what emission standards are needed to protect public health and welfare renders this rulemaking unlawful and fundamentally flawed. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

L/MDVs that are commercially available today with zero emission power trains obviously satisfy the available technology requirement. A large fraction of the CO2 emitted from on-road vehicles comes from L/MD vehicle types that are NOW commercially available with zero emission power trains. These include transit and school buses, delivery vans, service trucks, and shuttles serving airports, hotels and resorts. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

EPA admits that ZEV technologies are available, and are the most cost-effective technologies, but the Agency only estimates the zero emission L/MDVs that will likely be available in 2027 as a result of current incentive policies and state regulations. EPA does not estimate the potential availability of zero emission L/MDVs that could be produced and sold if EPA were to promulgate zero emission standards. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

Instead EPA assumes that the rule will marginally improve the efficiency of IC engines and "induce" enough ZEV sales to reduce CO2 emissions less than 5% by 2030 from new L/MDVs sold in 2027 and subsequent years. By failing to require the production and sale of zero emission L/MDVs along with a fleet averaging rule that allows engine manufacturers to sell "dirty" uncontrolled L/MDVs through the use of emission reduction credits obtained by selling zero emission vehicles in California and section 177 states, EPA is effectively allowing engine manufacturers to capture the benefits of clean zero emission vehicles for themselves while increasing the exposure of at-risk communities to harmful pollutants in non-177 states. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

We include a legal analysis that demonstrates EPA's failure to set standards that will achieve the maximum deployment of zero emission technologies fails to achieve the public health purpose of the Act, and is not consistent with the statutory text and the legislative history of the Act. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

By setting zero emission standards for NOx beginning in 2027 for the vehicle types currently available as zero emission vehicles (ZEVs), EPA should determine the NOx emissions that would be avoided in nonattainment areas where EPA's modeling for the 2022 HD rule shows that current and proposed HD emission standards will not be sufficient to provide for attainment. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

CONCLUSION.

EPA must determine the extent to which a zero emission standard for L/MD vehicles beginning in 2027 would be needed to put our nation's vehicle fleet on a clear path to attaining the ozone and PM NAAQS by the statutory deadline. In addition, EPA must, at a minimum, use the IPCC modeling analysis and data to estimate the endangerment that will result from climate warming if global mean temperature is allowed to exceed 1.5o C as the benchmark for determining endangerment to the public health and welfare, and determine what emission standard is needed for L/MD vehicles to achieve the reductions needed to ensure that the U.S. contribution to atmospheric loadings of CO2 will be reduced to the levels need to prevent more severe effects of climate warming. Organization: Environmental Defense Fund (EDF) (1of 2)

A. EPA has authority to consider ZEV technology in setting emission standards.

The language, structure, and legislative history of the CAA clearly show that Congress granted EPA authority to consider all available technologies, including ZEV technologies, in setting emission standards under Section 202(a). More recent acts of Congress have reaffirmed legislative intent that EPA consider the emissions-reducing potential of ZEVs in its rules. [EPA-HQ-OAR-2022-0829-0786, p. 10]

Section 202(a)(1) directs EPA to set emissions standards for new “motor vehicles” -- a term defined broadly and functionally to include “any self-propelled vehicle designed for transporting persons or property on a street or highway,” 42 U.S.C. 7550(2). Such standards are applicable regardless of “whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution.”9 The Act’s language thus explicitly rejects limitations to internal-combustion engines or to particular kinds of technologies. It just as clearly includes technology beyond ICEVs, including ZEVs, which are plainly a “complete system[]” that can “prevent” pollution. [EPA-HQ-OAR-2022-0829-0786, p. 10]

9 42 U.S.C. § 7521(a)(1).

This reading of Section 202 is well supported by its core function and by the long history of its interpretation by EPA and the courts. In Section 202, Congress authorized EPA to “project future advances” in technology, and not be confined to pollution-control methods that were currently available.10 Indeed, Congress expected EPA to “adjust to changing technology.”11 Based on its clear CAA authority, EPA has factored ZEV technologies (ranging from mild hybrid technologies to fully electric battery-powered vehicles) into its rules for more than two decades.12 EPA first included ZEVs in its fleetwide averages in its 2000 “Tier 2” criteria pollutant standards.13 The agency has continued to consider and incentivize these technologies in every one of its six greenhouse gas rules for both light- and heavy-duty vehicles.14 Accordingly, its decision to do so again in this rule now that ZEV technologies are more widely available is eminently reasonable. Organization: Governing for Impact and Evergreen Action (GFI)

I. Background: the Proposed Rule & the Major Questions Doctrine

The EPA's Proposed Rule, covering light and medium duty vehicle emissions of both greenhouse gases ("GHGs") and criteria pollutants for MYs 2027-2032, appropriately fulfills the statutory obligation under Section 202(a) of the Clean Air Act ("CAA") to issue standards for motor vehicle emissions that "cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare."11 It also marks a positive and necessary step towards reducing carbon emissions in line with current domestic and international climate commitments, as well as addressing environmental justice concerns. This administration has committed to reducing GHG pollution by 50-52 percent by 2030 (relative to 2005 levels)—and policies to address pollution from the transportation sector will be critical to achieving this goal.12 The transportation sector accounts for the largest share of domestic GHG pollution (29 percent); and light duty vehicles are responsible for the largest share of greenhouse emissions within the transportation sector (58 percent).13 Despite the EPA's previous GHG regulations under Section 202(a), transportation emissions in the United States continue to grow,14 demonstrating that greater action is needed to fulfill the CAA's statutory goals and achieve this administration's climate targets. [EPA-HQ-OAR-2022-0829-0621, p. 2]

The Proposed Rule, contrary to some public commentary,18 simply follows the course laid by decades of CAA §202(a) emissions standards for new motor vehicles and motor vehicle engines.19 Since the 1970s, the EPA has used this authority to set standards for passenger vehicles that reduced deadly emissions such as lead, carbon monoxide, particulate matter, and nitrogen oxide. In the wake of the Supreme Court's 2007 decision in Massachusetts v. E.P.A., which held that carbon dioxide and other greenhouse gas emissions as air pollutants under the CAA,20 the EPA released its first Section 202(a) standard targeting GHG emissions from light duty vehicles in 2010, covering MYs 2012-2016.21 As new data about the urgency of the climate crisis and its ensuing public health impacts, especially to environmental justice communities, have emerged over the last decade, the EPA has further tightened those standards in a series of subsequent rulemakings. [EPA-HQ-OAR-2022-0829-0621, p. 3]

20 549 U.S. 497.

21 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards; Final Rule," 75 Fed. Reg. 25324 (May 2010), https://www.govinfo.gov/content/pkg/FR-2010-05-07/pdf/2010-8159.pdf.

The Proposed Rule meets the moment. It carefully balances current technological capacities, market trends, and the need to reduce emissions on the most accelerated timeline possible in order to protect public health and welfare, as the CAA demands. Because the average vehicle lifespan is 10 years, and Section 202(a) rules only apply to new vehicles, it is rational for GHG standards to become iteratively more stringent so that we can achieve our climate and pollution (and therefore our public health and welfare) goals on an adequate timeline and in response to the latest scientific data—as the Proposed Rule does. While we are also supportive of the proposed Alternative I — as we believe the statute, ambitious automaker commitments, and scientific data robustly support an even stronger standard — this comment narrowly focuses on the Proposed Rule's central proposal, which has been the subject of MQD criticism.26 [EPA-HQ-OAR-2022-0829-0621, p. 4]

26 See supra at 1.

Finally, suggestions by some opponents that the EPA must promulgate its emissions standards in coordination with the National Highway Traffic Safety Administration ("NHTSA"),75 which sets fuel- economy standards but is prohibited from taking EVs' fuel economy into account in setting those standards, are wrong. While it is true that the two agencies have jointly promulgated GHG and fuel economy regulations in the past, there is no statutory requirement that they do so—and the agencies did not do so in 2021 when the EPA promulgated 202(a) GHG regulations for MYs 2023-2026.76 In fact, the Supreme Court has described the EPA's authority to regulate carbon emissions from motor vehicles as "a statutory obligation wholly independent" from NHTSA's energy efficiency mandate regarding mileage requirements.77 [EPA-HQ-OAR-2022-0829-0621, pp. 9-10]

75 See, e.g., Private Petitioners' brief, Texas v. E.P.A., D.C. Cir. No. 22-1031.

the EPA's obligations under the CAA); Proposed Rule at fn. 388; Dan Farber, "The Car Rule and the Major Questions Doctrine," Legal Planet (April 24, 2023), https://legal-planet.org/2023/04/24/the-car-rule-and-the-major-questions-doctrine/; Proof Brief of the Institute for Policy Integrity at 10–11.

2. The Proposed Rule does not mark a novel use of the EPA's regulatory authority.

A review of the agency's past actions also weighs in the agency's favor under the MQD. The EPA has deployed the same suite of regulatory mechanisms — for example, its reliance on fleetwide averages — for decades.78 As the Proposed Rule does for zero emission vehicles, past Section 202(a) standards have encouraged automakers to develop and deploy cutting edge technologies that fulfill the statute's "public health and welfare" mandates.79 And as noted above, the Proposed Rule's modest effects on EV growth find ample precedent in previous 202(a) GHG regulations.80 [EPA-HQ-OAR-2022-0829-0621, p. 10]

78 See Proposed Rule at 29233 ("Congress also directed EPA to phase-in certain section 202(a) standards, see CAA section 202(g), which confirms EPA's authority to promulgate standards, such as fleet averages, phase-ins, and averaging, banking, and trading programs, that are fulfilled through compliance over an entire fleet, or a portion thereof, rather than through compliance by individual vehicles"). See also EPA's Proof Answering Brief, Texas v. E.P.A., D.C. Cir. No. 22-1031 10–18 (Feb. 24, 2023), https://www.edf.org/sites/default/files/2023-02/Texas%20-%20EPA%20Opening%20Brief.pdf; Proof Brief of State and Public Interest Repondent-Intervenors, Texas V. E.P.A.,D.C. Cir. 22-1031 6–19 (Mar. 21, 2023), https://www.edf.org/sites/default/files/2023-03/Texas-%20NGO%20and%20State%20brief.pdf; Proof Brief of the Institute for Policy Integrity at 8–10.

79 See infra at 13.

80 See supra at 9.

Given the importance that the MQD places on regulatory antecedents,99 the agency might consider including in its final rule a more sophisticated version of the above chart (or an analogous qualitative description), which compares the agency's GHG tailpipe rules (and perhaps its criteria pollutant rules) across a range of metrics. Such an analysis would help demonstrate to a non-expert reviewing court that the Proposed Rule does not pose an impermissibly "unheralded" or "unprecedented" exercise of agency authority. [EPA-HQ-OAR-2022-0829-0621, pp. 11-12]

99 Revesz and Sarinsky at 2 ("[T]he concept of regulatory novelty plays an important role in the doctrine under both Supreme Court precedent and lower-court application. If an action represents a marked and substantial departure from anything the agency has done before (i.e., is "unheralded"), then this could favor the application of the major questions doctrine to strike down the challenge action—so long as the doctrine's other prongs are met. If, however, the agency can point to analogous exercises of authority in the past, such a showing could strongly support the agency's statutory authority for the challenged action").

As a result, 202(a) standards have historically served a technology-forcing function, pushing the market to develop and adopt innovative technologies that will better serve the public health and welfare. In the 1970's and 1980's, for example, the EPA used its Section 202(a) authority to facilitate uptake of a then-nascent technology: catalytic converters, now commonplace.111 The fact that, some forty-plus years later, the innovation has shifted to zero emissions engines does not change the fundamental tenor of the legal analysis or EPA's core statutory responsibilities. [EPA-HQ-OAR-2022-0829-0621, p. 13]

111 See "Timeline of Major Accomplishments in Transportation, Air Pollution, and Climate Change," U.S. Enviro. Prot. Agency, https://www.epa.gov/transportation-air-pollution-and-climate-change/timeline-major-accomplishments- transportation-air (last visited June 15, 2023).

Second, as the EPA also notes in its Proposed Rule, the IRA includes language reaffirming the core holding of Massachusetts v. E.P.A. and the agency's subsequent scientific conclusions: that the EPA is obligated to regulate GHGs as air pollutants under the CAA, and specifically to regulate such emissions from mobile sources.112 In the IRA, Congress appropriated funds for states "to adopt and implement greenhouse gas and zero-emission standards for mobile sources pursuant to §177 of the Clean Air Act (42 U.S.C. 7507)."113 The CAA cross-reference in this IRA provision holds important implications. CAA §177 allows states, which are normally preempted from setting their own motor vehicle emissions standards under the CAA, to adopt California's standards (for which the EPA must waive pre-emption unless specific findings are made).114 So to expressly fund "greenhouse gas and zero emission" activities under §177 necessarily implies that these are the types of standards states would normally be preempted from pursuing because the CAA reserves their regulation to EPA. The IRA, then, necessarily implies that GHGs are regulable under the CAA.115 Indeed, during consideration and passage of the IRA, key drafters explicitly stated on the record their understanding that the IRA's provisions statutorily affirmed the Supreme Court's Mass v. EPA decision.116 [EPA-HQ-OAR-2022-0829-0621, p. 13]

112 See generally, Greg Dotson and Dustin J. Maghamfar, "THE CLEAN AIR ACT AMENDMENTS OF 2022: CLEAN AIR, CLIMATE CHANGE, AND THE INFLATION REDUCTION ACT," 53 Enviro. L. Rep. 10017, 10030 (2023), https://www.eli.org/sites/default/files/files-pdf/53.10017.pdf.

113 IRA, Pub. L. No. 117-169, §60105(g), 136 Stat. 1818 (2022).

114 See 42 U.S.C. §7507.

115 See Dotson and Maghamfar at 10030 ("If GHGs were not considered to be air pollutants or EPA could not regulate GHGs from motor vehicles pursuant to the CAA, then §177 would not apply to state GHG and zero emission standards because such standards for motor vehicles would not be preempted by §209(a)").

116 See Lisa Friedman, "Democrats Designed the Climate Law to Be a Game Changer. Here's How," N.Y. Times, https://www.nytimes.com/2022/08/22/climate/epa-supreme-court-pollution.html (Aug. 22, 2022) (quoting Senate Environmental and Public Works Chairman Tom Carper, a lead drafter, explaining that "[t]he language, we think, makes pretty clear that greenhouse gases are pollutants under the Clean Air Act"). See also Proposed Rule at 29233 (quoting House Energy and Commerce Chairman Frank Pallone explaining that the IRA "reinforces the longstanding authority and responsibility of [EPA] to regulate GHGs as air pollutants under the Clean Air act" and "the IRA clearly and deliberately instructs EPA to use" this authority by "combin[ing] economic incentives to reduce climate pollution with regulatory drivers to spur greater reductions under EPA's CAA authorities"); 168 Cong. Rec. E868–02 (daily ed. Aug. 12, 2022) (statement of Rep. Pallone); 168 Cong. Re.

Organization: Growth Energy

And, more fundamentally, it will require manufacturers to primarily make EVs at the expense of ICE vehicles—including those that can use higher blends of biofuels. Effectively picking one greenhouse gas reduction technology to the exclusion of another is arbitrary and outside the scope of EPA's authority under Section 202 of the Clean Air Act. It is also inconsistent with Congress's directive in the 2007 EISA to establish and maintain a credit system for encouraging minimum levels of biofuel use. [EPA-HQ-OAR-2022-0829-0580, p. 4]

B. There is No Rational Basis for the Disparate Treatment of EVs and Biofuels.

EPA is by no means constrained to consider only emissions from the tailpipe in Section 202 of the Act. EPA itself has already concluded as much, explaining in response to a comment on a prior tailpipe rule that:

EPA disagrees with Nissan that excluding upstream GHGs is legally required under section 202(a)(1). In this rulemaking, EPA is adopting standards under section 202(a)(1), which provides EPA with broad discretion in setting emissions standards. This includes authority to structure the emissions standards in a way that provides an incentive to promote advances in emissions control technology. This discretion includes the adjustments to compliance values adopted in the final rule, the multipliers we proposed, and other kinds of incentives. [EPA-HQ-OAR-2022-0829-0580, p. 10]

75 Fed. Reg. at 25,437.

EPA's statutory analysis is correct. Section 202(a) broadly authorizes EPA to establish "standards" applicable to harmful pollutants emitted from new motor vehicles. Despite the colloquial framing of rules promulgated under Section 202 as "tailpipe rules," nothing about Section 202 constrains the standards EPA may set to apply strictly standards that affect the amount of a pollutant emitted from the tailpipe of a vehicle. In the past, EPA has used Section 202 to create a variety of types of standards and incentives related to non-tailpipe aspects of motor vehicle, like air conditioning efficiency credits and off-cycle credits. [EPA-HQ-OAR-2022-0829-0580, p. 10]

Indeed, EPA has already created a methodology for accounting for upstream emissions from EVs; prior light-duty vehicle rules committed to begin accounting for upstream emissions above a certain cap in future years. See, e.g., 77 Fed. Reg. 62624. [EPA-HQ-OAR-2022-0829-0580, p. 10]

EPA provided the following example of how that emissions accounting would work for a Nissan Leaf:

- A measured 2-cycle vehicle electricity consumption of 238 watt-hours/mile over the EPA city and highway tests[EPA-HQ-OAR-2022-0829-0580, p. 10]

- Adjusting this watt-hours/mile value upward to account for electricity losses during electricity transmission (dividing 238 watt-hours/mile by 0.935 to account for grid/transmission losses yields a value of 255 watt-hours/mile) [EPA-HQ-OAR-2022-0829-0580, p. 10]

- Multiplying the adjusted watt-hours/mile value by a 2030 EV/PHEV electricity upstream GHG emissions rate of 0.534 grams/watt-hour at the power plant (255 watt-hours/mile multiplied by 0.534 grams GHG/watt-hour yields 136 grams/mile) [EPA-HQ-OAR-2022-0829-0580, p. 10]

- Subtracting the upstream GHG emissions of a comparable midsize gasoline vehicle of 41 grams/mile to reflect a full net increase in upstream GHG emissions (136 grams/mile for the EV minus 41 grams/mile for the gasoline vehicle yields a net increase and EV compliance value of 95 grams/mile). [EPA-HQ-OAR-2022-0829-0580, p. 10]

Id. at 82,822. While that methodology is a simplification of the upstream emissions to a certain extent, it is an easily workable estimate for the upstream emissions from EVs. EPA could and should, at a minimum, use that approach or a similar one to account for EV emissions for 2027 and later years in this rule. [EPA-HQ-OAR-2022-0829-0580, p. 10]

Yet, EPA backed away from its promise to account for upstream emissions in the 2020 rule, and it has now proposed to make the continued lack of any such accounting “permanent.” 88 Fed. Reg. at 29,252. EPA articulated two purported reasons for doing so: (1) that its regulations have “functioned as intended” without any upstream accounting by “encouraging the continued development and introduction of electric vehicle technology,” and (2) that upstream emissions are “addressed by separate stationary source programs.” Id. [EPA-HQ-OAR-2022-0829-0580, p. 10]

Neither of those justifications is a rational reason to continue deliberately underestimating the emissions from EVs. To begin with, while it is true that systematic underestimates of emissions incentivize EV development, this ignores the fact that they disincentivize development in other promising GHG-reduction technologies like biofuels. By incentivizing one technology to the exclusion of others, EPA is reducing an opportunity to develop different technologies that will be appropriate for more applications across the country. [EPA-HQ-OAR-2022-0829-0580, p. 10]

And the fact that upstream emissions are addressed by stationary source permitting programs is no justification at all. Those programs help reduce emissions but do not eliminate them—EPA’s rule still fails to estimate the true lifecycle emissions from EVs even when considering that power plants must get Title V, PSD, and NSPS permits. [EPA-HQ-OAR-2022-0829-0580, p. 10]

EPA also points out that, if it estimated upstream emissions from EVs, “it would appear appropriate to do so for all vehicles, including gasoline-fueled vehicles.” 88 Fed. Reg. at 29,252. [EPA-HQ-OAR-2022-0829-0580, p. 10]

That’s right—EPA should compare apples to apples. But that additional burden of estimating another set of upstream emissions is no reason not to do it. By comparing the lifecycle emissions of EVs and the lifecycle emissions of ICE vehicles, EPA could much better align the incentives provided by its tailpipe rules with the real world. [EPA-HQ-OAR-2022-0829-0580, p. 10]

Moreover, whether EPA has authority to require what amounts to a mandate to shift mainly to EVs across the country presents a “major question.” See West Virginia v. EPA, 142 S. Ct. 2587, 2595 (2022). And Section 202 of the Clean Air Act does not provide the necessary “clear congressional authorization” for a regulation with such a fundamental economic and practical impact on U.S. citizen’s lives. Section 202 gives EPA authority to set “standards” that relate to particular air pollutants, not the authority to pick an entire set of vehicles over another. 42 U.S.C. § 7521(a). But the latter is exactly what EPA is proposing. The proposal’s very stringent standard, combined with EPA’s decision to both underestimate the emissions from BEVs and overestimate the emissions from biofuels, means that the only way for auto manufacturers to comply is to shift rapidly towards producing primarily EVs. If finalized in its current form, the proposal would exceed EPA’s Section 202 authority under West Virginia. [EPA-HQ-OAR-2022-0829-0580, pp. 14-15]

EPA’s proposal also conflicts with Congress’s instructions to incentivize greater biofuel use in the 2007 EISA. That statute, which established the Renewable Fuel Standard (“RFS”) program, requires refiners and importers of petroleum fuels to blend increasing percentages of biofuels into their products. See Clean Air Act §211(o), 42 U.S.C. § 7545(o). So, not only does Section 202 not give any indication that Congress delegated EPA authority to effectively mandate EV usage, Section 211(o) demonstrates that Congress spoke clearly to the contrary. EPA cannot ignore Congress's instructions in one part of the Clean Air Act to better fit its policy preferences under another part. [EPA-HQ-OAR-2022-0829-0580, pp. 14-15]

Organization: HF Sinclair Corporation

The "major questions doctrine" holds that Congress must "speak clearly when authorizing an agency to exercise [such] powers" of "vast economic and political significance."4 As EPA is aware, this doctrine applies in the context of environmental regulation. Last year, in West Virginia v. EPA, the Supreme Court relied on the major questions doctrine in holding that the EPA exceeded its statutory authority in adopting the Clean Power Plan. That regulation sought to impose caps on GHG emissions by requiring utilities and other providers to shift electricity production from coal-fired power plants to natural gas and then to renewable energy in place of imposing source- specific requirements reflective of the application of state-of-the-art emission reduction technologies.5 [EPA-HQ-OAR-2022-0829-0579, p. 3]

4 Nat'l Fed. Of Indep. Bus. v. Dep't of Labor, 595 U.S. , slip op. at 6 (Jan 13, 2022); see also Ala. Assoc. of Realtors v. Dep't of Health & Human Servs., 141 S. Ct. 2485, 2489 (2021); Utility Air Regulatory Group v. EPA, 573 U.S. 302, 324 (2014); U.S. Telecom Assoc. v. FCC, 855 F.3d 381, 419-21 (D.C. Cir. 2017) (Kavanaugh, J., dissenting from denial of rehearing en banc) (explaining provenance of "major rules doctrine").

5 West Virginia v. EPA, 597 U.S. (2022).

As noted by the Court, EPA "announc[ed] what the market share of coal, natural gas, wind, and solar must be, and then require[d] plants to reduce operations or subsidize their competitors to get there."6 EPA's attempt to devise GHG emissions caps based on a generation-shifting approach would have had major economic and political significance impacting vast swaths of American life and substantially restructuring the American energy market; however, EPA's purported authority was only based on a "vague statutory grant" within Section 111(d) of the Clean Air Act—far from the "clear authorization required by [Supreme Court] precedents."7 [EPA-HQ-OAR-2022-0829-0579, p. 3]

6 Id., slip op. at 33, n.4.

7 Id., slip op. at 24. EPA's Proposed Rule here presents an analogous, if not identical, situation. Mandating a shift from ICE to PEV will reshape the American automotive market with profound collateral effects, making clear that EPA is encroaching upon an issue of "vast economic and political significance." As further discussed herein, the direct compliance costs are enormous—EPA estimates that the cost of vehicle technology (not including the vehicle or battery tax credits) would be approximately $180 billion–$280 billion respectively, in addition to over $7 billion in electric vehicle supply equipment ("ESVE") costs through 2055, and these figures do not include the complete transformation of the electric power sector.8 The Proposed Rule will go above and beyond natural market forces to change what consumers are able to purchase by requiring the production of a different product. The Proposed Rule undoubtedly forces OEMs to meet production lead times that would not exist but for EPA's new PEV mandate.

8 Proposed Rule at 29,199.

As with the Clean Power Plan, EPA lacks Congressional authorization in the Clean Air Act to impose a manufacturing shifting standard to a preferred powertrain and effectively order regulated parties to phase out combustion engine technologies. EPA's standard-setting tools are limited to those which Congress provided in Section 202(a) of the Clean Air Act. Here, EPA is only authorized to set "standards" for "emission[s]" from "any class or classes of new motor vehicles or new motor vehicle engines, which . . . cause, or contribute to," potentially harmful air pollution. EPA has elected to focus solely on tailpipe emissions and not the entire lifecycle analysis. But PEVs do not have tailpipe emissions of carbon dioxide, the pollutant of concern here, so the operation of such vehicles alone cannot "cause, or contribute to," air pollution within the constructs of a tailpipe emissions regulation, especially when EPA does not require vehicle manufactures to account for the upstream emissions from PEVs in their compliance calculations. [EPA-HQ-OAR-2022-0829-0579, pp. 4-5]

Far from "clear congressional authorization," Section 202(a) provides EPA no authority to set standards that go above and beyond that which could be achieved by improvements to ICE vehicles alone such that OEMs must completely cease to produce the underlying technology governed at the time the Clean Air Act was adopted and amended. Nor does it permit EPA to establish a fleet averaging and credit trading program as a mechanism to limit ICE sales.9 Notably, Congress instituted a clean fuel vehicles program with reference to "clean alternative fuel" vehicles, which includes BEVs, in its 1990 updates to the Clean Air Act. In doing so, Congress explicitly distinguished such vehicles from "conventional gasoline-fueled or diesel-fueled vehicles of the same category and model year," dispelling the notion that BEVs and ICE vehicles can be lumped together to set standards that will enable the former to eventually displace the latter.10 EPA does not—and cannot—explain how such authority can be read to regulate PEVs and ICE vehicles under a common standard. It is no surprise then that up until the current Administration, EPA has never claimed the authority to mandate even partial electrification. [EPA-HQ-OAR-2022-0829-0579, pp. 4-5]

9 See supra, II.B.

10 42 U.S.C. §§ 7581, 7582(b); see also § 7585(a) (defining NOx and non-methane hydrocarbon emission standards for heavy-duty clean-fuel vehicles as a percentage of conventional heavy-duty vehicles).

Congress clarified that it, not EPA, must make the important policy decisions affecting if, when, and how the American automotive industry will transition from ICE vehicles to BEVs. In the 116th Congress, for example, Congress introduced 44 bills seeking to reduce petroleum-based fuel consumption and GHG emissions from the transportation sector through customer rebates, vehicle and fuel producer incentives, local funding, development of standards, and research and development. But none went so far as to propose requiring adoption, let alone mass adoption of heavy duty PEVs through the phase-out of ICE vehicles.11 In fact, Congress rejected bills that would have banned the sale of new LD ICE vehicles by 2040,12 and it has consistently disapproved of EPA's efforts to hamstring the automotive sector with more stringent air pollution standards than are feasible.13 [EPA-HQ-OAR-2022-0829-0579, pp. 4-5]

11 "Alternative Fuel and Vehicles: Legislative Proposals," Congressional Research Service (July 28, 2021).

12 See Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019); Zero-Emission Vehicles Act of 2018, S. 3664, 115th Cong. (2018); see also 116 Cong. Rec. 19238-40 (1970) (proposed amendment to Title II that would have banned ICE vehicles by 1978).

13 See, e.g., S. J. Res. 11, 118th Cong. (2023) (Although passed only by the Senate thus far, the joint resolution calls for disapproval of the rule submitted by the Administrator of the Environmental Protection Agency relating to "Control of Air Pollution From New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards," 88 Fed. Reg. 4296 (January 24, 2023).).

It should be no surprise then in the wake of the Proposed Rule, members of Congress have requested that the Agency rescind the proposals, asserting they “effectively mandate a costly transition to electric cars and trucks in the absence of congressional direction.”14 That Congress intended for it, not EPA, to direct these policy decisions is made all the more clear by the passage of the IRA and BIL whereby Congress identified the policy levers it deemed appropriate. Congress could have, but did not, delegate the authority to (or otherwise direct) EPA to establish a fleet- wide credit trading regime to further drive PEV development and rapid adoption. Instead, the Proposed Rule stands in direct contrast to other legislation, such as the Renewable Fuel Standard Program, whereby Congress mandated that “gasoline sold or introduced into commerce in the United States” must contain a year-over-year increasing share of renewable fuels15 and, in 2022, must include tens of billions of gallons of renewable fuel.16 An EPA-mandated shift in transportation technology from vehicles that can operate on increasing volumes of renewable fuel to PEVs does not square with such requirements. Consequently, Congress, not EPA, should determine how to regulate electrification of transportation.17 [EPA-HQ-OAR-2022-0829-0579, pp. 4-5]

14 Letter from Senator Shelley Capito, et al. to Administrator Michael S. Regan, EPA (May 25, 2023); see also Senate Resolution S.J. Res. 11, 118th Congress (April 26, 2026) (Although related to heavy duty vehicles (“HDVs”), Congress has expressed its disapproval of EPA’s overreach in this space. For example, in April of this year both houses of Congress passed a Congressional Review Act resolution to rescind EPA’s December 2022 heavy duty NOx standards, sending a strong signal that Congress views EPA’s efforts in this space as unnecessary, infeasible, and uniformed in light of economic and energy security concerns); House Resolution H2523 (May 23, 2023); see also Congressional Record, H2523 (May 23, 2023) at 1444, Statement from Mr. Walberg (R-MI) (“From tailpipe emissions regulations that will force people to buy expensive and less practical EVs to new rules on power plants that will threaten the reliability of our electric grid. It seems like the EPA hasn’t even thought about the economic and energy security of our constituents.”).

15 42 U.S.C. § 7545(o)(2)(A)(i).

16 Id., § 7545(o)(2)(B); 87 Fed. Reg. 39,600 (July 1, 2022).

b. EPA Lacks Statutory Authority to Set Fleetwide Average Emission Standards, and In All Events May Not Average In Vehicles that Do Not Emit the Relevant Pollutant.

EPA lacks statutory authority under Section 202(a) of the Clean Air Act to set fleetwide emission standards, and even if it had such authority, it could not lawfully use it to force electrification by including vehicles that have no tailpipe emissions in the fleetwide average standard for ICE vehicles. The Proposed Rule results in fleetwide standards that cannot be met by ICE vehicles alone; however, under the Clean Air Act, EPA may only set individual vehicle-level emission standards. Such standards must be for “emission[s]” from “any class or classes of new motor vehicles or new motor vehicle engines, which . . . cause, or contribute to,” potentially harmful air pollution.18 The plain language of this provision authorizes EPA to set standards for classes of individual vehicles or engines that emit air pollutants. Because PEVs do not directly “cause, or contribute to,” air pollution individually within the construct of a tailpipe emissions standard, any standard applicable to “any class or classes” of vehicles cannot include PEVs. [EPA-HQ-OAR-2022-0829-0579, p. 6]

18 42 U.S.C. § 7521(a)(1).

PEVs are simply not the “technology” contemplated by Congress here. Instead, Congress enabled EPA to increase emission standard stringency through cleaner fuels and improved emissions-related systems to be incorporated into ICE vehicles such as advances in fuel injection, exhaust gas combustion management, and advances catalysts to neutralize pollutants of concern.19 By factoring in PEV performance as a part of its averaging scheme, EPA is ignoring the technological feasibility of emissions-related systems and simply requiring the production of fewer ICE vehicles. The Proposed Rule does not consider advances to ICE technologies when setting the standard. [EPA-HQ-OAR-2022-0829-0579, p. 6]

19 For example, Section 202(m) requires the monitoring of “emission-related systems” such as the “catalytic converter and oxygen sensor.” 42 U.S.C. § 7521(m)(l).

And even for criteria pollutants emitted from ICE vehicles, the Clean Air Act says nothing about averaging across fleets or banking and trading credits across different model years, different vehicle classes, and OEMs. While EPA has previously adopted fleetwide averaging, it has also acknowledged that “Congress did not specifically contemplate an averaging program when it enacted the Clean Air Act.”20 And “[j]ust as the statute does not explicitly address EPA’s authority to allow averaging, it does not address the Agency’s authority to permit banking and trading.”21 By definition, then, the Act does not address—let alone clearly authorize—the use of averaging, banking, and trading in a manner that mandates electrification of the national vehicle fleet of motor vehicles and motor vehicle engines. [EPA-HQ-OAR-2022-0829-0579, p. 6]

20 48 Fed. Reg. 33,456, 33,458 (July 21, 1983).

21 54 Fed. Reg. 22,652, 22,665 (May 25, 1989); see 55 Fed. Reg. 30,584, 30,593 (July 26, 1990) (same).

The structure of the Clean Air Act and its regulatory provisions for standard setting, certification, compliance enforcement, warranties, and penalties also directly conflict with a fleet-wide averaging regulatory regime. Notably, under Section 202(a), EPA “shall test, or require to be tested in such manner as [it] deems appropriate, any new motor vehicle or new motor vehicle engine submitted by a manufacturer” and issue a certificate of conformity “if such vehicle or engine” complies with the standards.22 And EPA must “test any emission control system incorporated in a motor vehicle or motor vehicle engine . . . to determine whether such a system enables such vehicle or engine to conform to the standards required to be prescribe under [Section 202(b)] of the Act.23 Section 202(b)(3) further authorizes EPA to grant waivers from certain nitrogen-oxide emission standards-which, again, are standards “under” Section 202(a), for no “more than 5 percent of [a] manufacturer’s production or more than fifty thousand vehicles or engines, whichever is greater.”24 This provision would be nonsensical under a fleetwide-averaging regime where, if applied, an OEM could essentially give itself a waiver for large swaths of its fleet by electrifying certain product lines. Taken together, the Clean Air Act regulatory framework contemplates EPA regulating vehicles on an individual basis according to the powertrain of those vehicles. But this cannot be accomplished if there is not a clear emission standard applicable to a single vehicle at the start of a model year. [EPA-HQ-OAR-2022-0829-0579, pp. 6-7]

22 42 U.S.C. § 7525(a)(1).

23 42 U.S.C. § 7525(a)(2).

24 42 U.S.C. § 7521(b)(3).

Organization: Institute for Energy Research (IER)

This proposed rule on tailpipe emissions standards from the Environmental Protection Agency (EPA) is a massive overreach, using a novel application of EPA motor vehicle authorities in an attempt to force a transition in the motor vehicles market to products that align with the ideological preferences of the Biden administration. This rule is a de facto electric vehicle mandate. Congress has not given EPA the authority to require the purchase or production of certain types of motor vehicles or outlaw the purchase or production of other types of vehicles. Congress has not given EPA the authority to require the purchase or production of electric vehicles. EPA's attempt to infer such power is contrary to longstanding administrative practice and contrary to recent Supreme Court precedent. Thus this rulemaking must be withdrawn and modified to fit within the motor vehicle regulatory authority granted by Congress. [EPA-HQ-OAR-2022-0829-0673, pp. 1-2]

EPA openly states that the intent of this rulemaking is to force a transition to electric vehicles [EPA-HQ-OAR-2022-0829-0673, pp. 1-2]

In this rulemaking and press announcements surrounding it, EPA repeatedly makes clear that the intent of this rulemaking is to transition the motor vehicles market to electric vehicles, pollution reduction is merely an aside. For example, the first sentence of EPA's press release announcing the rulemaking states "Today, the U.S. Environmental Protection Agency (EPA) announced new proposed federal vehicle emissions standards that will accelerate the ongoing transition to a clean vehicles future." The rulemaking itself extensively focuses on trends in electric vehicle manufacturing and announced plans from automakers and state governments regarding electric vehicles. But EPA's mandate from Congress is to reduce criteria pollutants from vehicles, not to pick and choose what type of vehicles can be sold. EPA cites an executive order from the Biden administration as impetus for this de facto electric vehicle mandate, but an executive order does not create new authority. Congress never intended the Clean Air Act motor vehicle regulations to be used to mandate or ban certain classes of product, it was always intended and has always been interpreted to give EPA the power to reduce pollution from those classes products. Yet EPA openly states that this rulemaking is meant to force a transition to electric vehicles. [EPA-HQ-OAR-2022-0829-0673, pp. 1-2]

1 https://www.epa.gov/newsreleases/biden-harris-administration-proposes-strongest-ever-pollution-standards-cars-and

EPA's statutory authority is to control emissions of vehicles, not to require the manufacture and sale of entirely different vehicles [EPA-HQ-OAR-2022-0829-0673, pp. 1-2]

Congress has not directed EPA to force the adoption of electric vehicles, EPA is claiming this mandate unilaterally. The Clean Air Act directs EPA to reduce pollutant emissions from vehicles themselves, by for example requiring emissions control devices like catalytic convertors. Electric vehicles are entirely separate products, they are not an emissions control device for internal combustion powered vehicles. EPA is thus for the first time seeking to mandate substitution of a different product in order to comply with its tailpipe emissions standards. This is a novel application of existing authority, and is frankly illegal. This illegality is made clear by an alternative scenario where EPA mandates the use of mass transit rather than individual motor vehicles. This would certainly reduce emissions from motor vehicles, but would be transparently beyond EPA's regulatory authority. [EPA-HQ-OAR-2022-0829-0673, pp. 1-2]

There is no authority to eliminate internal combustion engines or to require the sale of electric vehicles in the plain language of the Clean Air Act. That EPA is now claiming such authority raises a major question of whether Congress has in fact given EPA such authority. Without a clear statement from Congress, this claim of new authority cannot be assumed by administrative fiat. [EPA-HQ-OAR-2022-0829-0673, pp. 1-2]

EPA is attempting to hide its illegal electric vehicles mandate behind a "fleetwide" average [EPA-HQ-OAR-2022-0829-0673, pp. 2-3]

EPA is setting fleetwide average standards for vehicles rather than setting individual standards for specific classes of vehicles as a means of hiding its de facto electric vehicle mandate. While these two actions may appear indistinguishable in many applications, the distinctness is put on clear display by the EPA's proposed rulemaking here. Setting fleetwide average standards at reasonable levels allows for the inclusion of new emissions control technologies in new vehicles. This has similar effect to setting a reasonable emissions standard for each specific class of vehicles. [EPA-HQ-OAR-2022-0829-0673, pp. 2-3]

However, setting a fleetwide average at an unreasonably low level, as this rulemaking does, disguises that there is no means of compliance through new control technologies, the only means of compliance is transitioning to a different product. If EPA set the same unreasonably low standard for a given class of vehicles, it would effectively outlaw that class of vehicles. If EPA were to directly say that a class of vehicles was illegal and require that an alternative replacement must be purchased, that would be clearly acknowledged as beyond EPA's authority. Congress has given EPA no such power. But using the "fleetwide" average set at an unreasonably low rate, EPA can pretend it is not outlawing the manufacture or sale of any class of products, while it is effectively requiring carmakers to produce and sell an alternative product (electric vehicles) as that is the only way to comply with the unreasonable low standard. But hiding behind a "fleetwide" average to attempt to disguise this kind of impermissible mandate does not suddenly give EPA the power to impose such a mandate. [EPA-HQ-OAR-2022-0829-0673, pp. 2-3]

B. Battery Electric Vehicles Do Not Belong to Any Class of Vehicle Subject to Regulation under Title II of the CAA. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

EPA is explicit about its purpose in the Proposed Rule: "Our analysis projects that for the industry overall, 65 percent of new vehicles in MY 2032 would be BEVs,"7 referring to fully electrical vehicles.8 That compares to less than six percent of new vehicle registrations for fully electric vehicles last year.9 As EPA says in the Proposed Rule: [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

7 88 Fed. Reg. at 29,342.

8 EPA distinguishes between Batery Electric Vehicles ("BEVs"), which are fully electric, and other sorts of electric vehicles, such as hybrids.

9 Ana Faguy, "Planned EPA Rules Could Make 67% of New U.S. Cars Electric by 2032," Forbes, April 12, 2023.

Among the range of technologies that have been demonstrated over the past decade, electrification technologies have seen particularly rapid development and lower costs, and as a result the number of PEVs projected across all the policy alternatives considered here is much higher than in any of EPA's prior rulemaking analyses. In particular, BEVs have zero tailpipe emissions and so are capable of supporting rates of annual stringency increases that are much greater than were typical in earlier rulemakings.10 [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

10 88 Fed. Reg. at 29341

The Proposed Rule is designed to accomplish its mission by imposing emissions standards on new motor vehicles so strict that no vehicle powered by an internal combustion engine would be able to comply with them. Hence, if the Proposed Rule applied only to vehicles with emissions subject to regulation under the CAA, the rule would not satisfy statutory requirements, which include feasibility and reasonable cost-of-compliance. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

EPA gets around this by what amounts to a clever accounting trick. It defines the "classes" of vehicles subject to Title II as including EVs, even though, according to EPA, they have zero emissions and should therefore be excluded from regulation under the CAA entirely. EPA then sets "emission standards" that reflect not its estimate of how much time manufacturers of regulated vehicles would need to develop and adopt any emissions-control technology on the vehicles subject to regulation—the determination required by Section 202 of the CAA—but rather only its estimate of the average emissions from vehicles of various sizes that would result from its guestimate of the extent to which EVs will displace combustion engine vehicles during the MYs in question. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

Because Title II of the CAA provides no guidance on how the Administrator is to define the "class or classes" of vehicles subject to Section 202(a)(1), the phrase "any class or classes of new motor vehicles" must be given its natural, plain meaning. While the Administrator doubtless has wide latitude to define the classes subject to regulation under Section 202(a)(1), and no federal court has ruled on this precise question, the phrase "class or classes of new motor vehicles" cannot mean whatever the Administrator wants it to mean. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

The phrase could not, for example, include both electric scooters and gasoline-powered cars, even though both are "motor vehicles" under the Clean Air Act.11 The structure of Title II clearly precludes that possibility. Section 202(a)(2) provides that any standard issued under Section 201(a) can only take effect after "such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period." Common sense dictates that this could not be read as authorizing EPA to force car manufacturers to produce electric scooters instead of cars in order to comply with emissions standards under Title II. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

11 The CAA defines "motor vehicle" as "any self-propelled vehicle designed for transporting persons or property on a street or highway." Section 216, 42 U.S.C. Sec. 7550.

Section 202(a)(1) obviously contemplates that a "class or classes of new motor vehicles" will share a common configuration, such that "the requisite technology" can be developed and applied to all vehicles of a future MY of that vehicle class. In that sense, "class or classes of new motor vehicles" is akin to the source categories under the New Source Performance Standards program of Section 111. Clearly, EPA could not define Portland Cement Manufacturing to include artisanal pottery for the purpose of imposing the latter's emissions rates on the former. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

One further observation bears mentioning in this connection. Section 202(a) authorizes EPA to regulate emissions "from any class or classes of new motor vehicles." EPA has made no effort to study the emissions from battery EVs, because, as it explains in the Proposed Rule, "BEVs have zero tailpipe emissions." But Section 202 is not limited to "tailpipe emissions." Its purview is much broader, referring to emissions "from" new motor vehicles. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

That the word "from" is susceptible of a broader meaning becomes clear when one considers that in the Proposed Rule, EPA continues the practice, introduced in the 2014 "Tier 3" final rule, of "considering the vehicle and its fuel as an integrated system."12 As the Proposed Rule explains, "The Tier 3 standards achieved reductions of up to 80 percent in tailpipe criteria pollutant emissions by treating the engine and fuel as an integrated system and requiring cleaner fuel as well as improved catalytic emissions control systems."13 [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

12 Control of Air Pollution From Motor Vehicles: Tier 3 Motor Vehicle Emission and Fuel Standards",79 Fed. Reg. 23414, 23416 (April 28, 2014).

13 88 Fed. Reg. at 29188.

EPA's practice of treating "the engine and fuel as an integrated system" is fully in keeping with the general scope of Section 202(a). There is no reason, and no reasonable basis, for EPA not to follow this same practice with EVs that EPA insists on including EVs in its definition of "classes" of new motor vehicles subject to Title II. EVs are not perpetual motion machines. Like all other motor vehicles, they use fuel, namely the fuel needed to produce the electricity needed to charge them. And that fuel—only a small fraction of which is renewable—produces significant emissions, including carbon emissions. The difference between EVs and combustion engine vehicles is not that EVs have zero emissions, but rather that their emissions occur elsewhere than at the tailpipe. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

This is particularly important considering the massive increases in electrical grid capacity that would be required by a transition to widespread EV use. There is a limit to how much renewable energy can be put on a grid while still maintaining grid reliability, and under current technology the limit appears to be quite low: At 30 percent renewable, the California grid is beset by a massive excess of solar electricity in the middle of the day and is often on the verge of blackouts by evening, particularly in summer months.14 Hence, in the near term, the Proposed Rule will result in a massive increase in the need for dispatchable power, which (given the long construction and permitting lead-times of nuclear power) can only come from coal and natural gas. That puts the Proposed Rule on a collision course with the EPA's proposed new power plant rule,15 which will require many coal and natural gas plants to cease operations at the same time as the Proposed Rule on vehicle emissions will require many more such plants to be built. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

14 Mario Loyola, "Unleashing America's Energy Abundance Permitting Reform Is Vital for Affordable Clean Energy," Competitive Enterprise Institute, September 27, 2022.

15 New Source Performance Standards for Greenhouse Gas Emissions from New, Modified, and Reconstructed Fossil Fuel-Fired Electric Generating Units; Emission Guidelines for Greenhouse Gas Emissions from Existing Fossil Fuel-Fired Electric Generating Units; and Repeal of the Affordable Clean Energy Rule, 88 Fed. Reg. 33240 (May 23, 2023).

EPA's failure to recognize that power plant emissions associated with EVs should be considered "emissions from" such vehicles is understandable, given that Title II of the CAA was clearly not designed with EVs in mind. That only highlights the absurdity of including them in the same "classes of new motor vehicles" as combustion engine vehicles subject to regulation under Title II. It also highlights the great political significance of the choices that EPA is taking upon itself to make, on the basis of sweeping powers that it claims to have found in a long-extant provision of the Clean Air Act that explicitly delegates no such power. [EPA-HQ-OAR-2022-0829-0689, pp. 3-6]

Organization: National Association of Convenience Stores (NACS) et al.

The Proposed Rule also exceeds the scope of the Agency's statutory authority, which does not include the authority to set greenhouse gas emission standards that effectively mandate EVs. Indeed, Congress directly precluded EPA from using Section 202(a) of the Clean Air Act to phase out internal combustion vehicles. The Supreme Court has also made clear in recent decisions that an agency must have clear congressional authorization in order to exercise significant powers.2 The Agency's attempt to shift the U.S. transportation fleet to EVs is analogous to the shift in energy policy that EPA directed in the Clean Power Plan, which was rejected by the Supreme Court in West Virginia v. EPA. The Agency also projects its rule will result in enormous compliance costs, indicating that the Proposal is economically significant and therefore likely to fall within the Supreme Court's "major question" doctrine. [EPA-HQ-OAR-2022-0829-0628, p. 2]

2 See Alabama Ass'n of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021); West Virginia v. EPA, 142 S. Ct. 2587, 2609 (2022).

Organization: National Parks Conservation Association (NPCA)

I. EPA has a Statutory Mandate to Develop Strong Rules to Reduce Climate Pollution from Light and Medium-Duty Vehicles.

The Clean Air Act (CAA) explicitly calls on EPA to promulgate emission standards for motor vehicles that "cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare."1. As held by the Supreme Court in Massachusetts vs. EPA, greenhouse gases (GHGs) qualify as air pollutants that could endanger public welfare under § 202(a)(1), and EPA has statutory authority to regulate carbon dioxide and other GHG emissions from sources like light and medium-duty vehicles.2 Subsequently, EPA in their 2009 endangerment finding held that GHG emissions from motor vehicles, including LDVs and MDVs, "contribute to the total greenhouse gas air pollution, and thus to the climate change problem, which is reasonably anticipated to endanger public health and welfare."3 [EPA-HQ-OAR-2022-0829-0607, pp. 1-2]

1 42 U.S.C. § 7521(a)(1).

2 See generally, 549 U.S. 497, 531 (2007).

3 74 Fed. Reg. at 66499.

EPA thus has an affirmative duty to develop GHG standards for light and medium-duty vehicles that reflect the "greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply."4 While the CAA provides some room for considerations of cost, energy, and safety,5 "it must place primary importance on achieving the greatest degree of emissions reduction."6 We strongly agree with EPA's assessment that the greatest degree of emission reductions can be achieved through EPA acting on its statutory authority to rely on a variety of technologies to reduce LDV and MDV GHG pollution. We believe these technologies should include zero-emission vehicle (ZEV) technologies like battery electric vehicles (EVs), as well as improvements to combustion engine technologies.7 [EPA-HQ-OAR-2022-0829-0607, pp. 1-2]

4 42 U.S.C. § 7521(a)(3)(A)(i).

5 Id.

6 See Husqvarna AB v. EPA, 254 F.3d 195, at 200 (D.C. Cir. 2001).

7 See 88 Fed. Reg. at 29232-33.

We urge EPA to finalize these LDV and MDV regulations quickly and to strengthen this proposal to achieve the greatest degree of reductions that protect public health and welfare. [EPA-HQ-OAR-2022-0829-0607, pp. 1-2]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

IV. Conclusion

Given the urgency of the climate crisis, the impacts of pollution from transportation on air quality and public health, anticipated growth of the transportation sector, and the rapid growth in ZEV adoption, it is necessary and appropriate for EPA to exercise its authority in CAA Section 202(a) to establish new and more stringent GHG and criteria pollutant and emissions standards for MYs 2027 and later LDVs and MDVs. NESCAUM and the OTC urge EPA to finalize a rule with the most stringent standards feasible. [EPA-HQ-OAR-2022-0829-0584, p. 12]

Organization: Pacific Legal Foundation (PLF)

Analysis

I. The Proposed Tailpipe Rule violates the major questions doctrine.

A. The major questions doctrine prevents executive agencies from issuing rules with "vast political and economic consequences" without clear congressional authorization.

Courts have long applied clear statement rules to protect the freedom provided by the Constitution's structure and protect foundational constitutional guarantees.5 As Chief Justice Marshall explained, "the laws of the United States ought not, if it be avoidable, so to be construed as to infract the ... general doctrines of national law."6 The major questions doctrine is one such clear statement rule. It is grounded in the Constitution's exclusive delegation of legislative power to Congress and protects against other branches from claiming unheralded subdelegations of that power. In this way, the doctrine presumes that Congress did not seek to transgress the Constitution's nondelegation limits through vague, open-ended statutory text. In other words, the major questions doctrine, like the nondelegation doctrine, "ensures that the national government's power to make the laws that govern us remains where Article I of the Constitution says it belongs— with the people's elected representatives."7 [EPA-HQ-OAR-2022-0829-0680, pp. 3-6]

5 See West Virginia v. EPA, 142 S. Ct. 2587, 2616 (2022) (Gorsuch, J., concurring).

6 Talbot v. Seeman, 5 U.S. 1, 43 (1801).

7 Nat'l Fed'n of Indep. Bus. v. Dep't of Lab., 142 S. Ct. 661, 668 (2022) (Gorsuch, J., concurring). See also id. at 669–70 (Gorsuch, J., concurring) ("Whichever the doctrine, the point is the same[:] Both serve to prevent 'government by bureaucracy supplanting government by the people.'").

The doctrine thus is grounded in "separation of powers principles,"8 and requires "Congress to speak clearly when authorizing an agency to exercise powers of vast economic and political significance."9 [EPA-HQ-OAR-2022-0829-0680, pp. 3-6]

8 West Virginia, 142 S. Ct. at 2609.

9 Alabama Ass'n of Realtors v. Dep't of Health & Hum. Servs., 141 S. Ct. 2485, 2489 (2021) (per curiam) (internal quotation marks omitted).

The principle is not new. As Justice Gorsuch recently explained, "[s]ome version of [the major questions doctrine] can be traced to at least 1897," when the Supreme Court in ICC v. Cincinnati denied the agency's "vast and comprehensive" claim of authority absent a clear delegation in the statutory text.10 In ICC, the Court found that claims of delegations of legislative power to "any administrative body is not to be presumed or implied from any doubtful and uncertain language."11 And this principle has persisted, in some form or another, in state and federal courts throughout the last 125 years.12 [EPA-HQ-OAR-2022-0829-0680, pp. 3-6]

10 West Virginia, 142 S. Ct. at 2619 (Gorsuch, J., concurring) (citing ICC v. Cincinnati, N. O. & T. P. R. Co., 167 U.S. 479, 499 (1897)).

11 Id.

12 Louis Capozzi, The Past and Future of the Major Questions Doctrine, 84 Ohio St. L.J., vol. 84, no. 2, 191 (2023) (explaining the major questions doctrine's history in state and federal courts to prevent agencies from expanding their regulatory reach without a clear statement from respective legislative branches).

While the doctrine's principle is not new, it has become more prominent over the last few decades as the primary constitutional check against executive lawmaking. This is because the federal government today is characterized by "presidential administration," as famously described by then-professor Elena Kagan.13 Because of the relative ease of regulating compared to legislating, the President—and not Congress—now leads "in setting the direction and influencing the outcome of" administrative policy.14 Rather than go through proper constitutional procedures and persuade lawmakers to enact laws, contemporary presidents bypass the Constitution's checks and balances and chart a unilateral path by directing agencies to adopt expansive interpretations of long-extant statutes.15 [EPA-HQ-OAR-2022-0829-0680, pp. 3-6]

13 Elena Kagan, Presidential Administration, 114 Harv. L. Rev. 2245, 2248 (2001) (describing how "presidential control of administration … expanded dramatically during the Clinton years").

14 Id. at 2246.

15 To be sure, the President has the authority, indeed the duty, to make sure the laws are "faithfully executed." See Free Enterprise Fund v. Public Co. Accounting Oversight Bd., 561 U.S. 477, 498 (2010). But that does not mean the executive branch may transgress the Constitution's Separation of Powers through the laws' execution.

To curb the worst excesses of executive lawmaking inherent to "presidential administration," the Supreme Court has embraced the major questions doctrine. For example, the case that ushered in the resurgence of the doctrine, FDA v. Brown & Williamson Tobacco Corp., involved a challenge to one of the first examples of "presidential administration": a sweeping tobacco regulation ordered by President Clinton in the late 1990s.16 And the trend has continued. Indeed, the Supreme Court has applied the major questions doctrine mainly when presidents compelled agencies to exercise novel and capacious authority.17 [EPA-HQ-OAR-2022-0829-0680, pp. 3-6]

16 Compare 529 U.S. 120, 133 (2000) (reviewing tobacco regulation under major questions framework), with Kagan, 114 Harv. L. Rev. at 2282–83 (using same tobacco regulation as exemplar of presidential administration).

17 See, e.g., Biden v. Nebraska, No. 22-506, 2023 WL 4277210 (U.S. June 30, 2023); Nat'l Fed'n of Indep. Bus., 142 S. Ct. 661 (reviewing agency's vaccine mandate ordered by the president); Alabama Ass'n of Realtors, 141 S. Ct. 2485 (reviewing agency's eviction moratorium requested by the president).

This executive branch overreach is nowhere more pronounced than in environmental regulation. For years, presidents have directed EPA and similar agencies to expand their power and "update" laws to fit modern environmental problems—most prominently through the Clean Air Act. But the Court has been unwilling "to stand on the dock and wave goodbye as EPA embarks on [] multiyear voyage[s] of discovery" under the Act.18 [EPA-HQ-OAR-2022-0829-0680, pp. 3-6]

18 Util. Air Regul. Grp. v. EPA, 573 U.S. 302, 328 (2014).

Most recently, the Court applied the major questions doctrine to the EPA's overreach in West Virginia. After failing to persuade Congress to enact a bill addressing climate change, President Obama directed EPA to use the Clean Air Act to regulate powerplants and require them to "shift" from using traditional forms of energy, such as coal and natural gas, to "clean energy" such as wind and solar.19 [EPA-HQ-OAR-2022-0829-0680, pp. 3-6]

19 West Virginia, 142 S. Ct. at 2602–03.

The Court held EPA did not have this power. In doing so, the Court explained there are "extraordinary cases" where "both separation of powers principles and a practical understanding of legislative intent" should make courts hesitant to "read into ambiguous statutory text the delegation claimed to be lurking there."20 "To convince" the Court "otherwise, something more than a merely plausible textual basis for the agency action is necessary." Id. Instead, under the major questions doctrine, an agency "must point to clear congressional authorization for the power it claims." Id. EPA flunked the test. [EPA-HQ-OAR-2022-0829-0680, pp. 3-6]

20 Id. at 2609 (citing Util. Air Regul. Grp., 573 U.S. at 324).

Organization: POET, LLC

Under EPA's own justification for the Proposed Rule, bioethanol is an essential strategy that must be recognized and given due credit under the GHG standards. EPA justifies the proposal based on (i) GHG emission reduction benefits, (ii) manufacturer cost and consumer cost, (iii) energy security, (iv) “criteria” and toxic air pollutant reductions, and (v) environmental justice.7 EPA inadequately addresses each of these key factors because EPA fails to consider the benefits of bioethanol for each. By taking this narrow approach that effectively pushes biofuels out of the market, EPA undermines its own criteria for undertaking the Proposed Rule. [EPA-HQ-OAR-2022-0829-0609, pp. 5-6]

7 See e.g., 88 Fed. Reg. at 29347.

The Proposed Rule’s analytical gaps regarding the failure to credit real-world biogenic lifecycle emission benefits and BEV feasibility call into question the legality of the Proposed Rule as currently structured. As EPA knows, courts will invalidate rules if the agency has “entirely failed to consider an important aspect of the problem” or “offered an explanation for its decision that runs counter to the evidence before the agency.”8 Additionally, the United States Supreme Court in West Virginia v. EPA faulted EPA for exercising Clean Air Act authority to “substantially restructure the American energy market” in a way that “Congress had conspicuously and repeatedly declined to enact itself.”9 By pressing for the extraordinarily rapid deployment of light-duty BEVs without thoroughly evaluating the lifecycle drawbacks of BEVs and BEV feasibility, supply chain and infrastructure challenges, and by failing to credit the lifecycle benefits of biofuels, the Proposed Rule is similarly deficient. [EPA-HQ-OAR-2022-0829-0609, pp. 5-6]

8 Motor Vehicles Mfrs. Ass’n v. State Farm Mutual Automobile Ins. Co., 463 U.S. 29, 43 (1983).

9 142 S. Ct. 2587, 2610 (2022) (quotation omitted). Similarly, under the “major questions” doctrine, agencies may not construe a statute to authorize them to exercise powers of “vast economic and political significance” unless the statute does so in clear terms. Alabama Ass’n of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021) (quoting Utility Air, 573 U.S. at 324 (2014)).

If EPA adds incentives for the real-world GHG benefits of renewable liquid fuels, EPA’s rule would build on historical carbon-reducing policies and help ensure the success of its light- duty GHG emission reduction program. EPA’s vehicle GHG program would not be, as the West Virginia Court put it, an impermissible “transformative expansion of” the agency’s “regulatory authority.”10 Instead, if EPA revises its proposed approach so as to credit bioethanol’s real-world GHG emission reductions, EPA would have more well-considered, legally durable, flexible, cost-effective, and successful regulations to reduce GHG emissions. [EPA-HQ-OAR-2022-0829-0609, p. 6]

10 West Virginia, 142 S. Ct. at 2595.

B. EPA Has the Authority to Set GHG Emissions Standards Based on Lifecycle GHG Emissions Reductions. [EPA-HQ-OAR-2022-0829-0609, pp. 11-12]

EPA has broad authority under Clean Air Action § 202 to set vehicle emissions standards that extends beyond tailpipe emissions reductions to other emissions in the fuel and vehicle manufacturing lifecycle. Clean Air Act § 202(a) requires EPA to set vehicle emissions standards for any air pollutant the Administrator determines may reasonably be anticipated to endanger public health or welfare. EPA may regulate emissions of such a pollutant “from any class or classes of new motor vehicles or new motor vehicle engines.”30 The statute does not expressly limit EPA to regulating emissions only from vehicle tailpipes or the engines themselves. Instead, it is broadly worded to include emissions of any air pollutant that “cause[s], or contribute[s] to, air pollution.”31 Lifecycle (upstream) emissions, especially for GHGs, fit that description.32

And in Massachusetts v. EPA, the Supreme Court confirmed EPA's broad authority to regulate additional, non-specified pollutants, provided the agency determines they endanger the public health or welfare.33 [EPA-HQ-OAR-2022-0829-0609, pp. 11-12]

30 42 U.S.C. § 7521(a)(1).

31 Id.

32 Other constraints in § 202(a) do not bar EPA from considering lifecycle emissions. The statute states that EPA's standards must apply to vehicles and engines during their useful life, cannot take effect until after a time that the EPA Administrator determines is necessary for the development and application of the technologies needed to meet EPA's standards, and must consider costs. Id. § 7521(a). None of those provisions prohibit EPA from crediting bioethanol vehicles for their positive lifecycle GHG emissions benefits.

33 See Massachusetts v. EPA, 549 U.S. 497, 506-07 (2007).

The best reading of Clean Air Act § 202(a) is that it mandates that EPA consider lifecycle GHG emissions as part of considering GHG emissions "from" motor vehicles. Otherwise, EPA would be failing "to consider an important aspect of the problem" in violation of U.S. Supreme Court precedent in Motor Vehicle Manufacturers Association v. State Farm.34 Emissions of GHGs, which are a globally mixed pollutant, from any phase of a LDV's lifecycle should be equally subject to § 202(a). Biofuels address the hazards caused by GHG emissions by reducing emissions on a lifecycle basis. As a result, the benefits generated by bioethanol in reducing lifecycle GHG emissions must be recognized through a crediting mechanism or other compliance flexibility benefits. [EPA-HQ-OAR-2022-0829-0609, pp. 12-13]

34 See Motor Vehicle Mfrs. Ass'n v. State Farm, supra. If EPA considers accounting for upstream emissions inappropriate under 202(a), query if 202(a) is inappropriate for addressing GHGs at all since GHGs are a globally mixed pollutant not a "tailpipe" pollution issue. Such a question is timely now since EPA proposes in this rulemaking to affirmatively ignore EV upstream emissions (as opposed to temporarily excluding upstream emissions when EVs were only an emerging and de minimis share of the vehicle market).

Courts interpreting § 202 have also found that EPA has the type of discretion sufficient to allow crediting bioethanol compatible vehicles for their lifecycle benefits. The D.C. Circuit has observed that "[m]anufacturers produce a wide variety of motor vehicles of different sizes, some using different engine technologies resulting in unusual emission characteristics."35 If EPA's authority to set emissions standards is flexible enough to address those varying vehicle characteristics, it should be similarly flexible to allow EPA to credit lifecycle emissions reductions from bioethanol. Under a common sense reading of section 202(a), EPA's ability to regulate GHGs from vehicles includes those lifecycle emissions. [EPA-HQ-OAR-2022-0829-0609, pp. 12-13]

35 Nat. Res. Def. Council, Inc. v. U. S. Envtl. Prot. Agency, 655 F.2d 318, 322 (1981).

EPA's statements in the Proposed Rule are consistent with the need for the vehicle GHG program to address lifecycle GHG emissions beyond a narrow focus on tailpipe emissions. EPA observes that, "[s]ince the earliest days of the CAA, Congress has emphasized that the goal of section 202 is to address air quality hazards from motor vehicles, not to simply reduce emissions from internal combustion engines to the extent feasible."36 While EPA is referring to electric vehicles, that sentiment also applies to the need for EPA to credit the lifecycle benefits of bioethanol. EPA's goal is to address air quality hazards from carbon dioxide emissions associated with classes of vehicles. One ton of GHG emissions causes the same harm whether it is released from a vehicle tailpipe or further upstream. [EPA-HQ-OAR-2022-0829-0609, pp. 12-13]

36 88 Fed. Reg. at 29233.

The Proposed Rule's discussion of the legislative and regulatory history regarding automotive emissions under the Clean Air Act repeatedly refers to alternative power sources and fuels, which further supports EPA's authority to establish a crediting program that accounts for bioethanol's lifecycle emissions benefits.37 Nothing in the record suggests that alternative power sources exclude other low-carbon alternatives, such as liquid renewable fuels. [EPA-HQ-OAR-2022-0829-0609, pp. 12-13]

37 Id.

The Proposed Rule, in fact, confirms that EPA believes it can regulate upstream emissions under § 202. EPA notes that its own current regulations would require "upstream emissions accounting for BEVs and PHEVs as part of a manufacturer's compliance calculation" to begin in MY 2027.38 EPA is now proposing, for the very first time, to permanently eliminate that upstream emissions accounting.39 But the fact that the current regulations do account for upstream emissions demonstrates that EPA knows it has the power to account for them in this Proposed Rule as well. [EPA-HQ-OAR-2022-0829-0609, pp. 12-13]

38 Id. at 29197.

39 Id.

Incorporating lifecycle emissions reductions into the Proposed Rule is the best reading of § 202 for carbon dioxide as an air pollutant, because, unlike other regulated substances, carbon dioxide (as a GHG) is a global, rather than a local, pollutant, meaning that it does not necessarily cause adverse effects in the specific places where emitted. GHGs instead result in adverse effects at a global scale, such as rising sea levels and eroding coastlines, flooding, more frequent and intense storms, melting polar icecaps, and droughts. A GHG emissions rule that focuses only on tailpipe emissions when emissions at all lifecycle stages have equal import is the very definition of arbitrary and capricious.40 [EPA-HQ-OAR-2022-0829-0609, pp. 12-13]

40 See Section III.e of these comments regarding absurd results in terms of emissions increases that may arise from the Proposed Rule as currently structured.

EPA has broad authority under Section 211(c)(1)(A) of the Clean Air Act to issue regulations controlling fuels or fuel additives that cause and/or contribute to air pollution that may endanger public health.155 This authority permits EPA to limit high-boiling compounds/heavy aromatics because these fuel additives contribute to PM emissions which endanger public health. Pursuant to Section 211(c)(2)(A), EPA must consider all relevant scientific evidence available to the agency when setting these standards, including the significant evidence that bioethanol blending is the most practicable replacement for heavy aromatics, and that bioethanol has particularly significant emissions benefits for PM, other criteria pollutants, and GHGs.156 The further reduction of aromatics in gasoline would also be consistent with EPA's mandates and authority under the Mobile Source Air Toxics Program.157 [EPA-HQ-OAR-2022-0829-0609, p. 33]

155 42 U.S.C. § 7545(c)(1)(A).

156 Id. § 7545(c)(2)(A).

157 See Control of Hazardous Air Pollutants from Mobile Sources, 72 Fed. Reg. 8428 (Feb. 26, 2007).

Bioethanol does not receive the credit it deserves as a powerful tool in reducing both criteria pollutant and GHG emissions. Replacing heavy aromatics with bioethanol blending would maintain octane levels, reduce tailpipe PM emissions, and reduce lifecycle GHG emissions, furthering many of EPA's Clean Air Act mandates. EPA should carefully consider the benefits of bioethanol blending as a key solution in any potential rulemaking to further reduce tailpipe PM reductions. [EPA-HQ-OAR-2022-0829-0609, p. 33]

Organization: Renewable Fuels Association (RFA)

VIII. EPA Lacks Legal Authority to Force Electrification of the U.S. Transportation Fleet

Because of its emphasis on promoting EVs, EPA's proposed rule exceeds the scope of its statutory powers, which do not include authority to set GHG emission standards that effectively mandate electric vehicles. Indeed, Congress directly precluded EPA from using Section 202(a) of the Clean Air Act to phase out internal combustion vehicles. Section 202(a) requires EPA to set standards for emissions from any class or classes of new motor vehicles or new motor vehicle engines which cause or contribute to potentially harmful air pollution. If EPA maintains its assumption that electric vehicles do not emit any CO2 or other air pollution—which is inaccurate, as explained throughout these comments—it may only set standards for internal combustion vehicles. [EPA-HQ-OAR-2022-0829-0602, pp. 13-14]

In addition, EPA must have clear congressional authorization to promulgate electrification-forcing regulations, and it does not have that authorization here. The Supreme Court has made clear in recent decisions that an agency must have clear congressional authorization in order to exercise significant powers.30 EPA's attempt to shift the U.S. transportation fleet to EVs is analogous to the shift in energy policy that EPA directed in the clean power plan, which was rejected by the Supreme Court in West Virginia v. EPA. EPA also projects its standards will result in enormous compliance costs, indicating that the rule is economically significant and therefore likely to fall within the Supreme Court's "major question" doctrine. [EPA-HQ-OAR-2022-0829-0602, pp. 13-14]

30 See Alabama Ass'n of Realtors v. HHS, 141 S. Ct. 2485, 2489 (2021); West Virginia v. EPA, 142 S. Ct. 2587, 2609 (2022).

EPA's proposed rule is also arbitrary and capricious because it fails to accurately account for the GHG emissions reductions achieved by both EVs and biofuels. EPA should use the best available science to accurately account for the lifecycle carbon intensity associated with particular fuels and technologies, but its proposed approach ignores the upstream emissions and emissions from electricity generation associated with EVs. Specifically, EPA proposes to assign a value of 0 grams/mile to EVs, which in effect assumes that electricity and battery minerals powering EVs are always 100% renewable and free of any CO2 emissions impacts. This assumption is flawed because the CO2 emissions associated with producing and transmitting electricity, as well as the emissions linked to critical mineral extraction and battery production, are significant. Indeed, lifecycle analysis studies show that some EVs (using coal-generated electricity and battery minerals from intensive mining practices) may have a larger carbon footprint than conventional vehicles using internal combustion engines. At the same time, EPA's proposal fails to recognize or account for the meaningful CO2 emissions savings that can be achieved through greater use of low-carbon ethanol in vehicles designed to accommodate higher blends (e.g., flex fuel vehicles). [EPA-HQ-OAR-2022-0829-0602, pp. 13-14]

In sum, we urge EPA to revise its proposal to create a technology neutral rule that accounts for all lifecycle emissions of the vehicles it regulates. A technology neutral rule will not only avoid some of the legal issues EPA's current proposal will face, but incentivizing multiple technologies is also the best way for EPA to achieve its ambitious goals. [EPA-HQ-OAR-2022-0829-0602, pp. 13-14]

Organization: South Dakota Department of Agriculture and Natural Resources (DANR)

Thank you for the opportunity to comment on the proposed regulations for both the light-duty/ medium-duty vehicles and heavy-duty vehicles - phase 3 published in the federal register on April 27, 2023, and May 5, 2023. [EPA-HQ-OAR-2022-0829-0523, p. 1]

DANR opposes the proposed emissions standards for the following reasons:

Lack of Clear Authority

EPA's fact sheet states the proposed standards would contribute "toward the goal of holding the increase in the global average temperature to well below 2 degrees Celsius ...." The U.S. Supreme Court has consistently told EPA it may not expand its federal regulatory reach beyond what Congress has given it authority to implement. The U.S. Congress has not established this 2 degrees Celsius goal under the requirements of Clean Air Act, and this goal is not found in a promulgated regulation. Using this standard for justification for the proposed regulations falls under the Supreme Court's major questions doctrine. It is evident that EPA lacks clear authority from Congress to require a generation-shifting approach to reduce vehicle emissions. Therefore, DANR does not think EPA has clear authority to implement these proposed emission standards and views this effort as federal overreach. [EPA-HQ-OAR-2022-0829-0523, p. 1]

Electric Vehicle (EV) Mandate

The proposed emissions standards are based on the projection that 70 percent of all new light duty passenger vehicles will need to be EVs for manufacturers to meet the standards. Setting the standards based on a projected level of EV production essentially mandates the manufacturing of EVs to comply. As discussed below, EVs do not make sense in all situations and environments and EPA should not be setting emissions standards that mandate their production. [EPA-HQ-OAR-2022-0829-0523, p. 2]

Organization: Southern Environmental Law Center (SELC)

EPA must adopt the strongest possible standards for light- and medium-duty vehicles under the Clean Air Act. [EPA-HQ-OAR-2022-0829-0591, p. 6]

Given the substantial impacts that light- and medium-duty vehicle emissions have on communities and the environment, EPA must adopt the most stringent standards possible under the Clean Air Act. As EPA correctly notes, "Congress has emphasized that the goal of [this Clean Air Act provision] is to address air quality hazards from motor vehicles, not to simply reduce emissions from internal combustion engines to the extent feasible[]" and that it expects

EPA “to press for the development and application of improved technology rather than be limited by that which exists.”51 We are now at a point where technology already exists that eliminates—not just reduces—tailpipe pollution, and EPA should therefore implement tailpipe emissions standards that accelerate the transition to ZEVs. [EPA-HQ-OAR-2022-0829-0591, p. 6]

51 Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 83 Fed. Reg. 29184, 29233 (May 5, 2023) (internal quotations omitted).

Organization: Steven G. Bradbury

My comments are divided into two parts:

First, I will explain why I believe these proposed rules far exceed the EPA’s authority under section 202 of the Clean Air Act4 and clearly implicate the Supreme Court’s “Major Questions Doctrine” under West Virginia v. EPA and related cases.5 Thus, if finalized as proposed, these rules would be “in excess of statutory … authority” within the meaning of the Administrative Procedure Act, or APA.6 [EPA-HQ-OAR-2022-0829-0647, p. 2]

4 42 U.S.C. § 7521, https://www.law.cornell.edu/uscode/text/42/7521.

5 See West Virginia v. EPA, No. 20-1530, 597 U.S. (2022), https://www.oyez.org/cases/2021/20-1530.

6 See 5 U.S.C. § 706(2)(C) (“The reviewing court shall … hold unlawful and set aside agency action, findings, and conclusions found to be … in excess of statutory … authority.”).

The Proposed Rules Exceed EPA’s Statutory Authority

Congress has never voted to cede to the Administrator of the EPA the far-reaching power and discretion the Agency is claiming in these rulemakings. There has been no dele- gation from the people’s elected representatives—let alone a clear and express delega- tion—of such economy-wide transformational power that could survive analysis under the Major Questions Doctrine. [EPA-HQ-OAR-2022-0829-0647, pp. 3-4]

If finalized as proposed, these rules would exceed the bounds of EPA’s statutory authority in two fundamental respects—one relating generally to the Agency’s regulation of carbon dioxide emissions from new motor vehicles; the other involving its leveraging of pollution-control authority to force on the American people a hyper-accelerated transi- tion to electric vehicles. [EPA-HQ-OAR-2022-0829-0647, pp. 3-4]

This scheme bears no resemblance to EPA’s past approach to the regulation of vehicle emissions under the Clean Air Act. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

Previously, when EPA has set emissions limits for criteria pollutants under section 202, the available control technologies that EPA has recognized as feasible for achieving compliance have involved cleaner fuels and discrete types of equipment added to the ICE vehicle. This equipment includes, for example, enhanced catalytic converters to capture certain types of pollutants and scrub them out of the vehicle’s exhaust, onboard computers to control more precisely the fuel mixture burned by the vehicle’s engine, vapor-capture systems for refueling, and fuel-injection systems to recycle unburned fuel back into the cylinders. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

The use of these types of discrete control technologies has already achieved impres- sive reductions in smog-producing criteria pollutants. As EPA itself acknowledges, exist- ing control technologies applied under previous regulations have enabled automakers to attain “reductions of up to 80 percent in tailpipe criteria pollutant emissions” from ICE vehicles.21 [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

21 88 FR at 29188.

But now, in these rules, EPA is proposing to do something radically different. The so-called control technology here is not some discrete equipment added to the ICE vehicle to achieve lower emissions; it is entirely separate replacement technology that uses a new and different powertrain. These are replacement vehicles, not true control technology; they are different vehicles from bumper to bumper, built on entirely different production lines. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

The EPA’s current proposals are thus closely analogous to the Clean Power Plan that was struck down by the Supreme Court last year in West Virginia v. EPA:

There, EPA was relying on its Clean Air Act authority to regulate power plant emis- sions based on the “best system of emission reduction” available to the plant operator. EPA had previously exercised that authority by setting emissions standards that required indi- vidual plants to take measures “to operate more cleanly.” But in the Clean Power Plan, EPA concluded that coal-fired power plants could not eliminate enough carbon dioxide emissions to satisfy EPA simply by employing additional measures at the plant. Instead, EPA proposed to require them to choose between greatly reducing their own electricity production (potentially even shutting down the plant) or paying to subsidize increased elec- tricity generation from alternative sources, including natural gas, wind, and solar power (the so-called “generation shifting” concept). The overall goal was to reduce the percentage of national electricity generation supplied by coal and increase the percentage contribution from wind and solar. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

The Supreme Court held that the Clean Power Plan implicated the Major Questions Doctrine because EPA was claiming the power to “restructure the American energy mar- ket,” and this represented a “transformative expansion” in the Agency’s exercise of its regulatory authority. The Court was unconvinced that Congress had “implicitly tasked” the EPA “with balancing the many vital considerations of national policy implicated in deciding how Americans will get their energy,” or with the authority to decide “how much of a switch from coal to natural gas is practically feasible” for the nation. There was “little reason to think Congress” had assigned matters of such economic and political significance to the EPA’s discretion. “The basic and consequential tradeoffs involved” are “ones that Congress would likely have intended for itself.” [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

Everything the Supreme Court said about the Clean Power Plan can be said about the EPA’s current proposals for regulating vehicle emissions. As it tried to do with the power market, EPA is now attempting to leverage its authority to set emissions limits for particu- lar types of vehicles into a grand new scheme for shifting and rebalancing the overall mix of ICE, battery-electric, and other powertrains in the national auto fleet—an extravagant role for the Agency to play, and one with enormous economic and political implications. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

Indeed, the current proposals represent an even more extreme example of regulatory overreach than the Clean Power Plan. Here, EPA is attempting to coerce the automakers into financing the entire transformation of the manufacturing base of a major industrial sector by converting their own production of ICE vehicles to EVs on a large scale, not simply contributing toward the marginal subsidization of alternative investments by others. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

Moreover, in the name of ensuring that its own preferred "control technology" will actually deliver the expected performance as a suitable long-term substitute for ICE vehicles, EPA is also claiming the authority to regulate the design and functionality of battery-electric technology over the entire life cycle of EVs. Like CARB, EPA proposes to adopt and enforce "Global Technical Requirement" (GTR) No. 22, promulgated by the United Nations Economic Commission for Europe, which sets standards and requirements for validating electric battery durability.22 [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

22 See 88 FR at 29284-85; 88 FR at 26013-15.

Thus, EPA expects to be in the permanent business of regulating EV technologies, which involve no tailpipes at all, let alone tailpipe emissions—all under the aegis of a statute enacted by Congress to address air pollution from vehicle tailpipes. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

What is clear is that EPA sees an endless horizon for its new-found power to regulate practically all aspects of the American automotive market. No doubt, for example, the Agency intends to be involved in overseeing the buildout and operation of electric vehicle charging infrastructure around the country—once again, as an incident of the regulators' own expansive conception of their section 202 authority to ensure the adequacy of EPA's chosen control technology. [EPA-HQ-OAR-2022-0829-0647, pp. 10-11]

We can easily imagine that someday this self-assumed mandate will include the power to ration the timing and extent of drivers' access to charging networks, as EPA deems necessary to maintain the general supply of electricity for EVs. California is already doing this. Because the buildout of charging infrastructure will depend critically on gov- ernment subsidies and approvals, government rationing of access to this infrastructure is a very real prospect, especially given the strains on grid reliability that I discuss below. [EPA-HQ-OAR-2022-0829-0647, pp. 10-11]

The bottom line under the Major Questions Doctrine is that section 202, on which the proposed rules rest, contains no clear and express delegation of any authority that could sustain these massively consequential proposals. As the Court observed in West Virginia v. EPA, "Congress certainly has not conferred [such] authority upon EPA anywhere … in the Clean Air Act." [EPA-HQ-OAR-2022-0829-0647, pp. 10-11]

The Analyses and Assumptions on Which the Proposed Regulatory Actions Are Based Are Arbitrary, Fundamentally Flawed, and Fail to Recognize and Account Properly for the Hugely Negative Consequences that Would Result from These Actions [EPA-HQ-OAR-2022-0829-0647, pp. 10-11]

EPA claims that, despite the coercive power and industry-transforming ambition behind its proposals, these rules will somehow deliver a stupendous bounty of net benefits, ranging at the high end from $1.5 trillion to $2.3 trillion for the light- and medium-duty vehicle rule,23 plus another $180 billion to $320 billion for the heavy-duty truck rule.24 [EPA-HQ-OAR-2022-0829-0647, pp. 10-11]

Organization: Tesla, Inc.

Tesla's proposed changes will significantly reduce emissions, result in increased deployment of the best available emissions reduction technology - BEVs6 - consistent with the emissions reduction technology requirements of the Clean Air Act standard setting mandate under section 202, and ensure the Administration is meeting it statutory mandate to protect the public health and welfare. [EPA-HQ-OAR-2022-0829-0792, p. 2]

Further, there should be no doubt, in view of recent amendments to the Clean Air Act and Congressional ratification accomplished by the IRA,126 that EPA has ample authority to address the regulation of greenhouse gas pollutants, from motor vehicles, through electrification, and in the light-duty sector.127 [EPA-HQ-OAR-2022-0829-0792, p. 21]

126 Pub. L. No. 117-169, 136 Stat. 1818 (2022).

127 See, Greg Dotson and Dustin J. Maghamfar, The Clean Air Act Amendments of 2022: Clean Air, Climate Change, and the Inflation Reduction Act, 53 ELR 10017 at 10019, 10032 (2023) (discussing Clean Air Act sec. 137 and other revisions) available at https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4338903

Tesla believes that this proposed rule -- in substance and structure -- is firmly in the mainstream of long and well-established agency motor vehicle emissions standard setting activities, and well within industry expectations and the agency's authorities. Indeed, the agency has deployed fleet averaging approaches for decades to provide manufacturers flexibility while increasing the stringency of motor vehicle emissions standards. 128 And it has addressed GHG emissions and criteria pollutants in doing so since 2010. 129 EPA's action has been rooted in the Clean Air Act's textual recognition that EPA is to set and revise standards controlling emissions from vehicles, "whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution."130 [EPA-HQ-OAR-2022-0829-0792, p. 21]

128 See, e.g., 45 Fed. Reg. 79382-83 (Nov. 28, 1980); Nat. Res. Defense Council v. Thomas, 805 F.2d 410, 425-26 (D.C. Cir. 1986).

129 75 Fed. Reg. 25324 (May 7, 2010) (Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards; Final Rule for MY 2011 and later).

130 42 U.S.C. § 7521(a)(1).

In addition, EPA has, for example, repeatedly expressed its own understanding that GHG standards should be viewed as a strategy to help control criteria pollutants to address National Ambient Air Quality Standards (NAAQS) nonattainment, as well as to address the climate crisis. EPA has previously explained that "[c]limate change is expected to increase regional ozone pollution, with associated risks in respiratory illnesses and premature death.”131 Whether through its impact on reducing atmospheric temperatures that contribute to the formation of ozone, or through its direct impact on air quality by lowering or eliminating altogether tailpipe emissions of smog-forming pollutants and PM, enhanced BEV recognition in the development of these requirements will have a significant impact on achieving air quality targets.132 [EPA-HQ-OAR-2022-0829-0792, p. 21]

131 Endangerment Finding, 74 Fed. Reg. at 66525 (“There is now consistent evidence from models and observations that 21st century climate change will worsen summertime surface ozone in polluted regions of North America compared to a future with no climate change.”); (While ozone “is a local or regional air pollution problem, the impacts of global climate change can nevertheless exacerbate this local air pollution problem.”).

132 Nonattainment for conventional pollutants such as NOx is also significantly affected by upstream fuel impacts from refinery emissions that are reduced or eliminated by a conversion to zero emissions vehicles. See California Air Resources Board, Analysis in Support of Comments on the SAFE Rule at 69, available at h ttps://www.edf.org/sites/default/files/CARB_Detailed_Comments_on_SAFE_NPRM.pdf.

Furthermore, the seemingly sharp former distinctions between regulatory strategies to address criteria pollutant emissions and GHG emissions have continued to erode in view of the appropriate control strategies and technologies and the increasingly smaller margins for improvement from conventional ICE emissions. States have noted that zero emission vehicles (ZEVs) produce no tailpipe emissions, reduce brake wear PM emissions, and have lower upstream emissions to contribute to their State Implementation Plan (SIP) strategies.133 EPA’s 2017 Tier 3 standards, for example, achieved reductions of methane (CH4) and nitrous oxide (N2O), each of which are GHGs that were part of EPA’s endangerment finding.134 [EPA-HQ-OAR-2022-0829-0792, pp. 21-22]

133 See e.g., CARB, Staff Report: Initial Statement of Reasons (Oct. 22, 2019) at 5, Table ES-1: Expected Emission Reductions of Proposed ACT Regulation Calendar Year (NOx (tpd) PM2.5 (tpd) WTW GHG (MMT/yr.) 2031 5.0 0.16 0.4 2040 16.9 0.46 1.7 (Proposed Rule)) available at h ttps://ww3.arb.ca.gov/regact/2019/act2019/isor.pdf

134 79 Fed. Reg. at 23445.

EPA has previously recognized the importance of this harmonization. In promulgating its Tier 3 motor vehicle emissions standards, for example, the agency noted:

The Tier 3 program addresses interactions with the 2017 LD GHG rule in a manner that aligns implementation of the two actions, to achieve significant criteria pollutant and GHG emissions reductions while providing regulatory certainty and compliance efficiency. As vehicle manufacturers introduce new vehicle platforms for compliance with the GHG standards, they will be able to design them for compliance with the Tier 3 standards at the same time.135 [EPA-HQ-OAR-2022-0829-0792, pp. 21-22]

135 79 Fed. Reg. at 23417.

Given the continuing need for emissions reductions in both the criteria pollutant and the GHG arenas and the increasing capabilities presented by advanced technologies, the multi-pollutant standards EPA is proposing are fully expected by automotive manufacturers, appropriate, and essential. Indeed, the Supreme Court has broadly defined emissions “standards” under the Clean Air Act as including instances where fleet ZEV standards were sought to be enforced.136 The Court explained that: [EPA-HQ-OAR-2022-0829-0792, p. 22]

136 Engine Mfrs. Ass'n v. S. Coast Air Quality Mgmt. Dist., 541 U.S. 246, 258 (2004).

Organization: Texas Public Policy Foundation (TPPF)

Both Tailpipe Rules Are Likely Unconstitutional [EPA-HQ-OAR-2022-0829-0510, pp. 2-3]

In the recent landmark West Virginia v. EPA decision, the Supreme Court ruled that the EPA did not have the power to "substantially restructure the American energy market" by regulation under the CAA. 142 S. Ct. 2587, 2610 (2022). That case dealt with the EPA's attempt to establish carbon dioxide ("CO2") emissions limits for new and existing coal-fired power plants under the Clean Power Plan, through regulations requiring plant operators to shift energy generation to cleaner sources. The EPA based the regulation on a misguided and overbroad reading of 42 U.S.C. § 7411 ("Section 111"). The Supreme Court informed the EPA that a scheme of regulations that restructures the national energy market to shift towards renewable energy did not qualify as the "best system of emission reduction" under Section 111, because Congress had not clearly delegated the "sweeping and consequential authority" to force vast energy market change by EPA regulation. See id. at 2608. [EPA-HQ-OAR-2022-0829-0510, pp. 2-3]

Yet that is exactly what the EPA seeks to do with these Tailpipe Rules. As the EPA's own press release states, the Tailpipe Rules are intended to "accelerate the ongoing transition to a clean vehicles future and tackle the climate crisis." Biden-Harris Administration Proposes Strongest-Ever Pollution Standards for Cars and Trucks to Accelerate Transition to a Clean-Transportation Future, ENVIRONMENTAL PROTECTION AGENCY (Apr. 12, 2023), https://www.epa.gov/newsreleases/biden-harris-administration-proposes-strongest-ever-pollution-standards-cars-and. The LMD Tailpipe Rule, specifically, is "projected to accelerate the transition to electric vehicles." Id. The EPA states that these regulatory changes are part of a push to "support the development and market for clean vehicle technologies and associated infrastructure" and to "expand the manufacture, sale, and use of zero emission vehicles." Id. [EPA-HQ-OAR-2022-0829-0510, pp. 2-3]

The EPA has no constitutional authority to make these regulatory changes. They have the power, and indeed the duty, to promulgate "standards which reflect the greatest degree of emission reduction achievable through the application of technology which the Administrator determines will be available for the model year to which such standards apply, giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology." 42 U.S.C. § 7521(a)(3)(A)(i). Nothing in this grant of authority allows the EPA to regulate in a way that pushes the use of electric vehicles over internal-combustion vehicles. The EPA did the same thing when it tried to force power producers to adopt so-called clean energy solutions through the Clean Power Plan, which the Supreme Court rightly rejected. [EPA-HQ-OAR-2022-0829-0510, pp. 2-3]

Both Tailpipe Rules Violate The Administrative Procedure Act ("APA") [EPA-HQ-OAR-2022-0829-0510, p. 3]

The Tailpipe Rules also violate the Administrative Procedure Act's prohibition against agency action that is "arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law . . . ." 5 U.S.C. § 706. [EPA-HQ-OAR-2022-0829-0510, p. 3]

The statute defines "air pollutant" as "any air pollution agent or combination of such agents, including any physical, chemical, biological, radioactive (including source material, special nuclear material, and byproduct material) substance or matter which is emitted into or otherwise enters the ambient air." 42 U.S.C. § 7602. Because the statute fails to define the meaning of the term "air pollution agent," this definition is facially circular and therefore void for vagueness. Antonin Scalia & Bryan Garner, READING LAW 134 (Thomson/West 2012) ("An unintelligible text is inoperative."); see also Sackett v. EPA, 598 U.S. ____ (2023), slip op. at 24 (stating that a "broad and unqualified" interpretation of the Clean Water Act "gives rise to serious vagueness concerns"). [EPA-HQ-OAR-2022-0829-0510, p. 3]

Furthermore, carbon dioxide, the most plentiful greenhouse gas, is a natural substance essential to life on Earth. It is everywhere and in everything, yet EPA claims the power to regulate it. Congress could not possibly have intended to grant the EPA such wide-ranging regulatory power when it passed the Clean Air Act. Courts analyzing grants of authority to executive agencies must consider "whether Congress in fact meant to confer the power the agency has asserted." West Virginia v. EPA, 142 S. Ct. 2587, 2608 (2022). In West Virginia, the Supreme Court affirmed that when "the history and breadth of the authority that the agency has asserted, and the economic and political significance of that assertion" are large and weighty, courts have "reason to hesitate" before concluding Congress meant to delegate such power. Id. (cleaned up). At the very least, the Court "expect[s] Congress to speak clearly if it wishes to assign to an agency decisions of vast economic and political significance." Util. Air Regulatory Grp. v. EPA, 573 U.S. 302, 324 (2014) (cleaned up). Because EPA's interpretation of the CAA to regulate CO2 "would bring about an enormous and transformative expansion in EPA's regulatory authority without clear congressional authorization," it is "patently unreasonable" for EPA to seize such authority. Id. [EPA-HQ-OAR-2022-0829-0510, p. 3]

EPA points to their Greenhouse Gas Endangerment Finding, see 74 Fed. Reg. 66496 (Dec. 15, 2009), as the source of their conclusion that it may regulate greenhouse gases. EPA made this Endangerment Finding without seeking peer review from the Science Advisory Board ("SAB"), a blue-ribbon panel of experts established by Congress to ensure that EPA regulations are based on accurate data and credible scientific analyses. In enacting the peer review requirement, Congress was concerned that EPA not impose unnecessary restrictions on economic and personal freedom by unintelligently pursuing its regulatory goals. By ignoring the peer review requirement, EPA violated 42 U.S.C. § 4365(c)(1), which states that EPA "shall" make its regulatory proposals available to the SAB for peer review. That fundamental error stemmed from a desire to impress the community of nations by being among the first to regulate greenhouse gas emissions timed to coincide with the 2009 Copenhagen international climate conference. [EPA-HQ-OAR-2022-0829-0510, pp. 3-4]

The Endangerment Finding has other flaws. In making it, EPA made no showing that the Finding or any of its related greenhouse gas rules will remove any dangers to human health or welfare. Indeed, EPA disclaimed any obligation to define its ultimate regulatory objectives or its chosen means of achieving them and even refused to articulate how the Endangerment Finding could lead to successfully combating anthropogenic climate change. Furthermore, EPA claimed it was 90-99% certain that human-caused climate change threatened public health and welfare, see 74 Fed. Reg. at 66518 n.22, while failing to state what constitutes a safe climate, acceptable global temperature ranges, how levels of greenhouse gases in the atmosphere (whether natural or man-made) may affect those ranges, or even whether its regulatory actions would ameliorate any risk. Because of these substantial gaps in its analysis, no one could accurately judge whether EPA achieved any discernable public benefit or congressionally-authorized goal when it made the Endangerment Finding. Section 202(a)(1) of the CAA requires the EPA to exercise its own independent judgment to determine how its regulatory response to a perceived risk will reduce or eliminate that risk. Instead, the EPA left evidentiary analysis and risk assessment almost entirely to international non-governmental organizations ("NGOs") when making the Endangerment Finding. Congress did not clearly delegate the significant power to make regulatory determinations affecting public policy to NGOs. See Util. Air Regulatory Grp., 573 U.S. at 324. [EPA-HQ-OAR-2022-0829-0510, pp. 3-4]

For all these reasons, the Endangerment Finding was itself arbitrary, capricious, and ultra vires, and any regulation based on its authority suffers the same problems. [EPA-HQ-OAR-2022-0829-0510, pp. 3-4]

Organization: Travis Fisher

Thank you for the opportunity to comment on the Environmental Protection Agency's (EPA's) proposal regarding Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles in Docket No. EPA–HQ–OAR–2022–0829 (Proposed Rule). The Proposed Rule violates the Clean Air Act because it relies on an incorrect factual basis—on multiple counts discussed below—derived from a misinformed and incomplete Draft Regulatory Impact Analysis (DRIA). [EPA-HQ-OAR-2022-0829-0655, p. 1]

1. THE PROPOSED RULE VIOLATES SECTION 202 OF THE CLEAN AIR ACT

The Proposed Rule would establish new emissions standards for light-duty and medium-duty vehicles pursuant to section 202 of the Clean Air Act. Significantly, unlike other sections of the Clean Air Act (such as those covering National Ambient Air Quality Standards, for example), section 202 requires the EPA Administrator to consider the impacts of a new standard on cost, energy, and safety. Section 202 states that regulations should apply "standards which reflect the greatest degree of emission reduction achievable" while "giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology."4 [EPA-HQ-OAR-2022-0829-0655, p. 2]

4 42 U.S. Code § 7521(a)(3)(A)(i).

The EPA Administrator has not given appropriate consideration to cost, energy, and safety, and thus the Proposed Rule violates section 202 of the Clean Air Act. EPA's failure to consider cost, energy, and safety in the Proposed Rule is a major flaw that, if left uncorrected, would make the final rule arbitrary and capricious. Not only does the Proposed Rule not provide an accurate assessment of its own impacts in a vacuum, but it also fails to consider key, well-known interactions between the Proposed Rule and other EPA regulations. Because the Proposed Rule fails to offer the Administrator a sound factual basis upon which to build, it is impossible that the Administrator gave "appropriate consideration to cost, energy, and safety factors" when establishing the standards in the Proposed Rule. [EPA-HQ-OAR-2022-0829-0655, p. 2]

Organization: Valero Energy Corporation

V. EPA lacks statutory authority—much less clear congressional authorization—to support the proposed action. [EPA-HQ-OAR-2022-0829-0707, pp. 65-66]

In this proposal and its companion proposal regarding HDV greenhouse gas emissions standards, EPA relies, for the first time outside of litigation, on its purported authority to mandate electrification as an "emission control device" or "emission control technology." It is also the first time that EPA proposes standards for MDVs, a subset of HDVs under the Clean Air Act, that rely on the availability of ZEV technologies.351 And it is also the first time that EPA utilizes its criteria pollutant standards, either standing alone or in combination with EPA's greenhouse gas emissions standards, to force further vehicle electrification. For these dramatic changes, however, EPA must have clear congressional authority. Yet EPA has failed to identify such clear authority for the standards and the electrification mandate. Instead, EPA relies on general authority and congressional statements that do not provide clear authority for the proposed action. To the contrary, EPA's references in the proposal demonstrate that Congress had many opportunities to provide clear authority but declined to do so. [EPA-HQ-OAR-2022-0829-0707, pp. 65-66]

351 Because the adoption of ZEVs contemplated by EPA in the proposal consists primarily, if not exclusively, of electric vehicles, these comments focus on the proposal's forced electrification of the Nation's LDV and MDV fleet; however, it should be noted that EPA's definition of ZEVs also includes other technologies, such as hydrogen fuel cell vehicles, which face even greater hurdles to widespread adoption and, more importantly, are equally unauthorized by Congress.

1. EPA claims an unheralded power with staggering implications.

In asserting the sweeping power to mandate increasingly high levels of electrification, EPA claims to have "discover[ed] in a long-extant statute an unheralded power to regulate 'a significant portion of the American economy.'" Utility Air, 573 U.S. at 324 (quoting Brown & Williamson, 529 U.S. at 159). The novelty and broad implications of the agency's approach are powerful clues that Congress never authorized it. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

Novel Assertion of Agency Authority.

Skepticism is warranted when an agency asserts an "unheralded power representing a transformative expansion in its regulatory authority." West Virginia, 142 S. Ct. at 2610 (internal quotation marks omitted). In prior rules setting greenhouse-gas emission standards, EPA has treated electric vehicles as a compliance "option" or "flexibility." In fact, for the 2021 GHG standards for LDVs, EPA argues that electrification was not mandated but was an option, that manufacturers could comply without using EVs. However, for the proposed LDV and MDV rule, EPA does not claim that electrification is merely an option and EPA's model clearly demonstrates that EPA expects OEMs to comply with the proposed standard by increasing production of BEVs and FCEVs while phasing out production of ICEVs. Indeed, with the exception of the companion HDV standards proposed in concert with this rule, forced electrification has never before even been on the table for MDVs (and other HDVs). Nor has EPA previously utilized its criteria pollutant standards in a thinly-cloaked strategy to disincentivize further ICEV production in favor of vehicle electrification, as it does in the proposal. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

Future Implications of the Agency's Claimed Power.

EPA has made no secret of the significance of the power it proposes to exercise here. In its proposed rule, EPA asserts the authority to force electrification as an "emission control technology" and notes that "[v]ehicle manufacturers can use powertrain electrification as an emissions control technology to comply with EPA standards and to generate credits for use in averaging, banking, and trading." 88 Fed. Reg. at 29184; see id. at 29346 ("This proposal seeks to build on the trends that these developments and projections indicate, and accelerate the continued deployment of these technologies…."); id. at 29312 ("Although the market share of PEVs in the U.S. is already rapidly growing, EPA recognizes that the proposed standards may accelerate this trend."). And as described above, this proposal is only part of a greater "whole of government" approach to mandate electrification at the Biden Administration's direction. By claiming the power of mandating some electrification of the Nation's vehicle fleet, EPA is claiming the authority to mandate 100% electrification as well. As in West Virginia, there is no reason to believe that EPA will stop here. "[O]n this view of EPA's authority, it could go further, perhaps forcing" LDV and MDV manufacturers to "cease making" internal-combustion vehicles altogether. 142 S. Ct. at 2612. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

In fact, this is exactly where EPA is headed. When EPA announced its proposal, it stated that the standards would "accelerate the ongoing transition" to an all-electric future, "delivering on" the Biden-Harris Administration's climate agenda.363 And in related rulemakings, EPA authorized California to adopt its own greenhouse-gas emission standards in its Advanced Clean Cars and Advanced Clean Trucks programs—an authority California is already citing to ban new combustion-engine vehicles and require 100-percent electrification of the LDV, MDV, and HDV fleets by 2036 via its Advanced Clean Cars II and Advanced Clean Fleets programs. See 87 Fed. Reg. 14,332; 88 Fed. Reg. 20,688. Both parts of EPA's strategy reveal the agency's goal to convert America to electric vehicles. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

363 https://www.epa.gov/newsreleases/biden-harris-administration-proposes-strongest-ever-pollution-standards-cars-and. (emphasis added).

Given the vast economic and political significance of EPA's proposal, it "must point to 'clear congressional authorization' for the power it claims." West Virginia, 142 S. Ct. at 2609. There is not one word in the Clean Air Act about a nationwide agency-led transition from conventional internal-combustion vehicles to electric vehicles, or any other so-called ZEV. To be sure, EPA has the power to set emission standards for air pollutants from motor vehicles, just as EPA had the power in West Virginia to set emission standards for air pollutants from power plants. But what EPA claims here for the first time is the authority to set standards in such a way that manufacturers can comply only by abandoning internal-combustion vehicles in favor of electric vehicles. And nothing in the Clean Air Act authorizes that. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

Organization: Western Energy Alliance

Congress did not give EPA authority to mandate the electrification of the vehicle fleet. The Energy Policy Act and Clean Air Act do not allow EPA to set standards that cannot be met with an internal combustion engine vehicles (ICEV). EPA does not have the authority to compel the transition to completely new vehicle types under the guise of setti ng tailpipe standards for ICEVs. Electric vehicles (EV) do not have a tailpipe, and although their emissions should be evaluated over the full lifecycle and not assumed to be zero as EPA does with this proposed rule, EPA only has authority to consider tailpipe emissions from ICEVs with this rule. EVs are technically not subject to the standards and thus ineligible for the fleet averaging scheme. [EPA-HQ-OAR-2022-0829-0679, p. 1]

The proposed rule would require 60% of new car sales to be battery-powered electric vehicles by 2030 and 67% by 2032, compared to 5.8% in 2022. With this rule, EPA is running afoul of the Supreme Court's ruling in West Virginia v. EPA. Congress nowhere provided authorization for EPA to effectively mandate a shift from ICEVs to electric vehicles (EV). Further, attempting to interfere with the market and compel market penetration up ten-fold in less than ten years is simply unrealistic. [EPA-HQ-OAR-2022-0829-0679, pp. 1-2]

EPA attempts to subvert the major questions doctrine by citing its authority under the Clean Air Act 202(a) to tighten emissions standards. Carbon Dioxide (CO2) emissions from vehicles constitute more than 95% of all tailpipe GHG emissions (75 FR 25326), yet there has not yet been invented a technology to control or capture these CO2 emissions from vehicles. In the absence of such a technology, the only means to meet the standards in the proposed rule is by switching to a so -called zero-emissions vehicle (ZEV). We encourage EPA to discard the use of the term "ZEV" in the rule, as no vehicle is zero emissions but merely transfers its emissions from the tailpipe to the power plant. I realize that EPA acknowledges that in its definition of ZEV, but that subtlety is largely lost on the public and serves as legerdemain. As we find EPA's use of BEVs, PEVs, PHEVs, and ZEVs to be inconsistent and at times interchangeable throughout the rule, we will use the simple term "EV" throughout these comments. [EPA-HQ-OAR-2022-0829-0679, pp. 1-2]

With its logic, EPA is equating emissions control technology to a EV, but an electric vehicle is not akin to a pollution control device. EPA cannot use its authority to control emissions under the CAA to treat EVs as pollution control devices, as doing so is an artifice that does not pass the major questions doctrine test and is arbitrary and capricious. [EPA-HQ-OAR-2022-0829-0679, pp. 1-2]

Despite finding that:

"…the standards proposed herein are consistent with EPA's responsibilities under the CAA and appropriate under CAA section 202(a). EPA has carefully considered the statutory factors, including technological feasibility and cost of the proposed standards and the available lead time for manufacturers to comply with them…Based on our analysis, it is our assessment that the proposed standards are appropriate and justified under section 202(a) of the CAA. Our analysis for this proposal supports the preliminary conclusion that the proposed standards are technologically feasible and that the costs of compliance for manufacturers would be reasonable." (p. 29187) [EPA-HQ-OAR-2022-0829-0679, pp. 1-2]

While acknowledging that EPA must:

"consider issues of technological feasibility, the cost of compliance, and lead time. EPA also may consider other factors, and in previous vehicle standards rulemakings, [EPA-HQ-OAR-2022-0829-0679, pp. 3-4]

as well as in this proposal, has considered the impacts of potential standards on emissions of air pollutants and associated public health and welfare effects, impacts on the automotive industry, impacts on the vehicle purchasers/consumers, oil conservation, energy security and other energy impacts, safety, and other relevant considerations." p. 29186 [EPA-HQ-OAR-2022-0829-0679, pp. 3-4]

it does not appear that EPA has actually done so. EPA's logic is often flawed in the analysis and the information relied on is biased or incomplete. [EPA-HQ-OAR-2022-0829-0679, pp. 3-4]

EPA Summary and Response

EPA responds to these comments, together with the comments reprinted in sections 2 and 2.2, below in section 2.3.

2.2 - Criteria pollutant standards

Comments by Organizations

Organization: Alliance for Automotive Innovation

2. Statutory Authority

Auto Innovators shares EPA's goal of addressing climate change by achieving a net-zero carbon transportation future, as part of an ambitious, comprehensive, and national strategy. The Proposed Rule, however, contemplates a rapid and transformative nationwide shift to electrification that may be well beyond what the industry or market can bear now or in the foreseeable future. Given the significant policy and economic consequences that would flow from this restructuring of the nation's vehicle market, and the breadth and unprecedented nature of EPA's proposed action, clear congressional authorization is required for the Proposed Rule. EPA lacks this clear authorization. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

The Proposed Rule seeks to use Clean Air Act section 202 rulemaking to force an extraordinary transformation of the nation's vehicle fleet away from ICE-based vehicles to BEVs, and it is not at all clear that the level of consumer demand and infrastructure that exists now and is expected in the future can support the expedited, aggressive timeline in the Proposed Rule. The Proposed Rule does not include an explicit electrification target, and EPA states that "a compliant fleet under the proposed standards will include a diverse range of technologies."152 But in practice, the stringency of the proposed standards is such that automakers will have no choice but to convert to BEV fleets on a massive scale. This is the result not only of the Proposed Rule's GHG emissions standards, but also its criteria pollutant standards and its tightening of credit programs and other flexibilities. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

152 NPRM at 29187.

As EPA notes, BEVs accounted for 5.8% of the new U.S. light-duty passenger vehicle market in 2022.153 Moreover, EPA's MY 2023-2026 GHG emissions standards that were finalized at the end of 2021 projected only a 17% light-duty penetration rate for both BEVs and PHEVs by MY 2026.154 Despite this low rate of consumer acceptance, the Proposed Rule projects a light-duty BEV penetration rate of 67% by MY 2032, up from 36% in MY 2027.155 Importantly, in the absence of these and other strict regulatory programs (such as California's ZEV mandate), EPA projects a significantly lower MY 2032 BEV penetration rate of only 39%.156 It is unclear from EPA's analysis how the regulations alone justify a 28 percentage point increase in BEV market between having regulations versus not. This is particularly concerning given that EPA's no- action analysis presumably includes the same level of existing supportive mechanisms such as the IRA and IIJA, assumptions for infrastructure development, and other market-enabling features. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

154 See Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions Standards, 86 Fed. Reg. 74434, 74485, Table 33 (Dec. 30, 2021).

155 NPRM at 29329, Table 80.

156 Id. at 29329, Table 81.

In other words, a staggering increase in the implementation and adoption of BEV technology underpins the Proposed Rule and is the central means by which the rule effectuates its contemplated emissions reductions. But this shift to electrification is not a simple matter of swapping one technology for another. The mass adoption of BEVs on the scale required for compliance with the Proposed Rule's standards requires a much broader transformation in the way vehicles are manufactured, purchased, fueled, serviced, and disposed of. Indeed, the Proposed Rule would reorder much of the U.S. automobile industry—which supports roughly 10.3 million American jobs and $558 billion in annual car sales, and about 6% of the U.S.'s Gross Domestic Product (GDP).157 Consumers must be willing to purchase BEVs at mass scale; the power sector must be able to generate and deliver adequate electricity158—which itself will contribute to emissions—while maintaining grid reliability and otherwise meeting consumer and industrial demand; adequate charging infrastructure must be available; batteries and other components must be manufactured at an increasing rate, critical minerals sourced, and supply chains developed. These needs must be met not only for light-duty vehicles, but also for medium- and heavy-duty vehicles. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

157 See Economic Insights, Alliance for Automotive Innovation, htps://www.autosinnovate.org/resources/insights.

158 In addition to increasing electricity capacity, utilities are also facing a transition in technology types and more renewable sources, as proposed under the "Greenhouse Gas Standards and Guidelines for Fossil Fuel-Fired Power Plants" [88 FR 33240, May 23, 2023].

As expressed throughout this comment, we have serious concerns that the market will not be able to bear the requirements of the Proposed Rule and that those requirements will not be feasible given these considerations. Compliance will impose significant costs, and require extraordinary effort, on the part of regulated parties—costs which will be passed along to consumers. Setting such stringent standards has the potential to create a significant market disruption, with consequences not only for the automobile industry but for the entire U.S. economy. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

In other words, the Proposed Rule is enormously consequential for the automobile industry, and for the economy and consumers as a whole. The Proposed Rule's provisions insert EPA into crucial policy tradeoffs and debates, such as concerns about the extraction and supply of critical minerals overseas, or the need to maintain a reliable, efficient electric grid.159 These considerations range far afield from the traditional ambit of section 202 rulemaking, delving into areas that are the subject of other regulatory schemes, or within the unique purview and authority of other agencies and other branches and levels of government. In short, the dramatic shift toward electrification required by the Proposed Rule implicates issues of tremendous political, economic, and social significance. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

159 See, e.g., NPRM at 29311-24.

Nor is such a transformative rule, with such wide-ranging implications, a typical feature of section 202 rulemaking. We acknowledge that some past EPA section 202 rules, most notably the MY 2023-2026 rule, have contemplated greater deployment of EVs as one of many options for complying with emissions standards. The Proposed Rule, however, is different not merely in degree but in kind, seeking to impose what is, at bottom, a mandate toward nationwide electrification. Such a proposal amounts to an unprecedented assertion of power on the part of EPA. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

"[A]n enormous and transformative expansion in EPA's regulatory authority" such as this necessitates "clear congressional authorization," as Congress is expected to "speak clearly if it wishes to assign to an agency decision of vast 'economic and political significance.'"160 But section 202 does not confer such clear authority. Section 202 authorizes EPA to promulgate "standards applicable to the emission of any air pollutant" from vehicles; it does not empower EPA to force a historic shift in the makeup of the nation's entire vehicle fleet. In the absence of plain statutory authorization, such a decision, and the tradeoffs and consequences it entails, properly belongs to Congress. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

160 Utility Air Regulatory Group v. E.P.A., 573 U.S. 302, 324 (2014) (quoting FDA v. Brown & Williamson Tobacco Corp., 529 U.S. 120, 160 (2000)).

The Proposed Rule frequently cites to the IIJA, also known as the "Bipartisan Infrastructure Law,"161 and the Inflation Reduction Act.162 To the extent EPA purports to rely on either statute as providing a legal basis for the Proposed Rule,163 it should not do so. No provision of the IIJA or the IRA expands or modifies EPA's regulatory authority under section 202 or the Clean Air Act more broadly. Nor can these laws be considered to have implicitly altered EPA's authority. After all, "implied amendments require 'clear and manifest' evidence of congressional intent,"164 and "neither courts nor federal agencies can rewrite a statute's plain text to correspond to its supposed purposes."165 Those conditions are not satisfied here. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

163 See, e.g., NPRM at 29233 ("The recently enacted Inflation Reduction Act 'reinforces the longstanding authority and responsibility of [EPA] to regulate GHGs as air pollutants under the Clean Air Act'") (quoting floor statement by Rep. Pallone).

164 Sackett v. E.P.A., 598 U.S , 2023 WL 3632751, at *13 (U.S. May 25, 2023) (internal quotation omitted).

165 Landstar Exp. America, Inc. v. Fed. Maritime Comm'n, 569 F.3d 493, 498 (D.C. Cir. 2009).

We reaffirm that we are fundamentally supportive of EPA's goals of reducing GHG emissions and transitioning to a net-zero carbon transportation future. Section 202 standards have a place in this effort, as we have previously expressed. We remain concerned, however, that the extraordinary and unprecedented nature of the Proposed Rule places it outside the bounds of EPA's statutory authority. [EPA-HQ-OAR-2022-0829-0701, pp. 89-92]

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

n any event, the Clean Air Act refutes EPA's view that Congress left the door open to fleetwide averaging. Other provisions in Section 202 itself and Title II as a whole make clear that fleetwide averaging is fundamentally incompatible with the statutory structure and design. [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

Other portions of Section 202 confirm Section 202(a)(1)'s focus on emission standards applicable to individual vehicles. For example: [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

- Under 42 U.S.C. § 7521(b)(1)(A), the standards for light-duty vehicles and engines in model years 1977–79 must provide that "emissions from such vehicles and engines may not exceed 1.5 grams per vehicle mile of hydrocarbons and 15.0 grams per vehicle mile of carbon monoxide." Id. (emphasis added). This provision contemplates that "such vehicles"—i.e., individual light-duty vehicles—will not exceed these limits. Under an averaging approach, however, individual vehicles would be permitted to exceed these statutorily mandated standards. [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

- Similarly, 42 U.S.C. § 7521(b)(3) authorizes EPA to grant waivers from certain nitrogen-oxide emission "standards," see id. § 7521(b)(1)(B), for no "more than 5 percent of [a] manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater." Id. § 7521(b)(3). The provision thus provides a default rule under which every vehicle must meet a per-vehicle emissions standard, then permits a waiver from that default rule for up to 5 percent of the fleet. Averaging is inconsistent with this pro- vision, which depends on a set number of individual vehicles meeting the standards. [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

- And under 42 U.S.C. § 7521(m)(1), EPA must require manufacturers to in- stall "diagnostic systems" on "all" new light-duty vehicles and trucks that are capable of identifying malfunctions that "could cause or result in failure of the vehicles to comply with emission standards established under this section." Requiring diagnostic equipment on "all" vehicles makes no sense on an averaging approach; each vehicle must have a diagnostic system that ensures that vehicle's "compl[iance] with emission standards established un- der [Section 202]," id., yet under EPA's averaging approach, no particular vehicle need be in compliance. [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

Beyond Section 202 itself, averaging is also deeply in tension with "the de- sign and structure of [Title II] as a whole." Util. Air, 573 U.S. at 321 (citation omitted). Consider Title II's provisions addressing testing, warranties, and penalties: [EPA-HQ-OAR-2022-0829-0683, pp. 14-15]

Organization: American Fuel & Petrochemical Manufacturers

And even for criteria pollutants emitted from ICEVs, the Clean Air Act says nothing about averaging across fleets or banking and trading credits across different model years, different vehicle classes, and OEMs. While EPA previously adopted fleetwide averaging, it has also acknowledged that “Congress did not specifically contemplate an averaging program when it enacted the Clean Air Act.”91 And “[j]ust as the statute does not explicitly address EPA’s authority to allow averaging, it does not address the Agency’s authority to permit banking and trading.”92 By definition, then, the Act does not address—let alone clearly authorize—the use of averaging, banking, and trading in a manner that mandates electrification of the national vehicle fleet of motor vehicles and motor vehicle engines. Instead, as EPA acknowledges, even if its authority to use averaging, banking, and trading could be inferred, such programs are limited to compliance flexibilities rather than setting the standards with which vehicles must comply or phasing out ICEVs on a national scale.93 [EPA-HQ-OAR-2022-0829-0733, p. 23]

91 48 Fed. Reg. 33,456, 33,458 (July 21, 1983)

92 54 Fed. Reg. 22,652, 22,665 (May 25, 1989); see 55 Fed. Reg. 30,584, 30,593 (July 26, 1990) (same).

93 Proposed Rule at 29,196-97 (describing averaging, banking, and trading provisions as “help[ing] manufacturers to employ a wide range of compliance paths”).

The structure of the Clean Air Act and its regulatory provisions for standard setting, certification, compliance enforcement, warranties, and penalties also directly conflict with a fleet- wide averaging regulatory regime. Notably, under Section 202(a), EPA “shall test, or require to be tested in such manner as [it] deems appropriate, any new motor vehicle or new motor vehicle engine submitted by a manufacturer” and issue a certificate of conformity “if such vehicle or engine” complies with the standards.94 And EPA must “test any emission control system incorporated in a motor vehicle or motor vehicle engine . . . to determine whether such a system enables such vehicle or engine to conform to the standards required to be prescribe under [Section 202(b)]” of the Act.95 EPA’s use of a fleetwide averaging regulatory regime directly conflicts with the statutory provisions that Congress already included to provide manufacturers with compliance flexibility. For example, section 202(b)(3) provided compliance flexibilities for NOx, but only for no “more than 5 percent of [a] manufacturer’s production or more than fifty thousand vehicles or engines, whichever is greater.”96 This provision would be nonsensical under a fleetwide-averaging regime where, if applied, an OEM could give itself a waiver for large swaths of its fleet by over-complying for certain product lines well beyond its 5 percent or 50,000 vehicle allotment.97 Together, the Clean Air Act regulatory framework contemplates EPA regulating vehicles individually. But this cannot be accomplished if there is not a clear emission standard applicable to a single vehicle at the start of a model year. [EPA-HQ-OAR-2022-0829-0733, pp. 23-24]

94 42 U.S.C. § 7525(a)(1).

95 42 U.S.C. § 7525(a)(2).

96 42 U.S.C. § 7521(b)(3).

97 While Clean Air Act Section 202(b)(3) is specific to legacy light-duty vehicles through model year 1985 subject to a 1.5 grams/mile NOx standard and no longer directly applicable, the provision is incongruent with fleet-wide averaging, and no associated amendments to Section 202(a) would support a different reading today.

Organization: California Attorney General's Office, et al.

C. History of Regulation of Multi-Pollutant Emissions

More than half a century ago, Congress established a statutory regime to reduce motor vehicle emissions in light of evidence that “[t]he automobile has had a devastating impact on the American environment” and “automotive pollution constitutes in excess of 60% of our national air pollution problem.”103 Under this regime, Congress has directed EPA to promulgate “standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” 42 U.S.C. § 7521(a)(1).104 Congress has required that these standards apply “whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution.” Id.105 EPA’s standards “shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance.” 42 U.S.C. § 7521(a)(2). [EPA-HQ-OAR-2022-0829-0746, pp. 16-17]

103 Int’l Harvester Co. v. Ruckelshaus, 478 F.2d 615, 623 (D.C. Cir. 1973); Pub. L. 89-272 § 201, 79 Stat. 992, 992-93 (1965).

104 Compare with Pub. L. 89-272 § 202(a), 79 Stat. 992, 992-93 (1965) (“The Secretary shall by regulation, giving appropriate consideration to technological feasibility and economic costs, prescribe as soon as practicable standards, applicable to the emission of any kind of substance, from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause or contribute to, or are likely to cause or contribute to, air pollution which endangers the health or welfare of any persons ”).

105 Compare with Pub. L. 89-272 § 202(a), 79 Stat. 992, 992-93 (1965) (“[S]uch standards shall apply to such vehicles or engines whether they are designed as complete systems or incorporate other devices to prevent or control such pollution.”).

From 1966 through 1970, pursuant to its statutory mandate, EPA’s predecessor106 promulgated three sets of emissions standards to control crankcase emissions, exhaust emissions of hydrocarbons and carbon monoxide, and evaporative fuel emissions. 31 Fed. Reg. 5,170 (Mar. 30, 1966); 33 Fed. Reg. 8,304 (June 4, 1968); 35 Fed. Reg. 17,288 (Nov. 10, 1970). Since it was formed in 1970, EPA has finalized upwards of fifty rules setting or amending emissions standards for various classes of vehicles and myriad air pollutants that EPA determined may endanger public health or welfare. See e.g., 36 Fed. Reg. 12,652 (Jul. 2, 1971) (EPA’s first emission standards for NOx), 45 Fed. Reg. 14,496 (Mar. 5, 1980) (EPA’s first emission standards for PM). [EPA-HQ-OAR-2022-0829-0746, pp. 16-17]

106 At the time, the federal body responsible for carrying out the statutory mandate was the U.S. Department of Health, Education, and Welfare.

Standards more stringent than EPA’s proposed standards would comport with its statutory mandate in Section 202(a) and further the statutory objective by reducing the threats from vehicle pollution to public health and welfare. EPA projects that the proposed standards will reduce GHG emissions by more than 7.3 billion metric tons of carbon dioxide (CO_2), 120,000 metric tons of methane (CH_4), and 130,000 metric tons of nitrous oxide (N_2O) through 2055, in addition to criteria pollutant reductions of 44,000 tons per year of nitrogen oxides (NO_x), 9,800 tons per year of fine particulate matter ($PM_{2.5}$), 200,000 tons per year of non-methane organic gases (NMOG), 2,800 tons per year of sulfur oxides (SO_x), and 1.8 million tons per year of carbon monoxide (CO) by 2055. 88 Fed. Reg. at 29,348 (Table 135); id. at 29,351 (Table 139). More emission reductions are feasible. See CARB Comment at 17-22. Given EPA’s description of these emissions reductions as an “essential factor” in its determination of the appropriate level of the proposed standards, id. at 29,344, and the primacy Congress placed on addressing pollution's danger to public health and welfare in Section 202(a), 42 U.S.C. § 7521(a)(1), our States and Cities urge EPA to increase the stringency of its standards beyond those proposed. [EPA-HQ-OAR-2022-0829-0746, p. 28]

Organization: Clean Fuels Development Coalition (CDFC)

EPA Experts Have Warned About "Atmospheric Transformation Products" from Aromatics for Many Years. Outside of OTAQ, EPA experts have been clear about EPA's duty under the Clean Air Act to control carcinogenic and mutagenic atmospheric reaction products, the predominant precursors of which are gasoline aromatics. [EPA-HQ-OAR-2022-0829-0630, p. 9]

"Although oxidized VOCs can be components of primary emissions from a variety of sources, most result from secondary reactions of hydrocarbons emitted into the atmosphere, making them late-generation atmospheric reaction products. Assessments of health effects based solely on direct emissions are incomplete if potentially important contributions from such products are neglected, as has been noted by the Clean Air Act, which mandates consideration of atmospheric transformation products. [EPA-HQ-OAR-2022-0829-0630, p. 9]

5. Conclusions and implications for control strategies

Other than 1,2,4- and 1,3,5-trimethylbenzene, all of the precursor aromatic VOCs investigated here are classified as hazardous air pollutants by the U.S. EPA, and therefore emissions of these species from industrial activities are controlled under the Clean Air Act (U.S. EPA, 2015a). Nonetheless, of the 8 VOCs that produced mutagenic atmospheres, all did so only under irradiation. Thus, only late-generation reaction products were responsible for the mutagenicity, not the precursor VOCs, raising an interesting point regarding potential control strategies when the photochemistry of certain chemical species is similar to those described here. Non-mutagenic primary compounds may be less likely to be controlled; however, the resulting late-generation products may be more likely to be mutagenic. Therefore, consideration should be given to precursor compounds based not only on their intrinsic health concerns but also on those of their potential late-generation atmospheric photochemical products. It seems that these products, which are typically not monitored or controlled, account for much of the gas-phase direct-acting mutagenicity. Based on these limited studies, reducing the concentrations of primary VOCs would likely result in a corresponding reduction in the concentrations of the products, with a parallel reduction in atmospheric mutagenicity."5 [EPA-HQ-OAR-2022-0829-0630, p. 9]

5 "Mutagenic atmospheres resulting from the photooxidation of aromatic hydrocarbon and NOx mixtures", Theran P. Riedela,∗ , David M. DeMarinib , Jose Zavalac , Sarah H. Warrenb , Eric W. Corsed , John H. Offenberga , Tadeusz E. Kleindiensta , Michael Lewandowski]

[Dr. Riedel is a senior scientist at EPA's National Exposure Research Lab in Research Triangle Park, NC. He and his colleagues published this study in 2018 ResearchGate https://www.researchgate.net/publication/315864231_Mutagenicity_and_Carcinogen icity] [EPA-HQ-OAR-2022-0829-0630, p. 9]

Organization: Elders Climate Action

C. EPA's Failure to Set Zero Emission Standards Violates the CAA.

The CAA declares that the primary purpose of the Act is "to protect and enhance the quality of the Nation's air resources so as to promote the public health and welfare and the productive capacity of its population." 42 U.S.C. §7401(b)(1). To implement this purpose, section 202(b)(1)(C) grants the Administrator discretion to commence a rulemaking to revise standards previously promulgated under subsection (a)(1), but once that rulemaking is commenced, as here, the Act requires that the Administrator determine what revisions are "needed to protect public health and welfare." That statutory benchmark has not been addressed in this rulemaking, either with respect to the emission reductions needed to prevent endangerment of the public health and welfare from the climate impacts of GHG emissions, or from the impacts of criteria pollutant violations of NAAQS on public health. The failure to undertake an analysis to determine what emission standards are needed to protect public health and welfare renders this rulemaking unlawful and fundamentally flawed. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

L/MDVs that are commercially available today with zero emission power trains obviously satisfy the available technology requirement. A large fraction of the CO2 emitted from on-road vehicles comes from L/MD vehicle types that are NOW commercially available with zero emission power trains. These include transit and school buses, delivery vans, service trucks, and shuttles serving airports, hotels and resorts. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

EPA admits that ZEV technologies are available, and are the most cost-effective technologies, but the Agency only estimates the zero emission L/MDVs that will likely be available in 2027 as a result of current incentive policies and state regulations. EPA does not estimate the potential availability of zero emission L/MDVs that could be produced and sold if EPA were to promulgate zero emission standards. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

Instead EPA assumes that the rule will marginally improve the efficiency of IC engines and "induce" enough ZEV sales to reduce CO2 emissions less than 5% by 2030 from new L/MDVs sold in 2027 and subsequent years. By failing to require the production and sale of zero emission L/MDVs along with a fleet averaging rule that allows engine manufacturers to sell "dirty" uncontrolled L/MDVs through the use of emission reduction credits obtained by selling zero emission vehicles in California and section 177 states, EPA is effectively allowing engine manufacturers to capture the benefits of clean zero emission vehicles for themselves while increasing the exposure of at-risk communities to harmful pollutants in non-177 states. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

We include a legal analysis that demonstrates EPA's failure to set standards that will achieve the maximum deployment of zero emission technologies fails to achieve the public health purpose of the Act, and is not consistent with the statutory text and the legislative history of the Act. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

By setting zero emission standards for NOx beginning in 2027 for the vehicle types currently available as zero emission vehicles (ZEVs), EPA should determine the NOx emissions that would be avoided in nonattainment areas where EPA's modeling for the 2022 HD rule shows that current and proposed HD emission standards will not be sufficient to provide for attainment. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

CONCLUSION.

EPA must determine the extent to which a zero emission standard for L/MD vehicles beginning in 2027 would be needed to put our nation's vehicle fleet on a clear path to attaining the ozone and PM NAAQS by the statutory deadline. In addition, EPA must, at a minimum, use the IPCC modeling analysis and data to estimate the endangerment that will result from climate warming if global mean temperature is allowed to exceed 1.5o C as the benchmark for determining endangerment to the public health and welfare, and determine what emission standard is needed for L/MD vehicles to achieve the reductions needed to ensure that the U.S. contribution to atmospheric loadings of CO2 will be reduced to the levels need to prevent more severe effects of climate warming. [EPA-HQ-OAR-2022-0829-0737, pp. 6-8]

Organization: Environmental. and Public Health Organizations

F. EPA should strengthen the Tier 4 NMOG+NOX standards and finalize the proposed PM requirements. [EPA-HQ-OAR-2022-0829-0759, p. 53]

We now turn to EPA’s proposed criteria pollutant standards for LDVs. As detailed below, while the proposed PM2.5 requirements are appropriate, EPA should strengthen the NMOG+NOX standards and consider ways to limit over-crediting. [EPA-HQ-OAR-2022-0829-0759, p. 53]

1. EPA should increase the stringency of the proposed NMOG+NOX standards. [EPA-HQ-OAR-2022-0829-0759, p. 53]

a. EPA should strengthen the NMOG+NOx standards to better reflect available, feasible, and cost-effective technologies. [EPA-HQ-OAR-2022-0829-0759, p. 53]

EPA’s 2014 Tier 3 emissions standards were set based on the deployment of technologies applicable to combustion vehicles. The NMOG+NOx standards are meant to continuously phase in from 2017-2025, ultimately reaching a fleet average of 30 mg/mile on the FTP and 50 mg/mile on the SFTP. However, over this time period, an increasing share of BEVs will be sold, which are certified to 0 mg/mile NMOG+NOx. While the deployment of BEVs will not alter the tailpipe emissions reductions anticipated under the Tier 3 program, the additional BEVs, counted as 0 mg/mile, substantially reduce manufacturers’ incentives to deploy the full extent of technologies EPA identified in the Tier 3 rulemaking to their combustion vehicles. [EPA-HQ-OAR-2022-0829-0759, p. 53]

Two responses are possible from manufacturers: they either (1) deploy the same suite of internal combustion engine technologies to their combustion vehicle fleet, and therefore generate a significant amount of overcompliance credits that can be used to reduce their compliance obligations under the Tier 4 standards EPA is now proposing; or (2) reduce the deployment of technologies as EPA originally envisioned when setting the Tier 3 standards, leaving emissions reductions for their combustion vehicle fleet on the table. Either response weakens compliance with the standards. Strengthening the Tier 4 standards will help avoid these problems. [EPA-HQ-OAR-2022-0829-0759, p. 53]

Therefore, EPA’s proposed NMOG+NOx standards leave a significant gap between the feasible deployment of zero-emission technologies (indicated by the share of BEVs modeled for GHG compliance) and the feasible deployment of improvements to combustion vehicles (indicated by the achievement of a Tier 3 fleet average standard without the deployment of

BEVs). Figure VI.F-1 illustrates, on the left, the implicit requirements on combustion vehicles under the proposed NMOG+NOx standards with EPA's modeled adoption of BEVs under the GHG standards; and, on the right, the implied share of BEVs required by the proposed Tier 4 standards if combustion vehicles achieve Tier 3 compliance. If BEVs are deployed at levels modeled by the Agency to comply with its GHG Proposal, NMOG+NOx emissions from combustion vehicles would remain about 30% higher than the Tier 3 requirement over the timeframe of the rule. If, instead, the combustion vehicle fleet matches the Tier 3 requirements in 2027-2032, far fewer BEVs would need to be deployed to meet the Tier 4 proposed targets. These scenarios demonstrate that numerous technological pathways are available to manufacturers to comply with the Tier 4 standards and that stronger standards are entirely feasible. [EPA-HQ-OAR-2022-0829-0759, pp. 53-54]

SEE ORIGINAL COMMENT FOR Figure VI.F-1. Emissions performance and ZEV market share implied by the combination of achieving the proposed GHG standards and Tier 3 / Proposed Tier 4 NMOG+NOx standards [EPA-HQ-OAR-2022-0829-0759, p. 54]

If manufacturers deploy ZEVs consistent with EPA's projection of compliance with the GHG standards, tailpipe emissions performance from the remaining combustion vehicles will exceed Tier 3 standards (left). If combustion vehicles instead achieve Tier 3 emissions standards, far fewer ZEVs will be required to meet the proposed Tier 4 fleet average standards than are modeled to comply with the GHG standards (right). [EPA-HQ-OAR-2022-0829-0759, p. 54]

EPA should close this gap in relative stringency by setting a standard that reflects the full emissions reductions of the combustion vehicle technologies it has already identified as feasible (and which are readily available). Aligning the Agency's assessment of ZEV deployment and its analysis (covered primarily in the Tier 3 rulemaking) of what is achievable to reduce NMOG+NOx emissions from combustion vehicles would yield a 2032 target of 10 mg/mi, a 17% reduction from its Proposal. Interim targets would then be adjusted accordingly. [EPA-HQ-OAR-2022-0829-0759, p. 54]

Such a standard for LDVs would still be technology-neutral: The target corresponds to the lowest non-zero bin in the Proposal (Tier 4 Bin 10),137 and the Agency has already identified combustion vehicles that have certified FTP emissions below 10 mg/mi.138 Moreover, we expect that manufacturers seeking to comply with the multipollutant standards primarily through combustion vehicle technologies would be investing in further emission-reduction technologies from those vehicles, such as by ensuring their vehicles are more in line with the emissions profiles of the industry-leading vehicles, including through deployment of hybridization and other EPA-identified strategies to reduce tailpipe emissions. Alternatively, for manufacturers that want to comply with the multipollutant standards through greater deployment of zero-emission technologies, this pathway would still allow flexibility for their combustion vehicle fleet to fall short of the Tier 3 requirements, provided they sell ZEVs beyond EPA's modeled industry average. [EPA-HQ-OAR-2022-0829-0759, pp. 54-55]

137 88 Fed. Reg. at 29419.

138 DRIA at 3-41, Tbl. 3-14.

EPA has embarked on a multipollutant rulemaking precisely because technologies exist to simultaneously achieve reductions in GHGs and criteria pollutants.139 Reducing the stringency of the final standards to 10 mg/mi NMOG+NOx better aligns with the feasible and cost-appropriate technologies already identified by the Agency. [EPA-HQ-OAR-2022-0829-0759, p. 55]

139 88 Fed. Reg. at 29187.

b. EPA should consider ways to limit over-crediting.

Figure VI.F-1 (left side) shows a non-monotonic behavior—that is, the allowable emissions profile of the combustion vehicles (green line) first increases significantly from 2026-2029, then decreases. This is largely due to the delay in increasing stringency for LDT3, LDT4, and MDPV classes (Class 2 light trucks), the result of EPA's interpretation of lead time requirements under the Clean Air Act.140 The Agency has offered an optional "early compliance" pathway for manufacturers; however, this pathway increases the total stringency over the six years covered by the proposal, reducing the likelihood of manufacturers choosing this path to compliance.141[EPA-HQ-OAR-2022-0829-0759, p. 55]

140 See id. at 29258.

141 If EPA sets a 10 mg/mile standard in 2032 as recommended in Section VI.F.1.a, and thus reduces the step for Class 2 light trucks to 10 mg/mile, there would presumably be no such gap in stringency between the early and default compliance pathways.

In an effort to induce manufacturers to align with the early compliance pathway and to acknowledge the reduced emissions benefits of the stagnant standard for Class 2 light trucks from 2025-2029 (a full five-year window corresponding to the lifetime of Tier 3 credits) under the default compliance pathway, EPA should condition manufacturers' full utilization of credits in this time period on their utilization of the early compliance pathway. For example, EPA could set a limit on the amount of averaging, banking, and trading (ABT) credits that could be utilized for compliance, in order to limit windfall credits from reductions in fleet emissions that occur during the 4-year period of stagnation. This would also ensure that manufacturers do not artificially prolong compliance through an overreliance on such credits. [EPA-HQ-OAR-2022-0829-0759, p. 55]

2. The proposed PM2.5 requirements are appropriate.

EPA is also proposing to set a limit on the allowable particulate matter (PM2.5) emissions from all LDVs. This is an appropriate step under the Agency's authority and is well-grounded in both the need for additional emissions reductions and technical feasibility. [EPA-HQ-OAR-2022-0829-0759, p. 55]

Stoichiometric gasoline direct-injection is deployed in over half the new vehicle fleet in the United States and supports the deployment of turbocharged, downsized engines as well as high-compression ratio engines, both of which are key technologies to reduce GHG emissions.142 At the same time, moving from port-fuel injection to direct-injection leads to an increase in both the amount of PM2.5 and the particle count.143 Addressing PM2.5 emissions from the vehicles deploying these technologies is critical as they become a larger share of the on-road fleet. [EPA-HQ-OAR-2022-0829-0759, p. 56]

142 See U.S. EPA, The 2022 Automotive Trends Report: Greenhouse Gas Emissions, Fuel Economy, and Technology Since 1975, EPA-420-R-22-029 (Dec. 2022), Chapter 4, available at https://www.epa.gov/automotive-trends/download-automotive-trends-report.

143 Omar I. Awad, et al, Particulate emissions from gasoline direct injection engines: A review of how current emission regulations are being met by automobile manufacturers, Sci. Total Env. 718, 137302 (2020), at https://doi.org/10.1016/j.scitotenv.2020.137302 (subscription required).

Gasoline particulate filters (GPFs) have been successfully deployed globally for years to address these emissions, as EPA has documented in the Draft Regulatory Impact Analysis (DRIA).144 Additionally, in-cylinder strategies can help mitigate emissions, including through the design of both the injector and the cylinder surface.145 Aftertreatment design can also be used to mitigate cold-start emissions, in particular.146 All of the technology developments described above are well-established, and many are analogous to technologies that have been deployed to limit PM2.5 emissions from diesel engines. [EPA-HQ-OAR-2022-0829-0759, p. 56]

144 DRIA, Section 3.2.5.

146 Id.

As part of its Advanced Clean Cars program, California finalized a PM2.5 standard of 1 mg/mile, to begin phasing in with the 2025 model year.147 As part of its review, the California Air Resources Board (CARB) conducted tests demonstrating the feasibility of achieving this standard, including data on particle count, GPF effectiveness, and the ability to measure sub-mg quantities of PM2.5.148 While these standards have not gone into effect, the underlying data support EPA's proposed PM2.5 program. [EPA-HQ-OAR-2022-0829-0759, p. 56]

147 Cal. Code of Regs. Tit. 13, § 1961.2(a)(2)(A).

148 For measurement capability, see CARB, An Update on the Measurement Of PM Emissions at LEV III Levels, (2015), available at https://ww2.arb.ca.gov/sites/default/files/2020-01/lev_iii_pm_measurement_feasibility_tsd_20151008_ac.pdf. For additional tests on GPF capability, see CARB, California[']s Advanced Clean Cars Midterm Review, Appendix K: PM Emission Testing Results (Jan. 8, 2017), available at https://ww2.arb.ca.gov/sites/default/files/2020-01/appendix_k_pm_test_results_ac.pdf.

The benefits of the PM2.5 standards are significant—depending on the assumed rate of deployment, EPA's Proposed Standards could cut tailpipe PM2.5 emissions by up to 90% by 2050.149 This could lead to cumulative health benefits of $85 to $160 billion over that same timeframe, at a 3% discount rate.150 Importantly, it could also lead to measurable improvements in near-roadway air quality,151 which could be significant for the more than 41 million people living within close proximity of high-traffic roadways.152 [EPA-HQ-OAR-2022-0829-0759, pp. 56-57]

Organization: Governing for Impact and Evergreen Action (GFI)

I. Background: the Proposed Rule & the Major Questions Doctrine

The EPA's Proposed Rule, covering light and medium duty vehicle emissions of both greenhouse gases ("GHGs") and criteria pollutants for MYs 2027-2032, appropriately fulfills the statutory obligation under Section 202(a) of the Clean Air Act ("CAA") to issue standards for motor vehicle emissions that "cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare."11 It also marks a positive and necessary step towards reducing carbon emissions in line with current domestic and international climate commitments, as well as addressing environmental justice concerns. This administration has committed to reducing GHG pollution by 50-52 percent by 2030 (relative to 2005 levels)—and policies to address pollution from the transportation sector will be critical to achieving this goal.12 The transportation sector accounts for the largest share of domestic GHG pollution (29 percent); and light duty vehicles are responsible for the largest share of greenhouse emissions within the transportation sector (58 percent).13 Despite the EPA's previous GHG regulations under Section 202(a), transportation emissions in the United States continue to grow,14 demonstrating that greater action is needed to fulfill the CAA's statutory goals and achieve this administration's climate targets. [EPA-HQ-OAR-2022-0829-0621, p. 2]

The Proposed Rule, contrary to some public commentary,18 simply follows the course laid by decades of CAA §202(a) emissions standards for new motor vehicles and motor vehicle engines.19 Since the 1970s, the EPA has used this authority to set standards for passenger vehicles that reduced deadly emissions such as lead, carbon monoxide, particulate matter, and nitrogen oxide. In the wake of the Supreme Court's 2007 decision in Massachusetts v. E.P.A., which held that carbon dioxide and other greenhouse gas emissions as air pollutants under the CAA,20 the EPA released its first Section 202(a) standard targeting GHG emissions from light duty vehicles in 2010, covering MYs 2012-2016.21 As new data about the urgency of the climate crisis and its ensuing public health impacts, especially to environmental justice communities, have emerged over the last decade, the EPA has further tightened those standards in a series of subsequent rulemakings. [EPA-HQ-OAR-2022-0829-0621, p. 3]

19 See EPA, "Timeline of Major Accomplishments in Transportation, Air Pollution, and Climate Change," https://www.epa.gov/transportation-air-pollution-and-climate-change/timeline-major-accomplishments-transportation- air (last visited June 15, 2023).

20 549 U.S. 497.

21 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards; Final Rule," 75 Fed. Reg. 25324 (May 2010), https://www.govinfo.gov/content/pkg/FR-2010-05-07/pdf/2010-8159.pdf.

Nor did West Virginia hold that any regulation touching on climate change constitutes a major question.52 In fact, that decision never suggested that the EPA lacks the power to regulate carbon emissions from power plants under the relevant section of the CAA—it merely held that the Clean Power Plan's particular method for doing so was impermissible.53 [EPA-HQ-OAR-2022-0829-0621, pp. 6-7]

52 Commentators have suggested as much across various regulatory proposals. See e.g., Letter from Attorney General Patrick Morrisey, West Virginia, et al. to Chair Rostin Behnam, CFTC, re: Comments on the CFTC's "Climate-Related Financial Risk RFI" by the Attorneys General of the States of West Virginia, Alabama, Alaska, Arizona, Arkansas, Georgia, Indiana, Kansas, Kentucky, Louisiana, Mississippi, Montana, Nebraska, North Dakota, Ohio, Oklahoma, South Carolina, Texas, Utah, Virginia, and Wyoming (Oct. 7, 2022), comments.cftc.gov/PublicComments/ViewComment.aspx?id=70868&SearchText=. In comments to a Federal Acquisition Regulatory Council proposal requiring certain large federal contractors to make limited disclosures about carbon emissions, the Washington Legal Foundation cited West Virginia for the proposition that "climate policy is the exclusive prerogative of Congress"—concluding that executive action touching on the issue therefore poses a "major question." Comment of Washington Legal Foundation, "FEDERAL ACQUISITION REGULATION: DISCLOSURE OF GREENHOUSE GAS EMISSIONS AND CLIMATE-RELATED FINANCIAL RISK," 1 (Feb. 13, 2023), https://www.regulations.gov/comment/FAR-2021-0015-0158.

53 See W. Virginia at 2615 ("the only interpretive question before us, and the only one we answer, is more narrow: whether the 'best system of emission reduction' identified by EPA in the Clean Power Plan was within the authority granted to the Agency in Section 111(d) of the Clean Air Act. For the reasons given, the answer is no").

Finally, note that even if a court concludes that an agency action constitutes a "major question," the court's work is not complete. The regulation can still survive if the agency can demonstrate "clear congressional authority" for its interpretation that goes beyond "a merely plausible textual basis."54 To date, most regulations that the Supreme Court has characterized as "major questions" have failed to meet this standard. But in King v. Burwell, a majority of the Court led by Chief Justice Roberts upheld an Internal Revenue Service interpretation concerning Affordable Care Act tax credits, even after finding that the action effectively qualified as a major question.55 [EPA-HQ-OAR-2022-0829-0621, pp. 6-7]

54 W. Virginia at 2609.

55 King at 485 ("In extraordinary cases, however, there may be reason to hesitate before concluding that Congress has intended such an implicit delegation… This is one of those cases") (internal citations omitted).

Finally, suggestions by some opponents that the EPA must promulgate its emissions standards in coordination with the National Highway Traffic Safety Administration ("NHTSA"),75 which sets fuel- economy standards but is prohibited from taking EVs' fuel economy into account in setting those standards, are wrong. While it is true that the two agencies have jointly promulgated GHG and fuel economy regulations in the past, there is no statutory requirement that they do so—and the agencies did not do so in 2021 when the EPA promulgated 202(a) GHG regulations for MYs 2023-2026.76 In fact, the Supreme Court has described the EPA's authority to regulate carbon emissions from motor vehicles as "a statutory obligation wholly independent" from NHTSA's energy efficiency mandate regarding mileage requirements.77 [EPA-HQ-OAR-2022-0829-0621, pp. 9-10]

75 See, e.g., Private Petitioners' brief, Texas v. E.P.A., D.C. Cir. No. 22-1031.

b. EPA Lacks Statutory Authority to Set Fleetwide Average Emission Standards, and In All Events May Not Average In Vehicles that Do Not Emit the Relevant Pollutant. [EPA-HQ-OAR-2022-0829-0579, p. 6]

EPA lacks statutory authority under Section 202(a) of the Clean Air Act to set fleetwide emission standards, and even if it had such authority, it could not lawfully use it to force electrification by including vehicles that have no tailpipe emissions in the fleetwide average standard for ICE vehicles. The Proposed Rule results in fleetwide standards that cannot be met by ICE vehicles alone; however, under the Clean Air Act, EPA may only set individual vehicle-level emission standards. Such standards must be for "emission[s]" from "any class or classes of new motor vehicles or new motor vehicle engines, which . . . cause, or contribute to," potentially harmful air pollution.18 The plain language of this provision authorizes EPA to set standards for classes of individual vehicles or engines that emit air pollutants. Because PEVs do not directly "cause, or contribute to," air pollution individually within the construct of a tailpipe emissions standard, any standard applicable to "any class or classes" of vehicles cannot include PEVs. [EPA-HQ-OAR-2022-0829-0579, p. 6]

18 42 U.S.C. § 7521(a)(1).

PEVs are simply not the "technology" contemplated by Congress here. Instead, Congress enabled EPA to increase emission standard stringency through cleaner fuels and improved emissions-related systems to be incorporated into ICE vehicles such as advances in fuel injection, exhaust gas combustion management, and advances catalysts to neutralize pollutants of concern.19 By factoring in PEV performance as a part of its averaging scheme, EPA is ignoring the technological feasibility of emissions-related systems and simply requiring the production of fewer ICE vehicles. The Proposed Rule does not consider advances to ICE technologies when setting the standard. [EPA-HQ-OAR-2022-0829-0579, p. 6]

19 For example, Section 202(m) requires the monitoring of "emission-related systems" such as the "catalytic converter and oxygen sensor." 42 U.S.C. § 7521(m)(l).

And even for criteria pollutants emitted from ICE vehicles, the Clean Air Act says nothing about averaging across fleets or banking and trading credits across different model years, different vehicle classes, and OEMs. While EPA has previously adopted fleetwide averaging, it has also acknowledged that "Congress did not specifically contemplate an averaging program when it enacted the Clean Air Act."20 And "[j]ust as the statute does not explicitly address EPA's authority to allow averaging, it does not address the Agency's authority to permit banking and trading."21 By definition, then, the Act does not address—let alone clearly authorize—the use of averaging, banking, and trading in a manner that mandates electrification of the national vehicle fleet of motor vehicles and motor vehicle engines. [EPA-HQ-OAR-2022-0829-0579, p. 6]

20 48 Fed. Reg. 33,456, 33,458 (July 21, 1983).

Organization: National Association of Clean Air Agencies (NACAA)

More than one-third of the U.S. population currently lives in an area that does not meet the health- and welfare-based National Ambient Air Quality Standards (NAAQS) for ozone, PM or both. Many of these areas are over-burdened communities whose citizens are exposed to a disproportionate share of harmful environmental conditions. Transportation-related emissions are a primary cause. EPA data show that in 2023, mobile sources will be responsible for about 54 percent of anthropogenic emissions of NOx, 5 percent of anthropogenic direct emissions of PM2.5 and 19 percent of anthropogenic emissions of VOCs – the key pollutants contributing to the formation of ozone and soot, which are linked with premature death as well as serious respiratory and cardiovascular impacts, cancer and other serious health effects. Of these amounts, about 20 percent of the NOx, 19 percent of the PM2.5 and 41 percent of the VOCs will come from LMDVs.8 [EPA-HQ-OAR-2022-0829-0559, pp. 2-3]

8 Supra note 1, at 29,186

While state and local air agencies have made great strides in reducing emissions from stationary sources, for the most part they lack the authority to regulate mobile sources and never have had the authority to regulate mobile sources across their borders. The regulation of mobile sources is an authority that lies almost entirely within the purview of the federal government. While air agencies in regions across the country may pursue standards under Clean Air Act (CAA) section 177 that are first adopted by California (under CAA section 209), most are precluded, by state policies or legislation, from adopting standards more stringent than those of the federal government. [EPA-HQ-OAR-2022-0829-0559, pp. 2-3]

As many parts of the country slip deeper into nonattainment, or are on the cusp of it, many state and local air agencies are left with few remaining mechanisms to achieve the emission reductions the CAA requires. Areas that miss their attainment deadlines face the threat of "bump-up" to a more demanding classification of nonattainment – if they are not already classified as Extreme – and statutorily required economic sanctions if they fail to meet their attainment deadlines. On October 7, 2022, EPA bumped up over 25 areas in nonattainment of the 20089 and 201510 ozone NAAQS, meaning the citizens of these areas continue to suffer the detrimental impacts of unhealthful air. [EPA-HQ-OAR-2022-0829-0559, pp. 2-3]

9 https://www.govinfo.gov/content/pkg/FR-2022-10-07/pdf/2022-20458.pdf

10 https://www.govinfo.gov/content/pkg/FR-2022-10-07/pdf/2022-20460.pdf

Further, EPA is now in the process of reconsidering the existing PM and ozone NAAQS, which were revised with greater stringency in 2012 and 2015, respectively, and retained without revision in December 2020. Regardless of whether either or both standards are strengthened, the fact is that many areas across the country need reductions in pollutants that contribute to PM2.5 and ozone just to meet or sustain the current NAAQS and provide clean air to their citizens. [EPA-HQ-OAR-2022-0829-0559, pp. 2-3]

Regarding attainment and maintenance of the ozone NAAQS, most areas of the country are “NOx- limited,” meaning that reducing NOx emissions is the key to success. In addition, research shows that in some areas of the country, such as much of the East Coast, NOx reductions are now “supercharged,” meaning that a one-pound reduction in NOx emissions equals more than one pound of ozone reduction. Failure to adequately address transportation-related NOx sources, including LDVs and MDVs, will have a direct and consequential impact on state and local air agencies’ abilities to fulfill their statutory obligations to attain and maintain federal air quality standards by mandated deadlines and achieve their environmental justice goals. [EPA-HQ-OAR-2022-0829-0559, pp. 2-3]

Carbon, criteria pollutant and toxic emissions from LMDVs harm public health and threaten our climate. Every area of the nation is adversely affected by these emissions and their growing impacts. Those living in communities that bear a disproportionately and unjustly greater burden of the consequences of these emissions must be the central focus, rather than on the margins, of EPA’s attention when the agency finalizes this rule. Toward all these ends, NACAA offers the following for EPA’s consideration. [EPA-HQ-OAR-2022-0829-0559, pp. 2-3]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

IV. Conclusion

Given the urgency of the climate crisis, the impacts of pollution from transportation on air quality and public health, anticipated growth of the transportation sector, and the rapid growth in ZEV adoption, it is necessary and appropriate for EPA to exercise its authority in CAA Section 202(a) to establish new and more stringent GHG and criteria pollutant and emissions standards for MYs 2027 and later LDVs and MDVs. NESCAUM and the OTC urge EPA to finalize a rule with the most stringent standards feasible. [EPA-HQ-OAR-2022-0829-0584, p. 12]

Organization: POET, LLC

EPA has broad authority under Section 211(c)(1)(A) of the Clean Air Act to issue regulations controlling fuels or fuel additives that cause and/or contribute to air pollution that may endanger public health.155 This authority permits EPA to limit high-boiling compounds/heavy aromatics because these fuel additives contribute to PM emissions which endanger public health. Pursuant to Section 211(c)(2)(A), EPA must consider all relevant scientific evidence available to the agency when setting these standards, including the significant evidence that bioethanol blending is the most practicable replacement for heavy aromatics, and that bioethanol has particularly significant emissions benefits for PM, other criteria pollutants, and GHGs.156 The further reduction of aromatics in gasoline would also be consistent with EPA’s mandates and authority under the Mobile Source Air Toxics Program.157 [EPA-HQ-OAR-2022-0829-0609, p. 33]

155 42 U.S.C. § 7545(c)(1)(A).

156 Id. § 7545(c)(2)(A).

157 See Control of Hazardous Air Pollutants from Mobile Sources, 72 Fed. Reg. 8428 (Feb. 26, 2007).

Bioethanol does not receive the credit it deserves as a powerful tool in reducing both criteria pollutant and GHG emissions. Replacing heavy aromatics with bioethanol blending would maintain octane levels, reduce tailpipe PM emissions, and reduce lifecycle GHG emissions, furthering many of EPA's Clean Air Act mandates. EPA should carefully consider the benefits of bioethanol blending as a key solution in any potential rulemaking to further reduce tailpipe PM reductions. [EPA-HQ-OAR-2022-0829-0609, p. 33]

Organization: Reginald Modlin and B. Reid Detchon

We note the comment in the Proposed Rule that "in addition to substantially reducing GHG emissions, a longer-term rulemaking could also address criteria pollutant and air toxics emissions from the new light-duty vehicle fleet – especially important considerations during the transition to zero-emission vehicles." Most vehicles entering the market today use gasoline direct injection (GDI) to enhance performance. DOE studies have identified a notable increase in ultrafine particle emissions from GDI engines. The increased number of particles and their size include emissions of toxic polycyclic aromatic hydrocarbons (PAHs). [EPA-HQ-OAR-2022-0829-0570, pp. 2-3]

For mobile source air toxics, such as PAHs derived from gasoline emissions, the Clean Air Act requires "the greatest degree of emission reduction achievable through the application of technology which will be available." In that context, just as with greenhouse gas emissions, vehicles and fuels must be seen as parts of an integrated system. The Department of Energy clearly understands the need for such an approach. Since 2016, the Co-Optimization of Fuels & Engines initiative (known as Co-Optima) has explored how simultaneous innovations in fuels and engines can boost fuel economy and vehicle performance, while reducing emissions. The Co-Optima team views fuels "not as standalone elements in the transportation system, but as dynamic design variables that can work with modern engines to optimize and revolutionize the entire on-road fleet." Their work will be useful as EPA considers the adoption of improved fuels in current and future rulemakings. [EPA-HQ-OAR-2022-0829-0570, pp. 2-3]

b. In the 30 years since the law was enacted, EPA has issued specific regulations on the subject of mobile source air toxics (MSATs) only twice – putting modest limits on benzene emissions in 2001 and on the benzene content of gasoline in 2007, but largely deferring action on the others. [EPA-HQ-OAR-2022-0829-0570, pp. 25-26]

i. The 2001 rule did list the BTEX aromatics as mobile source air toxics and noted that mobile sources accounted for more than 75% of total national emissions in each instance. Also listed was polycyclic organic matter: A group of seven PAHs, "which have been identified by EPA as probable human carcinogens" – including BaP – were used as surrogates for the larger group of POM compounds. Mobile sources were said to account for only 6% of total national emissions – but as measured by mass, not particle number. [EPA-HQ-OAR-2022-0829-0570, pp. 25-26]

129 U.S. EPA, "Control of Emissions of Hazardous Air Pollutants from Mobile Sources" (2001), op. cit., supra note 22.

c. Congress reiterated its 1990 mandate in the Energy Policy Act of 2005: "Not later than July 1, 2007, the [EPA] Administrator shall promulgate final regulations to control hazardous air pollutants from motor vehicles and motor vehicles fuels ... as authorized under section 202(l) of the Clean Air Act." [EPA-HQ-OAR-2022-0829-0570, pp. 25-26]

130 Energy Policy Act of 2005, P.L. 109-58, "Elimination Of Oxygen Content Requirement For Reformulated Gasoline," sec. 1504(b)(1)(vi): https://www.congress.gov/109/plaws/publ58/PLAW-109publ58.pdf (accessed Feb. 24, 2021). Codified at 42 U.S. Code, sec.?7545(k)(1)(B)(vi), "Regulation of fuels": https://www.law.cornell.edu/uscode/text/42/7545 (accessed Feb. 24, 2021).

i. EPA issued its 2007 mobile-source rule in response to this congressional directive. It acknowledged that "Recent studies have found that maternal exposures to PAHs in a population of pregnant women were associated with several adverse birth outcomes, including low birth weight and reduced length at birth, as well as impaired cognitive development at age three." [EPA-HQ-OAR-2022-0829-0570, pp. 25-26]

131 U.S. Environmental Protection Agency, "Control of Hazardous Air Pollutants From Mobile Sources; Final Rule," Federal Register (2007): 72(37): p. 8439: https://www.govinfo.gov/content/pkg/FR-2007-02-26/pdf/E7-2667.pdf (accessed Feb. 24, 2021).

1. But EPA took no action, saying that, according to its model, emissions of polycyclic organic matter "correlate directly with VOC emissions" and thus would decline as VOC emissions decline – failing to anticipate the contrary effect of new GDI engine technology, noted above. [EPA-HQ-OAR-2022-0829-0570, pp. 25-26]

132 Ibid., p. 8478.

ii. In proposing the rule, the agency also acknowledged "limited data that suggest that aromatic compounds (toluene, xylene, and benzene) react photochemically in the atmosphere to form secondary particulate matter (in the form of secondary organic aerosol (SOA)), although our current modeling tools do not fully reflect this" (emphasis added) [EPA-HQ-OAR-2022-0829-0570, pp. 25-26]

Organization: Steven G. Bradbury

My comments are divided into two parts:

First, I will explain why I believe these proposed rules far exceed the EPA's authority under section 202 of the Clean Air Act4 and clearly implicate the Supreme Court's "Major Questions Doctrine" under West Virginia v. EPA and related cases.5 Thus, if finalized as proposed, these rules would be "in excess of statutory … authority" within the meaning of the Administrative Procedure Act, or APA.6 [EPA-HQ-OAR-2022-0829-0647, p. 2]

4 42 U.S.C. § 7521, https://www.law.cornell.edu/uscode/text/42/7521.

5 See West Virginia v. EPA, No. 20-1530, 597 U.S. (2022), https://www.oyez.org/cases/2021/20-1530.

6 See 5 U.S.C. § 706(2)(C) ("The reviewing court shall … hold unlawful and set aside agency action, findings, and conclusions found to be … in excess of statutory … authority.").

The Proposed Rules Exceed EPA's Statutory Authority

Congress has never voted to cede to the Administrator of the EPA the far-reaching power and discretion the Agency is claiming in these rulemakings. There has been no delegation from the people's elected representatives—let alone a clear and express delegation—of such economy-wide transformational power that could survive analysis under the Major Questions Doctrine. [EPA-HQ-OAR-2022-0829-0647, pp. 3-4]

If finalized as proposed, these rules would exceed the bounds of EPA's statutory authority in two fundamental respects—one relating generally to the Agency's regulation of carbon dioxide emissions from new motor vehicles; the other involving its leveraging of pollution-control authority to force on the American people a hyper-accelerated transition to electric vehicles. [EPA-HQ-OAR-2022-0829-0647, pp. 3-4]

This scheme bears no resemblance to EPA's past approach to the regulation of vehicle emissions under the Clean Air Act.

Previously, when EPA has set emissions limits for criteria pollutants under section 202, the available control technologies that EPA has recognized as feasible for achieving compliance have involved cleaner fuels and discrete types of equipment added to the ICE vehicle. This equipment includes, for example, enhanced catalytic converters to capture certain types of pollutants and scrub them out of the vehicle's exhaust, onboard computers to control more precisely the fuel mixture burned by the vehicle's engine, vapor-capture systems for refueling, and fuel-injection systems to recycle unburned fuel back into the cylinders. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

The use of these types of discrete control technologies has already achieved impressive reductions in smog-producing criteria pollutants. As EPA itself acknowledges, exist- ing control technologies applied under previous regulations have enabled automakers to attain "reductions of up to 80 percent in tailpipe criteria pollutant emissions" from ICE vehicles.21 [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

21 88 FR at 29188.

But now, in these rules, EPA is proposing to do something radically different. The so-called control technology here is not some discrete equipment added to the ICE vehicle to achieve lower emissions; it is entirely separate replacement technology that uses a new and different powertrain. These are replacement vehicles, not true control technology; they are different vehicles from bumper to bumper, built on entirely different production lines. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

The EPA's current proposals are thus closely analogous to the Clean Power Plan that was struck down by the Supreme Court last year in West Virginia v. EPA:

There, EPA was relying on its Clean Air Act authority to regulate power plant emissions based on the "best system of emission reduction" available to the plant operator. EPA had previously exercised that authority by setting emissions standards that required individual plants to take measures "to operate more cleanly." But in the Clean Power Plan, EPA concluded that coal-fired power plants could not eliminate enough carbon dioxide emissions to satisfy EPA simply by employing additional measures at the plant. Instead, EPA proposed to require them to choose between greatly reducing their own electricity production (potentially even shutting down the plant) or paying to subsidize increased elec- tricity generation from alternative sources, including natural gas, wind, and solar power (the so-called "generation shifting" concept). The overall goal was to reduce the percentage of national electricity generation supplied by coal and increase the percentage contribution from wind and solar. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

The Supreme Court held that the Clean Power Plan implicated the Major Questions Doctrine because EPA was claiming the power to "restructure the American energy market," and this represented a "transformative expansion" in the Agency's exercise of its regulatory authority. The Court was unconvinced that Congress had "implicitly tasked" the EPA "with balancing the many vital considerations of national policy implicated in deciding how Americans will get their energy," or with the authority to decide "how much of a switch from coal to natural gas is practically feasible" for the nation. There was "little reason to think Congress" had assigned matters of such economic and political significance to the EPA's discretion. "The basic and consequential tradeoffs involved" are "ones that Congress would likely have intended for itself." [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

Everything the Supreme Court said about the Clean Power Plan can be said about the EPA's current proposals for regulating vehicle emissions. As it tried to do with the power market, EPA is now attempting to leverage its authority to set emissions limits for particular types of vehicles into a grand new scheme for shifting and rebalancing the overall mix of ICE, battery-electric, and other powertrains in the national auto fleet—an extravagant role for the Agency to play, and one with enormous economic and political implications. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

Indeed, the current proposals represent an even more extreme example of regulatory overreach than the Clean Power Plan. Here, EPA is attempting to coerce the automakers into financing the entire transformation of the manufacturing base of a major industrial sector by converting their own production of ICE vehicles to EVs on a large scale, not simply contributing toward the marginal subsidization of alternative investments by others. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

Moreover, in the name of ensuring that its own preferred "control technology" will actually deliver the expected performance as a suitable long-term substitute for ICE vehicles, EPA is also claiming the authority to regulate the design and functionality of battery-electric technology over the entire life cycle of EVs. Like CARB, EPA proposes to adopt and enforce "Global Technical Requirement" (GTR) No. 22, promulgated by the United Nations Economic Commission for Europe, which sets standards and requirements for validating electric battery durability.22 [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

22 See 88 FR at 29284-85; 88 FR at 26013-15.

Thus, EPA expects to be in the permanent business of regulating EV technologies, which involve no tailpipes at all, let alone tailpipe emissions—all under the aegis of a statute enacted by Congress to address air pollution from vehicle tailpipes. [EPA-HQ-OAR-2022-0829-0647, pp. 8-10]

What is clear is that EPA sees an endless horizon for its new-found power to regulate practically all aspects of the American automotive market. No doubt, for example, the Agency intends to be involved in overseeing the buildout and operation of electric vehicle charging infrastructure around the country—once again, as an incident of the regulators' own expansive conception of their section 202 authority to ensure the adequacy of EPA's chosen control technology. [EPA-HQ-OAR-2022-0829-0647, pp. 10-11]

We can easily imagine that someday this self-assumed mandate will include the power to ration the timing and extent of drivers' access to charging networks, as EPA deems necessary to maintain the general supply of electricity for EVs. California is already doing this. Because the buildout of charging infrastructure will depend critically on government subsidies and approvals, government rationing of access to this infrastructure is a very real prospect, especially given the strains on grid reliability that I discuss below. [EPA-HQ-OAR-2022-0829-0647, pp. 10-11]

The bottom line under the Major Questions Doctrine is that section 202, on which the proposed rules rest, contains no clear and express delegation of any authority that could sustain these massively consequential proposals. As the Court observed in West Virginia v. EPA, "Congress certainly has not conferred [such] authority upon EPA anywhere … in the Clean Air Act." [EPA-HQ-OAR-2022-0829-0647, pp. 10-11]

The Analyses and Assumptions on Which the Proposed Regulatory Actions Are Based Are Arbitrary, Fundamentally Flawed, and Fail to Recognize and Account Properly for the Hugely Negative Consequences that Would Result from These Actions [EPA-HQ-OAR-2022-0829-0647, pp. 10-11]

EPA claims that, despite the coercive power and industry-transforming ambition behind its proposals, these rules will somehow deliver a stupendous bounty of net benefits, ranging at the high end from $1.5 trillion to $2.3 trillion for the light- and medium-duty vehicle rule,23 plus another $180 billion to $320 billion for the heavy-duty truck rule.24 [EPA-HQ-OAR-2022-0829-0647, pp. 10-11]

24 88 FR at 25937.

Organization: Tesla, Inc.

Tesla believes that this proposed rule -- in substance and structure -- is firmly in the mainstream of long and well-established agency motor vehicle emissions standard setting activities, and well within industry expectations and the agency's authorities. Indeed, the agency has deployed fleet averaging approaches for decades to provide manufacturers flexibility while increasing the stringency of motor vehicle emissions standards. 128 And it has addressed GHG emissions and criteria pollutants in doing so since 2010. 129 EPA's action has been rooted in the Clean Air Act's textual recognition that EPA is to set and revise standards controlling emissions from vehicles, "whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution."130 [EPA-HQ-OAR-2022-0829-0792, p. 21]

128 See, e.g., 45 Fed. Reg. 79382-83 (Nov. 28, 1980); Nat. Res. Defense Council v. Thomas, 805 F.2d 410, 425-26 (D.C. Cir. 1986).

129 75 Fed. Reg. 25324 (May 7, 2010) (Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards; Final Rule for MY 2011 and later).

130 42 U.S.C. § 7521(a)(1).

In addition, EPA has, for example, repeatedly expressed its own understanding that GHG standards should be viewed as a strategy to help control criteria pollutants to address National Ambient Air Quality Standards (NAAQS) nonattainment, as well as to address the climate crisis. EPA has previously explained that "[c]limate change is expected to increase regional ozone pollution, with associated risks in respiratory illnesses and premature death."131 Whether through its impact on reducing atmospheric temperatures that contribute to the formation of ozone, or through its direct impact on air quality by lowering or eliminating altogether tailpipe emissions of smog-forming pollutants and PM, enhanced BEV recognition in the development of these requirements will have a significant impact on achieving air quality targets.132 [EPA-HQ-OAR-2022-0829-0792, p. 21]

131 Endangerment Finding, 74 Fed. Reg. at 66525 ("There is now consistent evidence from models and observations that 21st century climate change will worsen summertime surface ozone in polluted regions of North America compared to a future with no climate change."); (While ozone "is a local or regional air pollution problem, the impacts of global climate change can nevertheless exacerbate this local air pollution problem.").

132 Nonattainment for conventional pollutants such as NOx is also significantly affected by upstream fuel impacts from refinery emissions that are reduced or eliminated by a conversion to zero emissions vehicles. See California Air Resources Board, Analysis in Support of Comments on the SAFE Rule at 69, available at h ttps://www.edf.org/sites/default/files/CARB_Detailed_Comments_on_SAFE_NPRM.pdf.

Furthermore, the seemingly sharp former distinctions between regulatory strategies to address criteria pollutant emissions and GHG emissions have continued to erode in view of the appropriate control strategies and technologies and the increasingly smaller margins for improvement from conventional ICE emissions. States have noted that zero emission vehicles (ZEVs) produce no tailpipe emissions, reduce brake wear PM emissions, and have lower upstream emissions to contribute to their State Implementation Plan (SIP) strategies.133 EPA's 2017 Tier 3 standards, for example, achieved reductions of methane (CH4) and nitrous oxide (N2O), each of which are GHGs that were part of EPA's endangerment finding.134 [EPA-HQ-OAR-2022-0829-0792, pp. 21-22]

133 See e.g., CARB, Staff Report: Initial Statement of Reasons (Oct. 22, 2019) at 5, Table ES-1: Expected Emission Reductions of Proposed ACT Regulation Calendar Year (NOx (tpd) PM2.5 (tpd) WTW GHG (MMT/yr.) 2031 5.0 0.16 0.4 2040 16.9 0.46 1.7 (Proposed Rule)) available at h ttps://ww3.arb.ca.gov/regact/2019/act2019/isor.pdf

134 79 Fed. Reg. at 23445.

EPA has previously recognized the importance of this harmonization. In promulgating its Tier 3 motor vehicle emissions standards, for example, the agency noted:

The Tier 3 program addresses interactions with the 2017 LD GHG rule in a manner that aligns implementation of the two actions, to achieve significant criteria pollutant and GHG emissions reductions while providing regulatory certainty and compliance efficiency. As vehicle manufacturers introduce new vehicle platforms for compliance with the GHG standards, they will be able to design them for compliance with the Tier 3 standards at the same time.135 [EPA-HQ-OAR-2022-0829-0792, pp. 21-22]

135 79 Fed. Reg. at 23417.

Given the continuing need for emissions reductions in both the criteria pollutant and the GHG arenas and the increasing capabilities presented by advanced technologies, the multi-pollutant standards EPA is proposing are fully expected by automotive manufacturers, appropriate, and essential. Indeed, the Supreme Court has broadly defined emissions "standards" under the Clean Air Act as including instances where fleet ZEV standards were sought to be enforced.136 The Court explained that: [EPA-HQ-OAR-2022-0829-0792, p. 22]

136 Engine Mfrs. Ass'n v. S. Coast Air Quality Mgmt. Dist., 541 U.S. 246, 258 (2004).

Organization: Valero Energy Corporation

V. EPA lacks statutory authority—much less clear congressional authorization—to support the proposed action. [EPA-HQ-OAR-2022-0829-0707, pp. 65-66]

In this proposal and its companion proposal regarding HDV greenhouse gas emissions standards, EPA relies, for the first time outside of litigation, on its purported authority to mandate electrification as an "emission control device" or "emission control technology." It is also the first time that EPA proposes standards for MDVs, a subset of HDVs under the Clean Air Act, that rely on the availability of ZEV technologies.351 And it is also the first time that EPA utilizes its criteria pollutant standards, either standing alone or in combination with EPA's greenhouse gas emissions standards, to force further vehicle electrification. For these dramatic changes, however, EPA must have clear congressional authority. Yet EPA has failed to identify such clear authority for the standards and the electrification mandate. Instead, EPA relies on general authority and congressional statements that do not provide clear authority for the proposed action. To the contrary, EPA's references in the proposal demonstrate that Congress had many opportunities to provide clear authority but declined to do so. [EPA-HQ-OAR-2022-0829-0707, pp. 65-66]

351 Because the adoption of ZEVs contemplated by EPA in the proposal consists primarily, if not exclusively, of electric vehicles, these comments focus on the proposal's forced electrification of the Nation's LDV and MDV fleet; however, it should be noted that EPA's definition of ZEVs also includes other technologies, such as hydrogen fuel cell vehicles, which face even greater hurdles to widespread adoption and, more importantly, are equally unauthorized by Congress.

1. EPA claims an unheralded power with staggering implications.

In asserting the sweeping power to mandate increasingly high levels of electrification, EPA claims to have "discover[ed] in a long-extant statute an unheralded power to regulate 'a significant portion of the American economy.'" Utility Air, 573 U.S. at 324 (quoting Brown & Williamson, 529 U.S. at 159). The novelty and broad implications of the agency's approach are powerful clues that Congress never authorized it. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

Novel Assertion of Agency Authority.

Skepticism is warranted when an agency asserts an "unheralded power representing a transformative expansion in its regulatory authority." West Virginia, 142 S. Ct. at 2610 (internal quotation marks omitted). In prior rules setting greenhouse-gas emission standards, EPA has treated electric vehicles as a compliance "option" or "flexibility." In fact, for the 2021 GHG standards for LDVs, EPA argues that electrification was not mandated but was an option, that manufacturers could comply without using EVs. However, for the proposed LDV and MDV rule, EPA does not claim that electrification is merely an option and EPA's model clearly demonstrates that EPA expects OEMs to comply with the proposed standard by increasing production of BEVs and FCEVs while phasing out production of ICEVs. Indeed, with the exception of the companion HDV standards proposed in concert with this rule, forced electrification has never before even been on the table for MDVs (and other HDVs). Nor has EPA previously utilized its criteria pollutant standards in a thinly-cloaked strategy to disincentivize further ICEV production in favor of vehicle electrification, as it does in the proposal. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

Future Implications of the Agency's Claimed Power. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

EPA has made no secret of the significance of the power it proposes to exercise here. In its proposed rule, EPA asserts the authority to force electrification as an "emission control technology" and notes that "[v]ehicle manufacturers can use powertrain electrification as an emissions control technology to comply with EPA standards and to generate credits for use in averaging, banking, and trading." 88 Fed. Reg. at 29184; see id. at 29346 ("This proposal seeks to build on the trends that these developments and projections indicate, and accelerate the continued deployment of these technologies…."); id. at 29312 ("Although the market share of PEVs in the U.S. is already rapidly growing, EPA recognizes that the proposed standards may accelerate this trend."). And as described above, this proposal is only part of a greater "whole of government" approach to mandate electrification at the Biden Administration's direction. By claiming the power of mandating some electrification of the Nation's vehicle fleet, EPA is claiming the authority to mandate 100% electrification as well. As in West Virginia, there is no reason to believe that EPA will stop here. "[O]n this view of EPA's authority, it could go further, perhaps forcing" LDV and MDV manufacturers to "cease making" internal-combustion vehicles altogether. 142 S. Ct. at 2612. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

In fact, this is exactly where EPA is headed. When EPA announced its proposal, it stated that the standards would "accelerate the ongoing transition" to an all-electric future, "delivering on" the Biden-Harris Administration's climate agenda.363 And in related rulemakings, EPA authorized California to adopt its own greenhouse-gas emission standards in its Advanced Clean Cars and Advanced Clean Trucks programs—an authority California is already citing to ban new combustion-engine vehicles and require 100-percent electrification of the LDV, MDV, and HDV fleets by 2036 via its Advanced Clean Cars II and Advanced Clean Fleets programs. See 87 Fed. Reg. 14,332; 88 Fed. Reg. 20,688. Both parts of EPA's strategy reveal the agency's goal to convert America to electric vehicles. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

363 https://www.epa.gov/newsreleases/biden-harris-administration-proposes-strongest-ever-pollution-standards-cars-and. (emphasis added).

Given the vast economic and political significance of EPA's proposal, it "must point to 'clear congressional authorization' for the power it claims." West Virginia, 142 S. Ct. at 2609. There is not one word in the Clean Air Act about a nationwide agency-led transition from conventional internal-combustion vehicles to electric vehicles, or any other so-called ZEV. To be sure, EPA has the power to set emission standards for air pollutants from motor vehicles, just as EPA had the power in West Virginia to set emission standards for air pollutants from power plants. But what EPA claims here for the first time is the authority to set standards in such a way that manufacturers can comply only by abandoning internal-combustion vehicles in favor of electric vehicles. And nothing in the Clean Air Act authorizes that. [EPA-HQ-OAR-2022-0829-0707, pp. 71-73]

Organization: Western Energy Alliance

While acknowledging that EPA must:

“consider issues of technological feasibility, the cost of compliance, and lead time. EPA also may consider other factors, and in previous vehicle standards rulemakings, [EPA-HQ-OAR-2022-0829-0679, pp. 3-4]

as well as in this proposal, has considered the impacts of potential standards on emissions of air pollutants and associated public health and welfare effects, impacts on the automotive industry, impacts on the vehicle purchasers/consumers, oil conservation, energy security and other energy impacts, safety, and other relevant considerations.” p. 29186 [EPA-HQ-OAR-2022-0829-0679, pp. 3-4]

it does not appear that EPA has actually done so. EPA’s logic is often flawed in the analysis and the information relied on is biased or incomplete. [EPA-HQ-OAR-2022-0829-0679, pp. 3-4]

EPA Summary and Response

EPA responds to these comments, together with the comments reprinted in sections 2 and 2.1, below in section 2.3.

2.3 - EPA responses to comments in section 2

Major Questions Doctrine

A number of commenters expressed views that EPA lacks statutory authority to adopt this rule because it is an extraordinary exercise of agency power for which EPA lacks clear authority from Congress. Other commenters express the view that CAA section 202(a)(1) provides clear authority for EPA to set performance-based standards using ABT that take into consideration electrification technologies, and this rule does not raise a so-called “major question.”

EPA agrees with the latter commenters. In Section 202(a), Congress directed EPA to regulate motor vehicle emissions based on its consideration of available technologies, their costs, and lead-time. In the final rule, consistent with its earlier rules, EPA considered updated data on pollution control technologies. The agency found that a range of technologies—including certain BEV technologies which prevent motor vehicle emissions—could be produced at a reasonable cost during the years covered by this rule, model years 2027-32. Based on the agency’s evaluation of all available technologies, EPA decided to strengthen the existing emissions standards for light and medium duty vehicles.

Commenters asserted that EPA lacks authority to adopt the final standards because the agency’s approach raised a major question and the statute is not sufficiently clear in granting EPA the necessary authority. Notwithstanding the plain statutory language in section 202(a) and EPA’s consideration of BEV technologies since the Tier 2 rule in 2000, commenters newly contended that the statute limits the agency to considering only technologies applicable to vehicles with specific types of engines—namely gasoline and diesel internal combustion engine (ICE) vehicles—or only encouraging the adoption of BEV technologies at some lower level.

Commenters' arguments are misplaced. As we discuss in preamble I.A-B and part I below, the statute provides clear Congressional authorization for EPA to consider updated data on all types of pollution control technologies—including BEV technologies—and to determine the emission standards accordingly. In section 202(a), Congress made the major policy decision to regulate air pollution from motor vehicles. Congress also prescribed that EPA should accomplish this mandate through a technology-based approach, and it plainly entrusted to the Administrator's judgment the evaluation of available pollution control technologies and the consequent determination of the emission standards. In the final rule, the Administrator determined that a wide variety of technologies exist to further control emissions from light and medium duty vehicles—including various ICE, hybrid, and BEV technologies, as well as add-on controls—and that such technologies could be applied at a reasonable cost to significantly reduce emissions of air pollutants that contribute to pollution that endangers the public health and welfare. These subsidiary technical and policy judgments were clearly within the Administrator's delegated authority. Because the meaning of the statutory text, read in its context, is unambiguous, there is no need to evaluate whether a major question exists.

In any event, EPA does not agree that this rule implicates the major questions doctrine as elucidated by the Court in *West Virginia* and related cases. The Court has made clear that the doctrine is reserved for extraordinary cases involving assertions of highly consequential power beyond what Congress could reasonably be understood to have granted.[1] The Court considers whether the agency's exercise of power is consistent with prior precedents or whether it claims "to discover in a long-extant statute an unheralded power representing a transformative expansion in [its] regulatory authority."[2] This is not such an extraordinary case in which congressional intent is unclear. Here, EPA is acting within the heartland of its statutory authority and faithfully implementing Congress's precise direction and intent. As we explain in part II, the final rule does not invoke a novel and transformative exercise of agency authority. Rather, the agency is acting in its traditional area of expertise, as it has for decades, to promulgate emission standards for motor vehicles. The rule maintains the fundamental regulatory structure of the existing program and iteratively strengthens the existing emissions standards, consistent with a long history of similar rules.

In part III, we assess the consequences of the rule. While this rule is a significant regulation of the motor vehicle industry, the nature and impacts of the rule are similar in kind to prior rules. On some important metrics, its impacts are smaller than prior rules. We also address commenters' reliance on alleged indirect impacts—on areas like national security, grid reliability, and the viability of fossil fuel companies—to claim that this rule creates extraordinary

---

[1] *West Virginia*, 142 S. Ct. at 2607–08 (cleaned up).

[2] *West Virginia*, 142 S. Ct. at 2610 (citing Util. Air Regul. Grp. v. E.P.A., 573 U.S. 302, 324 (2014)) (alterations in original); id. at 2596 ("This view of EPA's authority was not only unprecedented; it also effected a "fundamental revision of the statute, changing it from [one sort of] scheme of ... regulation' into an entirely different kind."); Biden v. Nebraska, 143 S. Ct. 2355, 2372 (2023) (applying the doctrine upon noting that "past waivers and modifications issued under the Act have been extremely modest and narrow in scope"). But see Biden v. Missouri, 595 U.S. 87, 94, 95 (2022) (declining to apply the major questions doctrine in light of the "longstanding practice of Health and Human Services in implementing the relevant statutory authorities," even though "the vaccine mandate goes further than what the Secretary has done in the past").

consequences. We do not agree that these indirect impacts are relevant to assessing the consequential nature of this rule. The statute does not direct EPA to consider indirect impacts, the legislative history indicates that Congress intended for EPA to regulate despite them, and they are the routine consequence of agency regulation and thus unsuitable for identifying extraordinary exercises of power. Even if these indirect impacts were relevant, EPA has comprehensively assessed these issues, often in consultation with other expert agencies, and found that the final rule does not cause significant indirect harms as alleged by commenters and on balance creates net benefits for society.

In part IV, we consider several additional factors which also weigh against application of the major questions framework: the agency's assertion of authority does not create an unworkable conflict with any other statutory provision; the action does not significantly alter the balance of Federal and state power or the power of government over private property; and notwithstanding ongoing political interest in motor vehicle GHG regulation, the weight of statutory and legislative evidence supports EPA's authority.

I. THE STATUTE PROVIDES CLEAR CONGRESSIONAL AUTHORIZATION.

As we explain in great detail in preamble III.B, the statute clearly authorizes EPA to consider BEV technologies in setting emission standards under section 202(a). Section 202(a) requires the Administrator to establish emission standards for classes of motor vehicles based on the "development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period."[3] "Motor vehicles" are defined broadly to mean "any self-propelled vehicle designed for transporting persons or property on a street or highway."[4] Electrification technologies, including BEVs, are "technologies" that reduce emissions and apply to "motor vehicles." Thus, EPA may consider such technologies in determining the emissions standards. The statutory context, purpose, and history, as well as administrative precedent, support this conclusion. Indeed, the statute unambiguously mandates EPA to consider BEVs on this record, as they are highly effective pollution control technologies available during the timeframe of this rule and at a reasonable cost.[5] In preamble III.B and later in this RTC section, we further address related statutory interpretation comments, including that BEVs cannot belong to the same "class" of vehicles as ICE vehicles and that BEVs are not "complete systems" or "devices" that "prevent or control" air pollution under section 202(a)(1).

We make three additional observations here in support of our argument that the statute provides clear Congressional authorization: (1) in section 202(a), Congress made the major policy decision to regulate air pollution from motor vehicles and appropriately delegated to EPA the interstitial judgments of identifying available pollution control technologies—like electrification technologies—and the level of the standards; (2) the statutory language is clear, and does not rely on modest or vague terms; and (3) the statutory provision is central to controlling motor vehicle emissions, not some ancillary or backwater enactment.

---

[3] CAA section 202(a)(1), (a)(2).
[4] CAA section 216(2).
[5] *See Guedes v. ATF*, 45 F.4th 306, 313 (D.C. Cir. 2022) (holding that when "traditional tools of statutory interpretation" show that the agency's interpretation is "the best one," the court can uphold the interpretation without resorting to deference principles).

First, in enacting Section 202(a), Congress itself made the relevant major policy decision: to regulate dangerous air pollution from motor vehicles. Granting the Executive Branch such authority was a decision of enormous import. To that point, Congress's prior forays into air pollution control had largely focused on research, funding, and study. Motivated by recent environmental crises and a growing awareness of the dangers of air pollution to public health and welfare, Congress in 1965 conferred upon the agency authority to regulate motor vehicle emissions.[6]

Congress also made the key policy decision that motor vehicle emissions control would be achieved through a technology-based approach: EPA is to identify the available control technologies and establish emissions standards based on the performance of such technologies, their costs, and the lead-time necessary for their development and application. Congress charged the agency with technical determinations and policy judgments of an interstitial nature: what kind of pollution is harmful to public health and welfare, which classes of motor vehicles cause or contribute to such pollution, what technologies exist to mitigate such pollution, the rate and costs at which such technologies can be adopted, the appropriate stringency of the emissions standards in light of findings on technology and costs, and how such standards should be complied with and enforced.[7] Congress conferred on the Administrator the authority to make these subsidiary, but also significant, judgments, recognizing both his expertise in this area, as well as the need to confer "regulatory flexibility" absent which "changing circumstances and scientific developments would soon render the Clean Air Act obsolete."[8] These sorts of technical and policy determinations were well within Congress's power to delegate, and such delegations are ubiquitous throughout the Clean Air Act.[9]

In subsequent amendments to the Act, Congress made clear the reach of section 202(a): it could be used to drive not merely modest reductions in motor vehicle emissions, but order-of-magnitude reductions. For example, in the 1970 Clean Air Act Amendments, Congress mandated that the Administrator issue regulations to reduce emissions of certain pollutants by 90% over a five-year period.[10] The 1990 Amendments required 100% phase-in of a new set of demanding

[7] *See* CAA section 202(a)(1) (delegating authority to determine what "air pollution which may reasonably be anticipated to endanger public health or welfare" and which emissions of air pollutants from a class or classes of motor vehicles "cause, or contribute" to such air pollution, and to establish standards to control such emissions), CAA section 202(a)(2) (delegating authority to determine the "period … necessary to permit the development and application of the requisite technology" to control such emissions and the "cost of compliance," and to balance these factors in determining the emissions standards), CAA sections 203-208 (delegating authority to determine the manners of compliance and enforcement).

[8] *Massachusetts v. EPA*, 549 U.S. 497, 532 (2007); *see also NRDC. v. EPA*, 655 F.2d 318, 322 (D.C. Cir. 1981).

[9] *See, e.g.*, CAA section 108, 109, 111, 112, 169A, 202.

[10] *See* Clean Air Act Amendments of 1970, Pub. L. 91-604, at sec. 6, 84 Stat. 1676, 1690 (Dec. 31, 1970) (amending section 202 of the CAA and directing EPA to issue regulations to reduce carbon monoxide and hydrocarbons from LD vehicles and engines by 90 percent in MY 1975 compared to MY 1970 and directing EPA to issue regulations to reduce NOx emissions from LD vehicles and engines by 90 percent in MY 1976 compared to MY 1971). Subsequent factual developments led to relaxation of the standards, see CAA section 202(b)(1); however, the 1970 statute nonetheless illustrates the breadth of EPA's statutory authority to mandate rapid emissions reductions. *See generally* preamble III.B (discussing the statutory numeric standards in section 202(b), (g)-(j), which required dramatic and rapid reductions in emissions).

standards over a six to seven model year period.[11] Congress further clarified that EPA should not view even such enormous reductions as the full extent of Congress's pollution-control intentions, but expressly empowered the agency to go still further.[12]

Commenters do not seriously question that the final rule implements the major policy decision Congress made: regulating air pollution from motor vehicles. Nor do commenters raise any plausible argument against the fact that Section 202(a)(1)-(2) entrusts to the Administrator's judgment the evaluation of pollution control technologies, their costs, and their rate of adoption. Rather, commenters disagree with how the Administrator has considered specific pollution control technologies (i.e., BEVs) in determining the standards. But the evaluation of pollution control technologies is fundamentally an interstitial decision well within EPA's authority.[13]

Commenters fail to seriously question this beyond suggesting that the final rule is unlawful absent an explicit legislative command to consider BEVs or (conversely) to only consider technologies applicable to ICE vehicles.[14] But Congress intentionally chose not to limit EPA's authority to ICE vehicles. Instead, it made the major policy decision here to control motor vehicle pollution via a technology-based approach and delegated to the Administrator the responsibility to implement that policy. Were this not so, any time a significant new pollution control technology has come along—and many have over the years—Congress would need to pass a new statute. While some commenters may prefer this outcome, they articulate no good reason for why Congress must serve as a perpetual monitor of new technological developments in the field of motor vehicle emissions control, as opposed to delegating such technical matters to the expert agency.

Second, the statutory language is clear, and does not use modest words, vague terms, or subtle devices.[15] As explained above and in preamble III.B, the statute is replete with clear language. Among other things, section 202(a) directs the Administrator to regulate emissions from "motor vehicles," which the statute defines as "any self-propelled vehicle designed for transporting persons or property on a street or highway."[16] Unlike other statutory provisions, Congress intentionally abstained from using limiting language such as "internal combustion engine"[17] or "gasoline" or "diesel" engine vehicles.[18] Section 202(a)(2) then directs EPA to establish the

[11] *See* CAA section 202(g).
[12] *See*, *e.g.*, CAA section 202(b)(1)(C) ("The Administrator may promulgate regulations under subsection (a)(1) revising any standard prescribed or previously revised under this subsection…. Any revised standard shall require a reduction of emissions from the standard that was previously applicable."), (i)(3)(B)(iii) ("Nothing in this paragraph shall prohibit the Administrator from exercising the Administrator's authority under subsection (a) to promulgate more stringent standards for light-duty vehicles and light-duty trucks … at any other time thereafter in accordance with subsection (a).")
[13] *See also West Virginia*, 142 S. Ct. 2587, 2601, 2602, 2611 (2022) (under statutes that provide for a technology-based approach to pollution control, noting with approval EPA's determination that "more traditional pollution control measures" include "efficiency improvements, fuel-switching," and "add-on controls").
[14] *But see Nebraska*, 143 S. Ct. 2355, 2378 (2023) (Barrett, J., concurring) (concluding that none of the Court's cases "requires an unequivocal declaration from Congress authorizing the precise agency action under review").
[15] *West Virginia*, 142 S. Ct. at 2609.
[16] CAA section 216(2).
[17] *See* CAA section 216(10) (definition of nonroad engine).
[18] *Compare*, *e.g.*, CAA section 202(a)(1)-(2) (granting general power to the Administrator to establish emission standards for "any class or classes of new motor vehicles or new motor vehicle engines"), with section 202(a)(3)(B)(ii) (addressing regulations under section 202(a)(1) for certain "gasoline and diesel-fueled" vehicles), 202(h) tab. H (same), (i)(1) (same), (k) (addressing regulation of "all gasoline-fueled motor vehicles").

standards for motor vehicles based on the "development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period." The statute does not confine the agency to consider any specific technology, but rather contains explicitly expansive language on the types of eligible technology.[19] Again, Congress made the major policy decision to regulate air pollution from motor vehicles and plainly entrusted the means of achieving such regulation to the Administrator's judgment. "The broad language of § 202(a)(1) reflects an intentional effort to confer the flexibility necessary to forestall … obsolescence."[20]

Third, section 202(a) is not a mere "ancillary" or backwater provision,[21] but rather has been the cornerstone of motor vehicle emissions regulation since its enactment in 1965. Section 202(a)(1) confers on EPA the "general regulatory power" to regulate motor vehicle emissions.[22] Additionally, over the course of the Clean Air Act Amendments of 1970, 1977, and 1990, Congress directed EPA to exercise this authority to promulgate many specific and stringent standards for controlling motor vehicle emissions.[23] Congress also enacted numerous other provisions providing for compliance with and enforcement of such standards.[24] Since section 202(a)'s enactment, EPA has also regularly exercised this authority to promulgate highly consequential motor vehicle emission standards, including numerous criteria pollutant and GHG standards.[25]

II. THE FINAL RULE DOES NOT ASSERT A TRANSFORMATIVE EXPANSION IN AGENCY POWER.

A. The final standards represent an iterative strengthening of existing standards.

The final rule is an iterative strengthening of existing emission standards, not "an unheralded power representing a transformative expansion in [the agency's] regulatory authority" or a "fundamental revision of the statute, changing it from one sort of scheme of regulation into an entirely different kind."[26] The rule asserts the same authority as asserted in earlier rules adopted under section 202(a), and it is premised on technical and policy judgments regarding motor vehicle pollution control that lie in the heartland of EPA's expertise.

[19] *See* CAA section 202(a)(1) ("Such standards shall be applicable to such vehicles and engines for their useful life … whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution.").

[26] *West Virginia*, 597 U.S. 697, 724, 728 (2022).

As a preliminary matter, we emphasize the real-world context antecedent to this rulemaking: the industry is making a significant shift to electrification and BEVs in particular. EPA's determination of what emissions reductions are feasible and appropriate is based first on its assessment of the future market for light and medium duty vehicles. EPA's assessment of the record—including technical information, manufacturer plans, third-party projections, and other relevant data—indicates that advancements in technology, together with the support provided by the BIL, IRA, and other government programs, will lead to significantly greater adoption of electrification technologies even absent new standards. For example, EPA anticipates that, absent this rule, PEVs will represent 39% of new light duty vehicles by MY 2030, as compared to our central estimate of 53% under the rule.[27] Some commenters may anticipate somewhat higher or lower figures than EPA's projection, but it is clear that increasing numbers of PEVs will be produced regardless of EPA rulemaking.

This fact is understood by the regulated community; Ford, Stellantis, and GM have all previously committed to selling 50% or more BEVs by 2030, and several other companies have indicated even higher targets; by comparison, EPA only projects 44% BEV penetration under the final standards. In comments on the proposal, manufacturers reiterated their continued commitment to electrification. Ford, for example, stated "Ford is all-in on electrification. We are investing more than $50 billion through 2026 to deliver breakthrough electric vehicles (EVs)" and expressed their support for a 2032 endpoint of approximately 67 percent PEVs.[28] GM's comments "reiterate[] our commitment" to sell 50 percent EVs by 2030 as "the appropriate path toward all EVs by 2035."[29] Stellantis stated it "is unwavering in its commitment to an all-electric portfolio and building an EV dominated market" including a 50 percent EV mix for passenger cars and light trucks by 2030.[30] Volkswagen expressed its goal of 20 percent BEV sales globally by 2025, and more than 50 percent by 2030.[31] Other OEMs also restated their own significant commitments to electrification, with Honda restating its commitment to selling 40 percent zero-emitting vehicles by 2030 and 80 percent by 2035[32] and Hyundai noting their support for selling 50 percent PEVs in 2030.[33] The final rule builds on these technological advancements, Congressional support, and industry trends.

As discussed in preamble III.B, the rule aligns with decades of the agency's exercise of its CAA section 202(a) authority and enacts an iterative strengthening of the emissions standards established in the earlier rules, including the Tier 3 rule and the 2021 Rule.[34] Since the 1970s, EPA has relied on its CAA section 202(a) authority to set emissions standards for classes of new motor vehicles. In 1971, EPA established the earliest standards for emissions of hydrocarbons, nitrogen oxides (NOx), and carbon monoxide (CO) from light-duty vehicles, requiring a 90% reduction in emissions. Since then, EPA has continued to set standards achieving significant reductions in criteria pollutant (and precursor) emissions for the full range of vehicle classes (including light-duty, medium-duty, and heavy-duty vehicles and passenger, cargo, and

vocational vehicles). Over the last several decades, EPA has set progressively more stringent vehicle emissions standards for criteria pollutants. For example, in 1997 EPA adopted the National Low Emission Vehicle program, which included provisions for certifying zero emissions vehicles. In 2000, EPA adopted the Tier 2 standards, which required passenger vehicles to be 77 to 95 percent cleaner (and further encouraged certification of zero-emitting vehicles through the establishment of "Bin 1", which is now referred to as "Bin 0"). Most recently, in 2014, EPA adopted Tier 3 emissions standards, which required a further reduction of 60 to 80 percent of emissions (depending on pollutant and vehicle class). Similar to the prior Tier 2 standards, Tier 3 established “bins” of Federal Test Procedure (FTP) standards, including bins for zero-emitting vehicles. EPA has also consistently set GHG emissions standards applicable to light-duty vehicles pursuant to CAA section 202(a), beginning with the 2010 rule, and continuing through subsequent rulemakings in 2012, 2020, and 2021.[35]

This rule exercises the same basic authority as asserted in many prior rules. The standards are similar with their predecessors in six fundamental ways: they (1) are promulgated pursuant to the same statutory authority, CAA section 202(a)(1)-(2); (2) address the same endangerment findings for GHG and criteria pollutants as applicable; and (3) impose the same basic regulatory requirement to meet more protective, performance-based standards to reduce emissions from motor vehicles,[36] on (4) the same parties (manufacturers of new motor vehicles); are (5) based on the same basic kind of technical justification, as required by 202(a)(2), namely a demonstration that the standards can be met, within the timeframe of the rule, through the “development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period”; and (6) consider the ability of a manufacturer to average the emissions performance of different vehicles across its fleet, which enables manufacturers to achieve emissions reductions more rapidly and for lower cost.[37,38]

Not only is the nature of the power asserted the same as in earlier rules, but the final rule also involves making the same kinds of technical and policy judgments that lie in the heartland of EPA’s traditionally delegated authority, matters in which the agency has clear expertise. As in prior CAA section 202(a) rulemakings, EPA assessed the availability of potential technologies to

[35] *See* 75 FR 25324 (May 7, 2010) (setting GHG standards applicable to model year 2012-2016 LD vehicles); 77 FR 62624 (Oct. 15, 2012) (setting GHG standards for model year 2017-2025 LD vehicles and “building on the success of the first phase of the National program for these vehicles”); 86 FR 774434 (Dec. 30, 2021) (revising GHG standards for model year 2023 and later light-duty vehicle).

[36] Commenters suggest in passing that the rule raises a major question because EPA failed to consider lifecycle emissions impacts associated with BEVs. EPA has considered certain lifecycle impacts, including GHG emissions from both EGUs and oil refineries, in setting the standards. Further, to the extent that commenters are concerned about the rule asserting a transformative and unprecedented exercise of power, EPA fails to see how an expansive consideration of GHG impacts across the entire vehicle and fuels supply chain—e.g., farms, mines, and factories, both domestic and foreign—would mitigate that concern. We further respond to comments about lifecycle emissions impacts in RTC 19.

[37] Averaging provides compliance flexibilities for manufacturers, allowing them to decide how and when to redesign specific vehicles and to deploy new technologies, and to balance these considerations in the way that makes the most sense for their individual vehicle fleets. This flexible structure is consistent with many previous vehicle rules and is effectively designed to reflect the diverse nature of the motor vehicle industry. For further discussion of averaging, as well as banking and trading, please see the later response on ABT in this RTC 2.3.

[38] This sentence applies in its entirety to the GHG and LD NMOG+NOx fleet average standards. As we explain in preamble III, certain standards in this rule are subject to some different requirements, also consistent with their predecessors; for example, the criteria pollutant standards for statutory heavy-duty vehicles are subject to the additional requirements in CAA section 202(a)(3)(A)(i), and the PM standards are per-vehicle standards.

reduce the pollutant at issue, lead time necessary for development and deployment of those technologies, cost of compliance with the standards, cost to purchasers, and broader societal and economic impacts. And as in those prior rules, EPA exercised its policy judgment and technical expertise to determine the final standards giving due consideration to the statutory and other relevant criteria. For example, EPA evaluated the light and medium duty vehicles industry, the technologies to further control GHG and criteria pollutant emissions from such vehicles, their feasibility, and their effectiveness at controlling emissions. EPA designed and applied its state-of-the-art model, OMEGA. EPA calculated cost metrics, including costs of compliance to regulated entities, costs to purchasers, and social costs, as well as other economic impacts. The agency analyzed emissions impacts, including based on the agency's longstanding MOtor Vehicle Emission Simulator (MOVES), and evaluated the health and welfare impacts of the emission reductions. EPA also monetized certain benefits associated with emissions reductions and energy security and performed a cost-benefits analysis. EPA has fully documented all of these steps in the record, including in the preamble and RIA. Finally, the agency exercised its policy judgment to determine the emissions standards based on its assessment of technological feasibility, lead-time, costs, and other factors.[39] Although the specific facts surrounding each rule vary, these are all among the kinds of considerations that EPA regularly evaluates in its motor vehicle rules: the nature of the industry and the regulated vehicles, the availability of control technologies, costs, emissions impacts, health and welfare impacts, economic and other impacts, cost-benefits analysis,[40] and of course the resulting emissions standards.[41]

While these standards are more protective than their predecessors, this difference is premised not on any transformative assertion of agency power, but rather on changing circumstances, most notably the increasing market adoption of technological advances that permit greater emissions reductions, as well as BIL and IRA funding that support greater adoption of BEVs. As required by the statute, the rule incorporates an updated technical analysis, including of feasibility, lead time, and costs, for emissions control strategies. As we explain in the preamble (e.g., sections III and V), there are more effective control technologies, such as increased electrification, that are being used at greater rates and are available at a reasonable cost for the timeframe of this rule (MY 2027-32) than at the time of prior rules, including the recent 2021 LD GHG rule. The agency also considered updated data on ICE vehicle technologies that are also available to reduce emissions. On balance, we determined that the potential for increased adoption of control technologies, including add-on controls as well as lower emitting powertrains, warranted strengthening the emissions standards.

This iterative strengthening of the emissions standards thus presents an ordinary exercise of agency power and is in no way "a transformative expansion" of EPA's regulatory authority as commenters would suggest. Instead, it is yet another action in a long list of EPA's exercises of its standard-setting authority under CAA section 202. Considerable precedent holds that merely

[39] *See* Preamble V.

[40] As discussed in preamble V and RTC 8, in addition to the statutory factors, EPA also evaluated additional factors, including factors to comply with E.O. 12866. Our assessment of these additional factors lends further support to the final rule.

[41] See, e.g., the final rule preamble and RIA for the HD Phase 2 and Phase 1 rules, and the 2021, 2020, 2012, and 2010 LD GHG rules. As we explain in Part III.E below, the agency also consulted with numerous other expert agencies in formulating its judgments.

strengthening an existing regulatory program does not amount to an extraordinary assertion of power.[42]

Commenters nonetheless claim that EPA's assertion of power here augurs a future where the agency might require the complete elimination of tailpipe pollution from motor vehicles and is therefore transformative. EPA agrees that the *statute* contemplates the possibility of completely preventing motor vehicle tailpipe pollution which contributes to endangerment, where that result is supportable under the statutory criteria and the record.[43] The natural outcome of Congress's major policy decision to control dangerous air pollution from motor vehicles is that such pollution might one day be eliminated. Nowhere does the statute afford a perpetual safe harbor for the production of vehicles that emit pollutants that contribute to air pollution which is endangering public health and welfare when pollution-free vehicles are available at a reasonable cost. This was Congress's, not the Administrator's, decision. In any event, this rule does not require the complete elimination of pollutants from vehicles; such a result is not justified on the current record.

The regulated community also supports EPA's authority to consider BEVs in establishing the standards.[44] While regulated entities filed comments questioning the available lead-time and rate at which the emissions standards should be strengthened, they indicated support for standards that would achieve significantly greater penetration rates for BEVs relative to the status quo. The Alliance for Automotive Innovators, a major trade group representing entities regulated by the final rule, support the goal "to accelerate the transition to zero-emission vehicles"[45] and endorses a PEV market share of 40-50% in 2030, with continued increases through 2032.[46] As noted above, major vehicle manufacturers also filed comments supportive of significant increases in BEV penetration, demonstrating both their intention to produce BEV products and support for EPA's consideration of BEVs in setting the standards.

B. Key aspects of the final rule are not transformative.

Commenters' assertions that certain aspects of this rule—its regulation of GHGs, evaluation of electric technologies, and consideration of the ABT compliance provisions—are nonetheless so transformative as to implicate the major questions doctrine are misplaced. First, commenters

[42] *See West Virginia*, 142 S. Ct. 2587, 2610 (2022) (distinguishing EPA's Mercury Rule, 90 Fed. Reg. 28616 (2005), from the Clean Power Plan and noting that "[t]he Mercury Rule . . . is one more entry in an unbroken list of prior [CAA] section 111 rules"); *Missouri*, 595 U.S. 87, 95 (2022) ("Of course the vaccine mandate goes further than what the Secretary has done in the past to implement infection control. But he has never had to address an infection problem of this scale and scope before. In any event, there can be no doubt that addressing infection problems in Medicare and Medicaid facilities is what he does."); *Utility Air*, 573 U.S. 302, 332 (2014) (declining to apply the major questions doctrine where the regulation "moderately increas[es] the demands EPA (or a state permitting authority) can make of entities already subject to its regulation")

[43] Indeed, an analogous result—of completely preventing a type of emissions—was achieved as early as 1966. The Department of Health, Education, and Welfare (HEW), the agency then in charge of administering section 202, determined that a different type of emissions—crankcase emissions—could be completely prevented from certain motor vehicles. See 31 FR 5171 (Mar. 30, 1966) ("No crankcase emissions shall be discharged into the ambient atmosphere from any new motor vehicle or new motor vehicle engine subject to this subpart.").

[44] *Missouri*, 595 U.S. 87, 95 (2022) (regulated communities' "support suggests that a vaccination requirement under these circumstances is a straightforward and predictable example of the health and safety regulations that Congress has authorized the Secretary to impose").

[45] AAI comment at i.

[46] AAI comment at vi.

wrongly suggest that any significant regulation of motor vehicles to address climate change creates a major question. But *Massachusetts* considered and rejected a similar argument—"that climate change was so important that unless Congress spoke with exacting specificity, it could not have meant the Agency to address it" under section 202(a).[47] While the Court had occasion to revisit that conclusion in *American Electric*, *Utility Air*, and *West Virginia*, it did not. And since *Massachusetts*, EPA has promulgated 6 motor vehicle GHG rules including 4 light duty GHG rules—there is nothing new here.[48]

Second, commenters erroneously claim that EPA's consideration of electric technologies as a basis for the standards is novel. As we explain in preamble III, electric technologies are at the heart of motor-vehicle pollution control. They are used by all new motor vehicles produced today. Electric technologies are fundamental to key emissions control technologies currently in use, including catalytic converters, selective catalytic reduction, particulate filters, and engine and powertrain electrification. Without electric technologies, no motor vehicle would be able to start, or operate, or control emissions. Congress also recognized "electronic emission control units," a kind of electric technology, as a specified major emissions control device in CAA section 207(i)(2). EPA has also repeatedly considered engine and powertrain electrification, including BEV, technologies in its prior rules, as shown in Table 1 and discussed in Preamble III and in greater detail below.

Table 1. Certain Prior Criteria Pollutant and GHG Rules and their Consideration of Averaging in Standard-Setting, ABT, and Electrification Technologies

Rule	**Averaging in Standard-Setting**	**ABT**	**Considering Electrification Technologies**
Tier 2, 65 FR 6698 (Feb. 10, 2000)	6744	6743-44	6746, 6793-4
2010 LD (MY 2011 and later), 75 FR 25324 (May 7, 2010)	25405/1, 25412/1-3	25412/3	25328/3, 25456 (tbl. III.D.6-3)

[47] *Massachusetts*, 549 U.S. 497, 512, 530-31 (2007) (distinguishing *Food & Drug Admin. v. Brown & Williamson Tobacco Corp*., 529 U.S. 120 (2000)).
[48] These rules are the 2010, 2012, 2020, and 2021 LD GHG rules, and the 2011 and 2016 HD GHG rules.

EPA has considered the role of electrification in national rulemakings since Tier 2.[49] In that rule, EPA stated that "we believe it is appropriate to provide inducements to manufacturers to certify vehicles to very low levels and that these inducements may help pave the way for greater and/or more cost effective emission reductions from future vehicles."[50] Accordingly, EPA adopted a "multiplier" to allow BEVs to be counted more than once in compliance calculations for the standards and allowed manufacturers to "propose HEV contribution factors for NOx to EPA . . . [to] be used in the calculation of a manufacturer's fleet average NOx emissions and . . . provide a mechanism to credit an HEV for operating with no emissions over some portion of its life."[51] EPA continued to consider electrification, and where appropriate to incentivize BEVs, in multiple rules under 202(a) since 2000.

EPA built on this technological approach in 2010 when it first adopted standards controlling emissions of GHG, stating we "expect[ed] that automobile manufacturers will meet these standards by utilizing technologies that will reduce vehicle GHG emissions . . . [including] increased use of hybrid and other advanced technologies, and the initial commercialization of electric vehicles and plug-in hybrids."[52] As technology advanced by the time of the 2012 LD GHG Rule, EPA continued to expand its consideration of electrification technology, including electric power steering/electro-hydraulic power steering, improved accessories (such as electrically driven water pumps and cooling fans), 12-volt stop-start, higher voltage stop-start/belt integrated starter generator, integrated motor assist/crank integrated starter generator, P2 hybrid (transmission integrated electric motor placed between engine and a gearbox or continuously variable transmission), 2-mode hybrid, power-split hybrid, plug-in hybrid electric vehicles, and electric vehicles with all-electric drive.[53] In 2014, EPA adopted the Tier 3 rule, coordinating its criteria pollutant standards with the recently adopted GHG standards. EPA projected that manufacturers would choose to meet the criteria pollutant standards with an increase in electric vehicle sales.[54]

In 2020, EPA continued to consider the above technologies in the context of "electric paths [which] include a large set of technologies that share the common element of using electrical power for certain vehicle functions that were traditionally powered mechanically by engine power. Electrification technologies thus can range from electrification of specific accessories . . . to electrification of the entire powertrain."[55] In the 2021 light duty vehicle rule, covering vehicles from MY 2023 to 2026, EPA explained that "[t]he technological readiness of the auto industry to meet the final standards . . . is best understood in the context of the decade-long light-duty vehicle GHG emission reduction program . . . . [M]anufacturers have access to a wide range

---

[49] Even before Tier 2, the voluntary National Low Emission Vehicle (NLEV) program allowed LD motor-vehicle manufacturers to comply with tailpipe standards for cars and light-duty trucks more stringent than that required by EPA in exchange for compliance credits for such low emission and zero emission vehicles. 63 FR 926 (Jan. 7, 1998).

[51] 65 FR 6793.
[52] 75 FR 25324, 25328 (May 7, 2010) ("Although many of these technologies are available today, the emissions reductions . . . finalized in this notice will involve more widespread use of these technologies across the light-duty vehicle fleet.").
[53] 77 FR 62706 (Oct. 15, 2012).
[54] Tier 3 RIA, Tables 2-42 and 2-43.
[55] 85 FR 24174, 24320 (Apr. 30, 2020).

of GHG-reducing technologies, many of which were in the early stages of development at the beginning of EPA's program in 2012, and which still have potential to reach greater penetration across all new vehicles."[56] We noted that, "[i]n addition to the technologies that were anticipated by EPA in the 2012 rule . . . recent technological advancements and successful implementations of electrification have been particularly significant and have greatly increased the available options for manufacturers to meet more stringent standards."[57] As in prior rules, EPA continued to consider electrified vehicles of all kinds alongside every other form of propulsion available and anticipated in light-duty vehicles.

In addition to the above-cited rules regulating the light-duty sector, EPA has also considered electrification in rules regulating the heavy-duty sector. Within the HD GHG program, EPA has considered the role of electrification since the Phase 1 rule in 2011. In that rule, EPA stated that "[t]echnologies such as hybrid drivetrains, advanced bottoming cycle engines, and full electric vehicles [were] promoted in this first step through incentive concepts . . . but we believe[d] that these advance technologies [would] not be necessary to meet the final standards."[58] However, we "expect[ed] these advanced technologies to be an important part of the regulatory program and [would] consider them in setting the stringency of any standards beyond the 2018 model year."[59] In 2016, when EPA promulgated the HD Phase 2 GHG standards, EPA continued to look toward electrification in the future because "we [had] found only one all-electric heavy-duty vehicle manufacturer that [had] certified through 2016."[60]

As electrified HD vehicles have become available in the market in the intervening years and with more HD electric vehicles under development, EPA's most recent rulemaking for the HD sector in 2023 again included consideration of HD electric vehicles.[61] This rulemaking finalized emission standards for NOx, PM, and other pollutants for model years 2027 and later HD vehicles. EPA explained that we developed "performance-based final standards" that allow "manufacturers [to] choose from any number of technology pathways to comply with the final standards (e.g., alternative fuels, including biodiesel, renewable diesel, renewable natural gas, renewable propane, or hydrogen in combination with relevant emissions aftertreatment technologies, and *electrification, including plug-in hybrid electric vehicles, battery-electric or fuel cell electric vehicles*)."[62]

In sum, there is nothing novel about EPA's consideration of electrification technologies, including BEVs, in promulgating the standards. To the contrary, were EPA to ignore BEV technologies in establishing these standards as these commenters suggest, that would be an unprecedented and extraordinary break from the agency's consistent historical practice. The resulting standards under such an approach would also bear little correlation with the regulated community's own plans for reducing emissions. For example, some commenters suggest that EPA—lacking authority to consider the emissions performance of BEV and ICE vehicles in the same class—could instead adopt a more stringent GHG standard specifically for ICE vehicles alone, while ignoring electrification technologies. Such an approach would likely lead to a

[56] 86 FR 74434, 74493 (Dec. 30, 2021).
[57] *Id.*
[58] 76 FR 57106, 57133 (Sept. 15, 2011).
[59] Id.
[60] 81 FR 73478, 73500 (Oct. 25, 2016).
[61] 88 FR 4296, 4330–31 (Jan. 24, 2023).
[62] 88 FR 4296, 4330–31 (Jan. 24, 2023) (emphasis added).

significant loss in emissions reductions, and by restricting or eliminating manufacturers' ability to average the emissions performance of BEV and ICE vehicles, also increase the costs of compliance. And given the enormous investments that the regulated community has made in BEVs and their support for the agency's consideration of BEVs in setting the standards, such a shift would create enormous regulatory uncertainty and undermine significant reliance interests.[63]

As we detail in Preamble ES and III, and as the manufacturers themselves state in their comments,[64] manufacturers have already shifted their research and development programs and selected BEVs as a central element of their future sales strategy, and as a principal, and in some cases the exclusive, long-term GHG emissions reduction strategy. To now prohibit manufacturers from complying through fleet-average emissions reductions achieved through BEVs and instead force them to deliver cleaner ICE vehicles would upend the industry's plans.

The agency appreciates that some commenters, especially those representing or supporting oil and biofuel companies, oppose BEV technologies as BEVs do not demand the liquid fuels these companies produce. But the purpose of section 202(a) is to reduce air pollution from motor vehicles, not to preserve the market share of any particular type of fuel or drivetrain. In light of the statutory language as described in Preamble III.B, BEVs being highly effective technologies available for controlling GHG emissions during MY 2027-32, the agency's longstanding practice of considering such technologies, and the regulated community's reliance on such technologies to achieve emissions goals, the agency can identify no reasoned justification for ignoring BEV technologies in establishing the standards. As we explain in Preamble III.B, such an approach is impermissible under the statute; it would also be arbitrary and capricious.

Commenters raise some sub-flavors of their argument that consideration of electric technologies is novel. They claim, for example, that consideration of electrification technologies that reduce or eliminate the use of liquid fossil fuels, or that prevent pollution from being generated entirely as opposed to controlling it after the fact, are novel. These comments are misplaced. To date, there has been no commercially viable technology that blocks or controls carbon pollution in motor vehicles after such pollution has been created. Rather, all motor vehicle GHG technologies, including all technologies that can be applied to ICE vehicles, result in the reduction of liquid fossil fuel consumption. All of these technologies also prevent pollution from being generated in the first place, for example by increasing engine efficiency, improving aerodynamics, or relying on fuel-switching (to electricity or hydrogen). These

[63] *Encino Motorcars, LLC v. Navarro*, 579 U.S. 211, 222 (2016) ("longstanding policies may have engendered serious reliance interests that must be taken into account. In such cases … a reasoned explanation is needed for disregarding facts and circumstances that underlay or were engendered by the prior policy. It follows that an unexplained inconsistency in agency policy is a reason for holding an interpretation to be an arbitrary and capricious change from agency practice. An arbitrary and capricious regulation of this sort is itself unlawful ….").

[64] *See e.g.*, Ford Motor Company, EPA-HQ-OAR-2022-0829-0605 at p. 1; General Motors, LLC, EPA-HQ-OAR-2022-0829-0700 at p. 3-4; Stellantis, EPA-HQ-OAR-2022-0829-0678 at p. 2; Volkswagen Group of America, Inc., EPA-HQ-OAR-2022-0829-0669 at p. 2; American Honda Motor Co. Inc., EPA-HQ-OAR-2022-0829-0652 at p. 3; Hyundai Motor America, EPA-HQ-OAR-2022-0829-0599 at p. 2.

technologies, moreover, prevent not only GHGs, but criteria pollution.[65] We further address this issue later in this RTC 2.3.

Some commenters, recognizing EPA's authority to consider BEVs, nonetheless claim that the *extent* to which EPA is basing the standards on increased adoption of BEVs, or increased electrification generally, is novel. EPA agrees that BEV technologies will be available in greater quantities and at lower costs during the timeframe for this rulemaking relative to earlier years, and that manufacturers will likely significantly increase their adoption of BEV technologies. These are new factual developments since our earlier rules, which we detail in Preamble ES and III, and these changing facts support more stringent standards. But regulation responsive to changing facts is part and parcel of the normal course of agency administration, not the sort of transformative action that gives rise to a major question.[66] Just as questions about the appropriate level of stringency of a standard are not extraordinary, so too questions about the penetration rates of a given technology that may be expected to occur under different stringencies are not extraordinary.

Commenters also wrongly claim that EPA's consideration of ABT is novel, whether in isolation or specifically with respect to how EPA considers ABT and BEVs in determining the stringency of the standards. As shown in Table 1, ABT is not at all novel: EPA has employed ABT throughout all its GHG rules and many criteria pollutant rules, and the use of averaging, both as a compliance provision and in standard-setting, dates back to 1985.[67] EPA did not even reopen the ABT program in this rule (excepting certain discrete changes discussed in Preamble III). Regulated entities also strongly support ABT and have come to rely on it as a cost-effective way to comply with the standards. By contrast, it would be an extraordinary break from precedent to now cease the ABT program or to cease considering the availability of averaging in determining the standards. We further address comments regarding ABT later in this RTC 2.3.

In sum, the final rule does not assert an unprecedented and transformative expansion of agency power, but merely iterates on the existing criteria pollutant and GHG control programs.

---

[65] Criteria pollutants have historically been controlled by both systems that treat pollution after it has been created (such as catalytic converters) as well as by systems that prevent pollution from being created in the first place. Examples of criteria pollution prevention technologies include exhaust gas recirculation (EGR) and other combustion chamber improvements that lead to a cleaner combustion process. *See, e.g.*, 66 FR 5002, 5035 (explaining that as of time of the 2001 HD rule, "the emission control development work for diesels has concentrated on improvements to the engine itself to limit the emissions leaving the combustion chamber"), 5055 ("non-catalyst related improvements to gasoline emission control technology include higher speed computer processors which enable more sophisticated engine control algorithms and improved fuel injectors providing better fuel atomization thereby improving fuel combustion"), 5092 (expecting certain vehicles to meet the standards through various technologies, including EGR and other combustion process improvements).

[66] *See, e.g., Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co*., 463 U.S. 29, 42 (1983) ("[W]e fully recognize regulatory agencies do not establish rules of conduct to last forever and that an agency must be given ample latitude to adapt their rules and policies to the demands of changing circumstances.… there is no more reason to presume that changing circumstances require the rescission of prior action, instead of a revision in or even the extension of current regulation."); *Missouri*, 595 U.S. 87, 94, 95 (2022) ("Of course the vaccine mandate goes further than what the Secretary has done in the past to implement infection control. But he has never had to address an infection problem of this scale and scope before. In any event, there can be no doubt that addressing infection problems in Medicare and Medicaid facilities is what he does.").

[67] *See* 50 FR 10606 (Mar. 15, 1985). The availability of averaging as a compliance flexibility has an even earlier pedigree. *See also* 48 FR 33456 (July 21, 1983) (EPA's first averaging program for mobile sources); 45 FR 79382 (Nov. 28, 1980) (advance notice of proposed rulemaking investigating averaging for mobile sources).

The nature and scope of the agency's authority is the same as in prior rules. The rule is premised on technical and policy judgments that lie in the heartland of EPA's traditionally delegated authority. And the agency's consideration of electrification and ABT in setting the standards follow decades of precedent.

III. THE FINAL RULE DOES NOT IMPOSE UNPRECEDENTED CONSEQUENCES.

A. The final rule standards impose similar regulatory costs to earlier rules.

In evaluating whether a regulation is of vast economic and political significance, the Supreme Court has typically compared the effects of the current rule with those of prior exercises of the agency's authority.[68] In particular, the Court has paid special attention to the number of directly affected entities and the costs of complying with the regulation[69]—whether in the form of dollars or other economic consequences such as forced plant closures or permitting delays.[70] In some cases, the Court has also considered the costs to customers of the regulated entity.[71]

Table 2 of this response presents a comparison of the impacts of this rule with three prior LD GHG rules: the original 2010 LD GHG rule, the 2012 LD GHG rule, and the most recent 2021 LD GHG rule. We begin by explaining why we chose to compare this rule with prior LD GHG rules. First, we believe this comparison is most responsive to commenters raising major questions doctrine concerns. With regard to their major questions arguments, commenters were principally concerned with the increasing penetration of vehicle electrification technologies EPA projected to meet the GHG standards, as opposed to, for instance, the application of gasoline particulate filters to meet the PM standards. Commenters also expressed significantly greater interest in the LD GHG standards as opposed to the MD GHG standards.

Second, as we explain in Section III of the preamble, we previously regulated MD vehicles under the heavy-duty program, for instance, as part of the HD Phase 1 and Phase 2 GHG rules. We also previously regulated criteria pollutants in separate rulemakings from GHGs. As such, there is no ready comparison between this rule, which regulates both criteria pollutants and GHGs and both LD and MD, with a particular past rule that regulates all the above. More importantly, this choice of presentation makes the comparisons we draw highly conservative from the perspective of the major questions doctrine. Were we to combine the aggregate impacts

---

[68] The Court has not viewed vast consequences, in isolation, as sufficient to warrant departure from the traditional principles of statutory interpretation. *See* Brianne J. Gorod et al., *Major Questions Doctrine: An Extraordinary Doctrine for 'Extraordinary' Cases*, 19 WAKE FOREST L. REV. (forthcoming) 19 ("in no case has economic significance or political controversy alone been enough to trigger application of the MQD"), *available at* https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4419602.

[69] *See, e.g.*, *Nebraska*, 143 S. Ct. 2355, 2372 (2023) ("43 million borrowers from their obligations to repay $430 billion in student loans"); *West Virginia*, 142 S. Ct. 2587, 2604 (2022); id at 2622 (Gorsuch, J., concurring); *Alabama Association*, 141 S. Ct. 2485, 2489 (2021); *Utility Air*, 573 U.S. 302, 322 (2014).

[70] *West Virginia*, 142 S. Ct. 2587, 2604 (2022) (closures of coal power plants); *Utility Air*, 573 U.S. 302, 322 (2014) (permitting delays).

[71] *West Virginia*, 142 S. Ct. 2587, 2604 (2022) (noting the impact of EPA's EGU regulation on "retail electricity prices").

of prior LD and MD GHG and criteria pollutant rules, those aggregate impacts would be significantly greater than the impacts of just prior LD GHG rules.

Table 2. Comparison of the Impacts of the Final Rule and Prior Light-Duty Vehicle GHG Rules.

Rulemaking	**2010 LD**	**2012 LD**	**2021 LD**	**2024 LMD**
Phase-In Schedule (MY)	2012-2016	2017-2025	2023-2026	2027-2032
Costs of Compliance for Manufacturers, Total (PV 3% billion 2022$) [a, b]	475[72]	689[73]	323[74]	760[75]
Average Per-Vehicle Costs of Compliance at Full Phase-In, LD Vehicles (Car + Truck) (2022$) [a, c]	1,302[76]	2,429[77]	1,153[78]	2,074[79]
Net GHG Reductions, Final Year (million metric tons CO2e) [d]	506[80]	569[81]	172[82]	410[83]
Reduction in Oil Consumption (billion barrels)	22[84]	22[85]	6.8[86]	15[87]
Net Benefits, Final Year (billion 2022$) [a, d]	275 [88]	287[89]	42[90]	270[91]
Net Benefits (PV 3% trillion 2022$) [a, d]	2.3[92]	1.9[93]	0.19[94]	2.0[95]

[a] **Comparing Values:** We present all dollar values in constant 2022$ to facilitate ease of comparison between the rules. We adjusted values from prior rules for inflation. Where values have been adjusted, the original values are noted in footnotes. For total costs of compliance and net benefits, we note there are differences in the methodologies used to present and estimate these values across the rules, including updates in certain modeling and monetization

[94] 86 FR 74443, Table 4 ($190 billion (2018$)).
[95] RIA Table 9-21 “Summary of costs, fuel savings and benefits of the final standards (billions of 2022 dollars).”

approaches (e.g., updates to MOVES and SC-GHG). Nonetheless, as EPA estimated these figures at the time of each rule, they appropriately reflect the impacts of the agency's exercise of authority in each such rule. Thus, these figures are suitable for evaluating the scope of the agency's exercise of authority in this rule compared to prior rules.

Specifically with respect to net benefits, for the 2010, 2012, and 2021 LD GHG rules, we present net benefits using a 3% average social cost of carbon (SC-GHG) figure, based on the social cost of carbon methodology developed and recommended by the IWG on the SC-GHG, as described in the RIAs for those rules. For this rule, we present the climate benefits associated with the SC-GHG estimates under the 2-percent near-term Ramsey discount rate. See RIA 6.2 for a discussion of changes to the methodology for monetizing the social cost of carbon. Were EPA to apply the methodology developed and recommended by the IWG on the SC-GHG for calculating the social cost of carbon, the net benefits of this rule would appear smaller. See RIA 9 Appendix Table 6.

More generally, we note there are differences in how values are presented across the preambles for various rules. For example, in some cases, we highlight the impacts of the program through 2050 or 2055, whereas in other cases we highlight the impacts during the years of the phase-in (e.g., MY 2012-16 for the 2010 LD GHG Rule). We compare like values to the fullest extent possible. For example, with regard to total costs of compliance and net benefits, we compare the 3% net present value over the full program (through 2050 or 2055). See also note d below on Final Year. Detailed discussion of the approach to calculating costs and benefits for each rule may be found in that rule's RIA.

[b] **Costs of Compliance, Total:** The costs of compliance for manufacturers represents the total vehicle technology costs for the program relative to the regulatory baseline for each rule. We note that for this rule, the value presented is taken from the summary table of costs and benefits and does not include the battery tax credit, which reduces the costs of compliance to manufacturers below that stated in the table. As shown in RIA 9.7 Table 9-25, the value of the battery tax credit is $17 billion (3% PV).

[c] **Average Per-Vehicle Costs of Compliance:** This row refers to the average per-vehicle cost for the light-duty fleet (passenger cars and light trucks) for the year of full-phase in for the program, i.e., the last year shown on the phase-in schedule row for each rule.

[d] **Final Year**: For this table, the "Final Year" for prior rules refer to 2050, and for this rule refers to 2055. These years approximate when most of the regulated fleet will consist of vehicles subject to the relevant standards due to fleet turnover.

We turn now to the comparison and highlight some key observations. First, this rule regulates the same community of regulated entities as earlier EPA rules: vehicle manufacturers.[96,97] Congress provided explicit textual authorization for regulating these entities, which EPA has been doing for five decades,[98] and they comprise "a relative handful of large sources capable of shouldering heavy substantive and procedural burdens" of section 202(a) regulation, and distinct from the millions of regulated entities that the Court found to give rise to major questions in other cases.[99]

As for the costs of compliance, the rule's costs are not so vast as to be unprecedented or transformative relative to earlier rules. The average costs per-vehicle for LD vehicles in the final year of the phase-in ($2,100 in MY 2032) fall within the range of prior rules, for example less than that of the 2012 rule ($2,400 in MY 2025) but greater than the costs of the 2010 and 2021 rule.[100] The per-vehicle costs, moreover, are small relative to what Congress itself accepted in enacting section 202.[101] The per-vehicle costs for earlier years of the program are also significantly lower, for example, with costs of about $200 in MY 2027.[102] We acknowledge that the total costs of compliance for this rule are greater than for prior rules, for example slightly over 10% higher than the costs for the 2012 rule after adjusting for inflation ($760 billion versus $689 billion in 2022$ (3% PV)). This is partly because, notwithstanding the significant emissions reductions achieved through compliance with prior GHG rules, we expect the regulated community to produce more vehicles than ever before to meet increasing consumer demand. And even these kinds of metrics reflect an iterative strengthening of the program, not the kind of unprecedented and transformative change that gives rise to a major question. They are a far cry, for instance, from the multiple order-of-magnitude increases in the number of regulated entities and in costs that the Court found in *Utility Air*. [103] The changes here reflect

---

[96] As noted in the text above, this rule regulates both LD and MD vehicle manufacturers. EPA previously regulated LD and MD vehicles separately, for instance, with the latter under the heavy-duty program through the Phase 1 and 2 GHG Rules. The more important point here, however, is that we continue to regulate the same regulated community as in prior rules.

[97] Perhaps the most notable development in the automotive market in recent years has been the rise of EV-only automakers. Since EPA adopted its first light duty GHG rule, Tesla's market has grown from virtually zero to 4.2%, ahead of Volkwagen, Subaru, and BMW. *See* Pras Subramian, *Tesla's US Market Share Now Tops Volkswagen, Subaru, and BMW*, Yahoo Finance (Jan. 9, 2024), https://finance.yahoo.com/news/teslas-us-market-share-now-tops-volkswagen-subaru-and-bmw-161055575.html.

[98] See CAA sections 202, 203, 216.

[99] *Utility Air*, 573 U.S. 302, 322 (2014).

[100] Note that per-vehicle costs for earlier years of the program are significantly lower than the costs in MY 2032.

[101] Compare Preamble V ("the highest estimated model year cost (MY 2032) of $2,100 represents about 4.5 percent of the projected average cost of a new MY 2032 light-duty vehicle (about $46,700)"), with *Motor & Equip. Mfrs. Ass'n, Inc. v. EPA*, 627 F.2d 1095, 1118 (D.C. Cir. 1979) ("Congress wanted to avoid undue economic disruption in the automotive manufacturing industry and also sought to avoid doubling or tripling the cost of motor vehicles to purchasers.").

[102] See preamble V for further discussion of costs in different years of the program.

[103] See, e.g., *Utility Air*, 573 U.S. 302, 322 (2014) ("Under the PSD program, annual permit applications would jump from about 800 to nearly 82,000; annual administrative costs would swell from $12 million to over $1.5 billion…. The picture under Title V was equally bleak: The number of sources required to have permits would jump from fewer than 15,000 to about 6.1 million; annual administrative costs would balloon from $62 million to $21 billion; and collectively the newly covered sources would face permitting costs of $147 billion.")

nothing more than an ordinary fluctuation in regulatory impacts in response to changed circumstances.[104]

Nor does the rule impose the kinds of other economic disruptions that the Supreme Court has noted in prior cases. For example, the rule does not require, legally or practically, any vehicle manufacturers to shut down or even to reduce their production. Nor does the rule create excessive, or any, delays in their ability to continue to produce vehicles—we expect that the certification process for compliance will continue entirely uninterrupted.

As for consumer costs, the statute does not require consideration of such costs.[105] Congress, of course, recognized that pollution control would entail costs, and the technologies used to meet EPA's motor vehicle emissions standards have historically increased costs for consumers. There is a subset of pollution control technologies, however, that provide savings to the consumer over the operational lifetime of a vehicle. When such technologies are available, they will obviously be of greater interest to customers. In the final rule, EPA considered the upfront costs associated with purchasing cleaner vehicles, including the costs of any charging infrastructure where applicable, as well as the costs of operating such vehicles over their lifetime. EPA found that lower operating costs for vehicles substantially outweigh the increased costs of meeting the standards over the life of the vehicles. For example, over the average period of first ownership of eight years, we estimate a MY 2032 PEV owner will on average save more than $8,000 on purchase and operating costs compared to a gasoline vehicle that meets these standards.[106]

We also carefully designed the final rule to avoid other kinds of disruptions to consumers. For example, we recognized that light and medium duty vehicles represent a very diverse array of vehicles (e.g., passenger cars, light trucks, work vans, etc.), and that even within a single grouping, there are a diversity of vehicle types and use cases. We carefully tailored the standards so that manufacturers would not be incentivized by the standards to limit the types of vehicles and vehicle sizes they offer to consumers. Furthermore, we recognize that vehicles require supporting infrastructure (e.g., fueling and charging stations) to operate, and we accounted for sufficient lead-time for the development of that infrastructure, including electric charging infrastructure. We also identified numerous industry standards and safety protocols to ensure the safety of vehicles, including BEVs.

Commenters generally failed to acknowledge the analog between this rule and prior rules. In some cases, they focused on the absolute size of the rules' impacts. But as we explain above, the major questions doctrine cases have evaluated the consequential nature of the regulation relative to prior exercises of agency power. And many regulations with large absolute impact, by virtue

---

[104] See Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 42 (1983); *Missouri,* 595 U.S. 87, 94, 95 (2022); All. for Fair Bd. Recruitment v. Sec. & Exch. Comm'n, 85 F.4th 226, 256-58 (5th Cir. 2023).

[105] See *Motor & Equipment Mfrs. Ass'n Inc. v. EPA*, 627 F. 2d 1095, 1118 (D.C. Cir. 1979) ("Section 202's cost of compliance concern, juxtaposed as it is with the requirement that the Administrator provide the requisite lead time to allow technological developments, refers to the economic costs of motor vehicle emission standards and accompanying enforcement procedures. It relates to the timing of a particular emission control regulation rather than to its social implications."); *Int'l Harvester Co. v. Ruckelshaus*, 478 F.2d 615, 640 (D.C. Cir. 1973) ("as long as feasible technology permits the demand for new passenger automobiles to be generally met, the basic requirements of the Act would be satisfied, even though this might occasion fewer models and a more limited choice of engine types. The driving preferences of hot rodders are not to outweigh the goal of a clean environment.").

[106] See Preamble I.C; RIA 4.2.2.

of their continuity with earlier assertions of authority, are not subject to major questions scrutiny.[107] The size of the impacts, moreover, is largely a product of the large size of the vehicle market,[108] as well as EPA's choice to assess impacts through 2055, which allows the agency to consider the long-term impacts of the rule in light of the gradual turnover of the motor-vehicle fleet.

B. The final rule does not impose a BEV mandate

Commenters also claim that the final rule imposes vast economic and political consequences because it effectively mandates specific pollution control technologies—namely BEVs—and effectively bans ICE vehicles. As an initial matter, commenters fail to explain why they believe establishing standards based on particular pollution control technologies imposes vast economic and political consequences inconsistent with congressional intent. More importantly, the rule does not require manufacturers to follow a particular technology pathway.[109] The rule is not a BEV mandate or ICE ban.

To begin with, commenters do not explain why emissions standards based on a specific pollution control technology run afoul of EPA's authority. *West Virginia v. EPA* addressed an analogous issue. In *West Virginia*, the Supreme Court reviewed the legality of EPA's Clean Power Plan, which regulated GHGs from the power sector by requiring a shift from regulated sources—coal fired plants—to completely different facilities—natural gas and renewable power plants. The agency determined that a coal fired power plant operator could comply by reducing its own production of electricity, building a new natural gas or renewable power facility, investing in another entity's such facility, or buying allowances generated by such facilities.[110] The Court applied the major questions doctrine to hold that this generation shifting scheme exceeded the agency's statutory authority under CAA section 111(d) to establish standards based on the "best system of emission reduction." By contrast, the Court noted a "technology-based" approach to regulation traditionally "focuses upon the control technologies that are available to industrial entities and *requires the agency to ensure that regulated firms adopt the appropriate cleanup technology*."[111] The Court observed that a wide range of technologies could fall under

---

107 Compare, e.g., *Missouri*, 595 U.S. 87 (2022) (declining to apply the major questions doctrine), with id. at 104 (Thomas, J., dissenting) (arguing the rule should be applied because it "is undoubtedly significant—it requires millions of healthcare workers to choose between losing their livelihoods and acquiescing to a vaccine they have rejected for months"); see also, e.g., *Becerra v. Empire Health Found.*, 142 S. Ct. 2354 (2022); *EPA v. EME Homer City Generation, L.P.*, 572 U.S. 489 (2014)).

108 See Alliance for Automotive Innovation, Economic Insights Map, available at https://www.autosinnovate.org/resources/insights ($1.21 trillion total car sales in 2022).

109 But see *Engine Mfrs. Ass'n v. S. Coast Air Quality Mgmt. Dist.*, 541 U.S. 246, 252-53 (2004) (noting "the use of 'standard' throughout Title II of the CAA…to denote requirements such as numerical emission levels with which vehicles or engines must comply… or emission-control technology with which they must be equipped.").

110 *West Virginia*, 142 S. Ct. at 2603.

111 *West Virginia*, 142 S. Ct. 2587, 2601 (2022) (emphasis added); see also id. at 2610 (describing that the Mercury and Air Toxics Rule, which was "no precedent for the Clean Power Plan" but only "one more entry in an unbroken list of prior Section 111 rules," as one where EPA "set the cap based on the application of particular controls, and regulated sources could have complied by installing them.").

this approach, including “more traditional air pollution control measures” such as “efficiency improvements, fuel-switching,” and “add-on controls.”[112]

The final rule is unlike the generation shifting that the Court condemned, but rather a prototypical example of the traditional technology-based approach. The statute authorizes EPA to regulate pollutant emissions from motor vehicles. Unlike the Clean Power Plan, the final rule does not require any manufacturer to reduce its production of motor vehicles; rather, as with all prior section 202(a) rules, manufacturers can produce as many vehicles as they want, so long as their fleet meets the emissions standards.[113] The rule also does not require manufacturers to build, invest in, or otherwise support any other forms of transportation, or any strategies to reduce transportation-sector emissions, besides producing cleaner motor vehicles—for example, we do not require motor vehicle manufacturers to build or invest in railroads, public transportation, bicycles, or smart zoning. The rule does not decree that “it would be best if [cars] made up a much smaller share of national [transportation],” [114] or prescribe that only X% of transportation can be accomplished by car, while Y% must occur via lower emitting modes such as rail, boat, or bicycle.[115] Nor does the final rule even require manufacturers to shift production within the light and medium duty vehicle categories toward subcategories that can achieve greater emissions reductions. Rather, EPA recognizes the diverse needs of consumers, and, consistent with its past rulemakings, has maintained separate car and truck standards, with the continuation of existing attribute-based standards for light and medium duty vehicles. EPA’s goal in keeping this approach was to avoid unduly influencing the market strategies of manufacturers (e.g., by incentivizing upsizing or downsizing of vehicles, or the use of cars over light trucks for transportation of people) and instead to preserve the diversity of products in the market. The final rule thus enacts no “sector-wide shift” in transportation.[116] The agency is not seeking to “improve the overall [transportation] system by lowering the carbon intensity of [transportation].”[117]

Rather, EPA is requiring manufacturers who make motor vehicles to produce vehicles that pollute less. The final standards are based on the application of pollution control technology to such vehicles: “traditional air pollution control measures” such as “efficiency improvements” that allow vehicles to consume less fuel and therefore produce fewer GHGs and “fuel-switching” including from gasoline and diesel to fuels such as electricity and hydrogen.[118] To be clear, the final rule does require manufacturers to apply some additional control technology, but it does not

[112] *West Virginia*, 142 S. Ct. 2587, 2611 (2022) (citing 80 Fed. Reg. 64784); see also id. at 2602 (“high-efficiency production processes and carbon capture technology” (citing 80 Fed. Reg. 64512)).
[113] Cf. *West Virginia*, 142 S. Ct. 2587, 2610 (2022) (“[O]ur traditional interpretation ... has allowed regulated entities to produce as much of a particular good as they desire provided that they do so through an appropriately clean (or low-emitting) process.” (citing 80 Fed. Reg. 64726, 64738)).
[114] *West Virginia*, 142 S. Ct. 2587, 2612 (2022).
[115] We offer these other forms of transportation for illustrative purposes only, not to suggest any finding regarding their relative GHG emissions.
[116] While the final rule does allow for credit trading, credits are generated solely by manufacturers of vehicles, not by other kinds of sources, like railroad, bike, or fitness product manufacturers. In other words, as with the MATS trading program that the Court recognized as falling within EPA’s authority, “EPA set the cap based on the application of particular controls, and regulated sources could have complied by installing them.” *West Virginia*, 142 S. Ct. 2587, 2610 (2022). Below, we further explain why the ABT program does not implicate a major question.
[117] *West Virginia*, 142 S. Ct. at 2611.
[118] *West Virginia*, 142 S. Ct. 2587, 2611 (2022). *Cf.* CAA section 241(2) (defining “clean alternative fuel” to mean any fuel including specifically “hydrogen” and “electricity”).

mandate any particular technology pathway. As a legal matter, the rule imposes performance-based standards, not a specific technology mandate. So although EPA accounted for BEV technologies along with other technologies in determining the level of the standards, there is no requirement for any manufacturer to produce a certain number of BEVs, ICE vehicles, or any particular kind of vehicle. This is in significant contrast to other programs to which commenters refer, such as California's ACT program or the Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019), both of which are ZEV sales mandates.

Commenters are correct that EPA considered available technologies, including BEV technologies, in assessing the feasibility of the standards; the standards are based on our assessment of various technologies. But this kind of technological assessment is what the statute requires. Section 202(a)(1) commands EPA to set technology-based standards, considering among other things the time "necessary to permit the development of the requisite technology" and the "cost of compliance." To do so, EPA must necessarily identify potential control technologies, evaluate the rate the technology could be introduced, and its cost.[119] In setting the standards, EPA has accordingly investigated potential compliance pathways, considering technological feasibility, costs, and lead time. Having identified a means of compliance, EPA's task is to "answer[] any theoretical objections" to that means of compliance, and to "offer[] plausible reasons for believing that each of those steps can be completed in the time available."[120] That is what EPA has done here, and indeed, what it has done in all of the emission standards rules implementing section 202(a) of the Act.[121]

As a practical matter, EPA's technical modeling demonstrates that the final standards do not require manufacturers to produce additional BEVs for compliance. EPA's modeling of a potential compliance pathway in preamble Section IV.D does show an increasing penetration of BEVs. But this is just one possible path for manufacturers to comply. In Section IV.F of the preamble, EPA presents several alternate pathways for attaining the standards, based on other technologies, including advanced ICE, hybrids, and PHEVs. In addition to our "central case," where BEVs reach 56% in 2032, we also provide details on a Lower BEV Production pathway in which BEVs reach 43%, and a higher HEV/PHEV pathway where BEVs never exceed 35 percent (which is what we project in our No Action case). Finally, in preamble Section IV.H, we discuss a potential illustrative compliance scenario in which BEVs never exceed 5%, which is well below their share of the market for 2023.[122] In Section IV of the preamble and in the RIA, EPA further discusses the feasibility, lead-time, costs of compliance, and consumer acceptance associated with these alternate technological pathways. Manufacturers have the discretion to choose to produce any of these vehicle mixes, or any other vehicle mix they choose, so long as they meet the numerical standards.

---

[119] *See NRDC v. EPA*, 655 F. 2d 321, 328 (D.C. Cir. 1981) (noting that in order to provide a reasoned explanation for its section 202(a)(1) standards, EPA must "include[] a defense of the methodology for arriving at numerical estimates").
[120] *NRDC v. EPA*, 655 F. 2d at 332.
[121] *See, e.g.*, 77 FR 62624, 62777 (Oct. 15, 2012) (light duty vehicle GHG standards predicated on a mix of potential technologies to improve engine and vehicle fuel economy); 66 FR 5002, 5035–36 (Jan. 18, 2001) (standards for PM and NOx from heavy duty diesel engines predicated on use of catalyzed diesel particulate traps and NOx adsorbers, respectively)
[122] EIA, "Electric vehicles and hybrids surpass 16% of total 2023 U.S. light-duty vehicle sales" Jan. 31, 2024, *available at* https://www.eia.gov/todayinenergy/detail.php?id=61344#.

Further, even under the modeled central compliance pathway, the rate at which BEVs enter the overall onroad fleet is gradual. This is largely due to the lengthy operational lives of vehicles, which can be decades. Our modeling for this pathway shows that 84% of light-duty vehicles on the road will still use gasoline or diesel in 2032.[123] This is a far cry from the commenters' claims of 100% electrification or a gasoline engine ban.[124]

Historical precedent shows that EPA's performance-based standards have provided real choices to manufacturers. For example, in promulgating the 2010 LD GHG rule, EPA modeled a technology pathway for compliance with the MY 2016 standards. In actuality, manufacturers significantly diverged from EPA's projections across a wide range of technologies, instead choosing their own technology pathways best suited for their fleets.[125] For example, EPA projected 62 percent dual clutch transmissions, but in practice less than 3 percent of the MY 2016 vehicles used them; by contrast, EPA projected 28 percent 6 speed automatic transmissions, but in actuality 55 percent of vehicles used them. Looking specifically at electrification technologies, start-stop systems were projected at 45 percent and were used in 10 percent of vehicles, while strong hybrids were projected to be 6.5 percent of the MY 2016 fleet and were actually only 2 percent.[126] Notwithstanding these differences between EPA's projections and actual manufacturer decisions, the industry as a whole was not only able to comply with the standards during the period of those standards (2012-2016), but to generate substantial additional credits for overcompliance.[127]

Likewise, for the HD Phase 2 rule, EPA projected compliance pathways for each of the HD subcategories.[128] To date, of the approximately 415,000 successful certifications showing compliance with the Phase 2 standards, not one has utilized the exact mix of technologies that EPA analyzed in its potential compliance pathways.

Manufacturers may also adopt entirely different strategies than what EPA anticipated. For example, in 1985, EPA set HD PM standards that were anticipated to require the use of particulate filters.[129] Manufacturers chose not to adopt such filters but rather to address the combustion process instead.[130] In 2001, EPA set HD NOx standards. We analyzed the feasibility

---

[123] See RIA Figure 8-5.

[124] Commenters point to various aspirational statements about achieving 100% PEVs, such as those made by the White House press office and the Joe Biden Presidential campaign, often citing to dead hyperlinks. While the President did direct EPA to initiate consideration of more stringent motor vehicle GHG standards, the Administrator is promulgating this final rule under his own statutory authority in section 202(a) based on his policy judgment and the voluminous technical record developed by EPA's technical experts. Aspirational statements made in White House press releases and campaign promises are not the basis for the final rule, and in any event, cannot alter the authority Congress granted in section 202(a).

[125] *See* EPA Memorandum to the docket for this rulemaking, "Comparison of EPA CO2 Reducing Technology Projections between 2010 Light-duty Vehicle Rulemaking and Actual Technology Production for Model Year 2016."

[126] Although in 2010, EPA overestimated technology penetrations for strong hybrids, in the 2012 LD GHG Rule, we underestimated technology penetrations for PEVs, projecting only 1 percent penetration by MY 2021, while actual sales exceeded 4 percent. Compare 2012 Rule RIA, table 3.5-22 with 2022 Automotive Trends Report, table 4.1.

[127] *See* 2022 Automotive Trends Report, Fig. ES-8 (industry generated credits each year from 2012-2015 and generated net credits for the years 2012-2016).

[128] *See, e.g.*, 81 FR at 73620–21 (technology packages in support of numerical GHG standard for class 7 and 8 tractors).

[129] 50 FR 10606, (Mar. 15, 1985).

[130] *See* 66 FR 5002, 5035-36 (Jan. 18, 2001).

of selective catalyst reduction (SCR) and concluded that “there [were] significant barriers to” the use of SCR, [131] such that the NOx adsorber would “be the only likely broadly applicable technology choice by the makers of engines and vehicles for the national fleet in this timeframe.”[132] Manufacturers instead chose to implement SCR to achieve the standards. In other cases, manufacturers did uniformly choose to adopt a single technology—for example, manufacturers have installed catalytic converters on all new ICE vehicles. But this is not because EPA mandates catalytic converters, but rather because manufacturers have themselves chosen that technology as the most effective way to comply with the performance-based standards.

Commenters’ subsidiary argument—that even if EPA could drive BEV adoption, the agency has done so at too rapid a rate—fails for similar reasons: EPA is not mandating any manufacturer to adopt BEVs at any rate. The majority of the shift to BEVs that is expected to occur over the next decade is reflected in our No Action scenario, or a rate of BEV adoption that is expected regardless of whether EPA adopts this final rule.[133] In addition, the rate at which EPA projects uptake of BEV, as well as PHEV, technologies in its modeled compliance pathway is consistent with, and often significantly smaller relative to uptake of new technologies projected in prior rules. Table 3 of this response presents projected technology adoption rates for the central case for this rule, as well as for the 2010 and 2012 LD GHG rules. The table shows that the increased adoption rates for BEV and PHEV technologies are well within the range of increased adoption rates for technologies evaluated in prior rules.

[131] *Id.* at 5053.
[132] *Id.* at 5036; *see also id.* at 5049.
[133] As discussed in the preamble, many third-party “moderate” projections anticipate even higher BEV projections than EPA’s No Action scenario.

Table 3. Technology Penetration Rates for Previous Vehicle Rules

Rulemaking	Technology	Initial Penetration Rate (MY)[134]	Projected Penetration Rate (First MY of Phase-in)	Projected Penetration Rate (Final MY of Phase-in)
2024 LMD Rule	BEV	10% (2023)[135]	26% (2027)	56% (2032)
2024 LMD Rule	PHEV	2% (2023)[136]	6% (2027)	13% (2032)
2012 LD Rule	High-efficiency gearbox	0% (2013)[137]	44% (2021)[138]	95% (2025)[139]
2012 LD Rule	Exhaust gas recirculation	6% (2021)[140]	12% (2021)[141]	68% (2025)[142]
2012 LD Rule	Gasoline direct injection	9 (2010)[143]	65% (2021)[144]	94% (2025)[145]
2010 LD Rule	42-volt stop-start	0% (2008)[146]	–	42% (2016)[147]

Indeed, premising protective emission standards on rapid technology adoption has been a mainstay of section 202(a) regulation since the earliest days of the Act. In 1971, EPA finalized standards for MY 1975, just three model years away, based on catalytic converter technology.[148]

[134] The Initial Penetration Rate column reflects the level of technology adoption prior to the promulgation of the rule. The data on this varies by rule; for example, in some cases, we report the level of adoption at the time the analysis for the rule was completed, while in other cases, we report the level of adoption for the baseline fleet evaluated in the rule.

At the time of the final rule, catalytic converters were not yet in widespread commercial production.[149] Faced with the ongoing air pollution crisis, EPA nonetheless established stringent standards premised on a technology that the agency believed would become available in the lead-time permitted. Many in the industry argued that the technology would not be ready in time and sought extensions, including based on testing data showing that many vehicles were not expected to meet the standards. The Administrator denied those requests.[150] By MY 1975, automakers began installing catalytic converters on their vehicles that achieved 85% reductions in emissions.[151] Over time, greater use of electrification technologies to control and monitor the performance of catalytic converters further increased their efficacy. Today, the catalytic converter "is considered to be one of the great environmental inventions of all time."[152] This history dating back to the very beginning of the Clean Air Act further reflects that the major questions comments, notwithstanding their citation to recent court cases, reflect fairly ordinary concerns. We emphasize, however, a critical difference between EPA's 1971 rules and this rule: unlike the catalytic converter, which was unproven at the time of the 1971 rule, PEV technology has been around for many years. For example, as noted above in table 3, we expect 10% of new MY 2023 vehicles to be BEVs. EPA's rule is predicated on a technological pathway associated with more of an existing commercialized technology, and in that respect it is far less transformative than the agency's earliest CAA section 202(a) rulemakings.

The size of emissions decreases also reflect a rule that is in line with its predecessors. Table 2 shows that the net GHG emissions reductions in the final year of the program are greater than the 2021 LD GHG Rule, but smaller than the 2010 and 2012 LD GHG Rules. When considering emissions reductions on a percent basis, the same is true: EPA's projected emissions reduction of 50% of GHG and NMOG+NOx emissions from light duty vehicles (and somewhat larger NMOG+NOx reductions and slightly smaller GHG reductions for medium duty vehicles) are well within the range of recent rules.[153] The statute itself also contemplates rapid emissions reductions. As noted in Part I above, the Clean Air Act Amendments of 1970 required emissions

[153] The 2010 and 2012 LD GHG rules when considered together achieved approximately a 50% reduction of GHG emissions and Tier 2 required reductions in NOx emissions of 77-95%.

decreases of 90% over a five-model-year period, the 1990 Amendments required a 100% phase-in of demanding standards over a six- to seven-year period, and Congress expressly preserved the Administrator's authority to promulgate even more stringent standards.

C. The final rule's indirect impacts do not give rise to a major question.

Commenters claiming the existence of a major question generally did not grapple with the considerable similarities between this rule and its predecessors. Rather, they focused on the rule's alleged impacts on third parties beyond the regulated entities and their customers, which we refer to here as "indirect impacts." They cite considerations as diverse as how demand for critical minerals could implicate US-China geopolitics, increased consumption of electricity to operate BEVs could destabilize the electric grid, decreased oil consumption could cause oil companies to fail, and so on. They claim that the proposal's costs grossly underestimate the rule's "true costs," based on their assertion that the proper metric is "aggregate cost" for the rule's significance to the "national economy." But commenters fail to identify any precedent holding that mere indirect impacts on unregulated entities give rise to a major question.[154] To the contrary, legal and technical reasons provide substantial reasons to hesitate before relying on indirect impacts to ascertain the existence of a major question.

First, the statute here does not require consideration of such indirect impacts, suggesting that their presence should not limit the agency's statutory authority. Section 202(a) mandates the Administrator to regulate emissions from motor vehicles, upon making the endangerment finding, subject to considerations of feasibility, lead-time, costs of compliance, and safety. While EPA is authorized to consider other factors and has in this rulemaking considered certain indirect impacts, as described in Part III.E below, consideration of other factors is not mandated by law.[155] As such, the agency's consideration of these additional impacts does not limit the agency's authority.

Second, the statutory context and legislative history supports not relying on indirect impacts to gauge the limits of statutory authority. For example, with respect to employment, Congress in enacting the 1977 Clean Air Act Amendments debated the employment impacts associated with the addition of new control technology for motor vehicles, with some Members projecting job increases of up to 180,000 new jobs and others projecting job losses in the tens of thousands.[156] Nonetheless, Congress enacted stringent statutory standards for motor vehicle emissions control. Congress in the 1990 Clean Air Act Amendments chose to further address labor dislocations through funding and training. It added Clean Air Employment Transition Assistance provisions

[154] See, e.g., *West Virginia*, 142 S. Ct. 2587 (2022) (considering the consequential nature of a regulation of electric generating units with regard to its direct burdens on that sector), 2613 (noting "an obvious difference between (1) issuing a rule that may end up causing an incidental loss of coal's market share, and (2) simply announcing what the market share of coal, natural gas, wind, and solar must be, and then requiring plants to reduce operations or subsidize their competitors to get there").

[155] *Motor & Equip. Mfrs. Ass'n, Inc. v. EPA*, 627 F.2d 1095, 1118 (D.C. Cir. 1979); see also id. ("There is no indication that Congress intended section 202's cost of compliance consideration to embody social costs of the type petitioners advance," and holding that the statute does not require EPA to consider antitrust concerns); *Coal. for Responsible Regul., Inc. v. EPA*, 684 F.3d 102, 128 (D.C. Cir. 2012) (holding that the statute "does not mandate consideration of costs to other entities not directly subject to the proposed standards"); *Massachusetts*, 549 U.S. 497, 534 (2007) (impacts on "foreign affairs" are not sufficient reason for EPA to decline making an endangerment finding under section 202(a)(1)).

[156] 123 Cong. Rec. 18182 (1977).

to the Job Training Partnership Act. The added provisions provided funding for "training, adjustment assistance, and employment services to [eligible dislocated workers] adversely affected by compliance with the Clean Air Act" and for "needs-related payments to such individuals."[157] In short, Congress was well aware that impacts to employment were a possibility and provided funding and training for affected workers; but it did not prohibit the agency from further regulation on the basis of employment.

To take another example, in enacting the CAA Amendments of 1990, Congress recognized the need for the critical mineral rhodium for the production of catalytic converters (a ubiquitous motor vehicle pollution control technology) and that South Africa was home to the vast majority of the world's then-known rhodium deposits.[158] While Congress acknowledged concerns with South Africa's human rights record, it nonetheless proceeded to significantly strengthen the motor vehicle emissions standards, such that the production of the necessary technologies could require dependence on South African rhodium supplies. Thus, Congress understood that the nation may need to look to other countries for critical materials where necessary to improve motor vehicle emissions control technology, but mandated emissions reductions regardless. At the same time, Congress also mandated that EPA study the appropriateness of even stronger standards and expressly reserved the agency's authority to promulgate such standards, without including critical minerals as a specific factor to consider.[159]

Third, indirect impacts are often subject to greater uncertainties, and in many cases are not reasonably foreseeable, particularly when separated from the agency's action by a lengthy causal chain. For instance, while EPA has assessed indirect impacts in calculating the rule's costs and benefits—and the presence of positive net benefits supports the rationality of the Administrator's judgment—we do not rely on cost-benefit calculations, with their uncertainties and limitations, in identifying the appropriate standards.[160] Some other impacts are so tenuously linked that they are not amenable to estimation at all, such as—to provide one example raised by a commenter—how the final rule might impact child labor in Congo, a matter which the final rule does not regulate

[157] Pub. L. 101-549, at sec. 1101, amending the Job Training Partnership Act, 29 U.S.C. 1501 et seq. (since repealed). *See also* 136 Cong. Reg. H12911-01 (Oct. 26, 1990) (statement of Representative William D. Ford) ("When a business closes or lays off workers as a consequence of this act, because demand for its products or services is adversely affected, because a product is banned, or because its production processes have become uneconomical, State government, substate grantees, employers, employer associations, and representatives of employees may apply to the Secretary of Labor for funds to help laid off workers find new employment.").

[158] See 136 Cong. Rec. 5102-04 (1990). The 1990 CAA Amendment are not the first time that Congress wrestled with potential dependence on South Africa for rhodium. Congress also recognized this issue when developing the 1977 CAA Amendments. See 123 Cong. Rec. 18173-74 (1977).

[159] See CAA section 202(i), (i)(3)(B).

[160] To provide a more specific example, the agency has modeled the impacts of the final rule on grid reliability and found that grid reliability is not expected to be adversely affected by the modest increase in electricity demand associated with increasing use of PEVs. Yet, as the agency explains in the Resource Adequacy and Grid Reliability Technical Memo, any potential reliability impacts would not be a direct result of this rule but rather of the compliance choices source owners, operators, ISOs and RTOs may pursue, none of which are directly regulated under the final rule. This is a critical difference between this rule and the rule under review in *West Virginia*, where EPA did directly regulate EGUs, and is why grid reliability impacts are of limited relevance to ascertaining the existence of a major question here.

and which, to the extent the United States has any influence, would involve matters of trade and foreign policy outside the scope of the CAA.[161]

Finally, regulations routinely have wide-ranging indirect impacts, so such impacts cannot practically be relied on to identify "extraordinary" cases. For example, EPA's motor vehicle rules generally impose costs on industry, and as such may affect the economics of the regulated entities as well as their employees, suppliers, and customers; fuel producers, distributors, and retailers; and generally the global supply chains to manufacture vehicles, parts, and raw materials. The same can be said for every major regulation, such that relying on indirect effects would offer no limiting principle in determining the existence of major questions.

As such, commenters' assertions about the myriad indirect effects do not reflect the rule's extraordinary nature, but rather the ordinary state of the global supply chain associated with motor vehicles. For instance, although commenters criticize US motor vehicles manufacturers' reliance on China for certain critical minerals used in manufacturing batteries, they fail to acknowledge that reliance on foreign trade is not unique to BEVs; rather manufacturers rely on imports from China and other nations for a wide range of inputs used in production of ICE vehicles,[162] and such reliance is continuously adapting to changing market and regulatory forces.[163] For example, a 2018 EPA case study of Ford found that Ford has "approximately 11,000 suppliers in over 60 countries."[164] Such reliance is not unique to the motor vehicle industry. Aluminium, for instance, is an important raw material used in motor vehicle manufacturing and numerous other industrial applications. It is largely imported, and such

[161] The commenter claims that EPA's final rule will increase demand for cobalt, the Democratic Republic of the Congo controls large reserves of cobalt, and therefore the final rule will aggravate the human rights concerns associated with Congolese child labor as well as geopolitical risks with China, which owns and refines a significant portion of Congolese cobalt output. But the final rule does not regulate battery manufacturers, much less the labor practices at Congolese critical minerals mines, or Chinese ownership of Congolese companies, rendering any such associated impacts highly speculative. (The same, of course, can be said in relation to critical minerals used in ICE vehicles emissions control technologies—e.g., the final rule does not regulate the labor practices of those mines either.) We also note that future technological developments may diminish the use of cobalt in vehicle batteries, which provides another reason not to place weight on the extended chain of hypothetical causation raised by the commenter. See Chen et al., "A Layered Organic Cathode for High-Energy, Fast Charging, and Long-Lasting Li-Ion Batteries," *ACS Cent. Sci.* 2024 (demonstrating "the operational competitiveness of sustainable organic electrode materials [derived from earth-abundant elements] in practical batteries"), available at https://pubs.acs.org/doi/epdf/10.1021/acscentsci.3c01478.

[162] *See, e.g.*, David Coffin, *China's Growing Role in U.S. Automotive Supply Chains*, Office of Industries of the U.S. International Trade Commission (USITC) Working Paper ID-060 (Aug. 2019).

[163] For example, the US motor vehicle industry relies on the global supply chain for semiconductors. The recent shortage in semiconductors caused significant impacts on the motor vehicle industry. *See, e.g.*, Jeanne Whalen, Semiconductor Shortage that Has Hobbled Manufacturing Worldwide is Getting Worse (Sep. 23, 2021), https://www.washingtonpost.com/us-policy/2021/09/23/chip-shortage-forecast-automakers/. The shortage was due to numerous factors, ranging from impacts of pandemic lockdowns on semiconductor production and international trade; the impacts of the pandemic in increasing demand for automobiles and other electronics that use semiconductors; natural disasters that shuttered production facilities; trade conflicts between the US, China, Korea, and Japan; and the Russia-Ukraine conflict. *See* KPMG, *Russia-Ukraine war: Impact on the Semiconductor Industry*, https://kpmg.com/ua/en/home/insights/2022/05/russia-ukraine-war-impact-semiconductor-industry.html; Esther Shein, *Global Chip Shortage: Everything You Need to Know* (Oct. 19, 2023), https://www.techrepublic.com/article/global-chip-shortage-cheat-sheet/.

[164] *See* EPA Center for Corporate Climate Leadership, *Success Stories: Case Studies in Supply Chain Engagement* (Aug. 21, 2023), https://www.epa.gov/climateleadership/success-stories-case-studies-supply-chain-engagement.

imports can have potential national security implications.[165] To provide another example, Apple's supply chain comprises "more than 400 facilities across 180 regions in nearly 30 countries."[166] Overcoming supply chain vulnerabilities is a key component of managing any significant manufacturing operation in today's global world.[167]

Turning to infrastructure, although commenters take aim at the need for new electric charging infrastructure to supply BEVs, they fail to mention that ICE vehicles depend on extensive infrastructure for their operation too,[168] and that infrastructure has changed considerably over the decades in response to environmental regulation. Important changes include the elimination of lead from gasoline, the provisioning of diesel exhaust fluid (DEF) at truck stops to support selective catalytic reduction (SCR) technologies, and the introduction of low sulfur diesel fuel to support diesel particulate filter (DPF) technologies.[169] Each of these changes required establishment of new manufacturing and distribution systems to ensure these fuels and DEF were available to drivers across the country.

Commenters also speculated that the costs of the rule will dramatically increase the costs of transportation; but all pollution control technologies impose upfront costs. And commenters neglected to mention that BEV technologies are actually expected to save purchasers money due to their lower operating expenses, such that the economic costs of transportation are likely to decrease.[170] Commenters also complain about the potential losses for the petroleum industry but fail to mention that this is true for all of EPA's motor vehicle GHG rules, which have continually been premised on reducing petroleum consumption.[171] Indeed, as shown in Table 2 of this response, both the 2010 and 2012 LD GHG rules were anticipated to cause even greater reductions in petroleum consumption. And commenters fail to grapple with the fact that increased demand for fossil fuels is associated with adverse impacts to US energy security.

D. EPA has expertise in assessing indirect impacts of its environmental regulations.

To the extent indirect impacts are relevant, EPA has relevant expertise in assessing such impacts, particularly in consultation with other expert agencies. In addition to the agency's principal expertise in pollution control, EPA also has broad expertise in evaluating the indirect impacts of its actions, both independently and in consultation with other expert agencies.

[167] *See, e.*g., Willy C. Shih, *Global Supply Chains in a Post-Pandemic World* (Sept. – Oct. 2020), https://hbr.org/2020/09/global-supply-chains-in-a-post-pandemic-world; KPMG, *Vulnerable Supply in Automotive*, https://kpmg.com/xx/en/home/insights/2022/05/vulnerable-supply-in-automotive.html.
[168] Moreover, we expect that through 2055 the majority of light and medium duty PEV charging will occur at home; by contrast, ICE vehicles are typically not refueled at home, but require a trip to the gas station.
[169] *See, e.g*., 88 FR 4376 (inducement requirements associated with SCR and DEF); 79 FR 23414 (low sulfur fuel and advanced control technologies for gasoline vehicles); 66 FR 5002 (low sulfur fuel and diesel particulate filters); CAA 218 (Prohibition on production of engines requiring leaded gasoline).
[170] *See* Preamble VIII.
[171] Commenters also neglect to note that the vast majority of such reduced consumption (estimated by EPA as 94.8%) would come from reduced net imports, with only the remaining small fraction linked to reduced domestic production. *See* Preamble VIII.D.

Congress itself recognized that EPA's CAA actions could have a wide range of non-environmental impacts and entrusted the Administrator with regulating notwithstanding such impacts.[172] For example, in section 202(a)(3)(A), Congress directed EPA to establish motor vehicle emission standards "giving appropriate consideration to cost, energy, and safety factors associated with the application of such technology." Congress also authorized EPA, in administering the motor vehicle emissions standards, to "exempt any new motor vehicle or new motor vehicle engine" from certain statutory requirements "upon such terms and conditions as he may find necessary . . . for reasons of national security."[173] Congress further directed EPA to promulgate emissions standards not only for domestically produced vehicles, but also vehicles imported into the United States from foreign nations.[174] Thus, while we agree that EPA is not the exclusive or principal Federal agency charged with regulating energy, safety, national security, international trade, and so forth, Congress nonetheless vested EPA with authority, and EPA possesses sufficient expertise, to evaluate concerns in these and other areas in relation to its motor vehicle emissions control program. It bears mentioning, moreover, Congress directed EPA alone—not in consultation with or subject to the agreement of any other agency—to evaluate the above effects, indicating Congress's decision to entrust such judgments to EPA's expertise.

More generally, Congress has also recognized the agency's general expertise in considering the "public health and welfare" implications of air pollution.[175] In addition to EPA's authority to act on its own, Congress further directed EPA, in consultation with other agencies, to conduct a "comprehensive analysis of the impact of this chapter on the public health, economy, and environment of the United States."[176] The statute also requires EPA to establish emission standards for electric generating units, including based on consideration of "the energy. . . impacts of compliance."[177] These statutory provisions further indicate that Congress believed EPA had sufficient expertise to evaluate manifold indirect impacts.[178] Moreover, EPA has in

[172] *See generally Am. Elec. Power Co. v. Connecticut*, 564 U.S. 410, 427, 428 (2011) ("As with other questions of national or international policy, informed assessment of competing interests is required. Along with the environmental benefit potentially achievable, our Nation's energy needs and the possibility of economic disruption must weigh in the balance. The Clean Air Act entrusts such complex balancing to EPA in the first instance, in combination with state regulators…. Congress designated an expert agency, here, EPA, as best suited to serve as primary regulator of greenhouse gas emissions.").

[175] *See, e.g.*, CAA section 202(a)(1) (requiring EPA to promulgate standards for emissions from motor vehicles "which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare"), 202(a)(4)(A) (precluding the use of any emissions control device that creates "unreasonable risk to public health, welfare, or safety in its operation or function").

[176] CAA section 312(a) (directing EPA to conduct a "comprehensive analysis of the impact of this chapter on the public health, economy, and environment of the United States").

[177] See, e.g., CAA section 169A(b), (g)(2) (requiring EPA to determine best available retrofit technology for existing "fossil-fuel fired generating powerplant[s]," giving consideration to factors including "the energy and nonair quality environmental impacts of compliance").

[178] See also, e.g., CAA section 202(l)(2) ("noise, energy, and safety factors"), 211(o)(2)(B)(ii)(II) ("energy security"), (IV) ("the infrastructure of the United States, including deliverability of materials, goods, and products other than renewable fuel, and the sufficiency of infrastructure to deliver and use renewable fuel"), (VI) ("job creation, the price and supply of agricultural commodities, rural economic development, and food prices").

numerous prior rulemakings considered the indirect impacts of its motor vehicle regulations on factors like employment, national security, and the electric grid.[179]

E. EPA determined that the final rule does not cause significant indirect harms and has large net benefits.

EPA carefully assessed the indirect impacts of the final rule, pursuant to its own expertise and in consultation with many expert agencies. The agency projects that the final rule accrues positive net benefits for society and will not cause significant indirect harms, such as to national security, grid reliability, or employment. The rule also creates the potential for positive benefits in these and other areas, including through mitigating air pollution and climate change, reducing dependence on foreign oil, and creating regulatory certainty for the manufacturing of advanced pollution control technologies and the development of electric charging infrastructure.

In promulgating the final rule, EPA applied its own considerable expertise in motor vehicle pollution control as well as assessing related environmental and economic impacts. Further, the agency engaged in extensive consultation both during the interagency review process pursuant to Executive Order 12,866 and outside of that process.[180] EPA consulted with numerous Federal agencies and workgroups[181] with a wide range of expertise, including in the availability of critical minerals, battery technologies, charging infrastructure, grid reliability, employment, safety, foreign trade, national security, and more. The agency also consulted with State and regional agencies with relevant expertise.[182] And EPA conducted extensive engagement with a diverse range of stakeholders, including vehicle manufacturers, labor unions, technology suppliers, dealers, utilities, charging providers, environmental justice organizations, environmental organizations, public health experts, tribal governments, and other organizations. EPA also carefully considered the input it received through the public hearing and written comments, including 252,439 comments representing diverse stakeholders.

EPA finds that this rule creates $99 billion in annualized net benefits (2022$ 2% AV). The rule's positive net benefits support the rationality of the Administrator's judgment. But the agency did not rely on the cost-benefit calculations, with their uncertainties and limitations, in identifying the appropriate standards. We recognize that some commenters claimed this large net

[181] National Highway Traffic Safety Administration (NHTSA) at the Department of Transportation (DOT), Department of Energy (DOE) including several national laboratories (Argonne National Laboratory (ANL), Lawrence Berkeley National Laboratory (LBNL), National Renewable Energy Laboratory (NREL), and Oak Ridge National Laboratory (ORNL)), United States Geological Survey (USGS) at the Department of Interior (DOI), Joint Office of Energy and Transportation (JOET), Federal Energy Regulatory Commission (FERC), Department of Commerce (DOC), Department of Defense (DOD), Department of State, Federal Consortium for Advanced Batteries (FCAB), and Office of Management and Budget (OMB).

[182] California Air Resources Board (CARB), and other States, including members of the National Association of Clean Air Agencies (NACAA), the Association of Air Pollution Control Agencies (AAPCA), the Northeast States for Coordinated Air Use Management (NESCAUM), and the Ozone Transport Commission (OTC).

benefits figure itself amounted to vast economic and political consequences. We do not agree for the reasons stated above in Part III.C. It would also be particularly perverse, given Congress's grant of authority in section 202(a) to control motor vehicle air pollution, to conclude that where an agency action is accomplishing what Congress directed the agency to do and achieves large benefits, for those benefits to somehow call into question EPA's authority for the action in the first place. Even were the size of the net benefits to be relevant, as we show in Table 2 of this response, the rule's net benefits ($2.0 trillion) are not different in kind from its predecessors: just slightly higher than those of the 2012 LD GHG Rule ($1.9 trillion) and lower than those of the 2010 LD GHG Rule ($2.3 trillion, all values expressed in 3% PV, 2022$).

Throughout the Preamble, RIA, and RTC, EPA further addresses specific impacts, including those of particular concern to these commenters, including electric charging infrastructure and grid reliability; oil imports and energy security; critical minerals; and employment. We summarize some key observations here.

We project that there will be adequate electric charging and refueling infrastructure to support the standards. Grid reliability is not expected to be adversely affected by the modest increase in electricity demand associated with PEV charging, and managed charging strategies can be applied to further decrease grid impacts.[183] We anticipate sufficient supplies of critical minerals to support battery production, given both global supplies as well the significant government efforts through the BIL and IRA as well as private investments to develop domestic mining and processing capacity. The rule is projected to significantly reduce the consumption of petroleum, whether through increased adoption of BEVs or other advanced ICE vehicle technologies that reduce petroleum use; we expect the vast majority of this decrease (94.8%) to reflect decreased net imports, which yields significant positive benefits for energy security ($2.1 billion 2% AV), with relatively limited impacts on domestic refining. We find the potential for employment shifts between industries (e.g., from ICE and ICE vehicle manufacturing to BEV, battery); and while we do not have sufficient data to quantify employment impacts, there is evidence that—assuming production of PEVs and their power supplies are done in the US at the same rates as ICE vehicles—US employment is likely to increase in response to PEV adoption.

Moreover, as we explain in the Preamble, EPA considers our estimates of battery costs and BEV adoption to be conservative, such that there is a reasonable likelihood that the market moves even more quickly toward BEV adoption and achieves greater emissions reductions at a lower cost than we anticipate. At the same time, the standards do not mandate a specific level of BEV technologies—or any at all —such that in the event the barriers to BEV adoption are greater than we project, manufacturers have the flexibility to adopt other technologies and mitigate the need for BEV-related critical minerals, infrastructure, and so forth.

Furthermore, as discussed in Preamble ES and throughout the RIA, many ongoing efforts help ensure the smooth implementation of the final rule. Significant initiatives by the Federal government (such as the BIL and IRA), State and local government, and private firms complement EPA's final rule, including initiatives to reduce the costs to purchase BEVs; support the development of domestic critical mineral, battery, and BEV production; and accelerate the establishment of charging infrastructure. EPA is also monitoring industry's performance in

[183] Specifically, EPA assessed the cumulative impacts of BEV charging in response to the combined impact of this rule and the HD Phase 3 rule. Taken together, these rules are associated with a modest and manageable increase in electricity demand and are not expected to adversely impact grid reliability.

complying with mobile source emissions standards, including the final rule. As appropriate and consistent with our CAA section 202(a) authority, EPA may decide to issue guidance documents, initiate a future rulemaking to consider modifications to the final rule, or make no changes to the program.

Moreover, commenters raising major questions concerns unduly focused on the potential for negative indirect impacts associated with the final rule, while neglecting the negative impacts of inaction. Put differently, they ignored the rule's potential to create positive impacts, which—as many other stakeholders noted—are many and great. Foremost, the positive impacts include the beneficial impacts of mitigating air pollution—the primary purpose of section 202(a). Section II of the preamble extensively documents the adverse effects of criteria pollutants and carbon pollution on human health, the environment, and the economy.[184] Other positive impacts include reduced dependence on foreign oil and increased energy security and independence; increased regulatory certainty for encouraging domestic production of advanced pollution control technologies and their components (including BEVs, batteries, fuels cells, battery components, and critical minerals) and for the development of electric charging infrastructure, with attendant benefits for employment and US global competitiveness in these sectors; and increased use of electric charging and potential for vehicle-to-grid technologies that can support electric resource adequacy and grid reliability.[185]

In sum, the final rule does not create vast economic and political consequences of an unprecedented kind. The rule builds upon the market's transition to PEVs—in response to emerging technological developments, Congress's support in the IRA, and other factors—and strengthens the existing emissions standards. Its direct impacts are analogous to, and in some respects less impactful than, its predecessors. And contrary to what commenters claim, the final rule is not a BEV mandate, whether legally or practically, as a manufacturer can comply with the standards without producing additional BEVs. As for indirect impacts, there is nothing different in kind about the impacts of the final rule compared to the impacts of prior rules; the presence of such impacts merely reflects the ordinary nature of the global supply chain for motor vehicles. Even were the agency to consider indirect regulatory impacts, the final rule causes no significant indirect harms of the kinds that commenters allege, has the potential for positive impacts, and on balance provides positive net benefits to society.

IV. ADDITIONAL FACTORS COUNSEL AGAINST APPLICATION OF THE MAJOR QUESTIONS DOCTRINE

Additional factors present further evidence that the major questions doctrine does not apply: the agency's assertion of authority does not create an unworkable conflict with any other statutory provision, the action does not significantly alter the balance of Federal and state power or the power of government over private property, and notwithstanding political interest in motor

[184] *See* Preamble II (describing, for instance, the adverse impacts of climate change as including catastrophic risks for human health and the environment, water supply and quality, storm surge and flooding, electricity infrastructure, agricultural disruptions and crop failures, human rights, international trade, and national security).
[185] EPA did not rely on these other positive impacts, or the net benefits calculations, in identifying the level of the standards. Nonetheless, the potential for such positive impacts as well as the presence of positive net benefits support the rationality of the standards.

vehicle GHG regulation, the weight of statutory and legislative evidence supports EPA's authority.

First, the final rule is not in conflict with other statutory provisions. As an initial matter, commenters' attempts to wrap their many statutory interpretation challenges in the major questions cloth are misplaced. Ordinary claims of statutory inconsistency, even when "multiple Federal statutes" are allegedly in conflict, are governed by the "traditional rules of statutory interpretation."[186] For example, in *Utility Air*, the Court deferred to EPA's interpretation of the statute notwithstanding petitioners' arguments that the agency's approach was "fundamentally unsuited" given the statutory context, because such approach was not "so disastrously unworkable, and need not result in such a dramatic expansion of agency authority."[187] Here, the commenters' allegations of inconsistency with other statutory provisions[188] are basically run-of-the-mill interpretive disputes that can be resolved under traditional principles of interpretation, and in any event, lack merit. We generally respond to commenters' statutory interpretation arguments later in this section of the RTC. Here, we summarize a few of the responses specifically as they pertain to the major questions doctrine.

Commenters assert that EPA's averaging, banking, and trading (ABT) program is inconsistent with various compliance and enforcement provisions in the statute, e.g., CAA sections 203-207, and specifically criticize EPA's decision to assess the feasibility of the standards based on an average of the emissions performance of different vehicle technologies, including ICE vehicles and BEVs. We respond to the statutory interpretation arguments against ABT later in this RTC section. We also do not see how ABT gives rise to a major question either as to its own validity or to EPA's use of averaging as part of the process of determining stringency of the standards.

Congress has decided the major question here: EPA must control air pollution from motor vehicles. ABT is a compliance mechanism to achieve that aim. ABT recognizes the practical realities of the motor vehicle industry and its strategies for reducing certain pollutants; manufacturers do not redesign every vehicle in every single year, any given manufacturer may find it cheaper to reduce emissions on one kind of vehicle versus another, certain manufacturers may be more cost effective at reducing emissions than other ones, and advanced pollution control technologies are typically phased in over a period of time as opposed to all at once. ABT thus enables EPA to ensure emissions reductions from the class of motor vehicles, while providing manufacturers with greater flexibility in developing their products and achieving emissions reductions at lower cost. ABT also has a lengthy pedigree—beginning (with the averaging component) in 1985 and being applied consistently for NMOG+NOx since 2000 and GHG emissions standards since their inception in 2010. It would be extraordinary for an

[186] *POM Wonderful LLC v. Coca-Cola Co.*, 134 S. Ct. 2228, 2236 (2014); cf. Dep't of Agric. Rural Dev. Rural Hous. Serv. v. Kirtz, No. 22-846, 2024 WL 478567, at *11 (U.S. Feb. 8, 2024) ("we approach federal statutes touching on the same topic with a strong presumption they can coexist harmoniously…. Where two laws are merely complementary—as is undisputedly the case here—our duty lies not in preferring one over another but in giving effect to both.").
[187] *Utility Air*, 573 U.S. 302, 332 (2014)
[188] In some cases, commenters do not even identify an actual conflict, but base their argument primarily on the *expressio unius* canon. We offer specific responses regarding the application of *expressio unius* later in this RTC 2.3.

interstitial compliance mechanism that EPA has implemented for nearly forty years to suddenly become a major question.[189]

Commenters claim there is a conflict between the final rule and the statute's Clean Fuel Vehicles provisions.[190] But the Clean Fuel Vehicle provisions, which are contained in a separate Part of the statute, have little bearing on the scope of EPA's section 202(a) authority.[191] That program was a specific project to advance alternative fuels and technologies.[192] The program prescribes more stringent criteria pollutant standards for certain years (e.g., MY 1998 and later for HD vehicles)[193] in some ozone nonattainment areas, relative to the standards applicable nationwide.[194] There is an obvious mismatch between these requirements and EPA's section 202(a) authority, under which we are setting GHG standards applicable to the entire nation for MY 2027-32. Moreover, the specific provision on which commenters place most weight, section 242(b), actually says that clean fuel vehicles and "conventional gasoline-fueled or diesel fueled vehicles" may be part of the "same category" of vehicles.[195] Finally, commenters erroneously presume that the distinction between clean fuel and conventional vehicles is a distinction between electric vehicles and gasoline and diesel vehicles. Clean fuel vehicles as a category include all kinds of vehicles, including those fueled by diesel, reformulated gasoline, ethanol, hydrogen, electricity, and so on.[196]

Commenters also allege a conflict between the final rule and the Energy Policy and Conservation Act (EPCA). The Supreme Court has already rejected a similar argument as EPCA and the CAA are two different statutes that impose independent duties.[197] If anything, the fact that EPCA precludes DOT from considering battery electric vehicles in exercising certain regulatory powers, and the CAA contains no similar limitation, suggests that Congress knew

---

[189] *West Virginia*, moreover, suggests this is not a major question. In describing the cap-and-trade program for the Mercury and Air Toxics Rule, the Court noted that there, "EPA set the cap based on the application of particular controls, and regulated sources could have complied by installing them." *West Virginia*, 142 S. Ct. 2587, 2610 (2022). This case is analogous. EPA sets the final standards based on technical factors such as feasibility, lead time, and costs, see section 202(a)(1)-(2), comparable to the "scientific, objective criterion" the Court noted with favor, not "wherever the Agency sees fit" based on vague notions of societal welfare.

[190] *See generally* Guidance for Fulfilling the Clean Fuel Fleets Requirement of the Clean Air Act, EPA-420-B-22-027 (June 2022).

[191] As we explain in Preamble III.B, however, we do think the Clean Fuel Vehicles program supports interpreting the statutory term "motor vehicle" to include electric vehicles. CAA section 241(2).

[192] *See* H. REP. NO. 101-490, pt. 1, at 283 (1990), 1990 WL 1222133, at *65-66 (Congress wanted "to encourage a broad range of vehicles," including those using electricity, and break the "chicken and the egg" supply-and-demand problem among automakers, consumers, and fuel producers).

[193] CAA section 245(a).

[194] Compare, e.g., clean fuel vehicle statutory numeric standards in CAA sections 243 and 245, with the those applying to conventional vehicles in CAA section 202(g)-(i).

[195] CAA section 242(b) says that clean fuel vehicles "shall comply with all requirements of this subchapter which are applicable in the case of conventional gasoline-fueled or diesel fueled vehicles of *the same category* and model year" (emphasis added).

[196] CAA section 241(2).

[197] *Massachusetts*, 549 U.S. 497, 532 (2007) (". . . [T]hat DOT sets mileage standards in no way licenses EPA to shirk its environmental responsibilities. EPA has been charged with protecting the public's "health" and "welfare," 42 U.S.C. § 7521(a)(1), a statutory obligation wholly independent of DOT's mandate to promote energy efficiency. *See* Energy Policy and Conservation Act, § 2(5), 89 Stat. 874, 42 U.S.C. § 6201(5). The two obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency.").

how to limit EPA's authority but intentionally declined to do so. We address the consistency of this rule with NHTSA's authority later in RTC 2.3.

As for the Renewable Fuel Standards (RFS) program, the statute explicitly states that the RFS provisions do not limit EPA's other authorities to regulate GHGs.[198] Commenters, moreover, erroneously claim that the increasing statutory biofuel volumes in the RFS program suggest that any future GHG decreases from the transportation sector must come from renewable fuels; but actually, the statute imposes no such requirement. In fact, beginning in 2023, there are no increasing statutory biofuel requirements, and the only statutory biofuel volume is a requirement that biomass-based diesel is not less than the volume in 2012.[199] We further address this comment in RTC 19, finding among other things that the final rule is consistent with EPA's recently promulgated RFS "Set" rule, under which EPA exercised its discretion to mandate increased renewable fuel volumes.

Second, the final rule does not intrude upon areas traditionally reserved for State police power. While Congress recognized the importance of cooperative Federalism in the Clean Air Act, it intended for regulation of motor vehicle emissions to be principally the domain of the Federal EPA. As such, section 209(a) preempts most State and local standards "relating to the control of emissions from new motor vehicles or new motor vehicle engines."[200] Moreover, motor vehicles are instruments of interstate commerce, the air pollutants they emit readily travel over state lines, and the same manufacturers produce motor vehicles for sale nationwide, such that regulation of motor vehicle emissions is eminently suitable for the Federal government.

Third, the final rule does not "significantly alter the balance … the power of the Government over private property."[201] Pursuant to section 202(a), EPA has imposed emissions standards on the motor vehicle industry since the 1970s, and we have regulated GHG emissions from LD vehicles since 2010. The final rule continues regulation of the same regulated community by implementing iteratively more protective emissions standards.

Fourth and finally, commenters erroneously claim that the presence of earnest political debate gives rise to a major question here. Notwithstanding ongoing political interest in motor vehicle regulation, the weight of statutory and legislative evidence strongly favors EPA's authority. EPA summarizes in Preamble III.B the considerable Federal statutory enactments and legislative history that support the agency's consideration of BEVs.[202] Without restating that history, we note that Congress has declared a policy of supporting electric vehicles. 15 USC 2501(b)(4)

---

[198] CAA section 211(o)(12) ("Nothing in this subsection, or regulations issued pursuant to this subsection, shall affect or be construed to affect the regulatory status of carbon dioxide or any other greenhouse gas, or to expand or limit regulatory authority regarding carbon dioxide or any other greenhouse gas, for purposes of other provisions (including section 7475) of this chapter….").
[199] *See* CAA section 211(o)(2)(B)(ii), (v).
[200] CAA section 209(b) creates an exception for "any State which has adopted standards (other than crankcase emission standards) for the control of emissions from new motor vehicles or new motor vehicle engines prior to March 30, 1966." The only State to meet this requirement is California, which has developed its own motor vehicle emissions program, subject to EPA's waivers of preemption. In addition, other States may adopt programs identical to the California program under section 177, but they may not establish their own programs. We note that California strongly supports EPA's further regulation of GHGs from motor vehicles.
[201] *Alabama Ass'n of Realtors v. Dep't of Health and Human Servs.*, 141 S. Ct. 2485, 2489 (2021) (citation omitted).
[202] *See also* Greg Dotson, Comments to Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles; Greg Dotson & Dustin Maghamfar, *The Clean Air Act Amendments of 2022: Clean Air, Climate Change, and the Inflation Reduction Act*, 53 ENVL. L, REPORTER 10017, 10030-32 (2023).

states that it is "the policy of Congress" to "support accelerated research into, and development of, electric and hybrid vehicle technologies," to "facilitate, and remove barriers to, the use of electric and hybrid vehicles in lieu of gasoline- and diesel-powered motor vehicles, where practicable," and "promote the substitution of electric and hybrid vehicles for many gasoline- and diesel-powered vehicles…." IRA Section 60106 provides $5 million for EPA "to provide grants to States to adopt and implement greenhouse gas and zero-emission standards for mobile sources pursuant to section 177 of the [CAA]."[203] The legislative history accompanying the IRA states, "Congress recognizes EPA's longstanding authority under CAA Section 202 to adopt standards that rely on zero emission technologies, and Congress expects that future EPA regulations will increasingly rely on and incentivize zero-emission vehicles as appropriate."[204] The statutory and legislative history unquestionably tilts in favor of Congress viewing electrified vehicles and BEVs as important technologies for pollution control, supporting EPA's authority to consider such technologies in establishing emissions standards.

In light of the substantial history in favor of BEV technologies, we think the various legislative history materials cited by commenters are of little relevance. Commenters point to a few failed bills. But failed legislation "offers a particularly dangerous basis on which to rest an interpretation of an existing law a different and earlier Congress" adopted.[205] Especially where, as here, Congress has passed laws regarding a topic, failed bills are of questionable relevance. Moreover, the specific failed bills that commenters cite sought to impose different regulatory outcomes than the final rule. For example, the Zero-Emission Vehicles Act of 2019, H.R. 2764, 116th Cong. (2019), which applied to light-duty vehicles, "sets a schedule for increasing the percentage of zero-emission vehicles a vehicle manufacturer delivers for sale, culminating in a requirement to sell only zero-emission vehicles from 2040 on."[206] The final rule, however, does not depart from EPA's historic approach of performance-based standards in favor of sales mandate-based standards, nor does the final rule project, much less require, that manufacturers only sell BEVs from 2040 on.

Separately, the commenters claim Congress's support for research and incentives for BEVs undermines EPA's Clean Air Act authority. But such efforts do not constitute a "distinct regulatory scheme"[207] that displaces the agency's authority. Rather, "[c]ollaboration and research do not conflict with any thoughtful regulatory effort; they complement it."[208] And as we explain in Section III of the preamble, the considerable incentives and other funding that Congress has provided for BEVs and their infrastructure support EPA's ability to establish strong emission standards accounting for the availability of such technologies. Besides, Congress's recent enactment of BEV incentives in the Bipartisan Infrastructure Law and the Inflation Reduction

[208] *Massachusetts*, 549 U.S. at 530 (2007).

Act occurred not "against a regulatory backdrop of disclaimers of regulatory authority,"[209] but rather with Congress's full knowledge that EPA was actively regulating motor vehicle GHG emissions; indeed the legislative history to the IRA shows affirmative Congressional support for EPA's efforts.[210]

Commenters also identify some letters from Congressional Members that criticized EPA's proposed rule. Member letters obviously have no legal effect on the agency's statutory authority.[211] To the extent they are relevant, many other Members of Congress sent letters supporting EPA's further regulation of GHGs from motor vehicles.[212]

We also give little weight to the commenters' claims about State-level political debates. As already explained, this rule relates to an area—control of emissions from new motor vehicles—where Congress has placed primary authority in the Federal government. To the extent State political action is relevant, the statute permits only certain State motor vehicle emissions regulation that is more stringent than the Federal regulation. Such regulations, moreover, can only be adopted in the first instance by California, and certain other States may then follow suit.[213] State regulation that is less stringent than the Federal program is expressly forbidden by the statute. So even if a State thinks less stringent motor vehicle emissions standards are better, that State cannot legally require that result. And notwithstanding the diversity of perspectives on BEVs, all states are actively taking actions to support BEVs. Among other things, all States are actively implementing plans for vehicle electrification infrastructure through the National Electric Vehicle Infrastructure (NEVI) Program.[214] And localities within all States have sought

and obtained funds to replace existing school buses with zero-emission and clean school buses under EPA's Clean School Bus Program.[215]

V. CONCLUSION

There is clear Congressional authorization for the final rule. In section 202(a), Congress made the major policy decision to control air pollution from motor vehicles and directed EPA to do so through a technology-based approach. The determination of what technology is available for achieving this policy is a subsidiary technical and policy judgment that Congress plainly entrusted to the Administrator's expertise. The statutory text of section 202(a), read in its context, is clear. And decades of legislative and administrative precedent specifically support the Administrator's authority to consider BEVs, a highly effective pollution control technology.

Even were the Court to apply the major questions framework, no major question exists. This rule represents an iterative strengthening of emissions standards based on the agency's evaluation of updated data within its technical expertise. The impacts of this rule are analogous to, and in some instances less significant than, its predecessor. And while the indirect impacts of the rule are not a suitable basis for assessing a major question, the agency performed a comprehensive assessment of such effects, finding that the final rule does not cause significant indirect harms, has the potential for indirect benefits, and creates net benefits for society. Additional factors considered by the courts also counsel against application of the major questions doctrine.

In the final rule, the Administrator did what he has been doing for over fifty years: evaluate updated data on pollution control technologies and set emissions standards accordingly. The agency recognizes that some stakeholders are unhappy with the increasing availability of BEV technologies, and they would prefer weaker standards, while others prefer stronger standards. But these are garden variety disputes amenable to arbitrary and capricious review. This rule is not an extraordinary and unprecedented assertion of agency power that implicates the major questions doctrine.

EPA's authority to issue standards under section 202 that determine compliance by reference to a fleetwide average

Several commenters suggest that various provisions of section 202 indicate that fleetwide averaging is inconsistent with provisions of title II. Other commenters support the use of averaging, noting that it has been used for more than two decades and is appropriate to continue to use, in light of BEVs becoming an increasingly large part of the vehicle fleet. EPA disagrees with commenters suggesting EPA lacks authority to incorporate ABT into emissions standards

involved/statewide/EV%20Charging%20Plan/040422-Letter%20from%20Governor%20on%20Electric%20Vehicle%20Charging.pdf.

[215] EPA, *Clean School Bus Program Awards* (Feb. 7, 2024), https://www.epa.gov/cleanschoolbus/clean-school-bus-program-awards. *See also* US Department of Energy Alternative Fuels Data Center, Electricity Laws and Incentives, https://afdc.energy.gov/fuels/laws/ELEC (cataloguing additional state laws and incentives to support EV and EVSE infrastructure); US Department of Energy Alternative Fuels Data Center, Hydrogen Laws and Incentives, https://afdc.energy.gov/fuels/laws/HY (hydrogen).

for several reasons as explained in section III.B.3 of the preamble and as further detailed below. First, EPA has employed fleetwide averaging in standard-setting and compliance since 1985. The final rule merely maintains and did not reopen the existing ABT programs, such that these comments are beyond the scope of the rulemaking. Second, ABT is consistent with the standard-setting authority conferred by Congress in section 202(a)(1)-(3). Indeed, ABT furthers the goals of the statute in enabling greater emissions reductions with lower costs and greater lead time. Third, ABT is consistent with the compliance and enforcement provisions of the Act. Commenters are simply wrong that ABT precludes compliance and enforcement of individual vehicles; rather, the regulatory program explicitly requires the compliance of individual vehicles, and EPA may also enforce against individual vehicles. Fourth, the fact that Congress required EPA or other agencies to provide for tradable credits in some other programs outside of the motor vehicle emissions control context is not relevant in ascertaining the agency's authority to provide for ABT in our motor vehicle programs. Fifth, the statute does not require EPA to classify motor vehicles by whether they emit or have an ICE powertrain. Indeed, EPA previously defined the relevant classes for GHG regulation as including passenger cars, light-duty trucks, and medium and heavy-duty trucks, in the 2009 Endangerment Finding, and we did not reopen that finding in this proceeding. Moreover, the commenters' preferred classification is unreasonable as it would delay the adoption of effective and available pollution control technologies and forgo large benefits for the public health and welfare. EPA responds to comments about the major questions doctrine earlier in this RTC 2.3.[216]

I. The comments are untimely.

These comments are untimely and beyond the scope of this final rule. EPA did not reopen whether it is permissible to use an averaging approach to setting standards under section 202(a)(1)-(2), or the general ABT program's flexibilities. EPA disagrees that how EPA has used averaging in this rulemaking is novel as compared with past rulemakings; EPA has repeatedly used averaging in setting standards under section 202(a)(1)-(2), beginning as early as 1985[217] and as recently as the 2020 and 2021 light duty GHG rules, and noted the importance of ABT program flexibilities overall. EPA also repeatedly has explained that ABT is consistent with and gives full effect to the requirements of section 202 as well as the statutory scheme, including Title II's compliance and enforcement provisions applicable to vehicles.[218] Under such circumstances, it is eminently reasonable for EPA not to reconsider a question that has been settled for decades.[219] Additionally, the commenter's assertions of a change from EPA's historical approach rest on a false assertion that this rule mandates adoption of a specific compliance pathway; rather, the final standards are performance-based standards with many potential compliance pathways, of which we provide several examples to further support that EPA is agnostic as to what technologies are ultimately applied in complying with the standards.

[216] Some commenters recycle arguments from the petitioners' briefs in *Texas v. EPA*, No. 22-1031 (D.C. Cir.). To the extent applicable, EPA also incorporates its responsive brief in that case by reference. EPA's Br., *Texas v. EPA*, No. 22-1031 (D.C. Cir.).
[217] 50 FR 10606.
[218] To the extent the commenters suggest that the use of averaging is novel because it amounts to a BEV mandate, this contention is inaccurate both legally and factually, as discussed in the preceding response.
[219] *See Growth Energy v. EPA*, 5 F.4th 1, 13 (D.C. Cir. 2021).

Commenters' claims that this rule is novel in treating ABT as integral to standard-setting, while prior rules viewed ABT only as a flexibility, are misplaced.[220] EPA has relied on the availability of averaging in countless standard-setting rulemakings since 1985. For example, the 1985 rule found that averaging was a key consideration in supporting the technological feasibility and lead-time of the standards. That rule stated:

> Particulate trap technology is heretofore untried on the fleet level. EPA believes that the … standard which, through averaging, effectively requires use of traps on 70 percent of all heavy-duty vehicles will significantly reduce the risk of widespread noncompliance while allowing manufacturers to gain valuable experience with this new technology. To promulgate this standard without allowing averaging … would increase the technological risk associated with the standard because traps would have to be used in even the most difficult design applications.[221]

Numerous subsequent rules have followed the same approach.[222] For example, the 1990 rule stated that "the standards were set with averaging in mind, making averaging integral to the standard."[223] Further, EPA has always viewed averaging as integral to standard-setting in the LD GHG program. In the 2010 LD GHG final rule, EPA established "a system of averaging, banking, and trading of credits integral to the fleet averaging approach," that was "similar to averaging, banking, and trading (ABT) program EPA has established in other programs."[224] We stated that "ABT is an integral part of the standard setting itself, and not just an add-on to help reduce costs," as "ABT resolves issues of lead-time or technical feasibility…."[225] All subsequent GHG rules followed the same approach.[226]

---

[220] EPA performed a no-credit-trading sensitivity and concluded that the standards can be met at a reasonable cost even in the absence of any credit trading. As such, while trading provides manufacturers with additional flexibility in meeting the standards, it is not necessary to EPA's judgment as to the feasibility of the standards. As such, trading is also severable from the final standards.

[226] *See* 77 FR 62788 ("ABT is an integral part of the standard setting itself, not just an add-on to help reduce costs. In many cases, ABT resolves issues of cost or technological feasibility which might otherwise arise…. The ABT provisions are integral to the fleet averaging approach established in the MY 2012-2016 rule and we view them as equally integral to the MY 2017-2025 standards."); 86 FR 74453 ("The ABT provisions are an integral part of the vehicle GHG program and the agency expects that manufacturers will continue to utilize these provisions into the future[.]"); see table 1 in the above response on Major Questions Doctrine.

Moreover, the legality of averaging under section 202(a) has already been litigated in *NRDC v. Thomas*, 805 F. 2d 410 (D.C. Cir. 1986), where the court of appeals ruled in favor of the agency. Commenters rely heavily on footnote dicta from that case to allege that the court identified potential statutory inconsistencies but did not reach them only because they were not raised in the litigation. We address the substance of these points later in our response. However, we note here that the footnote dicta were comprehensively addressed by EPA's 1989 proposal[227] and 1990 final rule,[228] where we also received copious comments on this specific issue. Any party wishing to challenge EPA's authority for averaging in light of the Agency's interpretation of *NRDC v. Thomas* had ample opportunity to do so following EPA's promulgation of the 1989 and 1990 rulemakings, and yet, no party did so.

EPA also disagrees with commenters who claim this is the first time EPA has considered electrified technologies in establishing standards based on averaging. As we explain in Section III.B.2-3 of the preamble and in our major questions doctrine response in RTC 2, all vehicles—including all ICE vehicles—today are electrified to some extent, and electrification exists on a large spectrum. The agency has considered powertrain electrification specifically since at least the 1998 NLEV rule and the 2000 Tier 2 standards. In the LD GHG program itself, EPA has previously adopted vehicle standards under 202(a)(1)-(2) where compliance pathways supporting the standards reflected inclusion of powertrain electrification technologies and included averaging with ICE vehicle technologies. For example, in the 2010 LD GHG Rule, EPA justified the feasibility of the standards based on a projection that strong hybrids would make up 6.5% of the MY 2016 fleet.[229] In promulgating the 2012 GHG Rule, EPA conducted a company-by-company projection of potential compliance pathways for MY 2021 and 2025 light duty vehicle GHG emission standards, indicating hybrid electric vehicle penetrations of up to 15% for some companies.[230] The 2012 Rule also projected the availability of PEV at 1% in MY 2021.[231] The

[227] 54 FR 22652, 22665-66 (May 25, 1989) ("EPA does not believe that the statutory text or legislative history cited by the court necessarily means that the CAA requires or that Congress intended that every vehicle or engine family emit at the same level. As the court itself noted, the Act gives EPA broad latitude in the testing of vehicles and, more fundamentally, in the formulation of standards. EPA promulgated the HDE NOx and PM emissions standards as averaged standards. It thus follows that in testing 'any' engine for compliance with those standards, EPA may hold particular engine families to different control levels as part of an averaged set of engine families so long as the engine families' average emission levels meet the applicable standard.").

[228] 55 FR 30584, 30593-94 (July 26, 1990) ("In [*NRDC v. Thomas*], the court upheld averaging, but expressed some reservations about averaging in light of a statutory provision and some legislative history not raised by the parties to the case. The court pointed out that under averaging some vehicles would not be required to comply with the standards and that this appeared inconsistent with the requirement that "any," a" or "such" vehicle or engine be tested and required to comply with emission standards. At the same time the court noted that the statutory language was ambiguous and that the testing and certification provisions empower the Agency to test vehicles and engines in the manner it 'deems appropriate' so as to conform to the prescribed standards. EPA fully discussed in the preamble to the proposed rule why the statute and its legislative history should be read to allow the Agency discretion to determine the manner of testing and certification of vehicles. EPA also found that the broad type of averaging represented by trading and banking would be consistent with the Congressional scheme. … EPA continues to believe that the statute provides the Agency discretion in this matter, and that trading and banking are consistent with the statutory aims.").

[229] *See* EPA Memorandum to the docket for this rulemaking, "Comparison of EPA CO2 Reducing Technology Projections between 2010 Light-duty Vehicle Rulemaking and Actual Technology Production for Model Year 2016."

[230] *See* 77 FR at 62854-55, 62856-57 (October 15, 2012).

[231] 2012 LD GHG Rule RIA, Table 3.5-22.

2021 rule projected further increases in powertrain electrification technologies, with PEV technologies reaching 17% in 2026.[232]

EPA also notes that given the lengthy pedigree of the ABT program, manufacturers have come to rely on it for compliance with many of EPA's motor vehicle programs. As we explain in Section V.B of the preamble, manufacturers are widely utilizing the various credit programs available, and we have every expectation that manufacturers will continue to take advantage of the compliance flexibilities and crediting programs to their fullest extent, thereby providing them with additional tools in finding the lowest cost compliance solutions in light of the revised standards. [233] Unsurprisingly, no directly regulated manufacturer is opposing the agency's authority for ABT or to establish standards with a fleet average form. While the agency has authority to change its policies when warranted, commenters have advanced no persuasive justification for reopening ABT at this time, particularly in light of manufacturers' reliance interests and the ABT program's ability to effectuate greater emissions reductions at lower costs. Indeed, their comments do not appear to even recognize the considerable reliance interests of directly regulated entities, recycle legal arguments that the agency considered and rejected long ago in the 1990 rule,[234] and effectively concede that abandoning averaging would delay the application of pollution control technologies and forgo otherwise feasible emission reductions. The little that commenters do say about manufacturers' interests is fundamentally wrong. They erroneously claim that the reason manufacturers have not pushed back on ABT is because the manufacturers view it solely as an extra-statutory accommodation that allows them greater flexibility. EPA thinks manufacturers understand very well how the agency has relied on averaging generally and ABT specifically to establish countless standards since 1985. In sum, commenters have not adduced sufficient reasons to adopt a policy, much less revisit a longstanding, foundational part of the motor vehicle program with a forty-year pedigree.

We reiterate that EPA did not reopen this issue in this rulemaking and the comments are outside the scope of the rule. In responding, EPA notes that we are not here "undertak[ing] a serious, substantive reconsideration of the existing" position.[235] EPA's response is intended solely to clarify and correct the misstatements and misrepresentations made by commenters concerning EPA's historical approach to averaging in standard setting and ABT program flexibilities, how EPA's ABT program is implemented, and the corresponding statutory basis. In providing this response, EPA also notes the extraordinary nature of commenters' claims: given the widespread use of ABT across EPA's section 202(a) programs, commenters—none of whom are regulated entities under section 202(a)—are implying that the agency has continually violated countless Title II compliance provisions for nearly forty years. That is completely false, and the agency here sets the record straight.

II. Section 202(a) delegates authority to EPA to adopt standards with a fleet average form.

Commenters maintained that section 202(a) does not mention averaging, banking, and trading. They assert that, whether under standard principles of statutory construction or under the major questions doctrine, Congressional silence is not tantamount to a delegation of authority.

The commenters are correct that section 202(a)(1) does not include the words "averaging, banking or trading."[236] But the standard-setting framework in section 202(a)(1) readily encompasses performance-based standards that are based on consideration of averaging. In later subsections, we explain how such a standard fits well within the Act's implementation and enforcement mechanisms, and how other provisions of section 202 and elsewhere confirm EPA's authority under section 202(a)(1) to set such standards.

Section 202(a)(1) mandates that EPA "prescribe . . . standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles . . . ." The Supreme Court has made clear that fleet average and other requirements applicable at the fleet-wide (as opposed to individual vehicle) level are "standards" within the meaning of Title II of the Act. In *Engine Mfrs. Ass'n v. S. Coast Air Quality Mgmt. Dist.*, 541 U.S. 246 (2004),[237] the Court indicated that "standards" encompass "fleet average emission requirements," which "decrease over time, requiring manufacturers to sell progressively cleaner mixes of vehicles," and under which "[m]anufacturers retain flexibility to decide how many vehicles in each emission tier to sell in order to meet the fleet average."[238] The Court also found that "standards" include other types of fleet-wide requirements like mandates that fleet owners purchase vehicles of a given type,[239] and that a certain percentage of a manufacturer's new vehicle sales must consist of vehicles of a given type.[240]

Section 202(a)(1) also applies to "class or classes of new motor vehicles." "Class or classes" necessarily refers to groups of vehicles, as opposed to individual vehicles. So section 202(a)(1) is naturally read to authorize EPA to set standards for groups of vehicles, which would include a manufacturer's fleet of vehicles that are in this group.

Regulation under section 202(a)(1) is also conditioned on the Administrator finding that emissions from a class or classes of motor vehicles "cause, or contribute to, air pollution which

[236] EPA's response here focuses on averaging. However, "trading and banking are simply forms of averaging between manufacturers and over time. Thus, they pose similar legal issues." 54 FR 22665. With respect to the arguments raised by the adverse comments, EPA believes trading and banking are justified on similar bases as averaging. *See also generally* 54 FR 22665-67 (discussing the legal bases for trading and banking), 55 FR 30593-99 (same).

[237] The Court in. *S. Coast Air Quality Mgmt. Dist.* was construing CAA section 209(a), which refers to "any standard relating to control of emissions from new motor vehicles". This language is similar to the text of section 202(a). The *South Coast* Court made clear that there is no reason to read "standard" in section 202(a) differently than in section 209(a)): "A 'standard' is defined as that which 'is established by authority, custom, or general consent, as a model or example; criterion; test.' This interpretation is consistent with the use of 'standard' throughout Title II of the CAA (which governs emissions from moving sources) to denote requirements such as numerical emission levels with which vehicles or engines must comply, *e.g.*, [CAA section 202] (a)(3)(B)(ii), or emission-control technology with which they must be equipped, *e.g.*, [CAA section 206](a)(6)." *Id*. at 253.

[238] *Id*. at 250, n.3.

[239] *Id*. at 250, 258.

[240] *Id*. at 255.

may reasonably be anticipated to endanger public health or welfare." In enacting section 202(a)(1), Congress was concerned with classes of motor vehicles contributing to dangerous air pollution, not with individual vehicles doing so. Indeed, it is ordinarily only emissions from a group of vehicles (i.e., a class) not a single vehicle that could cause dangerous air pollution. As we explain later in this response, this is also how EPA has long interpreted the statute, including in making the 2009 GHG endangerment finding for motor vehicles. This further indicates that EPA may regulate the class of vehicles as a whole, including at the fleet-wide level, not just individual vehicles.

The statute explicitly subjects regulation under section 202(a)(1) to the requirements of section 202(a)(2), which states that "[a]ny regulation prescribed under paragraph (1) of this subsection (and any revision thereof) shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period." Fleet average standards relate directly to section 202(a)(2)'s considerations of technical feasibility, cost, and lead time. As we explain above, EPA has found for decades that establishing fleet average standards allows the agency to set standards at a given stringency for lower cost. It also affords regulated entities more flexibility in determining how to meet those standards, accommodating practical realities of vehicle redesign cycles and market fluctuations, and allowing additional lead-time for a portion of the fleet to meet the standards if the regulated entity decides to have another portion of the fleet achieve the standards more rapidly.[241] Similarly, the ability to generate credits promotes earlier introduction of advanced technologies, furthering the Act's emission reduction and technology advancement goals.

The D.C. Circuit reviewed and upheld EPA's use of averaging in promulgating section 202(a) standards in *NRDC v. Thomas*, 805 F.2d 410 (D.C. Cir. 1986). Observing that there was no "clear congressional prohibition of averaging," the Court held that "the EPA's argument that averaging will allow manufacturers more flexibility in cost allocation while ensuring that a manufacturer's overall fleet still meets the emissions reduction standards makes sense."[242] While the Court noted in dicta that its analysis did not consider certain potential arguments not raised by the litigants—arguments which we addressed in a subsequently rulemaking[243] and which we discuss later in this response—its holding was unquestionably to uphold EPA's averaging program.

Congress subsequently ratified EPA's and the Court's interpretation in the 1990 Clean Air Act Amendments. "Congress is presumed to be aware of an administrative or judicial interpretation of a statute and to adopt that interpretation when it re-enacts a statute without change."[244] Ratification is particularly applicable here because there is explicit evidence in both the House and Senate legislative history indicating that Congress knew of EPA's and the Court's

---

[241] *See also White Stallion Energy Ctr., LLC v. EPA*, 748 F.3d 1222, 1253 (D.C. Cir. 2014) (allowing averaging across multiple utility units under CAA section 112(d), which "neither expressly allows nor disallows emissions averaging," where averaging is a "more flexible, and less costly alternative" than unit-by-unit compliance, even though "this may allow individual units to exceed the emissions limitation"), *rev'd on other grounds, Michigan v. EPA*, 576 U.S. 743 (2015).
[242] *NRDC v. Thomas*, 805 F.2d at 425.
[243] 55 FR 30584, 30593-94 (July 26, 1990); 54 FR 22652, 22665-66 (May 25, 1989).
[244] *See Lorillard v. Pons*, 434 U.S. 575, 580 (1978).

interpretation on this issue.[245] Legislative history from the House recognized that, under the Clean Air Act:

> EPA has promulgated regulations for averaging (50 Fed. Reg. 10606) and for banking and trading (55 Fed. Reg. 30584). Cognizant of these rules and the Court's decision in *NRDC v. Thomas*, 805 F.2d 410 (D.C. Cir. 1986) the House-Senate conferees chose not to amend the Clean Air Act to specifically prohibit averaging, banking and trading authority.
>
> Averaging, banking and trading programs, in fact, have very positive impacts on air quality. Such programs preserve the requirement that each family of engines must meet or exceed a preassigned standard. Furthermore, averaging programs create an incentive to produce engines lower than the applicable standard, and encourage the development and early use of improved emission control technologies, and the development and sale of alternative-fueled vehicles. Such programs also aid manufacturers in reducing the costs of controlling emissions.[246]

As such, "[t]he intention was to retain the status quo," that is, the agency's continued application of averaging in establishing the standards following *NRDC v. Thomas*.[247] Similar legislative history is found in the Senate.[248]

The text of the Clean Air Act further corroborates Congress's ratification of EPA's use of averaging in setting section 202(a) standards. In section 219 of the Act, Congress directed EPA to establish standards for urban buses pursuant to section 202(a). Section 219(b)(1) provides:

> The standards under section 7521(a) of this title applicable to urban buses shall require that, effective for the model year 1994 and thereafter, emissions of particulate matter (PM) from urban buses shall not exceed 50 percent of the emissions of particulate matter (PM) allowed under the emission standard applicable under section 7521(a) of this title as of November 15, 1990, for particulate matter (PM) in the case of heavy-duty diesel vehicles and engines manufactured in the model year 1994.

The referenced 1994 HD PM standard (i.e., "the emission standard applicable under section 7521(a) of this title as of November 15, 1990, for particulate matter (PM) in the case of heavy-duty diesel vehicles and engines manufactured in the model year 1994") was a standard with a fleet average form. Indeed, it was one of the standards litigated in *NRDC v. Thomas* on the issue of averaging.[249] Thus, Congress expressly recognized an EPA standard with an averaging form and endorsed such a standard as the basis for further standard-setting under section 202(a).

246 136 Cong. Rec. 35,367, 1990 WL 1222469, at *1.
247 *Id.*
248 136 Cong. Rec. 36,713, 1990 WL 1222468, at *1. (Congress, noting *NRDC v. Thomas*, instead opted to let the existing law "remain in effect.").
249 *See NRDC v. Thomas*, 805 F.2d 410, 425 (D.C. Cir. 1986) ("The NRDC challenges the EPA's program of emissions averaging for the 1991 and 1994 PM standards and the 1991 NOx standard.").

Pursuant to this provision, EPA promulgated urban bus standards, and those standards provided for averaging, as well as banking and trading.[250]

Following the 1990 Amendments, EPA continued to establish many other motor vehicle standards based on averaging, and the use of ABT became a well-settled part of the regulatory landscape. Consistent with this, in enacting the Energy Independence and Security Act of 2007, Congress specifically recognized the possibility of fleet average GHG standards. The statute generally barred Federal agencies from acquiring "a light duty motor vehicle or medium duty passenger vehicle that is not a low greenhouse gas emitting vehicle."[251] It directed the Administrator to promulgate guidance on such "low greenhouse gas emitting vehicles," but explicitly prohibited vehicles from so qualifying "if the vehicle emits greenhouse gases at a higher rate than such standards allow for the *manufacturer's fleet average grams per mile of carbon dioxide-equivalent emissions for that class of vehicle*, taking into account any emissions allowances and adjustment factors such standards provide."[252] In other words, Congress explicitly contemplated the possibility of fleet-average GHG standards for motor vehicles.[253]

In light of the clear congressional authorization for averaging, EPA also does not agree with commenters who claim that averaging is precluded by the major questions doctrine. We further address the applicability of the major questions doctrine earlier in this RTC 2.3. We also disagree with commenters who claim that EPA is relying on silence as an implicit delegation of authority.[254] EPA is not asserting authority for ABT based on statutory silence; as explained above, the basis for ABT is the statutory text of section 202(a)(1)-(2), read in light of the context, purpose, and history.[255]

---

[250] *See* 58 FR 15781, 15784, 15787.
[251] 42 USC 13212(f)(2)(A).
[252] 42 USC 13212(f)(3)(C) (emphasis added).
[253] 42 USC 13212 does not specifically refer back to section 202(a). However, we think it is plain that Congress intended for EPA to consider relevant section 202(a) standards in implementing section 13212. *See* 42 USC 13212(f)(3)(B) ("In identifying vehicles under subparagraph (A), the Administrator shall take into account the most stringent standards for vehicle greenhouse gas emissions applicable to and enforceable against motor vehicle manufacturers for vehicles sold anywhere in the United States.").
[254] In addition, the commenters' selective quotation from *Entergy v. Riverkeeper*, 556 U.S. 208,223 (2009), is inapposite. That case *upheld* EPA's determination that the delegation for EPA to issue standards reflecting "best technology available for minimizing adverse environmental impact" allowed standards based on cost-benefit analysis, notwithstanding that such an authorization appears nowhere in the statutory text. *Id.* at 218, 226. The commenters cite the following language from the opinion in support of their argument: "sometimes statutory silence, when viewed in context, is best interpreted as limiting agency discretion." *Id.* at 223. The following sentence of the opinion, however, states that "[f]or the reasons discussed earlier, § 1326(b)'s silence cannot bear that interpretation." *Id.* The Court thereupon concluded, "This extended consideration of the text of § 1326(b), and comparison of that with the text and statutory factors applicable to four parallel provisions of the Clean Water Act, lead us to the conclusion that it was well within the bounds of reasonable interpretation for the EPA to conclude that cost-benefit analysis is not categorically forbidden." *Id*. In any event, this case is not applicable because EPA is not relying on statutory silence here.
[255] Notwithstanding commenters' selective citations of past preambles, the agency has never touted statutory silence as the basis for the ABT program. We have, as we do today, noted the fact that the statute does not explicitly specify an ABT program. But in promulgating such programs, we have also consistently justified them in light of the text and purpose of the Act. See, e.g., 55 FR 30593-99 (describing in detail the legal bases for ABT and concluding on page 30599 that "EPA believes that trading, banking and expanded averaging are consistent with and support the goals and provisions of the Act. Compliance with the technology forcing 1991 and 1994 NOX and PM emissions

III. Standards with a fleet average form are consistent with the statutory context and structure.

As explained above, in section 202(a)(1), Congress delegated to EPA the authority to adopt new motor vehicle standards and to revise the standards as appropriate. Specifically, Congress entrusted to the Administrator the determination of the class or classes of vehicles subject to the standards, the form of the standard, the lead time provided, the consideration of the costs of compliance, and, taking all of these elements and other factors into account, the stringency of the standards. As we explain further in our response to the major questions doctrine comments, this delegation provides EPA the flexibility needed to appropriately address the widely varying circumstances that can arise under section 202, such as differences in the need for emissions control, and differences in technology and cost considerations. This provision's authority readily encompasses the kind of fleet averaging standards EPA has adopted over many years and covering many different types of vehicles and pollutants.

At various points, Congress directed EPA to exercise its section 202(a) authority to adopt certain specific standards.[256] These various provisions identify the specific group of vehicles to which they apply, as well as the specific model years, pollutants, and stringency of the standards. Although Congress limited EPA's discretion for those specific vehicles, model years, and pollutants, even in those cases Congress recognized and adopted provisions reflecting a variety of the flexibilities authorized in standard setting under section 202(a). For example, Congress directed that EPA provide for waivers; alternative standards for small volume manufacturers; phase-ins over time based on a percentage of a manufacturer's production; as well as standards that changed over the useful life of the vehicles.

In addition, Congress specifically addressed to what extent, if any, EPA's authority was limited to revise these standards in the future, including under its general section 202(a)(1) authority. In general, Congress placed only a few limitations on EPA's future standard setting. Congress typically specified that EPA's future revisions of the standards for these vehicles and pollutants had to preserve a specified degree of stringency, and in some cases Congress specified the number of model years before revisions were allowed. But these provisions do not constrain EPA's general authority to set standards under section 202(a)(1) in other circumstances. Most importantly for purposes of this response, none of these provisions limit fleetwide averaging or otherwise limit EPA's authority to structure the form of future section 202(a)(1) standards in this rulemaking.

These provisions place no other limits on EPA's standard setting under section 202(a)(1). They did not limit EPA's ability to structure the form and level of future standards for these vehicles and pollutants, only the stringency and lead time. Through these provisions Congress placed no limits at all on EPA's authority to set standards under section 202(a)(1) for other vehicles and other pollutants. Congress directly addressed the specific limits it placed on EPA's future standard setting, and those are the only limits it imposed on the authority it provided EPA in setting standards under section 202(a).

standards will be enhanced, emissions will be reduced, not increased, and the important role of NCPs will not be supplanted. Furthermore, as indicated in the discussion above, EPA does not think that banking, trading or expanded averaging contradict the provisions of section 206 regarding certification and testing.").

[256] *See, e.g.*, CAA section 202(a)(3)(A)(i), 202(b), (g), (h).

EPA's past fleet averaging standards, as well as the standards at issue in this rulemaking, are fully consistent with the grant of authority in section 202(a)(1). In no case do these standards violate the limited conditions Congress placed on future standard setting in the provisions discussed in section 202.

We now discuss each of these provisions that commenters cite. Commenters refer to section 202(a)(3)(A)(i) as evincing Congressional intent not to include averaging as part of the standard setting process for heavy duty vehicles. But this provision, like section 202(a)(1), refers to standards for emission from "classes" of heavy-duty vehicles (and from "categories" as well). This language is most naturally applicable to groups of vehicles like fleets.

Commenters viewed sections 202(b)(1) and 206(a)(2) as showing incompatibility with standards predicated on averaging. The argument goes that section 202(b)(1) commands standards for "vehicles and engines," and that the testing of "any emission control system incorporated in a motor vehicle or engine" provisions in section 206(a)(2) only make sense on a per vehicle basis. They further point to the 5 percent waiver authority in section 202(b)(3) and the testing provision for section 202(b) standards found in section 206(a)(2). They maintain that the waiver provision is unnecessary in a fleet averaging regime since well over 5% of a manufacturer's vehicles could be above a fleet average limit without the need of a waiver, and they further note that the testing provision is written in the singular ("vehicle or engine"), and so can only be read to mean vehicle-by-vehicle testing.

These arguments are misplaced. First, section 202(b)(1) is an explicit exception to EPA's general standard-setting authority (see section 202(a)(1) opening clause, "Except as otherwise provided in subsection (b)"). Section 202(b)(1) establishes standards for certain pollutants, model years, and classes of vehicles. It thus cannot derogate from the general scope of authority in section 202(a)(1) and has no applicability on its face to these standards. Moreover, section 202(b)(1) accords with fleet-average standards because it specifically refers to standards for certain classes of vehicles (e.g., light-duty vehicles for certain model years), as opposed to individual vehicles; the provision also uses the term "such vehicles and engines," which naturally refers back to the classes identified in the provision.

CAA section 206(a)(2) adds nothing to the commenters' argument. That provision requires EPA in some cases to test emission-control systems to determine whether they enable vehicles to conform with standards Congress prescribed in section 202(b). As such, section 206(a)(2) prescribes duties relating to standards under section 202(b), and as just discussed, that section has no bearing on the section 202(a) authority beyond the specific circumstances to which it applies, circumstances inapplicable here. Moreover, in section 206(a)(2), Congress had a specific reason to speak to individual vehicles. Added in 1970, it enabled a private party that developed a new "emission control system," such as a new catalyst, to submit a vehicle or engine incorporating that system for testing "to determine whether such system enables such vehicle or engine to conform to the [Subsection 202(b)] standards."[257] It was sensible for Congress to establish this mechanism for testing new technologies in the context of specific vehicles and individuals, rather than fleets. But there is no basis in section 206(a)(2) to think Congress meant to prohibit fleet averages even under section 202(b), let alone section 202(a). To the extent that it

[257] CAA section 206(a)(2); *see* Environmental Policy Division of the Congressional Research Service, Volume 1, 93d Cong., 2d Sess., A Legislative History of the Clean Air Amendments of 1970, at 128, 200 (Comm. Print 1974).

is relevant, section 206(a)(2) confirms that Congress intended EPA to consider all feasible emission-control technologies, even those that had not been developed as of 1970.

The commenters' reference to section 202(b)(3) is also mistaken.[258] That provision allows EPA to impose standards less stringent than subsection (b)(1) standards for nitrogen-oxides emissions for up to 5% of production of model-years 1977-1979 light-duty vehicles, where an automaker "demonstrates that such waiver is necessary to permit the use of an innovative power train technology."[259] Under subsection (b)(3), an automaker identifies its total production for the year and the specific emission standard to which each vehicle was certified. EPA would then assess whether at least 95% of the fleet met the subsection (b)(1)(B) standard and whether the rest met the subsection (b)(3) standard. But this would be true whether each of those standards was a vehicle specific standard, a fleet-average standard, or both. None of these approaches would be inconsistent with subsections (b)(1) and (b)(3). More basically, nothing in either subsection speaks to EPA's authority under section 202(a)(1). We reiterate that nothing in section 202(b), including the waiver provision in (b)(3), has any applicability beyond the specific circumstances to which it applies, which circumstances are inapplicable here. Nor does anything in section 202(g) constrain standards with a fleet average form. This provision—as well as the parallel provision in section 202(h)—is another example of Congress directing EPA to use its section 202(a) authority in a specific manner, for specific vehicles (light-duty trucks and light-duty vehicles), pollutants (NMHC, CO, NOx, and PM), and model years. Under this provision for these specified pollutants and model years, such vehicles must meet one or the other of the specified phase-in standards. These provisions say nothing about EPA's authority to establish standards for different types of vehicles, pollutants, or model years. It is worth noting, however, that the phase-in of standards Congress specified in section 202(g) is an example of the range of forms available to EPA. As we explain further below, a phase-in form of a standard requiring specified percentages of a manufacturer's production of vehicles to meet a standard is similar to the fleet averaging-based form used in this rule.

Commenters also assert that compliance with a fleet average is inconsistent with the definition of "emission standard" in section 302(k): "a requirement … which limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis." The argument is that one cannot "know" "on a continuous basis" whether an automaker is meeting its fleet-average standard. It is not clear that the definitions in section 302 apply to Title II,[260] but even if they do, the emission standard definition requires standards to *apply* continuously, not that compliance be *measured* continuously. In general, fleet-average standards control emissions from vehicles on a continuous basis. The same is true for the vehicle-specific standards, such as the in-use LD GHG standard and the LD NMOG+NOx bin standard, which are both applicable continuously[261] and measurable at any time throughout the vehicle's useful life.

---

[258] Fuel Br. 41.
[259] 42 U.S.C. § 7521(b)(3).
[260] *Motor & Equip. Mfrs. Ass'n*, 627 F.2d at 1112 n.35. The commenters' arguments are also inconsistent with the Supreme Court's interpretation of "standard' in the context of Title II provisions on controlling emissions from motor vehicles in *South Coast*, as explained above.
[261] The standards (whether fleet average or per-vehicle standards) are subject to different testing cycles, testing requirements, and other provisions, such that different requirements may apply in different circumstances. For example, vehicles are allowed under EPA's regulations to have excursions that exceed their certified levels of

Finally, we note that the commenters' reliance on specific provisions in section 202 to limit EPA's more general authority under section 202(a)(1)-(2) is at odds with normal tenets of statutory construction. Broad grants of discretionary authority like section 202(a)(1) are generally not limited by other narrower provisions focused on particular situations.[262] Moreover, Congress has expressly indicated what limitations the specific provisions impose on future EPA standard setting, but they do not impose any limitations which preclude fleet average standards, indicating that no such limitations should be implied.[263]

IV. Standards using a fleet average standard form fit the Act's implementation and enforcement provisions

A number of commenters viewed fleet average standards as fundamentally incompatible with the certification of conformity provisions of section 206. They maintain that these provisions are written as vehicle specific; they refer to "engine" and "vehicle" in the singular, and they require a determination "whether such vehicle or engine" (referring back to the individual vehicle or engine) "conforms with the [section 202 emission standards]." They argue that testing of an individual vehicle, however, does not indicate whether or not a fleet average is achieved, since in their view conformity cannot be determined until the conclusion of a model year. For similar reasons, these commenters claim that fleet average standards are inconsistent with section 203(a)(1), which prohibits sale of a vehicle or engine not "covered by a certificate of conformity," and section 205(a), under which any violation of applicable standards "shall constitute a separate offense with respect to each motor vehicle or motor vehicle engine."

criteria pollutant emissions under certain operating conditions as controlled by the Auxiliary Emission Control Device definition.

[262] *See Catawba Cnty. v. EPA*, 571 F.3d 20, 36 (D.C. Cir. 2009) ("[A] congressional mandate in one section and silence in another often suggests … a decision not to mandate any solution in the second context, i.e., to leave the question to agency discretion."); *Corbett v. Transportation Sec. Admin*., 19 F.4th 478, 489 (D.C. Cir. 2021*), cert. denied*, 143 S. Ct. 395 (2022) ("Petitioner turns the holding in *Alabama Realtors* on its head by asking this court to apply limiting constructions to provisions plainly granting TSA broad authority to act by drawing on entirely separate provisions that appear throughout 49 U.S.C. Chapter 449.…There is no viable canon of construction that endorses this interpretive approach."); *Helicopter Ass'n Int'l, Inc. v. FAA*, 722 F.3d 430, 435 (D.C. Cir. 2013) (holding that specific statutory provisions amplifying the FAA's regulatory authority merely indicated that Congress intended to address the matters subject to regulation in several different ways, not to limit the statute's broad grant of authority); *Farrell v. Blinken*, 4 F.4th 124, 136–37 (D.C. Cir. 2021).

[263] *See Odhiambo v. Republic of Kenya*, 764 F. 3d 31 (D.C. Cir. 2014) ("the [Foreign Sovereign Immunities Act] is the sole way for a plaintiff suing a foreign sovereign to invoke the jurisdiction of U.S. courts, and the exceptions enumerated by the FSIA are exhaustive"); cf. *Law v. Siegel*, ––– U.S. ––––, 134 S. Ct. 1188, 1196, 188 L.Ed.2d 146 (2014) (enumeration of exemptions "confirms that courts are not authorized to create additional exceptions")*; Air Transp. Ass'n of Am., Inc. v. United States Dep't of Agric.*, 37 F.4th 667, 677 (D.C. Cir. 2022) (standing for the proposition that one does not infer a limitation from a provision authorizing a different sort of activity; "[t]he section containing the 'commensurate' language is a limitation on how much can be collected in fees from a particular user class. It is not a limitation on how those fees may be spent. Therefore, Appellants' argument that fees collected from multiple user classes cannot be comingled in a fund that pays for the inspections of fee-paying user classes fails because the FACT Act does not prohibit this form of cross-subsidization"); *GPA Midstream Ass'n v. United States Dep't of Transp.*, 67 F.4th 1188, 1196 (D.C. Cir. 2023) ("Section 4 creates neither a condition precedent nor a ban. As the petitioners themselves explain at length in their opening brief, § 4 does not apply to gathering pipelines. Section 4 by its plain terms applies only to "transmission pipeline facilities." We do not understand how § 4 could plausibly be read to create a condition precedent for a different type of pipeline facility.").

These commenters further maintain that fleetwide-average emission standards are inconsistent with Title II's remediation and notification provisions. Those provisions state that if EPA "determines that a substantial number of any class or category of vehicles or engines . . . do not conform to the regulations prescribed under [Section 202]," the manufacturer must remedy "the nonconformity of any such vehicles or engines."[264] If "a motor vehicle fails to conform," the manufacturer bears the cost.[265] Further, "dealers, ultimate purchasers, and subsequent purchasers" must be given notice of any nonconformity,[266] which requires identification of specific nonconforming vehicles. These commenters maintain that none of this is possible where the nonconformity is tied to a fleet average.

EPA disagrees with these comments. The regulatory provisions for demonstrating compliance with emissions standards have been successfully implemented for decades, including provisions in our regulations for demonstrating compliance through our ABT program. Commenters who alleged inconsistency with the compliance and enforcement provisions fundamentally misapprehend the nature of EPA's motor vehicle program and the ABT regulations, where compliance and enforcement do in fact apply to individual vehicles consistent with the statute. It is true that ABT allows manufacturers to meet emissions standards by offsetting emissions credits and debits for individual vehicles. However, individual vehicles must also continue to themselves comply with standards applicable on a vehicle-by-vehicle basis throughout that vehicle's useful life, as described below. As appropriate, EPA can suspend, revoke, or void certificates for individual vehicles. Manufacturers' warranties, which are mandated under CAA section 207, apply to individual vehicles. EPA and manufacturers perform testing on individual vehicles, and recalls can be implemented based on evidence of non-conformance by a substantial number of individual vehicles within the class. The above is true for all of EPA's ABT programs, including for NMOG+NOx and GHG for light- and medium-duty vehicles. Each program, however, differs somewhat from other programs, and below we examine in detail the ABT programs for LD NMOG+NOx and LD GHG. We then turn to specific statutory arguments raised by the commenters. The ultimate conclusion is that the regulatory scheme fully satisfies the compliance and enforcement requirements of the statute.

Under the Tier 3 fleet average standard for LD NMOG+NOx, each vehicle must certify its emissions performance using a "Bin" structure (i.e., a vehicle with no emissions will certify to Bin 0, a vehicle with emissions over 0 mg/mi but less than or equal to 10 mg/mi will certify to Bin 10, and so on, up to Bin 70; vehicles emitting over 70 mg/mi, can certify to Bin 125 or Bin 160).[267] No vehicle is required to certify to any particular bin, so long as the average of all vehicles is equal to or less than the fleet average standard (30 mg/mi under Tier 3). In other words, a manufacturer can certify all of its vehicles to Bin 30 to meet the Tier 3 standard, or it could certify half of its vehicles to Bin 0 and half to Bin 60, or any other combination that on average meets the fleet average standard. However, once a manufacturer certifies an individual vehicle to a particular bin, that individual vehicle is required to emit at the corresponding emissions level or below. Under a fleet average scheme, a manufacturers' compliance with fleet average obligations is determined by aggregating the compliance determinations for individual vehicles, and these individual vehicles must also meet their own obligations. These requirements

[264] CAA section 207(c)(l).
[265] CAA section 207(h)(l).
[266] CAA section 207(c)(2).
[267] *See* 79 FR 23451 ("Structure of the Primary Tier 3 Tailpipe Standards").

are therefore entirely consistent with Title II's compliance and enforcement provisions that apply to individual vehicles—including those related to a vehicle's conformance with applicable regulations, its certificate of conformity and warranty, and on-board diagnostics requirements. EPA retained and did not reopen this general scheme for NMOG+NOx standards in today's Tier 4 rulemaking, with some discrete changes to the bin structure as discussed in preamble III.D.2 (e.g., eliminating bin 125 and 160 so as to remove the dirtiest vehicles from the future fleet).

EPA's LD GHG fleetwide average standards are structured similarly.[268] Under the GHG program, instead of vehicles certifying to a bin value, manufacturers determine the emissions performance of each vehicle through testing. Based on that testing, EPA assigns each vehicle an in-use compliance value which it is obligated to meet. EPA also evaluates the manufacturer's compliance with the fleetwide average based on the testing results.[269] However, compliance with the GHG program is fundamentally established the same way as the NMOG+NOx program—by determining the emissions performance of individual vehicles—which are measurable and enforceable—and then determining compliance with the fleet average standards based on the emissions performance of individual vehicles. Again, the regulatory scheme is entirely consistent with the compliance and enforcement provisions in Title II.[270] We further discuss how GHG compliance and enforcement function in Section III.G.5 of the preamble.

The ABT program has been in place for decades and has worked admirably in practice, including as applied to both NMOG+NOx and GHG compliance. The elements of the program described above are entirely consistent with the Act, including all the provisions cited by commenters.[271] First, the argument that the regulatory approach is unlawful because conformity cannot be determined until the end of the model year is incorrect. Congress itself used this kind of approach when it mandated certain standards under section 202. For example, Congress

---

[268] *See* 75 FR 25412-14 (establishing the ABT program for LD GHG and explaining its similarities and differences from criteria pollutant ABT programs). The somewhat different structure of the GHG ABT program is because GHG emissions performance, relative the criteria emissions performance, typically varies to a greater degree among different models of vehicles, and because the GHG ABT program structure allows for greater harmonization with NHTSA's fuel economy standards.

[269] Generally for the NMOG+NOx standard, manufacturers include a compliance margin in their compliance plans, such that a vehicle will not be certified to a bin unless the manufacturer's testing indicates that the vehicle performs sufficiently below the required level for that bin, in order to avoid compliance issues that could arise due to minor variability in testing and manufacturing of individual vehicles. The GHG program addresses this issue by allowing manufacturers a 10% compliance margin between the in-use compliance standard and the emissions performance level use.

[270] To spell things out further, under Title II's compliance and enforcement provisions, EPA issues a certificate of conformity for every vehicle, as required by 42 U.S.C. § 7525(a)(1). This certificate is conditioned on the automaker's compliance with the standards, including for example both the in-use and the fleet-average GHG standard, and warrant that each new vehicle is designed to comply with all applicable emissions standards. 75 FR 25412/1-2; 40 C.F.R. §§ 86.1848-10(c)(2), (5), (9), 86.1865-12(j)(2); 42 U.S.C. § 7541. Automakers (and EPA) then test vehicles post-sale, to obtain "real-world in-use data representing the majority of certified vehicles." 75 FR 25474/3; 40 C.F.R. §§ 86.1865-12(l)(2), 86.1848-10(c)(9), 600.010(d). This "ensure[s] that an individual vehicle complies with the [greenhouse-gas] standards in-use," and throughout the vehicle's useful life. 75 FR 25476/1; *see id*. at 25468/3. The certificate and the warranty are both based on the automaker's compliance plan and ability to manufacture individual vehicles meeting particular emission specifications. *See* 40 C.F.R. §§ 86.1848- 10(c)(2), (5), (9), 86.1865-12(j)(2).

[271] *See* CAA section 206(a)(1) (leaves to EPA the means of determining "whether such vehicle…conforms with" the section 202 emissions standards and authorizes EPA to "test, or require to be tested in such manner as he deems appropriate" for purposes of vehicle certification); *see also EDF v. Thomas*, 805 F.2d 410, 425 n.24 (D.C. Cir. 1986) (noting this discretion).

mandated phase-ins over time of certain emission standards for certain vehicles and model years.[272] Each of these provisions requires that a specified percentage of a manufacturer's production has to meet a specified standard. This made the level of a manufacturer's production over a model year a core element of the standard.[273] The form of the standard mandated by Congress recognized that pre-production certification would need to be based on a projection of production for the upcoming model year, with actual compliance with the required percentages not demonstrated until after the end of the model year.[274] EPA's ABT provisions use this same kind of approach, which also makes the level of a manufacturer's production a core element of the standard. In both forms, compliance is evaluated not only with respect to individual vehicles, but with respect to the fleet as a whole. The difference is that EPA's provisions provide manufacturers with greater flexibility in meeting the performance-based standards, allowing them the ability to achieve the required level of emissions reductions even more cost-effectively. That is, Congress's approach required a specific number of vehicles each year to meet more stringent standards, while EPA allows manufacturers to choose how many vehicles each year will meet the more stringent standards, subject to the overall constraint of a fleet average standard that gradually increases in stringency.[275]

Vehicle manufacturers also warrant at the time of sale that each new vehicle is designed to comply with all applicable emission standards and will be free from defects that may cause noncompliance.[276] Manufacturers must warrant to the ultimate purchaser, and to subsequent purchasers, that the vehicle is designed, built, and equipped to conform at time of sale with all applicable standards, and is free of defects that will cause it to fail to conform in use during the applicable warranty period. Components covered by the warranty include all emission-related components included in the manufacturer's application for a certificate of conformity.

Consistent with section 205, civil penalties are provided for under CAA section 205 for violations of section 203, which prohibits sale or offering into commerce any equipment not covered by a valid certificate of conformity, and authorizes assessment of civil penalties up to

---

[272] CAA sections 202(a)(6), (g)(1) (as noted earlier), (g)(2), and (j) (all of which require EPA to issue standards pursuant to section 202(a)).

[273] *See, e.g.*, CAA section 202(g)(1) (defining "standards which provide that emissions from a percentage of *each manufacturer's sales volume of such vehicles and trucks* shall comply with the levels specified in table G" (emphasis added)).

[274] *See* 56 FR 25724, 25733-34 (June 5, 1991).

[275] EPA continues to apply phase-ins of emissions standards in some contexts. For reasons noted in Section III of the preamble, the PM standard is being phased in, with increasing percentages of automakers' fleets being subject to the new 0.5 mg/mi standard from 2027 to 2032. Again, each vehicle will have an individual emissions standard which that vehicle is required to meet. However, that standard could be 3 mg/mi (25° FTP) or it could be 0.5 mg/mi, depending to which standard the manufacturer certified the vehicle. If the phase-in percentage is 30%, a manufacturer is not allowed to simply represent 30% of all vehicles sold meet the 0.5 mg/mi standard. Rather the manufacturer must certify each vehicle to a particular performance level and 30% of those vehicles must be below 0.5 mg/mi. It is worth noting that there is nothing in theory or practice which would prevent EPA from combining both a fleet average and a phase in of standards if it were appropriate. EPA could decide to allow the revised PM standard to be met be through fleet averaging of individual vehicle PM emissions performance and also phase in the adoption of that standard, such that increasing percentages of the fleet would need to be included in the averaging set for the lower standard. These approaches are alternative approaches to addressing lead time for technology adoption, but they are certainly not inconsistent or mutually exclusive.

[276] CAA section 207.

$57,617 per vehicle in violation.[277] Individual certificates are conditioned on compliance with all regulatory requirements including all those pertaining to compliance demonstrations via averaging. A certificate can be voided "*ab initio*" in the event of a violation of averaging requirements. For example, if a manufacturer fails to meet the required standard using averaging, they can be required to identify the vehicles causing the deficit. The conditions in the certificates mean EPA may declare that the deficit-causing vehicles are not covered by the certificate. If EPA exercises that authority, the vehicles causing the deficit would no longer be considered to be covered by the certificate and would be deemed to be introduced into commerce without a valid certificate of conformity. This could lead to enforcement action and civil penalties for each of the vehicles not covered by a certificate, consistent with sections 203 and 205 of the Act. In addition, automakers can be penalized for prohibited acts like selling uncertified vehicles or failing to honor the emissions warranty, all of which apply under a fleet-average standard in the same way as they do under vehicle-specific standards.

Failure of vehicles to achieve their standards in-use could lead to a recall under section 207(c)(1). Commenters' arguments that there is no way to assess if a substantial number of vehicles are non-conforming is incorrect. Testing provides a ready means of determining if and how many vehicles fail to meet their applicable standard in-use. We further discuss the GHG compliance and enforcement program in preamble III.G.4, including discrete changes EPA is making to provisions relating to recall and in-use testing.

Similarly incorrect is the commenters' argument that the standards do not allow for section 202(m) emissions control diagnostic systems that accurately identify emissions control-related deterioration that could result in failure of vehicles to comply with emissions standards. Once again, every vehicle is certified to an emissions limit that is determinable, as are means of diagnosing potential deterioration of the vehicle's emission control system relative to this emissions limit.

Further, commenters reliance on the *NRDC v. Thomas* dicta is misplaced. First, the court noted that Section 206(a)'s testing and certification provisions refer to vehicles, not to classes of vehicles.[278] As explained above, however, the certification is conditioned not only on compliance with the fleet-average standards, but also on each vehicle complying with its vehicle-specific standards.[279]

Second, the *NRDC* court noted that in legislative history to the 1970 amendments, Congress indicated that each prototype, rather than the average of prototypes, should meet emission standards.[280] EPA addressed this concern in the preamble to a 1990 rule. Congress's concern was that "we did not have an adequate testing program" to "get to this problem of cleaning up the auto emissions,"[281] and that the testing of a small number of prototypes and averaging of those prototypes did not provide an accurate assessment of vehicle compliance with standards. But

[277] The statutory penalty figure in section 205 has been updated pursuant to the Federal Civil Penalties Inflation Adjustment Act of 1990, as amended through the Federal Civil Penalties Inflation Adjustment Act Improvements Act of 2015. *See* 88 FR 89309 (Dec. 27, 2023).
[278] *NRDC v. Thomas*, 805 F.2d at 425 n.24.
[279] The *NRDC* court also noted the "counterargument" to its concern, that "the manner of testing deemed appropriate or the content of the standards themselves is within the discretion of the agency." *NRDC v. Thomas*, 805 F.2d at 425 n.24.
[280] *Id.*
[281] *Id.*

EPA's current certification and in-use standards are vehicle-specific and "ensure that each engine meets the [applicable] limit."[282] Averaging as used in the current program does not create any uncertainty as to whether automakers are in compliance with the standards because every vehicle must achieve its certified emission performance as part of the fleetwide compliance framework.

V. The Russello Canon is inapplicable

Commenters invoked the Russello and *expressio unius* canons of statutory construction, claiming that various provisions of both the CAA and other statutes indicate that Congress knew how to specify ABT-based standards when it wished, and therefore that the absence of such an explicit delegation in section 202(a)(1) is an indication that no such delegation is intended. We disagree with the relevance of these canons here, which we refer to collectively as the Russello canon. To begin with, the "canon does not apply unless it is fair to suppose that Congress considered the unnamed possibility and meant to say no to it, and that the canon can be overcome by contrary indications that adopting a particular rule or statute was probably not meant to signal any exclusion."[283] As explained above, a more direct and explicit indication of Congressional intent vis-a-vis ABT is available, as Congress ratified EPA's use of ABT as upheld by the D.C. Circuit's decision in *NRDC v. Thomas*, 805 F. 2d 410, 425 (D.C. Cir. 1986).[284] For this reason alone, the Russello canon does not apply.

Moreover, the Russello canon has limited, if any, utility where wording is not identical or otherwise substantially similar.[285] That is the case with respect to the provisions cited by the commenters. Commenters cite the Clean Fuels Vehicle provisions in Part C of Title II for the proposition that Congress knew how to specify an ABT program.[286] This program is found in a separate Part of the statute, uses different language than section 202, and is not otherwise parallel to section 202. Namely, the Part C provisions direct EPA to set standards for clean-fuel vehicles operating on clean alternative fuel including electricity, but only on a targeted regional basis. This was a specific project to advance alternative fuels and technologies,[287] not a limit on EPA's general section 202(a)(1) authority. Moreover, the credit provisions are highly detailed, and in some cases, mandatory. For example, the credit provisions in section 246(f) are mandatory, specific to certain State Implementation Plan (SIP) revisions, and subject to limits on how the credits can be used, such as "to demonstrate compliance with other requirements applicable

United States* — that the inclusion of a phrase in one provision and its absence in another is deliberate, 464 U.S. 16, 23, 104 S. Ct. 296, 78 L. Ed.2d 17 (1983) — to argue that the exception to the price cap for emergencies in § 3622(d)(1)(E) demonstrates that Congress decided not to grant the Commission the authority to override the price cap in § 3622(d)(3). Mailers Br. 20–21. That canon has limited force here, however, because the two provisions use different words and are not otherwise parallel. *See City of Columbus v. Ours Garage & Wrecker Serv., Inc*., 536 U.S. 424, 435–36, 122 S. Ct. 2226, 153 L. Ed.2d 430 (2002).").
[286] Commenters also cite to the Clean Fuel Vehicles program as evidence that Congress knew how to explicitly specify a program for electric vehicles. We respond to these comments in RTC 2.3.
[287] *See* H. Rep. No. 101-490, pt. 1, at 283 (1990), 1990 WL 1222133, at *65-66 (Congress wanted "to encourage a broad range of vehicles," including those using electricity, and break the "chicken and the egg" supply-and-demand problem among automakers, consumers, and fuel producers).

under this section in the same nonattainment area."[288] By contrast, section 202(a)(1) does not explicitly mandate or specify a credit program, and it also provides for nationally applicable standards. EPA's decision to implement ABT and fleet-average standards falls within Congress's delegation to the agency to establish the standards. Thus, sections 246 and 249 are quite different from section 202(a)(1), and the Russello canon is inapplicable.

Commenters cited the Reformulated Gasoline and Renewable Fuel Standards provisions of the Act as further examples of Congress knowing how to specify averaging or credit programs when it wished to adopt them.[289] These provisions involve fuels, not emissions from motor vehicles, and so are not the same or parallel to section 202(a). Moreover, the credit programs in those provisions are also mandatory.[290] Further, Congress explicitly specified that the RFS program does not limit the agency's authority to promulgate other GHG programs.[291]

EPA notes that the ABT program for section 202(a) standards is not unique in lacking an explicit statutory ABT provision. Over the decades, EPA has also promulgated ABT programs in other similar instances. For instance, EPA implemented a highly successful ABT program for fuels standards under section 211(c).[292] Indeed, many fuels companies, such as members of commenters API and AFPM, have historically supported and benefited from these ABT programs. Like the section 202(a) ABT programs, fuels programs containing ABT provisions that are promulgated under section 211(c) also lack an explicit statutory ABT provision. Such absence is also in marked contrast to the section 211(k) ABT program.

More broadly, in light of the history of Federal environmental law, it is not surprising that the later-enacted clean fuel vehicles, reformulated gasoline, and RFS programs have explicit provisions relating to credits, while the earlier-enacted sections 211(c) fuels and 202(a) motor vehicle programs do not. Credit programs generally and ABT programs specifically were not widely used in the early days of federal air pollution control, and the lawmakers likely had limited knowledge of such programs.[293] For instance, at the time of the Motor Vehicle Air Pollution Control Act of 1965, there was no ABT program for any federal air pollution regulatory program. Congress, recognizing the need for regulatory flexibility so as to avoid obsolescence, declined to specify the details of how the standards should be implemented, entrusting those technical judgments to the expertise of the administrative agency.

Even further afield is Valero's assertion that the Energy Policy Conservation Act provision directing NHTSA to issue regulations setting "average fuel economy standards for automobiles manufactured by a manufacturer" (49 U.S.C. § 32902(a)) constrains EPA's section 202(a) authority. EPCA is a different statute from the CAA, and it is also concerned with entirely different purposes. Section 202(a) is concerned with preventing or controlling emissions of air

Harrison, Jr., Emissions Trading in the U.S.: Experience, Lessons and Considerations for Greenhouse Gases (2003), *available at* https://globalchange.mit.edu/publication/13922 (discussing the history of ABT and other credit programs in US environmental law, summarized on p. 7 tab. 1).

pollutants from motor vehicles which contribute to endangerment, not with vehicular fuel economy.[294] The Russello canon has no applicability here.

VI. EPA may include BEV and ICE vehicles within a single regulatory class.

Several of the commenters argue that even if section 202(a)(1) authorizes fleet average standards, ICE and non-ICE vehicles' performance cannot be averaged together because they are not of the same "class" as required by section 202(a)(1). There are two versions of this argument: that all members of the class being averaged must emit the pollutant(s) which are contributing to endangerment, or that they have fundamentally different powertrains and so cannot be reasonably grouped together.

EPA disagrees. As discussed in Section III.B.1 of the preamble, Congress required EPA to prescribe standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles, which in his judgment cause, or contribute to, air pollution which endangers public health and welfare. Congress defined "motor vehicles" by their function: "any self-propelled vehicle designed for transporting persons or property on a street or highway."[295] Likewise, with regard to classes, Congress explicitly contemplated functional categories: "the Administrator may base such classes or categories on gross vehicle weight, horsepower, type of fuel used, or other appropriate factors."[296] It is indisputable that electric vehicles are "new motor vehicles" as defined by the statute and that they fall into the weight-based "classes" that EPA established with Congress's explicit support.

Under section 202(a), regulation of motor vehicle emissions has two distinct aspects: (1) if the Administrator finds that "any class or classes of new motor vehicles or new motor vehicle engines, … in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare," then (2) "[t]he Administrator shall by regulation prescribe (and from time to time revise) in accordance with the provisions of this section, standards applicable to the emission of any air pollutant from" such class or classes. The first step of this inquiry is the endangerment finding, while the second step is setting the standards.[297] As the Supreme Court held in *Massachusetts* and the D.C. Circuit reaffirmed in *Coalition for Responsible Regulation,* the Endangerment Finding is a matter of "scientific judgment"—whether air pollution endangers and whether the class of motor vehicles contributes

---

[294] *See Massachusetts v. EPA,* 549 U.S. 497, 532 (2007) ("[T]hat DOT sets mileage standards in no way licenses EPA to shirk its environmental responsibilities. EPA has been charged with protecting the public's "health" and "welfare," 42 U.S.C. § 7521(a)(1), a statutory obligation wholly independent of DOT's mandate to promote energy efficiency. *See* Energy Policy and Conservation Act, § 2(5), 89 Stat. 874, 42 U.S.C. § 6201(5). The two obligations may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency.").

[295] CAA section 216(2).

[296] CAA section 202(a)(3)(A)(ii). This section applies to standards established under section 202(a)(3), not to standards otherwise established under section 202(a)(1). But it nonetheless provides guidance on what kinds of classifications and categorizations Congress thought were appropriate.

[297] See 74 FR 66544 ("the decisions on cause or contribute and endangerment are separate and distinct from the decisions on what emissions standards to set under CAA section 202(a)."); *see also id.* at 66501-02; Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act: EPA's Response to Public Comments, Volume 11: Miscellaneous Legal, Procedural, and Other Comments, 11.3.

to such pollution.[298] By contrast, the decision on what standards to set is a policy decision subsequent to the endangerment finding based on technical determinations of technology availability, cost of compliance, and lead-time.[299]

In making the GHG Endangerment Finding in 2009, EPA defined the classes of motor vehicles and engines as "Passenger cars, light-duty trucks, motorcycles, buses, and medium and heavy-duty trucks."[300] Light and medium-duty BEVs fall within the classes of passenger cars, light-duty trucks, and medium and heavy-duty trucks. In making the Endangerment Finding, EPA satisfied the statutory prerequisite for establishing GHG standards for these entire classes, which includes zero-emitting vehicles that do not emit pollutants.[301] That is, the Administrator's judgment as to endangerment applied to the above-stated classes as wholes, with no qualification as to the level of emissions, powertrain, or any other characteristic. The Endangerment Finding was upheld after extensive litigation.[302] EPA did not reopen the 2009 Endangerment Finding in this rulemaking, and comments collaterally challenging it are beyond the scope of this rulemaking. Once EPA made the endangerment finding for the class, EPA was required to set emission standards for vehicles in that class to address the contribution to endangerment. In the final rule, as in prior GHG rules, EPA acts consistently with the endangerment finding in promulgating GHG regulations for the classes of passenger cars, light-duty trucks, and medium and heavy-duty trucks. [303]

Some commenters nonetheless contend that BEVs fall outside of EPA's regulatory reach under this provision because they do not cause, or contribute to, air pollution which endangers human health and welfare. That misreads the statutory text. Section 202(a)(1)'s focus on regulating emissions from "class or classes" indicates that Congress was concerned by the air pollution problem generated by a class of vehicles, as opposed to from individual vehicles. Accordingly, Congress authorized EPA to regulate *classes* of vehicles, and EPA has concluded that the *classes* of passenger cars, light-duty trucks, and medium and heavy-duty trucks, cause or

[298] *Massachusetts v. EPA*, 549 U.S. 497, 534 (2007); *Coal. for Responsible Regul., Inc. v. EPA*. 684 F.3d 102, 117-19 (D.C. Cir. 2012).

[299] *See Coal. for Responsible Regul., Inc. v. EPA*, 684 F.3d 102, 118 (Policy inquiries "muddle the rather straightforward scientific judgment about whether there may be endangerment by throwing the potential impact of responding to the danger into the initial question. To be sure, the subsection following § 202(a)(1), § 202(a)(2), requires that EPA address limited questions about the cost of compliance with new emission standards and the availability of technology for meeting those standards, but these judgments are not part of the § 202(a)(1) endangerment inquiry. The Supreme Court made clear in Massachusetts v. EPA that … policy concerns were not part of the calculus for the determination of the endangerment finding in the first instance."); *see generally id.* at 117-19.

[300] 74 FR 66496, 66537 (Dec. 15, 2009).

[301] We note that this is not special to GHGs. For example, EPA has also made endangerment findings and established criteria pollutant standards for an entire class or classes of vehicles (e.g., for light-duty vehicles and heavy-duty vehicles), with includes ICE only vehicles, hybrid vehicles, and ZEV vehicles. Of course the nature of compliance demonstration may differ by vehicle. For example, it would be a waste of resources to test BEVs for tailpipe emissions, and thus EPA allows BEVs to certify to certain standards without testing.

[302] *Coal. for Responsible Regul., Inc. v. EPA*, 684 F.3d 102, 117 (D.C. Cir. 2012) ("We ultimately conclude that the Endangerment Finding is consistent with *Massachusetts v. EPA* and the text and structure of the CAA, and is adequately supported by the administrative record.").

[303] Our response focuses on GHG regulation. However, similar arguments also apply to the regulation of criteria pollutants. *See, e.g.*, 79 FR 23414 (Tier 3 criteria pollutant rule) (establishing standards for "both tailpipe and evaporative emissions from passenger cars, light-duty trucks, medium-duty passenger vehicles, and some heavy-duty vehicles"), 23416 (assessing the contribution to air pollution due to emissions from "passenger cars").

contribute to dangerous pollution. As noted, the *classes* of these vehicles include BEVs, along with ICE and hybrid vehicles. And EPA has consistently viewed passenger cars, light-duty trucks, and medium and heavy-duty trucks as classes of motor vehicles for regulatory purposes, including in our prior GHG rules.

Commenters do not seriously question that passenger cars, light duty trucks, and medium and heavy-duty trucks as defined by EPA are classes of vehicles, which they clearly are. A "class" is a "set, group, collection…containing members having…at least one attribute in common."[304] Each of these three classes is a "set" or "group" of vehicles "containing members" having attributes in common. The members of these classes are all motor vehicles as defined in section 216(2) of the Act, and the members of each class further share specific attributes. For example, EPA historically defined "light-duty truck" to mean:

> any motor vehicle rated at 8,500 pounds GVWR or less which as [sic] a vehicle curb weight of 6,000 pounds or less and which has a basic vehicle frontal area of 45 square feet or less, which is:
>
> (1) Designed primarily for purposes of transportation of property or is a derivation of such a vehicle, or
>
> (2) Designed primarily for transportation of persons and has a capacity of more than 12 persons, or
>
> (3) Available with special features enabling off-street or off-highway operation and use.[305]

The statute plainly permits this kind of classification. Congress ratified this historical approach in the 1990 amendments to the CAA. Congress added definitions in section 216 that incorporated into the statute EPA's prior inclusive definitions of "light duty vehicle" and "light duty truck" which "have the meaning provided in regulations promulgated by the Administrator and in effect as of November 15, 1990." Congress then mandated certain standards for light duty vehicles and light duty trucks that incorporated those inclusive definitions, which do not include any distinction based on whether a vehicle emits pollutants or has a certain powertrain. CAA sections 202(g), (h)(1), and (j)(1).[306]

Commenters fail to seriously grapple with these arguments, but nonetheless claim that the prerequisite for EPA regulation is the agency finding that *individual* regulated vehicles must themselves emit air pollutants. This claim is completely unmoored from the statutory text and purpose, which speaks in terms of "classes" of vehicles that emit pollutants. Section 202(a)(1) does not speak to emissions from individual vehicles at all. For that view to be right, section 202(a) would have to be rewritten to say the emission of air pollutants "*from any new motor vehicle*."

[304] Webster's II Universal Dictionary.
[305] 40 CFR 86.082-2; *see also id*. ("Light-duty vehicle means a passenger car or passenger car derivative capable of seating 12 passengers or less."); 46 FR 50464-01, 50476-77 (Oct. 13, 1981).
[306] EPA has subsequently revised the definition of "light-duty truck" over the years, including in this final rule; however, the revised definitions also are not based on whether vehicles emit pollution or have a certain powertrain. See the regulatory text at the end of this notice amending 40 CFR 86.1803-01 (defining "light-duty vehicle," "light-duty truck," "heavy-duty vehicle," "medium-duty passenger vehicle," and "medium-duty vehicle").

Furthermore, while an individual vehicle could possibly "contribute" to dangerous air pollution warranting regulation, it would not typically "cause" such pollution. Instead, the more common "cause" would be a group of vehicles aggregated as a class. This confirms that "cause, or contribute to" clause as a whole modifies emissions from a "class or classes" of vehicles, rather than emissions from individual vehicles.[307]

These commenters also misunderstand the broader statutory scheme. Congress directed EPA to apply the standards to vehicles whether they are designed as complete systems or incorporate devices to prevent or control pollution. Thus, Congress understood that the standards may be premised on and lead to technologies that prevent pollution in the first place. It would be perverse to conclude that in a scheme intended to control the emissions of dangerous pollution, Congress would have prohibited EPA from premising its standards on controls that completely prevent pollution, while also permitting the agency to premise them on a technology that reduces 99 percent of pollution. Such a nonsensical reading of the statute would mean that the availability of technology that can reduce 99 percent of pollution could serve as the basis for highly protective standards, while the availability of a technology that completely prevents the pollution could not be relied on to set emission standards at all. Such a reading would also create a perverse safe harbor allowing polluting vehicles to be perpetually produced, resulting in harmful emissions and adverse impacts on public health, even where available technology permits the complete prevention of such emissions and adverse impacts at a reasonable cost. That result cannot be squared with section 202(a)(1)'s purpose to reduce emissions that "cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare,"[308] or with the statutory directive to not only "control" but also "prevent" pollution.

Commenters' suggestion that EPA define the class to exclude BEVs would also be unreasonable and unworkable. *Ex ante*, EPA does not know which vehicles a manufacturer may produce and, without technological controls including add-on devices and complete systems, *all* of the vehicles have the potential to emit dangerous pollution.[309] Therefore, EPA establishes standards for the entire class of vehicles, based upon its consideration of all available technologies. It is only after the manufacturers have applied those technologies to vehicles in actual production that the pollution is prevented or controlled. To put it differently, even hypothetically assuming EPA could not set standards for vehicles that manufacturers intend to build as electric vehicles—a proposition which we do not agree with—EPA could still regulate vehicles manufacturers intend *not* to build as electric vehicles and that would emit dangerous pollution in the absence of EPA regulation.[310] When regulating those vehicles, Congress

[307] The rule of last antecedent does not alter that conclusion. That rule is sometimes used to interpret "a list of terms or phrases followed by a limiting clause." *Lockhart v. United States*, 577 U.S. 347, 351 (2016). But section 7521(a)(1) presents no such list, and thus no conundrum of whether the final modifier applies to everything in a preceding list or just the last item.

[308] *See also Coal. for Responsible Regulation*, 684 F. 3d at 122 (explaining that the statutory purpose is to "prevent reasonably anticipated endangerment from maturing into concrete harm").

[309] As noted above, manufacturers in some cases choose to offer different models of the same vehicle with different levels of electrification. And it is the manufacturer who decides whether a given vehicle will be manufactured to produce no emissions, low emissions, or higher emissions controlled by add-on technology.

[310] In other words, the additional BEVs EPA projects in the modeled central case analysis exist in the baseline case as pollutant-emitting vehicles with ICE. We further note that it would be odd for EPA to have authority to regulate a given class of motor vehicles so long as those vehicles emit air pollution at the tailpipe, but to lose its authority to regulate those very same vehicles should they install emission control devices to limit such pollution or be designed to prevent the endangering pollution in the first place.

explicitly authorized EPA to premise its standards for those vehicles on a "complete system" technology that prevents pollution entirely, like BEV technologies.

Commenters' claim that EPA must classify or categorize vehicles by powertrain is also misplaced. For any given class of vehicles, the Administrator may make appropriate subcategorizations in establishing the standards.[311] Section 202(a)(1) does not explicitly delineate how EPA should categorize, indicating that Congress entrusted this subsidiary technical determination to the Administrator's judgment.[312] EPA routinely makes categorizations based on characteristics like vehicle weight and functionality, and establishes different standards for each category where that is warranted, for instance, often establishing less stringent standards for heavier vehicles as compared to lighter vehicles of the same functionality in light of differences in technological feasibility and costs. For example, as we explain in Section III.C.2 of the preamble, EPA's light-duty GHG program—which applies to both passenger cars and light-duty trucks—employs attribute-based standards that depend on the size of the vehicle's footprint and also provides additional offsets for towing and all-wheel drive functionality.

Commenters do not identify anything in the statute that mandates categorization based on whether a vehicle emits or whether it has a certain powertrain. And in fact, Section 202(a)(1) does not require categorization (or classification) on these bases. Moreover, the intention underlying the commenters' preferred categorization is to delay the introduction of effective pollution control technologies like BEVs, with the result of perpetuating dangerous air pollution. That is not a reasonable way to implement section 202(a)(1).

Although it does not directly apply to section 202(a)(1) standards, Section 202(a)(3)(A)(ii) provides guidance on what kinds of classifications and categorizations Congress thought were appropriate. [313] That section states "[i]n establishing classes or categories of vehicles or engines for purposes of regulations under this paragraph, the Administrator may base such classes or categories on gross vehicle weight, horsepower, type of fuel used, or other appropriate factors." As noted above, the class of light-duty trucks, for instance, is distinguished from other motor vehicles by its members having a certain weight and function. Within that class, vehicles are subject to different standards based on their footprint and functionality (the availability of all-wheel drive and towing), which the Administrator views as "other appropriate factors."[314]

---

[311] We acknowledge that we have not always clearly delineated between the terms "class" versus "category." But the key point here is not the semantics of these two words, but rather a substantive distinction: the "classes" of vehicles that contribute to dangerous pollution for which EPA makes the endangerment finding and are thereby subject to the regulation for the relevant pollutant, and the "categories" or "subcategories" of vehicles within a class for which the agency may in its discretion establish different standards based on the characteristics of those subcategories.

[312] Congress, however, did provide indicia as to what appropriate categorizations could be in section 202(a)(3)(A)(ii), which we discuss further below. This section does not apply directly to this rulemaking but is nonetheless instructive as to potential means of categorizing (as well as classifying) heavy duty vehicles.

[313] Section 202(a)(3)(A)(ii) applies to standards established under section 202(a)(3), not to standards otherwise established under section 202(a)(1). Nonetheless, we think it provides guidance more generally on what classifications and categorizations Congress thought appropriate.

[314] *See White Stallion Energy Center v. EPA*, 748 F. 3d 1222, 1249 (D.C. Cir. 2014) ("[N]othing in the Clean Air Act 'requires' EPA to create a CFB subcategory. Rather, the statute gives EPA substantial discretion in determining whether subcategorization is appropriate."); s*ee also* CAA § 112(d)(1), 42 U.S.C. § 7412(d)(1) (EPA "may distinguish among classes, types, and sizes of sources"); *Nat'l Ass'n of Clean Water Agencies v. EPA*, 734 F.3d 1115, 1159 (D.C.Cir.2013) ("EPA's subcategorization authority under § 112 involves an expert determination,

Moreover, we note that other parts of the statute do actually *require* distinctions based on powertrain or based on fuel type (which corresponds to powertrain). Even within section 202 itself, Congress specified certain standards applicable only to some “gasoline and diesel-fueled” vehicles.[315] In section 216(1), Congress also limited the definition of a nonroad engine to mean only certain kinds of “internal combustion engine.”[316] This treatment shows that when Congress wants to require distinctions related to powertrain, it knew how to do so. The conspicuous absence of any such limitation in section 202(a)(1) suggests that no such limitation should be implied.

Commenters’ suggestion that BEVs are somehow so fundamentally different from ICE vehicles as to require different classification or categorization is also misplaced. EPA has found that, during the timeframe for this rule, BEVs are generally capable of performing the same functions as ICE vehicles of their respective types and established the standards accordingly. Indeed, manufacturers will sometimes produce the same vehicle model with varying levels of electrification.[317]

Relatedly, a commenter claims that because there is no identifiable vehicle configuration that corresponds to the standards, industry as a whole would have to certify at least two fundamentally different types of vehicles to satisfy them. It is not entirely clear what this comment means. Motor vehicles are highly diverse, and different manufacturers produce different subsets of such vehicles, with diverse vehicle configurations. We expect manufacturers to continue to produce the kinds of vehicles they have traditionally produced as the standards do not limit manufacturers to only producing a single vehicle configuration or applying only a single type of pollution control technology. Moreover, it is up to manufacturers to decide how to comply with EPA’s standards, and we expect each manufacturer to choose the compliance pathway that best suits its business.

Commenters suggest that calculating a fleetwide average that includes both BEVs and other vehicles creates an illogical or false average, but EPA rejects that suggestion. It is entirely consistent with the history of motor vehicle regulation under the CAA for advanced pollution control technologies to be phased in across the fleet, and there is nothing false about the tailpipe emissions compliance figures being averaged together under this rule. After all, BEVs do indeed produce no tailpipe emissions, so it is accurate to account for them as such. Indeed, it would be more inaccurate to exclude BEVs in calculating fleetwide compliance. And there is nothing false about regulatory averages that include electric vehicles. Emission standards apply to all motor vehicles in the relevant class. Automakers count the emissions of every vehicle in their fleet when calculating fleet-average emissions. Electric vehicles are thus treated just like any other

---

placing a heavy burden on a challenger to overcome deference to EPA's articulated rational connection between the facts found and the choice made.”); *NRDC v. EPA*, 489 F. 3d 1364, 1375 (D.C. Cir. 2007) (“Because Congress has vested EPA with subcategorization authority under Section 112(c)(1), and its exercise of that authority involves an expert determination, L–P carries a heavy burden to overcome deference to the agency's articulated rational connection between the facts found and the choices made.”).

[315] CAA section 202(a)(3)(B)(ii), (h) tab. H, (i)(1); *see also* CAA section 202(a)(5)(A) (“gasoline vapor recovery”), (g) tab. G (“diesel-fueled LDTs”), (k) (“gasoline-fueled motor vehicles”).

[316] CAA section 216(10).

[317] For example, the Ford F-150 has been offered in ICE and EV versions, while the Hyundai Ioniq and Kia Niro has been offered in HEV, PHEV, and EV versions. Jaguar Land Rover has also indicated that every model will be available with a fully electric version by the end of the decade. The Freightliner Cascadia and eCascadia are ICE and BEV versions of Freightliner’s HD semi truck.

vehicle with emission-control technology. For that reason, averaging is technology neutral. The impact a particular technology has on a fleet's performance depends on its effectiveness. And electric vehicles are very effective at reducing greenhouse-gas emissions. But that effectiveness does not mean EPA must categorize electric vehicles separately or that such vehicles are beyond EPA's regulatory authority.

EPA acknowledges that we have at times established separate categories for vehicles based on powertrain or fuel type. For example, EPA has traditionally established separate categories for spark ignition and compression ignition vocational vehicles for purposes of HD GHG regulation.[318] EPA proposed to retain this categorization scheme in the recent HD Phase 3 GHG rule. We expect manufacturers to continue producing both spark and compression ignition ICE vocational vehicles during the timeframe of that rule; that is, we projected that manufacturers will likely comply with the Phase 3 standards, as with their Phase 2 predecessors, in whole or in part based on the GHG performance of both types of vocational vehicle engines. Given technological differences, spark and compression ignition ICE emit different amounts of pollutants, including GHGs, and including when using the same pollution control technologies.[319] As such, EPA's standards and categorization scheme appropriately reflect the different feasible emissions performance of these two types of internal combustion engines and vehicles. In principle, this is no different than having different GHG standards for, say, an ICE long-haul tractor and an ICE light HD vocational vehicle: they emit different amounts of pollutants, even when using the same pollution control technologies, and the standards appropriately reflect this difference.[320]

We note the key difference between this scheme and the ones that commenters say are compelled. Under EPA's proposed HD Phase 3 rule, vocational vehicles with all engine types must meet GHG standards whose stringency is supported by the feasible emission reductions under the modeled compliance pathway, which includes both zero-emitting vehicles and ICE vehicles technologies.[321] Under the commenters' approach, EPA is precluded from requiring any emission reductions associated with zero-emitting vehicle technologies that are available at a reasonable cost, and the nation has to forgo large public health and welfare benefits. We do not think such a result is reasonable.

Finally, many of the commenters' arguments rest on a false premise that BEVs cannot emit any air pollutants. EPA structures its light duty standards to regulate GHG leakage from AC systems which occurs in BEVs as well as other vehicles,[322] and EPA recognizes that BEVs like other vehicles emit PM through tire wear. Thus, to the extent the commenters view BEVs as not being part of the class subject to regulation under section 202 because BEVs do not emit pollutants, that view is factually inaccurate as well.

---

[318] *See* 40 CFR section 1037.105 (b)(1).

[319] *See, e.g.,* 81 FR at 73562, 73679, 73703 (Phase 2 rule discussions of engine technologies considered in vehicle standard-setting).

[320] To provide another example, EPA has promulgated specific provisions for light-duty PHEVs to properly account for the way the internal combustion engine is used in PHEVs under certain conditions. But broadly speaking the same light duty tailpipe standards apply to all vehicles regardless of powertrain or fuel type, including to gasoline vehicles, diesel vehicles, HEV, PHEV, BEV, etc.

[321] The standard can of course be met by any means a manufacturer chooses.

[322] *See* Preamble III.C.5.

BEVs as systems or devices to prevent or control emissions

Some commenters further suggest that BEVs are beyond the scope of regulation under section 202(a) because the provision does not specifically mention BEVs, and because they view the clause at the end of section 202(a) which requires standards to be applicable for the useful life of vehicles “whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control pollution” as not describing BEVs. Other commenters argue that BEVs are best considered a design feature related to the control of emissions which should be considered in determining fleet average standards in order to achieve the goals and requirements of the Clean Air Act, and that BEVs constitute vehicles designed as a “system” within the meaning of section 202.

EPA disagrees with these comments. First, section 202(a)(1) directs EPA to regulate emissions from motor vehicles, and BEVs are motor vehicles as defined in section 216(2) of the Act. Second, in the 2009 Endangerment Finding, EPA identified the classes of motor vehicles subject to GHG regulation without any distinction as to whether they emit or to their powertrain. Once EPA made the endangerment finding for the class, EPA was required to set emission standards for vehicles in that class to address the contribution to endangerment. Third, the last clause in section 202(a)(1)—“whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control pollution”— does not alter the scope of vehicles subject to regulation under the Act. It does, however, confirm the broad scope of Congressional intent of the kinds of technologies that EPA may consider in establishing the standards, including “complete systems” and technologies that “prevent” pollution, which describe BEVs. We reject the commenters’ subsidiary arguments, including that BEVs are beyond the scope of regulation because they do not control pollution from a carbon-dioxide or criteria-pollutant emitting engine, they are not designed for emissions control, or they do not block or capture pollution.

First, as we explain in Section III.B of the preamble, BEVs unambiguously fall under the statutory definition of motor vehicles in section 216(2), and the statute also unambiguously allows EPA to consider electrified technologies, including BEVs, in establishing section 202(a)(1) standards. Section 202(a)(1) applies to the “emission of any air pollutant from any class … of new motor vehicles …. which … cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” Vehicles with electric powertrains, including BEVs, are indisputably “motor vehicles,” since they are “self-propelled” and are “designed for transporting persons or property on a street or highway.”[323]

Commenters wrongly suggest that despite the very broad statutory definition of motor vehicles, which remained untouched through repeated revisions of Title II, Congress could not have possibly intended to include BEVs in that definition simply because most vehicles in 1965 were gasoline. It is worth noting that “[a]t the beginning of the 20th century, 40 percent of American automobiles were powered by steam, 38 percent by electricity, and 22 percent by

[323] CAA section 216(2).

gasoline,"[324] and as noted in the preamble and by other commenters, by the 1960s Congress was actively considering the potential role of EV technology for reducing motor vehicle pollution.[325] In any case, as the Supreme Court has held, "the Congresses that drafted § 202(a)(1) … did understand that without regulatory flexibility, changing circumstances and scientific developments would soon render the Clean Air Act obsolete. The broad language of § 202(a)(1) reflects an intentional effort to confer the flexibility necessary to forestall such obsolescence."[326] Just as greenhouse gases "fit well within the Clean Air Act's capacious definition of 'air pollutant,'"[327] BEVs likewise fit well within the definition of motor vehicles. And as we explain in the preamble, the Administrator appropriately considered BEVs in establishing the standards as they are a highly effective technology for reducing vehicle emissions and available at a reasonable cost during the timeframe of the rulemaking.

Second, as we explain in our prior response regarding ABT, EPA identified the classes of vehicles subject to GHG regulation in the 2009 Endangerment Finding. The classes identified included passenger cars, light duty trucks, and medium and heavy-duty trucks, without exception as to their level of emissions or powertrain. BEVs are included in each class of vehicles. Once EPA made the endangerment finding for the class, EPA is required to set emission standards for vehicles in that class to address the contribution to endangerment.

Third, contrary to what commenters argue, the final clause of section 202 (a)(1) does not change the class of vehicles for which EPA must promulgate emission standards. That clause states that the standards "shall be applicable to those vehicles for their useful life whether such vehicles … are designed as complete systems or incorporate devices to prevent or control such pollution." This language requires that the standards apply to vehicles over their useful life, as opposed to, for example, only at the certification stage. The final standards do this.

As we explain in Section III.B of the preamble, this statutory language also confirms the breadth of Congress's intent with regard to the technologies that EPA may consider. We think it is clear that BEVs fall under this language as they are designed as complete systems. It is also reasonable to view BEVs as incorporating devices (e.g., batteries and e-motors) that prevent pollution from being created. Either way, BEVs clearly fall within the statutory text.

The commenters' arguments to the contrary are all misplaced. Commenters suggest that EPA cannot consider BEVs in establishing the standards because BEVs are designed to run on an entirely different power system, not to limit or control pollution from a carbon-dioxide-emitting engine. The argument first of all ignores the statutory language in section 202(a)(1), which speaks to EPA establishing emissions standards for classes of motor vehicles that contribute to

[324] Britannica, *Early Electric Vehicles*, https://www.britannica.com/technology/automobile/Early-electric-automobiles; see also Amicus Brief of Margo Oge and John Hannon in *Texas v. EPA* (D.C. Cir. No. 22-1031) at 9, 16-17.
[325] For example, in 1967, Congress was working on research-and-development programs for vehicle electrification. See S. Rep. No. 90-403, at 59-61 (1967). As part of that effort, Congress held hearings on "electric vehicles and other alternatives to the internal combustion engine." Joint Hearings Before the Committees on Commerce and Public Works for S. 451 and S. 453, 90th Cong. 297 (1967). Later that year, a Senate report approvingly noted that electrified vehicles could comprise one third of the market by 1985. S. Rep. No. 90-403, at 60 (1967). A few years later, Congress amended the Clean Air Act to create a research program for new vehicle technology, including "low emission alternatives to the present internal combustion engine." CAA section 104 (a)(2).
[326] *Massachusetts v. EPA*, 549 U.S. 497, 532 (2007).
[327] *Id.*

dangerous air pollution, not for classes of "carbon-dioxide emitting engines." Moreover, the argument proves far too much. Many GHG and criteria pollution control technologies are "designed" for or have other purposes beyond merely pollution control. For instance, many of the technologies on which the GHG emissions standards are predicated – e.g., improved engines and transmissions, low rolling resistance tires, aerodynamic improvements, lightweighting, improved accessories, mild and strong hybrids[328]—also improve vehicle functionality (e.g., turbocharging and engine downsizing, high efficiency automatic transmissions, electrified power steering) and fuel economy. The same is true for criteria pollutant technologies that improve the combustion process, such as exhaust gas recirculation, which beyond improving emissions performance can also improve knock resistance, reduce the need for high load fuel enrichment, and so on.[329]

Commenters similarly maintain that BEVs are not designed as complete systems because they lack a self-contained mechanism to block or capture pollution that otherwise would be emitted. This argument lacks a statutory basis and is premised on an incorrect understanding of how pollution control technology works. The statute speaks to vehicles "designed as complete systems or incorporate devices to prevent or control such pollution." [330] Preventing pollution includes reducing or eliminating pollution at the source, as opposed to merely blocking or capturing the pollution after it has been emitted.[331] Relatedly, controlling pollution could mean blocking or capturing pollution that otherwise would be emitted, but could also mean using chemical processes to transform air pollutants into harmless compounds. Technologies to address GHG emissions work by preventing pollution, e.g., by making the vehicle lighter or more aerodynamic or by increasing engine efficiency, so as to reduce fuel consumption and associated emissions, or by relying on a different fuel (e.g., natural gas, hydrogen, or electricity) that inherently creates and emits less pollution from the motor vehicle. To date, no motor vehicle GHG add-on control or aftertreatment technologies have become widely available. Criteria emissions technologies can also prevent pollution—for example by increasing the efficiency of the fuel combustion process or by fuel-switching—or control it—for example by a catalyst transforming pollutants into less harmful compounds.

The commenters' reading is implausible for another obvious reason. It reads the statute as disallowing technologies which are best suited to "prevent" the emissions which contribute to endangerment. Instead of preventing and controlling the emissions which contribute to endangerment, the commenters' reading would preclude EPA from considering highly effective technologies for reducing emissions, with the result of perpetuating emissions that contribute to dangerous air pollution. This result is antithetical to the statutory goal of using emission standards to prevent endangerment from "maturing into concrete harm."[332]

---

[328] 81 FR at 73747–53.

[329] See Hannu Jääskeläinen & Magdi K. Khair, Exhaust Gas Recirculation (May 2022), https://dieselnet.com/tech/engine_egr.php.

[330] EPA notes that some commenters, both those that read section 202(a) as authorizing consideration of electrification technologies in setting vehicles standards and those that do not, appear to read the last phrase of section 202(a)(1), "to prevent or control pollution," as modifying "designed as complete systems." An alternate reading would be to construe "to prevent or control pollution" as solely modifying "incorporate devices." EPA finds it is unnecessary to resolve this interpretive issue because either way BEVs do prevent pollution.

[331] See CAA section 101(a)(3) ("air pollution prevention (that is, the reduction or elimination, through any measures, of the amount of pollutants produced or created at the source)").

[332] *Coal. for Responsible Regulation*, 684 F. 3d at 122.

The commenters' reliance on *Truck Trailer Manufacturers Association, Inc. v. EPA*, 17 F.4th 1198, 1202 (D.C. Cir. 2021) is misplaced. The case involved whether trailers were "motor vehicles," not which emissions control technologies are permissible under the statute. The commenter seizes on language in the decision stating that section 202(a)(1) creates two categories of complete motor vehicles: those with built-in pollution control, and those with add-on devices for pollution control. Nothing in this language supports a reading that BEVs are not "complete systems" or "devices." Indeed, BEVs can be regarded as "built-in pollution control," since the pollution control system is integral to the vehicle design, as opposed to being an add-on. In this way, BEVs are similar to many other pollution prevention technologies described above. For example, improved vehicle aerodynamics, lightweighting, and ICE engine and transmission improvements are integral aspects of the vehicle that can also be regarded as "built-in pollution control." By contrast, for example, an aftertreatment system can be seen as an "add-on device." Thus, to the extent *Truck Trailer* is relevant to the issue, we think it, like the statutory language it glosses, confirms the breadth of technologies Congress intended for EPA to consider and further supports our decision to consider BEV technologies in setting the standards.

Further, as discussed in Section III of the preamble, EPA does not mandate which vehicles a manufacturer may produce or how a manufacturer may choose to design individual vehicles or their overall fleet composition to meet emission standards. Without technological controls, including add-on devices and complete systems, all of the vehicles EPA regulates under section 202(a) have the potential to emit dangerous pollution.[333] Therefore, EPA establishes standards for the entire class of vehicles, based upon its consideration of all available technologies. Once EPA promulgates the emission standards, it is incumbent upon manufacturers to determine which technology or mix of technologies, whether they be add-on devices or complete systems, to use to meet the standards for their individual fleets. Accordingly, and consistent with the text of section 202(a), EPA has authority to set standards for an entire class of motor vehicles—and must have this authority—irrespective of how manufacturers ultimately comply. It would be absurd for EPA to set standards for a class of motor vehicles only for EPA to lose its authority to regulate those very same vehicles based on how manufacturers ultimately choose to comply after EPA has issued its standards. And it is only after EPA issues standards, and manufacturers begin to produce cars to meet those standards that the Agency can know with certainty what technologies manufacturers are using to meet the standards; accordingly, it is only after the manufacturers have applied those technologies to vehicles in actual production that the pollution is prevented or controlled.

Section 202(e)

One commenter points to section 202(e) as support for their view that BEVs should not be treated as part of the same class as other vehicles, and argues that any new propulsion system must be evaluated by the Administrator under section 202(e) before being certified. However, that provision is mostly notable for the specific circumstances under which it applies and is entirely permissive as an optional additional source of authority for the Administrator regarding certification.

---

[333] As noted above, manufacturers in some cases choose to offer different models of the same vehicle with different levels of electrification. And it is the manufacturer who decides whether a given vehicle will be manufactured to produce no emissions, low emissions, or higher emissions controlled by add-on technology.

Section 202(e) clarifies that if a vehicle or engine with a novel power source or propulsion system would meet currently applicable emissions requirements but would emit air pollutants which the Administrator judges are harmful but for which EPA has not yet established standards, the Administrator may postpone certifying the vehicle for sale (notwithstanding the fact that the vehicle nominally meets the currently applicable emissions standards) until standards to address the novel pollutants are issued.

For example, in 1975 an inventor sought, and in 1977 was issued, a US Patent (No. 4,006,595) for a “refrigerant-powered engine.”[334] In explaining the need for such an engine, the patent states, “[p]erhaps the most serious problem facing this generation is the creation of air pollution as a result of the by-products of the automobile internal combustion engine,” and thus there “exists a need for a practical alternative to the internal combustion engine.”[335] The engine in question would use Freon vapor to drive a turbine (the Freon would then be collected in a sealed system and reused).

Were an automaker to develop such an engine today (using Freon or a chemical with similar characteristics), it would appear that no standards would apply to leaks of the chemical from the powertrain of the vehicle. In the absence of section 202(e), the Administrator might be required to issue a certificate of conformity allowing the vehicles to be sold, even if the leaks of the chemical were expected to have serious, long-lasting adverse impacts on the environment. Section 202(e) authorizes the Administrator to delay issuing certificates to such vehicles until appropriate standards can be established to protect public health and the environment.

Thus, this provision simply confirms the breadth of EPA’s authority to regulate any self-propelled vehicles—regardless of their form of propulsion (be it internal combustion, external combustion, electric, or a technology unknown to Congress in 1970 or to the agency today). Notably the provision has no potential application where a vehicle does not emit novel air pollutants (i.e., those for which an endangerment finding has not been made), and the provision certainly does not limit EPA to classifying vehicles according to their fuel or method of propulsion. As a discretionary power regarding certification, the provision also does not limit EPA’s standard-setting authority in any way.

Coordination with NHTSA

Some commenters suggest that EPA is bound by the terms of EPCA, either implicitly or because EPA is required to coordinate its standards with NHTSA’s fuel economy standards. Similarly, some commenters suggest that EPA decided not to undertake a joint rulemaking with NHTSA in order to avoid legal constraints on its standard-setting that would otherwise have applied.

EPA disagrees with the view that it is required to engage in joint rulemaking with NHTSA, that its legal authority with respect to establishing section 202 standards changes in any way if it does not engage in joint rulemaking with NHTSA, or that EPCA in any way constrains the scope of EPA’s authority to set standards under section 202.

---

[334] The patent also discloses a prior patent, filed in 1973, which likewise uses Freon in a piston-reciprocating engine.
[335] *Id*. at 7

EPA issued its earliest light duty GHG rules jointly with the National Highway Traffic Safety Administration. However, from the beginning the two agencies have recognized their standards have different statutory mandates and that each agency must set its standards according to its respective statute, which has always resulted in the agencies' standards being varied in certain ways. In the very first joint LD GHG rule, EPA and NHTSA explained at length the distinct statutory authority of each agency and the areas in which they were similar and in which they were different, and the ways in which the agencies would coordinate their standard-setting and the ways in which the standards would diverge.[336] EPA thus has never viewed joint rulemaking as altering the scope of its authority. As discussed in Section III of the preamble and in Chapter 26 of the RTC, EPA has continued to coordinate closely with NHTSA in setting GHG standards even when not proceeding through joint rulemaking, and EPA has continued that practice for this rule, closely coordinating with NHTSA on a full range of issues related to feasibility, modeling, and stringency.

EPA continues to believe that EPA and NHTSA can and should each implement their respective statutory authorities while avoiding inconsistency. However, EPA does not believe that to avoid inconsistency EPA must, or can, ignore technological developments that enable significant advances toward necessary pollution reductions. As the Supreme Court made clear, "EPA has been charged with protecting the public's 'health' and 'welfare,'"[337] a statutory obligation wholly independent of DOT's mandate to promote energy efficiency."[338] Congress specified for NHTSA how to consider alternative fueled vehicles for purposes of calculating fuel economy, and Congress directed EPA to be forward-looking in assessing all available technologies when assessing feasibility of emissions reductions. These two mandates may result in somewhat different treatment of BEVs for purposes of assessing the feasibility of standards, but that does not indicate that either approach is inconsistent with the relevant statute, or that the ultimate standards will necessarily be inconsistent with each other. As the Supreme Court has already held, these statutes are complementary and do not displace one another.[339] EPA further discusses the lack of relevance of EPCA for interpreting section 202 in the Section 2.3 of the RTC concerning major questions.

Need for standards to adequately protect public health and welfare

Several commenters stated that the purpose of CAA section 202 is to reduce threats to public health and welfare. They supported standards more stringent than the final standards, with some commenters supporting zero emissions standards (i.e., standards of 0 g/mile). One commenter suggested that EPA was required under CAA 202(b)(1)(C) to undertake an analysis to determine what emission standards are needed to protect public health and welfare, including the NOx and PM standards that are needed to attain the ozone and $PM_{2.5}$ NAAQS in all nonattainment areas, and then to establish standards on that basis. An association of state agencies commented that stringent emissions standards are needed to ensure state and local air agencies can meet their statutory obligations to timely attain and maintain NAAQS. Other commenters pointed to the

338 *Massachusetts*, 549 U.S. at 532.
339 *See id.*

standard-setting provisions of CAA section 202(a)(3), which apply to criteria pollutant standards for heavy duty vehicles.

As discussed in Section III and elsewhere in the preamble, EPA agrees with commenters that the purpose of the Clean Air Act is to reduce emissions of air pollutants that have been determined to contribute to dangerous air pollution, and Congress expected and directed that EPA would consider a full range of available technologies (not only internal combustion engine technologies) in carrying out that statutory purpose. As further discussed in the preamble, EPA agrees that section 202(a)(3)(A), which applies to certain standards adopted in this rule, is intended to achieve the greatest degree of emission reduction achievable, subject to EPA's consideration of certain factors, although section 202(a)(1)-(2) (which applies to light duty standards and HD GHG standards) provides more discretion to EPA whether to adopt technology forcing standards or not. EPA agrees with commenters who pointed out that federal mobile source standards are critically necessary to reduce harmful air pollution and in particular to assist states to come into attainment with the NAAQS. EPA is promulgating standards to achieve significant reductions in criteria pollution, as well as GHG. For the reasons stated in Section V of the preamble, EPA finds that the standards in this rule are consistent with section 202(a) (including, where applicable, section 202(a)(3)). These topics are further addressed in Section II of the preamble, Chapter 6 of the RIA, and Section 11 of the RTC.

Some commenters supported standards even more stringent than the proposed (or final) standards, including "zero emission standards." Some commenters suggested that standards should be set by determining what reductions are necessary to attain the NAAQS or achieve other public health goals. EPA finds, for the reasons explained in Section V of the preamble, that more stringent standards would not be appropriate under section 202(a). In particular, EPA finds that zero emissions standards would not be feasible or appropriate for these model years, taking into consideration cost and lead time. Although EPA recognizes that emissions reductions are the primary focus and purpose of section 202, and has adopted standards to achieve significant reductions in emissions, EPA disagrees that standards must be set by first identifying a specific amount of reductions needed, such as NOx reductions needed to attain the NAAQS, and then setting the standards to achieve those reductions. Section 202(a) directs EPA to achieve reductions in air pollutants, but does not suggest that the level of the standard must be tied to achieving a particular amount of reductions. Rather, section 202(a) is focused on technological feasibility, including cost. This approach enables EPA to achieve significant reductions which are critical to achieving public health goals, including attainment of the NAAQS, but there is nothing in section 202(a) that directs EPA to set standards based on achieving a specific quantity of emissions reductions, and EPA disagrees that such an approach is required under section 202(a).

EPA recognizes that some commenters read the text of section 202(b)(1)(C) as applying to these standards and as requiring such an analysis of what standards are necessary to prevent endangerment of public health and welfare, but EPA disagrees. First, section 202(b)(1)(C) has no relevance to GHG standards or to medium duty vehicles, as section 202(b) does not specify any such standards for EPA to promulgate. Second, EPA disagrees that the light duty criteria pollutant standards promulgated in this rulemaking are revising standards prescribed under or previously revised under section 202(b).

Third, even hypothetically assuming section 202(b) was intended to displace section 202(a) for all rulemakings going forward as the statutory criteria for light duty criteria pollutant standards, EPA further disagrees that it has not satisfied this requirement. EPA does not read the clause “as needed to protect public health or welfare, taking costs, energy and safety into account” to require that EPA conduct an analysis of what mobile source standards would result in nationwide attainment of the NAAQS, or some more nebulous goal, before adopting standards. Certainly, EPA has considered the public health and welfare implications of these pollutants and the need for additional mobile source controls, as discussed at length in Section II of the preamble. As discussed in Section V of the preamble, EPA is setting standards that it views as appropriate in light of the critical need for further pollutant reductions, but also taking into consideration costs, as well as energy, safety, and other factors. For those vehicles over 6,000 lbs, EPA has expressly found that the standards being adopted reflect the greatest degree of emissions reduction achievable through the application of available technology, giving appropriate consideration to cost, energy, and safety. In this way, EPA, by considering both the need for additional emission reductions and cost, feasibility, and additional factors including energy and safety, is adopting standards “as needed to protect public health and safety, taking costs, energy and safety into account.” EPA does not find a separate analysis of what standards would be necessary to achieve attainment of the NAAQS across the country to be required or appropriate under section 202(b)(1)(C).

Had Congress wanted that result, it could have said so. Cf., e.g., CAA 110(a)(2)(C) (requiring certain measures “as necessary to assure that national ambient air quality standards are achieved”), 202(i)(2)(A) (requiring the Administrator to “examine the need for further reductions in emissions in order to attain or maintain the national ambient air quality standards”), 213(a)(2) (requiring a study of nonroad engine contribution to nonattainment of national ambient air quality standards for ozone or carbon monoxide). Instead, Congress in section 202(b)(1)(C) simply said that “[a]ny revised standard shall require a reduction of emissions from the standard that was previously applicable.” It would be strange to read the modest phrase “as needed to protect public health or welfare” coupled with an anti-backsliding provision to mean a newfound mandate to achieve the NAAQS. Further while light duty vehicles are significant sources of pollution, other mobile and stationary sources are also very significant sources for these pollutants. Thus, it is doubtful that it would even be possible to ensure attainment of the NAAQS solely through light duty standards. Moreover, it is evident from the extensive statutory provisions in title I, part D of the Clean Air Act that attainment of the NAAQS was never intended to be achieved solely by mobile sources (much less solely light duty vehicles). It would be unreasonable to read the requirement for EPA to consider the “need” for protecting public health and welfare as requiring an analysis of what light duty standards would result in attainment of the NAAQS. To the extent this provision applies to this rulemaking, EPA’s decision to set standards taking into account the critical need for further emissions reductions to protect public health and welfare but also considering cost, energy, and safety, is consistent with the provision.

Nondelegation

The Pacific Legal Foundation comments that “if Congress gave EPA the unfettered discretion to alter the automobile market—with no limiting principle on its power to do so—then the Clean Air Act violates the Constitution’s nondelegation doctrine.” They assert that under the EPA’s assertion of authority in this rule, "the Clean Air Act is essentially a blank check under which the President and EPA may fill in their preferred policy, and Congress will have effectively enacted a law that is 'nothing except a raw delegation to enact rules.'"

Contrary to Pacific Legal Foundation's comment, the Clean Air Act, and this rule's promulgation thereunder, is sound under the nondelegation doctrine. "All legislative Powers herein granted shall be vested in a Congress of the United States . . . ."[340] As reaffirmed in *Gundy v. United States*, the Supreme Court held "that a statutory delegation is constitutional as long as Congress 'lay[s] down by legislative act an intelligible principle to which the person or body authorized to [exercise the delegated authority] is directed to conform.'"[341] Justice Rehnquist described the doctrine further:

> First, and most abstractly, it ensures to the extent consistent with orderly governmental administration that important choices of social policy are made by Congress, the branch of our Government most responsive to the popular will. *See Arizona v. Californi*a, 373 U.S. 546, 626 (1963) (Harlan, J., dissenting in part); *United States v. Robel*, 389 U.S. 258 (1967) (Brennan, J., concurring in result). Second, the doctrine guarantees that, to the extent Congress finds it necessary to delegate authority, it provides the recipient of that authority with an "intelligible principle" to guide the exercise of the delegated discretion. *See J.W. Hampton & Co. v. United States*, 276 U.S. 394, 409 (1928); *Panama Refining Co. v. Ryan*, 293 U.S. 388, 430 (1935). Third, and derivative of the second, the doctrine ensures that courts charged with reviewing the exercise of delegated legislative discretion will be able to test that exercise against ascertainable standards. *See Arizona*, 373 U.S. at 626 (Harlan, J., dissenting in part); *American Power & Light Co. v. SEC*, 329 U.S. 90, 106 (1946).[342]

In considering nondelegation, the Court looks to both the statutory context of the provisions,[343] and the "statutory purpose."[344]

The scope of congressional delegation need not be precise to be effective. As of early 2001, "[i]n the history of the Court we have found the requisite 'intelligible principle' lacking in only two statutes, one of which provided literally no guidance for the exercise of discretion, and the other of which conferred authority to regulate the entire economy on the basis of no more precise a standard than stimulating the economy by assuring 'fair competition.'"[345] The Court has

United States*, 334 U.S. 742, 778–86 (1948); authorizing the Price Administrator to fix "fair and equitable" commodities prices, *see Yakus v. United States*, 321 U.S. 414, 426–27 (1948); and authorizing the Federal Communications Commission to regulate broadcast licensing in the "public interest," *see National Broadcasting Co. v. United States*, 319 U.S. 190, 225–26 (1943).[346]

The Court has "almost never felt qualified to second-guess Congress regarding the permissible degree of policy judgment that can be left to those executing or applying the law."[347]

As noted throughout the preamble and other sections of this rule regarding statutory authority, Congress clearly and intelligibly established EPA's mandate in the Clean Air Act with respect to air pollution from motor vehicles. The statute provides that "[t]he Administrator shall by regulation (and from time to time revise) . . . standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in his judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare."[348] Further, the statute requires that "[a]ny regulation prescribed under paragraph (1) of this subsection (and any revision thereof) shall take effect after such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period."[349] As we further explain in our response to major questions doctrine comments, Congress made the major policy decision here to control air pollution from motor vehicles, while delegating to the Administrator interstitial technical and policy judgments to achieve that goal. The statute lays down intelligible principles, and indeed numerous statutory criteria and constraints on EPA's discretion. These include, but are not limited to, (1) any standards must be premised on an endangerment finding—that some "air pollutant from any class or classes of new motor vehicles or new motor vehicle engines . . . cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare"; (2) the standards must be developed through an approach based on available "technology"; (3) the standards must provide for sufficient lead-time "to permit the development and application" of such technology; and (4) the standards give "appropriate consideration to the cost of compliance within such period."

Advanced Clean Cars II

Some commenters state that this rule cannot be based on California's ACC II program, as that program does not have a waiver, and suggest that the standards do rely on them.

EPA agrees that it has not issued a preemption waiver for the ACC II standards and without such waiver California and other states cannot enforce the ACC II program. However, this rule is independent from California's ACC II standards and EPA's feasibility analysis does not depend on the implementation of ACC II. EPA's authority to promulgate rules is independent from

[346] *Touby v. United States*, 500 U.S. 160, 165–66 (1991) (holding the Controlled Substances Act clause requiring "imminent hazard to the public safety" to be an intelligible principle, even in the higher-specificity criminal context).
[347] *Misretta*, 488 U.S. at 416 (Scalia, J., dissenting); *see id*. at 373 (majority opinion).
[348] 42 U.S.C. § 7521(a)(1).
[349] CAA section 202(a)(2).

California's; this rule is being promulgated in accordance with that independent authority. EPA has conducted a sensitivity analysis ("state level ZEV policies") to explore the potential impact implementation of ACC II in California and section 177 states might have. That analysis indicates that the costs of the standards would be less, compared to the No Action baseline, if ACC II were implemented than if it was not. However, EPA finds that the cost estimates of its central analysis (i.e., without ACC II) are reasonable and is not relying on the results of this sensitivity analysis to justify adoption of these standards. It is true that EPA pointed to the adoption of ACC II as an example of international and state trends towards encouraging further sales of PEVs, but this was illustrative of international market trends in the marketplace and the standards adopted in this rule do not depend on ACC II being implemented, or indeed on further international regulatory developments. ACC II has been fully adopted by California and although it may not be enforced until a waiver is granted, the very fact it has been adopted, and that other states have adopted the standards, is relevant information for automakers and in turn for EPA. Past experience has suggested that manufacturers may choose to consider in their product planning the adoption by California of new standards, even in the absence of a waiver. Similarly, EPA has taken certain ACC II standards into account in its planning, judging that EPA's standards are appropriate and will only become more appropriate if a waiver is granted. Thus, EPA is not relying on the waiver for ACC II being granted in the future, we are simply taking into consideration in a limited way the fact that ACC II has been adopted. EPA finds that this is entirely reasonable and consistent with the current status of ACC II (as adopted but lacking a waiver). EPA has judged the standards to be feasible and appropriate based on its assessment of the state of technology, lead-time, costs, and other relevant factors. To the extent that EPA considers ACC II in its impact analysis, such consideration does not contribute to the rule itself, only to the expected impact of this rule compared to various baselines, one of which is the potential impact of ACC II on the light-duty vehicle market.

Significance of Congressional enactment of IRA and BIL

Commenters disagree on the significance of Congressional action in the IRA and BIL for EPA's legal authority, with some commenters stating that these statutes do not add to EPA's regulatory authority, and other commenters stating that these statutes reinforce EPA's authority and confirm Congress's commitment to reducing motor vehicle emissions through electrification. Similarly, some commenters point to the fact that legislation passed under Congressional budget reconciliation rules must be related to spending, revenue, or the federal debt limit, as evidence that the legislation did not increase EPA's authority, while other commenters point to the fact that Congress only incentivized BEVs in the legislation and did not mandate them as evidence that EPA lacks authority to consider EVs in standard-setting under section 202(a).

EPA agrees with those commenters who state that the IRA and BIL reinforce EPA's authority. Although the BIL and IRA are not necessary to find that the statute plainly authorizes the final rule, they confirm and extend Congress's longstanding interest (which, as discussed in Section III of the preamble and elsewhere in this RTC, dates back to the 1960s) in encouraging the development and deployment of BEVs. EPA acknowledges that the IRA and BIL are not what gives EPA authority to include consideration of electrification technologies in standard-setting, but finds that this legislation, which is consistent with the long history of congressional support for cleaner alternative-fueled vehicles, provides further support for the conclusion that the

Congresses that enacted and amended section 202(a)(1) gave EPA the authority to take into consideration the emissions performance of BEVs when setting standards for motor vehicles.

Likewise, EPA does not find that it would be appropriate to infer from the massive incentives of this legislation that Congress wanted EPA to change course and stop taking into consideration the emissions performance of BEVs in setting standards. This rulemaking does not constitute an EV mandate, so the fact that Congress likewise did not adopt an EV mandate provides no basis for suggesting that this rulemaking is beyond the scope of EPA's authority. In fact, since EPA's 2021 rule was adopted shortly after the BIL but shortly before the IRA, Congress can be presumed to have acted in the IRA with knowledge of EPA's approach to regulating motor vehicles for GHG emissions. The fact that Congress increased incentives for EVs and provided funding for states to adopt GHG standards, rather than objecting to EPA's approach, confirms that the purpose of this legislation was not to displace EPA's authority (or to correct EPA's views of its authority) but to support EPA's authority to set standards based on BEV emissions performance—to "combine[] new economic incentives to reduce climate pollution with bolstered regulatory drivers that will allow EPA to drive further reduction under its CAA authorities."[350] We further address this issue in Section 2.3 of the response to comments regarding the major questions doctrine.

Other constitutional claims

Valero comments that the proposed rule may violate the Takings Clause of the Constitution and, to the extent that the rule relies on any state's ZEV mandate, a number of other Constitutional provisions: the Dormant Commerce Clause, the Import-Export Clause, the Privilege and Immunities Clause, and the Full Faith and Credit Clause.

Our Children's Trust comments that "[u]nder the Public Trust Doctrine . . . U.S. residents . . . have a right to access and use crucial natural resources, like air and water," and the government has "fiduciary duties as trustees to manage, protect, and prevent substantial impairment to our country's vital natural resources which the government holds in trust for present and future generations." They state that as such, the EPA has a duty to use its authority to protect "a climate system that sustains human life and liberty."

EPA disagrees with Valero that the Takings Clause applies here. The Takings Clause of the U.S. Constitution states that "private property [shall not] be taken for public use, without just compensation."[351] The purpose of the Takings Clause is to prevent "Government from forcing some people alone to bear public burdens which, in all fairness and justice, should be borne by the public as a whole."[352] The protections of the Takings Clause apply to real property,[353] personal property,[354] and intangible property.[355]

[351] U.S. Const. amend. V.
[352] *Penn Central Trans. Co. v. City of New York*, 438 U.S. 104, 123 (1978).
[353] *See Lucas v. South Carolina Coastal Council*, 505 U.S. 1003, 1019 (1992).
[354] *See Andrus v. Allard*, 444 U.S. 51, 65 (1979).
[355] *See Ruckelshaus v. Monsanto Co*., 467 U.S. 986, 1003-04 (1984).

Regulatory takings are treated more narrowly. A compensable taking can occur by government regulations that unduly burden private property interests.[356] However, "[t]he mere regulation of the use of property, even if it results in the diminution of its value and profitability does not constitute a taking within the meaning of the fifth amendment."[357] In considering whether a regulation constitutes a taking of private property, "'the aggregate must be viewed in its entirety'" such that "for example, a regulation that prohibited commercial transactions in eagle feathers, but did not bar other uses or impose any physical invasion or restraint upon them, was not a taking."[358]

We do not believe the rule takes the property of any entity, let alone does it take the entirety of any industry. The rule sets feasible emission standards, allowing industry to comply by the means of its choosing. EPA's modeling of various pathways of compliance does not direct any certain path, and even shows that no particular industry need be ceased to comply. To the extent that a court could find a taking here, it cannot be viewed as barring all economic uses of such property. This is true for all industries affected by this rule, from vehicle manufactures to fuels and beyond.

Further, the injury that the commenter, who represents fuels interests, complains of is no more than derivative economic injury not recognized by the courts as a takings violation. A takings claimant must, at minimum, assert that its property interest was actually taken by the government action.[359] But where, as here, the regulation's indirect impact to the claimant flows only through its impact to another, the claimant lacks a cognizable property interest.[360] The rule addresses emissions from motor vehicles, without directing the means of reduction. Although the affected vehicles may decrease fossil fuel demand, that impact is secondary to the emissions controls required in the vehicles themselves. As such, the commenter's warning of a takings violation through the rule's perceived economic impact to fossil fuel demand is misplaced.

As for the remaining constitutional principles cited by the commenter relating to state ZEV mandates, EPA disagrees that any such principles apply. As noted in the response on ACC II, EPA is not basing its standards on any assumptions that ACC II will be implemented. This action is a final rule issued by the federal EPA, not an action issued by any State government. While EPA has carefully considered and addressed comments on how the agency should account for state ZEV mandates in assessing factors like technology availability and costs, comments on the constitutionality of those state ZEV mandates are beyond the scope of this rulemaking.

With respect to comments raising Public Trust legal theories, the Agency does not dispute that climate change poses a serious threat, nor that addressing climate change requires the active

[358] *Tahoe-Sierra Preservation Council, Inc. v. Tahoe Reg. Planning Agency*, 535 U.S. 302, 328 (2002) (quoting *Andrus*, 444 U.S. at 66); *see also Keystone Bituminous Coal Ass'n v. DeBenedictis*, 480 U.S. 470, 498 (1987) (holding that a requirement that coal pillars be left in place to prevent mine subsidence was not a regulatory taking).
[359] *See United States v. Gen. Motors Corps*., 323 U.S. 373, 379 (1945); *see also Yuba Nat. Res., Inc. v. United States*, 904 F.2d 1577, 1581 (Fed. Cir. 1990) (holding that "the measure of just compensation is the fair value of what was taken, and not the consequential damages the owner suffers as a result of the taking"); *Klein v. United States*, 375 F.2d 825, 829 (1967) (holding that "compensation under the Fifth Amendment may be recovered only for property taken and not for incidental or consequential losses, the rationale being that the sovereign need only pay for what it actually takes rather than for all that the owner has lost.").
[360] *Air Pegasus of D.C., Inc. v. United States*, 424 F.3d 1206, 1215 (Fed. Cir. 2014).

involvement of the federal government. Commenters espouse novel Constitutional and Public Trust legal theories not relevant to this rulemaking and cite *Juliana v. United States,* 947 F.3d. 1159 (9th Cir.), *Juliana v. United States*, 217 F. Supp. 3d 1224, 1254 (D. Or. 2016) and *Held v. Montana,* No. CDV-2020-307 (1st Dist. Ct. Mont., 2023). The Agency notes that the referenced district court decision in Juliana was overruled for lack of jurisdiction, and further notes that the referenced 9th Circuit decision did not reach the merits of the Constitutional and public trust theories at issue in that case. Juliana v. United States, 947 F.3d 1159, 1175 (9th Cir. 2020), reh'g en banc denied, 986 F.3d 1295 (9th Cir. 2021). Further, *Held v. Montana* (currently subject to appeal) is a case decided by a Montana state court judge interpreting Montana's constitution.

Role of cost/benefit analyses

One commenter suggests that the standards are arbitrary and capricious because EPA gave insufficient weight to the results of the benefit-cost analysis.

To be clear, as documented in Section VIII of the preamble (and in the RIA), EPA did assess the costs and benefits of the final standards. As explained in Sections III and V, when section 202(a) requires EPA to consider "the cost of compliance," it is referring to costs to automobile manufacturers, not total social costs. However, EPA considered both costs to manufacturers and total social costs before adopting the standards. The Administrator identified the standards that he finds appropriate taking into account emissions reductions, costs to manufacturers, feasibility, and other required and discretionary factors. The fact that the estimated benefits exceed the estimated costs of the program reinforces our view that the standards are appropriate under section 202(a). However, as noted in the preamble, EPA did not rely on benefit-cost analysis to *identify* the appropriate standards. That is, EPA did not seek to select standards that would maximize net benefits as calculated by the benefit-cost analysis. Based on the RIA and the range of scenarios we evaluated, we anticipate such an approach would have required significantly more stringent standards, which would, in EPA's judgment, be inconsistent with the requirement to give appropriate consideration to costs of compliance and lead time.[361] EPA finds that our approach, of placing weight on judging the appropriate level of emissions reduction in light of the costs of compliance and lead time, while still evaluating and considering total social costs and benefits, is consistent with both the Supreme Court's decision in *Michigan v. EPA*, 576 U.S. 743 (2015) and with section 202 of the CAA.

Limiting global temperature increases

A commenter alleged that the rule is directed at the goal of limiting global temperature increase to 2 degrees Celsius. EPA disagrees. The final rule is not predicated on any global temperature-specific metric. EPA is acting consistent with our CAA statutory authority and the applicable statutory factors in CAA section 202(a) to limit emissions from motor vehicles which contribute to air pollution that endangers public health and welfare.

[361] The benefit-cost analyses for this rulemaking suggest that, at least across the range being considered, more stringent standards have higher net benefits than less stringent standards.

3 - GHG Standards

3.1 - Program design and structure

Comments by Organizations

Organization: Alliance for Consumers (AFC)

Indeed, the path to compliance that EPA chose to highlight features nearly 70% of the passenger car market shifting to battery electric vehicles (and 40% or so of medium duty vans and pickup trucks). See EPA Fact Sheet, "Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles," Apr. 2023, at 5. This despite only about 1% of the current cars on the road being electric vehicles. [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

The current EPA proposal is an unlawful EV mandate masquerading as a tailpipe regulation. That is the only conclusion that a disinterested observer or everyday consumer could reach, given how the proposal was promulgated, the limits that have been proposed, and the commentary surrounding its release. [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

While an extreme EV mandate might be popular in progressive enclaves, and with federal employees who live in Washington, D.C., a rapid shift to electric vehicles along the lines proposed by EPA here will make lives worse for everyday consumers while costing them more for the privilege of having their lives inconvenienced. [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

Early indications from places like California back up this conclusion and provide warning signs that were not properly addressed by EPA in the proposed rule. [EPA-HQ-OAR-2022-0829-0534, pp. 1-2]

Organization: American Council for an Energy-Efficient Economy (ACEEE)

ACEEE commends EPA for proposing several positive changes to the standards. We support the phase-out of off-cycle credits, limiting A/C credits to internal combustion engine vehicles (ICEVs), eliminating the advanced vehicle multiplier incentives, and lowering the cut-points in the light truck curves. Many of these credits and incentives provide automakers with loopholes for meeting their fleetwide targets and have the potential to weaken the proposed standards. By limiting the off-cycle and A/C credits to vehicles with internal combustion engines, EPA is rightly avoiding over-crediting battery electric vehicles (BEVs) for compliance. Use of these credits by BEVs would result in negative emissions for these vehicles, which distorts their real-world GHG impact. Lowering the cut-points on the light truck curve, or the point at which the emissions level flatlines as footprint increases, from 74 sq-ft to 70 sq-ft ,over the life of the standards is a welcome change that will limit further upsizing in the pick-up truck market. [EPA-HQ-OAR-2022-0829-0642, pp. 2-3]

Organization: BMW of North America, LLC (BMW NA)

BMW NA strongly believes that hydrogen technology will play a key role on the path to climate neutrality across all industries and has great potential, particularly for individual mobility. The pilot series of the BMW iX5 Hydrogen, which is currently being presented to the public during various events all around the globe, highlights the possibilities of hydrogen technology in this context. [EPA-HQ-OAR-2022-0829-0677, p. 3]

BMW NA would like to encourage EPA to extend the regulatory guidance for FCEVs by the means of incorporating an official test procedure (e.g., incorporation of SAE J2572). We believe that this will benefit the automotive industry to better evaluate the technology's potential compared to BEV and quantify its contribution to the overall electrification goals. [EPA-HQ-OAR-2022-0829-0677, p. 3]

In general, we support that no changes have been proposed to the basic structure of the regulation (separate PC and LT fleet, footprint base, averaging, banking and trading possibility). We also support the treatment of EV with 0g/mile in the CREE fleet. Upstream emissions should not be part of a vehicle-based regulation but being treated by specific and targeted regulation regarding the emission sources. [EPA-HQ-OAR-2022-0829-0677, p. 3]

3. Extend the proposed rule to 2035, resulting in the equivalent of 100% ZEV sales by 2035, consistent with ACC II.

4. Lock in a rapid transition to a zero-carbon transportation system, while sending a clear market signal. [EPA-HQ-OAR-2022-0829-0618, p. 6]

Organization: BorgWarner Inc.

To meet EPA’s forecast for BEV penetration levels, there is little room for supply chain or production delays. Any setback could negatively impact the availability or purchase of new BEVs. EPA can reduce these risks to manufacturers by incentivizing vehicles with longer ranges and adjusting multipliers as better BEVs and plug-in hybrid electric vehicles (PHEVs) are introduced. [EPA-HQ-OAR-2022-0829-0640, pp. 3-4]

BorgWarner supports the proposed adjustments to compliance credits. BorgWarner agrees with EPA’s proposed changes to the current compliance credits offered for BEVs, PHEVs and fuel cell electric vehicles (FCEVs). Credits can serve as a valuable tool to incentivize the development of new vehicle technologies and should be used to create new technology pathways. Once these technologies are clearly established, EPA should eliminate these credits. Offering credits once a technology is established could potentially disincentivize new innovations in efficiency-and performance-improving vehicle technologies.

Organization: California Air Resources Board (CARB)

Greenhouse Gas Standards

U.S. EPA is proposing more stringent GHG emission standards for the 2027 through 2032 MYs, along with several modifications to the existing GHG program. Generally, CARB supports U.S. EPA’s proposal, but offers several recommendations to further strengthen the proposed standards to achieve the greatest degree of emission reductions available, considering costs and technology readiness, to further protect public health and combat climate change. As described in detail below, CARB recommends that U.S. EPA adopt more stringent light-duty GHG emission standards; include provisions to ensure manufacturers do not allow emissions to increase from conventional vehicles and instead continue to apply all available cost-effective emission control technologies; estimate real-world PHEV emissions based on the best available data and collect additional data to inform future updates; and update elements of the comprehensive regulatory program, including retiring elements of the off-cycle and air conditioning credits programs as proposed, establishing explicit requirements to eliminate leaks from air conditioning systems, eliminating credit multipliers for medium-duty ZEVs as proposed, and requiring small-volume manufacturers to comply with the proposed standards as proposed. [EPA-HQ-OAR-2022-0829-0780, p. 12]

Medium-Duty Vehicle GHG Standards

In addition to the proposed light-duty standards, U.S. EPA is also proposing to tighten GHG fleet average standards for medium-duty vehicles along with other program modifications. CARB supports U.S. EPA's decision to better delineate the medium-duty vehicle class from heavy-duty vehicles to enable application of the most rigorous and appropriate GHG emission standards and procedures. [EPA-HQ-OAR-2022-0829-0780, p. 16]

CARB supports the proposed medium-duty vehicle GHG fleet average standards and has recently adopted several regulations that are driving emission reductions for this market segment. Adopted in June 2020, the Advanced Clean Trucks (ACT) regulation establishes requirements for manufacturers to sell zero-emission medium- and heavy-duty trucks. This regulation was followed in April 2023 by the Advanced Clean Fleets (ACF) regulation that further drives fleet purchases and turnover to ZEVs and requires that 100 percent of sales of vehicles above 8,500 lbs. gross vehicle weight rating be zero-emission beginning in 2036. Together, these regulations will dramatically increase penetration of ZEVs in the medium- and heavy-duty sectors. CARB has also previously adopted GHG fleet average standards largely aligned with U.S. EPA's Phase 2 heavy-duty GHG regulations for the 2021 through 2027 MYs. [EPA-HQ-OAR-2022-0829-0780, p. 16]

Conclusion

Reducing GHG emissions from motor vehicles is imperative to combat climate change and protect public health. Given the ZEV market trends, manufacturer commitments, and emission reduction opportunities associated with retaining cost-effective technologies on conventional vehicles, CARB finds that U.S. EPA could establish a more stringent light-duty GHG fleet average standard than it has proposed. CARB recommends that U.S. EPA adopt the most stringent standard feasible. [EPA-HQ-OAR-2022-0829-0780, p. 16]

The U.S. has no choice but to take bold action to dramatically reduce GHG emissions across the economy. Motor vehicles are a key GHG emissions source, and U.S. EPA's proposal represents an absolutely critical step towards reducing transportation emissions and stabilizing the climate. However, there are opportunities to do more, particularly protecting or insuring against conventional vehicles increasing their GHG emissions. Motor vehicles also continue to contribute to poor air quality for millions of people across the country. The public health benefits from the suite of proposed standards will reduce healthcare costs and improve quality of life. These benefits are especially important for our country's most vulnerable residents, many of whom face disproportionate exposure to air pollution and are the first to suffer the effects of climate change. [EPA-HQ-OAR-2022-0829-0780, p. 67]

CARB finds that a more stringent set of standards, and thus certainly the proposed standards as well, are technically feasible and cost-effective and recommends that U.S. EPA incorporate CARB's recommendations and adopt the most stringent standards feasible. [EPA-HQ-OAR-2022-0829-0780, p. 67]

Organization: Competitive Enterprise Institute

I. The Proposed Standards Are Electric Vehicle Mandates

The EPA protests that, unlike California's motor vehicle program, which officially bans the sale of gasoline-powered cars by 2035,2 "the GHG program in this proposal is performance-based and not a ZEV mandate."3 In fact, like the California program, the EPA program compels automakers to manufacture and sell increasing percentages of ZEVs, only at a slower pace. It does this by establishing fleet-average GHG emission standards that automakers can meet only by phasing out gasoline-powered vehicles. The EPA's program is not a bare-naked EV mandate, but almost. [EPA-HQ-OAR-2022-0829-0611, pp. 2-4]

2 California Air Resources Board, "California moves to accelerate to 100% new zero-emission vehicle sales by 2035, Press Release, August 25, 2022, https://ww2.arb.ca.gov/news/california-moves-accelerate-100-new-zero- emission-vehicle-sales-2035. The release explains: "The rule establishes a year-by-year roadmap so that by 2035 100% of new cars and light trucks sold in California will be zero-emission vehicles, including plug-in hybrid electric vehicles. The regulation realizes and codifies the light-duty vehicle goals set out in Governor Newsom's Executive Order N-79-20. [Link: https://www.gov.ca.gov/2020/09/23/governor-newsom-announces-california-will-phase-out-gasoline-powered-cars-drastically-reduce-demand-for-fossil-fuel-in-californias-fight-against-climate-change/]"

3 88 FR 29255.

The evidence is palpable. According to the EPA, in 2022, EVs accounted for 5.8 percent of new light-duty passenger vehicle sales. 4Under the policy baseline established by the EPA's MY 2023-2026 GHG emission standards, EV market share in 2032 is projected to reach 39 percent.5 Under the proposed standards, EV market share in 2032 is projected to reach 67 percent6—two-thirds of all new light-duty vehicles sold. The California Air Resources Board may be in the fast lane, but the EPA is driving down the same regulatory freeway and with no plan to stop before the final destination. [EPA-HQ-OAR-2022-0829-0611, pp. 2-4]

4 88 FR 29189.

5 88 FR 29296.

6 88 FR 29329.

Here's an easy way to visualize the substance of the EPA's proposal. The Toyota Prius is the most popular hybrid car. In terms of fuel efficiency and GHG emissions, the Prius is the best-in-class gasoline-powered car on the market.7 Could Toyota comply with the EPA's proposed standards in 2032 if all its light-duty vehicles were hybrids matching today's Prius in fuel economy and GHG emissions per mile? No, far from it. [EPA-HQ-OAR-2022-0829-0611, pp. 2-4]

7 TrueCar, Hybrids with Best Gas Mileage, https://www.truecar.com/best-cars-trucks/fuel-hybrid/by-gas-mileage/ (accessed June 27, 2023).

The EPA's GHG standards are calibrated in grams per mile (g/mi) of carbon dioxide (CO_2). According to the EPA, "for passenger cars, the proposed MY 2032 standards are projected to result in CO_2 fleet-average levels of 73 g/mi in MY 2032, which is 52 percent lower than that of the (adjusted) MY 2026 standards."8 The MY 2032 standard is less than half the CO_2 emissions per mile of MY 2023 Toyota Prius hybrids, which range from 155 g/mi to 179 g/mi.9 [EPA-HQ-OAR-2022-0829-0611, pp. 2-4]

8 88 FR 29239.

9 Fueleconomy.gov, Accessed June 26, 2023.

[See original for graphic on the gas mileage of various cars] [EPA-HQ-OAR-2022-0829-0611, pp. 2-4]

To comply with the proposed standards, the fleet-average CO_2 emissions of Toyota passenger cars in MY 2032 will have to be 52 to 60 percent lower than that of an MY 2023 Prius. To reach those targets, Toyota will have to rapidly increase the percentage of ZEVs it sells—and rapidly reduce the percentage of hybrids it sells. Toyota will have to do so regardless of whether most consumers can afford or want to buy ZEVs. [EPA-HQ-OAR-2022-0829-0611, pp. 2-4]

Even the EPA's previous (December 2021) rule establishing tailpipe GHG standards for MY 2023-2026 motor vehicles is functionally a ZEV mandate, although less ambitious, and therefore less conspicuous. [EPA-HQ-OAR-2022-0829-0611, pp. 2-4]

Organization: Consumer Energy Alliance (CEA)

As a practical, real-world policy solution, CEA, therefore, encourages the U.S. EPA to pursue attainable, technologically neutral standards to meet consumer needs and emission reduction targets. [EPA-HQ-OAR-2022-0829-0788, p. 2]

Organization: Cummins Inc.

II. General Principles

Aligned with Cummins' commitments described above, Cummins offer these principles for consideration as EPA develops its Final Rule addressing criteria pollutant and GHG emissions for light-duty (LD) and medium-duty vehicles (MDV): [EPA-HQ-OAR-2022-0829-0645, pp. 2-3]

A harmonized national program for criteria pollutant, GHG, and fuel efficiency standards by EPA, the California Air Resources Board (CARB), and the National Highway Traffic Safety Administration (NHTSA) is essential to assure the greatest improvements are achieved in the most cost-efficient manner and to provide vehicle and engine manufacturers, suppliers, and end-users with the certainty necessary for investment in technologies to improve emissions. We urge the agencies to work together towards a single, nationwide program. [EPA-HQ-OAR-2022-0829-0645, pp. 2-3]

Sufficient regulatory lead time and stability should be provided to allow manufacturers to develop and implement the technologies needed to improve emissions and spread investments over time to minimize cost to customers. [EPA-HQ-OAR-2022-0829-0645, pp. 2-3]

Standards should be performance-based and technology neutral, as opposed to standards which mandate a specific technology, to allow manufacturers to innovate across a broad range of technologies to meet customers' diverse needs. [EPA-HQ-OAR-2022-0829-0645, pp. 2-3]

Standards should be fuel neutral (i.e., same stringency regardless of fuel type) to ensure the environmental benefits of the regulation are achieved regardless of the fuel type chosen by customers. [EPA-HQ-OAR-2022-0829-0645, pp. 2-3]

The tradeoff between oxides of nitrogen (NOx) and carbon dioxide (CO2) reductions must be considered when setting the stringency of standards. Also, linkage of criteria pollutant and GHG certification and compliance protocols is important so that improvement in one type of pollutant is not achieved at the expense of the other. [EPA-HQ-OAR-2022-0829-0645, pp. 2-3]

Well-to-wheels emissions should be considered in assessing technology effectiveness to ensure alignment of the standards with the most beneficial path to zero emissions. [EPA-HQ-OAR-2022-0829-0645, pp. 2-3]

Cummins currently certifies heavy-duty (HD) pickup trucks with gross vehicle weight ratings (GVWR) between 8,501 and 14,000 pounds, also known as Class 2b and 3 vehicles, meeting EPA's Tier 3 criteria pollutant emissions standards and Phase 2 GHG standards. Diesel Class 2b and 3 pickup trucks can have significant towing capability and are used in applications going beyond personal use such as construction and agriculture, and as such, do vital work for America. Our additional comments detailed below pertain to those vehicles. [EPA-HQ-OAR-2022-0829-0645, pp. 2-3]

Organization: Donn Viviani

Recommendations for changes in the rule to decrease emissions further

What can be done under this rule to extract additional reductions in GHGs? Reducing the average weight of the fleet can address both the NEE issue and reduce carbon emissions further. Lighter EVs extend mileage and reduce EGU emissions. Lighter IC vehicles will reduce fuel combustion. Lighter vehicles result in less NWW PM. Perhaps more importantly, lighter vehicles can reduce emissions in the manufacturing sector, especially important in light of the quantity new BEVs EPA projects will penetrate the market. EPA should investigate regulatory options for reducing fleet gross vehicle weights (GVW). One way to require lower fleet average weight and decrease the emissions from manufacture of vehicles is to limit the embedded carbon allowed per ton of vehicle. [EPA-HQ-OAR-2022-0829-0697, pp. 6-7]

Savings promoted by weight reduction are immediate and do not depend on the pace of decarbonization of the electricity grid. The sooner the emission reductions occur the better the chance of avoiding catastrophic non- linear feedback warming effects. [EPA-HQ-OAR-2022-0829-0697, pp. 6-7]

GHG emissions embedded in the production of vehicles is responsible for ~10% of vehicle carbon footprints. Slowly reducing down the allowable embedded carbon by class will have several outcomes. [EPA-HQ-OAR-2022-0829-0697, pp. 6-7]

Limiting the embedded carbon per ton would result in, e.g., more steel made with green hydrogen, less metal and more plastic parts (already these are replacing metal) which can require less energy to produce, and even parts made with bio-based plastics which count as negative carbon. [EPA-HQ-OAR-2022-0829-0697, pp. 6-7]

Lighter vehicles burn less fuel or draw less electrical power from EGUs, all these reduce carbon emissions. The lighter weight will produce less NEE PM as well. Weight is one driver of road friction and resuspension of PM. [EPA-HQ-OAR-2022-0829-0697, pp. 6-7]

Lastly, here, it is important to ensure that imports would be subject to any such embedded carbon restrictions, as that would serve to increase pressure on overseas EGUs to transition away from coal. [EPA-HQ-OAR-2022-0829-0697, pp. 6-7]

Organization: Electric Drive Transportation Association (EDTA)

We recommend that the final rules integrate flexibility that recognizes the uncertainties of the policy and market landscapes, while establishing ambitious goals for Multi-Pollutant Emissions reductions. [EPA-HQ-OAR-2022-0829-0589, p. 2]

Organization: Electrification Coalition (EC)

III. The EPA should consider additional regulatory frameworks or policies to achieve mass adoption of EVs for MY 2032 and beyond.

The EPA specifically requests comments on whether the standards should increase in stringency beyond MY 2032, in particular through 2035, or whether EPA should consider additional approaches to the trajectory of any standards that were to continue increasing in stringency beyond 2032.6 The EC applauds the EPA for prioritizing emissions reductions through electrification. For future rulemakings, the EPA should consider policies that will further drive electrification and prioritize clean electricity as a transportation fuel. This could be accomplished through enabling electricity as an eligible pathway in the existing renewable fuel standard (RFS) program or modifying the RFS into a clean fuels standard (CFS). Both an RFS and CFS could direct a portion of the credits back to the EV industry that would then further promote and incentivize the manufacturing of clean vehicles such as EVs. [EPA-HQ-OAR-2022-0829-0588, p. 3]

Organization: Environmental. and Public Health Organizations

2.EPA should finalize a fuel-neutral standard and a maximum cap on the work factor.

EPA has made two significant changes to its GHG program for Class 2b-3 pickups and vans: 1) setting a fuel-neutral standard; and 2) setting a maximum cap on the work factor. As described below, both such changes are appropriate. [EPA-HQ-OAR-2022-0829-0759, p. 73]

208 88 Fed Reg. at 29242.

During the rulemaking process for the Phase 2 standards, numerous commenters opposed setting separate emissions standards for diesel and gasoline engines, with Cummins, Honeywell, Daimler, Bosch, and the Motor and Equipment Manufacturing Association all supporting a single fuel-neutral standard.209 As noted in the sections above on gasoline- and diesel-powered MDVs, there is a significant overlap in the available technologies to reduce emissions from either powertrain (e.g., variable geometry turbocharging, cylinder deactivation, hybridization). [EPA-HQ-OAR-2022-0829-0759, p. 73]

And technological advancements since finalization of the Phase 2 standards, including the advancement of zero-emission technologies, supports setting a single standard for the fleet that well exceeds the Phase 2 requirements for either gasoline- or diesel-powered Class 2b-3 vehicles. For these reasons, we support EPA setting a fuel-neutral standard for MDVs. [EPA-HQ-OAR-2022-0829-0759, p. 73]

209 81 Fed. Reg. at 73738-39.

We also support EPA setting a maximum cap on the work factor. As noted in Section

VIII.A.1.a regarding GM's latest Duramax diesel engine, manufacturers continue to prioritize increases in power for new engines for Class 2b-3 pickups. Unfortunately, the existing work factor structure creates no disincentive to this path, and may actually encourage manufacturers to try to game the system by increasing tow capacity across their fleets in order to increase the allowable emissions of their fleet, particularly since tow capacity is not captured in the emissions certification tests. EPA's proposal to cap the work factor at least creates a limit to this behavior. While concerns may remain about the safety and emissions impacts from manufacturers' efforts to out-spec their competition, a cap on the work factor would limit regulatory incentives for such behavior. [EPA-HQ-OAR-2022-0829-0759, p. 73]

Organization: General Motors, LLC (GM)

In many cases, an EPA final rule aligned with CARB's LEV IV in internal combustion engine criteria emission stringency and the associated test and certification procedures will help GM achieve significant emissions reductions for internal combustion engine products as soon as MY 2027 despite limited lead time, while continuing to transition to zero-emission vehicle technologies. [EPA-HQ-OAR-2022-0829-0700, p. 6]

Organization: Hyundai Motor America

The Final Rule Should Include Incentives for PEV Penetration Within Disadvantaged Communities. [EPA-HQ-OAR-2022-0829-0599, p. 8]

Hyundai appreciates EPA's specific request for comment on how to address the unique impacts of vehicle emissions on disadvantaged communities because we believe the NPRM simply does not go far enough. EPA acknowledges the "differential exposure levels" to criteria pollutants experienced by these communities and notes they are "especially vulnerable to the impacts of climate change."25 However, the NPRM simply concludes that "this action is likely to reduce existing disproportionate and adverse effects" and "the GHG emission reductions from this proposal would contribute to efforts to reduce the probability of severe impacts related to climate change."26 [EPA-HQ-OAR-2022-0829-0599, p. 8]

25 88 Fed. Reg. 29184, 29407 (May 5, 2023)

26 Id.

Increasing PEV penetration within these communities to reduce emissions throughout these neighborhoods is an untapped solution. For example, disadvantaged communities experience disproportionately higher exposure to emissions from higher polluting vehicles. This is due, in part, to the high cost of replacing their older and higher-emitting vehicles with a newer, cleaner car. [EPA-HQ-OAR-2022-0829-0599, p. 8]

Turning over the fleet of the dirtiest cars will go a long way in improving the health of disadvantaged communities.27 Unfortunately, the NPRM does not discuss these impacts or propose to address them. We believe that vehicle fleet turnover within these communities can improve quality of life by mitigating emissions impacts. Notably, these communities are less likely to have a place to charge their vehicles at home, a challenge that should be addressed either through the final rule or via credit flexibility eligibility. Accordingly, we urge the EPA to create a new flexibility that incentivizes automakers to place PEVs into disadvantaged communities. See Attachment 1. Due to its unprecedented nature, our concept provides a framework within which automakers may innovate solutions to access this credit but we are open to other concepts that will facilitate a meaningful difference in the lives of these vulnerable populations. The framework design is inspired in part by the off-cycle credit flexibility, which also was created to spur innovation. In the alternative, we encourage creation of a PEV Equity Taskforce, much like what California has commenced, to address issues of equitable access to zero- or low-emitting vehicles. To the extent such a taskforce is convened, Hyundai is interested in participating in this important work. [EPA-HQ-OAR-2022-0829-0599, p. 8]

COMPARISON WITH AUTOMAKER COMMITMENTS

In the proposed rule, EPA highlighted the proliferation of announcements by automakers in the past couple of years signaling a market shift away from internal-combustion technologies toward plug-in electric vehicles. The rapid growth in the global vehicle market shows that more automakers are committed to developing and investing in ZEV technologies at a global and regional level. ICCT recognizes the increasing number of commitments made by automakers and the speed at which the automotive industry is electrifying its fleet. [EPA-HQ-OAR-2022-0829-0569, pp. 19-22]

ICCT previously collected information and analyzed announcements made by automakers on ZEV targets through the end of 2022. The analysis, from ICCT's 2022 Global Automaker Rating report, shows that 19 out of 20 top global automakers have made specific commitments on their pace of electrification. For example, General Motors and Ford Motors (the second and third largest automakers in the U.S by 2022 sales), as well as Mercedes-Benz have committed to cease internal combustion engine in leading markets by 2035 as COP26 ZEV declaration signatories. [EPA-HQ-OAR-2022-0829-0569, pp. 19-22]

With the rapid development of ZEV technologies, automakers are constantly updating their targets. Consequently, ICCT recommends the EPA to incorporate more recent ZEV target announcements in Table 2 (right column) in addition to those outlined in page 24-28 of section II of the proposed rule (left column). We believe these developments further reflect the desirability of ZEV technologies in the market. [EPA-HQ-OAR-2022-0829-0569, pp. 19-22]

The increased ambition in announced ZEV targets among automakers is observed to be in parallel with the growing number of regulations proposed by governments across the globe pledging for zero-emission transportation policies and transitioning to a ZEV fleet. The implementation of regulations in these jurisdictions that establish more stringent CO2 standards or require higher ZEV penetration can steer automakers to prioritize investments and ZEV deployment in these markets to comply. Thus, regulatory mechanisms can be one of the driving factors to accelerate ZEV penetration in the new vehicle fleet. [EPA-HQ-OAR-2022-0829-0569, pp. 19-22]

In the case of the European Union, the CO2 emission standards, adopted in March 2023, sets a more stringent CO2 emission performance standards for LDVs, with a requirement for zero-CO2 LDVs in 2035. Aligned with this, automakers operating in the region have pledged more ambitious ZEV targets or commitment to electrify their new sales. For example, Volkswagen (VW) and Stellantis, the two biggest automakers in Europe (by sales), have pledged to sell 80% and 100% ZEVs, respectively, by 2030. This sales target is more ambitious than their targets in other regions including the U.S in which VW and Stellantis are committed to a 50% ZEV target by 2030 for its new passenger cars and light-duty vehicles respectively. Another example is Toyota, which aims for 100% CO2 emission reductions in all new vehicle sales in Europe by 2035 with at least 50% ZEV mix in 2030. In addition to the global ZEV target sales, Europe is the only region where Toyota is ready to commit to cease its ICE sales. [EPA-HQ-OAR-2022-0829-0569, pp. 19-22]

The trend observed among automakers provides evidence of the suitability of ZEVs as emissions-reducing technologies. The developments outlined above further underscore the fact that ZEV technology is feasible and desirable as evidenced by the increasing fleet penetration. Automakers will need to transition toward ZEVs to stay on track as government policies continued to push for regulations that align with the Paris Agreement climate goals and as market forces continue to push in this direction. [EPA-HQ-OAR-2022-0829-0569, pp. 19-22]

This changing reality is already reflected in new LDV sales. The share of EVs has been growing rapidly in leading markets such as China and Europe at 24% and 21%, respectively in 2022. The demand for these vehicles in the U.S., although lagging, also increased rapidly, even under the current standards. In 2022, PEV accounted for approximately 7.3% of total LDVs sold, an increase from 4.8% in 2021 and 2.6% in 2020. In terms of absolute number, total PEV sales in 2022 nearly reached 1 million with 80% of sales being BEVs, and 20% PHEVs. With the right supporting regulatory mechanism, the proposed regulation will enable the U.S. to achieve the ZEV penetration rate needed to achieve the emission reductions projected under the proposed scenario. [EPA-HQ-OAR-2022-0829-0569, pp. 19-22]

In conclusion, a strong market force to advance ZEV technologies, as evidenced by the increasing commitment among automakers and a more stringent standards in place such as the proposed rule, can push the automotive industry to accelerate ZEV technology penetration in the fleet. ICCT supports the proposition of EPA to advance technologies that will further enable emission reductions and consequently the proposed rule needed to achieve those targets. [EPA-HQ-OAR-2022-0829-0569, pp. 19-22]

Organization: International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)

The footprint-based approach to increase efficiency and emissions reductions is a proven policy that acknowledges that stringency increases should be targeted based on the fact that different vehicles serve different functions and markets. Changes to the footprint-based formulas, particularly regarding the light- truck fleet, could undermine domestic manufacturing and quality union jobs. We urge EPA to continue to work with all key stakeholders to ensure the new rules do not disproportionately impact domestic union auto production. [EPA-HQ-OAR-2022-0829-0614, p. 8]

Organization: KALA Engineering Consultants

Before full comments begin, a personal note

As a personal note, the principal of KALA Consulting wants to let all of EPA administrators, scientists, and engineers know that I am ON YOUR SIDE. I happen to disagree with the approach used in this proposed rulemaking that appears to promote extensive electrification of the US fleet, which I believe to be unsupportable from a GHG reduction standpoint. I believe that you may not have reviewed the National Academy of Sciences 2010 report that shows, when all knowable upstream and downstream GHG emissions are considered, BEV associated GHG emissions are essentially the same as conventional gasoline-fueled vehicles for a projected 2030 time frame. Once Republican law makers and think tank mavens read my section on that study, they may use it to bash this attempted rulemaking the likes of which you may never have experienced. I hate to do this to the EPA because I support most of the emissions reduction efforts you have made up to now and your agency and the national laboratories were so beleaguered and mistreated by the Trump Administration. [EPA-HQ-OAR-2022-0829-0617, p. 2]

However in my best engineering judgement, this rulemaking is misguided. There is a biofuel substitute that could make significant reductions in both criterial pollutants and GHG emissions if it were to be made from cellulosic sources and entrained into the national fuel mix in high percentages. We have done extensive research and engineering adaptation of this biofuel, butanol, that could surprise many of you. We ask your forbearance as we have included a discussion of this advanced biofuel in our comments as an alternative to mass electrification. Therefore, we are extending our hand and our knowledge base to EPA and the Department of Energy to contact us and discuss what we might learn from each other. [EPA-HQ-OAR-2022-0829-0617, p. 2]

No Conflict of Interest Disclaimer Statement: The author(s) of this document, principals, officers, staff and others associated with KALA Consulting hereby declare that none of those persons or the Corporation itself have any potential employment, contracted services, financial, or familial interests or connections of any kind to any interest, corporations or other entities mentioned, referenced, or in any other way could be construed to benefit either financially, public relations or potential contracting of services or equipment sales from any statements or mentions by name or other reference in this document. No one associated with KALA Consulting has ever been employed nor wishes to be employed by any entity mentioned or refenced herein. [EPA-HQ-OAR-2022-0829-0617, p. 2]

Comments

2. We never expected to see blatant examples in the explanation given for proposed EPA rulemaking to be so obviously biased toward a so-called solution for emission reductions, the all-electric vehicle, using batteries as their propulsive energy source. Let us give some examples of what appears to us as rulemaking with what amounts to only one option for vehicle manufacturers to comply with the proposed regulatory standards, the BEV. EPA repeatedly states that the rulemaking provides “options” for auto makers when in reality few if any actually exist. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

From Section I. A. 2, i “[C]ontinued GHG emission reductions in the motor vehicle sector are needed to protect public health and welfare….Also separately from this proposal, the Administration has recognized the recent industry advancements in zero- emission vehicle technologies and their potential to bring about dramatic reductions in emissions….EPA anticipates that a compliant fleet under the proposed standards will include a diverse range of technologies, including higher penetrations of advanced gasoline technologies as well as zero-emission vehicles…. Based on our analysis, it is our assessment that the proposed standards are appropriate and justified under section 202(a) of the CAA. Our analysis for this proposal supports the preliminary conclusion that the proposed standards are technologically feasible and that the costs of compliance for manufacturers would be reasonable. The proposed standards would result in significant reductions in emissions of criteria pollutants, GHGs, and air toxics, resulting in significant benefits for public health and welfare. We also estimate that the proposal would result in reduced vehicle operating costs for consumers and that the benefits of the proposed program would significantly exceed the costs.” [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

Well, that all sounds good and substantially founded in good science and technological feasibility. However, in later statements in the FedReg text we begin to find indications of bias and attempts at “Steering” manufacturers toward one technology, the BEV. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

From Section I. A. 2, ii “In designing the scope, structure, and stringency of the proposed standards, the Administrator considered previous rulemakings, as well as the increasing availability of vehicle technologies that can be utilized by manufacturers to further reduce emissions. This proposal continues EPA’s longstanding approach of establishing an appropriate and achievable trajectory of emissions reductions by means of performance-based standards, for both criteria pollutant and GHG emissions, that can be achieved by employing feasible and available emissions-reducing vehicle technologies for the model years for which the standard will apply…. While standards promulgated pursuant to CAA section 202(a) are based on application of technology, the statute does not specify a particular technology or technologies that must be used to set such standards; rather, Congress has authorized and directed EPA to adapt its standards to emerging technologies. Compliance with the EPA GHG standards over the past decade has been achieved predominantly through the application of advanced technologies to internal combustion engine (ICE) vehicles. In that same time frame, as the EPA GHG standards have increased in stringency, automakers have relied to a greater degree on a range of electrification technologies, including hybrid electric vehicles (HEVs) and, in recent years, plug-in electric vehicles (PEVs) which include plug-in hybrid electric vehicles (PHEVs) and battery-electric vehicles (BEVs). As these technologies have been advancing rapidly in just the past several years, and battery costs have continued to decline, automakers have begun to include BEVs and PHEVs as an integral and growing part of their current and future product lines, leading to an increasing diversity of these clean vehicles planned for high volume production. As a result, zero and near-zero emission technologies are more feasible and cost-effective now than at the time of prior rulemakings.” [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

So now we start to see a rosy picture being painted of new vehicle propulsion technologies ready to become “planned for high-volume production.” It is as though the EPA is indirectly telling auto makers that the BEV is expected to become a greater and greater share of their model lines as a result of these new emission regulations. How nice that the EPA would be providing such guidance. But it gets worse from here. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

From Section I. A. 2, ii “The year-over-year growth in U.S. PEV sales suggests that an increasing share of new vehicle buyers are concluding that a PEV is the best vehicle to meet their needs. Many of the zero-emission vehicles already on the market today cost less to operate than ICE vehicles, offer improved performance and handling, have a driving range similar to that of ICE vehicles, and can be charged at a growing network of public chargers as well as at home.” [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

Again, EPA is painting a glowing portrait of the future where most people in the US will gladly accept the new BEV form of personal transportation and enjoy multiple benefits from this change. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

We can’t help compare this form of cheerleading for the latest new transportation “hot thing” to the EPA’s description of a wonderous new fuel additive that was going to make life in the US better: [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

MTBE, which is the most common fuel oxygenate, is used in more than 80 percent of oxygenated fuels. Since 1993, MTBE has been the second most produced organic chemical manufactured in the United States. Ethanol, which is the second most common fuel oxygenate, is used in about 15 percent of the oxygenated fuels…. Three major factors have influenced how these two fuel oxygenates are used in petroleum products. MTBE: In addition to requiring that fuels burn cleaner, EPA requires areas with high levels of smog (including but not limited to RFG areas) to reduce the vapor pressure of gasoline in the summer months in order to decrease the volatilization of petroleum constituents at storage facilities and during fuel transfer. Because MTBE- blended gasoline has a lower vapor pressure than ethanol- blended gasoline, MTBE is the preferred oxygenate in warm weather. The cost of transportation and the convenience of use favors MTBE over ethanol. Because MTBE is more compatible with gasoline, it can be blended at the refinery and distributed with gasoline through pipelines. Ethanol, on the other hand, must be shipped separately from gasoline and added at the distribution terminal soon before use. If ethanol-blended gasoline is exposed to water or even water vapor (as in pipelines), ethanol will bring the water into solution and make the gasoline unusable. In addition, if ethanol-blended gasoline is stored for an extended period, the ethanol will begin to separate from the gasoline (emphasis ours). [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

Methyl-Tertiary Butyl Ether (MTBE) is produced by combining methanol with iso- butylene. Refineries could produce methanol cheaply from natural gas and combine it with one of the by-products of refining oil, iso-butylene to obtain a very inexpensive oxygenate that it seemed EPA was favoring more than ethanol when EPA in a January 1998 publication by the EPA’s Office of

Underground Storage Tanks, the MTBE Fact Sheet #3, Use of and Distribution of MTBE and Ethanol gave short shrift to ethanol by extolling the virtues of MTBE in the quoted text provided above. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

We really cannot blame EPA for gushing over MTBE because the oil companies could freeze out ethanol producers and make the required oxygenate cheaply and entirely from fossil petroleum and natural gas with no one getting a piece of the profits but them, and EPA and the executive administration at the time, did not have a problem with that arrangement. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

But, there was one small problem with MTBE – it was poisoning the fresh water supplies of the nation. The environmental disaster-in-the-making was best described in the Harvard Environmental Law Review. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

The expanded use of MTBE as a gasoline additive in the 1990s and the deteriorating state of America's sixty-year-old infrastructure of Underground Storage Tank Systems (USTS) for gasoline combined to yield an MTBE groundwater crisis by the end of the 1990s when studies had documented "the widespread detection of MTBE in the nation's water supplies." The United States Geological Survey in 1999 reported a 27% incidence of MTBE-contaminated groundwater in urban areas where MTBE was used substantially. A 1999 EPA Blue Ribbon Panel reported that between 5 and 10% of community drinking water supplies in high MTBE-use areas contained detectable amounts of MTBE. Because of the "inadequacy of long-term monitoring data," however, the "extent and trends" of groundwater contamination in the country are "still not well known." [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

The Harvard Review continues by stating that the MTBE fiasco is the largest and most recent example of US regulatory failure and perhaps the new poster child for the Law of Unintended Consequences: [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

At the same time that MTBE was easing the transition away from tetra-ethyl lead and helping states attain the national ambient air quality standards ("NAAQS") for photochemical oxidants in some of the most heavily polluted areas of the country, it was silently polluting the groundwater feeding the aquifers used by cities throughout the country for their drinking water. Indeed, if taking the lead out of gasoline is a striking example of the virtues of the modern environmental regulatory regime, the addition of MTBE to gasoline in full view of a powerful regulatory agency armed with multiple authorities designed to prevent the kind of environmental damage that MTBE is now causing throughout the country represents one of its most striking failures. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

While we hate to bring up this example of American regulatory failure and perhaps the most embarrassing set of events ever for the US EPA, we must look at MTBE as a lesson in how not to move forward with a proposal for a major overhaul of our nation's transportation options, as presented by the EPA in this proposed rulemaking, without comprehensive engineering and environmental review of such a proposal. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

So, the question becomes: Is EPA favoring one method of meeting their new regulations over most others, as unfortunately, they seem to have done in the past? [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

The proof might lie in statements found in the FedReg text as follows:

From Section I. A. 2, ii “Taken together, these developments indicate that proven, zero-emissions technologies such as BEVs, PHEVs, and FCEVs are already poised to become a rapidly growing segment of the U.S. fleet… Accordingly, EPA considers these technologies to be an available and feasible way to greatly reduce emissions, and expects that these technologies will likely play a significant role in meeting the proposed standards for both criteria pollutants and GHGs.” [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

Aha! Now we have statements that reveal the “expectations” of the EPA that three different kinds of low operating emission vehicle types “will likely play a significant role in meeting the proposed standards for both criteria pollutants and GHGs.” Fuel Cell Electric Vehicles (FCEV) are a tiny fraction of low operating emission vehicles and will remain so for some time. Plug-In Hybrid Electric Vehicles (PHEV) are more numerous, but EPA has a special regulatory formula for those types in order to meet the new standards. Battery Electric Vehicles (BEV) are the only vehicles that can easily meet the more stringent emission standards being proposed for both air pollutants and GHG according to how EPA will consider emissions from BEVs. If you were an auto manufacturer what sort of signals would you be getting from statements like this? We could cite many more similar “Expectation/Anticipation” EPA statements in the FedReg publication, but we think the statement made below sums up the overt messaging to auto makers the EPA is sending. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

From Section III. C. “Given the cost effectiveness of BEVs for compliance with both criteria pollutant and GHG standards, EPA anticipates that most (if not all) automakers will include BEVs in their compliance strategies.” [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

We were astonished that EPA would allow such an obvious “Steering” statement to be published in the Federal Register publication, but there it is for everyone to see. When zealots take over the rulemaking, statements like this inevitably leak out because those zealots are so passionate about their “Mission from God” they have to tell everybody about it. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

Good sound science and sound engineering is what its needed to formulate sound environmental regulations that do not “Force” a change in vehicle propulsion methods that may never achieve the desired results, especially in reducing GHG emissions. We have more to say about changes that appear to be forced upon the American public by zealots at the EPA when it comes to the kind of vehicle they use for their transportation needs. [EPA-HQ-OAR-2022-0829-0617, pp. 4-8]

A statement of the definition of Scientific Integrity appears on Page 8 of The Framework” document. https://www.whitehouse.gov/wp-content/uploads/2023/01/01-2023-Framework-for-Federal-Scientific-Integrity-Policy-and-Practice.pdf [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

“A substantial gap identified in the Report was that the US Federal Government lacked a consistent definition of scientific integrity. A definition was developed and agreed upon by the National Science and Technology Council 2022 Scientific Integrity Framework Interagency Working Group and the 2021 Scientific Integrity Fast Track Action Committee. Federal agencies should adopt this definition, incorporate it into their scientific integrity policy, and communicate it to their workforce. [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

Scientific integrity is the adherence to professional practices, ethical behavior, and the principles of honesty and objectivity when conducting, managing, using the results of, and communicating about science and scientific activities. Inclusivity, transparency, and protection from inappropriate influence are hallmarks of scientific integrity." [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

"The Framework" document further states in Section I on Page 30: [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

"I. Protecting Scientific Processes

Scientific Integrity fosters "honest scientific investigation, open discussion, refined understanding, and a firm commitment to evidence". It also enables consideration and documentation of differing scientific opinions, and includes peer review. Science, and public trust in science, thrives in an environment that shields scientific data and analyses and their use in policymaking from political interference or inappropriate influence. It is the policy of this agency to: [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

1. Prohibit political interference or inappropriate influence in the funding, design, proposal, conduct, review, management, evaluation, or reporting of scientific activities and the use of scientific information. [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

2. Prohibit inappropriate restrictions on resources and capacity that limit and reduce the availability of science and scientific products outside of normal budgetary or priority- setting processes or without scientific justification." [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

We emphasized the requirements of a "firm commitment to evidence" and "consideration and documentation of differing scientific opinions," which includes peer review. We do so because KALA intends to present scientific findings from a group of scientists selected by the National Academy of Sciences (NAS) and the National Research Council (NRC) to respond to a study request and funding for same made by Congress. Therefore, the study segments and results depictions we present are part of the response made by NAS and NRC to a Congressional commission and are, therefore, part of the record of Federal Research studies made either by Federal Agencies or by outside contractors, such as NAS. [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

Preface

The U.S. Congress directed the U.S. Department of the Treasury to arrange for a review by the National Academy of Sciences to define and evaluate the health, environmental, security, and infrastructural external costs and benefits associated with the production and consumption of energy - costs and benefits that are not or may not be fully incorporated into the market price of energy, into the federal tax or fee, or into other applicable revenue measures related to production and consumption of energy.

In response, the National Research Council established the Committee on Health, Environmental, and Other External Costs and Benefits of Energy Production and Consumption, which prepared this report. Biographic information on the committee members is presented in Appendix A. In the course of preparing this report, the committee met six times. At two of the meetings, oral presentations were made by the following individuals at the invitation of the committee: Christopher Miller (staff for U.S. Senator Harry Reid); Mark Heil and John Worth (U.S. Department of the Treasury); Raymond Braitsch, Thomas Grahame, and Robert Marlay (U.S. Department of Energy); Robert Brenner and James Democker (U.S. Environmental Protection Agency); Arthur Rypinski (U.S. Department of Transportation); Nicholas Muller (Middlebury College); and Richard Tol (Economic and Social Research Institute, Dublin, Ireland). Interested members of the public at large were also given an opportunity to speak on these occasions. Subsequently, the committee held two teleconferences and one subgroup meeting to complete its deliberations. In addition to the information from those presentations, the committee made use of peer-reviewed scientific literature, government agency reports, and databases.

This report has been reviewed in draft form by individuals chosen for their diverse perspectives and technical expertise in accordance with procedures approved by the National Research Council Report Review Committee. The purpose of this independent review is to provide candid and critical comments that will assist the institution in making its published report as sound as possible and to ensure that the report meets institutional standards for objectivity, evidence, and responsiveness to the study charge. [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

We include the foregoing to emphasize that the study materials we will present below are serious business and were taken seriously by the NAS and NRC. A cavalcade of science, health and engineering professionals were selected to research and write the study results. Therefore, we view the Transportation Section results of this 2009 study as relevant today as it was when presented to Congress 14 years ago, due mainly to the fact that the laws of physics, thermodynamics, chemodynamics of battery chemistry, engineering principals, and the logical projections that could be made for the subject matter in the Transportation Section were subject to those and other predictable progressions in both transportation, energy production and emission controls. [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

We would further point out that oral presentations were given just prior to publishing by EPA staff members at the time, Robert Brenner & James Democker, and we would have thought that a copy of the report would have made its way into the records kept by the EPA, since it was a Congressionally commissioned report and its contents may well have been informative to the EPA's future rulemaking. However, in our search of cited references and other materials cited in the materials relating to the current EPA Docket ID No. EPA–HQ–OAR– 2022–0829 the 2010 NAS report was never cited or mentioned. It is unknown whether EPA staff consulted this 2009-2010 study for this or any other docket and if it was not, why it was not consulted. [EPA-HQ-OAR-2022-0829-0617, pp. 16-19]

Organization: Lucid Group, Inc.

Battery/Vehicle Efficiency is Critical to Long-Term Viability of EVs

EPA solicited input on additional ways the program could provide alternative pathways encouraging manufacturers to achieve lower CO2 emissions earlier than projected in the proposal. Incentivizing EV efficiency measured by either miles/kWh or miles per gallon equivalent (MPGe) would help achieve lower CO2 emissions and reduce the demand for raw materials and on the grid. We must ensure that we do not electrify for the sake of electrification, but instead establish policies and programs that prioritize efficient use of electricity and resources, yielding benefits such as: [EPA-HQ-OAR-2022-0829-0664, pp. 7-9]

Reduced upstream emissions: Most EVs are charged from the power grid, which, while rapidly becoming cleaner, still includes emitting sources. More efficient EVs would use less grid electricity, thereby reducing the upstream emissions associated with their charging and vehicles miles traveled. [EPA-HQ-OAR-2022-0829-0664, pp. 7-9]

Conservation of critical minerals and associated de-risking of the supply chain: Using fewer batteries reduces the demand per vehicle for lithium and other critical materials. Reducing the use of these materials reduces supply chain bottlenecks and enhances national security. [EPA-HQ-OAR-2022-0829-0664, pp. 7-9]

Reduced consumer purchase costs: EV efficiency speeds mass adoption by reducing vehicle prices. It seeds a virtuous cycle—efficiency lowers vehicle production costs and purchase prices by reducing the number of batteries (the largest cost input for EVs) needed to achieve a targeted range. Fewer batteries lower the vehicle curb weight thereby further reducing the required cell count to achieve a desired range. [EPA-HQ-OAR-2022-0829-0664, pp. 7-9]

Reduced consumer energy costs: Efficient vehicles require less energy to travel a given distance. More efficient ICE vehicles have demonstrably reduced the gas bill for consumers, and more efficient BEVs reduce consumers' electric bill. [EPA-HQ-OAR-2022-0829-0664, pp. 7-9]

A more resilient grid through smarter energy consumption: While government programs have been known to encourage the use of electricity and have even extended to promote energy derived from wind, solar, and renewables, there exists a common denominator—use of energy. By focusing on increasing efficiency, we can foster smarter energy consumption easing the resources necessary for the grid's clean energy transition. [EPA-HQ-OAR-2022-0829-0664, pp. 7-9]

Environmental Justice benefit: The U.S. Department of Transportation (DOT) states "low income and minority communities are more likely to be located near highways and other transportation facilities that produce local reduced air quality, and to suffer from negative health effects such as asthma." Addressing environmental inequality goes beyond roadway design and extends to the vehicles on the roads. Zero-emission vehicles (ZEVs) are a first line of defense in addressing respiratory and cardiovascular disease and other pollution-related health disparities by improving air quality in communities located in or near traffic-dense areas. Efficiency brings down the costs of such vehicles and will help increase equitable adoption of medium- and heavy-duty electric vehicles. [EPA-HQ-OAR-2022-0829-0664, pp. 7-9]

Higher overall vehicle performance: There is a misconception regarding the correlation between vehicle efficiency and vehicle performance. Traditionally, fuel efficient vehicles were not associated with high performance. However, Lucid's vehicles demonstrate that increased efficiency in EVs yields faster charging, increased power density, and higher output power derived from the same energy input providing faster acceleration capability. With higher vehicle performance often comes increased consumer interest, which in the case of electrification supports consumer adoption. [EPA-HQ-OAR-2022-0829-0664, pp. 7-9]

OEMs should be incentivized and rewarded for the engineering and production of highly efficient EVs and to continue developing cutting edge technologies that would further enhance vehicle efficiency. To gain additional efficiency, greater investment in technologies is generally required, and higher EV credit should be awarded to incentivize this investment. [EPA-HQ-OAR-2022-0829-0664, pp. 9-10]

An example of such a bonus credit structure could involve EPA adding a fleet average MPGe for the OEM as a basis for an efficiency incentive, in the form of a bonus GHG credit. For demonstration purposes this method would use threshold values of MPGe, based on current

MY22 EV MPGe data to assign credit multipliers and a higher multiplication at higher values of MPGe. This method would not use vehicle footprint as a variable because previous CAFE MPG target curves as described in the CAFE Standards for Model Years 2024–2026 Passenger Cars and Light Trucks already allow for OEMs to meet lower MPG targets if they make larger footprint vehicles. [EPA-HQ-OAR-2022-0829-0664, pp. 9-10]

Additional efficiency credits would be awarded to OEMs with a certain minimum MPGe fleet average which reflects the current competitiveness of the market. Above this minimum threshold, OEMs would continue to be awarded credits according to a linear function to incentivize incremental improvements in vehicle efficiency. Similarly, above a certain threshold, the linear function or slope increases to reward improvements at the higher end of technological limits. [EPA-HQ-OAR-2022-0829-0664, pp. 9-10]

Under this example, a minimum threshold of 90 MPGe reflects the current competitiveness of the EV market at that range and encourages further efficiency development. The threshold of 115 MPGe recognizes the significant step in technology that is required to achieve a fleet MPGe in that range, as it becomes exponentially tougher to realize any incremental improvement in this range which the greater slope of credit multiplier targets specifically. [EPA-HQ-OAR-2022-0829-0664, pp. 9-10]

The proposed credit structure would be determined as below:

- The minimum threshold to receive an efficiency credit multiplication is 90 MPGe. [EPA-HQ-OAR-2022-0829-0664, pp. 9-10]

- From 90 MPGe to 115 MPGe, the linear scale is Credit Multiplier = 1+(0.0132*(x1- 90)); x1 being the fleet MPGe of the OEM. [EPA-HQ-OAR-2022-0829-0664, pp. 9-10]

- Above 115 MPGe the linear scale is increased, and the function is Credit Multiplier =1.33+(0.0268*(x2-115)); x2 being the fleet MPGe of the OEM. Each 1 MPGe incremental gain in the 115 to 140 band is awarded a 103.03% more credit over the same gain in the 90 to 115 band. [EPA-HQ-OAR-2022-0829-0664, pp. 9-10]

OEMs should be encouraged to produce more efficient EVs; such a program would inspire competitiveness that ultimately leads to the desired benefits of transportation electrification. This methodology is also highly flexible and adaptable. EPA would be able to adjust the threshold values of MPGe for credit multiplication based on available technologies, similar to what the agency and NHTSA do for GHG and CAFE standards. [EPA-HQ-OAR-2022-0829-0664, pp. 9-10]

Like efficiency standards for ICE vehicles, MPGe as the basis for EV efficiency would indirectly achieve other benefits in vehicle weight and form. For example, OEMs producing compact EVs with high efficiency can leverage this to buffer larger SUV or truck offerings. This approach minimizes the complexities in calculations, thus lowering the administrative burden on OEMs and the EPA. [EPA-HQ-OAR-2022-0829-0664, pp. 9-10]

Organization: Mass Comment Campaign sponsored by Center for Biological Diversity. (web) (12,460 signatures)

To fight climate change and protect public health, the United States MUST confront the massive pollution from passenger cars. Fossil fueled vehicles worsen the climate crisis and air quality for everyone — especially for low-income communities and communities of color, which are disproportionately located near major roadways and transportation infrastructure. This is an unfortunate legacy of racist planning and policy that you have the power to remedy. Reducing vehicle emissions is the low-hanging fruit of the battle against climate change. We need you to set new clean car standards strong enough to protect our communities and our health. I urge you to instruct the Environmental Protection Agency to write new rules that: - Cut auto pollution 75% by 2030 — in line with the Paris Agreement — by rapidly increasing sales of electric vehicles and slashing pollution from new gas-powered cars and trucks. - Close all loopholes that allow manufacturers to make more gas guzzlers. - Ensure that the communities most impacted by fossil fuel pollution have ample access to affordable electric vehicles, purchase incentives, and charging infrastructure. Automakers already have the technology to safely improve vehicle efficiency and reduce emissions. You must require them to build the vehicles people want and need, as their past actions show that the key to low-pollution cars is strong government standards. NOW is the time for making strong and effective rules — not for half-measures. For you to truly protect public health, especially for those on the frontlines, clean car standards MUST meet this critical moment and lead the world. [EPA-HQ-OAR-2022-0829-0722]

Organization: Mass Comment Campaign sponsoring organization unknown (email) (5,313 signatures)

I write in opposition to the U.S. Environmental Protection Agency's proposed multipollutant standards for light-and medium-duty vehicles (Docket ID No. EPA–HQ–OAR–2022–0829). I have serious concerns with all three of the options included in the draft rulemaking, as the EPA seeks to lower carbon emissions under timelines that effectively make electric vehicles the only option for automakers to meet the pollution limits from 2027 through 2032. [EPA-HQ-OAR-2022-0829-1721]

The large-scale shift to electric vehicles, comprising two-thirds of all new-car sales in the U.S. by 2032 under this proposal, will hurt consumers, workers, and small businesses while doing little to help the environment. The proposed rule would lead to fewer vehicle choices for individuals and families, reducing the selection of vehicles that fit their household budgets and unique needs. [EPA-HQ-OAR-2022-0829-1721]

This proposal flies in the face of consumers being free to purchase the vehicles that best suit their needs. According to an April 2023 report from Kelley Blue Book, the average cost of a Battery electric vehicle (BEV) is $58,000, which is over 20% more than the average cost of a non-BEV which puts undue, financial burden on American consumers. The average cost of a BEV outpaces the medium salary of $54,132 of American as reported by the Bureau of Labor Statistics from 2022. In addition to the increased up-front costs to consumers to purchase a BEV, J.D. Power reported that approximately 28 million American homeowners must spend on average, an additional $1,300 to install at-home chargers. [EPA-HQ-OAR-2022-0829-1721]

While the goal of this proposal is to reduce the U.S. automotive fleet's carbon footprint, it simply shifts how emissions are produced. The EPA is ignoring the value of technologies produced by American workers, manufacturers, and farmers critical to our transportation future. Specialty automotive aftermarket businesses are leading the way through other fuel innovations. There are numerous lower-and-zero emissions fuels and technologies available today, such as hydrogen, domestic biofuels, hybrid technologies, and more. Today's innovations also include replacing older internal combustion engine technologies with newer, cleaner versions and converting older ICE vehicles to new electric, hydrogen, and other fuels. Sadly, the EPA's plans to reduce greenhouse gases and criteria pollutants do not factor this in nor provide an equal playing field for technologies beyond EV. Studies show that we can reach lower and zero-emissions goals faster by employing multiple technology solutions compared to the proposed "all-in" on EV rules. [EPA-HQ-OAR-2022-0829-1721]

The EPA's proposal boosts an electric vehicle supply chain dominated by China, which powers its manufacturing-base through coal-fired power plants and mines critical minerals for EV batteries with the use of environmental practices that we would never approve of in the United States. Emissions coming out of tailpipe matter, but so do the lifecycle emissions of building a car, constructing and charging a battery, and retiring vehicles. [EPA-HQ-OAR-2022-0829-1721]

During the pandemic, the average cost of new and used vehicles increased by five percent and 30 percent, respectively, according to Edmunds, who tracked prices from May 2020-2021. These increases resulted from supply chain issues, such as the ongoing global microchip shortage, which has upended the automotive market over the last couple of years. The shortage of critical components today will potentially be repeated as a direct result of this proposed rule, which still has many unanswered questions about how the U.S. is going to end its dependence on sourcing critical minerals and resources from foreign countries, including nations such as China that are geopolitical foes, that are needed to produce more electric batteries for vehicles. [EPA-HQ-OAR-2022-0829-1721]

As a consumer, I believe that the EPA should not dictate the types of vehicles that can be sold in the United States. Despite 8.5% of new vehicles sold being BEV, a May 2023 report from J.D. Power found that 21% of consumers are very unlikely to consider purchasing an EV due to issues such as price, range, and limited charging availability. [EPA-HQ-OAR-2022-0829-1721]

The future of automotive technology matters to consumers, millions of automotive enthusiasts, and all the men and women who work in the industry. Accordingly, I ask that the EPA does not follow through on any of the three options outlined in this proposed rulemaking and instead pursues a rulemaking for light and medium-duty vehicles that embrace a technology-neutral approach that factors in the infrastructure that exists, the innovation we are all capable of, consumer preferences, and the lifecycle emissions of the technology that powers our vehicles. [EPA-HQ-OAR-2022-0829-1721]

Organization: Minnesota Pollution Control Agency (MPCA)

Include regulatory mechanism(s) to prevent backsliding on emissions from non-EVs

EPA's fleet average standard would allow for increasing emissions from non-EVs as the EV share of the fleet rises. With EPA's projected EV shares, non-EV emissions could increase while the overall fleet would be compliant. While some emissions would result from the dirtier vehicles remaining in the fleet, the standard would not prevent new internal combustion engine vehicles from having higher emissions than earlier models. These vehicles should have equal if not lower emissions than their earlier models to prevent backsliding on emissions. Backsliding is inconsistent with climate goals that necessitate pursuing all feasible, cost-effective greenhouse gas emissions reductions. [EPA-HQ-OAR-2022-0829-0557, p. 5]

Organization: National Corn Growers Association (NCGA)

As stated in the proposed rule, the transportation sector is the largest source of U.S. GHG emissions, representing 27.2 percent of total U.S. emissions. Within the sector, light-duty vehicles are the largest contributor, comprising 15.5 percent of total U.S. GHG emissions. Immediate progress toward decarbonizing the light duty fleet will help meet the Administration's goal of cutting emissions by 2030 and reaching net zero emissions by 2050. Achieving those decarbonization goals in transportation will require a mix of solutions. As recent analysis from the Rhodium Group concludes, a "portfolio of strategies is the lowest cost and most likely to succeed," including low carbon liquid fuels such as biofuels. However, the singular focus of the currently proposed multi-pollutant emission standards for model year (MY) 2027 through 2032 light and medium duty vehicles on battery electric vehicles (BEVs), ignores the immediate and long-term benefits of leveraging a portfolio of various transportation technologies and the emission reductions they can achieve. [EPA-HQ-OAR-2022-0829-0643, p. 2]

In order to achieve emission reduction goals in the most robust, rapid, and affordable way, EPA must instead encourage multiple additional solutions such as hybrid electric vehicles (including plug-in hybrids), reinstating meaningful flex-fuel vehicle credits, and the introduction of credits that encourage the utilization of internal combustion engines (ICE) designed to utilize higher blends of biofuels (such as ethanol) by recognizing the combined carbon and multi-pollutant emission reduction benefits of the engine technology and fuel. [EPA-HQ-OAR-2022-0829-0643, p. 2]

Low-carbon liquid fuels have a unique and important role to play, immediately and in the long term. Fuels such as E15 (15% ethanol) are approved for and available for use in the millions of vehicles already on the road today, and thus offer immediate emissions benefits on a much larger scale than changes to only new vehicles. In the longer term, low-carbon or zero-carbon liquid fuels offer emissions solutions for market segments and customers that may not be well served by battery electric vehicles. [EPA-HQ-OAR-2022-0829-0643, p. 2]

To foster a vibrant and competitive landscape of multiple solutions, it is critical for EPA to set performance-based and technology-neutral emissions standards. Unfortunately, the proposed standard falls short of this ideal. It is essential to look beyond the tailpipe and use life cycle analysis for fair comparisons and a "level playing field". [EPA-HQ-OAR-2022-0829-0643, p. 2]

Organization: National Parks Conservation Association (NPCA)

As it relates to medium-duty vehicles, we believe that EPA underestimates the number of MDVs that can be electrified as well as the full scope of new technologies that can be used to reduce emissions of remaining fossil fuel powered MDVs. We request that EPA include additional MDV electrification in the final rule while also requiring technological improvements to make fossil fuel powered MDVs sold after 2027 more efficient and less polluting. [EPA-HQ-OAR-2022-0829-0607, p. 4]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

NESCAUM and the OTC have some concerns that EPA's fleet average allows for emissions from ICE vehicles manufactured during the regulated period to increase for MYs 2028 and later. Specifically, assuming EPA's projected increases in battery-electric vehicle (BEV) market share over time, it appears that non-BEV emissions could increase from approximately 240 g/mi in 2027 to approximately 250 g/mi in 2032. As a policy matter, we believe it is appropriate for EPA to include in its final rule a regulatory mechanism, such as a maximum allowable emissions rate, to ensure emissions from non-BEVs do not increase during the regulated period and beyond. [EPA-HQ-OAR-2022-0829-0584, p. 9]

Organization: Plug In America

Since the EPA has offered multiple scenarios for multi-pollutant emissions standards reduction for MY 2027 and later light- and medium-duty vehicles and has requested comments on these scenarios, Plug In America asks that for administrative consistency and efficiency, the final standards align with an overall goal of achieving a 50 percent to 52 percent reduction from 2005 levels in economy-wide net greenhouse gas pollution in 2030 to reach the U.S. Nationally Determined Contribution under the Paris Agreement. A holistic approach will be necessary to determine this pathway and requires incorporating other economic sectors into the calculations. Given that the ongoing rulemaking process for "New Source Performance Standards for Greenhouse Gas Emissions from New, Modified, and Reconstructed Fossil Fuel-Fired Electric Generating Units; Emission Guidelines for Greenhouse Gas Emissions from Existing Fossil Fuel-Fired Electric Generating Units; and Repeal of the Affordable Clean Energy Rule" this presents an opportunity to align the multi-pollutant emissions standards to levels consistent with the goal of limiting global warming to no more than 1.5 degrees Celsius by 2050. [EPA-HQ-OAR-2022-0829-0625, p. 2]

Organization: POET, LLC

II. POET Generally Supports Aggressive Emissions Reduction Standards for Light-Duty Vehicles, But Those Standards Must Truly Be Technology Neutral.

Light-duty vehicles are the largest contributor to GHG emissions from the transportation sector, accounting for over 57 percent of transportation emissions and over 15 percent of total GHG emissions nationwide.12 POET stands behind technology-neutral standards that achieve significant GHG emission reductions in the transportation sector. Indeed, reducing transportation GHG emissions is POET's business. POET produces more bioethanol and other low carbon bioproducts than any other company in existence. [EPA-HQ-OAR-2022-0829-0609, p. 7]

12 See 88 Fed. Reg. at 29186.

Regarding PHEV pickup trucks, the Proposed Rule correctly notes that "PHEV pickup architecture would provide several benefits" including among others "zero-emission electric range," "increased total vehicle range during heavy towing and hauling," and "job-site utility with auxiliary power capabilities." Also, pickup trucks have been a difficult-to-decarbonize class of vehicles. Even under the Proposed Rule's extremely aggressive electrification scenarios, medium-duty pickup trucks only obtain a 19% BEV deployment rate in 2032. [EPA-HQ-OAR-2022-0829-0609, p. 20]

EPA should specifically incentivize PHEV FFV pickup trucks with additional incentives, which could go even further beyond incentives for other FFVs. FFV architecture has been broadly used with pickup trucks, so consumers are familiar with the role biofuels can play. [EPA-HQ-OAR-2022-0829-0609, p. 20]

Pickup trucks are also broadly used in Midwestern states where bioethanol is readily available. Various precedent exists for specially incentivizing pickup trucks given the difficulties in decarbonizing pickup trucks and other work vehicles where consumers need high towing capacity, reliability, and extended range. [EPA-HQ-OAR-2022-0829-0609, p. 20]

Organization: Stellantis

Improve liquid fuels to reduce GHG and criteria emissions from the approximately 280M ICE vehicles on the road [EPA-HQ-OAR-2022-0829-0678, pp. 24-25]

Organization: Strong Plug-in Hybrid Electric Vehicle (PHEV)

EPA should consider adding a small bonus for vehicles that have on-board AC bidirectional chargers or are integrated with multiple DC off-board chargers. Alternatively, at minimum, EPA should conduct an analysis on how EPA can advance bi-directional charging in the future. Justification: The promise of bi-directional charging (AC or DC) to address air pollution, GHG and electric grid issues is very significant with BEVs and PHEVS in light-, medium- and heavy-duty vehicles, or off-road equipment. For example, a recent May 2022 presentation by the World Resources Institute using Bloomberg NEF and Energy Information Administration data found the power capacity in 2030 for EVs to be 10 to 20 times more than the 2030 power capacity of stationary storage. EPA can and should play a role in helping to unlock this potential. [EPA-HQ-OAR-2022-0829-0646, p. 9]

a. For example, the internal combustion engine in a PHEV has a much lower emission signature than a stand-alone, backup generator. [EPA-HQ-OAR-2022-0829-0646, p. 9]

b. Bidirectional charging, like battery stationary energy storage, can reduce GHG and traditional pollutants from fossil fueled power plants by shifting electricity use to renewable energy in the cleanest hours of the day and reducing the need for high- emitting plants (such as traditional peaker power plants). [EPA-HQ-OAR-2022-0829-0646, p. 9]

c. Bidirectional charging can also provide many types of grid services including ancillary services, providing resource adequacy, and helping with the evening transition from renewables to other generation resources. Because the batteries are already paid for by the car and truck owners, utilities can gain a low-cost resource compared to battery stationary storage. [EPA-HQ-OAR-2022-0829-0646, p. 9]

d. The potential value is significant and can contribute to lower operating costs for BEVs and PHEVs. [EPA-HQ-OAR-2022-0829-0646, p. 9]

While we understand the desire by EPA to simplify the regulation and reduce the use of bonus multiplier credits, we believe a small bonus credit in the final regulation for a few years is justified and needed to unlock this technology because of the large emission reduction benefits and other benefits enabled by bidirectional charging. [EPA-HQ-OAR-2022-0829-0646, p. 9]

EPA should require automakers who sell PHEVs to include in the sale a portable cord set that can charge at level 1 and/or level 2 similar to the Advanced Clean Cars II regulation as this will increase the likelihood of consumers charging. While this adds cost, it does not add much cost and, like CARB, we think this will make it easier for purchasers and should increase consumers using a PHEV's all-electric miles. Similarly, we are concerned about automakers and dealers selling PHEVs without a portable cord set and potentially turning PHEVs into a so-called "compliance."

EPA should provide small bonus credits (multipliers) in 2027 to 2030 for several advanced technologies including PHEVs with a long all-electric range that are not being produced today. While we understand the need to simplify the regulation and dramatically reduce the use of multipliers, we do support very limited continuation of multiplier to advance technologies that do not exist today or are in very limited numbers such as bidirectional charging vehicles (recommendation 4) and PHEVs with an all-electric range of 60 or more miles. These technologies need extra lead time to develop. Having multiple technologies helps in reaching many hard-to-reach customer segments, and PHEVs with over 60 mile all-electric range by legacy automakers are not offered today and have rarely been produced and sold. Also see our recommendation 8 below. [EPA-HQ-OAR-2022-0829-0646, p. 10]

Organization: Tesla, Inc.

Accordingly, Tesla asserts the EPA should amend its proposal with a more stringent version of Alternative 1 and take, inter alia, the following additional steps to increase the performance and overall stringency of the proposed standards: [EPA-HQ-OAR-2022-0829-0792, p. 2]

2 See, 88 Fed. Reg. 29332-33, Table 96.

3 Id., at 29348 (comparing Tables 135 and 136).

- Eliminate off-cycle crediting for all types of vehicles; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Revisit the plug-in hybrid electric vehicle (PHEV) utility factor to accurately reflect real world emissions; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Amend the proposal to create parity in promoting motor vehicle air conditioning (MVAC) efficiency adoption; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Maintain the existing zero emissions upstream approach for BEVs; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Eliminate credit multipliers for all vehicles; and [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Ensure BEVs continue to be accounted for, and participate in, the NMOG + NOx reduction standard. [EPA-HQ-OAR-2022-0829-0792, p. 2]

Tesla also supports increasing the stringency of standards through MY 2035 in a manner that is consistent with the 100% ZEV sales achieved in California's Advanced Clean Car II (ACC II).4 However, recognizing that there are some uncertainties within the marketplace, in the final rule EPA should clearly denote that such an extension for MY 2033-35 is intended to be severable from the rest of the proposal and provide a rationale for this severability.5 [EPA-HQ-OAR-2022-0829-0792, p. 2]

4 88 Fed. Reg. at 29239; See also, California Air Resources Board (CARB), Advanced Clean Cars II Regulations: All New Passenger Vehicles Sold in California to be Zero Emissions by 2035 available at h ttps://ww2.arb.ca.gov/our- work/programs/advanced-clean-cars-program/advanced-clean-cars-ii.

5 See generally, Administrative Conference of the U.S., Severability in Agency Rulemaking (June 29, 2018) available ath ttps://www.acus.gov/recommendation/severability-agency-rulemaking.

Tesla welcomes the EPA's proposal to reduce GHG emission standards across the light- and medium- fleet and to adjust the footprint-based standards curves to reduce incentives to upsize vehicles.115 Further, Tesla encourages the agency to quickly implement more stringent emissions standards for light- duty vehicles, and to finalize standards well-before the end of the calendar year. [EPA-HQ-OAR-2022-0829-0792, p. 16]

115 88 Fed. Reg. at 29196.

Organization: Western Energy Alliance

While acknowledging that EPA must: "consider issues of technological feasibility, the cost of compliance, and lead time. EPA also may consider other factors, and in previous vehicle standards rulemakings, [EPA-HQ-OAR-2022-0829-0679, pp. 3-4] as well as in this proposal, has considered the impacts of potential standards on emissions of air pollutants and associated public health and welfare effects, impacts on the automotive industry, impacts on the vehicle purchasers/consumers, oil conservation, energy security and other energy impacts, safety, and other relevant considerations." p. 29186 [EPA-HQ-OAR-2022-0829-0679, pp. 3-4]

It does not appear that EPA has actually done so. EPA's logic is often flawed in the analysis and the information relied on is biased or incomplete. [EPA-HQ-OAR-2022-0829-0679, pp. 3-4]

EPA Summary and Response

Summary:

Supportive comments were received from American Council for an Energy-Efficient Economy, BMW, BorgWarner, California Air Resources Board, Consumer Energy Alliance, Electric Drive Transportation Association, Environmental. and Public Health Organizations, General Motors, ICCT, International Union, United Automobile Aerospace and Agricultural Implement Workers of America, Lucid Group, Mass Comment Campaign sponsored by Center for Biological Diversity, POET LLC, and Tesla. Many elements of the program were supported including phase-out of off-cycle credits, limiting A/C credits to internal combustion engine vehicles (ICEVs), eliminating the advanced vehicle multiplier incentives, lowering the cut-points in the light truck curves, technology neutrality, program flexibilities, work factor, and the footprint-based standard.

Response:

EPA appreciates the supportive comments.

Summary:

Alliance for Consumers, KALA Engineering Consultants, and Competitive Enterprise Institute commented with concern the rulemaking forces BEVs into the vehicle fleet. Cummins commented that standards should be performance-based and technology neutral, and not "mandate a specific technology" and also be fuel neutral.

Response:

For this rulemaking, we are continuing our longstanding approach (with over 50 years of experience in reducing criteria pollutants and 14 years of history for GHGs) of establishing an appropriate and achievable trajectory of emissions reductions by means of performance-based standards. As we state in Section I.A.2 of the preamble, we anticipate that a compliant fleet under the final performance-based emissions standards will include a diverse range of technologies. The standards are fuel neutral. In Section I.B.1. of the preamble we discuss the GHG emissions standards and illustrate multiple potential pathways which demonstrate compliance with varying mixes of non-hybrid ICE vehicles, hybrids, PHEVs and BEVs (Table 4).

Summary:

BMW NA submitted comments encouraging the Agency to adopt test procedures for hydrogen fuel cell electric vehicles. BMW believes hydrogen FCEVs will be a key technology for achieving climate neutrality. BMW requested EPA adopt SAE technical standard J2572, Recommended Practice for Measuring Fuel Consumption and Range of Fuel Cell and Hybrid Fuel Cell Vehicles Fueled by Compressed Gaseous Hydrogen, which defines a procedure for testing FCEVs and possibly adopting a time-limited advanced technology vehicle credit multiplier for hydrogen FCEVs.

Response:

EPA has considered BMW's comment encouraging the Agency to propose a specific test procedure for hydrogen FCEVs by adopting SAE technical standard J2572. At this time the Agency is not prepared to propose specific test procedures for hydrogen FCEVs. Manufacturers producing hydrogen FCEVs are eligible to propose special test procedures according to the provisions of §1065.10(c)(2). BMW and other hydrogen FCEVs are eligible to request approval to use SAE J2572 for testing. The request to use the special procedure needs to be made prior to the manufacturer beginning the test program.

Summary:

The American Council for an Energy-Efficient Economy and Donn Viviani, Alliance for Vehicle Efficiency, and Lucid Group commented with concern that zero emissions for PEVs, lack of requirements for PEV efficiency, and lack of requirements for mass reduction will contribute to larger vehicles being manufactured and consume additional energy. Donn Viviani commented on the need to account for embedded carbon in the manufacturing of vehicles.

Response:

The final rulemaking establishes performance-based standards allowing manufactures to choose any combination of technologies to meet the standards. Furthermore, EPA is adopting revised footprint curves that EPA considers will not encourage changes in the size of vehicles (see Section 3.2.1 of this RTC). For further discussion of the compliance treatment of PEVs with zero grams/mile CO2 tailpipe emissions, and related issues about vehicle efficiency, please refer to Section 3.1.5 of the RTC. EPA interprets comments from Mr. Viviani on embedded carbon to be in support of lifecycle analysis, which we are not adopting for this rulemaking. For further comments related to lifecycle emissions refer to Section 19.2 of this RTC.

Summary:

BMW, Electrification Coalition, National Corn Growers Association, Stellantis, and POET LLC commented with suggestions to include additional fuels such as gasoline blends, biofuels, and hydrogen in the program for compliance.

Response:

The final rule does not include any modifications to vehicle fuels. Some commenters noted the importance of hydrogen technology and fuel cell electric vehicles (FCEVs). While EPA is aware that a few vehicle manufacturers either are producing light-duty FCEVs today (e.g., Toyota Mirai, Hyundai Nexo) or have plans to produce FCEVs in the future, at present such vehicles are at low volumes, and EPA has not explicitly modeled FCEVs as a technology option in our rule analysis. Nevertheless, under our performance-based standards, manufacturers can choose to utilize FCEV technology as part of their mix in complying with the standards.

Summary:

Hyundai Motor America, Mass Comment Campaign, and Western Energy Alliance commented that the high cost of EVs present affordability issues and affect consumer choice.

Response:

EPA has considered impacts on consumers as part of this final rule. See RTC Section 13 for discussion of consumers issues, including affordability and consumer choice.

Summary:

Several commenters expressed the importance of PHEVs in the current and future vehicle fleet.

Response:

PHEVs were not included in the proposed rule as the necessary modeling data was unavailable at that time. As we had indicated in the proposal was our intention, EPA has in fact explicitly included PHEVs as a technology option within our modeling of potential compliance pathways to meet the final standards, as detailed in Section 12.2.4 of this RTC.

Summary:

Minnesota Pollution Control Agency, Environmental and Public Health Organizations, California Air Resources Board, District of Columbia Department of Energy and Environment, Northeast States for Coordinated Air Use Management, Ozone Transport Commission, and

International Council on Clean Transportation expressed concern of backsliding of ICE vehicle emissions due to the addition of PEVs to the fleet.

Response:

EPA understands that in theory some backsliding of individual vehicles is possible due to the nature of a fleetwide average standard. At the same time, the revised GHG and criteria pollutant standards require significant reductions. For example, the final standards for NMOG+NOX reduce the level of emissions from the worst performing vehicles by eliminating the highest "bins" and any backsliding would have to be offset with additional technologies to reduce emissions. As another example, the GHG standards require significant year-over-year emissions reductions, and though manufacturers are not prohibited by the standards from backsliding on existing ICE vehicles, if they were to do so, they would then be obligated to make even further emission reductions elsewhere in their fleet, as this is the nature of fleetwide averaging standards. For these reasons, EPA does not consider it likely that significant backsliding will occur or would undermine the public health and welfare benefits of the rule.

3.1.1 - Vehicle regulatory classifications

Comments by Organizations

Organization: Alliance for Automotive Innovation

3. Separate Car and Truck Standards

Auto Innovators supports EPA's intent to continue to set separate passenger car and light-duty truck / medium-duty passenger vehicle standards. Separate standards recognize the physical energy demands of larger, more capable vehicles. Appropriately set standards will continue to drive improvements in both passenger cars and light trucks. In the long term the two standards will naturally converge, assuming similar percentage reductions for both fleets. [EPA-HQ-OAR-2022-0829-0701, p. 110]

4. NHTSA Car and Truck Definitions

EPA intends to continue to use the NHTSA car and truck definitions for its light-duty GHG program. We generally support this approach. However, because NHTSA has yet to propose its CAFE rules for MY 2027 and beyond, we do not know for certain whether NHTSA will maintain the existing definitions that EPA has based its proposal upon. Additionally, our understanding is that NHTSA is developing test procedures that may have the effect of changing the classification of some vehicles regardless of the present definitions. [EPA-HQ-OAR-2022-0829-0701, pp. 110-111]

There is also the potential for misalignment between EPA and NHTSA in the definition of medium-duty passenger vehicles. EPA is proposing to modify the definitions of medium-duty vehicles / medium-duty passenger vehicles. It is unclear what NHTSA may or may not do to align with EPA's proposal. [EPA-HQ-OAR-2022-0829-0701, pp. 110-111]

We urge EPA to coordinate with NHTSA in developing its final rule to ensure that the proposed greenhouse gas standards in the NPRM are not in conflict with changes NHTSA may propose in its CAFE rulemaking, or through later test procedure changes. [EPA-HQ-OAR-2022-0829-0701, pp. 110-111]

D. MDPV Definition

6. Background

In EPA's 2000 Tier 2 criteria pollutant rule299, EPA established a new regulatory classification: Medium Duty Passenger Vehicle (MDPV). EPA states it created this classification to include larger, heavier vehicles that were driven similarly to passenger vehicles in the passenger vehicle averaging sets for emissions.300 EPA defined this new regulatory class with references to Gross Vehicle Weight Rating (GVWR), seating configuration, and pickup bed length.301 Currently, the MDPV definition may include vehicles up to 10,000 lbs. GVWR. If a vehicle meets the EPA definition of an MDPV, the vehicle is removed from the Class 2b and 3 vehicle averaging set (proposed in the NPRM to be called Medium Duty Vehicles, or "MDVs"), which typically includes vehicles used for "work" purposes (i.e., trailering, towing, and hauling). [EPA-HQ-OAR-2022-0829-0701, pp. 195-196]

299 Add citation.

30 NPRM at 29278.

301 CFR-2014-title40-vol19-sec86-1803-01.pdf (govinfo.gov) page 10/14

EPA is proposing to expand the definition of MDPV to include heavier vehicles in the passenger vehicle emissions averaging sets. EPA recognizes that including zero emissions vehicles (ZEVs), and particularly BEVs, will be important to comply with its proposed Tier 4 multipollutant standards for passenger vehicles and MDVs. BEVs typically have higher curb weight than comparable-capability internal combustion engine vehicles due to battery weight, so it's likely that some EV light-duty trucks and sport utility vehicles will exceed the current 10,000 lbs. GVWR threshold for MDPV when equipped with BEV technology and change averaging sets. EPA's compliance pathway and cost-benefit analysis does not explicitly model vehicles switching regulatory classes due to BEV weight, but EPA purports that the proposed updates to the MDPV definition capture vehicles with significant weight changes due to batteries - and only these vehicles - to maintain regulatory continuity in emissions averaging sets. EPA states that "[i]n selecting the proposed 5,000-pound work factor cut point, EPA reviewed current vehicle offerings and does not believe this threshold would pull into the MDPV category a significant number of work vans or trucks."302 [EPA-HQ-OAR-2022-0829-0701, pp. 195-196]

302 NPRM at 29278.

7. Summary of EPA MDPV Definition Proposal

As shown below, EPA proposes to use "Work Factor (WF)," in combination with GVWR and pickup bed length, to expand the definition of MDPV, or rather to define which MDVs would not be MDPVs. [EPA-HQ-OAR-2022-0829-0701, pp. 196-197]

[See original comment for Figure 72: NPRM Table 56: Summary of Exclusions for the Proposed Revised MDPV Definition] [EPA-HQ-OAR-2022-0829-0701, pp. 196-197]

Previously, EPA has used WF to set GHG targets for Class 2b and 3 vehicles, and EPA proposes to carry-over the WF equation through 2029MY. In 2030MY, EPA proposes to limit the maximum threshold of Gross Combined Weight Rating (GCWR) to 22,000 pounds in the WF equation.303 [EPA-HQ-OAR-2022-0829-0701, pp. 196-197]

303 NPRM at 29425.

This means the calculated work factor for vehicles above 22,000 pounds GCWR will change between 2029MY and 2030MY (see text below). [EPA-HQ-OAR-2022-0829-0701, pp. 196-197]

[See original attachment for equations] [EPA-HQ-OAR-2022-0829-0701, pp. 196-197]

EPA largely carries over elements of the previous MDPV definition related to seating configurations and bed length. Pickups with one row of seating or an eight-foot pickup bed remain in Class 2b and 3 (MDV). [EPA-HQ-OAR-2022-0829-0701, pp. 196-197]

EPA proposes, however, to require manufacturers to use its new definition for MDPV in 2027MY. Alternatively, manufacturers may adopt the new definition of MDPV prior to 2027MY, and if the manufacturer chooses to do so, the manufacturer must apply the MDPV definition for GHG and criteria emissions standards. EPA proposes special consideration of criteria emissions in 2027MY-2029MY for vehicles that become MDPV due to the new definition:

"(vi) MDPV. Any vehicle that becomes an MDPV as a result of the revised definition in §86.1803 starting in model 2027 remains subject to the heavy-duty Tier 3 standards in § 86.1816-18 under the default phase-in specified in paragraph (b)(6)(ii) of this section for model years 2027 through 2029."304 [EPA-HQ-OAR-2022-0829-0701, pp. 196-197]

304 https://www.epa.gov/system/files/documents/2023-04/lmdv-multi-pollutant-emissions-nprm-redline-memo-2023-04.pdf (page 41 / 129).

Manufacturers may opt in to the new MDPV definition early without selecting an early phase-in schedule for Tier 4 multipollutant criteria standards. Said another way, manufacturers may opt- in to the MDPV definition early, and still choose the default compliance scenario (Scenario H).305 [EPA-HQ-OAR-2022-0829-0701, pp. 196-197]

305 NPRM at 29259.

8. Observations and Concerns with Proposed MDPV Definition

EPA's MDPV definition proposal may not produce the stated outcome EPA desires. For instance, the proposed expanded MDPV definition will capture some Class 2b and Class 3 internal combustion engine vehicles when the work factor is used in combination with the GCWR limit in MY 2030, resulting in those vehicles being included in a BIN12 averaging set. Many BEV trucks may be classified as MDPV, and therefore not be available to contribute to the stringent BIN60 criteria emissions standard for MDV. Some vehicles will both meet the MDPV definition and be regulated as light-duty, and yet paradoxically be over the proposed 22,000 pounds GCWR limit, which would otherwise require heavy-duty engine dyno certification for criteria emissions. If a manufacturer optionally adopts the MDPV definition early, the vehicle may change criteria emissions averaging sets three times in the span of five years. Certification and label requirements for MDPVs may complicate lab procedures. And finally, the EPA definition of MDPV may differ from the Department of Transportation regulatory classes used in the Corporate Average Fuel Economy / Corporate Average Fuel Consumption programs, adding complexity to certification workstreams. Each of these items is discussed in detail below along with Auto Innovators' suggested modifications to address these observations while working toward EPA's stated goals. [EPA-HQ-OAR-2022-0829-0701, pp. 196-198]

In the Proposed Rule, EPA makes clear that the expanded MDPV definition is intended to address heavier BEVs likely to be driven as passenger vehicles, and the definition updates are not meant to pull gasoline or diesel-powered work vehicles into light-duty standards:306 [EPA-HQ-OAR-2022-0829-0701, pp. 196-198]

306 NPRM at 29278.

- "First, EPA is proposing to include in the MDPV definition any passenger vehicles at or below 14,000 pounds GVWR with a work factor at or below 5,000 pounds except for pickups with an open bed interior length of eight feet or larger…This modification would address new BEVs that are primarily passenger vehicles but fall above the current 10,000 pound MDPV threshold primarily due to battery pack weight increasing the vehicle's GVWR." [EPA-HQ-OAR-2022-0829-0701, pp. 196-198]

- "In selecting the proposed 5,000 pound work factor cut point, EPA reviewed current vehicle offerings and does not believe this threshold would pull into the MDPV category a significant number of work vans or trucks…" [EPA-HQ-OAR-2022-0829-0701, pp. 196-198]

- "Currently, there is a clear distinction between pickups in the light-duty vehicle category and those in the medium-duty category…The proposed changes to the MDPV definition are intended to account for any new pickup offerings that would fall into the GVWR "space" at or above 8,501 pounds but below 9,900 pounds. EPA is not aware of any current or planned products that would be covered by this proposed modification." [EPA-HQ-OAR-2022-0829-0701, pp. 196-198]

However, when evaluating the existing vehicles pulled into the new MDPV definition and making conclusions that the proposed definition would not affect the classification of existing Class 2b and 3 ICE vehicles, it does not appear that EPA considered the proposed 22,000-pound limit to GCWR in the WF calculation, which is proposed to begin in MY 2030, in combination with the 5,000-pound WF threshold. After the WF GCWR limit, many ICE work trucks in the market today would be classified as MDPV in MY 2030 and beyond (see examples below). Manufacturers encourage EPA to review compliance data submissions to reassess how the proposed MDPV definition may interact with 2023MY and 2024MY ICE products. [EPA-HQ-OAR-2022-0829-0701, pp. 198-200]

[See original attachment for Figure 73: Sample ICE Work Trucks and Classifications]

307 Press Kit: 2023 Ram Heavy Duty, Towing specifications (Public "Base Weight Total" used for example may vary from "EPA Curb" weight) https://media.stellantisnorthamerica.com/newsrelease.do?id=24053&mid=,

The consequences of shifting ICE work vehicles to the MDPV regulatory class are significant. For criteria emissions, the MDPV NMOG+NOx targets are proposed to be 12 mg/mi in MY 2030 vs. 178 or 247 mg/mi for MDV in MY 2029 in the default compliance pathway308 (see Figure 74 below), and the MDPV definition would preclude these work trucks from certifying to proposed Bin 160 or Bin 125, which are reserved only for MDVs.309 The EPA NPRM analysis does not appear to recognize that many ICE work trucks would switch to MDPV with the proposed new MDPV definition, and no technology pathway is discussed to bring a 2029MY9

MDV work truck into a compliant light-duty averaging set. [EPA-HQ-OAR-2022-0829-0701, pp. 198-200]

308 NPRM at 29261, Table 41.

309 NPRM at 29261, Table 42.

[See original attachment for Figure 74: NPRM Table 41: LDV, LDT, MDPV and MDV Fleet Average NMOG+NOx Standards Under the Default Compliance Pathway] [EPA-HQ-OAR-2022-0829-0701, pp. 198-200]

With the proposed new MDPV definition, after the WF calculation adjustments beginning in MY 2030, many ICE work trucks over 22,000 pounds GCWR would otherwise be required to engine dyno cert if they were not MDPVs. The logic appears paradoxical and unintended. These vehicles cannot be both so alike to passenger vehicles that they should be regulated as passenger vehicles, and so alike to heavy-duty purpose-built work trucks that they should be regulated the same as light-heavy engines. Many of these ICE vehicles pulled into the new MDPV definition in MY 2030 today share engine hardware with vehicles that would be required to engine dyno cert under Part 1036 in MY 2030 due to the 22,000-pound GCWR limit. [EPA-HQ-OAR-2022-0829-0701, p. 200]

There is a stark difference between light-duty chassis dyno certification procedures, required for MDPVs, and engine dyno certification procedures for vehicles over 22,000-pound GCWR. Similar vehicles sharing parts and development resources today could be forced to pursue different development paths based on the proposed MY 2030 class definitions and test procedures. [EPA-HQ-OAR-2022-0829-0701, p. 200]

Complexity with the proposal is not limited to within the EPA program. Department of Transportation, through the Corporate Average Fuel Economy program, may have different regulatory class definitions for fuel consumption regulations than proposed by EPA. California Air Resources Board, through Advanced Clean Cars II, has different NMOG+NOx Bins, and different certification requirements than EPA proposes.310 [EPA-HQ-OAR-2022-0829-0701, p. 200]

310 htps://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/accii/2acciifro1961.4.pdf

9. Recommendations on MDPV Definition

EPA is correct in its desire to ensure vehicles, including ZEVs, are included in the appropriate compliance category. EPA identifies that some light trucks and sport utility vehicles, used often passenger vehicles, will cross weight thresholds and regulatory class definitions. Adjusting the MDPV definition is one mechanism for EPA to maintain some continuity in GHG and criteria emissions averaging sets as more BEVs are required to meet proposed standards. EPA proposes changes to the MDPV definition, but the structure and mechanisms need improvement from the proposal to the final rule to better achieve the stated intent as well as address the concerns noted above. [EPA-HQ-OAR-2022-0829-0701, pp. 200-202]

EPA offers manufacturers the option to adopt the new MDPV definition early. Adopting the MDPV option early may help manufacturers apply credit for ZEVs in the light-truck fleet as GHG stringency increases, consistent with the compliance pathway of adding battery electric vehicle technology to light-trucks and large sport utility vehicles, possibly for the model years

2024 (depending on the timing of the final rule), 2025, and 2026. We agree with EPA's proposal to allow manufacturers to adopt the MDPV definition early independent of the choice of criteria pollutant phase-in scenario. [EPA-HQ-OAR-2022-0829-0701, pp. 200-202]

To reduce complexity and regulatory burden associated with the proposed MDPV definition, and to address some potentially unintended consequences of the NPRM as written, manufacturers recommend the following changes to the proposed MDPV definition for the final rule. [EPA-HQ-OAR-2022-0829-0701, pp. 200-202]

- Our preferred option is that EPA should maintain the current MDPV definition, and also allow Class 3 BEV/FCEV/PHEV vehicles the option to contribute to either Medium-Duty or Light-Duty GHG compliance, but not both. This is similar to the approach taken by CARB for compliance with the heavy-duty ZEV regulation. This is a common sense approach that would achieve agency goals and also enable OEMs the flexibility needed with Class 3 vehicles, given the very aggressive standards in both the Light- and Medium- Duty GHG rules along with the anticipated relatively low volume of traditionally light- duty vehicles that could end up with Class 3 weight. The added benefit of this proposal is that NHTSA's CAFE rule could remain aligned with EPA's, as NHTSA is statutorily constrained from revising the MDPV definition. When fleets are not aligned, this creates a stringency burden that neither agency may recognize, but drives additional cost and complexity on OEMs . Alignment between the various regulatory programs is an ongoing goal of (and necessity for) OEMs. [EPA-HQ-OAR-2022-0829-0701, pp. 200-202]

- If EPA chooses not to accept the above, the following alternatives are proposed; while either would be acceptable for addressing concerns, we recommend the first approach:

o Implement a new MDPV definition that would simply make Class 3 BEV/FCEV/PHEVs with a work factor less than 4,500 lbs subject to the MDPV requirements and otherwise maintain the current MDPV definition. Given the relative lack of popularity of bed lengths 72" and greater in the light-duty segment, this would accomplish essentially all of EPA's goals. [EPA-HQ-OAR-2022-0829-0701, pp. 200-202]

o Implement a 9,500-pound GVWR limit and a 4,500 pound work factor limit versus the proposed 9,900 and 5,000 pound limits. This would reduce the risk of unintentionally capturing Class 2b and 3 trucks as could occur with the proposed limits. [EPA-HQ-OAR-2022-0829-0701, pp. 200-202]

- Manufacturers should not be required to adopt the MDPV definition until MY 2030. Aligning the required use of a new MDPV definition with the required timing of engine dyno certification for Class 2b and 3 vehicles may reduce test burden and streamline lab procedures, while giving manufacturers reasonable lead time to produce a fleet that meets such stringent requirements. Alignment in timing of MDPV definitions and Part 1036 requirements is especially important given the narrow definition of MDVs qualifying for chassis certified criteria emissions in the proposal in MY 2030 and beyond. MY 2030 also aligns with the timing of the proposed cap in GCWR for the WF equation. The GCWR cap as proposed in the WF equation, both in terms of timing and the value and mechanism of the cap, would result in many ICE vehicles flipping between MDV and MDPV at a critical time for criteria emissions phase-ins. [EPA-HQ-OAR-2022-0829-0701, p. 202]

- Manufacturers recommend eliminating the proposed GCWR cap in the WF equation. If EPA's intention is to limit the upper bound of WF for determining GHG stringency, EPA should explicitly set an upper bound for WF or GHG stringency itself – like footprint and GHG stringency for light-trucks -- instead of adding limits to components of the WF calculation. The GCWR limit as proposed in the WF equation interacts with and disrupts the applicability of the MDPV definition, pulling capable ICE work trucks into MDPV, subjecting them to more stringent criteria emissions targets and GHG targets, and changing their averaging sets. The mechanism as proposed by EPA is so complex that EPA's own analysis for compliance pathways to meet Tier 4 multipollutant standards overlooked the applicability of MDPV for a significant portion of the ICE work truck fleet. [EPA-HQ-OAR-2022-0829-0701, p. 202]

- Manufacturers recommend EPA clarify in the final rule that the new MDPV definition measures bed length with tailgate and mid-gates up. Often battery electric trucks have the option of a mid-gate that can extend the usable bed length of the vehicle in some configurations with mid-gates or tailgates down. If EPA were to measure bed length with the mid-gate down, many BEV trucks, the very trucks EPA intended to include in the MDPV class with the new proposed definitions, would exceed the maximum bed length allowed for MDPVs and remain MDVs. [EPA-HQ-OAR-2022-0829-0701, p. 202]

Organization: American Council for an Energy-Efficient Economy (ACEEE)

The proposed standards need to limit upsizing as the light-duty fleet electrifies

In the past decade the U.S. automotive market has seen a shift towards larger vehicles. The average footprint for all vehicle types has increased and more and more light trucks are being sold compared to cars. This has been a major factor for the recent stagnation in real- world fuel efficiency of the fleet.17 We applaud EPA for attempting to counter these trends with the proposed standards and for correcting conditions from past GHG rulemakings that have exacerbated the issue. Lowering the cutpoints on the light truck curve will reduce emissions by setting a more stringent standard for the largest trucks, as will the flattening of both the car and light truck curves and reducing the GHG grams per mile (gpm) gap between them. [EPA-HQ-OAR-2022-0829-0642, pp. 6-8]

17 https://www.epa.gov/automotive-trends

EPA must correct the slope of its car curve to accurately reflect BEV penetration [EPA-HQ-OAR-2022-0829-0642, pp. 6-8]

ACEEE agrees that the slopes of the car and light truck curves that demonstrate the relationship between vehicle footprint and the relevant emissions targets should reflect rising BEV penetration over the period of the standards, and that the appropriate slope for ZEVs should be zero. Tailpipe-only accounting combined with steep curves means that the production of large ZEVs can generate a considerable number of credits for a given manufacturer, which will incentivize vehicle companies to upsize their ZEV offerings and ignore improvements to ICEV options. For an ICEV car curve, EPA has determined that the appropriate slope to avoid incentivizing vehicle upsizing or downsizing is 0.8 gpm/ft2 and contends that the curve should be adjusted over time based on the ZEV share of sales. However, the car curve slopes for both the proposed standards and Alternative 1 are inconsistent with this finding, as explained below. [EPA-HQ-OAR-2022-0829-0642, pp. 6-8]

Table 1. Car curve slope unadjusted and adjusted for BEV penetration

Model Year	Proposed Standard Car Curve Slope (gpm/sq-ft)	Expected Car BEV Penetration	Adjusted Slope (gpm/sq- ft)	Alternative 1 Car Curve Slope	Expected Car BEV Penetration	Adjusted Slope (gpm/sq-ft)
2027	0.64	43%	1.12	0.59	44%	1.05
2028	0.56	51%	1.14	0.51	50%	1.02
2029	0.47	59%	1.15	0.42	58%	1.00
2030	0.43	65%	1.23	0.38	67%	1.15
2031	0.39	69%	1.26	0.34	72%	1.21
2032	0.35	73%	1.30	0.30	74%	1.15

[EPA-HQ-OAR-2022-0829-0642, pp. 6-8]

ACEEE calculated the adjusted slopes in Table 1 based on EPA's description of their methodology in the Draft Regulatory Impact Analysis (DRIA) where a slope of 0.8 is scaled to 0.4 to reflect 50% ZEV penetration (p.1-7). The adjusted slopes shown in Table 1 are far higher than 0.8 and rise over time with increases in BEV penetration. If 0.8 is the slope that minimizes the incentive to upsize or downsize vehicles, then anything higher than that would encourage the manufacture of larger vehicles and lead to higher emissions. Given that the light truck curve is based on EPA's car curve but has added offsets, the light truck curve would be similarly affected. EPA projects that average footprints will rise as a result of the proposed standard, further evidence that the curves as proposed are too steep (DRIA p.1- 14). We strongly recommend that EPA flatten both curves to accurately reflect expected BEV penetration in accordance with its own analysis. [EPA-HQ-OAR-2022-0829-0642, pp. 6-8]

Offsets for the light truck curve should be decreased to reflect real-world conditions

EPA constructs the light truck curve for the proposed standards by adding offsets (in the form of higher levels of emissions for a given footprint) to the car curve then similarly adjusting it for light truck BEV penetration. The first offset is for all-wheel drive (AWD) capability. EPA assumes that crossover vehicles need additional emissions allowances to allow for AWD capability, which would effectively classify them as truck crossovers (DRIA p.1-8). This offset is set at 10 grams per mile (gpm) and is applied uniformly across the entire ICEV-only light truck curve. However, not all light trucks have AWD and EPA's adjustment to the emissions allowance is based on an analysis of what is needed to add AWD to a model (DRIA p.1-8 – 1-9). Therefore, applying this offset to all light trucks, regardless of whether they have AWD, unnecessarily increases the allowable emissions level. In 2021, 78% of pickups and 87% of truck SUVs had AWD while almost 20% of car SUVs and sedans had AWD capabilities.18 The 10 gpm offset should be reduced to account for this and not further incentivize the shift of cars to trucks. [EPA-HQ-OAR-2022-0829-0642, pp. 6-8]

18 https://www.epa.gov/automotive-trends

The second adjustment that EPA makes to the car curve to create the light truck curve is for towing and hauling capability. To accommodate towing and hauling, EPA increases towing allowance linearly from 0-63 gpm for light trucks with footprints between 45 and 70 square feet on an all-ICEV curve. However, EPA assumes that all light trucks need to be able to haul and tow and therefore applies the allowance across the board . Not every vehicle classified as a light truck needs to tow or haul significant amounts of cargo. The vehicles that do need to tow or haul may only do so occasionally, and some may never need to.19 The 63 gpm offset for the all-ICEV light truck curve should be lowered to reflect the data on usage of towing and hauling capabilities by light truck owners. [EPA-HQ-OAR-2022-0829-0642, pp. 6-8]

Complementary elements of EPA's LDV program should be extended to MDVs

Two other areas in which MDVs could benefit from being folded into the LDV program are compliance reporting requirements and consumer labeling. EPA's compliance report for heavy-duty vehicles24 does not include heavy-duty pickups and vans, and we are not aware of any other source for this data. This situation has hampered our ability to make informed judgments on the current proposal for MDV standards, as data on matters such as compliance credit balances and rates of ICEV technology adoption are not currently available for these vehicles. These vehicles should be incorporated into EPA's Trends report no later than MY 2027. [EPA-HQ-OAR-2022-0829-0642, p. 11]

24 https://www.epa.gov/system/files/documents/2023-05/420r22028A.pdf

MDVs also should have a consumer label, and the label should provide a basis for comparison with LDVs. This could be an important element, along with the reclassification of vehicles for purposes of the standards, of EPA's effort to discourage the upward creep in size and performance attributes of light-duty trucks. California began labeling MDVs on January 1, 2021.25 While the MDV scores are not directly comparable to California's LDV scores, CARB provides a comparison table with LDV GHG scores. We urge EPA to create a meaningful consumer label for MDVs in time for MY 2027. [EPA-HQ-OAR-2022-0829-0642, p. 11]

Organization: American Fuel & Petrochemical Manufacturers

Moreover, EPA's Proposal further conflicts with the Clean Air Act by establishing a new class of medium duty vehicles that conflicts with the plain language of the CAA defining heavy-duty vehicles. Congress created specific lead time requirements for heavy-duty vehicles to ensure technological feasibility: "Any standard promulgated or revised under this paragraph and applicable to classes or categories of heavy-duty vehicles or engines shall apply for a period of no less than 3 model years beginning no earlier than the model year commencing 4 years after such revised standard is promulgated."98 In the Proposed Rule, EPA lumps a newly-defined category of Class 2b and 3 "medium-duty vehicles" (with a gross vehicle weight rating between 8,501 and 14,000 pounds) in with light-duty vehicles. But medium-duty vehicles are actually "heavy-duty vehicles" under the Clean Air Act, which defines "heavy-duty vehicle" as "a truck, bus, or other vehicle manufactured primarily for use on the public streets, roads, and highways (not including any vehicle operated exclusively on a rail or rails) which has a gross vehicle weight (as determined under regulations promulgated by the Administrator) in excess of six thousand pounds."99 Presuming the Proposed Rule results in a final rule promulgated in 2024, any new standards for Class 2b or 3 vehicles cannot apply until model year 2028.100 Furthermore, EPA is ignoring Congressional direction to issue separate standards for heavy-duty and light-duty vehicles by comingling them into the same fleet averaging, banking, and trading program (which is also unlawful, see Section III.A.1).101 [EPA-HQ-OAR-2022-0829-0733, p. 24]

98 Id., § 7521(a)(3)(C).

99 Id., § 7521(b)(3)(C) (emphasis added).

100 EPA's promulgation of standards for medium duty vehicles and light duty trucks along with other light duty vehicles is arbitrary and capricious as EPA itself recognizes that its approach – "for regulatory purposes" – differs from the statutory definition of heavy-duty vehicles in the Clean Air Act. See 88 Fed. Reg. at 29226, n. 382.

101 See 42 U.S.C. § 7521(a)(3)(B) (recognizing additional requirements for heavy-duty vehicles).

EPA recognized the need to treat different motor vehicle technologies differently. In previous rulemakings, EPA distinguished between Otto-cycle (primarily gasoline-fueled vehicles) and diesel heavy-duty vehicles.115 EPA also differentiated between gasoline- and diesel-fueled vehicles and those operated on natural gas.116 And more than 30 years ago, EPA promulgated specific standards for methanol-fueled vehicles.117 The regulations varied emission-control requirements based on fuel type.118 For example, in promulgating regulations for methanol-fueled vehicles, EPA explained that "because the design and function of methanol vehicles is very much like that of their petroleum counterparts, the methanol emission control requirements are comparable (in most cases identical) to those already in existence."119 At the same time, within the methanol vehicle rule, EPA noted that "in some future cases, this criterion may not be sufficient to adequately determine the classification of a vehicle . . . [EPA] may need to take into account other relevant factors, such as compression ratio, combustion characteristics, characteristics of the engine's operating thermodynamics, or intended in-use duty cycle."120 In other words, EPA recognized the varying methods of converting energy into motive power could require different criterion (classification) for regulating different vehicles. And the agency did so in circumstances where the drivetrain technologies were substantially more similar to ZEV than to ICEV. To remain consistent in its regulatory approach, were EPA to have the authority to set emissions standards for ZEVs, it must promulgate separate emission standards that apply solely to ZEVs. c. Both this Proposal and the Heavy-Duty Vehicle Proposal Miss the Mark.

i. EPA is missing millions of vehicles that will contribute to emissions.

API is concerned that this proposal, as well as EPA's Heavy-Duty proposed11 GHG rule, seriously miss the mark with respect to reducing emissions from the transportation sector. The proposals focus heavily on ZEV technologies, and specifically BEVs, for reductions in the 2027 to 2032 timeframe. Yet, EPA is leaving emissions reductions on the table for existing LMDVs, given the lifespan of these vehicles, as well as new ICE vehicles that will be sold between now and 2032. According to Oak Ridge National Lab (ORNL)12 there were over 105 million cars and 148 million light trucks in the U.S. in 2020. In 2021, over 3.3 million new cars and over 11.2 million new light trucks were sold. The average age of a light-duty vehicle (LDV) is over 12 years. The U.S. Department of Energy's Energy Information Administration (EIA)13 projects the stocks of light-duty internal combustion engines will exceed 247 million vehicles in 2050. EPA's overly limited focus on ZEVs, and specifically BEV solutions, ignores options that could better accomplish the agency's objectives to achieve greater transportation sector-related emission reductions at lower cost to society. [EPA-HQ-OAR-2022-0829-0641, pp. 7-8]

11 88 Fed. Reg. 25,926 (April 27, 2023).

13 U.S. Energy Information Administration. "Annual Energy Outlook 2023." March 2023. https://www.eia.gov/outlooks/aeo/.

EPA's proposal extends to "medium-duty vehicles" (MDVs), previously referred to as "heavy-duty class 2b and 3 vehicles or heavy-duty pickups and vans."14 Vehicles in this class may include large SUVs, heavy-duty pickups, utility vans, mini-buses, step vans, delivery vans, and light dump trucks (i.e., GVWR up to 14,000 pounds) which have different and diverse usage applications 15 compared to lighter LDVs and medium-duty passenger vehicles (MDPVs), which fall into EPA's LDV classifications of light-duty passenger cars and light-duty trucks. The MDV market (i.e., class 2b and 3 vehicles) is made up of purchasers that want to get "the right tool for the job" and often include service providers such as plumbers, landscapers, and utility company fleets.16 Although there is little published regarding makeup, usage, and environmental impact of class 2b and class 3 vehicles, there are approximately 13 million class 2b and 3 million class 3 vehicles in the U.S. fleet and these vehicles may remain in fleets up to 15 years.17 Purchasing decisions and usage of class 2b and class 3 vehicles are driven by demands of meeting commercial, business, and personal use and these vehicles are likely used in distinctly different applications compared to lighter LDVs covered by EPA's proposal. Accordingly, these vehicles should not be included in the LMDV program. Further, as discussed in Section h below, EPA exceeded its authority in changing the definitions. [EPA-HQ-OAR-2022-0829-0641, pp. 7-8]

14 88 Fed. Reg. 29196 (May 5, 2023).

16 Ibid.

17 Ibid.

EPA explains in the Proposed Rule that "[l]ight-duty trucks (LDTs) that have gross vehicle weight ratings above 6,000 pounds and all MDVs are considered ''heavy-duty vehicles'' under the CAA." 88 Fed. Reg. at 29226 n. 382. This comports with CAA § 202(b)(3)(C), which defines the term "heavy duty vehicle" to mean "a truck, bus, or other vehicle manufactured primarily for use on the public streets, roads, and highways (not including any vehicle operated exclusively on a rail or rails) which has a gross vehicle weight (as determined under regulations promulgated by the Administrator) in excess of six thousand pounds." This definition communicates Congress's clear intent that heavy-duty vehicles should be regulated as a distinct class of vehicles, separate from light-duty vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 29-30]

The Proposed Rule violates this obligation by regulating certain heavy-duty vehicles as light-duty vehicles and by commingling these two classes in the same averaging, banking, and trading program (which, as addressed in subsection iii, above, is unlawfully considered in formulating the proposed emissions standards). [EPA-HQ-OAR-2022-0829-0641, pp. 29-30]

The problem here involves "medium duty vehicles" ("MDV"), which EPA defines to mean Class 2b and 3 vehicles. 88 Fed. Reg. at 29226. EPA explains that it "has not previously used the MDV nomenclature, referring to these larger vehicles in prior rules as either heavy-duty Class 2b and 3 vehicles or heavy-duty pickups and vans." EPA further explains that it previously "addressed medium-duty vehicle emissions as part of regulatory programs for GHG emissions along with the heavy-duty sector." Id. at 29227. The exception was "medium duty passenger vehicles" ("MDPV") which EPA previously has defined as "vehicles between 8,501 and 10,000 pounds GVWR designed primarily for the transportation of persons." Id. at 29226 n. 382. According to EPA, "[w]hen [it] established its GHG standards in 2010, EPA included MDPVs in the light-duty vehicle GHG program as well," such that "[e]ssentially, MDPVs are heavy-duty vehicles that are included in light-duty vehicle programs." Id. at 29278. [EPA-HQ-OAR-2022-0829-0641, pp. 29-30]

EPA here proposes to expand the definition of MDPV in two ways: (1) "EPA is proposing to include in the MDPV definition any passenger vehicles at or below 14,000 pounds GVWR with a work factor at or below 5,000 pounds except for pickups with an open bed interior length of eight feet or larger which would continue to be excluded from the MDPV category"; and (2) EPA proposes "to include in the MDPV category any pickups with a GVWR below 9,900 pounds and an interior bed length less than eight feet regardless of whether the vehicle work factor is above 5,000 pounds. Pickups at or above 9,900 pounds up to 14,000 pounds GVWR with a work factor above 5,000 pounds would be included as MDPVs only if their interior bed length is less than six feet." Id. EPA proposed these changes out of concern that "potential market changes [] could move passenger vehicles out of the LD regulatory class." Id. [EPA-HQ-OAR-2022-0829-0641, pp. 29-30]

The inclusion of heavy-duty vehicles (i.e., "a truck, bus, or other vehicle manufactured primarily for use on the public streets, roads, and highways … which has a gross vehicle weight … in excess of six thousand pounds," CAA § 202(b(3)(C)) in the same class as light-duty vehicles for purposes of setting emissions standards violates EPA's obligation to regulate heavy-duty vehicles and light-duty vehicles as separate classes under CAA § 202. This fundamental error is magnified by the current proposal to expand the category of MDPVs to include both heavier vehicles and an expanded range of lighter vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 29-30]

EPA explains in the Proposed Rule that “light-duty trucks (LDTs) that have gross vehicle weight ratings above 6,000 pounds and all MDVs are considered ‘‘heavy-duty vehicles’’ under the CAA.” 88 Fed. Reg. at 29226 n. 382. This comports with CAA § 202(b)(3)(C), which defines the term “heavy duty vehicle” to mean “a truck, bus, or other vehicle manufactured primarily for use on the public streets, roads, and highways (not including any vehicle operated exclusively on a rail or rails) which has a gross vehicle weight (as determined under regulations promulgated by the Administrator) in excess of six thousand pounds.” This definition communicates Congress’s clear intent that heavy-duty vehicles should be regulated as a distinct class of vehicles, separate from light-duty vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 29-30]

The problem here involves “medium duty vehicles” (“MDV”), which EPA defines to mean Class 2b and 3 vehicles. 88 Fed. Reg. at 29226. EPA explains that it “has not previously used the MDV nomenclature, referring to these larger vehicles in prior rules as either heavy-duty Class 2b and 3 vehicles or heavy-duty pickups and vans.” EPA further explains that it previously “addressed medium-duty vehicle emissions as part of regulatory programs for GHG emissions along with the heavy-duty sector.” Id. at 29227. The exception was “medium duty passenger vehicles” (“MDPV”) which EPA previously has defined as “vehicles between 8,501 and 10,000 pounds GVWR designed primarily for the transportation of persons.” Id. at 29226 n. 382. According to EPA, “[w]hen [it] established its GHG standards in 2010, EPA included MDPVs in the light-duty vehicle GHG program as well,” such that “essentially, MDPVs are heavy-duty vehicles that are included in light-duty vehicle programs.” Id. at 29278. [EPA-HQ-OAR-2022-0829-0641, pp. 29-30]

EPA here proposes to expand the definition of MDPV in two ways: (1) “EPA is proposing to include in the MDPV definition any passenger vehicles at or below 14,000 pounds GVWR with a work factor at or below 5,000 pounds except for pickups with an open bed interior length of eight feet or larger which would continue to be excluded from the MDPV category”; and (2) EPA proposes “to include in the MDPV category any pickups with a GVWR below 9,900 pounds and an interior bed length less than eight feet regardless of whether the vehicle work factor is above 5,000 pounds. Pickups at or above 9,900 pounds up to 14,000 pounds GVWR with a work factor above 5,000 pounds would be included as MDPVs only if their interior bed length is less than six feet.” Id. EPA proposed these changes out of concern that “potential market changes [] could move passenger vehicles out of the LD regulatory class.” Id. [EPA-HQ-OAR-2022-0829-0641, pp. 29-30]

The inclusion of heavy-duty vehicles (i.e., “a truck, bus, or other vehicle manufactured primarily for use on the public streets, roads, and highways … which has a gross vehicle weight … in excess of six thousand pounds,” CAA § 202(b(3)(C)) in the same class as light-duty vehicles for purposes of setting emissions standards violates EPA’s obligation to regulate heavy-duty vehicles and light-duty vehicles as separate classes under CAA § 202. This fundamental error is magnified by the current proposal to expand the category of MDPVs to include both heavier vehicles and an expanded range of lighter vehicles. [EPA-HQ-OAR-2022-0829-0641, pp. 29-30]

Organization: Arconic Corporation (ARCO)

5. Arconic agrees with the proposed modifications to the medium duty passenger vehicle definition. The previous definition is that any vehicle with a GVWR over 8500 pounds is a medium duty vehicle. This change would prevent vehicles that are used as light duty vehicles to be moved into the "medium duty" category by higher vehicle weights and minor capacity improvements and thus qualify for higher emission targets. [EPA-HQ-OAR-2022-0829-0741, p. 3]

Organization: Electrification Coalition (EC)

We suggest the EPA address the topic of vehicle right-sizing in the future in the context of reducing the overall impact of emissions from the transportation sector, and to more widely enable the benefits of transportation electrification. [EPA-HQ-OAR-2022-0829-0588, p. 3]

The EC agrees with the EPA’s projection that a future fleet will be characterized by a greatly increased projection of EVs. It is also reasonable to project that the future light duty fleet will, in the absence of regulatory action on vehicle size, continue to be dominated by large and heavy vehicles such as trucks and SUV EVs. An increasing number of larger EVs are appearing on the consumer market, whilst there has not been similar growth in the variety of smaller EVs. [EPA-HQ-OAR-2022-0829-0588, p. 3]

The EC believes that the approach by the EPA in this proposal is understandable and appropriate given the structure of the existing regulatory framework and we appreciate the work EPA has done to broaden he definition of medium duty passenger vehicles (MDPVs) to ensure that auto manufacturers will not upsize vehicles to avoid emissions controls. However, the question of vehicle size and cost must continue be thoughtfully considered by the EPA and other regulators going forward in the context of reducing the emissions impact of the transportation sector and helping to expand the benefits of electrified transportation more widely. To help accelerate and optimize the electrification transition, in future rulemakings, emissions standards for internal combustion engine vehicles should be paired with policy that incentivizes the production of a wider range of EV choices for all consumers and transportation needs. [EPA-HQ-OAR-2022-0829-0588, p. 3]

We suggest the EPA address the topic of vehicle right-sizing in the future in the context of reducing the overall impact of emissions from the transportation sector, and to more widely enable the benefits of transportation electrification. [EPA-HQ-OAR-2022-0829-0588, p. 3]

The EC agrees with the EPA’s projection that a future fleet will be characterized by a greatly increased projection of EVs. It is also reasonable to project that the future light duty fleet will, in the absence of regulatory action on vehicle size, continue to be dominated by large and heavy vehicles such as trucks and SUV EVs. An increasing number of larger EVs are appearing on the consumer market, whilst there has not been similar growth in the variety of smaller EVs. [EPA-HQ-OAR-2022-0829-0588, p. 3]

[EPA-HQ-OAR-2022-0829-0588, p. 3]

Organization: Environmental Defense Fund (EDF) (1of 2)

IV. EPA should finalize medium-duty standards that deliver needed pollution reductions from Class 2b and 3 vehicles.

EPA reasonably included Class 2b and 3 vehicles, referred to in the proposal as medium-duty vehicles (MDVs), in the same rule as the light-duty vehicles. The medium-duty large vans and pick-up trucks included in this proposal are more similar to LDVs in their use patterns and configurations than HDVs. Indeed, many 2b trucks are simply larger versions of 2a trucks with engines and transmissions that are nearly identical in configuration. Like LDVs, Class 2b and 3 vehicles are chassis certified rather than engine certified. Including MDVs in this proposal also aligns the treatment of these vehicles with previous criteria pollutant standards where chassis certified vehicles are considered separately from engine certified vehicles. [EPA-HQ-OAR-2022-0829-0786, p. 45]

Organization: Lucid Group, Inc.

Lucid Supports the Medium-Duty Passenger Vehicle Definition

Lucid supports EPA's proposed new medium-duty passenger vehicle (MDPV) classification, which closes a loophole for larger passenger vehicles. In recognizing the actual uses of certain larger and heavier vehicles as passenger vehicles, EPA's proposed MDPV classification would subject these heavier passenger vehicles to the same standards as all other passenger vehicles, i.e., light duty passenger vehicles. Without this change, larger SUVs and passenger vans would be regulated as heavy-duty vehicles with less stringent emissions standards despite available technology to allow these vehicles to meet the same standards as light duty vehicles. Further, in the absence of the classification change proposed by EPA, automakers would be perversely incentivized to continue making and selling larger, potentially more dangerous vehicles with higher emissions. [EPA-HQ-OAR-2022-0829-0664, p. 5]

Organization: Mercedes-Benz AG

We would like to emphasize the importance of setting feasible and achievable standards for Class 2b and Class 3 vehicles. Similar to light-duty vehicles (“LDVs”), there remain many uncertainties in customer uptake and acceptance of medium-duty electric vehicles. Moreover, electrification in this segment lags that of light-duty, as production of these vehicles is only just beginning. As a result, there are currently limited options available to consumers, and medium-duty charging infrastructure requires additional attention, funding, and considerations appropriate for medium-duty vehicle usage. Medium-duty vans are being increasingly swept into pick-up truck focused regulations, as well as EPA’s intent to treat medium-duty more like light-duty. Yet, medium-duty vans remain fundamentally different than either pick-ups or light-duty, and therefore warrant specific consideration of their technologies, customer uses, and corresponding regulatory requirements. [EPA-HQ-OAR-2022-0829-0623, pp. 2-3]

Section V: MDVs (Vans)

Use-Cases

In the MDV segment, there are typically two kinds of vehicles included, pickup trucks and vans. These two vehicle types are fundamentally different. [EPA-HQ-OAR-2022-0829-0623, pp. 16-17]

For vans, there are use cases with high potential for rapid electrification, but also segments with long-distance driving, high payload requirements and thus lower potential for rapid electrification. As shown in 2021 sales data, although last mile delivery applications form a portion of Sprinter van sales, they are used for a wide variety of other applications as well– construction vehicles, small businesses such as plumbers and electricians, people movers, and recreational vehicles. These applications are not typically fulfilled by pick-up trucks, but the EPA NPRM makes no differentiation between the diversity of use cases within the MDV segment. Further, EPA increasingly treats MDVs as light-duty vehicles. Yet traditionally they were aligned with the heavy-duty segment. The MDV segment provides unique functionality separate from light-duty or heavy-duty vehicles. As such, standard setting for MDVs should be differentiated. [EPA-HQ-OAR-2022-0829-0623, pp. 16-17]

[See original for diagram for 2021 sales data] [EPA-HQ-OAR-2022-0829-0623, pp. 16-17]

When standard setting, EPA should consider the unique use cases that MDV vans fulfill in the market and reflect that in standards proposed. It is unreasonable for the agency to set one standard for pickup trucks with towing capacities approaching 50,000lb that also includes vans that are used as people movers and recreational vehicles. EPA should also not tie MDV emissions standards to the same expectations as light-duty. [EPA-HQ-OAR-2022-0829-0623, pp. 16-17]

Organization: Rivian Automotive, LLC

Rivian Supports Proposed Technical Changes to Ensure Strict Standards Govern Larger Vehicles [EPA-HQ-OAR-2022-0829-0653, p. 12]

Rivian commends EPA for its thoughtfully proposed modifications to certain vehicle classifications and the car and truck standards. As the agency notes, the regulatory structure of the GHG standards could “inadvertently provide an incentive for manufacturers to change the size or regulatory class of vehicles as a compliance strategy”—an increasingly important concern in light of sustained fleet mix changes in the market in favor of truck-classified passenger vehicles and the use of larger high-utility vehicles like pickups.34 This set of concerns predates the current proposal, and we welcome the actions proposed by EPA in response—namely commonsense modifications to expand the MDPV definition and valuable changes to the car and truck curves. As a manufacturer of MDPVs, Rivian understands the importance of vehicle classification for ensuring that the full universe of passenger vehicles adheres to the appropriate emissions standards and consumer assurance measures. Similarly, adjusting the slopes of the standards curves and narrowing the difference in stringency between the car and truck standards should moderate any perverse incentives for manufacturers to upsize and/or reclassify vehicles. EPA should finalize the proposed vehicle classification changes. [EPA-HQ-OAR-2022-0829-0653, p. 12]

34 Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 87 (May 5, 2023) (revising 40 C.F.R. Parts 85, 86, 600, 1036, 1037, and 1066), 29,196.

Organization: Stellantis

Implicit / Explicit MDV GHG Standards are Infeasible

The EPA is proposing a very challenging set of regulatory changes for the medium-duty vehicles that are infeasible. This includes direct core stringency changes along with four other actions that further increase stringency: [EPA-HQ-OAR-2022-0829-0678, pp. 17-18]

- Medium-duty Passenger Vehicle (MDPV) – Changes the MDPV definition which negatively impacts both light-duty and medium-duty greenhouse gas stringency [EPA-HQ-OAR-2022-0829-0678, pp. 17-18]

Medium-Duty Passenger Vehicle Classification Changes Hurt Medium-Duty Pickup Trucks

Revisions to the MDPV definition are proposed by EPA. EPA notes that the Work Factor threshold of 5,000 lb. was set to avoid capturing a significant number of work vans or trucks. [redacted text.] [EPA-HQ-OAR-2022-0829-0678, pp. 20-22]

In summary, the MDPV proposed revised definition needs to be changed because it:

-- Reclassifies some GHG reducing BEVs back to LDT fleet, effectively harming MD GHG fleet

-- [redacted text.] [EPA-HQ-OAR-2022-0829-0678, pp. 20-22]

Stellantis recommends that EPA should:

GHG Standards

-Fix incorrect MDV adjustments that mistakenly force medium-duty vehicles into light-duty standards and double stringency of high capability products arbitrarily [EPA-HQ-OAR-2022-0829-0678, p. 24]

Organization: Tesla, Inc.

Tesla Supports EPA’s Proposed Changes to the Medium Duty Definition

Tesla supports the agency’s proposed definitional changes around medium-duty passenger vehicles.166 As more electrification takes place across the passenger vehicle fleet, the definitional changes will allow the agency to recognize the increased weight associated with such electrification while ensuring that passenger vehicles are appropriately subject to more stringent passenger-vehicle emissions standards. [EPA-HQ-OAR-2022-0829-0792, p. 26]

Organization: Zero Emission Transportation Association (ZETA)

7. ZETA Comments on the Additional Proposed Regulatory Changes

Beyond the overall stringency of EPA's proposed GHG and multipollutant emissions standards for LMDVs, ZETA is providing the following comments on the various regulatory changes proposed in the rule. [EPA-HQ-OAR-2022-0829-0638, p. 28]

ZETA supports EPA's proposed changes to the medium-duty passenger vehicle (MDPV) definition. As MDPVs become increasingly electrified, EPA regulations should reflect the increased weight associated with the onboard battery. MDPVs are predominantly used to transport people, rather than goods, and therefore should be subject to emissions standards whose stringency is consistent with non-work based applications. [EPA-HQ-OAR-2022-0829-0638, p. 28]

<u>EPA Summary and Response</u>

<u>Summary:</u>

EPA received a variety of comments regarding proposed vehicle regulatory class changes. Comments ranged from highly supportive to strong opposition, with some comments either being out of scope or more nuanced.

EPA received supportive comments from Arconic Corporation (ARCO), the Electrification Coalition, Lucid Group, Rivian, Tesla and the Zero Emissions Transportation Association (ZETA). Referring to the proposed expansion of the Medium Duty Passenger Vehicle Definition (MDPV), Rivian commented that EPA's proposed change to the MDPV definition was a "common sense modification" and agreed with EPA that retaining the existing MDPV definition could inadvertently provide an incentive for manufacturers to change the size or regulatory class of vehicles as a compliance strategy.

The Alliance for Automotive Innovation (AAI) provided a significant number of comments regarding potential changes to regulatory classifications. AAI noted that the MDPV definition change may result in misalignment with NHTSA's regulatory classifications, and they suggested the definition change might not result in the intended outcome. They further noted that moving heavy BEVs out of the medium-duty averaging set would result in the cleanest vehicles not contributing to medium-duty vehicle compliance. AAI also expressed concerns with the consistency of the revised MDPV definition and the proposed 22,000-pound GCWR limit for engine certification. AAI went on to make several recommendations: 1. Allow the revised MDPV definition to be adopted early in MY 2027 as an option but delay mandatory adoption until MY 2030. 2. Preferred option is to retain the existing MDPV definition and allow Class 3 BEV/FCEV/PHEV vehicles the option to contribute to either Medium-Duty or Light-Duty GHG compliance, but not both. 3. If the MDPV definition is adopted, the GVRW threshold should be lowered to 9,500 pounds and the work factor threshold should be lowered to 4,500 pounds. AAI also recommended clarification in the revised MDPV definition for the measured bed length.

AFPM objected to the classification of some vehicles as medium duty vehicles, on the ground that the Clean Air Act defines these vehicles as heavy-duty vehicles, which triggers certain statutory provisions such as lead time and stability.

API stated that the inclusion of heavy-duty vehicles in the same class as light-duty vehicles for purposes of setting emissions standards, and commingling the vehicles for the ABT program violates EPA's obligation to regulate heavy-duty vehicles and light-duty vehicles as separate classes under CAA § 202.

EPA also received Confidential Business Information (CBI) from several vehicle manufacturers which provided specific feedback on the proposed MDPV definition change which are largely reflected in the AAI comments above.

Response:

EPA appreciates the comments received regarding changes to regulatory classifications. Upon review of the public comments, EPA has decided to finalize changes to the MDPV definition, but with several specific modifications from the proposal. EPA is adopting AAI's recommended changes to the thresholds for the MDPV definition, with 9,500 pounds and 4,500 pounds being the final thresholds for GVWR and work factor, respectively because the agency agrees with the commenters that these thresholds more appropriately encompass the range of vehicle weights and utility that the agency was attempting to address. In addition, EPA agrees with AAI that we should allow vehicle manufacturers the option of adopting the revised MDPV definition prior to MY 2027, but the Agency has decided against delaying the requirement until MY 2030 because the agency believes that there is risk of manufacturers moving light-duty vehicles into the medium duty category to gain less stringent standards; the revised MDPV definition will be required starting in MY 2027. Because there are little to no ICE-based vehicles that fall under the MDPV definition as a result of the changes in this rule, the Agency does not believe that there are any lead time issues associated with adopting the revised definition at the start of the program.

EPA has collaborated extensively with the National Highway Traffic Safety Administration (NHTSA) during the development of this rulemaking and have consulted with NHTSA about our intent to revise the MDPV definition for GHG and criteria pollutant emissions. EPA understands that NHTSA does not have the same flexibility under the CAFE statute to follow suit with EPA's revised MDPV definition change. We have accordingly amended 40 CFR part 600 to maintain consistency with NHTSA's MDPV definition for regulatory provisions related to fuel economy standards and labeling. However, EPA does not view the differences in program structure for applying emission standards as being significantly different than other programmatic and statutory differences between the two agencies. Differences already exist, such as the CAFE program's limitation on car/truck credit trading that require vehicle manufacturers to manage two different averaging sets. We do not believe that this difference in MDPV definition will cause difficulties with or be disruptive to manufacturers' strategies to simultaneously comply with both the CAFE standards and these GHG standards.

Regarding AFPM's objections to the medium duty class, EPA recognizes that these vehicles are heavy duty vehicles for purposes of Clean Air Act section 202(a)(3). In fact, the regulation defines "Medium-duty vehicle" at 40 CFR 86.1803-01 to be a subset of heavy-duty vehicles. As such, we use the term medium-duty vehicles only to more clearly establish how the regulation applies for that collection of heavy-duty vehicles. It is precisely because these are heavy-duty vehicles that EPA has adopted a default compliance schedule, consistent with the lead time and stability requirements of CAA section 202(a)(3)(C), as well as an optional compliance schedule for these vehicles. In addition, in setting the standards, EPA identified criteria pollutant standards for the greatest degree of emissions reduction achievable pursuant to CAA section 202(a)(3)(A). However, EPA does not see any basis for concluding that the Clean Air Act prohibits EPA from grouping these vehicles together (or to allow very limited credit transfers for ABT purposes) for purposes of these emissions standards. To the contrary, CAA section 202(a)(3)(A)(ii) authorizes EPA to establish classes or categories of vehicles based on gross vehicle weight or other appropriate factors.

With respect to API's objection that heavy duty vehicles should be regulated in the same class as light duty vehicles, EPA notes, as previously stated, that it is regulating heavy duty vehicles pursuant to section 202(a)(3), as appropriate. To the extent API objects to vehicles above 6,000 lbs GVWR being subject to the same standards as vehicles below 6,000 lbs GVWR, EPA disagrees that there is anything that makes such an outcome impermissible under the CAA, provided EPA promulgates standards under the relevant statutory provision. Moreover, EPA has a longstanding practice of adopting standards for certain light trucks with GVWR somewhat above 6,000 lbs GVWR consistently with light trucks at or below 6,000 lbs GVWR, in recognition of the fact that these trucks generally serve similar purposes and have similar control strategies available. EPA considers it beneficial for the environment, the public, and manufacturers to avoid creating sharp divides in regulatory treatment that do not reflect real-world differences in vehicles. This approach prevents situations where disparate regulatory treatment shapes the market, rather than reflecting differences in vehicles and market demand. EPA allows exchanging emission credits across vehicle types when doing so is consistent with the rationale of the ABT program, providing flexibility and incentives to manufacturers to identify efficient areas for pollution reduction, within comparable segments of the market.

In response to comments received from AAI regarding the GCWR cap in the WF equation, please see Section 3.2.2 of this RTC.

3.1.2 - Averaging, banking, and trading

<u>Comments by Organizations</u>

Organization: Alliance for Automotive Innovation

Averaging, Banking, and Trading

Auto Innovators supports EPA's greenhouse gas averaging, baking, and trading (ABT) program. This flexibility helps manufacturers plan more cost-effective compliance. We agree with EPA's proposal to not change ABT provisions at this time. [EPA-HQ-OAR-2022-0829-0701, p. 108]

O_2 Credits for Advanced Technology Vehicles

EPA proposes changes to the method for calculating MY 2022-2024 caps on multiplier-based advanced technology vehicle credits in the proposed 40 C.F.R. § 86.1866-12.195 Given the limited comment period and the denial of our request to extend it, Auto Innovators did not have sufficient time to evaluate the proposed change. Additionally, we were unable to locate a description of the proposed change in the preamble of the NPRM, so it is difficult to know what the intent of the proposed change is. Following the formal comment period, we may revisit this issue and request a meeting with EPA staff if there is a concern. [EPA-HQ-OAR-2022-0829-0701, pp. 108-109]

195 NPRM at 29438.

E. Structure and Development of GHG Standards

1. Authority to Set Fleet Average Standards

Auto Innovators reaffirms its previously expressed support for the fleetwide averaging, banking, and trading approach used by EPA in the Proposed Rule, including for EVs. EPA has repeatedly employed this approach in prior section 202 rulemakings, including in the GHG context, and this approach is amply supported by statute. [EPA-HQ-OAR-2022-0829-0701, pp. 109-110]

EPA and automakers have long relied on averaging, credits, and banking, and these features are now integral to many manufacturers' business strategies. Indeed, fleetwide averaging has been essential to the auto industry's efforts to meet EPA's GHG reduction goals in past rulemakings. Fleetwide averaging, credits, and banking provides manufacturers with flexibility, and reflects the realities of product life cycles, while still ensuring that the manufacturer's overall fleet meets emissions reduction standards. Thus, averaging permits the imposition of tough emissions standards on manufacturers, while reducing compliance costs and encouraging the development and marketing of emissions reduction technologies. [EPA-HQ-OAR-2022-0829-0701, pp. 109-110]

Fleetwide averaging is fully supported by the text of section 202, which requires EPA to "prescribe . . . standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines." As the D.C. Circuit has recognized, "[n]nothing" in this language precludes EPA's consideration "of a manufacturer's ability to meet emissions standards by averaging different engine families." [EPA-HQ-OAR-2022-0829-0701, pp. 109-110]

Consistent with this statutory text, EPA has employed fleetwide averaging in its section 202 standards for decades. EPA first adopted an averaging program for certain light-duty vehicles in 1983, followed by an averaging program for certain types of emissions from heavy-duty engines and light-duty trucks in 1985. This program was unanimously upheld by a panel of the D.C. Circuit in Thomas. A few years later, EPA extended the averaging approach to include banking and trading. Each of EPA's GHG emissions standards, since the agency began regulating GHG emissions under section , has employed fleetwide averaging, banking, and trading. And EPA has long recognized that EVs may be accounted for in complying with fleet- average emissions regulations, dating back to EPA's approval in 1990 of California's Low Emission Vehicle Program—which effectively employed a fleet average standard including EVs— as "consistent with section 202(a)."202 [EPA-HQ-OAR-2022-0829-0701, pp. 109-110]

We endorse EPA's continued use of fleetwide averaging, banking, and trading, which is well-supported by statute and essential to comply with any GHG emissions standards. [EPA-HQ-OAR-2022-0829-0701, pp. 109-110]

Organization: American Council for an Energy-Efficient Economy (ACEEE)

Credit issues should be addressed further in the final rule

EPA states that MDVs are a separate averaging set and credits are not allowed to be transferred between MDVs and LDVs due to differences in the structure of the standards for these two vehicle categories and manufacturer competitiveness issues (FR 29245). ACEEE strongly supports this decision and believes that keeping the categories separate will help to avoid unintended consequences. [EPA-HQ-OAR-2022-0829-0642, pp. 10-11]

ACEEE also supports EPA's proposal to remove the BEV, PHEV, and FCEV multipliers for MY 2027 (FR 29244), especially in view of the changing environment for the electrification of MDVs, including availability of federal purchase incentives. However, leaving in place advanced technology multipliers through MY 2026 could severely erode the real-world emissions reductions of the proposed standards. In particular, we find that if advanced technology credits were to retain the 5-year life assigned under the Phase 2 rule, credits generated by BEV vans sold in MY 2024-2026 would eliminate the need for manufacturers to produce any of the BEV pickup sales that EPA has projected for MY 2027-2031. Alternatively, these credits could be used to offset the modest medium-duty ICE pickup efficiency gains EPA projects for MY 2027-2031. We recommend that EPA eliminate advanced technology multipliers for MY 2024-2026 in the final rule. [EPA-HQ-OAR-2022-0829-0642, pp. 10-11]

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

That fleetwide-averaging approach is at the heart of EPA's proposed rule at issue—which sets stringent new GHG and criteria-pollutant emission stand- ards for light- and medium-duty vehicles (broad categories that together encompass sedans, pickup trucks and SUVs, vans, and more) for model years 2027 and beyond, Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 29,184 (May 5, 2023)—and its parallel proposed rule for heavy-duty vehicles, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles—Phase 3, 88 Fed. Reg. 25,926 (Apr. 27, 2023). Although prior EPA rules issued under Section 202 have employed fleetwide averaging—including a light-duty motor-vehicle rule for earlier model years, currently being litigated, see Texas v. EPA, No. 22-1031 (D.C. Cir.)—EPA's proposed Light- and Medium-Duty and Heavy-Duty rules do so in a fundamentally different way to achieve a different end. Previously, averaging was presented as merely a flexibility. Now, prompted by an Executive Order calling for a massive shift to "zero-emission vehicles" by 2030 and directing EPA to undertake rulemakings on these issues with that goal in mind, Exec. Order 14,037, 86 Fed. Reg. 43,583 (Aug. 5, 2021); see 88 Fed. Reg. at 29,186, EPA openly seeks in both rules to shift a substantial portion of motor-vehicle production toward vehicles that emit zero GHG emissions in operation. Fleetwide averaging is the linchpin of that ambition—it is this that allows EPA to reverse engineer its preferred outcomes. [EPA-HQ-OAR-2022-0829-0683, p. 7]

Organization: American Fuel & Petrochemical Manufacturers

The structure of the Clean Air Act and its regulatory provisions for standard setting, certification, compliance enforcement, warranties, and penalties also directly conflict with a fleet- wide averaging regulatory regime. Notably, under Section 202(a), EPA "shall test, or require to be tested in such manner as [it] deems appropriate, any new motor vehicle or new motor vehicle engine submitted by a manufacturer" and issue a certificate of conformity "if such vehicle or engine" complies with the standards. And EPA must "test any emission control system incorporated in a motor vehicle or motor vehicle engine . . . to determine whether such a system enables such vehicle or engine to conform to the standards required to be prescribe under [Section 202(b)]" of the Act. EPA's use of a fleetwide averaging regulatory regime directly conflicts with the statutory provisions that Congress already included to provide manufacturers with compliance flexibility. For example, section 202(b)(3) provided compliance flexibilities for NOx, but only for no "more than 5 percent of [a] manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater." This provision would be nonsensical under a fleetwide-averaging regime where, if applied, an OEM could give itself a waiver for large swaths of its fleet by over-complying for certain product lines well beyond its 5 percent or 50,000 vehicle allotment. Together, the Clean Air Act regulatory framework contemplates EPA regulating vehicles individually. But this cannot be accomplished if there is not a clear emission standard applicable to a single vehicle at the start of a model year. [EPA-HQ-OAR-2022-0829-0733, pp. 23-24]

Organization: American Petroleum Institute (API)

iv. EPA exceeded its authority by ignoring the distinctions Congress made between heavy duty vehicles and light-duty vehicles and commingling them in the same averaging, banking, and trading (ABT) program with smaller vehicles.

The Proposed Rule violates this obligation by regulating certain heavy-duty vehicles as light-duty vehicles and by commingling these two classes in the same averaging, banking, and trading program (which, as addressed in subsection iii, above, is unlawfully considered in formulating the proposed emissions standards). [EPA-HQ-OAR-2022-0829-0641, pp. 29-30]

Organization: Aston Martin Lagonda (AML)

SVMs cannot effectively fleet average

One assumption supporting the NPRM which is not applicable to SVMs is that all OEMs have the ability to average the emissions of their various test groups in order to meet a fleet standard. SVMs have long maintained that with only one or two high-performance test groups, they cannot use "averaging" as a compliance strategy and have therefore needed, and still need, the long-standing EPA policy affording extra leadtime and flexibility to SVMs. In the absence of such flexibility, a fleet average standard becomes in effect a required (BIN) standard for these SVMs. [EPA-HQ-OAR-2022-0829-0566, pp. 4-5]

This point further underlines the simple reality that large car makers can achieve lower averages, whereas an SVM with a narrow or niche offering of products simple does not have this ability to comply with the regulation. [EPA-HQ-OAR-2022-0829-0566, pp. 4-5]

It is improper to set a standard so stringent that it requires an SVM to rely entirely on credits from another manufacturer to maintain compliance

EPA projects that SVM fleets on average, and individually, will exceed the proposed standards, requiring purchased credits to continue selling vehicles in the US. EPA therefore relies on credit trading flexibility as a key means by which SVMs will maintain compliance with standards. We disagree with this approach. [EPA-HQ-OAR-2022-0829-0566, pp. 4-5]

It is counterproductive to set a standard so stringent that it requires a manufacturer to rely entirely on credits from another manufacturer to maintain compliance. The decision to sell credits, who to sell them to, at what price to sell them, and when to sell them (or to keep them for drafted later use or future value} is a business decision. There is nothing that requires a manufacturer to sell its credits, or to sell them to a particular party. [EPA-HQ-OAR-2022-0829-0566, pp. 4-5]

This approach would prevent SVMs from focusing valuable resources on investment in the development and production of zero emission cars and instead divert resources to buy credits or pay financial penalties. [EPA-HQ-OAR-2022-0829-0566, pp. 4-5]

On the one hand, EPA justifies its standard setting on the basis that credits can be bought, but on the other hand, EPA steadfastly maintains that it will not get involved in credit trading and leaves it to the free market. As a result, the availability and cost of credits is inherently risky, including the risk that credit-generating manufacturers may strategically withhold credits to limit SVMs' market access. [EPA-HQ-OAR-2022-0829-0566, pp. 4-5]

And finally, compliance with EPA's proposed standards is largely premised on very high levels of electrification. If EPA's projections are incorrect, and sales of electric vehicles are not as high as expected, many manufacturers will likely need to hold onto credits to maintain their own compliance. [EPA-HQ-OAR-2022-0829-0566, pp. 4-5]

Organization: Clean Fuels Development Coalition et al.

C. Even if EPA could use fleetwide averaging, this cannot be used to force electrification.

Part of the reason EPA has traditionally been granted deference in its averaging schemes is because the agency has historically used averaging as an accommodation to regulated parties, allowing them additional flexibility that the statute does not in fact authorize. In prior rules, the use of fleet-wide averaging meant that a vehicle manufacturer could comply by making some vehicles that emitted more and others that emitted less. Thus, while some commentors have pointed out the illegality of this scheme, vehicle manufacturers have not opposed EPA’s averaging approach because it provided them with the flexibility necessary to achieve in a more cost-effective way otherwise impractical standards. [EPA-HQ-OAR-2022-0829-0712, pp. 10-11]

Thus, when considering EPA’s authority to use averaging, the D.C. Circuit has always noted that it was critical that the averaging serve as merely a flexibility. See NRDC v. Thomas, 805 F.2d 410, 425 (D.C. Cir. 1986) (“EPA’s argument that averaging will allow manufacturers more flexibility in cost allocation while ensuring that a manufacturer’s overall fleet still meets the emissions reduction standards makes sense.”) (emphasis added); cf. White Stallion Energy Ctr., LLC v. EPA, 748 F.3d 1222, 1253 (D.C. Cir. 2014) (permitting averaging across multiple utility units under 42 U.S.C. § 7412(d) because averaging is a “‘more flexible, and less costly alternative.’”). [EPA-HQ-OAR-2022-0829-0712, pp. 10-11]

But in this new proposal EPA is not offering an extra statutory accommodation to a regulated party, but is instead taking an additional step away from the statutory text by using fleetwide averaging to mandate electrification. The proposal would set emissions standards in such a way that no fleet of internal combustion engine vehicles can meet the standards. This means that averaging no longer provides flexibility about which kinds of internal-combustion vehicles a manufacturer may sell, but instead amounts to a de facto mandate to incorporate electric vehicles to comply with its proposed standards. Much as in the Clean Power Plan, crediting is deployed as a tool for reverse engineering a share of preferred technologies by setting targets that cannot be achieved by disfavored technologies. Thus, even if the agency was properly entitled to deference in its previous averaging schemes, this deference evaporates when the scheme is used coercively, rather than permissively. [EPA-HQ-OAR-2022-0829-0712, pp. 10-11]

Organization: Environmental and Public Health Organizations

D. The averaging, banking, and trading program continues to be an important way for manufacturers to maintain flexibility in meeting EPA's vehicle emission standards.

Like its previous GHG emission standards for light- and heavy-duty vehicles, and standards for certain vehicle criteria pollutant emissions dating back to 1983, EPA's Proposed Standards rely on an averaging, banking, and trading (ABT) approach allowing manufacturers to meet the standards by averaging emissions across vehicles. Given its longstanding use of this approach under Section 202, EPA's Proposal emphasizes that EPA is "not proposing any revisions to the [light-duty or medium-duty] GHG program ABT provisions or reopening them." 88 Fed. Reg. at 29246; id. at 29245; see also id. at 29277 (similar statement regarding ABT provisions for the proposed criteria pollutant program for NMOG+NOx standards). [EPA-HQ-OAR-2022-0829-0759, p. 85]

We agree with EPA's determination that there is no reason to reopen the question whether it is permissible to use an ABT approach under Section 202. EPA has not only repeatedly used ABT in Section 202 standards but also repeatedly explained that ABT is consistent with and gives full effect to the requirements of Section 202 as well as the Clean Air Act's compliance and enforcement provisions applicable to standards issued under Section 202. Under such circumstances, it is eminently reasonable for EPA not to reconsider a question that has been settled for decades. See Growth Energy v. EPA, 5 F.4th 1, 13 (D.C. Cir. 2021). In promulgating its final standards, EPA should refrain from "substantive reconsideration," id. at 21, of whether ABT is a permissible approach under Section 202, which might inadvertently suggest, notwithstanding the statements in the Proposal, that EPA has reopened the issue. EPA may, of course, express its continued adherence to its previously settled view that Section 202 permits standards using ABT without reopening the issue, and it may respond to any unsolicited comments it may receive on the issue. See Banner Health v. Price, 867 F.3d 1323, 1341 (D.C. Cir. 2017) (quoting Kennecott Utah Copper Corp. v. U.S. Dep't of Interior, 88 F.3d 1191, 1213 (D.C. Cir. 1996)). But reexamination and reconsideration of whether ABT is consistent with the Clean Air Act is unnecessary and uncalled-for. [EPA-HQ-OAR-2022-0829-0759, pp. 85-86]

EPA first promulgated a Section 202 standard that used averaging when it issued its particulate standards for light-duty diesel vehicles in 1983. See 43 Fed. Reg. 33456 (July 21, 1983). EPA explained at that time that standards employing averaging fell within its "broad authority" under Section 202 and were "consistent with the [Clean Air Act's] certification scheme." Id. at 33458. Specifically, the 1983 standard required EPA to certify the conformity of a manufacturer's vehicles with a standard that was established based on a combination of testing of the families of vehicles making up their fleets and planned production volumes. This process would yield a fleet whose average emissions complied with the standard; the certificate would be conditioned on the manufacturer actually "maintain[ing] family production volumes such that the production-weighted average of the manufacturer's family limits indeed meets the standards at year's end." Id. at 33459. As EPA explained, averaging thus accords with the Act's prohibition on the sale of vehicles not covered by a certificate of conformity and allows imposition of appropriate penalties for any violations. [EPA-HQ-OAR-2022-0829-0759, p. 86]

EPA's 1985 standard for NOx emissions from light-duty trucks, as well as for NOx and particulates from HD engines, similarly employed an averaging approach. See 50 Fed. Reg. 10606 (Mar. 15, 1985). EPA's final rulemaking notice again explained that its averaging approach was consistent with the statutory requirement that compliance be certified before vehicles were sold, and that certification was subject to the condition that the certificate would be voided if the manufacturer's production-weighted average emissions did not meet the standard at the end of the model year. See id. at 10633, 10636-37. EPA found that "the averaging concept" was "fully consistent with the technology-forcing mandate of the Act," id. at 10634, while at the same time "eas[ing] the compliance burden" for manufacturers, id. at 10635. [EPA-HQ-OAR-2022-0829-0759, p. 86]

The D.C. Circuit rejected arguments that the 1985 standard's averaging approach was unauthorized under the Clean Air Act in NRDC v. Thomas, 805 F.2d 410 (D.C. Cir. 1986). The court observed that "EPA's agreement that averaging will allow manufacturers more flexibility in cost allocation while ensuring that a manufacturer's overall fleet still meets the emissions reduction standards makes sense." Id. at 425. [EPA-HQ-OAR-2022-0829-0759, pp. 86-87]

Thomas noted that there were potential arguments against averaging that it did not address because they had not been raised before the Agency, including an argument that an averaging approach might not be consistent with the Act's testing and certification provision, Section 206. Id. at 425 n.24. The court suggested that EPA consider this question in future proceedings and provide a further explanation of how averaging conformed to statutory requirements. Id. [EPA-HQ-OAR-2022-0829-0759, p. 87]

EPA took the court up on that invitation in its subsequent 1990 rulemaking proceeding establishing certification programs for banking and trading of NOx and particulate emission credits for HD engines. That rulemaking resulted in an expanded averaging regime, with the addition of provisions for banking and trading of credits generated if manufacturers production-weighted average emissions were below the requirements of the NOx and particulate standards. See 55 Fed. Reg. 30584, 30584-86 (July 26, 1990). Both in the final rulemaking notice and the proposal for those standards, EPA addressed the issues flagged in Thomas and explained at length how the ABT program conformed with the Clean Air Act's certification requirements. See id. at 30593-94 (final rule); 54 Fed. Reg. 22652, 22665-67 (May 25, 1989) (proposed rule). EPA articulated in detail how its ABT approach entails presale certification of the conformity of each engine or vehicle with the applicable standards based on testing of emissions generated by engine families and projected production estimates, with certification conditioned on a final end-of-model-year determination that a manufacturer's actual production-weighted average emissions comply with the standard. See 55 Fed. Reg. at 30585, 30594, 30600-04. These features of the ABT program, EPA explained, facilitate application of the Act's enforcement and penalty provisions. See id. at 30594, 30603-04. EPA similarly used ABT in its Tier 2 light-duty NOx standards promulgated in 2000. See 65 Fed. Reg. at 6744. [EPA-HQ-OAR-2022-0829-0759, p. 87]

Having determined in these earlier rules that ABT standards are consistent with Section 202, EPA employed the ABT approach pioneered in the 1990 HD standards when it first adopted GHG standards for LDVs in 2010 and HD engines and vehicles in 2011. See 75 Fed. Reg. 25324, 25405 (May 7, 2010); 76 Fed. Reg. 57106, 57127-28 (Sept. 15, 2011). In each case, EPA explained at length how, in implementing ABT standards, it fulfills its statutory obligations to certify conformity of vehicles or engines with the standards before they are introduced into commerce, to require warranties of compliance, and to test for in-use compliance. See 75 Fed. Reg. at 25468-77; 76 Fed. Reg. at 57254-92. EPA also explained how, under an ABT approach, it would give full effect to the statute's provision for calculation of penalties for each nonconforming vehicle in the event of a violation of the standards. See 75 Fed. Reg. at 25482; 76 Fed. Reg. at 57257. [EPA-HQ-OAR-2022-0829-0759, p. 87]

Subsequent iterations of GHG and other motor-vehicle emission standards under Section 202 for both LD and HD vehicles and engines have likewise used an ABT approach consistent with that used in the 2010 and 2011 GHG standards. See 77 Fed. Reg. 62624, 62788 (Oct. 15, 2012) (LD GHG standards); U.S. EPA, Control of Air Pollution From Motor Vehicles: Tier 3 Motor Vehicle Emission and Fuel Standards; Final rule, 79 Fed. Reg. 23414, 23419 (LD and HD Tier 3 NOx standards); 81 Fed. Reg. 73478, 73495 (Oct. 25, 2016) (HD Phase 2 GHG standards); 85 Fed. Reg. 24174, 25103-04, 25114 (Apr. 30, 2020) (LD GHG standards); 86 Fed. Reg. 74434, 74441 (Dec. 30, 2021) (LD GHG standards). In none of those rulemaking proceedings did EPA reopen the issue whether Section 202 permits use of ABT in standard-setting; the Agency treated the option to use ABT under Section 202 as a settled matter. [EPA-HQ-OAR-2022-0829-0759, p. 88]

The Agency's settled practice of using ABT in Section 202 standards from 1990 onward did not generate further legal challenges until the most recent set of light-duty GHG standards. As to the latter standards, however, petitioners challenging the standards have argued in review proceedings pending in the U.S. Court of Appeals for the D.C. Circuit that Section 202 permits only the use of standards that specify emissions limits on an individual-vehicle basis, and that standards employing averaging render the Clean Air Act's compliance and enforcement provisions meaningless. See Final Br. for Priv. Petitioners, Texas v. EPA, Case No. 22-1031 (D.C. Cir. Apr. 27, 2023), ECF No. 1996915, at 36-50. EPA rejected those arguments when it considered them in the 1990 rulemaking, and they run counter to the settled construction of the statute on the basis of which EPA has issued standards since that time. EPA's brief in the D.C. Circuit and the brief of the state and nongovernmental organizations supporting EPA explain that challenges to ABT are untimely attempts to challenge determinations made decades ago, but also detail the reasons ABT is consistent with the language and structure of Section 202 and the applicable enforcement and compliance provisions of the Act. See EPA Br. 34-39, 62-75; State & Pub. Int. Br. at 3-6, 9-17. [EPA-HQ-OAR-2022-0829-0759, p. 88]

In sum, the Proposal's statements that "EPA has included ABT in many programs across a wide range of mobile sources," 88 Fed. Reg. at 29245, and that the "ABT provisions are an integral part of the vehicle GHG program," id. at 29246, are unquestionably accurate. Given that EPA long ago addressed and resolved the lawfulness of ABT under Section 202, that EPA's use of ABT is consistent with the D.C. Circuit's precedent in Thomas, that EPA has repeatedly explained how the statute's certification, warranty, testing, and enforcement provisions function effectively in the context of ABT, and that the arguments against the use of ABT are essentially the same as those discussed in Thomas and revisited in the round of rulemaking that followed, there is no reason for the Agency to reopen these settled questions by reexamining them substantively in this rulemaking (or appearing to do so). The Agency should adhere to its statement in the Proposal that it is not reopening these issues. [EPA-HQ-OAR-2022-0829-0759, p. 88]

To foster understanding of how the Act's testing, certification, warranty, in-use compliance, and penalty provisions operate in the context of a standard using ABT, it may be useful to include in the final rule's preamble a clear description of how EPA uses testing and manufacturers' production plans to issue certificates of conformity before vehicles or engines are marketed; how manufacturers warrant compliance; how EPA determines in-use compliance; how EPA determines whether a manufacturer's vehicles and engines have met the conditions imposed on their initial certification by ultimately complying with the production-weighted emission standards to which they are subject; and, in the event of noncompliance, how EPA would identify noncompliant vehicles and impose penalties or other remedies. If it does so, EPA should make clear that it is describing the operation of the statute and the ABT rules, not reexamining EPA's settled view that its ABT standards and their implementation conform to the Act's requirements. [EPA-HQ-OAR-2022-0829-0759, p. 89]

Although the Agency need not, and should not, reconsider the lawfulness of ABT standards under Section 202, EPA's analysis more than adequately explains the benefits of continuing to use the ABT approach for this latest set of emission standards. EPA's analysis of the benefits ABT provides in this context, see 88 Fed. Reg. at 29342-43, amply justifies the Agency's choice of retaining the ABT approach for this set of standards. As EPA has indicated, the ABT structure allows EPA to require the reductions in vehicle pollutant emissions that are essential to addressing the endangerment of public health and welfare attributable to those emissions in a manner that best balances the need for significant cuts in emissions with the requirement that standards be feasible and achievable within the time allowed for compliance. The ABT approach "recognize[s] that automakers typically have compliance opportunities and strategies that differ across their fleet, as well a multi-year redesign cycle, so not every vehicle will be redesigned every year to add emissions-reducing technology;" ABT allows manufacturers to keep pace with required improvements by overcomplying with newly designed or redesigned vehicles while other vehicles whose designs are already locked in undercomply. 88 Fed. Reg. at 29342. Thus, "performance-based standards with ABT provisions give manufacturers a degree of flexibility in the design of specific vehicles and their fleet offerings, while allowing industry overall to meet the standards and thus achieve the health and environmental benefits projected for this rulemaking at a lower cost." Id. at 29343. These benefits of the ABT approach are recognized by regulators, environmental advocates, and industry alike. See Final Answering Br. for Intervenor Alliance for Automotive Innovation, Texas v. EPA, Case No. 22-1031 (D.C. Cir. Apr. 27, 2023), ECF No. 1996757, at 8-9 (stating that ABT has "been essential to the auto industry's efforts to meet EPA's increasingly ambitious goals for greenhouse gas reduction" and that "the automotive industry has relied for more than a generation" on ABT "to enable cost-effective emissions reductions"). These considerations more than justify EPA's continued use of this approach for purposes of these standards. [EPA-HQ-OAR-2022-0829-0759, p. 89]

Organization: Environmental Defense Fund (EDF)

B. EPA properly decided not to reopen its longstanding use of averaging, banking, and trading.

EPA has used an ABT approach in standards for light- and heavy-duty vehicles since the 1980s, including each of its previous light-duty GHG rules upon which this proposal builds. Within this decades-long history, EPA has repeatedly explained why such an approach is reasonable and consistent with the text of Section 202. Based on EPA's settled and longstanding use of ABT in its Section 202 rules and ABT's well-established basis in the statute, the agency's decision not to reopen "the basic structure of the ABT program" is reasonable. [EPA-HQ-OAR-2022-0829-0786, p. 12]

Organization: Jaguar Land Rover NA, LLC (JLR)

We particularly support the EPA's continuation of the existing regulation in two areas:

Credit Banking and Trading Flexibilities [EPA-HQ-OAR-2022-0829-0744, pp. 3-4]

JLR fully supports EPA's decision to make no changes to averaging, banking, and trading provisions. We commend the agency for the continued inclusion of the flexibility to carry backwards and forwards the overcompliance in a given calendar year to offset any shortfalls in another year. As a lower volume manufacturer, JLR relies on this flexibility due to our limited product line up with typically less than half the opportunities to introduce new models and technologies to the market compared to larger manufacturers. We believe flexibilities are a fundamental part of any GHG or ZEV regulation. They allow for car manufacturers' different plans and launch cadences, allowing each manufacturer to develop their own path for compliance. [EPA-HQ-OAR-2022-0829-0744, pp. 3-4]

Credit Trading between Manufacturers

JLR disagrees with the conclusion that EPA has come to with regards to calculating the feasibility of the regulation including the purchase of credits as a viable compliance option as referenced in the NPRM. "…EPA has included the ability of manufacturers to trade credits as part of our central case compliance modeling for this proposal, rather than as a sensitivity analysis as we did in the modeling for the 2021 rule." [EPA-HQ-OAR-2022-0829-0744, p. 9]

As there is no option to resolve non-compliance through a fine payment, EPA should not determine the feasibility of a regulation that includes a pathway where an OEM potentially has to rely on a competitor to achieve compliance, especially as there is no requirement that an OEM must sell the credits they have generated. [EPA-HQ-OAR-2022-0829-0744, p. 9]

The GHG regulation should be designed to ensure there are sufficient flexibilities in the regulation for the manufacturer to achieve compliance on its own. This ensures that a car manufacturer's budget is spent on funding its transition to an EV future. JLR does not view fine payment as an appropriate compliance route or as a flexibility in the regulation, but we would like to highlight one benefit of a fine is to help set an appropriate price of credits. As it is absent in this regulation, there is no limit on credit price, which further compounds the significant planning uncertainty. [EPA-HQ-OAR-2022-0829-0744, p. 9]

From the 2022 EPA Automotive Trends Report as detailed in Table 5.15, the balance of credit/debit generation by industry resulted in a credit deficit across 2016-2021MY, with only historical banked credits bridging the gap. If this trend continues, we can expect less availability of credits in the market. Even for those companies producing electric vehicles only, the number of credits they will have available to sell will reduce over time as the stringency of the regulation increases which could lead to increases in credit prices. [EPA-HQ-OAR-2022-0829-0744, p. 9]

In response to EPA's suggestion of alternative routes to compliance if an OEM chooses not to partake in credit trading. "…manufacturers also could elect to shift market segments and sales volumes as a strategy for increasing the proportion of credit-generating vehicles relative to debit-generating vehicles." This is correct, however JLR disagrees that it is a viable option within the regulation time period due to the lead time involved with such a drastic restructure of a manufacturer's product plans. [EPA-HQ-OAR-2022-0829-0744, p. 9]

JLR requests that EPA excludes the ability of manufacturers to trade credits from the central case compliance model. [EPA-HQ-OAR-2022-0829-0744, p. 9]

Organization: Kia Corporation

Kia strongly supports the ABT credit program remaining unchanged. The ABT program is critical for automakers to plan and strategize product planning with long-term compliance. Kia agrees that the ABT program encourages technological innovations and helps increase fleetwide emissions. Kia emphasizes that keeping the ABT program does not resolve all potential lead time and cost challenges. [EPA-HQ-OAR-2022-0829-0555, pp. 12-13]

Organization: MECA Clean Mobility

Advanced technology credit multipliers for PHEV, BEV and FCEV should end before MY 2027. [EPA-HQ-OAR-2022-0829-0564, pp. 35-36]

Analyses by ICCT and researchers at Carnegie Mellon have shown that extended use of super credits in the light-duty sector has resulted in the unintended consequence of increased emissions from the non-ZEV fleet as it is allowed to emit more under a fleet average regulatory structure that includes averaging, banking and trading provisions. Given the considerable incentives created by the Inflation Reduction Act (IRA) and Bipartisan Infrastructure Law (BIL) and other federal and state programs supporting the production, sale and operation of medium-duty zero tailpipe emitting vehicles, MECA agrees that Advanced Technology Multipliers for PHEVs, BEVs and FCEVs are no longer needed for medium-duty vehicles beyond MY 2026. Similar to the light-duty sector, an over-incentivized credit scheme for medium-duty ZEVs is likely to result in market distortions that will reduce the broader deployment of electric and hydrogen fuel cell powertrains and thus decrease the benefits anticipated by the standards. [EPA-HQ-OAR-2022-0829-0564, pp. 35-36]

Organization: Porsche Cars North America (PCNA)

Credits will help leverage the averaging, banking, and trading (ABT) portion of the CO2 regulation that EPA notes in the NPRM as being an important and successful part of the regulation. The extent to which electric vehicles can earn additional credits through flexibilities will further enhance the benefits of ABT by providing additional credit liquidity to be traded by manufacturers. ABT is a successful incentive for manufacturers to over comply and an important flexibility for manufacturers who may fall short in a single year. Porsche does not see the programmatic value in reducing liquidity within the ABT market, especially given the ambition of the future proposed standards. [EPA-HQ-OAR-2022-0829-0637, p. 20]

Organization: Southern Environmental Law Center (SELC)

EPA should continue to tailor compliance flexibilities to close loopholes. [EPA-HQ-OAR-2022-0829-0591, pp. 9-10]

The credit system is a longstanding component of federal tailpipe emissions standards. [EPA-HQ-OAR-2022-0829-0591, pp. 9-10]

Credits issued for overcompliance with the standards can be averaged, banked, or traded, allowing vehicle manufacturers to design compliance strategies that best suit their unique fleet composition. It is critical, however, that EPA carefully construct these credit systems in a way that balances compliance flexibility and incentivization of innovation with the inevitable loss of stringency of the standards that result from the use of credits. [EPA-HQ-OAR-2022-0829-0591, pp. 9-10]

We therefore support EPA's proposal to not restore the advanced technology credit multipliers for light-duty vehicles that currently end in model year 2024, and to end advanced technology credit multipliers for medium-duty vehicles in model year 2027. Two of the three advanced technologies currently provided favorable treatment through the application of credit multipliers—BEVs and PHEVs—are common technologies in today's marketplace. The use of credit multipliers for these technologies would create a compliance loophole that allows manufacturers to continue making and selling dirtier vehicles and could result in backsliding on emissions reductions. For these same reasons, we also urge EPA to consider phasing out credit multipliers for medium-duty vehicles prior to model year 2027. [EPA-HQ-OAR-2022-0829-0591, pp. 9-10]

Organization: Strong Plug-in Hybrid Electric Vehicle (PHEV)

EPA, in the final rule or future rule, should include a true-up system for automaker's FUF where debits or credits are provided based on actual data from on-board diagnostics and reporting by automakers of a fairly large sample. In other words, under this proposal, an automaker would lose or gain credits after-the-fact based on actual data on how consumers drive both new and older PHEVs. If EPA opts not to do this, we request that EPA should, at minimum, require manufacturers in this rulemaking to share anonymized actual data from PHEVs so that in future years, the EPA can make informed decisions about the FUF based upon real world data. [EPA-HQ-OAR-2022-0829-0646, p. 7]

Our coalition is supportive of continuing averaging, banking and trading (ABT) provisions as long as it is technology neutral, and performance based and does not favor engine-based technology for either current or future vehicles. Specifically, an ABT program should reward automakers who are making PHEVs, BEVs and FCEVs today by allowing these credits to carry forward into the new MY 2027 program. We also support including the ability to trade the CO2 reduction benefits of PHEVs, BEVs and FCEVs between different sizes and types of vehicles until at least MY 2032. We believe this is a modest way to help encourage the most advanced clean technologies in this regulation. [EPA-HQ-OAR-2022-0829-0646, p. 10]

Organization: Valero Energy Corporation

a) The statutory structure confirms EPA lacks statutory authority to use fleetwide averaging to mandate ZEVs.

EPA's proposal would require electrification by setting average emission standards for manufacturers' nationwide fleets and "averaging" in more and more zeros to represent the electric vehicles it wants to see in future years. Manufacturers that exceed the standards may bank credits and trade them to other manufacturers that fall short. [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

EPA relies on NRDC v. Thomas, 805 F.2d 410 (D.C. Cir. 1986), for the proposition that it is authorized to average vehicles. That case found EPA could average a manufacturer's different engine families. Id. at 425. It did so, however, with some caveats. First, its reasoning was based on a deference to EPA's interpretation of the statute "in the absence of clear evidence Congress meant to prohibit averaging." This standard, of course, is directly contrary to the standard applicable in this case in which EPA is proposing regulations that affect a major question—clear Congressional authority to permit averaging to mandate electric vehicles. Second, the parties failed to raise a textual argument against averaging. Id. at n.24 ("Although it was not raised by any party before the agency, and accordingly cannot be dispositive here … there is an additional argument against emissions averaging. The Act's testing and certification provision, 42 U.S.C. § 7525 [Link: https://1.next.westlaw.com/Link/Document/FullText?findType=L&pubNum=1000546&cite=42USCAS7525&originatingDoc=I80714eef94d311d9a707f4371c9c34f0&refType=LQ&originationContext=document&transitionType=DocumentItem&ppcid=0591cc222593448083058c4608d3c583&contextData=(sc.UserEnteredCitation)], speaks of 'any,' 'a,' or 'such' motor vehicle or engine being tested and certified. With averaging, some vehicles or engines would not be required to comply with the standards and would not be subject to NCPs for failing to so comply. This practice appears inconsistent with the requirement that 'any,' 'a,' or 'such' vehicle or engine be tested and required to comply with emissions standards."). [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

On the other hand, EPA has previously acknowledged that the Act is silent on the mechanisms of averaging, banking, and trading (ABT). When EPA first adopted fleetwide averaging, it recognized that "Congress did not specifically contemplate an averaging program when it enacted the Clean Air Act." 48 Fed. Reg. 33,456, 33,458 (July 21, 1983). And "[j]ust as the statute does not explicitly address EPA's authority to allow averaging, it does not address the Agency's authority to permit banking and trading." 54 Fed. Reg. 22,652, 22,665 (May 25, 1989); see 55 Fed. Reg. 30,584, 30,593 (July 26, 1990) (same). By definition, then, the Act does not address—let alone clearly authorize—the use of averaging, banking, and trading to electrify the Nation's vehicle fleet. [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

That should be the end of the analysis. Section 202 of the Clean Air Act does not itself "direct [conventional vehicles] to effectively cease to exist." West Virginia, 142 S. Ct. at 2612 n.3. EPA has instead relied on mechanisms that are not themselves spelled out in the statute and that have never before been used to mandate LD and MD electric vehicles. Just as in West Virginia, EPA has nothing "close to the sort of clear authorization" necessary for such a transformational policy shift. 142 S. Ct. at 2614. [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

But in truth, the problem is far worse for EPA than that. As explained below, the Act unambiguously precludes fleetwide-average emission standards under Section 202(a). And even if the statute permitted some fleetwide averaging, it does not allow EPA to take the additional step of incorporating non-emitting vehicles into emission averages and thus forcing the market toward electric vehicles. The proposal is not merely stretching vague statutory language. It is defying clear statutory text. [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

The text and structure of Section 202, and of Title II more broadly, unambiguously require that emission standards under Section 202(a) apply to individual vehicles, not manufacturers' fleets on average. EPA claims to find authority for fleetwide averaging in Section 202(a), which authorizes EPA to issue "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles ... which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a). [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

On its face, that provision authorizes EPA to set standards for vehicles that emit harmful air pollutants. It says nothing about averaging across fleets. As noted, when EPA first adopted fleetwide averaging, it acknowledged that "Congress did not specifically contemplate an averaging program when it enacted the Clean Air Act." 48 Fed. Reg. at 33,458. EPA claimed to have the authority because the Act "does not explicitly preclude standards" based on averaging. 54 Fed. Reg. at 22,666 (emphasis added). EPA was wrong. "[T]he broader context of the statute as a whole," Robinson v. Shell Oil Co., 519 U.S. 337, 341 (1997), makes clear that Section 202(a) does not permit fleetwide averaging. And, even if EPA could somehow show that the statute tacitly or implicitly allows (or does not expressly preclude) averaging, that would still be insufficient to meet the necessary clear congressional authority to use fleetwide averaging as a means to force a transition from internal-combustion engines to ZEVs. [EPA-HQ-OAR-2022-0829-0707, pp. 78-80]

a. Other provisions in Section 202 demonstrate that emission standards may not be based on averaging.

Title II is replete with provisions that necessarily apply to vehicles individually, not to fleets on average. That is evident first in the emission standards prescribed by Section 202 itself. For example, in Section 202(b), the Act sets forth specific light-duty vehicle emission standards that EPA must promulgate in "regulations under" Section 202(a). 42 U.S.C. § 7521(b). For vehicles in model years 1977 to 1979, the standards must provide that "emissions from such vehicles and engines may not exceed 1.5 grams per vehicle mile of hydrocarbons and 15.0 grams per vehicle mile of carbon monoxide." Id. § 7521(b)(l)(A). [EPA-HQ-OAR-2022-0829-0707, pp. 80-81]

Those provisions require that the "regulations under [Section 202(a)]" apply to "vehicles and engines," not "vehicles and engines on an average basis across a fleet." Construing those provisions to allow averaging would, in effect, add words to the statute that change its meaning. Neither courts nor agencies may "supply words ... that have been omitted." Antonin Scalia & Bryan Garner, Reading Law: The Interpretation of Legal Texts 93 (2012); accord Rotkiske.v. Klemm, 140 S. Ct. 355, 360-361 (2019). And supplying the extra words "on average" would have a significant substantive effect: "roller coaster riders must be 48 inches tall" means something very different from "roller coaster riders must be 48 inches tall on average." [EPA-HQ-OAR-2022-0829-0707, pp. 80-81]

The testing requirements accompanying the Section 202(b) standards confirm that those standards apply to all vehicles. In particular, EPA must "test any emission control system incorporated in a motor vehicle or motor vehicle engine ... to determine whether such system enables such vehicle or engine to conform to the standards required to be prescribed under [Section 202(b) of the Act]." 42 U.S.C. § 7525(a)(2). If the system complies, EPA must issue a "verification of compliance with emission standards for such system." Id. Those requirements plainly contemplate standards that apply to individual vehicles and their emission-control systems. Not only does the statutory text frame the inquiry as whether an individual "vehicle" or "engine" conforms to the emission standards, but the provision's foundational premise-that an emission-control system can enable a vehicle to meet emission standards depends on individually applied standards. [EPA-HQ-OAR-2022-0829-0707, pp. 80-81]

Other parts of Section 202 further demonstrate that emission standards under Section 202(a) cannot rely on averaging. Section 202(b)(3), for example, authorizes EPA to grant waivers from certain nitrogen-oxide emission standards—which, again, are standards "under" Section 202(a), see 42 U.S.C. § 7521(b)(l)(B)—for no "more than 5 percent of [a] manufacturer's production or more than fifty thousand vehicles or engines, whichever is greater." Id. § 7521(b)(3). This provision would be nonsensical under a fleetwide-averaging regime. It contemplates a default under which every vehicle meets a standard, then gives manufacturers a waiver from that default for up to 5% of the fleet. But under fleetwide averaging, no waiver is needed. Instead, a vast proportion of a manufacturer's fleet—perhaps 50% or more— effectively has a "waiver" so long as a sufficient number of vehicles outperform the standard. Likewise, Section 202(g), which specifies an increasing "percentage of each manufacturer's sales volume" of each model year's vehicles that must comply with specified emission standards, is fundamentally incompatible with averaging. Id. § 7521(g)(l). [EPA-HQ-OAR-2022-0829-0707, pp. 80-81]

Similarly, under Section 202(m), EPA must require manufacturers to install on "all" new light-duty vehicles and trucks "diagnostic systems" capable of identifying malfunctions that "could cause or result in failure of the vehicles to comply with emission standards established under this section." Id. § 7521(m)(l). As this requirement makes clear, individual vehicles must "comply with emissions standards established under [Section 202]." Id. Otherwise, requiring diagnostic equipment on "all" vehicles makes no sense. In a fleetwide-averaging regime, this requirement would be pointless, as the deterioration or malfunction of an individual vehicle's emission-related systems would provide virtually no information about whether the fleet as a whole is compliant. [EPA-HQ-OAR-2022-0829-0707, pp. 80-81]

b. Title II’s compliance and enforcement provisions for emission standards confirm that EPA cannot use fleetwide averaging.

Fleetwide averaging also clashes with "the design and structure of [Title II] as a whole." Utility Air, 573 U.S. at 321 (citation omitted). Title II sets forth a comprehensive, interlocking scheme for enforcing emission standards through testing, certification, warranties, remediation, and penalties. Fleetwide-average standards are incompatible with these provisions, which are "designed to apply to" individual vehicles and "cannot rationally be extended" to fleets. Id. at 322. [EPA-HQ-OAR-2022-0829-0707, pp. 81-82]

Testing and Certification. Under Title II, EPA must "test, or require to be tested in such manner as [it] deems appropriate, any new motor vehicle or new motor vehicle engine submitted by a manufacturer to determine whether such vehicle or engine conforms with the regulations prescribed under [Section 202]." 42 U.S.C. § 7525(a)(l). If the "vehicle or engine conforms to such regulations," EPA must issue the manufacturer a "certificate of conformity." Id. EPA may later test a manufacturer's vehicles and engines, and if "such vehicle or engine does not conform with such regulations and requirements, [EPA] may suspend or revoke such certificate insofar as it applies to such vehicle or engine." Id. § 7525(b)(2)(A)(ii). A manufacturer may not sell a vehicle or engine not "covered by a certificate of conformity." Id. § 7522(a)(l). [EPA-HQ-OAR-2022-0829-0707, pp. 81-82]

Fleetwide averaging is incompatible with these requirements in at least two respects. First, by using the singular terms "vehicle" and "engine," along with "any" and "such," the statute contemplates that individual vehicles may be tested, determined to "not conform" with the standards, and have their certificates of conformity suspended or revoked. In a fleetwide-averaging regime, testing an individual vehicle or engine does not enable EPA to determine whether it "conforms with the regulations prescribed under [Section 202]," 42 U.S.C. § 7525(a)(l), because conformity turns not on an individual vehicle's emissions but on the fleet's average performance overall. Second, fleetwide averaging also makes it impossible to determine compliance with applicable emission standards before a vehicle is sold, as required to obtain the certificate of conformity needed for a sale. See 42 U.S.C. § 7522(a)(l). Under fleetwide-average standards, a vehicle's "conform[ity] with the regulations prescribed under [Section 202]" cannot be determined until the manufacturer calculates its production-weighted average at "the end of each model year," when the manufacturer knows the quantity and model of "vehicles produced and delivered for sale." 40 C.F.R. §§ 86.1818-12(c)(2)(2), 86.1865-12(i)(l), (j)(3). [EPA-HQ-OAR-2022-0829-0707, pp. 81-82]

For similar reasons, fleetwide averaging is inconsistent with the statutory definition of an "emission standard," which "limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis." 42 U.S.C. § 7602(k). It is impossible to know on a "continuous basis" whether a manufacturer's fleet complies with EPA's proposed average standards, because a manufacturer cannot calculate its production-weighted average until the end of the year. Simply put, an after-the-fact compliance regime is incompatible with the Act's testing and certification scheme. [EPA-HQ-OAR-2022-0829-0707, pp. 81-82]

Warranties and Remediation. Fleetwide-average standards similarly clash with Title II's warranty provisions. Under Section 207, a manufacturer must "warrant to the ultimate purchaser and each subsequent purchaser" "at the time of sale" that each new vehicle complies with applicable regulations under [Section 202]. 42 U.S.C. § 7541(a)(l) (emphasis added). Yet, as with certificates of conformity, manufacturers cannot warrant conformity with fleetwide-average emission standards at the time of sale, because compliance can be determined only at the end of the year. See 40 C.F.R. § 86.1865-12(i)(l) (requiring manufacturers to compute their "production weighted fleet average" by "using actual production [data]" for the year in question). [EPA-HQ-OAR-2022-0829-0707, pp. 82-83]

Fleetwide-average emission standards are also inconsistent with Title II's remediation and notification provisions. Those provisions state that if EPA "determines that a substantial number of any class or category of vehicles or engines ... do not conform to the regulations prescribed under [Section 202]," the manufacturer must remedy "the nonconformity of any such vehicles or engines." 42 U.S.C. § 7541(c)(l). If "a motor vehicle fails to conform," the manufacturer bears the cost. Id. § 7541(h)(l). Further, "dealers, ultimate purchasers, and subsequent purchasers" must be given notice of any nonconformity, id. § 7541(c)(2), which requires identification of specific nonconforming vehicles. None of this is possible where the nonconformity is tied to a fleet on average. [EPA-HQ-OAR-2022-0829-0707, pp. 82-83]

c. The broader text and history of Title II confirm that the rule exceeds EPA's authority through fleetwide averaging.

Other indicia of statutory meaning demonstrate that the proposed rule exceeds EPA's statutory authority under Section 202(a). Elsewhere in Title II, Congress showed that it knew how to legislate with respect to "average annual aggregate emissions." 42 U.S.C. § 7545(k)(l)(B)(v)(II) (directing EPA to take certain actions if "the reduction of the average annual aggregate emissions of toxic air pollutants in a [designated district] fails to meet" certain standards). [EPA-HQ-OAR-2022-0829-0707, pp. 83-84]

Thus, "if Congress had wanted to adopt an [averaging] approach" for motor vehicle standards under Section 202(a), "it knew how to do so." SAS Inst., Inc. v. Iancu, 138 S. Ct. 1348, 1351 (2018); see Rotkiske, 140 S. Ct. at 360-361 ("Atextual judicial supplementation is particularly inappropriate when, as here, Congress has shown that it knows how to adopt the omitted language or provision."). It did not choose that approach in Section 202(a). [EPA-HQ-OAR-2022-0829-0707, pp. 83-84]

The Energy Policy Conservation Act, enacted just two years before the 1977 Clean Air Act amendments, reinforces that conclusion. There, Congress directed the Secretary of Transportation to issue regulations setting "average fuel economy standards for automobiles manufactured by a manufacturer" in a given model year. 49 U.S.C. § 32902(a). That Congress has not used similar language in Section 202(a) of the Clean Air Act is a "telling clue" that the Act does not permit fleetwide averaging. Epic Sys. Corp. v. Lewis, 138 S. Ct. 1612, 1626 (2018). [EPA-HQ-OAR-2022-0829-0707, pp. 83-84]

The Clean Air Act's history also reflects Congress's understanding that emission standards would apply to all vehicles individually. Congress was so focused on reducing emissions at the level of the individual vehicle that, in the 1970 amendments, Congress permitted EPA to test any individual vehicle as it comes off the assembly line. See Pub. L. No. 91-601, § 8, 84 Stat. 1676, 1694-1696. Such a vehicle-by-vehicle test was meant to supplement the pre-1970 testing of prototypes. Congress explained that while testing of prototypes "will continue," "tests should require each prototype rather than the average of prototypes to comply with regulations establishing emission standards." H.R. Rep. No. 91-1146, at 6 (1970). And if Congress forbade averaging across prototypes, it certainly did not permit averaging across entire fleets. [EPA-HQ-OAR-2022-0829-0707, pp. 83-84]

d. Related provisions confirm that Section 202(a) does not authorize averaging of non-emitting electric vehicles.

Other provisions of the Clean Air Act drive home the lack of statutory authorization to mandate electrification as well. In the Clean Air Act Amendments of 1990, Congress spoke directly to the phase-in of electric vehicles on America's roads. Congress instructed EPA to establish standards for "clean-fuel vehicles" operating on "clean alternative fuel," including "electricity." Pub. L. No. 101-549, § 229, 104 Stat. 2399, 2513 (codified at 42 U.S.C. §§ 7581(2), (7), 7582(a)). Congress required that certain areas of the country with the worst pollution would have to "phase-in" a "specified percentage" of "clean-fuel vehicles" using "clean alternative fuels" (defined to include "electricity") in certain fleets. 42 U.S.C. § 7586; see id. § 758l(a). The 1990 amendments highlight that Congress knows how to clearly establish standards that apply to electric vehicles, and to directly require that such vehicles be phased into a particular fleet. But Congress chose to do so only on a targeted, regional basis. The contrast between the 1990 amendments and Section 202(a) highlights the absence of any statutory authority for EPA's rule. [EPA-HQ-OAR-2022-0829-0707, p. 84]

Other related statutes also suggest the same. In the Energy Policy Act of 1992, Congress directed NHTSA to set fuel-economy standards based on averages, but prohibited NHTSA from setting fuel-economy standards that average in the fuel economy of electric vehicles. See Pub. L. No. 102-486 §§ 302, 403, 106 Stat. 2776, 2870-2871, 2876 (later codified at 49 U.S.C. § 32902(h)). This prohibition bars NHTSA from doing exactly what EPA is doing here: misusing its regulatory authority to force a transition from conventional vehicles to electric vehicles by artificially tightening the "average" standard a fleet must meet. Of course, when Congress finalized the language of Section 202(a)(l) in 1977, it had no need to explicitly block EPA from considering electric vehicles, because it did not contemplate that EPA would set emission standards using averaging in the first place (or that EPA would be setting standards for greenhouse gases). The prohibition on NHTSA nevertheless underscores just how far EPA is reaching here: it is straining statutory language to seize a power that Congress expressly denied to a sister agency that actually has authority to promulgate fleetwide-average standards. [EPA-HQ-OAR-2022-0829-0707, p. 84]

e. EPA’s lack of authority for a credit-trading scheme further confirms its lack of authority to set fleetwide averages.

The proposal’s credit banking and trading program is critical to EPA's electrification mandate. But the agency also lacks authority under Title II to establish a credit scheme as part of its emission standards under Section 202(a). [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

As with fleetwide averaging, EPA has previously acknowledged that Title II says nothing about banking and trading credits in connection with motor-vehicle emission standards. See 54 Fed. Reg. at 22,665. What EPA has ignored, however, is that Title II is not silent regarding banking and trading in other contexts. Indeed, in multiple other provisions under Title II, Congress expressly authorized the use of bankable and tradable credits. See, e.g., 42 U.S.C. § 7545(k)(7) (reformulated gasoline credits); § 7545(o)(2)(A)(ii)(II)(cc), (5)(A)(i) (renewable fuel credits); id. § 7545(o)(2)(A)(ii)(II)(cc), (5)(A)(ii) (biodiesel credits); id. § 7545(o)(2)(A)(ii)(II)(cc), (5)(A)(iii) (small refineries credits); id. § 7586(f) (clean- fuel fleet-operator credits); id. § 7589(d) (California pilot test program's clean-fuel vehicle manufacturer credit). [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

Under EPA's proposed approach, those provisions would all be superfluous, because EPA already had the discretion to adopt a credit-trading regime for any program. If Congress had wanted to permit credits in connection with emission standards under Section 202(a), it knew how to and would have done so expressly. See SAS Inst., 138 S. Ct. at 1351. [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

For all these reasons, courts have cast substantial doubt on EPA's authority to set fleetwide-average emission standards. As the D.C. Circuit Court of Appeals explained in NRDC v. Thomas, 805 F.2d 410 (D.C. Cir. 1986), the "engine specific thrust" of Title II's "testing and compliance provisions" is evident both in Congress's choice to "spea[k] of 'any,' 'a,' or 'such' motor vehicle or engine" in the text of the statute and in the "troubling" legislative history recounted above. Id. at 425 n.24. The arguments were not dispositive in Thomas only because the parties there had failed to present them. Id. But the Court nevertheless recognized that the arguments were relevant to "future proceedings." Id.. [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

f. At a minimum, EPA may not use fleetwide averaging to require electrification.

Despite the absence of statutory authorization for fleetwide averaging, EPA has long employed that mechanism without significant industry pushback. That is likely because fleetwide averaging has generally been offered as an accommodation to regulated parties, allowing them flexibility that the statute does not in fact permit. In its current proposal, however, EPA is not offering an extra statutory accommodation. It is taking an additional step away from the statutory text by using fleetwide averaging to mandate electrification. [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

To be clear, in prior rules EPA set an average emission standard and allowed manufacturers to make some vehicles that emitted more and some that emitted less. Here, EPA has set tailpipe emission standards at a level so stringent that manufacturers must incorporate an increasing percentage of LD and MD electric vehicles—which EPA treats as zero-emission vehicles—into their averages in order to comply with the "standards." See p. 13, supra. Put differently, the agency is proposing an emission standard that is artificially low because it incorporates electric vehicles, which EPA treats as emitting zero pollutants for averaging purposes. [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

Whatever the permissibility of fleetwide averaging, the text and structure of Title II make plain that EPA cannot manipulate averaging as a means to force production of an increasing market share of electric vehicles. Section 202 does not grant EPA the power to make the internal-combustion engine go the way of the horse and carriage. At the very least, Section 202 is hardly clear in granting that awesome power—which is what matters under West Virginia. For automobiles as for power plants, EPA has purported to discover in the Clean Air Act the authority to "force" manufacturers to "cease making" a particular type of energy "altogether." 142 S. Ct. at 2612. We have seen that play recently before, and it should end the same way. [EPA-HQ-OAR-2022-0829-0707, pp. 84-86]

Organization: Zero Emission Transportation Association (ZETA)

EPA’s own compliance trends show that significant emissions reductions are being left on the table in the form of banked credits. While credit banking and trading provisions are a key component of these emissions standards, the size of the OEMs’ collective credit bank–as shown in Figure 3–highlights the need for EPA to set stringent standards that turn these theoretical CO_2 reductions into real-world, on-road reductions. [EPA-HQ-OAR-2022-0829-0638, pp. 17-18]

The pressing need to reduce GHG and criteria pollutant emissions from the light- and medium-duty transportation sectors justifies EPA finalizing stringent emissions standards. While the standards are technology neutral, the auto industry has chosen electrification as the preferred option for reducing emissions and the standards should support the considerable investments being made to continue bringing these technologies to market. [EPA-HQ-OAR-2022-0829-0638, pp. 17-18]

ZETA supports the proposed accelerated phaseout of MDEV credit multipliers by MY 2027. EPA has recognized that multipliers present a tradeoff between driving emissions reductions and incentivizing new technology. Based on the technology available today, multipliers are no longer required to incentivize MDEV technology investments, and a more stringent GHG standard would most effectively drive MDEV adoption and, in turn, emissions reductions. As such, we encourage the agency to finalize the phaseout of MDEV credit multipliers as proposed and encourage EPA to consider the benefits of sunsetting multipliers for advanced technology vehicles in the MD category starting in MY 2025. [EPA-HQ-OAR-2022-0829-0638, p. 29]

EPA Summary and Response

Summary:

Alliance for Automotive Innovation, American Council for an Energy-Efficient Economy, American Free Enterprise Chamber of Commerce, Environmental and Public Health Organizations, Environmental Defense Fund, Jaguar Land Rover NA, Kia Corporation, MECA Clean Mobility, Porsche Cars North America, Strong Plug-in Hybrid Electric Vehicle, and Zero Emission Transportation Association have expressed support for the Averaging, Banking, and Trading provisions of this final rulemaking.

Response:

EPA appreciates the comments in support of the Averaging, Banking, and Trading (ABT) provisions in this rulemaking. EPA has not reopened the ABT provisions in this rule (except for the carry-forward of criteria pollutant Tier 3 credits during the phase-in of the Tier 4 standards as described in section 4.1.7 of this RTC). EPA agrees with commenters that these provisions continue to allow manufacturers flexibility in planning compliance with the standards at potentially lower costs.

Summary:

Clean Fuels Development Coalition and Valero Energy Corporation commented concern that the proposed rule is forcing electrification for compliance.

Response:

The final standards do not require any specific compliance path. Manufacturers are free to utilize any combination of technologies as pathways for compliance, as well as utilization of the program's Averaging, Banking, and Trading provisions.

Summary:

Aston Martin raised concerns about whether the standards are so stringent that they can only be complied with using credits.

Response:

EPA does not consider the standards to be so stringent as to require credit trading among firms. EPA has undertaken a sensitivity analysis which models the absence of credit trading (even for small volume manufacturers such as Aston Martin) and finds the standards are feasible, with sufficient lead time and at reasonable costs even under that limiting assumption, an assumption which EPA considers unrealistic. EPA recognizes that decisions about trading credits are business decisions for individual firms, but EPA sees no evidence that the market is not available to firms seeking credits. To the contrary firms appear to be actively trading credits and increasing sales volumes of EV-only manufacturers (who likely view credits as a potential revenue source, particularly given the limited lifespan and compliance benefits of credits for those manufacturers) suggest the market will continue to be a viable and economically efficient compliance tool in the future. Additional discussion of SVM-specific concerns is found below in RTC 3.1.7.

Summary:

Jaguar Land Rover NA commented that only credits are available for compliance and would like to see fines added as a compliance option.

Response:

EPA does not have the statutory authority under the Clean Air Act to use fines as a routine compliance option. The Averaging, Banking, and Trading provisions of the final rule provide multiple flexibilities for compliance. As discussed in section 3.3.1 and 3.3.2, EPA has made several changes to reduce the stringency of the standards and provide additional lead time compared to the proposal, which we believe address manufacturers' comments about concerns for compliance.

3.1.3 - Vehicle air conditioning system related provisions

Comments by Organizations

Organization: Ad Hoc Tier 4 Light-Duty Small Manufacturer Group

- The Small OEM GHG situation is exacerbated by the following:

-EPA proposes to eliminate AC leakage credits (we do not fully understand why the goal of fighting climate change demands this)

Organization: Alliance for Automotive Innovation

D. Light-Duty GHG Program Flexibilities

Flexibilities have been an important part of EPA's light-duty vehicle GHG program since its inception in 2012. Features such as the averaging, banking, and trading program have helped smooth product planning and investment cycles. Other flexibilities like off-cycle technology and air conditioning credits have encouraged the development of new technologies and have resulted in real-world emissions improvements beyond those that would have been achieved on laboratory test cycles. [EPA-HQ-OAR-2022-0829-0701, p. 95]

Auto Innovators believes that such flexibilities still play an important role moving forward. They are a potential lever for addressing uncertainties in the transition to electric vehicles, particularly in the early years of the proposed 2027-2032 program. While manufacturers would prefer that the core footprint-based standards reflect achievable emission reductions, flexibilities could also serve to ensure that desired emission targets are met. [EPA-HQ-OAR-2022-0829-0701, p. 95]

Instead, EPA proposes to eliminate and/or phase down many existing flexibilities, including paring back the off-cycle credit menu and limiting GHG improving technologies to the ICE fleet. The result of this will be abandonment of GHG benefits from prior rulemakings. [EPA-HQ-OAR-2022-0829-0701, p. 95]

The existing refrigerant, AC efficiency, and off-cycle credits are balanced to produce a verifiable real-world result. EPA's proposal to change the credit system will unbalance those results, leaving unprecedented rates of electrification as the main flexibility left to meet fleetwide stringency targets. [EPA-HQ-OAR-2022-0829-0701, p. 95]

1. Air Conditioning Refrigerant Leakage Credits

EPA encouraged the auto industry's move from R134a refrigerant to R1234yf with a credit program that recognized both improvements to minimize leakage of refrigerant and the use of low global warming potential (GWP) refrigerants. The credit program is responsible for the quick adoption of R1234yf in U.S. light-duty vehicles since it became commercially available in 2013. Already, 95% of the light-duty vehicle fleet has moved from R134a with GWP of 1,430 to R1234yf with a GWP of 4.176 [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

176 EPA Trends Report at 91.

EPA has proposed a rule for phasing down HFC refrigerants sooner than anticipated or required by the AIM Act.177 The proposed HFC phase down would eliminate R134a from light-duty vehicles, effectively leaving one refrigerant, R1234yf, to serve current and future heating, ventilation, and air conditioning (HVAC) system designs.178 Auto Innovators can see why EPA believes this is a good time to eliminate the air conditioning refrigerant leakage credit program, but there are a number of good reasons to continue the program that EPA has not considered. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

177 Phasedown of Hydrofluorocarbons: Restrictions on the Use of Certain Hydrofluorocarbons Under Section (i) the American Innovation and Manufacturing Act of 2020, Notice of Proposed Rulemaking and Advance Notice of Proposed Rulemaking, 87 Fed. Reg. 76738 (Dec. 15, 2022).

178 Although other low-GWP refrigerants exist, they have not come into common use in the U.S. Therefore, new HVAC system designs are under development for electric vehicles.

a) HVAC Systems for Electric Vehicles

Current electrified HVAC systems are not up to the challenge of an electrified future. High voltage positive temperature coefficient ("PTC") system heaters that indirectly heat the cabin using glycol as a heat transfer fluid are inefficient. Energy that otherwise would be used to extend driving range is instead diverted to defrosting cabin glass, warming the battery, and passenger comfort. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

Electric range may be reduced by 30% or more in a -10 °F setting which is common in winter around much of the country. Consistently colder climates can reduce range even more. Even in variable climates, the thermal mass of the battery must be conditioned to enable fast charging. The variable nature of diurnal temperature excursions means battery conditioning will continue to be a large consumer of stored energy at the expense of vehicle range, customer comfort and acceptance of electric vehicles. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

Similarly, today's common HVAC systems have significant power requirements when used in a cooling mode. Cabin occupants and battery cooling systems are the beneficiaries of the AC system in an electrified vehicle where up to 10 kW or more of power may be expended to keep the battery at proper operating temperatures and occupants comfortable. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

b) Future HVAC Systems Need Costly Technology to Minimize Refrigerant Leakage

The conditions that exacerbate the shortcomings of today's HVAC systems are expected to be overcome by heat pump systems currently under development.179 Heat pump systems extract energy from the atmosphere, collect and concentrate that energy through onboard heat exchangers, then transfer it to where it is needed. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

179 We recognize that certain manufacturers already use a heat pump HVAC system, but this technology has yet to become commonplace across the industry.

Heat pumps use a refrigerant to transfer heat. Heat pump systems resemble AC systems, but are modified to heat and cool the cabin and battery. Heat pump systems also have additional complexity over today's AC systems. They need to be designed for assembly, adding additional connections and hose length to reach distant components. The additional valving to make a heat pump system operate flawlessly results in potential additional leak paths. Heat pump systems also have one or more additional heat exchangers, adding another potential leak path to the system. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

Though much of the leakage concern may be solved, the credit recognizing reduced AC refrigerant leakage technology is still needed and would still recognize real-world benefits. In the drive to electrify vehicles, all costs will be scrutinized, and history shows that better sealing systems were only implemented following the availability of low-leak system credits. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

c) New Refrigerants in Heat Pump Systems Benefit from Low-Leak Technology

Refrigerant R1234yf is suitable for heat pump applications, but is performance limited at high and low temperature extremes. Other refrigerants are better suited to heat pump applications. SAE International has several subcommittees investigating seven diffierent refrigerants. Each of these refrigerants have performance benefits, but come with tradeoffs. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

Many of these refrigerants are blended using R1234yf or CO_2 as the base. Other refrigerants in different concentrations are added to the base refrigerant to address performance needs at temperature extremes. Different suppliers have unique formulations. It is expected that each of these refrigerants will be brought to market and be available for heat pump applications, though none have SNAP approval at this time. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

Each of the refrigerant blends being considered are zeotropic, i.e., they have constituents whose boiling points differ. Other molecular properties will differ with the refrigerant blend including permeation rates. Permeation in turn can be selective and the refrigerant component that permeates fastest may be the component that gives the blend its low or high temperature performance. What permeates or leaks selectively may also have undesirable properties that EPA will address during the SNAP approval process. These are additional reasons for EPA to continue the leakage credit program. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

The semi-hermetic nature of heat pump systems is still largely undefined and not understood enough to place a meaningful limit on leakage. SAE International is developing an updated J2727 standard to address heat pumps and new refrigerant blends. The credit formula using the SAE J2727 leak score, in being revised for the new refrigerants, will yield the correct values in terms of leakage and GWP and therefore inform a refrigerant leakage program credit level. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

Auto Innovators believes that leaving the credit program in place is in the best interest of EPA, industry, and the environment. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

d) Impact of the AC Leakage Credit Program on Leak Rates

Over 200 million vehicles on the road today were produced prior to the EPA low leak/low GWP program’s implementation. Assessing the HVAC systems of these vehicles with the SAE J2727 methodology demonstrates that they have a wide range of leakage and well over the amount observed in vehicles with HVAC systems designed to minimize refrigerant leakage. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

Lifetime AC system service needs are proportional to refrigerant leakage rates. Low-leak technology drastically lowers the service levels needed. Manufacturers should be encouraged to minimize the refrigerant leakage from electric vehicles given their larger charge sizes and chemically active refrigerant components. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

In summary, electrification is driving new HVAC system architecture and using new refrigerants in greater quantities than in ICE vehicles. These new refrigerants are likely to have higher-GWP components than R1234yf and selectively leak at different rates. Encouraging the use of the lowest GWP blends possible and minimizing leakage is still an important environmental consideration. EV heat pumps systems are expensive,180 as are the improved components and fittings that minimize leakage.   Recognition of efforts to reduce leakage and to minimize its environmental impact when leakage occurs will provide additional incentives to manufacturers to include best-in-class low-leak technology in HVAC system designs. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

180 The electric compressor of a heat pump system alone may cost up to eight times that of a comparable electronic carriable displacement compressor in an ICE application.

e) Recommendations

-Maintain CO2 credits for reducing leakage of air conditioning refrigerant and limiting the environmental impact of leakage. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

-If EPA decides to eliminate leakage credits, implement a phase-down instead of an immediate elimination as a potential lever to reduce concerns with and to provide flexibility for meeting the stringency of the proposed GHG standards. [EPA-HQ-OAR-2022-0829-0701, pp. 96-99]

2. Air Conditioning Efficiency and Off-Cycle Credits on Electric Vehicles

EPA's concern of negative emissions on individual vehicles is misplaced. EPA's regulations calculate air conditioning efficiency and off-cycle credits on a fleet average basis, which are then combined with fleet average tailpipe emissions and other adjustments.181 However, we acknowledge the concern that, once combined with fleet average tailpipe emissions, air conditioning and off-cycle credits may result in a fleet that implies a negative emission rate. [EPA-HQ-OAR-2022-0829-0701, p. 99]

181 In actual practice, greenhouse gas credits and tailpipe emissions (relative to target) are first converted to megagrams (metric tons) of carbon emissions and then combined. (See 40 CFR 86.1865-12.) Air conditioning and off-cycle credits are always positive megagrams. Tailpipe fleet average emissions may result in either a positive (credit generating) or negative (credit needed) megagram balance. In short, EPA's regulations never result in negative emissions for an individual vehicle, nor negative emissions for an overall fleet, although such a result might be implied.

Our recommendation is to handle this situation at the fleet average level. If the summed fleet average tailpipe emissions, credits, and other adjustments would result in a negative value, total fleet megagrams of credit for the model year would be truncated at the level equivalent to that which would have been achieved by a fleet at zero g/mile fleet average emissions before credits and other adjustments. Such an approach would address EPA's concern of "negative" emissions while still providing an incentive for and recognition of air conditioning and -cycle improvements on electric vehicles during the remaining time when many manufacturers' fleets have net positive emission rates. [EPA-HQ-OAR-2022-0829-0701, p. 99]

3. Air Conditioning efficiency Credits

Auto Innovators disagrees with EPA's proposal to eliminate AC efficiency credits for electrified vehicles. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

The AC efficiency credit program has been a success, resulting in verified emission reductions and conservative credit values. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

The SAE Interior Climate Control Committee has helped, having developed the testing and specifications for hardware technologies on the AC efficiency credit menu. The hardware specifications taken together with the AC17 test procedure improvements ensure a robust and verifiable greenhouse gas benefit. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

We agree with EPA that the program has been valuable. Many automakers have utilized the program. EPA calls the air conditioning efficiency and refrigerant leakage credit programs voluntary, but they have been relied upon by manufacturers to meet GHG standards. EPA itself has assumed the benefits of the AC efficiency and leakage credit programs in setting GHG targets. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

a) AC efficiency Improvements Benefit Both ICE Vehicles and BEVs

The AC efficiency credit menu has been successful in recognizing and encouraging AC system improvements. Due to their expense, the technologies on the AC efficiency menu were not widely deployed in the fleet prior to the creation of the AC efficiency credit program. The AC efficiency menu provided the needed business justification to widely deploy the included technologies in light-duty vehicles. The EPA Trends Report demonstrates the dramatic year over year growth of AC efficiency credits. Twenty automakers have deployed high levels of AC efficiency technology in mass market vehicles, including in PHEVs and BEVs. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

Although it may be appropriate to limit eligibility for AC efficiency credits to ICE vehicles in the future, we do not believe that time is now. Removing BEVs from participation in the credit program now may undermine the system efficiency improvements made to date. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

b) AC efficiency Credit Values

The AC efficiency credit values developed for the menu were based on ICE vehicles but also apply to BEVs. The technology benefits between ICE vehicles and BEVs are similar in that they lower the amount of energy needed to condition the cabin. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

The AC efficiency credits related to the reduced reheat, automatic recirculation algorithms, and PWM controlled blowers are dependent on system operation. They do not depend on the powertrain type. Their energy-savings benefit is equivalent between BEV and ICE vehicles. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

Oil separator technology is deployed in both BEV electric compressors and ICE vehicle compressors. The efficiency benefit is proportional to the refrigerant flow exiting the compressor and that in turn is based on the vehicle cabin thermal load. The differences in efficiency between BEV and ICE vehicles is similar under the same conditions. The way that BEV compressors are decoupled from an engine’s accessory drive means they are operated at a more consistent speed that yields a greater oil separator benefit. The BEV version of an oil separator may be underrepresented in terms of menu credit. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

The credit values for internal heat exchanger technology in ICE vehicles are not usually applied to a BEV. BEVs generally have efficiency improvements incorporated into the heat exchanger designs. Both heat exchange technology improvements are quantified by bench testing per SAE specifications. The additional benefit that a BEV provides is underrepresented in terms of menu credit. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

Compressor efficiency depends on how the compressor is driven. Isentropic and volumetric efficiency improve as the compressor is driven at greater speeds. Belt driven compressors such as the fixed displacement or internally controlled variable displacement compressors are least efficient among the compressor types since they are controlled by engine speed. Electronically controlled variable compressors are also belt driven and suffer from the same engine speed issues but are more efficient since they can vary their output and tailor it more directly to cabin load. The most efficient variable displacement compressor is the electric scroll variant that is independent of engine operation and used on EVs. The compressor is driven to the most efficient operating point for the given cabin thermal load. In this case, the electric scroll type of variable displacement compressor is more efficient than those on ICE vehicles. The benefit of this technology is underrepresented relative to the menu credits. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

Evidence of this conservative nature of the menu credits exists with the Denso ESB compressor off-cycle applications that were approved by EPA. Credit levels for this compressor are above those of the menu and apply exclusively to BEVs and PHEVs. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

The AC efficiency menu credits, while developed for ICE vehicles, remain conservative for EVs. Industry will continue to work with EPA if a new credit menu that correctly recognizes these technologies in BEVs is deemed necessary. Measuring the efficiency benefits in a BEV is straightforward based as measured energy consumption during an operating cycle. Eliminating the credit for BEVs due to the credits' basis on ICE vehicles is not the appropriate solution. [EPA-HQ-OAR-2022-0829-0701, pp. 99-101]

c) AC efficiency Credit Menu Adjustments

Several air conditioning efficiency technologies have been approved for credit under the alternative method off-cycle credit program. These technologies provide on-road greenhouse gas emission and energy consumption improvements. We recommend that EPA add any air conditioning efficiency technologies approved under the off-cycle program's alternative methodology to the air conditioning efficiency credit menu, and that the credit caps be adjusted accordingly. [EPA-HQ-OAR-2022-0829-0701, pp. 101-102]

d) Solar Thermal Control Technologies

Auto Innovators believes that technologies on the AC efficiency credit interact with technologies on the solar-thermal control submenu of the off-cycle credit menu and need to be considered. Given that EPA has proposed the phaseout of menu-based off-cycle credits, we recommend that EPA move the solar thermal control technologies to the AC efficiency credit menu and adjust the caps accordingly. These technologies reduce air conditioning system load, thereby reducing energy consumption and related GHG emissions from operation of the HVAC system. [EPA-HQ-OAR-2022-0829-0701, pp. 101-102]

e) Conclusion

The current AC efficiency credits should remain available to both the ICE and BEV fleetss during the transition from ICE to BEV vehicles. Keeping the credits (and therefore the technologies that they encourage) improve range, preserve customer comfort, and ensure lower energy consumption regardless of source. Continuing the AC credit program ensures the continued application of existing technologies and ensure future innovation in this area. Auto Innovators believes that: [EPA-HQ-OAR-2022-0829-0701, pp. 101-102]

-Limiting eligibility for AC efficiency credits to only ICE vehicles makes sense only once the transition to BEV mass volumes is more robust. [EPA-HQ-OAR-2022-0829-0701, pp. 101-102]

-That a subsequent rulemaking is the appropriate time to revisit this issue once BEV AC system architecture is better developed and mature. [EPA-HQ-OAR-2022-0829-0701, pp. 101-102]

-That AC credits applied to BEV vehicles is at an acceptably conservative level. The ICE values are conservative and verifiable. [EPA-HQ-OAR-2022-0829-0701, pp. 101-102]

-The solar thermal control technologies on the off-cycle menu are synergistic with the technologies on the AC efficiency credit menu and should be combined if the off-cycle credit menu is phased out. The resulting credit menu should have the caps adjusted to accommodate the solar thermal control technologies. [EPA-HQ-OAR-2022-0829-0701, pp. 101-102]

Organization: Arconic Corporation (ARCO)

3. Arconic agrees with the proposed phase out of the air conditioning (AC) system related credits. [EPA-HQ-OAR-2022-0829-0741, p. 3]

Organization: BorgWarner, Inc.

We also agree with EPA's decision to discontinue air conditioning credits under the new standard. [EPA-HQ-OAR-2022-0829-0640, pp. 4-5]

Organization: California Air Resources Board (CARB) (Part 1 of 5)

Greenhouse Gas Standards

U.S. EPA is proposing more stringent GHG emission standards for the 2027 through 2032 MYs, along with several modifications to the existing GHG program. Generally, CARB supports U.S. EPA's proposal, but offers several recommendations to further strengthen the proposed standards to achieve the greatest degree of emission reductions available, considering costs and technology readiness, to further protect public health and combat climate change. As described in detail below, CARB recommends that U.S. EPA adopt more stringent light-duty GHG emission standards; include provisions to ensure manufacturers do not allow emissions to increase from conventional vehicles and instead continue to apply all available cost-effective emission control technologies; estimate real-world PHEV emissions based on the best available data and collect additional data to inform future updates; and update elements of the comprehensive regulatory program, including retiring elements of the off-cycle and air conditioning credits programs as proposed, establishing explicit requirements to eliminate leaks from air conditioning systems, eliminating credit multipliers for medium-duty ZEVs as proposed, and requiring small-volume manufacturers to comply with the proposed standards as proposed. [EPA-HQ-OAR-2022-0829-0780, p. 12]

Motor Vehicle Air Conditioning

U.S. EPA is proposing several GHG program modifications that would impact motor vehicle air conditioning (AC). Controlling emissions from AC systems is an important climate stabilization strategy as traditional refrigerants used in AC systems are short-lived climate pollutants with high global warming potential (GWP). Acting now to reduce emissions of these powerful climate forcers can have an immediate beneficial impact. [EPA-HQ-OAR-2022-0829-0780, p. 24]

Air Conditioning Efficiency Credit Eligibility

U.S. EPA requested comments on its proposal to limit eligibility of AC efficiency credits to internal combustion engine vehicles starting in MY 2027. CARB supports this proposed change. CARB agrees with U.S. EPA that with an increasing ZEV market share, retaining AC efficiency credit eligibility for ZEVs would generate large negative calculated GHG emissions, which would not be representative of the vehicles' actual emissions. [EPA-HQ-OAR-2022-0829-0780, p. 24]

Air Conditioning Leakage Credit Elimination for Light-Duty Vehicles

U.S. EPA requested comments on its proposal to end the existing AC leakage credit for light-duty vehicles starting in the 2027 MY. CARB agrees with U.S. EPA's proposal to eliminate the AC leakage credit but recommends that U.S. EPA establish a leakage standard for light-duty vehicles. [EPA-HQ-OAR-2022-0829-0780, pp. 24-25]

CARB agrees with U.S. EPA that the GHG benefits of the AC leakage credit program are being achieved primarily through industry-wide adoption (around 95 percent of 2021 MY light-duty vehicles) of HFO-1234yf, a low-GWP refrigerant. 26 CARB further agrees that the GWP limit of 150 for light-duty vehicles starting with the 2025 MY in the newly proposed U.S. EPA "Technology Transitions" regulation would—if finalized as proposed—provide a backstop for any reversion back to high-GWP refrigerants. 27 [EPA-HQ-OAR-2022-0829-0780, pp. 24-25]

26 U.S. EPA. 2022 EPA Automotive Trends Report. EPA-420-R-22-029. (2022). https://www.epa.gov/automotive- trends/download-automotive-trends-report.

27 U.S. EPA. Phasedown of Hydrofluorocarbons: Restrictions on the Use of Certain Hydrofluorocarbons Under Subsection (i) the American Innovation and Manufacturing Act of 2022. Federal Register 87, no. 240 (December 15, 2022). Docket ID: EPA–HQ–OAR–2021–0643. Available at: https://www.govinfo.gov/content/pkg/FR-2022- 12-15/pdf/2022-26981.pdf and U.S. EPA. "Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles - Phase 2." Federal Register 81, No. 206 (October 25, 2016). Docket ID: EPA–HQ–OAR–2014–0827. Available at: https://www.govinfo.gov/content/pkg/FR-2016-10- 25/pdf/2016-21203.pdf.

However, CARB notes that there are secondary benefits—including GHG benefits—for having low-leak AC systems regardless of refrigerant type, including: helping to maintain AC system efficiency; 28 reducing the generation of trifluoroacetic acid (TFA), an atmospheric degradation byproduct of fluorinated gases such as HFO-1234yf; 29 and reducing the need for AC recharge and therefore the associated cost to consumers. [EPA-HQ-OAR-2022-0829-0780, pp. 24-25]

Published December 8, 2009. http://dx.doi.org/10.1021/es902481f.

Given the benefits associated with low-leak AC systems and the risk that manufacturers may not pursue this technology in the absence of the leakage credit, CARB recommends that U.S. EPA establish an AC leakage standard for light-duty vehicles, similar to the AC leakage standard for heavy-duty vehicles in the current U.S. EPA Heavy-Duty Vehicle GHG regulations. 30 CARB notes that one data source that U.S. EPA could analyze to establish the appropriate leakage threshold for light-duty vehicles is the AC leakage data reported by auto manufacturers to the State of Minnesota's Mobile Air Conditioning Leakage Reporting Requirements. 31 The same data source was used in U.S. EPA's analysis to establish the leakage threshold for the AC leakage standard in its Heavy-Duty Vehicle GHG regulations. 32 [EPA-HQ-OAR-2022-0829-0780, pp. 24-25]

Elimination of Air Conditioning Leakage Standard for Medium-Duty Vehicles

U.S. EPA requested comments on the proposed ending of the AC leakage standard for medium-duty vehicles starting in the 2027 MY. As noted above for light-duty vehicles, while CARB agrees with U.S. EPA that the majority of the GHG emissions from medium-duty vehicle AC refrigerants can be reduced with the proposal to require low-GWP alternative refrigerants, CARB recommends continuing to subject medium-duty vehicles to the existing AC leakage standard. [EPA-HQ-OAR-2022-0829-0780, p. 26]

Again, as noted above for light-duty vehicles, there are secondary benefits—including GHG benefits—associated with low-leak AC systems regardless of the refrigerant type, including: helping to maintain AC system efficiency; reducing the generation of TFA; and reducing the need for AC recharge and therefore the associated cost to consumers. CARB notes that in the existing U.S. EPA Heavy-Duty Vehicle GHG standards for the 2021 through 2027 MYs (also known as the GHG “Phase 2” regulation), which currently applies to these medium-duty vehicles, the same AC leakage standard applies to all refrigerant types. For these reasons, CARB recommends that U.S. EPA retain the existing AC leakage standard for medium-duty vehicles regardless of refrigerant type. [EPA-HQ-OAR-2022-0829-0780, p. 26]

Organization: California Attorney General's Office, et al.

However, we urge EPA to consider retaining a smaller-value air conditioning credit for refrigerant leakage, id. at 29,247-48, or other, similar measures to continue preventing leakage of air conditioning refrigerants. Although the use of refrigerants with low global warming potential (“GWP”) indicates refrigerant leaks will contribute less to climate change, even low-GWP refrigerant leaks continue to be harmful in the aggregate. Id. at 29,246 (low-GWP refrigerant HFO-1234yf has a GWP of 4, compared to HFC134(a)’s GWP of 1430). Continuing to incentivize the prevention of refrigerant leaks still appears beneficial, even if the credit itself should be reduced to reflect the lower GWP of the predominant refrigerant. See CARB Comment at 35-37. [EPA-HQ-OAR-2022-0829-0746, pp. 37-38]

Organization: Chemours Company FC, LLC

The Chemours Company FC, LLC ("Chemours") appreciates the opportunity to comment on the Environmental Protection Agency's ("EPA" or "Agency") proposed rule. We support the Agency's proposal to revise the air conditioning (AC) credits program to remove the refrigerant-based AC provision. We agree that statutory requirements under the American Innovation and Manufacturing (AIM) act will continue to drive adoption of lower GWP refrigerants in vehicles. Because this proposal, in part, relies upon a pending rule under Subsection (i) of the AIM Act, the Agency must remain cognizant of any changes to the final AIM regulation and what, if any, impacts those changes could have on this proposed rule. To avoid such discrepancy, it would be prudent to finalize this rule after the Technology Transition final rule under Subsection (i) of the AIM Act for auto AC is published and effective. [EPA-HQ-OAR-2022-0829-3644, p. 1]

Organization: DENSO Corporation

4) A/C Efficiency Credit Program

DENSO supports the A/C efficiency credit program and appreciates EPA continuing the program.2

2 Ibid.

If EPA sunsets the alternative method off-cycle credit program, then interactions with the A/C efficiency credit program need to be considered. For example, several A/C efficiency technologies have been approved for credit under the alternative method off-cycle credit program. These technologies provide on-road greenhouse gas emission and energy consumption improvements. Therefore, we request EPA consider adding any A/C efficiency technologies approved under the off-cycle program's alternative methodology to the A/C efficiency credit menu, and that the credit caps be adjusted accordingly. [EPA-HQ-OAR-2022-0829-0651, pp. 4-6]

Also similar to our comments on off-cycle, concerning the 5-Cycle and Alternative Method pathways, EPA should follow through under the current regulation and complete action on all submitted applications, even if it requires additional discussions. [EPA-HQ-OAR-2022-0829-0651, pp. 4-6]

In addition, and as shared in previous comments to EPA, DENSO requests the agency consider expanding the AC efficiency credit cap based on the National Renewable Energy Laboratory (NREL) study showing greater A/C improvement possibilities.3 [EPA-HQ-OAR-2022-0829-0651, pp. 4-6]

3 NREL Presentation 17TMSS-0056 at SAE Thermal Management Systems Symposium 2017 (October 2017).

NREL Study 17TMSS-0056 estimates the latest A/C energy consumption at 23.5 g/mile based on a series of simulations were performed to three vehicle platforms using various US driving patterns. This is compared to 11.9 g/mile for passenger car and 17.2 g/mile for light truck, which were baseline A/C emissions impacts previously used by the agencies to determine A/C efficiency credit cap, new baseline A/C emission impact is calculated to 20.3 g/mile for passenger car and 29.3 g/mile for light truck by using the latest A/C energy consumption (23.5 g/mile). [EPA-HQ-OAR-2022-0829-0651, pp. 4-6]

Based on the new baseline emission impact and A/C improvement possibility, 42% of which were previously used by the agencies, the increased A/C credit cap would be 8.5 g/mile for passenger car and 12.3 g/mile for light truck. Therefore, DENSO would request EPA to consider increasing A/C efficiency credit cap as supported by this study. [EPA-HQ-OAR-2022-0829-0651, pp. 4-6]

These recommendations are explained in more detail here:

A/C Impact on Vehicle CO2 Emissions: New NREL Research4

- 30 gal/yr=23.5 g/mi where individual traveling 11,246 miles/yr
- 8887 grams CO2 per gallon of gasoline
- 2012MY LD Vehicle Production5: Car (64%), Truck (36%)
- Baseline A/C Emissions Impact: Car: 11.9 g/mi, Truck: 17.2 g/mil
- Split NREL results into car/truck based on EPA ratios:

Car: 11.9/13.8*23.5 = 20.3 g/mi

Truck: 17.2/13.8*23.5 = 29.3 g/mil [EPA-HQ-OAR-2022-0829-0651, pp. 4-6]

4 EPA-NHTSA Joint Technical Support Document for Final Rulemaking for 2017-2025 Light-Duty Vehicle GHG & CAFE Standards: https://nepis.epa.gov/Exe/ZyPDF.cgi/P100F1E5.PDF?Dockey=P1000F1E5.PDF.

5 EPA Light-Duty Automotive Technology, Carbon Dioxide Emissions and Fuel Economy Trends: 1975 through 2017.

A/C Credit Cap Revisions

- New Baseline A/C Emissions Impact (based on new research by NREL) Car: 20.3 g/mi, Truck: 29.3 g/mi
- A/C Credit Cap

Improvement possibility = 42% (current assumption in Joint TSD 6)

Car: Current 11.9 g/mi x 42% = 5.0 g/mi; New: 20.3 g/mi x 42% = 8.5 g/mil Truck: Current: 17.2g/mi x 42% = 7.2 g/mi; New: 29.3 g/mi x 42% = 12.3 g/mi [EPA-HQ-OAR-2022-0829-0651, pp. 4-6]

6 Ibid, 4.

The A/C efficiency credit program is robust and verifiable; however, the current cap constraints can create situations where an A/C technology that reduces GHG emissions may not be applied on a vehicle’s system. For example, a technology may be left on the shelf if it will not be accounted for through direct contribution to achieving the standard, nor recognized through a credit recognizing the technology contribution to emissions reduction. Therefore, we again ask EPA to consider increasing the credit cap for this program. [EPA-HQ-OAR-2022-0829-0651, pp. 4-6]

5) Technologies Supporting ZEV Energy Consumption Reduction

DENSO requests EPA to reconsider its proposal to eliminate A/C efficiency and off- cycle credits for electrified vehicles. Off-cycle and AC efficiency credits for technologies applied across all powertrain types encourage their continued use with commensurate benefits to consumers and the environment. The elimination of off- cycle and air conditioning efficiency credits on electric vehicles would have an unfortunate effect on the application of existing technologies and further innovation in this area. [EPA-HQ-OAR-2022-0829-0651, p. 6]

DENSO also encourages EPA to explore how energy reductions from thermal technologies could be rewarded when used on BEVs, PHEVs and FCEVs. All technologies and all powertrains should continue to improve their performance. Consequently, technologies that reduce use of the vehicle battery (and reduce the amount of battery charging needed) and therefore the electricity used to power the vehicle should be recognized in MYs 2027 and beyond. [EPA-HQ-OAR-2022-0829-0651, p. 6]

Beyond the off-cycle and A/C efficiency credit programs, DENSO would welcome the opportunity to discuss the possibility of credits to further incentivize BEV energy consumption reduction directly and further support the industry during this critical technology transition period.7 A credit or incentive for technologies that support BEV energy consumption reduction from a consumer comfort and battery comfort perspective, as well as to encourage responsible critical mineral usage and grid management, would also contribute to US climate goals generally. Similar to the off- cycle and A/C efficiency program, a similar ZEV-focused technology credit would help to support industry investment in innovative and forward-looking technologies that provide additional environmental benefits. [EPA-HQ-OAR-2022-0829-0651, p. 6]

7 Please see Appendix 2 for a partial list of DENSO technologies that support ZEV energy consumption reduction.

6) Air Conditioning Refrigerant Leakage Credits

As a supplier committed to the environment, we support maintaining the low Global Warming Potential (low GWP) refrigerant credits. This credit program advances technological leadership and recognizes significant technological investments. The credits also provide an important incentive to voluntarily transition to next- generation refrigerants with low GWP. Therefore, we request EPA to consider continuation of the air conditioning refrigerant leakage credits. If EPA decides to eliminate the leakage credits, we request EPA to consider a phase-down instead of an immediate elimination. [EPA-HQ-OAR-2022-0829-0651, p. 6]

Appendix 1

DENSO GREEN Technology Examples:

Off-Cycle Credit/AC Efficiency Credit Technologies for ICE and ZEV Powertrains [EPA-HQ-OAR-2022-0829-0651, p. 8]

1. SAS Compressor w/CS Valve: Technology has improved pressure drop through the cylinders and a crankcase suction valve that minimizes internal compressor losses at conditions other than maximum capacity. [EPA-HQ-OAR-2022-0829-0651, p. 8]

2. Electric Scroll Air Conditioning Compressor Variation B (ESB) with pressure adjusting valve technology: This technology improves the efficiency of the electric scroll compressor using a pressure adjusting valve to optimize back pressure on the fixed scroll and reduce mechanical losses. [EPA-HQ-OAR-2022-0829-0651, p. 8]

3. S-Flow System: Reduces the thermal load on the air conditioning system through targeted cooling of only the occupied cabin areas, and for a pulse width modulated brushless motor power controller used in the HVAC system, which improves the efficiency of the HVAC system. [EPA-HQ-OAR-2022-0829-0651, p. 8]

4. High-Efficiency Alternator: High efficiency alternators use new technologies to reduce the overall load on the engine yet continue to meet the electrical demands of the vehicle systems, resulting in lower fuel consumption and lower CO2 emissions. [EPA-HQ-OAR-2022-0829-0651, p. 8]

5. Compressor Oil Separator: Technology removes at least 50% of the oil entrained in the oil/refrigerant mixture exiting the compressor and returns it to the compressor housing or compressor inlet, or a compressor design, which does not rely on the circulation of an oil/refrigerant mixture for lubrication. [EPA-HQ-OAR-2022-0829-0651, p. 8]

6. Internal Heat Exchanger (SCX): An Internal Heat Exchanger reduces load on the compressor by transferring heat from the high-pressure liquid entering the expansion valve (TXV) to the low- pressure gas exiting the evaporator. [EPA-HQ-OAR-2022-0829-0651, p. 8]

7. 2-Layer HVAC: Full technology explanation is below (from SAE Paper 2018-01-1368). Short explanation: In cold ambient conditions, two-layer HVAC recirculates already warmed air in the lower part of the HVAC unit and distributes it to the lower part of the vehicle cabin, while using air from outside the vehicle in the upper part of the HVAC unit, distributing it to the upper part of the vehicle cabin. Outside air is necessary to keep windows fog-free. Recirculated air requires less energy to re-heat. Two-layer HVAC allows both, minimizing energy needed to keep the cabin warm and fog-free. In an ICE vehicle, this results in an energy savings by enabling faster engine warm-up (since less heat is needed for cabin heating), while in a BEV the energy savings impact is even greater, since the energy used for heating the vehicle cabin needs to come from the vehicle battery. [EPA-HQ-OAR-2022-0829-0651, p. 8]

8. LE40: This technology allows for reduced power consumption during compressor operation through improved and more efficient clutch technology. [EPA-HQ-OAR-2022-0829-0651, p. 8]

9. Cold-Storage Evaporator: (Off-Cycle Alt-Method/Off-Cycle Cap): This technology utilizes phase change material in the HVAC evaporator of vehicles equipped with engine Start & Stop technology to extend the time that cold air can be delivered to the cabin with the engine and compressor off. This reduces the amount of time the engine would otherwise operate solely for the purpose of cooling the cabin. [EPA-HQ-OAR-2022-0829-0651, p. 8]

Organization: Environmental. and Public Health Organizations

A. Air conditioning credits

For light-duty vehicles,215 EPA proposes to renew credits for manufacturers that install technology that improves the efficiency of air conditioning ("AC") systems, but to exclude BEVs from eligibility, while retaining current 5-cycle testing protocols that confirm the systems actually reduce emissions as anticipated. 88 Fed. Reg. at 29246. EPA also proposes not to renew light-duty vehicles' hydrofluorocarbon ("HFC") refrigerant leakage control credits and to sunset current refrigerant standards for medium-duty vehicles, because another rulemaking under a different statute is addressing HFCs. Id. We generally support EPA's proposals. [EPA-HQ-OAR-2022-0829-0759, p. 79]

215 The medium-duty vehicle fleet does not include air conditioning efficiency-related credits or requirements, and EPA is not taking comments on that matter. 88 Fed. Reg. at 29246; 81 Fed. Reg. at 73742; 76 Fed. Reg. at 57196.

1.Background

AC systems create tailpipe emissions by using additional power generated through the combustion of gasoline. 88 Fed. Reg. at 29246. Since 2012 EPA has granted credits for AC systems that reduce this extra fuel usage by means of installing more efficient components and air recirculation settings, both measures that reduce engine loads. EPA states it has consistently increased the stringency of the light-duty CO2 footprint curves in the amount of the anticipated AC credits by shifting the footprint curves downwards. Thus, according to EPA, manufacturers who opt not to install the more efficient systems must meet the increased stringency by means of other technology. AC efficiency credits are capped at 5.0 g/mile for passenger cars and 7.2 g/mile for light trucks, and all vehicles in these classes have been eligible for the credits. EPA deems the credits to be effective in reducing emissions and reports increased usage. In MY 2021, 17 of 20 manufacturers reported efficiency credits resulting in an average credit of 5.7 g/mile. 88 Fed. Reg. at 29246. [EPA-HQ-OAR-2022-0829-0759, p. 79]

2.Proposal to renew AC efficiency credits for vehicles with combustion engines only

EPA now proposes to renew AC efficiency credit eligibility only for vehicles equipped with internal combustion engines. EPA reasons that such credits for BEVs are no longer required because BEVs running AC systems do not combust gasoline; AC efficiency credits are not representative of their emission reductions; and BEVs are already counted as 0 g/mile, so that adding AC efficiency credits to the calculation has led to reporting of BEV emissions at less than zero (in the case of Tesla, a fleet average of negative 126 g/mile, including 18.8 g/mile of AC credits). 88 Fed. Reg. at 29247. The credits, EPA explains, were adopted when BEV sales were low and incentivized BEVs, but are no longer needed. EPA next proposes to renew AC efficiency credits for combustion vehicles while increasing the standards' stringency to reflect use of those credits. EPA states it will continue to condition credit approval on mandatory 5-cycle testing216 of certain grouped vehicles to confirm that the projected emission reductions are occurring in the real world (the "AC17" test). [EPA-HQ-OAR-2022-0829-0759, pp. 79-80]

216 The test includes a highway cycle, a high temperature condition cycle, a preconditioning cycle, and a cycle at solar peak periods of four hours. Where test results do not support full menu credits, proportional credits may be allowed. Tests are performed on one vehicle model for each platform, starting with the highest sales volume vehicles, and moving to the next-highest sales volume vehicle annually thereafter, until all vehicle models have been tested or the platform undergoes redesign. EPA is not taking comments on the testing procedures. 88 Fed. Reg. at 29247.

We fully support EPA's proposal not to grant any AC credits to vehicles without a combustion engine. BEVs should no longer be credited with fictitious tailpipe emission reductions, in this case or otherwise. BEVs do not combust gasoline, regardless of whether they use AC systems. We also agree that the current credits are not representative of BEV upstream emissions and are no longer justified to incentivize BEVs, and that BEVs should not be accounted for as if they produce less than zero grams per mile. [EPA-HQ-OAR-2022-0829-0759, p. 80]

We generally support the proposal to retain AC efficiency credits for vehicles with internal combustion engines, with some caveats. Historically, credits have allowed manufacturers to significantly delay compliance with EPA's standards, leading to near-term emission increases, as EPA has often acknowledged. E.g., 86 Fed. Reg. at 43756; 77 Fed. Reg. 62812. That problem is exacerbated when vehicles do not have to undergo testing to confirm the technologies for which credits are awarded do in fact reduce emissions by an equivalent amount, and where the stringency of the standards has not been increased to reflect the anticipated credit use. Here, the latter concern is addressed if EPA does in fact increase stringency by lowering the footprint curve to reflect the available credits, and the AC17 test is vigorous. We would, however, oppose these AC efficiency credits should EPA relax any of the current AC17 test procedures, as their real-world effectiveness could no longer be assured. We also ask EPA to fully explain exactly how it ensures that the standards' stringency is in fact increased by an amount equivalent to the credits it grants. [EPA-HQ-OAR-2022-0829-0759, p. 80]

We also support renewed AC efficiency system credits (for combustion vehicles only) for an additional reason. In light of the astonishingly rapid and dangerous temperature increases all across the country produced by the climate crisis, more frequent and more energy-intensive use of air conditioning is inevitable. Assuring that these systems are as efficient as possible is therefore of great importance. For that reason, we urge EPA to adopt an AC efficiency standard rather than a voluntary credit, as it has done for the medium-duty fleet in the case of refrigerant credits or, at a minimum, in its post-MY 2023 rulemaking. [EPA-HQ-OAR-2022-0829-0759, p. 80]

B.Proposal not to renew air conditioning leakage credits

1.Background

When EPA established the current refrigerant leakage credits in 2012, the most common HFC refrigerant used in mobile air conditioners was HFC-134a, carrying a global warming potential ("GWP") of 1430 times that of CO2. 88 Fed. Reg. at 29246. The most emission-reducing alternative at that time was HFO-1234yf, with a GWP of 4. To encourage the shift from HFC-134a, the 2012 standards allowed manufacturers to earn refrigerant credits for light duty vehicles and trucks, respectively, that are capped at 13.8 and 17.2 g/mile when an alternative refrigerant is used, and at 6.3 and 7.8 g/mile for employing leak-tight components. For the medium-duty fleet, EPA adopted a refrigerant leakage standard rather than a voluntary credit. Id. EPA describes the program as successful and reports that as of MY 2021, 95% of new vehicles use the refrigerant HFO-1234yf, 88 Fed. Reg. at 29247, which has a GWP of 4. 88 Fed. Reg. at 29246. [EPA-HQ-OAR-2022-0829-0759, p. 81]

2.Proposal to eliminate refrigerant credits

EPA now proposes not to renew refrigerant credits beginning in MY 2027 for the light-duty fleet, and to sunset the refrigerant standards for medium-duty vehicles, largely because of the passage of the American Innovation and Manufacturing ("AIM") Act, 42 U.S.C. § 7675, in December 2020. Two years later, EPA issued a Notice of Proposed Rulemaking under the AIM Act (the "AIM Proposal") to restrict the HFCs used in light- and medium-vehicles to those not exceeding a GWP of 150, with effective dates, respectively, of MY 2025 for the light-duty fleet and MY 2026 for the heavy-duty fleet.217 EPA states that there is no reason to believe manufacturers would use higher GWP refrigerants in the absence of EPA vehicle-based credits, and that not renewing the credits would avoid duplicative programs, simplify this rule, and reduce manufacturer credit reporting burdens. [EPA-HQ-OAR-2022-0829-0759, p. 81]

217 Phasedown of Hydrofluorocarbons: Restrictions on the Use of Certain Hydrofluorocarbons Under Subsection (i) of the American Innovation and Manufacturing Act of 2020, 87 Fed. Reg. 76738 (Dec. 15, 2022).

EPA requests comments on whether there is any value in retaining the refrigerant credits. In our view, the answer is no. The AIM Proposal is expected to be finalized this summer or early fall, before EPA completes this rulemaking. If the current refrigerant credits are eliminated, there is no reason to believe manufacturers would use refrigerants other than HFC-1234yf (with its GWP of 4). Two possible alternative refrigerants with GWP values under 150 exist (HFC-152a and carbon dioxide), but adopting either would require a significant redesign of mobile air conditioners. We are not aware of any manufacturers currently planning to use HFC-152a, and while a few companies that import vehicles have investigated CO2-based systems in northern Europe, it is our understanding that those systems would not work well in the temperature ranges experienced in the U.S. market. Thus, we concur with EPA's judgment that neither the majority of manufacturers already using HFO-1234yf nor the minority of manufacturers still using HFC-134a are likely to switch to either of the other two alternatives with GWPs under 150. Thus, while the AIM Proposal could be tightened to bar refrigerants with GWP greater than 4, the potential for backsliding under that proposal appears minimal. Thus, we agree that if the AIM Proposal is finalized as proposed, and considering that HFO-1234yf is already used in 95% of vehicles, there is no reason to renew a refrigerant credit program dating from 2012. [EPA-HQ-OAR-2022-0829-0759, pp. 81-82]

As a backstop, however, any remaining concerns can be resolved if either the AIM Proposal or this rule, once finalized, adopts a standard requiring refrigerants with no more than GWP values of 4, effective for MY 2026 and 2027, respectively. [EPA-HQ-OAR-2022-0829-0759, p. 82]

Organization: Ford Motor Company

Likewise, Ford recommends that EPA establish a phase-out for refrigerant credits, rather than discontinue them all at once. Ford understands EPA's rationale for discontinuing these credits in the long-term given the American Innovation and Manufacturing (AIM) Act program, but we encourage EPA to coordinate these separate actions to allow a phase-out over time. This would help mitigate the stringency increases early in the GHG program, and make the final program more feasible. [EPA-HQ-OAR-2022-0829-0605, p. 8]

Organization: Hyundai America Technical Center, Inc. (HATCI)

HMG requests ZEVs to remain eligible for both Off-Cycle Credits and indirect A/C (efficiency) credits [EPA-HQ-OAR-2022-0829-0554, p. 7]

Under the Proposed Rule, from MY 2027, ZEVs will no longer be eligible for A/C efficiency credits. HMG believes the same argument can be made here as related to the OCC proposal. A/C technology improvements will lead to reduced energy use in ZEVs and thus reduced emissions associated with such vehicles. Therefore, when considering overall emissions reductions and EPA' s broader goals to improve human health and the environment by such emissions reductions, there is considerable value in incentivizing energy-saving ZEVs, particularly while challenges to developing and deploying ZEV technology remain. HMG therefore opposes the Proposed Rule's elimination of indirect A/C efficiency credits for ZEVs. [EPA-HQ-OAR-2022-0829-0554, p. 7]

HMG believes direct A/C (leakage) credits should not be eliminated [EPA-HQ-OAR-2022-0829-0554, p. 7]

EPA also proposes to remove direct A/C leakage credits from MY 2027 for all vehicles. HMG again opposes the removal of this important incentive. If retained , the majority of auto manufacturers would receive these credits because great efforts were made over the past few years to switch to a low global warming potential (GWP) refrigerant. Removing this credit opportunity places a greater burden on manufacturers already undergoing substantial challenges associated with the push to electrification. [EPA-HQ-OAR-2022-0829-0554, p. 7]

For this reason, HMG believes the A/C leakage credits should exist beyond MY 2027. Auto manufacturers made large investments to make the switch to their entire fleet with the expectation that earned credits would offset some of these costs. HMG suggests slowly phasing out A/C leakage credits over 5 years instead of eliminating them completely in MY 2027. A/C leakage credits are also a large percentage of credits currently earned, and with the reduction of these credits, it will be much more difficult to meet the more stringent GHG emissions standards than it ap pears. [EPA-HQ-OAR-2022-0829-0554, p. 7]

Organization: Hyundai Motor America

The Final Rule Should Delay the Start of Off-Cycle Credit Phase Down Until MY 2031. [EPA-HQ-OAR-2022-0829-0599, pp. 7-8]

The final rule should enable compliance pathways by offering a real choice of clean technology innovation or greater PEV penetration. However, the fundamental stripping away of technology- earning credit flexibilities, in effect, creates an EV mandate. The result will cause an industrywide race to simply “buy” compliance through credit trading provisions. In this way, the Proposed Alternative’s restructured off-cycle and air conditioning credit provisions incentivize the wrong behavior by industry. [EPA-HQ-OAR-2022-0829-0599, pp. 7-8]

Organization: Kia Corporation

- Kia strongly supports preserving many of the current program flexibilities – a phase- down of the A/C refrigerant leakage credits and preserving the off-cycle technology credits. These flexibilities should still play an important role as these credits could help ease the uncertainties in the transition to EVs. [EPA-HQ-OAR-2022-0829-0555, p. 3]

Kia Supports Continuation of the A/C Efficiency Credit Program

EPA proposes to continue the A/C efficiency credit program, but limit the eligibility for the A/C efficiency credits to only ICE vehicles starting in MY2027. Starting with MY2027, BEVs are no longer eligible for A/C efficiency credits. Kia supports the continuation of the A/C efficiency credit program. These efficiency technologies result in real-world GHG emissions reductions. Therefore, they should not be eliminated or viewed as cutting into the effective stringency of the program. [EPA-HQ-OAR-2022-0829-0555, pp. 14-15]

Kia Supports a Phase Down of the A/C Refrigerant Leakage Credit Program

EPA proposes to remove the A/C refrigerant leakage credits for both light and medium duty vehicles and trucks because of the separate law disallowing the use of high global warming potential refrigerants under the American Innovation and Manufacturing (AIM) Act of 2020. [EPA-HQ-OAR-2022-0829-0555, pp. 14-15]

Because of the mandate in the AIM Act and because the transition to low global warming refrigerant is in effect, Kia recommends, instead of immediate elimination, a phase-down of credits before eventually discontinuing the A/C leakage credit. [EPA-HQ-OAR-2022-0829-0555, pp. 14-15]

Kia urges EPA to accurately reflect the transition of the credit in the stringency curve. While this transition has been reflected in the stringency curve for passenger vehicles from MYs 2027 - 2032, it is less clear how the stringency curve for light trucks reflects this change. We recommend EPA further adjust the stringency curves for light trucks to better reflect the transition to low global warming refrigerants from MYs 2027 - 2032. Both of these recommended adjustments will provide flexibility for meeting the extremely stringent and front-loaded GHG standards. [EPA-HQ-OAR-2022-0829-0555, pp. 14-15]

Organization: Lucid Group, Inc.

Lucid Supports Eliminating AC Leakage and Off-Cycle Menu Credits

EPA proposes removing the air conditioning (AC) refrigerant leakage control credit starting with MY27. Lucid supports the agency’s decision to remove the leakage control credit; the credit has led to the reduction of leakage of hydrofluorocarbon (HFC) 134a refrigerant by manufacturers transitioning to leak-tight components in the AC system or to refrigerants with a lower global warming potential. [EPA-HQ-OAR-2022-0829-0664, p. 7]

Lucid Encourages EPA to Consider Parity with AC Efficiency Credits

Lucid agrees with EPA that AC efficiency credits have been effective in incentivizing AC efficiency improvements since the program’s inception, and the usage of these credits by manufacturers has increased over time. AC efficiency improvements have a direct impact on tailpipe emissions for ICE vehicles. As a corollary, improvements to AC efficiency in EVs yields benefits such as better vehicle range, increased vehicle efficiency, and less demand on the grid. These benefits directly impact EV usage, vehicle miles traveled, and consumer sentiment toward the adoption of EVs. [EPA-HQ-OAR-2022-0829-0664, p. 7]

Lucid encourages EPA to consider parity in treatment of ICE vehicles and EVs under the AC efficiency credit program. The benefits in increased efficiency should be recognized in both or neither. [EPA-HQ-OAR-2022-0829-0664, p. 7]

Organization: MEMA, The Vehicle Suppliers Associated

Continue Off-Cycle Technologies Credit & A/C Efficiency Technology Credit Programs

MEMA urges EPA to continue to provide the off-cycle technology credit program and the A/C efficiency credit program. The supplier community, working independently and in collaboration with OEMs, develop and engineer innovative technologies that contribute to vehicle manufacturers' strategies for real-world GHG and fuel consumption reductions often beyond those measured with standard test procedures. The off-cycle credit program and A/C efficiency credit program have helped to support industry investment in innovative and forward-looking technologies that provide environmental benefits. These technologies offer measurable, demonstrable, and verifiable real-world benefits that improve efficiencies and reduce GHG emissions. They also provide an important cost-effective option for OEMs to achieve fuel economy and GHG targets. [EPA-HQ-OAR-2022-0829-0644, pp. 9-10]

These credit programs are not loopholes and do not distort the market but instead recognize technologies that are not measured accurately on the existing test-cycles. These technologies are often more cost effective than other available technologies to reduce pollutant emissions. It is important that the MY27+ program allows a variety of regulatory tools to broaden compliance pathways for vehicles to manage their product mix during this transition period. [EPA-HQ-OAR-2022-0829-0644, pp. 9-10]

The continuation of the off-cycle credit program is critical in encouraging technologies that allow greater innovation which can provide a cost-efficient range of technology options that ultimately lower compliance costs and increase consumer choice. These technologies will continue to promote consumer choice, spur technology development, and minimize compliance costs while achieving significant pollutant emissions and oil reductions. Importantly, continuation of the off-cycle technology credit program will help maintain market certainty for these technologies. [EPA-HQ-OAR-2022-0829-0644, pp. 9-10]

Similarly, MEMA encourages EPA to explore how emissions reductions from off-cycle technologies and A/C efficiency technologies could be rewarded when used on BEVS, PHEVs, FCEVS, and other ZEVs. Many off-cycle and A/C efficiency technologies, along with emerging ZEV technologies, could help reduce battery energy use and therefore lower the amount of electricity used to power the vehicle overall. Consequently, technologies that reduce the amount of battery charging needed and, therefore, the electricity used to power the vehicle should be recognized in MY2027 and beyond. [EPA-HQ-OAR-2022-0829-0644, pp. 9-10]

MEMA urges:

- EPA to maintain off-cycle credits and A/C credits programs at full value through 2032 for all vehicle types, including ZEV, and consider additional ways emerging technologies that reduce ZEV energy consumption can be rewarded. [EPA-HQ-OAR-2022-0829-0644, pp. 9-10]

Organization: Minnesota Pollution Control Agency (MPCA)

- Phase out air conditioning and off-cycle credits

The MPCA agrees with EPA's proposal to phase out air conditioning and off-cycle credits. While useful to encourage manufacturers to invest in improved technology in earlier phases of EPA's greenhouse gas vehicle emissions standards, they no longer provide substantive benefit, and it is appropriate to sunset these programs. [EPA-HQ-OAR-2022-0829-0557, p. 5]

Organization: Mitsubishi Motors North America, Inc. (MMNA)

Mitsubishi participated in the development of - and supports - the comments submitted by Auto Innovators. [EPA-HQ-OAR-2022-0829-0682, p. 2]

In addition, based on its considerable experience discussed previously with BEV and PHEV leadership, Mitsubishi provides the following recommendations to supplement the comments of Auto Innovators:

1. Closely align the multi-pollutant emissions standards with President Biden's 2030 goal by assuming no more than 40-50% PHEVs and FCEVs by 2030, even though our experience leads us to caution that this itself is very ambitious, and is predicated on the assumption that the necessary supportive policies will be effectively implemented. [EPA-HQ-OAR-2022-0829-0682, p. 2]

2. Consider the many benefits of PHEVs to consumers and the environment during the expected period of constrained battery critical minerals production capacity, and how PHEVs are the perfect stepping- stone to full BEV acceptance. [EPA-HQ-OAR-2022-0829-0682, p. 2]

3. Maintain the current PHEV Utility Factor (UF) and work with industry to identify opportunities to increase PHEV electric operation. This is the ideal stepping-stone technology to encourage long-term BEV acceptance and utilization. [EPA-HQ-OAR-2022-0829-0682, p. 2]

4. Keep the proposed approach to determine the passenger car curves, and consider adjusting the cutpoint and stringency levels of the light-duty trucks during the early years of the program. [EPA-HQ-OAR-2022-0829-0682, p. 2]

5. Maintain the existing GHG program flexibilities, such as Air Conditioning and Off-Cycle technologies credits (including the alternative method to apply off-cycle credits), and allow previously approved technologies to continue receiving credits. [EPA-HQ-OAR-2022-0829-0682, p. 2]

6. Align the Tier-4 (criteria pollutants) with CARB's LEV-IV criteria test procedures and standards. [EPA-HQ-OAR-2022-0829-0682, p. 2]

7. Consider the impact that very aggressive GHG standards will have on vehicle affordability, and especially the detrimental impact to low-to-moderate income families. Regardless of the vehicles that regulation may require us to produce, it is critical that regulators always keep the accessibility of consumers in mind. [EPA-HQ-OAR-2022-0829-0682, p. 2]

The rationale for each one of these recommendations is further explained below. [EPA-HQ-OAR-2022-0829-0682, p. 2]

5. GHG Program Flexibilities

At the onset of GHG regulations in MY2012, EPA developed a set of program flexibilities designed to provide credits for technologies that provide real-world GHG emissions benefits but are unable to be measured under the required test procedures. Specifically, credits are available for refrigerant systems which use low global warming potential refrigerants and reduce leakage, improvements to air conditioning efficiency, and “off-cycle” technologies which improve emissions but are not fully measured during 2-cycle testing. This proposed regulation intends to phase out and eliminate several of these credits as well as limit their application for electric vehicles. Mitsubishi supports the position of Auto Innovators to maintain these program flexibilities as these technologies provide real-world environmental benefits. Mitsubishi also supports Auto Innovators’ position that any vehicles with previously approved alternative method off-cycle technology continue to receive credits for MY27 and later. In addition, Mitsubishi believes that the alternative method to apply for off-cycle credits should remain as an option for MY27 and later. [EPA-HQ-OAR-2022-0829-0682, pp. 8-9]

It is important to note that NHTSA’s CAFE program in the past has mirrored EPA’s GHG approach to these flexibilities. Since it is not possible to comment on a proposed CAFE regulation that has not yet been published, it is only reasonable to assume that NHTSA will follow previous precedent regarding flexibilities and adopt the same structure as EPA. However, there is a significant deviation with regard to the treatment of EV compliance under the CAFE and GHG programs. Where EVs are rightly considered zero g/mi under the GHG program, the CAFE program requires EVs to be assign a mile per gallon equivalent compliance value based on the PEF. Increasing this discrepancy in the GHG and CAFE programs, DOE has proposed reducing the PEF by 72% compared to the current value. The PEF reduction will lead to a substantial decrease in the CAFE compliance value of BEVs and PHEVs. The elimination of air conditioning and off- cycle credits for EVs combined with changes to the PEF, and UF within the CAFE program could put BEVs and PHEVs at a distinctive compliance disadvantage relative to some Strong Hybrid-Electric Vehicles (SHEVs). Keeping these flexibilities in the GHG program for electric vehicles should reduce potential harmonization issues between the GHG and CAFE regulations. For this reason and the reasons stated by Auto Innovators, Mitsubishi supports Auto Innovators proposed approach to apply all available credits at the vehicle level regardless of propulsion, but ensure fleet-wide average emissions are not allowed to go below a value equivalent to zero g/mi. [EPA-HQ-OAR-2022-0829-0682, pp. 8-9]

Organization: National Association of Clean Air Agencies (NACAA)

We also support the proposed elimination of air conditioning (AC) leakage credits and recommend that EPA include in the final rule a leakage design standard to serve as a backstop against the impact of any leakage. In the December 2020 American Innovation and Manufacturing (AIM) Act Congress authorized EPA to phase down production and consumption of hydrofluorocarbons (HFCs) in various sectors and subsectors, including vehicle AC systems. As EPA explains in the proposal, "The AIM Act has sent a strong signal to all vehicle manufacturers that there is no future for using high GWP [Global Warming Potential] refrigerants in new vehicles. In December 2022, in response to the AIM Act, EPA proposed to restrict the use of high GWP refrigerants such as HFCs in vehicle applications. The new restriction on refrigerant use, if finalized as proposed, would be effective in MY 2025 for light-duty vehicles and MY 2026 for MDVs, well ahead of the start of the new CO2 vehicle standards EPA is proposing."28 [EPA-HQ-OAR-2022-0829-0559, p. 8]

28 Supra note 1, at 29,247.

Organization: National Automobile Dealers Association (NADA)

It would also revise the air conditioning credit program by limiting credit eligibility to light-duty internal combustion engine (ICE) vehicles for tailpipe CO2 emissions control beginning in MY 2027, and remove refrigerant- based air conditioning provisions for both light- and medium-duty vehicles to maintain consistency with a separate proposal to disallow their use.10 [EPA-HQ-OAR-2022-0829-0656, p. 3]

10 88 Fed. Reg. 29196, 29246-48.

NADA generally supports retention of all compliance flexibilities that will afford OEMs a greater ability to cost-efficiently deliver compliant vehicles, and to help incentivize the acceptance of new technology and alternative fuel vehicles in the marketplace. Hence, NADA opposes EPA's proposals to (i) eliminate or reduce the incentive multiplier for medium-duty vehicles prior to MY 2027, (ii) limit eligibility for the air conditioning credit to light-duty internal combustion engine (ICE) vehicles, (iii) eliminate refrigerant-based air conditioning credit provisions for both light-duty and medium-duty vehicles, and (iv) to sunset the off-cycle credits program for both light-duty and medium-duty vehicles. NADA shares the concerns expressed by AAI in its comments regarding the changes EPA proposes on these matters. [EPA-HQ-OAR-2022-0829-0656, p. 16]

Organization: Nissan North America, Inc.

As a member of the Alliance for Automotive Innovation ("the Alliance"), Nissan fully endorses the comments on the Proposed Multi-Pollutant Rule submitted separately by the Alliance. In particular, Nissan highlights several points from the Alliance's comments, including: [EPA-HQ-OAR-2022-0829-0594, p. 9]

- Request continuing AC and off-cycle credit eligibility for EVs that are part of mixed fleets [EPA-HQ-OAR-2022-0829-0594, p. 9]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

We also support EPA's air conditioning credit programs and its proposal to sunset the off-cycle credits program for both LDVs and MDVs and suggest EPA consider whether shorter timeframes are appropriate. [EPA-HQ-OAR-2022-0829-0584, p. 9]

Organization: Porsche Cars North America (PCNA)

2. Porsche supports continued availability of flexibilities for electrified vehicles.

Porsche supports the continued allowance for electric vehicles to participate in the off-cycle and air conditioning related GHG flexibilities. Porsche does not support the proposal from EPA to remove both for electric vehicles beginning in model year 2027. Off-cycle technology and air conditioning credits have been a pragmatic and supportive pillar within the suite of flexibilities in EPA's GHG regulation for many years and Porsche believes that these flexibilities can continue to provide value within the overall construct of the GHG fleet regulation, even for fully electrified vehicles. [EPA-HQ-OAR-2022-0829-0637, pp. 19-20]

Electric vehicles operate as a supportive element within a manufacturers GHG fleet and should provide a compliance incentivize intended to increase production of EVs. Electric vehicles like any other vehicle should have the opportunity to leverage additional off-cycle or air conditioning technologies that further contribute to CO2 reduction goals and for those credits to be equally available for use within a manufacturers fleet. These types of credits act as an internal flexibility for the manufacturer to manage their overall annual compliance. [EPA-HQ-OAR-2022-0829-0637, p. 20]

3. Porsche supports continued availability of GHG credits for newer, low-GWP air conditioning systems.

Specific to air conditioning leakage credits, Porsche recommends EPA retain the provision for new, low GWP refrigerants such as R-744 that offer even lower global warming potential (GWP) values that the commonly used 1234-YF refrigerant. Porsche recommends that a credit be provided that reflects the GWP of 1.0 for R744 versus the 4.0 of 1234-YF. Furthermore, Porsche recommends EPA revisit the HiLeakDis equation and associated values as defined in 86.1867-12 to establish an appropriate set of values HiLeakDis equation for R-744 systems. R-744 is a smaller molecule than 1234-yf and R-744 systems operate at a much higher pressure. As such, the values reflected in the current HiLeakDis do not provide a benchmark system leakage rate appropriate to benchmark R-744 systems. The current values reduce the overall credit available for R-744 systems even though the R-744 has a lower GWP than 1234-YF. The values within the current HiLeakDis were established to reflect average system leakage rates for 1234- YF in order to prevent backsliding in system leakage control. A similar HiLeakDis may be appropriate to ensure quality R-744 systems but would need to be established to set a benchmark for reasonable leak control specific to R-744. [EPA-HQ-OAR-2022-0829-0637, p. 21]

Organization: Rivian Automotive, LLC

Consider the Tradeoffs in Ending Air Conditioning ("AC") Efficiency Credits for BEVs

EPA proposes two actions related to AC credits. First, EPA proposes to end credits for use of AC refrigerants with a lower global warming potential ("GWP"). Rivian supports this change. Pursuant to the American Innovation and Manufacturing Act of 2020, EPA has proposed to disallow high-GWP refrigerants, obviating the need for the existing incentives in the vehicle emissions rules.27 Second, EPA proposes to make BEVs ineligible for AC system efficiency credits beginning in MY27. Rivian appreciates the agency's rationale for making BEVs ineligible for AC efficiency credits but encourages consideration of the tradeoffs. As in the off-cycle program, Rivian believes EPA should maintain parity in its treatment of BEVs and ICEs for AC credit purposes. While AC efficiency directly affects an ICE's tailpipe emissions, efficiency credits for BEVs incentivize manufacturers to maintain maximally efficient AC systems in those vehicles—a contributing factor in a BEV's overall energy efficiency and a feature the agency acknowledges in the NPRM.28 Energy efficiency is an important value even without a tailpipe impact. While direct regulation of BEV efficiency would be premature at this stage, EPA should consider the benefits of regulatory provisions that indirectly incentivize efficiency improvements as the BEV fleet grows. To address potential concerns about AC efficiency credits for BEVs—and the resulting "negative" emissions credited to BEV manufacturers—eroding the stringency of the regulation, the agency could increase stringency of the standards as needed. [EPA-HQ-OAR-2022-0829-0653, pp. 9-10]

27 Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, 88 Fed. Reg. 87 (May 5, 2023) (revising 40 C.F.R. Parts 85, 86, 600, 1036, 1037, and 1066), 29,196.

28 Id. at 29,246-29,247.

Unlike advanced technology multipliers that do not represent real-world emissions improvements, AC efficiency credits for BEVs do link to a real-world reduction in energy demand. Rivian understands the agency's argument for eliminating efficiency credits for BEVs but believes this would come at a cost. EPA should consider the tradeoffs involved and reexamine this proposal by treating BEV and ICE vehicle AC efficiency similarly. [EPA-HQ-OAR-2022-0829-0653, pp. 9-10]

Organization: Southern Environmental Law Center (SELC)

EPA is proposing several modifications to other credit systems that are part of the tailpipe emissions standards in order to ensure these systems actually result in emissions reductions. We support EPA's proposal to eliminate the air conditioning (AC) system credits for AC refrigerant leakage control. Since the phase out of high global warming potential (GWP) refrigerants is required under other laws and regulations, manufacturers should not be rewarded under the tailpipe emissions standards for actions they are already required to take. Vehicles, however, will continue to use low GWP refrigerants, and EPA should implement a leakage design standard to protect against potential system leaks. [EPA-HQ-OAR-2022-0829-0591, p. 10]

EPA is also proposing to close loopholes that allow for emissions reductions provided by ZEVs to be claimed more than once. We support EPA's modification to the AC efficiency credit so that it applies only to internal combustion engine vehicles starting in model year 2027. This makes sense because AC efficiency credits are earned solely by improving internal combustion engine vehicles. Under the current tailpipe emissions standards, however, some manufacturers were reporting ZEV emissions of less than zero when implementing AC efficiency technology in those vehicles. For similar reasons, we also support EPA's proposal to modify the off-cycle credit system to only include eligible vehicles (i.e., internal combustion engine vehicles) in calculating the cap used for these types of credits until they are phased out. [EPA-HQ-OAR-2022-0829-0591, p. 10]

Organization: Stellantis

EPA's Discounting of Technology Benefits Increases Implicit GHG Stringency

EPA has proposed AC, off-cycle and PHEV technology actions that would increase the implicit GHG stringency, making it even more difficult to achieve the explicit aggressive GHG targets. These EPA proposed actions are summarized below:

- Remove the Direct AC refrigerant and leak credit in a single model year (2027MY) [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

- Impose an artificial phase down of off-cycle credits, disregarding the real-world benefits of GHG saving technology [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

- Exclude PHEV technology from modeling and discount highly capable PHEV technology that would provide a bridge to a fully electrified future [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

These long-standing flexibilities have incentivized significant investment in GHG saving technology that now proliferates across the light-duty fleet. The Direct AC credit incentive has been a very successful program that industry has moved to implement at a very high rate. The investment and piece costs incurred to develop and introduce the lower Global Warming Potential (GWP) refrigerants and their systems are partially offset by the GHG credits received. In addition, the lower leak technologies and materials, now deployed across the ICE fleet, continue to achieve real-world GHG savings. This GHG benefit of low AC leak rates does not go away as we transition the fleet to higher rates of electrified product. [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

Similarly, the ongoing and already incurred investment and costs of GHG saving off-cycle technologies in the fleet have led to real world benefits. These benefits also do not go away as the fleet adds more EVs and PHEVs. While there may be less available menu credits for EVs versus ICE products, this naturally achieves what the EPA is now proposing in this rule via a forced phase-down of the allowed credit cap. That is, the menu of available technologies will naturally decrease as fleet mix shifts to EVs. EPA's effort to drastically reduce the cap will immediately call into question the ongoing development and deployment of these GHG saving technologies. [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

These combined actions significantly increase the stringency of the proposed rule by making the extremely aggressive fleet targets more difficult to achieve while at the same time incentivizing OEMs to remove this GHG saving technology from products. ICE vehicles and EVs both benefit from many of these technologies and therefore their GHG compliance and real-world benefits should not be removed. [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

- The Direct AC credit and off-cycle credit programs need to be retained for continued GHG benefits on both ICE and EV products. [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

- The implicit stringency impact in the early years of this rulemaking is drastically increased by the additional burden experienced if the proposed flexibilities are removed. [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

Stellantis recommends that EPA should:

-Retain GHG saving technology flexibilities recognizing the GHG benefit that continues to be present on electric vehicles and that will naturally decrease as EV penetration increases [EPA-HQ-OAR-2022-0829-0678, p. 24]

Organization: Tesla, Inc.

Tesla supports the proposed Alternative 1 with added stringency so that the final performance standards achieves a fleet BEV penetration rate greater than 69% in MY 2032.2 Alternative 1 is estimated to provide greater CO2 emissions reduction of -51% from no action by 2050 compared to -46% under EPA's proposal, and the additional stringency will result in even greater emission reductions.3 Accordingly, Tesla asserts the EPA should amend its proposal with a more stringent version of Alternative 1 and take, inter alia, the following additional steps to increase the performance and overall stringency of the proposed standards: [EPA-HQ-OAR-2022-0829-0792, p. 2]

2 See, 88 Fed. Reg. 29332-33, Table 96.

3 Id., at 29348 (comparing Tables 135 and 136).

- Eliminate off-cycle crediting for all types of vehicles; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Revisit the plug-in hybrid electric vehicle (PHEV) utility factor to accurately reflect real world emissions; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Amend the proposal to create parity in promoting motor vehicle air conditioning (MVAC) efficiency adoption; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Maintain the existing zero emissions upstream approach for BEVs; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Eliminate credit multipliers for all vehicles; and [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Ensure BEVs continue to be accounted for, and participate in, the NMOG + NOx reduction standard. [EPA-HQ-OAR-2022-0829-0792, p. 2]

Reducing short-lived climate pollutant emissions, such as HFC-134a, is a critical step toward mitigating climate change. Accordingly, Tesla supports EPA's actions to prohibit high GWP (>## 150) refrigerants such as HFC 134a in new light-duty A/C systems post MY-2025.158 As the proposal recognizes, the transition to lower GWP refrigerants is rapidly underway and all manufacturers can be compliant before the implementation of the proposed standards go into effect. Accordingly, the agency has correctly eliminated the A/C leakage credit. [EPA-HQ-OAR-2022-0829-0792, p. 25]

158 88 Fed. Reg. at 29247.

EPA Should Create Parity on A/C Efficiency Crediting

The EPA's decision to limit voluntary A/C efficiency credits to only ICE vehicles is bad policy.159 In proposing this limitation, the agency runs the risk of creating a disincentive for manufacturers of BEVs to continue to improve and deploy the most efficient cooling systems. The agency instead should consider a technology neutral approach allowing the crediting of all vehicles and increasing the stringency of the overall standard consistent with the additional level of credit generation that will accumulate with BEV A/C efficiency credit generation eligibility. [EPA-HQ-OAR-2022-0829-0792, p. 25]

159 88 Fed. Reg. at 29239.

Organization: Volkswagen Group of America, Inc.

A/C Efficiency Credits – Proposed Vehicle Air Conditioning System Related Provisions (Section III.B.5.)

Beginning with MY 2027, EPA is proposing to retain A/C efficiency credits but with eligibility limited to vehicles equipped with only IC engines. Volkswagen recommends keeping the current A/C efficiency credits approach for PEVs within the compliance calculation. The A/C credits considered as a part of an incentive program for manufacturers to include efficient A/C technologies since the A/C is continuously running while the vehicle is driven. [EPA-HQ-OAR-2022-0829-0669, p. 5]

The electrical energy consumption of BEVs should be incentivized. Real world efficiency of BEVs can be improved year-round, e.g., through efficient air-conditioning systems. Efficient A/C gives the customer a greater driving range and contributes to feasibility of the GHG stringency as the overall energy demand of the vehicle is reduced. A/C credits allow a quantifiable internal positive business case to offset the expense of more expensive technologies as part of vehicle development. In addition to efficient air conditioning systems, the current method of evaluating A/C efficiency should be applied to heat pumps. The use of heat pumps should also be considered to be rewarded with A/C efficiency credits. [EPA-HQ-OAR-2022-0829-0669, p. 5]

It should not be an advantage for manufactures with a higher ICE fleet share to claim A/C efficiency credits and contrarily a disadvantage for manufacturers with a higher fleet PEV share. A PEV is always “0 g/mi” and not negative. The credit value by itself is part of the fleet compliance calculation and not truly a discrete negative GHG score for a given PEV. [EPA-HQ-OAR-2022-0829-0669, p. 5]

A/C Leakage Credits (Section III.B.5.ii)

EPA proposes sun setting the voluntary refrigerant-related credits in MY 2027 in its vehicles GHG program as appropriate and reasonable due to the American Innovation and Manufacturing (AIM) Act of 2020 (42 U.S.C. § 7675). Yet, there is no incentive provided to use refrigerants with even lower global warming potential (GWP) and in addition to the current standard refrigerant R1234yf (GWP = 4), the refrigerant R744 (GWP = 1) has an even lower GWP. Continuation or further development of A/C leakage credits for refrigerants with GWP <= 4 would provide an incentive to increase installation rates of low GWP refrigerants such as R744 and help to further improve the A/C system leakage effects. Volkswagen suggests continuation of leakage credits as an incentive to motivate the automotive industry to continue application or development of these improved A/C systems. [EPA-HQ-OAR-2022-0829-0669, p. 5]

Organization: Volvo Car Corporation (VCC)

VCC believes it is important to continue flexibilities (air conditioning credits for ZEVs and off- cycle credits for ICE vehicles) because low AC emissions and AC efficiency are environmental improvements. EPA should continue these programs and develop a new process so that pure ZEV companies receive these credits without resulting in an overall negative C02 result. [EPA-HQ-OAR-2022-0829-0624, p. 4]

Organization: Zero Emission Transportation Association (ZETA)

While we appreciate EPA's intent behind making BEVs ineligible to generate AC efficiency credits, we would note that AC efficiency does affect the overall vehicle efficiency, regardless of the fuel type of the vehicle. As such, EPA should maintain parity between ICE and BEVs in regards to AC efficiency credits in the final rule. [EPA-HQ-OAR-2022-0829-0638, pp. 28-29]

<u>EPA Summary and Response</u>

A/C leakage credit: general comments:

<u>Summary:</u>

The following organizations and companies recommend maintaining A/C leakage credits.

- Alliance for Automotive Innovation, Ad Hoc Tier 4 Light-Duty Small Manufacturer Group, DENSO, Hyundai America Technical Center, Inc. (HATCI), Mitsubishi Motors North America, Inc. (MMNA), National Automobile Dealers Association (NADA), Nissan North America, Inc., Porsche Cars North America (PCNA), Stellantis, Volkswagen Group of America, Inc., Zero Emission Transportation Association (ZETA)

The following organizations and companies support a phase-out over time if EPA decides to eliminate leakage credits given provisions of the American Innovation and Manufacturing (AIM) Act.

- Ford Motor Company, Kia Corporation

The following organizations and companies support phase-out and the elimination of air conditioning (A/C) leakage credits and some commenters recommend that EPA include in the final rule a leakage design standard to serve as a backstop against the impact of any leakage.

- Arconic Corporation (ARCO), California Air Resources Board (CARB), Chemours Company FC, LLC, Environmental. and Public Health Organizations, Lucid Group, Inc., Minnesota Pollution Control Agency (MPCA), National Association of Clean Air Agencies (NACAA), Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC), Rivian Automotive, LLC, Southern Environmental Law Center (SELC), Tesla, Inc.

- CARB recommends that U.S. EPA retain the existing AC leakage standard for medium-duty vehicles regardless of refrigerant type and establish an AC leakage standard for light-duty vehicles.

- California Attorney General's Office, et al. recommend retaining a smaller value A/C leakage credit to continuously incentivize the prevention of refrigerant leaks for the lowest GWP refrigerant.

- NACAA recommends that EPA include in the final rule a leakage design standard to serve as a backstop against the impact of any leakage.

- NESCAUM recommends EPA consider whether shorter timeframes for sunsetting the leakage credits are appropriate.

Response:

As discussed in preamble Section III.C.5, EPA agrees with commenters who expressed support for retaining some credits and regulatory support for reducing leakage. We agree with commenters (e.g., California Attorney General's office) that it would be environmentally beneficial to continue a small credit for the cleanest A/C refrigerants under the GWP threshold of EPA's Technology Transitions rule established pursuant to the AIM Act. For MY 2031 and later, EPA is establishing A/C leakage credits of 1.6 g/mile cars and 2.0 g/mile trucks A/C leakage credits to incentivize using the lowest-GWP refrigerants and the use of low leak systems. The A/C credits have been very successful in encouraging the adoption of low leak systems and lower GWP refrigerants and EPA finds it is appropriate to continue the credits, but at a lower level to reflect more recent developments, including the AIM Act. We also recognize that the proposed elimination of A/C leakage credits in MY 2027 would pose challenges for manufacturers with respect to lead time and feasibility. We recognize that a phase-out of these credits would provide for a more orderly transition and also provide necessary additional lead time in meeting the stringency of standards in the early years of the program. Therefore, in this final rule, EPA is phasing down the existing A/C leakage credits from 2027 through MY 2030.

We agree with commenters supporting the existing MDV refrigerant leakage standard. EPA is retaining the existing MDV refrigerant leakage standard that was established under the Phase 2 program. The current MDV leakage standard requires that loss of refrigerant from A/C systems may not exceed a total leakage rate of 11.0 grams per year or a percent leakage rate of 1.50 percent per year, whichever is greater. This leakage standard applies regardless of the refrigerant used in the A/C system.

In the Phase 2 rule, EPA revised the refrigerant leakage standard to be refrigerant neutral, meaning that regardless of the type of refrigerant used, the loss of refrigerant cannot exceed the standard of 11 g/year or a percentage leakage rate greater than 1.5 percent per year for maximum leakage credits. The MDV program does not include A/C efficiency related credits or requirements.

A/C maximum leakage credits (MaxCredit) available to manufacturers, final program (CO_2 g/mile).

MY	Car	Truck
2026	13.8	17.2
2027	11.0	13.8
2028	8.3	10.3
2029	5.5	6.9
2030	2.8	3.4
2031	1.6	2.0
2032 and later	1.6	2.0

Leakage: use of heat pumps and alternative refrigerants in future HVAC systems

Summary

Alliance for Automotive Innovation (AAI), Porsche Cars North America (PCNA) and Volkswagen Group of America, Inc. made the following comments:

AAI commented that the use of heat pumps is expected to become more prevalent in HVAC systems, particularly in BEVs. These systems resemble AC systems but are modified to heat and cool the cabin and battery. Thus, they have additional connections, valving, and heat exchangers that represent additional leak paths in the system. For these systems in particular, the credit recognizing reduced AC refrigerant leakage technology is still needed and would still recognize real-world benefits.

AAI further commented that refrigerant R1234yf is suitable for heat pump applications, but is performance limited at high and low temperature extremes. Other refrigerants are better suited to heat pump applications. Electrification is driving new HVAC system architecture and using new refrigerants in greater quantities than in ICE vehicles. These new refrigerants are likely to have higher-GWP components than R1234yf and selectively leak at different rates. Encouraging the use of the lowest GWP blends possible and minimizing leakage is still an important environmental consideration.

Volkswagen commented that there is no incentive provided to use refrigerants with even lower global warming potential (GWP) than the current standard refrigerant R1234yf (GWP = 4), such as the refrigerant R744 (GWP = 1). Volkswagen recommended further A/C leakage credits for refrigerants with GWP <= 4 to provide an incentive to increase installation rates of low GWP refrigerants such as R744 and help to further improve the A/C system leakage effects.

PCNA: Porsche recommended EPA retain the provision for new, low GWP refrigerants such as R-744 that offer even lower global warming potential (GWP) values that the commonly used 1234-YF refrigerant. Porsche recommends that a credit be provided that reflects the GWP of 1.0 for R744 versus the 4.0 of 1234-YF. Porsche also recommended EPA revisit the HiLeakDis equation to establish a different set of values in the HiLeakDis equation for R-744 systems.

Response:

EPA agrees with commenters that it would be environmentally beneficial to continue a small credit for the cleanest A/C refrigerants under the GWP threshold of EPA's Technology Transitions rule established pursuant to the AIM Act.

As discussed above, EPA is phasing down the A/C leakage credits from MY 2027 through 2030; the A/C leakage credits will be available but for a reduced credit value when using higher GWP refrigerants. For A/C leakage credits for MY 2031 and later, A/C leakage credits in the vehicle program are only available for those refrigerants with GWPs at or below 150 (the threshold established by EPA's Technology Transitions rule).

In response to Porsche's comment on the GWP of 1.0 for R-744 versus the 4.0 of HFO-1234yf refrigerant, EPA has previously revised the GWP value of HFO-1234yf refrigerant to 1. Therefore, the leakage credits of both HFO-1234yf and R-744 refrigerants are identical when using the same HiLeakDis values. EPA believes the current values in the HiLeakDis equation remain appropriate for all refrigerants.

EPA agrees with the comment that an A/C leakage credit could incentivize refrigerants cleaner than the EPA Technology Transitions rule's threshold. For model year 2031 and later, EPA has established A/C leakage credit values of up to 1.6 g/mile for cars and 2.0 g/mile for trucks, dependent on the GWP of the refrigerant used, to incentivize using the lowest GWP refrigerant. EPA notes that the most recent GWP value of R1234yf refrigerant is 1; thus, manufacturers' use of this or other refrigerants less than 150 GWP are eligible to earn the available optional A/C credits.

A/C efficiency credit for electric vehicles: general comments

<u>Summary:</u>

The following organizations and companies oppose limiting A/C efficiency credits to ICE vehicles and urged EPA to continue allowing A/C efficiency credits for BEVs:

- Alliance for Automotive Innovation, DENSO, Ford Motor Company, Hyundai America Technical Center, Inc. (HATCI), Hyundai Motor America, Kia Corporation, Lucid Group, Inc., MEMA (The Vehicle Suppliers Associated), Mitsubishi Motors North America, Inc. (MMNA), National Automobile Dealers Association (NADA), Nissan North America, Inc., Porsche Cars North America (PCNA), Rivian Automotive, LLC , Stellantis, Tesla, Inc., Volkswagen Group of America, Inc., Volvo Car Corporation (VCC)
- Alliance for Automotive Innovation comments that eliminating eligibility for AC efficiency credits for BEV vehicles makes sense only once the transition to BEV mass volumes is more robust.
- Many of the organizations and companies commented that maintaining A/C efficiency credits for both ICE vehicles and BEVs would maintain "parity" between the two types of powertrains.

The following organizations and companies support excluding BEV air conditioning (A/C) efficiency credits, while retaining current 5-cycle testing protocols that confirm the systems actually reduce emissions.

- Arconic Corporation (ARCO), BorgWarner, Inc., California Air Resources Board (CARB), Environmental. and Public Health Organizations, Minnesota Pollution Control Agency (MPCA), National Association of Clean Air Agencies (NACAA), Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC), Southern Environmental Law Center (SELC)

<u>Response:</u>

EPA disagrees with commenters who urged us to continue allowing A/C efficiency credits for BEVs. EPA is finalizing its proposal to limit A/C efficiency credits to vehicles equipped with IC engines beginning in MY2027, which is responsive to the many commenters who supported this provision. The A/C efficiency credits are based on emissions reductions from ICE vehicles. They correspond to motor vehicle emissions reductions that occur when the A/C systems on ICE vehicles are operated more efficiently, which in turn reduces their use of electricity produced by the alternator and engine, and which in turn reduces pollution emitted by the motor vehicle engine. The credits provide an incentive for manufacturers to increase the efficiency of their A/C systems and in turn reduce the pollution emitted by the vehicle engine. The amount of the credits was determined based on our technical analysis of the emissions produced by an ICE engine and how A/C efficiency improvements could reduce such emissions.

As explained in the preamble Section III.C.5.ii., currently, BEVs are generating credits even though the credits are based solely on improvements to ICE vehicles, and not representative of emissions reductions for BEVs. That is, BEVs completely prevent engine emissions. Thus, improving A/C efficiency does not and is not needed to further decrease vehicle engine emissions. Moreover, the amount of the credits EPA previously determined based on ICE vehicle emissions has no real-world correlation to BEVs. Allowing BEVs to generate A/C efficiency credits is therefore not technically sound. It also means they are receiving a windfall of credits that fails to correspond to any real-world reduction in vehicle emissions, a problem which increases in significance as the manufacturers choose to produce an increasing number of BEVs.

As described for off-cycle credits in preamble Section III.C.6.i, the final rule also restricts the applicability of A/C efficiency credits for PHEVs to the portion of vehicle operation when the engine is running, based on the vehicle's utility factor. Similar to the preceding discussion of BEVs and A/C efficiency credits, this calculation adjustment is appropriate to associate A/C efficiency credits only with ICE operation beginning in MY 2027.

Efficiency: testing for A/C efficiency credits

Summary:

Environmental. and Public Health Organizations and Volkswagen Group of America, Inc. made the following comments.

Environmental. and Public Health Organizations: We would, however, oppose these AC efficiency credits should EPA relax any of the current AC17 test procedures, as their real-world effectiveness could no longer be assured. We also ask EPA to fully explain exactly how it ensures that the standards' stringency is in fact increased by an amount equivalent to the credits it grants.

Volkswagen commented that the current method of evaluating A/C efficiency should be applied to heat pumps used for cabin heating in BEVs, and heat pumps should also be rewarded with A/C efficiency credits.

Response:

EPA agrees with Environmental and Public Health Organizations that the existing AC17 test procedures for A/C efficiency credits should not be relaxed and remain an important means of verifying A/C efficiency credits. EPA did not reopen the AC17 testing procedures in this rulemaking, and thus the existing AC17 test procedures remain in effect. Additionally, in response to Volkswagen's comment on heat pumps, for the reasons described above, EPA is finalizing its proposal to limit A/C efficiency credits to vehicles equipped with IC engines beginning in MY2027, and thus BEVs will not be eligible for A/C efficiency credits.

In response to the comment from Environmental. and Public Health Organizations, we understand the commenter was concerned about impacts on overall stringency of the program if we were to relax the existing AC17 testing provisions, as those tests are critical in ensuring that GHG reductions are in fact achieved in the real-world commensurate with the AC efficiency credits. EPA has not reopened the AC17 testing provisions as part of this rulemaking, and thus the existing AC17 testing requirements remain in effect. EPA agrees with the commenter that these testing provisions are a vital part of the program to ensure the validity of the AC efficiency credits.

Efficiency: A/C efficiency and off cycle credit interactions

Summary:

Alliance for Automotive Innovation (AAI) and DENSO Corporation made the following comments.

AAI: Auto Innovators believes that technologies affecting the AC efficiency credit interact with technologies on the solar-thermal control submenu of the off-cycle credit menu that reduce AC load. AAI recommended that EPA move the solar thermal control technologies to the AC efficiency credit menu and adjust the caps accordingly.

DENSO: DENSO recommended that EPA consider adding any A/C efficiency technologies approved under the off-cycle program's alternative methodology to the A/C efficiency credit menu, and that the credit caps be adjusted accordingly.

Response:

EPA does not agree with the commenters' suggestion of moving the off-cycle menu's thermal control technologies to the A/C efficiency credits menu. As discussed in Section III.C.6, EPA is phasing out off-cycle credits for a number of reasons, including shifts in the vehicle marketplace, the scale of credits relative to the standards, and continued concerns about how to verify whether off-cycle technologies provide emissions reductions in use commensurate with the level of the credits the menu provides.

For those technologies on the off-cycle credit menu including solar-thermal control, reliable efficiency data cannot be measured repeatedly, e.g., using AC17 test. For example, the efficiency of solar panels is dependent on many unpredictable factors such as daylight, clear sunny days, clouds, etc. Therefore, for the reasons discussed in the preamble for phasing out off-cycle credits, GHG credits for A/C technologies previously on the off-cycle menu are being phased out.

However, EPA is finalizing a phase-out of the off-cycle credits that is slower than proposed. Specifically, EPA is phasing down the off-cycle menu cap from MYs 2030 through MY 2032; beginning in MY 2033 off-cycle credits will no longer be available. See Section 3.1.4 of this RTC for additional discussion.

As discussed in Section III.C.6 of the preamble, while EPA is phasing out the off-cycle credits entirely after MY 2032, EPA is not phasing out A/C efficiency credits for ICE vehicles because the A/C efficiency credits program is more robust as it includes a check of vehicle emissions performance through AC17 testing.

Efficiency: increase of A/C efficiency credit cap

Summary:

DENSO Corporation made the following comment:

DENSO: DENSO requests the agency consider expanding the AC efficiency credit cap based on the National Renewable Energy Laboratory (NREL) study showing greater A/C improvement possibilities. NREL Study 17TMSS-0056 estimates the latest A/C energy consumption at 23.5 g/mile based on a series of simulations were performed to three vehicle platforms using various US driving patterns. This is compared to 11.9 g/mile for passenger car and 17.2 g/mile for light truck, which were baseline A/C emissions impacts previously used by the agencies to determine A/C efficiency credit cap). The current cap constraints can create situations where an A/C technology that reduces GHG emissions may not be applied on a vehicle's system.

Response:

As discussed in Section III.C.5.ii of the preamble, EPA is not changing the requirement that A/C efficiency credits for ICE vehicles be based on emissions performance through AC17 testing. EPA established the AC17 testing requirements as part of the 2012 rule to provide an assurance that the A/C systems earning credits were providing anticipated emissions reductions. As established in the 2012 rule, the AC17 test is mandatory for MYs 2017 and later (with the exception that manufacturers are not required to test BEVs). The off-cycle credits program includes no such mechanism to check performance. EPA did not reopen the existing AC17 testing provisions as part of this rule; therefore, the AC17 testing requirements for manufacturers earning A/C efficiency credits will remain in effect under the MY 2027 and later program. The AC17 test is mandatory for MYs 2017 and later. A series of simulations cannot be accepted to replace AC17 tests on A/C efficiency credits for ICE vehicles.

Efficiency: adoption of an A/C efficiency standard rather than credit

Summary:

Environmental. and Public Health Organizations commented that more frequent and more energy-intensive use of air conditioning is inevitable, and therefore recommended EPA adopt an AC efficiency standard rather than a voluntary credit, as it has done for the medium-duty fleet in the case of refrigerant credits.

Response:

EPA disagrees that AC efficiency should be a standard rather than a voluntary credit. We conclude that the availability of the AC credit, together with sufficiently stringent tailpipe standards, appropriately incentivizes manufacturers to identify GHG reductions from AC efficiency improvements and concentrate efforts to reduce GHGs in the areas they feel are most cost-effective, thus producing the greatest environmental impact for the least cost.

Efficiency: CAFE program harmonization

Summary:

Mitsubishi Motors North America, Inc. (MMNA) recommends keeping AC efficiency credits for BEVs to reduce potential harmonization issues between the GHG and CAFE regulations. In support they note that NHTSA's CAFE program in the past has mirrored EPA's GHG approach to flexibilities, and they therefore assume that NHTSA will follow previous precedent regarding flexibilities and adopt the same structure as EPA. However, they further note that while EVs are considered zero g/mi under the GHG program, the CAFE program requires EVs to be assigned a mile per gallon equivalent compliance value based on the PEF, which DOT has proposed to reduce. The PEF reduction will lead to a substantial decrease in the CAFE compliance value of

BEVs and PHEVs, and thus could put BEVs and PHEVs at a distinctive compliance disadvantage relative to some strong HEVs.

Response:

As explained in the preamble Section III.C.5.ii., currently, BEVs are generating air conditioning efficiency credits even though the credits are based solely on improvements to ICE vehicles, and not representative of emissions reductions for BEVs. That is, BEVs completely prevent engine emissions. Thus, improving A/C efficiency does not and is not needed to further decrease vehicle engine emissions. Allowing BEVs to generate A/C efficiency credits under the GHG program is therefore not technically sound. Regarding the comment about NHTSA's CAFE program and the PEF, we respond to these comments in section 26 of this RTC.

3.1.4 - LDV off-cycle technology credits

Comments by Organizations

Organization: Alliance for Automotive Innovation

D. Light-Duty GHG Program Flexibilities

Flexibilities have been an important part of EPA's light-duty vehicle GHG program since its inception in 2012. Features such as the averaging, banking, and trading program have helped smooth product planning and investment cycles. Other flexibilities like off-cycle technology and air conditioning credits have encouraged the development of new technologies and have resulted in real-world emissions improvements beyond those that would have been achieved on laboratory test cycles. [EPA-HQ-OAR-2022-0829-0701, p. 95]

Auto Innovators believes that such flexibilities still play an important role moving forward. They are a potential lever for addressing uncertainties in the transition to electric vehicles, particularly in the early years of the proposed 2027-2032 program. While manufacturers would prefer that the core footprint-based standards reflect achievable emission reductions, flexibilities could also serve to ensure that desired emission targets are met. [EPA-HQ-OAR-2022-0829-0701, p. 95]

Instead, EPA proposes to eliminate and/or phase down many existing flexibilities, including paring back the off-cycle credit menu and limiting GHG improving technologies to the ICE fleet. The result of this will be abandonment of GHG benefits from prior rulemakings. [EPA-HQ-OAR-2022-0829-0701, p. 95]

The existing refrigerant, AC efficiency, and off-cycle credits are balanced to produce a verifiable real-world result. EPA's proposal to change the credit system will unbalance those results, leaving unprecedented rates of electrification as the main flexibility left to meet fleetwide stringency targets. [EPA-HQ-OAR-2022-0829-0701, p. 95]

2. Air Conditioning Efficiency and Off-Cycle Credits on Electric Vehicles

EPA's concern of negative emissions on individual vehicles is misplaced. EPA's regulations calculate air conditioning efficiency and off-cycle credits on a fleet average basis, which are then combined with fleet average tailpipe emissions and other adjustments.181 However, we acknowledge the concern that, once combined with fleet average tailpipe emissions, air conditioning and off-cycle credits may result in a fleet that implies a negative emission rate. [EPA-HQ-OAR-2022-0829-0701, p. 99]

181 In actual practice, greenhouse gas credits and tailpipe emissions (relative to target) are first converted to megagrams (metric tons) of carbon emissions and then combined. (See 40 CFR 86.1865-12.) Air conditioning and off-cycle credits are always positive megagrams. Tailpipe fleet average emissions may result in either a positive (credit generating) or negative (credit needed) megagram balance. In short, EPA's regulations never result in negative emissions for an individual vehicle, nor negative emissions for an overall fleet, although such a result might be implied.

Our recommendation is to handle this situation at the fleet average level. If the summed fleet average tailpipe emissions, credits, and other adjustments would result in a negative value, total fleet megagrams of credit for the model year would be truncated at the level equivalent to that which would have been achieved by a fleet at zero g/mile fleet average emissions before credits and other adjustments. Such an approach would address EPA's concern of "negative" emissions while still providing an incentive for and recognition of air conditioning and -cycle improvements on electric vehicles during the remaining time when many manufacturers' fleets have net positive emission rates. [EPA-HQ-OAR-2022-0829-0701, p. 99]

4. Off-Cycle Technology Credits

EPA is proposing to sunset the off-cycle credit program by eliminating 5-cycle and alternative method credits in MY 2027 and by lowering the menu credit caps over several years with an elimination of menu credit in MY 2031. EPA's proposed actions will not only increase the stringency of the rulemaking, but also disincentivize and disregard the proven real-world GHG savings that this technology provides. [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

As documented in previous rulemakings, peer-reviewed research, national laboratory studies, and public applications for credits, off-cycle technologies provide direct GHG benefits. They can continue to provide actual emission reductions in MY 2027 and beyond and should remain a part of EPA's GHG emissions program. [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

Automobile manufacturers and suppliers have invested significant resources to develop these technologies, manufacturers have included them as part of their compliance plans, and the technologies will continue to provide real-world benefits. [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

Off-cycle credits should be continued. If some total reduction is deemed necessary besides the natural occurrence from increased BEV volumes, the proposed phasedown should not be as rapid as proposed, nor occur prior to MY 2032, thereby encouraging continued investment in off-cycle emission improvements. [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

a) Menu-Based Credits

EPA proposes a phase-out of menu-based off-cycle credits for vehicles equipped with internal combustion engines, and eliminating these credits after MY 2030.182 [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

182 NPRM at 29249.

The menu-based off-cycle technologies still provide real-world benefits beyond those observed in GHG certification testing. There is no reason to eliminate them entirely. This is particularly true for ICE vehicles. The average emissions of non-EVs were approximately 275 g/mile in MY 2022.183 Off-cycle technologies can still provide meaningful emission improvements for these vehicles. [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

183 S&P Global Mobility, MYs 2012-2022 Baseline Study for Auto Innovators.

Auto Innovators recommends that EPA maintain menu-based off-cycle credits. [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

i) Credit Cap Phase Down

EPA notes that with increasing volumes of electric vehicles, fewer ICE vehicles will be on the road to justify continued credit levels. In general, a phase-down of the off-cycle credit cap is unnecessary if the goal is to simply reduce fleet average credits. Many of the off-cycle technologies on the credit menu are not available to BEVs, such as engine oil heaters, transmission oil heaters, engine stop-start systems, and high efficiency alternators. As the production and market share of BEVs increase, the lower availability of off-cycle credits applicable to BEVs will result in lower fleet average credits. [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

As discussed elsewhere, Auto Innovators opposes EPA's proposal to limit off-cycle credits to vehicles equipped with internal combustion engines. However, we note that that proposal in combination with the EV market share that would be required to meet the GHG targets under consideration also effectively phases out menu-based off-cycle credits. Thus, EPA's proposal to set a separate, declining cap on menu-based credits is duplicative and unnecessary. If EPA decides to finalize its proposal to limit off-cycle credits to only vehicles equipped with internal combustion engines, it should discard the proposal to set a declining cap on menu-based off-cycle credits. [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

Nevertheless, if EPA decides to proceed with a phasedown in the off-cycle menu credit cap, the proposed phasedown is too rapid and should not phaseout before MY 2032, at which time at least 30% ICEVs will continue to be sold in the fleet and who will continue to benefit from these off-cycle technologies. EPA's proposal includes a reduction in the menu credit cap from 15 g/mi to 10 g/mi in the first year. The NPRM fails to consider this difference between MYs 2026 and 2027 in its "normalization" of the MY 2026 standards for the purposes of estimating the MY 2027 stringency increase.184 EPA estimates that roughly 41 million ICE vehicles will be sold in MYs 2027-2032.185 To disincentivize continued or potentially new off-cycle credit technologies so early in a phasedown would severely impact decisions on investment and implementation of them. If the credit cap was not reduced so quickly early in the MYs 2027-2032 program, additional costs and investments might still be justified by automakers. [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

184 See NPRM at 29237. (Table 28. EPA's analysis assumes only 10 g/mile off-cycle credit in MY 2026, when the cap on off-cycle credits is 15 g/mile in 2026. See 40 C.F.R. § 86.1869-12 prior to proposed amendments.)

185 Calculation by Auto Innovators based on data in EPA's central analysis OMEGA output file 2023_03_14_22_42_30_central_3alts_20230314_Proposal_vehicles.csv.

In the previous GHG rulemaking, the cap on off-cycle credits was recognized by the agency as important enough to increase the allowed amount from 10 g/mile to 15 g/mile beginning MY 2023. In response to this increased incentive, OEMs potentially invested in additional off-cycle technologies, but due to the development time to implement and fund some of this technology, production would not necessarily occur that soon. Now, because of the proposed rapid phase-down, the development and application of some off-cycle technologies may no longer be worthwhile, stranding investments and foregoing potential benefits both before and during the proposed MY 2027-2032 program. [EPA-HQ-OAR-2022-0829-0701, pp. 102-104]

ii) Menu Credit Values

Auto Innovators continues to see the GHG benefit of off-cycle technology and agrees with previous assessments that many technologies are achieving higher on-road benefit amounts than credited. However, EPA is concerned that newer vehicles would not see as much benefit from off-cycle technologies.186 While some of both arguments may be warranted, as understood in the original GHG rulemaking, the average credit amounts continue to be applicable for most vehicles. To the extent that the absolute emission benefits of such technologies may have changed over time, it would be more reasonable for EPA to estimate new absolute benefits or to convert the menu to a percentage improvement basis using tools such as EPA's ALPHA model instead of simply dismissing the benefits of such technologies entirely. If EPA wishes to reduce the amount allowed, a gradual decrease in credit values is preferable to avoid stranding the investments OEMs have made in response to the last GHG rulemaking. Slightly steeper cuts to the desired allowed credit amount only make some sense at the end of the rulemaking, and credits should not be reduced to zero. [EPA-HQ-OAR-2022-0829-0701, pp. 104-106]

186 NPRM at 29250.

EPA also expresses concerns that other equipment such as roof racks or remote start systems might increase real-world emissions.187 To the extent such equipment is added by dealerships, customers, or other aftermarket equipment suppliers, EPA's certification and compliance program is based on vehicles as delivered for sale (i.e., what the regulated manufacturers can reasonably control), those concerns are out of scope. In the case of equipment included on the vehicle when delivered for sale, consideration should be given to the extent such equipment is likely to be used. Technologies that are granted menu-based credit are generally used on a regular or continuous basis. [EPA-HQ-OAR-2022-0829-0701, pp. 104-106]

187 NPRM at 29250.

b) 5-Cycle Method Credits

EPA notes that there have been few 5-cycle demonstrations of off-cycle technologies, and proposes to eliminate the 5-cycle pathway, effective MY 2027.188 [EPA-HQ-OAR-2022-0829-0701, pp. 104-106]

188 NPRM at 29249.

Automakers have reviewed with EPA their 5-cycle testing plans for off-cycle technologies. This path is being pursued according to the current regulation but is a difficult path to follow. This method has not been used to a great extent since allowed under the original GHG rulemaking, because the auto industry and EPA concurred that the original formula to calculate credits under the 5-cycle method was in error. [EPA-HQ-OAR-2022-0829-0701, pp. 104-106]

Errors in the formula were finally corrected in 2020. Since then, automakers report that testing has begun to evaluate certain technologies. At the same time, automakers report that the threshold to prove emissions impacts has been very challenging to meet. Therefore, we believe that even the corrected 5-cycle formula has not addressed the problem. [EPA-HQ-OAR-2022-0829-0701, pp. 104-106]

Under the current formula in 40 C.F.R. § 86.1869.12(c)(3), the unadjusted 2-cycle benefit is subtracted from the adjusted 5-cycle benefit of the off-cycle technology. This unadjusted 2- cycle value often masks the adjusted 5-cycle benefit within the test-to-test variability and makes this very hard to statistically quantify. We believe the formula should be amended again to compare the adjusted 5-cycle results without the off-cycle technology to the adjusted 5-cycle results with the technology. [EPA-HQ-OAR-2022-0829-0701, pp. 104-106]

Auto Innovators recommends that EPA retain the 5-cycle method and improve upon the formula to reduce unnecessary burden of proof by making the revisions noted above. [EPA-HQ-OAR-2022-0829-0701, pp. 104-106]

If EPA decides to eliminate the 5-cycle method, we ask EPA to consider the following.

-Retain the 5-cycle method for the same period of time as the menu-based credits.

-For vehicles that have 5-cycle method credits approved prior to MY 2027 that remain in production in MY 2027 and later, Auto Innovators recommends that credit continue to be granted (i.e., carry-over). If this is EPA's intent (or final decision), clarifying text should be added to the regulation. Alternatively, EPA should consider adding previously approved technologies to the off-cycle credit menu and adjusting the caps as appropriate for the additional technologies. [EPA-HQ-OAR-2022-0829-0701, pp. 104-106]

c) Alternative Method Credits

EPA is also proposing to eliminate the alternative method process for off-cycle credits. EPA has rationalized this credit elimination proposal by stating that very few OEMs are utilizing the alternative analysis application method. The proper context should be that the agency has actioned very few of the proposed credit submissions. [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

Auto Innovators is aware that there are multiple alternative applications that have been submitted by OEMs in 2020 to 2023 that are awaiting a decision by EPA, or even published for public comment, even after multiple technical reviews with the agency to answer questions and supply additional analysis. Even after agency assurances that the technology is understood, and proper explanation has been provided for the public review process, no action has occurred for many months. While we agree that this alternative analysis process is not effective, EPA should follow through under the current regulation and complete action on all submitted applications, even if it requires additional back-and-forth with the manufacturer. [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

For vehicles that have had alternative method off-cycle credits approved prior to MY 2027 that remain in production in MY 2027 and later, Auto Innovators recommends that credit continue to be granted. If this is EPA's intent (or final decision), clarifying text should be added to the regulation. [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

Alternatively, EPA should consider adding previously approved technologies to the off-cycle credit menu and adjusting the caps as appropriate for the additional technologies. Automobile manufacturers and suppliers have invested significant resources to develop these technologies, manufacturers have included them as part of their compliance plans, and the technologies will continue to provide real-world benefits. [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

d) Adjustments to Off-Cycle Credits for Electric Operation of PHEVs

As described above, Auto Innovators opposes EPA's proposal to limit off-cycle credits to only ICE-equipped vehicles. In the same vein, we believe that off-cycle credits should not be adjusted for PHEVs to address electric vs. ICE operation. Notwithstanding those positions, Auto Innovators provides the following comment in response to EPA's request on how to handle PHEVs if it decides to limit off-cycle credits to only the ICE portion of their operation. [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

As a threshold consideration, making such adjustments adds significant complexity to calculating credit values and/or compliance with credit caps. EPA should consider whether the difference resulting from those adjustments in overall emissions is worth the complexity added for regulated stakeholders, EPA compliance staff, and EPA staff preparing public reports to describe the use of such provisions. This is particularly true if EPA finalizes related proposals to reduce credit applicability to only vehicles equipped with internal combustion engines and to phase-out menu-based off-cycle credits relatively quickly. Given these considerations, we recommend that EPA simply afford PHEVs the same credits as other ICE-equipped vehicles and to assess compliance to applicable credit caps without further adjustments. [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

EPA describes in the preamble that "manufacturers would apply the utility factor to the total off-cycle credits generated by the PHEVs to properly account for the value of the off-cycle credit corresponding to expected engine operation."189 This concept does not appear to be captured in the regulatory text. The only place PHEVs and utility factors are Specifically mentioned in the proposed regulatory text is at 40 C.F.R. § 86.1869-12(b)(2)(v).190 Based on the first sentence of this paragraph, this appears to be instructions for ensuring average credit values do not exceed applicable limits. We also note that, in this paragraph, there is a conspicuous absence of any instruction for how to calculate off-cycle credits in the case that such limits are not exceeded. [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

189 NPRM at 29251.

190 NPRM at 29440.

Therefore, we conclude that, as drafted, 40 C.F.R. § 86.1869-12(b)(2)(v) does not address applying the utility factor to off-cycle credits generated by PHEVs as long as the credit cap is not exceeded. [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

EPA also describes scaling "the menu cap for PHEVs by the vehicle's assigned utility factor" and that "the menu credit cap for each manufacturer's eligible vehicles would be the production-weighted average of ICE vehicles counting at the full cap amount and PHEVs at their maximum credit allowance."191 This approach seems to be captured in the regulatory text at the proposed 40 C.F.R. § 86.1869-12(b)(2)(v).192 The first sentence of the proposed regulatory text discusses the need to assess whether the "fleet average CO2 emissions attributable to use of the default credit values193 in (b)(1)" exceed the specified values in (b)(2)(v). However, even that is not entirely clear. Unlike (b)(2)(iii) and (b)(2)(iv), which both refer to comparing values determined in (b)(2)(i) to the cap at (b)(2)(v), the text at (b)(2)(v) doesn't describe how to derive the "fleet average" value that should be compared to values in (b)(2)(v). For example, one could just as easily interpret the instruction in the context of individual car and truck fleets as opposed to the combined car and truck fleets as is clearer in (b)(2)(i). [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

191 NPRM at 29251.

192 NPRM at 29440.

193 EPA should consider adding "credit" after "fleet average CO2 emissions" in the term "fleet average CO2 emissions attributable to use of the default credit values" to avoid confusion between calculated fleet average emission values and off-cycle credits if this term continues to be used in a final rule.

Setting aside whether PHEV adjustments should be made to off-cycle credits, and if so, where adjustments should be made, the adjustment in (b)(2)(v) of the proposed regulatory text has a technical error. The proposed regulatory text describes as an example: "if a PHEV has a utility factor of 0.3 and an off-cycle credit of 3.0, count it as having a credit value of 10 (3/0.3) for calculating the fleet average value." A utility factor of 0.3 implies 30% operation on electricity and 70% operation on conventional fuel. Therefore, if the credit is for improved emissions during ICE operation, it should be 70% of the menu credit, i.e., credit x (1 – UF). [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

e) Calculation of the Off-Cycle Credit Cap

As described elsewhere, we oppose EPA's proposal to exclude ZEVs from off-cycle credits. However, if EPA decides to finalize that proposal, we note that EPA has not proposed regulatory text that would exclude zero-emission vehicles in model years 2027 and later from the assessment of whether a credit cap has been exceeded as described in the preamble.194 [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

194 NPRM at 29250.

Also, the proposed paragraphs (b)(2)(iii) and (b)(2)(iv) discuss comparing a calculated value from (b)(2)(ii) to a given value in (b)(2)(v). However, the value derived in (b)(2)(ii) is in megagrams, and the values in (b)(2)(v) are in grams per mile. We would agree that a conversion can be calculated, but the text should be modified such that any comparison is made in consistent units without the need to rely on otherwise undefined calculations. [EPA-HQ-OAR-2022-0829-0701, pp. 106-108]

Organization: American Honda Motor Co., Inc.

Off-Cycle Credits

Over the years, Honda has remained supportive of the off-cycle technology program, recognizing the real emissions reductions these technologies deliver. The program provides a practical rationale to apply GHG reduction measures to new and/or existing technologies and systems that might not otherwise occur, given that the benefits are (by definition) not captured through standard test procedures. [EPA-HQ-OAR-2022-0829-0652, pp. 29-30]

That said, we recognize that uncertainty associated with agency approvals, among other things, remain core impediments to the pursuit of these technologies. Over the years, we have expressed support for periodic updating of the off-cycle menu, to reflect better understanding of off-cycle technologies, as well as a recognition of an industry shifting toward greater levels of electrification. [EPA-HQ-OAR-2022-0829-0652, pp. 29-30]

As we have noted in the past, "changes should be data driven, include opportunity for stakeholder input, and provide sufficient lead time to ensure continuity of compliance plans."49 In the proposed rule, the agency suggests sunsetting the off-cycle credit program as follows:

49 American Honda Motor Co., Inc. comments on Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emissions. September 27, 2021. Docket ID No. EPA–HQ–OAR–2021–0208.

First, EPA proposes to phase out menu-based credits by reducing the menu credit cap year-over- year until it is fully phased out in MY 2031. Specifically, EPA is proposing a declining menu cap of 10/8/6/3/0 g/mile over MYs 2027-2031 such that MY 2030 would be the last year manufacturers could generate optional off-cycle credits. Second, EPA proposes to eliminate the 5-cycle and public process pathways starting in MY 2027. Third, EPA proposes to limit eligibility for off-cycle credits only to vehicles with tailpipe emissions greater than zero (i.e., vehicle equipped with IC engines) starting in MY 2027.50 [EPA-HQ-OAR-2022-0829-0652, pp. 29-30]

50 88 Fed. Reg. 29196 (May 5, 2023)

Honda understands the agency's motivation for sunsetting the program. Ironically, however, by pairing stringent GHG standards that dictate aggressive EV adoption with a sunsetting off-cycle program, the agency is forcing the use of technologies that reside high on the technology cost curve, while prohibiting the use of more cost-effective technologies that reside on the low end of the curve. [EPA-HQ-OAR-2022-0829-0652, pp. 29-30]

All else being equal, ending the program does not necessarily impact stringency, so long as modifications to top-line stringency are adjusted in accordance with the phase-out. Unfortunately, evidence of this is obfuscated in the proposed rule. The agency appears to have upward-adjusted (relaxed) topline stringency in the first year of the program by approximately 20 g/mi (presumably to account for the changing off-cycle and A/C programs), but beyond that Honda was unable to track whether stringencies in subsequent years were similarly adjusted. Given the exceedingly challenging GHG standards, and the fact that off-cycle technologies are among the lowest-cost means to reduce emissions, Honda recommends the agency continue the existing off-cycle program at least throughout MY2032. [EPA-HQ-OAR-2022-0829-0652, pp. 29-30]

Finally, Honda respectfully requests that the agency approach its handling of the off-cycle (and A/C) programs with greater transparency in the Final Rule. We believe off-cycle technology can continue to play an important role in decarbonizing the fleet, but only if the program meaningfully allows a manufacturer to apply the technology and earn credit in a streamlined fashion. [EPA-HQ-OAR-2022-0829-0652, pp. 29-30]

Recommendation: Honda respectfully requests that the agency continue the existing off-cycle program at least throughout MY2032 and, in order to ensure its role as a compliance flexibility, provide sufficient transparency that its inclusion is not offset by a corresponding stringency increase. [EPA-HQ-OAR-2022-0829-0652, pp. 29-30]

Organization: Betsy Cooper

Aaron Barkhouse is a Rhodes Scholar material scientist and Technology Strategy Manager at Maxeon Technologies. Betsy Cooper is the Director of the Aspen Institute's Tech Policy Hub, and a founder of the Aspen Institute's Climate Cohort, a training program teaching climate scientists to influence policy (including by submitting public comments). We also happen to be a married couple who own a plug-in hybrid vehicle (PHEV). [EPA-HQ-OAR-2022-0829-0654, p. 1]

Together, we write to propose that the EPA reconsider its approach to PHEVs in its recent draft regulations, particularly to incentivize car manufacturers to develop longer range PHEVs. In particular, we recommend you give full off-cycle credits to manufacturers who develop PHEVs with a range of 50 or more miles. [EPA-HQ-OAR-2022-0829-0654, p. 1]

In recent years, the electric range capacity of PHEVs has dropped precipitously. We own a Chevy Volt, which before it was discontinued in 2019 advertised up to 53 miles of electric range.1 [Link: https://www.recurrentauto.com/guides/chevrolet-volt] Today even the best PHEVs on the market have approximately 40 or less miles of range [Link: https://www.autoguide.com/auto-news/2022/03/the-plug-in-hybrid-with-the-longest-range-top-10-list.html]. The only exceptions, the Land Rover Plug-In Hybrid [Link: https://www.edmunds.com/land-rover/range-rover/2023/plug-in-hybrid/] and the Land Rover Range Rover Sport [Link: https://www.edmunds.com/land-rover/range-rover-sport/2023/plug-in-hybrid/], retail for more than $100,000 apiece. [EPA-HQ-OAR-2022-0829-0654, p. 1]

1 And we use the electric range most of the time; we have maintained a 112 mile-per-gallon average over 4 years.

Off-cycle credits give manufacturers credit for using technologies that decrease greenhouse gas emissions and fuel consumption but are not detectable using EPA's existing city and highway test cycles (otherwise known as the two-cycle test). (Federal Register (FR) at 29248.) The EPA's rule proposes to lower the amount that PHEVs are driven using electric power for the purposes of off-cycle credits. “While PHEVs would remain eligible for off-cycle credits under EPA's proposed eligibility criteria, EPA proposes, as a reasonable approach for addressing off-cycle credits for PHEVs, to scale the menu credit cap for PHEVs by the vehicle's assigned utility factor.” (FR at 29251.) [EPA-HQ-OAR-2022-0829-0654, p. 1]

Discussion

The EPA should give full off-cycle credit to PHEVs with adequate distance to enable commuters to cover their daily driving needs without charging, even after degradation: those with more than 50 miles of range. By downgrading all PHEVs with no differentiation by miles of range, the EPA is missing an opportunity to incentivize manufacturers to build PHEVs that work for consumers and allow them to feel the full benefits of electric power without the range anxiety that plagues current consumers. [EPA-HQ-OAR-2022-0829-0654, p. 2]

Together, we write to propose that the EPA reconsider its approach to PHEVs in its recent draft regulations, particularly to incentivize car manufacturers to develop longer range PHEVs.

In particular, we recommend you give full off-cycle credits to manufacturers who develop PHEVs with a range of 50 or more miles. EPA's current plan will disincentivize all PHEVs, ignoring the real market benefits to keeping long-range versions of these cars in the market. Intentional or not, the effects of the EPA's current policy will be to push vehicle manufacturers further towards full EVs—before the charging infrastructure is ready to support them. In the meantime, consumers not ready to adopt full EVs – including for the same reasons we are not yet able to do so – will continue to buy gas cars instead. [EPA-HQ-OAR-2022-0829-0654, pp. 1-4]

With more long-range PHEVs on the market, more Americans will be able to drive their full commute on electricity and charge overnight at home (with reduced demand on the grid relatively to fast-charging of full EVs). Moreover, as longer range PHEV cars grow more popular, there will be greater incentives for individuals and communities to invest in improving charging infrastructure, thus reducing the friction facing current consumers. [EPA-HQ-OAR-2022-0829-0654, pp. 1-4]

We propose a 50+ mile PHEV range requirement for full off-cycle credit. There is already momentum in favor of this standard; California is planning to require 50+ mile range PHEVs by 2035 [Link: https://ww2.arb.ca.gov/news/california-moves-accelerate-100-new-zero-emission-vehicle-sales-2035]. Moreover, even with battery degradation, a PHEV rated for 50+ miles at the point of sale will still cover the average American commute many years later. [EPA-HQ-OAR-2022-0829-0654, p. 4]

The EPA may respond that its scaled utility factor already takes into account miles of range in its calculation. Even if true, by penalizing all PHEVs across the board, the EPA is incentivizing manufacturers to make fewer plug-in hybrid vehicles, period. Especially until charging infrastructure resembles the gas station infrastructure of today, long-range PHEV cars remain an important consumer option. By rewarding manufacturers for making PHEVs with a 50+ mile range, EPA will help bring an important class of climate-friendly vehicles back to market. [EPA-HQ-OAR-2022-0829-0654, p. 4]

Organization: BMW of North America, LLC (BMW NA)

BMW NA opposes the proposal to phase out the OCT credit cap for the full fleet based on the assumption that a changing fleet mix from ICE to BEV removes the benefit of an OCT credit provision. The menu credit technologies and alternative pathway technologies already approved by the EPA still provide a real-world CO2 benefit on ICE vehicles and phase-out of the OCT credit cap could lead manufacturers to reconsider implementation of certain CO2-reducing technologies. [EPA-HQ-OAR-2022-0829-0677, p. 3]

As an alternative, BMW proposes that rather than phase-out the OCT cap from 10 g/mi in 2027MY to 0 g/mi in 2031, EPA should maintain a 10 g/mi cap which applies only to the ICE vehicle portion of the fleet (including PHEV). Manufacturers would continue to receive credit for innovative CO2 reducing technologies listed in the menu and for alternative and 5-cycle pathway technologies which are approved prior to 2027MY for those ICE vehicles. This would still allow manufacturers to receive credits for technologies with a real-world CO2 benefit. Based on the anticipated electric vehicle percentages in EPA's standard proposal, the effective whole-fleet OCT g/mi cap would stifl reduce significantly compared to the current cap (for example, a 50% BEV fleet would create an effective OCT cap of 5 g/mi), in line with the agencies intent to change the approach to accommodate a changing fleet mix. [EPA-HQ-OAR-2022-0829-0677, p. 3]

Organization: California Air Resources Board (CARB) (Part 1 of 5)

Greenhouse Gas Standards

U.S. EPA is proposing more stringent GHG emission standards for the 2027 through 2032 MYs, along with several modifications to the existing GHG program. Generally, CARB supports U.S. EPA's proposal, but offers several recommendations to further strengthen the proposed standards to achieve the greatest degree of emission reductions available, considering costs and technology readiness, to further protect public health and combat climate change. As described in detail below, CARB recommends that U.S. EPA adopt more stringent light-duty GHG emission standards; include provisions to ensure manufacturers do not allow emissions to increase from conventional vehicles and instead continue to apply all available cost-effective emission control technologies; estimate real-world PHEV emissions based on the best available data and collect additional data to inform future updates; and update elements of the comprehensive regulatory program, including retiring elements of the off-cycle and air conditioning credits programs as proposed, establishing explicit requirements to eliminate leaks from air conditioning systems, eliminating credit multipliers for medium-duty ZEVs as proposed, and requiring small-volume manufacturers to comply with the proposed standards as proposed. [EPA-HQ-OAR-2022-0829-0780, p. 12]

Off-Cycle Credits Program

U.S. EPA's GHG emission standards allow manufacturers to receive credit for technologies that reduce GHG emissions but whose reductions may not be measured on the "2-cycle" city and highway tests (or Federal Test Procedure [FTP] and Highway Fuel Economy Test [HFET]) for determining compliance with the standards. Credit may be obtained under three approaches: (1) from a "menu" of technologies, (2) testing emissions under five different specified test cycles to better estimate real-world performance, or (3) approval of a specific technology. U.S. EPA requested comment on its approach for phasing out the off-cycle program, including the number of years over which the menu phase out would occur as well as the proposed menu credit caps in those years. 24 [EPA-HQ-OAR-2022-0829-0780, pp. 22-23]

24 87 Fed. Reg. at 29,248 - 250.

CARB supports U.S. EPA's proposal to phase out the off-cycle program. As U.S. EPA acknowledges, the current off-cycle program credits are based on the projected impact the technologies would have when paired with 2008 MY vintage engine and vehicle baseline technologies (assessed during the 2012 rule). In the 11 years since the rule was adopted, new vehicles have lower GHG emissions and have incorporated technologies that target similar areas of emission reductions thereby reducing the opportunities for some of the off-cycle technologies. The credit levels are therefore becoming increasingly less representative of the actual emission reductions provided by the off-cycle technologies. [EPA-HQ-OAR-2022-0829-0780, pp. 22-23]

With its comments, CARB submits additional evidence supporting U.S. EPA's claim that the credit levels are less representative of the emission reductions provided by off-cycle technologies. Specifically, CARB has acquired BAR data that confirm at least one of the off-cycle credit technologies, idle stop-start, is not being used in a manner reflected by the original assumptions described in the Joint Technical Support Document (TSD): Final Rulemaking for 2017-2025 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards. 25 CARB arrived at this conclusion by analyzing SmogCheck data for over 40,000 vehicles (2019 through 2023 MYs) in the BAR data set. For each idle start-stop-equipped vehicle within the data set, CARB staff assessed the total idle time (seconds) and total idle stop-start timer duration (seconds). Using these data points, staff divided total idle time by idle stop-start timer duration for each vehicle to derive the total percentage of idle time with the engine off. This value, 9.38 percent, was significantly lower than the value used under the original assumptions of the TSD (87.75 percent). When this fraction is applied to the total idle fraction (25.8 percent), the idle fraction eligible for engine-off is only 2.42 percent. This is also substantially lower than the fraction assumed in the TSD (12.07 percent). Table 2 summarizes these findings. [EPA-HQ-OAR-2022-0829-0780, pp. 23-24]

25 U.S. EPA and the U.S. Department of Transportation. Joint Technical Support Document: Final Rulemaking for 2017-2025 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards. August 2012. Docket ID EPA-HQ-OAR-2010-0799-12013. Available at: https://www.nhtsa.gov/sites/nhtsa.gov/files/joint_final_tsd.pdf or https://www.regulations.gov/document/EPA- HQ-OAR-2010-0799-12013.

Table 2. CARB Analysis of Idle Stop-Start Emissions.

Cycle: Projected by U.S. EPA (2012 TSD)

Idle Fraction: 13.8%

Percentage of Idle with Engine-off: 87.75%

Resultant Idle Fraction Eligible for engine-Off: 12.07%

Cycle: Real-World (2019-2023 MY BAR)

Idle Fraction: 25.8%

Percentage of Idle with Engine-off: 9.38%

Resultant Idle Fraction Eligible for engine-Off: 2.42% [EPA-HQ-OAR-2022-0829-0780, pp. 23-24]

CARB believes these results further support U.S. EPA’s contention that off-cycle credits, for idle stop-start in this case, are not representative of emission reductions originally assumed in the TSD. In this case, the credits for idle stop-start significantly overestimate the reductions achieved in the real world and further supports the case for a phase out of such credits during the regulatory timeframe. [EPA-HQ-OAR-2022-0829-0780, pp. 23-24]

U.S. EPA requested comments on ways of addressing off-cycle credits for PHEVs. As proposed, the off-cycle credit cap for PHEVs would be scaled by the vehicle’s assigned utility factor. CARB believes this approach is appropriate given that off-cycle credits would only apply to vehicles with internal combustion engines under the proposal. As a result, this is a reasonable way to attribute off-cycle credits to PHEVs in a manner that is consistent with the limited application of off-cycle credits to conventional vehicles. CARB has also provided comments on

U.S. EPA's proposed FUF and supports lowering the values to better reflect real-world PHEV emissions. [EPA-HQ-OAR-2022-0829-0780, pp. 23-24]

Finally, U.S. EPA requested comment on its proposal to eliminate the 5-cycle and public process pathways for OEMs to obtain off-cycle credits starting in the 2027 MY. CARB supports this proposal as stated. Given the rarity with which manufacturers chose these pathways, CARB believes they no longer need to be made available as compliance options in the future. [EPA-HQ-OAR-2022-0829-0780, p. 24]

Organization: California Attorney General's Office, et al.

D. EPA's Proposal to Retire or Limit Credits Is Consistent with Section 202(a)'s Focus on Real-World Emission Reductions

Finally, the States and Cities support EPA's Proposal to retire certain compliance flexibilities associated with the light- and medium-duty vehicle emissions program. In particular, EPA's rationales for limiting air-conditioning efficiency credits, 88 Fed. Reg. at 29,246-48, and for phasing out off-cycle credits and the MDV multipliers, id. at 29,243-45, 29,249-52, are consistent with the agency's responsibility to ensure the emissions program's environmental integrity by tying credits and other flexibilities to real-world emission reductions as closely as possible. [EPA-HQ-OAR-2022-0829-0746, p. 37]

Organization: Consumer Reports (CR)

6.5. Elimination of Additional Credits for EVs

CR supports EPA eliminating credits for EVs that could allow vehicles to achieve compliance values below 0g/mi. These credit provisions were in place to capture real-world emissions benefits that were not captured by EPA's test cycle. They are not appropriate when applied to vehicles that already have eliminated all tailpipe emissions. [EPA-HQ-OAR-2022-0829-0728, p. 23]

Organization: Dana Incorporated

Off-cycle Credit

Dana supports continuing an off-cycle technology credit program based on the success of this program in encouraging the adoption of technologies such as those identified in Tables 34 and 35 of the NPRM. As noted in the NPRM, the off-cycle credit program has helped support industry investment in innovative and forward-looking technologies that provide environmental benefits and reduce GHG emissions. [EPA-HQ-OAR-2022-0829-0538, p. 3]

Dana does not have a firm opinion on EPA's proposals to phase-out the current off-cycle credit program. Dana does propose that EPA continue to offer off-cycle credits, however, for new technologies for BEVS, PHEVS, FEVs, and other ZEVs. Such off-cycle technologies could help reduce battery use and therefore lower the amount of electricity used to power ZEVs. Off-cycle technologies that reduce the amount of ZEV battery charging should be recognized in MY 2027 and beyond. Potential examples of efficiency and sustainability enablers specific to ZEVs include magnet-free motors, technology improvements in continuous power relative to peak power, use of carbon-free eFluids, etc. Incentivizing the use of these technologies could also help address some of the sustainability concerns raised above. [EPA-HQ-OAR-2022-0829-0538, p. 3]

Dana thus proposes that EPA consider ways to provide credits to emerging technologies that reduce ZEV energy consumption, such as those listed above. [EPA-HQ-OAR-2022-0829-0538, p. 3]

Organization: DENSO Corporation

2) DENSO Green Technologies

DENSO is committed to supporting our customers in their application of technology to improve fuel economy performance and reduce the greenhouse gas emissions of their products to in line with consumer preferences, while meeting regulatory requirements. In this work, there are challenges and sometimes trade-offs to allowing multiple pathways to compliance, but we believe there can be a balance in achieving a successful regulatory program between stringency and real-world achievement of the standards. [EPA-HQ-OAR-2022-0829-0651, pp. 3-4]

Around the world, successful fuel economy and emissions programs offer credit programs to support the deployment of technologies, which may otherwise take multiple years to penetrate the market. DENSO encourages the agency to continue to offer flexible options supporting emerging technologies for both ICE and ZEV powertrains. [EPA-HQ-OAR-2022-0829-0651, pp. 3-4]

3) Off-Cycle Technology Credit Program

DENSO supports the continuation of the off-cycle technology credit program at its full value through at least MY 2032. It also encourages both EPA and NHTSA to recognize the important contribution the off-cycle program makes to the overall goals of the regulations, especially during this technological transition period. [EPA-HQ-OAR-2022-0829-0651, pp. 3-4]

DENSO, along with others in the supplier community working independently and in collaboration with OEMs, develop and engineer innovative technologies that contribute to vehicle manufacturers' strategies for real-world GHG and fuel consumption reductions often beyond those measured with standard test procedures. The off-cycle credit program has helped to support industry investment in innovative and forward-looking technologies that provide environmental benefits, while improving the consumer experience. These technologies offer measurable, demonstrable, and verifiable real-world benefits that improve efficiencies and reduce GHG emissions. They also provide an important cost-effective option for OEMs to achieve fuel economy and GHG targets. Therefore, DENSO has a vested interest in making sure innovative technologies continue to be deployed and utilized by OEMS to ensure these benefits are realized.1 [EPA-HQ-OAR-2022-0829-0651, pp. 3-4]

1 Please see Appendix 1 for a partial list of DENSO GREEN Technologies supporting GHG reductions via the Off- Cycle and AC Efficiency programs.

Off-cycle credits should be continued, and if some total reduction is necessary besides the natural occurrence from increased BEV volumes, the proposed phasedown should not be as rapid as proposed, thereby encouraging continued investment in off-cycle emission improvements. [EPA-HQ-OAR-2022-0829-0651, pp. 3-4]

Concerning the 5-Cycle and Alternative Method pathways, EPA should follow through under the current regulation and complete action on all submitted applications, even if it requires additional discussions. [EPA-HQ-OAR-2022-0829-0651, pp. 3-4]

It is also critically important that vehicles with alternative method off-cycle credits approved prior to MY 2027 and that remain in production in MY 2027 and later continue to be granted credits during the timeframe of this regulation. If this is EPA's intent (or final decision), clarifying text should be added to the regulation. [EPA-HQ-OAR-2022-0829-0651, pp. 3-4]

Alternatively, EPA could consider adding previously approved technologies to the off- cycle credit menu and adjusting the caps as appropriate for the additional technologies. Automobile manufacturers and suppliers have invested significant resources to develop these technologies, manufacturers have included them as part of their compliance plans, and the technologies will continue to provide real-world benefits. [EPA-HQ-OAR-2022-0829-0651, pp. 3-4]

5) Technologies Supporting ZEV Energy Consumption Reduction

DENSO requests EPA to reconsider its proposal to eliminate A/C efficiency and off- cycle credits for electrified vehicles. Off-cycle and AC efficiency credits for technologies applied across all powertrain types encourage their continued use with commensurate benefits to consumers and the environment. The elimination of off- cycle and air conditioning efficiency credits on electric vehicles would have an unfortunate effect on the application of existing technologies and further innovation in this area. [EPA-HQ-OAR-2022-0829-0651, p. 6]

DENSO also encourages EPA to explore how energy reductions from thermal technologies could be rewarded when used on BEVs, PHEVs and FCEVs. All technologies and all powertrains should continue to improve their performance. Consequently, technologies that reduce use of the vehicle battery (and reduce the amount of battery charging needed) and therefore the electricity used to power the vehicle should be recognized in MYs 2027 and beyond. [EPA-HQ-OAR-2022-0829-0651, p. 6]

Beyond the off-cycle and A/C efficiency credit programs, DENSO would welcome the opportunity to discuss the possibility of credits to further incentivize BEV energy consumption reduction directly and further support the industry during this critical technology transition period.7 A credit or incentive for technologies that support BEV energy consumption reduction from a consumer comfort and battery comfort perspective, as well as to encourage responsible critical mineral usage and grid management, would also contribute to US climate goals generally. Similar to the off- cycle and A/C efficiency program, a similar ZEV-focused technology credit would help to support industry investment in innovative and forward-looking technologies that provide additional environmental benefits. [EPA-HQ-OAR-2022-0829-0651, p. 6]

7 Please see Appendix 2 for a partial list of DENSO technologies that support ZEV energy consumption reduction.

Appendix 1

DENSO GREEN Technology Examples:

Off-Cycle Credit/AC Efficiency Credit Technologies for ICE and ZEV Powertrains

1. SAS Compressor w/CS Valve: Technology has improved pressure drop through the cylinders and a crankcase suction valve that minimizes internal compressor losses at conditions other than maximum capacity. [EPA-HQ-OAR-2022-0829-0651, p. 8]

2. Electric Scroll Air Conditioning Compressor Variation B (ESB) with pressure adjusting valve technology: This technology improves the efficiency of the electric scroll compressor using a pressure adjusting valve to optimize back pressure on the fixed scroll and reduce mechanical losses. [EPA-HQ-OAR-2022-0829-0651, p. 8]

3. S-Flow System: Reduces the thermal load on the air conditioning system through targeted cooling of only the occupied cabin areas, and for a pulse width modulated brushless motor power controller used in the HVAC system, which improves the efficiency of the HVAC system. [EPA-HQ-OAR-2022-0829-0651, p. 8]

4. High-Efficiency Alternator: High efficiency alternators use new technologies to reduce the overall load on the engine yet continue to meet the electrical demands of the vehicle systems, resulting in lower fuel consumption and lower CO2 emissions. [EPA-HQ-OAR-2022-0829-0651, p. 8]

5. Compressor Oil Separator: Technology removes at least 50% of the oil entrained in the oil/refrigerant mixture exiting the compressor and returns it to the compressor housing or compressor inlet, or a compressor design, which does not rely on the circulation of an oil/refrigerant mixture for lubrication. [EPA-HQ-OAR-2022-0829-0651, p. 8]

6. Internal Heat Exchanger (SCX): An Internal Heat Exchanger reduces load on the compressor by transferring heat from the high-pressure liquid entering the expansion valve (TXV) to the low- pressure gas exiting the evaporator. [EPA-HQ-OAR-2022-0829-0651, p. 8]

7. 2-Layer HVAC: Full technology explanation is below (from SAE Paper 2018-01-1368). Short explanation: In cold ambient conditions, two-layer HVAC recirculates already warmed air in the lower part of the HVAC unit and distributes it to the lower part of the vehicle cabin, while using air from outside the vehicle in the upper part of the HVAC unit, distributing it to the upper part of the vehicle cabin. Outside air is necessary to keep windows fog-free. Recirculated air requires less energy to re-heat. Two-layer HVAC allows both, minimizing energy needed to keep the cabin warm and fog-free. In an ICE vehicle, this results in an energy savings by enabling faster engine warm-up (since less heat is needed for cabin heating), while in a BEV the energy savings impact is even greater, since the energy used for heating the vehicle cabin needs to come from the vehicle battery. [EPA-HQ-OAR-2022-0829-0651, p. 8]

8. LE40: This technology allows for reduced power consumption during compressor operation through improved and more efficient clutch technology. [EPA-HQ-OAR-2022-0829-0651, p. 8]

9. Cold-Storage Evaporator: (Off-Cycle Alt-Method/Off-Cycle Cap): This technology utilizes phase change material in the HVAC evaporator of vehicles equipped with engine Start & Stop technology to extend the time that cold air can be delivered to the cabin with the engine and compressor off. This reduces the amount of time the engine would otherwise operate solely for the purpose of cooling the cabin. [EPA-HQ-OAR-2022-0829-0651, p. 8]

Organization: Environmental. and Public Health Organizations

IX.EPA Should Finalize the Proposed Changes to the Credit Program, but Should Not Renew Off-Cycle Menu Credits.

Below, we address EPA's proposal to renew the existing credit program with the following changes: (1) exclude all BEVs from eligibility for any off-cycle credits; (2) allow off-cycle credit eligibility for PHEVs based only on a ratio called the "utility factor"; (3) eliminate two of the three ways to obtain off-cycle menu credits (undergoing a 5-cycle testing procedure and documenting the efficacy of new technology via public notice and comment), while retaining only the third way (menu credits); and (4) renew but phase out the off-cycle menu credits for the remainder of the light- and medium-duty fleets over four years, in 10/8/6/3/0 gram/mile annual steps between MY 2028-2031. We support most of EPA's proposals but strongly urge EPA not to renew any off-cycle menu credits in this rulemaking. [EPA-HQ-OAR-2022-0829-0759, p. 78]

We support EPA's continued use of an averaging, banking, and trading (ABT) compliance credit program for light- and medium-duty vehicle emissions, as it has for decades. We agree with EPA's determination that there is no reason to reopen those program provisions in this rulemaking. [EPA-HQ-OAR-2022-0829-0759, p. 78]

We also note that the current compliance credit program includes multipliers for vehicles equipped with batteries, creating negative grams per mile values, and that EPA does not propose to renew those multipliers. We strongly support the sunsetting of all PEV multipliers and any other measures that create fictitious emission reductions. [EPA-HQ-OAR-2022-0829-0759, pp. 78-79]

B. Off-cycle credits

We strongly urge EPA not to renew any part of the off-cycle credit program after MY 2026. As explained below, EPA concedes that the program will cause significant fleet emissions increases even though it no longer achieves any of its purposes. There is no reasonable basis for carrying any part of the program forward beyond 2026, and doing so would be arbitrary and capricious. [EPA-HQ-OAR-2022-0829-0759, p. 82]

1.Excluding BEVs from off-cycle credit eligibility

We concur with EPA's determination that off-cycle credits are inappropriate for BEVs for each of the reasons EPA states. 88 Fed. Reg. at 29251-52. Because EPA does not adjust the footprint curves downward to compensate for off-cycle credits, fleet emissions increase. Awarding credits is particularly inappropriate for BEVs because they have no tailpipe emissions and are already counted as emitting zero grams per mile, meaning that any credit awards tip their emission values into fictional negative territory. This in turn creates phantom benefits that further reduce the rule's average stringency. Because off-cycle credits are intended to stimulate the development of new combustion vehicle technologies, awarding them to BEVs also cannot, by definition, incentivize the development or application of new technology. Off-cycle credit values are also not representative of upstream emissions. These reasons for not awarding any off-cycle credits to BEVs become even more pertinent as the number of BEVs increases. Id. We urge EPA to finalize its proposal to exclude BEVs from off-cycle credit eligibility. [EPA-HQ-OAR-2022-0829-0759, p. 82]

2. Renewing PHEV off-cycle credits based on the utility factor only.

We also concur with EPA that off-cycle credits for PHEVs exceeding their utility factor is inappropriate. 88 Fed. Reg. at 29251. Granting credits for any portion of time when PHEVs do not run on electricity is inappropriate for the reasons discussed in connection with BEVs. We agree with EPA that the current utility factor is inaccurate, as PHEVs run on electricity far less often than estimated. 88 Fed. Reg. at 29252, and see detailed discussion in Section XII, infra.218 That is an additional reason why, as discussed below, off-cycle credits should not be renewed for PHEVs at all, regardless of whether they run on electricity or gasoline. [EPA-HQ-OAR-2022-0829-0759, pp. 82-83]

218 See also the numerous studies EPA cites at 88 Fed. Reg. 29252 n.274-475.

3. Eliminating the 5-cycle test procedures and the public notice and comment pathway

EPA justifies not renewing these two pathways for claiming off-cycle credits mainly because manufacturers have little or no interest in them. EPA points out that since 2021, the 5-cycle process has led to no new credits, and only one manufacturer has used it since 2012. As to the notice-and-comment pathway, EPA states that it has resulted in the award of only a few small credits since 2021. 88 Fed. Reg. at 20251. We agree that these programs should not be renewed, but we note that under EPA's Proposal, aside from air conditioning credits, the only off-cycle credits remaining would be menu credits, which require neither testing nor public comment, and as such are the least reliable and least defensible credits of all. Yet, as EPA reports, the use of menu credits has only grown over the years, and now constitutes a whopping 95% of credit use. 88 Fed. Reg. at 29249. Eliminating pathways that automakers eschew because they impose the burden of demonstrating their effectiveness thus does very little indeed to address the fundamental flaws. [EPA-HQ-OAR-2022-0829-0759, p. 83]

Because EPA's prior rules limited medium-duty fleet off-cycle credits to those approved under the 5-cycle test procedures or the notice-and-comment pathway and contained no menu credits, 88 Fed. Reg. at 29249, EPA's proposal not to renew those two pathways effectively terminates the credit program for that fleet, a decision we fully support. [EPA-HQ-OAR-2022-0829-0759, p. 83]

4. Phasing out menu credits through MY 2030

EPA proffers numerous reasons for "phasing out" the menu credits program—for vehicles with internal combustion engines only—through 2030. But those reasons all demonstrate that retaining the program in any form has no verifiable benefits even as it significantly increases the fleet's emissions. Renewal of menu credits thus would be arbitrary and capricious, and we strongly urge EPA to abandon the proposal and not to renew the program at the end of MY 2026. [EPA-HQ-OAR-2022-0829-0759, p. 83]

First, the Agency states that menu credits were designed "to provide an incentive for new and innovative technologies that reduce real world CO2 emissions primarily outside of the 2-cycle test procedures." 88 Fed. Reg. at 29249. But EPA now concedes the program no longer accomplishes this purpose. It notes that industry is rapidly shifting its research and development resources and vehicle mix away from combustion vehicles to electrification, and is not likely to continue to "invest resources on off-cycle technology in the future for their ICE vehicle fleet." 88 Fed. Reg. at 29250. Moreover, industry has fewer and fewer opportunities of "recouping" its investments as “ICE vehicle production declines.” Id. In other words, chances of menu credits stimulating any new technologies at all are slim to none. [EPA-HQ-OAR-2022-0829-0759, pp. 83-84]

Since 2012, EPA has also assured the public in its rulemakings that the increased emissions driven by credits are intended to be short-term and of a temporary nature only.219 But EPA proposes to renew the program once again, even as it acknowledges the voluminous record evidence demonstrating its shortcomings and failures.220 Reinstating the program through 2030 (for a total of 20 years) is in no way temporary and cannot be supported, as it is not delivering the hope for technical innovations that initially may have justified it. [EPA-HQ-OAR-2022-0829-0759, p. 84]

219 E.g., 88 Fed. Reg. at 29246, 29248; 86 Fed. Reg. at 74441; 75 Fed. Reg. at 25331.

220 See generally EPA, Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emission Standards: Response to Comments, EPA-420-R-21-027, at 6-51 (Dec. 2021).

221 The fleet average-modeled sum of off-cycle and air conditioning menu credits for MYs 2027-2032 represents about 3% of the MYs 2027-2032 Proposed Standards. We calculated this number by first sales-weighted averaging the direct off-cycle credits (i.e. air-conditioning plus off-cycle credits) in the modeled Proposal output file. We then compared these values to the Proposed Standards for the combined fleet. 88 Fed. Reg. at 29202, Table 10.

Eliminating menu credits for MYs 2027-2055 improves the cumulative CO_2 emissions reductions of the Proposal by 275 million metric tons (roughly 3% of the total 8,000MMT shown in DRIA table 9-21). We calculated this number by first assuming manufacturers would achieve the same combustion vehicle emissions levels as they do in the modeled Proposal output file with only on-cycle technologies. We used this file because the on-cycle emissions values in a no-off-cycle scenario are equal to the currently-modeled certified emissions values (used for compliance calculations). These on-cycle values are then converted to on-road (i.e. real-world) emissions using conversion factors calculated from the output file. Finally, total fleetwide lifetime emissions are estimated by multiplying on-road CO_2e by lifetime vehicle-miles traveled and annual sales. For the detailed calculations, see the Excel Workbook attachment to this comment letter titled “No Off-Cycle Credits 2027-2055.”. [EPA-HQ-OAR-2022-0829-0759, p. 84]

EPA also concedes that menu credits meet neither of the guardrails that justify continuation of air conditioning credits. Menu credits undergo no or at most minimal testing to ascertain what, if any, emission reductions they may yield, and EPA once again is not proposing to increase the standards’ stringency to account for the increased emissions. In 2021, EPA calculated the impact of the off-cycle credits it allowed under the MY 2023-2026 rulemaking as the loss of 42 g/mile. 88 Fed. Reg. at 29249 n.453, citing Revised 2023 and Later Model Year Light-Duty Vehicle GHG Emissions Standards: Regulatory Impact Analysis,” EPA-420-R-21-028 (Dec. 2021). For MY 2016-2025, the impact of all off-cycle credits amounted to a stringency loss of 4-6%. 88 Fed. Reg. at 29249. EPA also notes that for this Proposal, emission increases caused by all off-cycle credits (i.e., under a full renewal of the program) would be even larger by 2032, when they would “become an outsized portion (e.g., up to 12 percent) of the program.” 88 Fed. Reg. at 29250. We note, however, that under EPA’s proposal to retain menu credits through the proposed phase-out schedule, these compliance giveaways would still amount to some 3%

reduction in stringency and a 3% increase in MY 2027-2055 cumulative CO_2e emissions.221. [EPA-HQ-OAR-2022-0829-0759, p. 84]

Next, EPA discusses that the synergistic effects and overlap among menu technologies—which reduce effectiveness—become more pronounced as credits represent a larger portion of emissions reductions and the standards become more stringent. Further, “the menu credits are based on MY 2008 vintage engine and vehicle baseline technologies . . . and therefore the credit levels are potentially becoming less representative of the emissions reductions.” Id. And crucially, the Agency frankly admits that there is “not currently a mechanism to check that off-cycle technologies provide emissions reductions in use commensurate with the level of the credits the menu provides.” 88 Fed. Reg. at 29250 (emphasis added). That the program simply cannot be fixed is all by itself sufficient reason not to carry it on. . [EPA-HQ-OAR-2022-0829-0759, p. 85]

The single reason proffered to justify a step-wise phase-out through MY 2030 as a “reasonable way to bring the program to an end” is the creation of “a transition period to help manufacturers who have made substantial use of the program in their product planning.” 88 Fed. Reg. at 29250. But nothing backs up the need for a lead time of six or seven years (from the expected rule finalization in 2023 or 2024 through MY 2030). To the contrary, no lead time beyond MY 2026 is warranted, particularly in an industry racing toward zero-emission technologies. In any event, the menu program does not have to be “brought to an end” through this new rulemaking: it expires on its own after MY 2026. In its 2023-2026 rule (as before), EPA characterized the program as “temporary” and gave no indication that it would be extended, 86 Fed. Reg. at 74441, and commenters have implored EPA to jettison it for more than a decade. If a manufacturer has nonetheless made menu credits part of its post-MY 2026 product planning, it did so at its own risk. There is no need for a “transition period” for a program that ends in MY 2026. [EPA-HQ-OAR-2022-0829-0759, p. 85]

Organization: Ford Motor Company

Off-cycle Credits

Ford believes that the EPA off-cycle credit program encourages adoption of technologies that reduce on-road CO_2 emissions. We also believe that the program can serve an important function during this transition period, and we encourage EPA to consider continuing targeted off- cycle credits for both ICE and EV technologies. If EPA discontinues certain off-cycle credits, the agency should phase-out them out over time, much like the phase-out proposal for the menu- based credits. [EPA-HQ-OAR-2022-0829-0605, p. 8]

Organization: Hyundai America Technical Center, Inc. (HATCI)

HMG requests all technologies approved to earn credit through the alternative or 5- cycle pathway be moved to the menu from 2027 model year [EPA-HQ-OAR-2022-0829-0554, p. 6]

HMG appreciates EPA' s inclusion of off-cycle credits (OCC), which incentivize the application of technologies that provide real word greenhouse gas (GHG) emissions improvements, but whose improvements are not fully reflected on the 2-cycle test. HMG currently claims credits from all three available pathways: menu technologies, 5-cycle testing, and the public process. [EPA-HQ-OAR-2022-0829-0554, p. 6]

Many challenges remain on the path to ZEVs, and HMG believes incentives will continue to be key to encouraging swift adoption of ZEV technologies. Given such challenges, now is not the time for EPA to reduce OCC incentives as part of the transition to ZEVs. Accordingly, HMG provides the below comments regarding the Proposed Rule's changes to the OCC program. [EPA-HQ-OAR-2022-0829-0554, p. 6]

EPA proposes to phase out the menu pathway by decreasing the menu credit cap from MY 2027-2031 (10, 8, 6, 3, 0 g/mi) and prohibiting battery electric vehicles (BEVs) from earning OCC from MY 2027. HMG believes the cap should remain at its current level (15 g/mi) or should be phased out at a slower rate. EPA may believe that with the shift to electrified technology, OCC are not going to be a key area of focus for manufacturers, but this is not the case. GHG-reducing technologies, such as high efficiency lighting, are used in both ICE and ZEVs. Keeping the menu cap at its current level will support EPA's original goal for the OCC program to encourage and develop new and innovative technologies that lead to significant GHG reductions. Reducing and eventually eliminating OCC technology credits will likely disincentivize future ICE technologies that further contribute to GHG reductions. HMG also believes ZEVs should remain a part of the OCC program. Although ZEVs have no tailpipe emissions, if an off cycle technology improves electrical energy efficiency of the EV, that technology is providing a reduction in overall emissions. ZEV market penetration is also not yet high enough, nor is it likely to be by MY 2027, to justify eliminating these incentives. The ultimate goal of a 100% ZEV fleet continues to require substantial support in these early stages. [EPA-HQ-OAR-2022-0829-0554, p. 6]

EPA further proposes to eliminate the 5-cycle and the alternative credit pathways by MY 2027. HMG opposes this proposal and believes the non-menu pathways offer valuable GHG reductions. As stated previously, overall emissions reductions can be achieved through both ZEV and ICE improvements . Without the credit incentives for innovative GHG technologies, manufacturers may be less inclined to develop and invest in OCC technologies, leading to increased ICE emissions , particularly in the early stages of consumer ZEV adoption when ICE vehicles are still dominant. [EPA-HQ-OAR-2022-0829-0554, p. 6]

If EPA decides to eliminate the 5-cycle and alternative credit pathways, HMG suggests all credits approved through these pathways prior to the start of the new rule be transferred to the menu from MY 2027 and the menu cap be adjusted accordingly. Between development and the application process, HMG has spent considerable time and resources on OCC technologies that would seek approval through the alternative pathway. [EPA-HQ-OAR-2022-0829-0554, p. 6]

HMG believes EPA should encourage every GHG reducing effort, including non menu off-cycle technologies . There is precedent for moving technologies from the alternative pathway to the menu as mentioned in the Proposed Rule: "[t]he public process pathway was used successfully by several manufacturers for high efficiency alternators, resulting in EPA adding them to the off-cycle menu beginning in MY 2021."HMG believes the EPA should review and approve/reject all pending alternative pathway applications by June 1, 2025, and from MY 2027 move those technologies and the corresponding credit values to the menu. [EPA-HQ-OAR-2022-0829-0554, p. 7]

Organization: Hyundai Motor America

The Final Rule Should Delay the Start of Off-Cycle Credit Phase Down Until MY 2031.

The final rule should enable compliance pathways by offering a real choice of clean technology innovation or greater PEV penetration. However, the fundamental stripping away of technology- earning credit flexibilities, in effect, creates an EV mandate. The result will cause an industrywide race to simply "buy" compliance through credit trading provisions. In this way, the Proposed Alternative's restructured off-cycle and air conditioning credit provisions incentivize the wrong behavior by industry. [EPA-HQ-OAR-2022-0829-0599, pp. 7-8]

Historically, Hyundai has earned credits from its light duty innovations under the off-cycle credit provision and we remain interested in continuing to do so. However, the proposed phasedown creates a deterrent effect. Real world considerations include the reduced credit value compared to the time and resources required to develop qualifying technologies. While we agree that a phase- out will eventually be appropriate, we urge the EPA to retain existing off-cycle credits through at least MY 2030. [EPA-HQ-OAR-2022-0829-0599, pp. 7-8]

Retaining existing off-cycle credits for BEVs through MY 2030 allows time for industry to make gains in BEV technology, such as efficiency and price. In this way, off-cycle credit opportunities will serve as a bridge to support compliance during this time. We would support a phasedown of off-cycle credits for both ICE and PEVs beginning at 80% in MY 2031 and 60% in MY 2032. [EPA-HQ-OAR-2022-0829-0599, pp. 7-8]

Recommendations

In summary, we support AFAI's proposal as it aligns with Executive Order 14037. In addition, the final rule should include a:

- Revised No Action case to more adequately account for infrastructure and grid capacity constraints, challenges related to IRA-related supply chain restructuring, and significantly reduced consumer access to EV tax incentives in the near and medium term, [EPA-HQ-OAR-2022-0829-0599, p. 9]

- Confidential and aggregated industry survey to understand real costs associated with supply chain and manufacturing changes caused by the 30D tax credit requirements, [EPA-HQ-OAR-2022-0829-0599, p. 9]

- Off-cycle credit provision consistent with current rules through MY 2030, with a phasedown beginning MY 2031 [EPA-HQ-OAR-2022-0829-0599, p. 9]

- Credit incentive for automakers to reduce tailpipe emissions within in disadvantaged communities, and [EPA-HQ-OAR-2022-0829-0599, p. 9]

- Federal Advisory Committee to, by July 1, 2030, assess and issue recommendations regarding the status of key enablers necessary to support the final rule's BEV penetration requirements [EPA-HQ-OAR-2022-0829-0599, p. 9]

Organization: International Council on Clean Transportation (ICCT)

ICCT supports EPA's proposed improvements on a number of technical design elements that will strengthen the overall rule. ICCT strongly supports EPA's proposal to phase out additional credits given to automakers for technologies that are not captured in the test cycle (off-cycle credits; OC) and that previously were considered novel but now are fully commercialized. In particular, ICCT supports EPA's proposal to sunset or eliminate off-cycle (OC) credits for air-conditioning (AC), to phaseout off-cycle (OC) credits by MY2031, to eliminate the off-menu OC credit option starting MY2027, and to limit OC credits to ICE vehicles. [EPA-HQ-OAR-2022-0829-0569, p. 5]

OFF-CYCLE CREDITS

ICCT strongly supports EPA's proposal to sunset or eliminate air-conditioning (AC) and off-cycle (OC) credits. [EPA-HQ-OAR-2022-0829-0569, pp. 43-44]

Eliminating the AC leakage credit is reasonable, since at least 95% of new LD vehicles now use HFO-1234yf,109 which is a low-GWP refrigerant. Since virtually all vehicles have this low-GWP refrigerant, this low-GWP status is now the baseline and there is no need to grant further AC leakage credits. Regarding AC efficiency credits, ICCT supports EPA limiting these credits to ICEVs, as the credits are based on ICE tailpipe emissions reductions for AC-system improvements. While BEVs also benefit from improved AC system efficiency, BEVs do not require the additional incentive provided by AC credits. BEVs already are granted compliance emissions values of 0 g/mi, and advances in AC efficiency are inherent to BEV development, as passenger and battery heating/cooling loads can significantly impact BEV range and battery size requirements. [EPA-HQ-OAR-2022-0829-0569, pp. 43-44]

> 109 EPA. (2022). Automotive Trends Report. https://www.epa.gov/automotive-trends/download-automotive-trends- report#Full%20Report

ICCT supports the proposal to phaseout OC credits by MY2031, to eliminate the off-menu OC credit option starting MY2027, and to limit OC credits to ICE vehicles. As with AC credits, a large portion of the fleet already incorporates the technologies that are granted OC credits. According to the 2022 Automotive Trends Report data, MY2021 cars averaged 5.1 g/mi in OC credits (51% of the 10 g/mi cap) and trucks averaged 10.2 g/mi in OC credits (102% of the 10 g/mi cap).110 With these averages as a proxy for the share of the car and truck fleets with OC technology, this technology is already widespread in the baseline and requires no further incentivization. Evidence suggests that the menu OC credit values (such as solar and thermal load control) overestimate the real-world impact of OC technologies.111 Moreover, the menu credits are defined in terms of absolute g/mi reductions, rather than relative or percentage- based reductions, as virtually all on-cycle technologies are defined. Because of this inappropriate definition, as vehicles become increasingly efficient, these absolute credit values represent unrealistically large shares of vehicles' overall emissions improvement. Additionally, as OC credits are based on reduced tailpipe emissions from ICE vehicles, they are not applicable to BEVs. As with AC efficiency improvements, any innovation that reduces real world energy consumption in BEVs is inherently incentivized by the reduced battery capacity requirements of incorporating such innovations. Relatedly, ICCT supports the proposal to scale PHEV OC credits by the (newly proposed) utility factor. [EPA-HQ-OAR-2022-0829-0569, pp. 43-44]

110 EPA. (2022). Automotive Trends Report [data]. https://www.epa.gov/automotive-trends/explore-automotive-trends- data

111 Lutsey, N., Isenstadt, A. (2018). How will off-cycle credits impact U.S. 2025 efficiency standards? International Council on Clean Transportation. https://theicct.org/publication/how-will-off-cycle-credits-impact-u-s-2025- efficiency-standards/

ICCT recommends EPA adjust its modeling of OC credits to more accurately reflect the trend of the car and truck fleets taking full advantage of the OC credit cap. As currently modeled, both the car and truck fleets use the full value of their respective AC efficiency credit cap.112 The OC credits, however, are not modeled as reaching their cap for either car or truck fleet in any model year. As evidenced in the 2022 Automotive Trends Report data discussed above, the car fleet is currently receiving at least 50% of the full OC credit cap, while the truck fleet is receiving at least 100% of the full OC credit cap. ICCT suggests EPA modify its inputs to OMEGA to capture the real-world trend of manufacturers taking full advantage of the off-cycle credit cap. (The AC efficiency credits are appropriately modeled at the full value of the cap, which accurately represents the trend of the fleet receiving nearly 90% of the AC credit cap in MY2021.) If EPA incorporates the maximal use of OC credits during years that the OC cap is nonzero, then the standards could be made more stringent to offset this higher OC credit usage and maintain the same GHG emissions impacts. [EPA-HQ-OAR-2022-0829-0569, pp. 43-44]

112 Based on analysis of column BV of output file 2023_03_14_22_42_30_central_3alts_20230314_Proposal_vehicles.csv as well as inspection of input file offcycle_credits_20230206.csv

Organization: International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW)

Given the potential barriers to compliance, it is also crucial that the system of credits and multipliers for advanced powertrain technology, over-compliance, and off-cycle technologies provide automakers for multiple-pathways to reach compliance. No two automakers are the same when it comes to technologies or markets. Any adjustments to the regulatory credit system should prioritize promoting advanced technology production domestically and recognizing the economic, social, and environmental benefits of a resilient domestic supply chain. [EPA-HQ-OAR-2022-0829-0614, p. 8]

Organization: Kia Corporation

- Kia strongly supports preserving many of the current program flexibilities – a phase- down of the A/C refrigerant leakage credits and preserving the off-cycle technology credits. These flexibilities should still play an important role as these credits could help ease the uncertainties in the transition to EVs. [EPA-HQ-OAR-2022-0829-0555, p. 3]

Kia Supports Preserving Off-cycle Technology Credits

EPA proposes to phase out the off-cycle technology credit program as follows: (1) credit eligibility is limited to ICE vehicles; (2) a phase out of menu-based credits by reducing the menu credit cap year over-year until it is fully phased out in MY 2031 (10 g/mile cap in MY 2027 then 8.0/6.0/ 3.0/0, with MY 2030 being the last year manufacturers could generate credits); (3) EPA proposes to eliminate the 5-cycle and alternative method process pathways starting in MY

2027.22 EPA proposes that PHEVs would remain eligible for off-cycle credits but off-cycle credit would scale the menu credit cap for PHEVs by the vehicles' utility factor.23 [EPA-HQ-OAR-2022-0829-0555, pp. 13-14]

22 88 Fed. Reg. 29,249.

23 88 Fed. Reg. 29,251.

Kia opposes EPA's proposal to phase out and eventually eliminate off-cycle technology credits by MY2031. While Kia agrees that a phase-out of off-cycle credits will eventually be appropriate, we urge the EPA to retain existing off-cycle menu-based credits through at least 2032. Off-cycle credits should be continued. Any eventual phasedown should be much slower than proposed. [EPA-HQ-OAR-2022-0829-0555, pp. 13-14]

Historically, Kia has invested significant resources to develop these off-cycle technologies and has used all three pathways to obtain off-cycle credits. Kia remains interested in earning off-cycle credits as we have invested in these technologies, included them in our compliance plans, and know these technologies continue to provide real-world emissions reductions. [EPA-HQ-OAR-2022-0829-0555, pp. 13-14]

In EPA's most recent vehicle GHG emissions standards rule, finalized in December 2021, EPA increased the off-cycle credit cap obtained from the off-cycle menu from 10 g/mi to 15 g/mi for MYs 2023-2026.24 The increased menu cap signaled to industry that EPA would continue to encourage and account for these off-cycle technologies. Consequently, Kia made investments in these technologies and would appreciate the opportunity to earn a return on investment (ROI). EPA's proposed immediate phase down in MY2027 will hurt our ROI, stranding investments and potentially foregoing potential emissions benefits both before and throughout the MYs 2027 - 2032 program. While EPA is proposing automakers make new investments in ICE vehicles, Kia is urging EPA to allow automakers to benefit from off-cycle technology investments that have already been made. [EPA-HQ-OAR-2022-0829-0555, pp. 13-14]

24 86 Fed. Reg. 74,446.

These program flexibilities, particularly the off-cycle menu, still play an important role for automakers in compliance. Retaining the existing off-cycle credits, particularly the off-cycle menu, is critical as this allows time for automakers to make gains in EV penetration and allows for industry to earn credits for investments already made in ICE technologies. These credits could help ease the uncertainties in the transition to EVs, particularly early in the MYs 2027 - 2032 program. Kia strongly supports preserving current program flexibilities. [EPA-HQ-OAR-2022-0829-0555, pp. 13-14]

Kia also recommends that EPA keep the 5-cycle and alternative method process off-cycle pathways through MY2032. While these pathways are not used as often as the menu, it is important that these pathways are still allowed. These pathways will encourage new, innovative, emissions-reducing technologies that are a cost-efficient range of technology options that ultimately lower compliance costs and increase consumer choice. By eliminating the credits and pathways, there will be no incentive or benefit to invest in these GHG reducing technologies. [EPA-HQ-OAR-2022-0829-0555, pp. 13-14]

However, if EPA does eliminate the 5-cycle and alternative method process off-cycle pathways starting in MY2027, we recommend that EPA consider the following: [EPA-HQ-OAR-2022-0829-0555, pp. 13-14]

- EPA should follow through under the current regulation and complete action on all submitted applications, no later than June 1, 2025. [EPA-HQ-OAR-2022-0829-0555, pp. 13-14]

- EPA should add technologies approved through the 5-cycle and alternative off-cycle pathways to the off-cycle credit menu. [EPA-HQ-OAR-2022-0829-0555, pp. 13-14]

- If an automaker has off-cycle credits approved through the alternative or 5-cycle method prior to MY2027 and that vehicle remains in production after MY2027, the credit continues to be granted. [EPA-HQ-OAR-2022-0829-0555, pp. 13-14]

Organization: Lucid Group, Inc.

Lucid Supports Eliminating AC Leakage and Off-Cycle Menu Credits

The intent behind the off-cycle program was to incentivize innovations that would reduce real world CO2 emissions outside of the 2-cycle test procedures. However, transportation technologies and the makeup of the vehicles on U.S. roads has drastically changed since the program's launch in 2014. In part, EPA proposes limiting the off-cycle program to vehicles with tailpipe emissions greater than zero starting in MY27 and sunsetting the program entirely by MY31. The accelerated transition to EVs, spurred by both government and industry commitments/investment as well as the exacerbation of the climate crisis, provides the opportunity for EPA to narrow the allowance of credits for vehicles that emit tailpipe emissions. Lucid urges the agency to eliminate the off-cycle program as proposed, or on an accelerated timeline ending with 0g/mile prior to MY31, and to eliminate the 5-cycle and public process pathways starting in MY27. [EPA-HQ-OAR-2022-0829-0664, p. 7]

Organization: MECA Clean Mobility

Off-cycle credits provide real-world emission benefits and should continue to be offered.

We continue to support EPA's off-cycle credit program for recognizing the breadth of engineering ingenuity to reduce real-world CO2 through a verifiable credit process. This program has offered a method for vehicle manufacturers to apply for off-cycle CO2 credits through three pathways with increasing levels of complexity. We agree that the five-cycle approval process is complex and thus has had limited subscribership. The program requires that off-cycle technologies be fully integrated into vehicles, and thus suppliers have had a difficult time generating enough evidence to convince their customers to commit resources to demonstrate the technology across a fleet of vehicles without any indication of the amount of credits the technology may deliver. Furthermore, suppliers have found it difficult to take advantage of the 5-cycle pathway to generating data toward demonstrating the CO2 reduction benefits of a technology to their customers without access to the methodology the agency uses for calculating the final credit value. [EPA-HQ-OAR-2022-0829-0564, p. 36]

However, light-duty super credits were recently sunset in 2022 and advanced technology multiplier credits for medium- and heavy-duty vehicles are phasing out by 2027, and we believe this could lead to increased interest and use of the current off-cycle credit program. While we understand EPA's rationale in its decision to simplify and eliminate the off-cycle credit process by removing the 5-cycle pathway and phasing out the credits, we request: (1) that the agency retain the five-cycle pathway; and (2) that the agency continue off-cycle menu credits at the 10 g/mile cap rather than phasing credit caps down to zero. [EPA-HQ-OAR-2022-0829-0564, p. 36]

Organization: MEMA, The Vehicle Suppliers Associated

Continue Off-Cycle Technologies Credit & A/C Efficiency Technology Credit Programs

MEMA urges EPA to continue to provide the off-cycle technology credit program and the A/C efficiency credit program. The supplier community, working independently and in collaboration with OEMs, develop and engineer innovative technologies that contribute to vehicle manufacturers' strategies for real-world GHG and fuel consumption reductions often beyond those measured with standard test procedures. The off-cycle credit program and A/C efficiency credit program have helped to support industry investment in innovative and forward-looking technologies that provide environmental benefits. These technologies offer measurable, demonstrable, and verifiable real-world benefits that improve efficiencies and reduce GHG emissions. They also provide an important cost-effective option for OEMs to achieve fuel economy and GHG targets. [EPA-HQ-OAR-2022-0829-0644, pp. 9-10]

These credit programs are not loopholes and do not distort the market but instead recognize technologies that are not measured accurately on the existing test-cycles. These technologies are often more cost effective than other available technologies to reduce pollutant emissions. It is important that the MY27+ program allows a variety of regulatory tools to broaden compliance pathways for vehicles to manage their product mix during this transition period. [EPA-HQ-OAR-2022-0829-0644, pp. 9-10]

The continuation of the off-cycle credit program is critical in encouraging technologies that allow greater innovation which can provide a cost-efficient range of technology options that ultimately lower compliance costs and increase consumer choice. These technologies will continue to promote consumer choice, spur technology development, and minimize compliance costs while achieving significant pollutant emissions and oil reductions. Importantly, continuation of the off-cycle technology credit program will help maintain market certainty for these technologies. [EPA-HQ-OAR-2022-0829-0644, pp. 9-10]

Similarly, MEMA encourages EPA to explore how emissions reductions from off-cycle technologies and A/C efficiency technologies could be rewarded when used on BEVS, PHEVs, FCEVS, and other ZEVs. Many off-cycle and A/C efficiency technologies, along with emerging ZEV technologies, could help reduce battery energy use and therefore lower the amount of electricity used to power the vehicle overall. Consequently, technologies that reduce the amount of battery charging needed and, therefore, the electricity used to power the vehicle should be recognized in MY2027 and beyond. [EPA-HQ-OAR-2022-0829-0644, pp. 9-10]

MEMA urges:

- EPA to maintain off-cycle credits and A/C credits programs at full value through 2032 for all vehicle types, including ZEV, and consider additional ways emerging technologies that reduce ZEV energy consumption can be rewarded. [EPA-HQ-OAR-2022-0829-0644, pp. 9-10]

Organization: Minnesota Pollution Control Agency (MPCA)

- Phase out air conditioning and off-cycle credits

The MPCA agrees with EPA's proposal to phase out air conditioning and off-cycle credits. While useful to encourage manufacturers to invest in improved technology in earlier phases of EPA's greenhouse gas vehicle emissions standards, they no longer provide substantive benefit, and it is appropriate to sunset these programs. [EPA-HQ-OAR-2022-0829-0557, p. 5]

Organization: Mitsubishi Motors North America, Inc. (MMNA)

Mitsubishi participated in the development of - and supports - the comments submitted by Auto Innovators. [EPA-HQ-OAR-2022-0829-0682, p. 2]

In addition, based on its considerable experience discussed previously with BEV and PHEV leadership, Mitsubishi provides the following recommendations to supplement the comments of Auto Innovators: [EPA-HQ-OAR-2022-0829-0682, p. 2]

1. Closely align the multi-pollutant emissions standards with President Biden's 2030 goal by assuming no more than 40-50% PHEVs and FCEVs by 2030, even though our experience leads us to caution that this itself is very ambitious, and is predicated on the assumption that the necessary supportive policies will be effectively implemented. [EPA-HQ-OAR-2022-0829-0682, p. 2]

2. Consider the many benefits of PHEVs to consumers and the environment during the expected period of constrained battery critical minerals production capacity, and how PHEVs are the perfect stepping- stone to full BEV acceptance. [EPA-HQ-OAR-2022-0829-0682, p. 2]

3. Maintain the current PHEV Utility Factor (UF) and work with industry to identify opportunities to increase PHEV electric operation. This is the ideal stepping-stone technology to encourage long-term BEV acceptance and utilization. [EPA-HQ-OAR-2022-0829-0682, p. 2]

4. Keep the proposed approach to determine the passenger car curves, and consider adjusting the cutpoint and stringency levels of the light-duty trucks during the early years of the program. [EPA-HQ-OAR-2022-0829-0682, p. 2]

5. Maintain the existing GHG program flexibilities, such as Air Conditioning and Off-Cycle technologies credits (including the alternative method to apply off-cycle credits), and allow previously approved technologies to continue receiving credits. [EPA-HQ-OAR-2022-0829-0682, p. 2]

6. Align the Tier-4 (criteria pollutants) with CARB's LEV-IV criteria test procedures and standards. [EPA-HQ-OAR-2022-0829-0682, p. 2]

7. Consider the impact that very aggressive GHG standards will have on vehicle affordability, and especially the detrimental impact to low-to-moderate income families. Regardless of the vehicles that regulation may require us to produce, it is critical that regulators always keep the accessibility of consumers in mind. [EPA-HQ-OAR-2022-0829-0682, p. 2]

The rationale for each one of these recommendations is further explained below. [EPA-HQ-OAR-2022-0829-0682, p. 2]

5. GHG Program Flexibilities

At the onset of GHG regulations in MY2012, EPA developed a set of program flexibilities designed to provide credits for technologies that provide real-world GHG emissions benefits but are unable to be measured under the required test procedures. Specifically, credits are available for refrigerant systems which use low global warming potential refrigerants and reduce leakage, improvements to air conditioning efficiency, and "off-cycle" technologies which improve emissions but are not fully measured during 2-cycle testing. This proposed regulation intends to phase out and eliminate several of these credits as well as limit their application for electric vehicles. Mitsubishi supports the position of Auto Innovators to maintain these program flexibilities as these technologies provide real-world environmental benefits. Mitsubishi also supports Auto Innovators' position that any vehicles with previously approved alternative method off-cycle technology continue to receive credits for MY27 and later. In addition, Mitsubishi believes that the alternative method to apply for off-cycle credits should remain as an option for MY27 and later. [EPA-HQ-OAR-2022-0829-0682, pp. 8-9]

It is important to note that NHTSA's CAFE program in the past has mirrored EPA's GHG approach to these flexibilities. Since it is not possible to comment on a proposed CAFE regulation that has not yet been published, it is only reasonable to assume that NHTSA will follow previous precedent regarding flexibilities and adopt the same structure as EPA. However, there is a significant deviation with regard to the treatment of EV compliance under the CAFE and GHG programs. Where EVs are rightly considered zero g/mi under the GHG program, the CAFE program requires EVs to be assign a mile per gallon equivalent compliance value based on the PEF. Increasing this discrepancy in the GHG and CAFE programs, DOE has proposed reducing the PEF by 72% compared to the current value. The PEF reduction will lead to a substantial decrease in the CAFE compliance value of BEVs and PHEVs. The elimination of air conditioning and off- cycle credits for EVs combined with changes to the PEF, and UF within the CAFE program could put BEVs and PHEVs at a distinctive compliance disadvantage relative to some Strong Hybrid-Electric Vehicles (SHEVs). Keeping these flexibilities in the GHG program for electric vehicles should reduce potential harmonization issues between the GHG and CAFE regulations. For this reason and the reasons stated by Auto Innovators, Mitsubishi supports Auto Innovators proposed approach to apply all available credits at the vehicle level regardless of propulsion, but ensure fleet-wide average emissions are not allowed to go below a value equivalent to zero g/mi. [EPA-HQ-OAR-2022-0829-0682, pp. 8-9]

Organization: National Association of Clean Air Agencies (NACAA)

NACAA agrees with EPA's assessment that the off-cycle credit program – originally created over a decade ago to provide flexibility to automakers and incentives for the development of new and innovative technologies – has successfully served its purpose. We therefore support the agency's proposal to phase out, between 2027 and 2030, the off-cycle credit program for LDVs and MDVs. [EPA-HQ-OAR-2022-0829-0559, p. 8]

Organization: National Automobile Dealers Association (NADA)

EPA also proposes to sunset the off-cycle credits program for both light- and medium-duty vehicles by: (i) reducing the menu credit cap annually until its unavailable in MY 2031; (ii) eliminating the 5-cycle and public process pathways starting in MY 2027; and (iii) limiting eligibility for off-cycle credits to vehicles with tailpipe emissions greater than zero starting in MY 2027.11 [EPA-HQ-OAR-2022-0829-0656, p. 3]

11 88 Fed. Reg. 29196, 29249-52.

NADA generally supports retention of all compliance flexibilities that will afford OEMs a greater ability to cost-efficiently deliver compliant vehicles, and to help incentivize the acceptance of new technology and alternative fuel vehicles in the marketplace. Hence, NADA opposes EPA's proposals to (i) eliminate or reduce the incentive multiplier for medium-duty vehicles prior to MY 2027, (ii) limit eligibility for the air conditioning credit to light-duty internal combustion engine (ICE) vehicles, (iii) eliminate refrigerant-based air conditioning credit provisions for both light-duty and medium-duty vehicles, and (iv) to sunset the off-cycle credits program for both light-duty and medium-duty vehicles. NADA shares the concerns expressed by AAI in its comments regarding the changes EPA proposes on these matters. [EPA-HQ-OAR-2022-0829-0656, p. 16]

Organization: Nissan North America, Inc.

Additionally, Nissan requests that EPA re-consider the proposed changes to its AC system efficiency credits and off-cycle credit programs. Nissan agrees with the comments of the Alliance for Automotive Innovation on these topics as described in more detail in Section VII below. [EPA-HQ-OAR-2022-0829-0594, p. 6]

VII. Endorsement of Comments from the Alliance for Automotive Innovation

As a member of the Alliance for Automotive Innovation ("the Alliance"), Nissan fully endorses the comments on the Proposed Multi-Pollutant Rule submitted separately by the Alliance. In particular, Nissan highlights several points from the Alliance's comments, including: [EPA-HQ-OAR-2022-0829-0594, p. 9]

- Support realigning the GHG standard stringency ramp up rates with market reality and uncertainties. [EPA-HQ-OAR-2022-0829-0594, p. 9]

- Support realigning the Federal criteria emission standards with California's program. [EPA-HQ-OAR-2022-0829-0594, p. 9]

- Emphasis regarding the industry's commitment to work towards electrification as quickly as practicable, while also taking into consideration resource availability, technological capabilities, market challenges and limitations, and consumer adoption hurdles. [EPA-HQ-OAR-2022-0829-0594, p. 9]

- Support continuation of tailpipe-based program and treatment of 0 g/mi for EVs [EPA-HQ-OAR-2022-0829-0594, p. 9]

- Request reconsideration of the proposed changes in the AC and off-cycle credit programs: [EPA-HQ-OAR-2022-0829-0594, p. 9]

- Request continuing AC and off-cycle credit eligibility for EVs that are part of mixed fleets [EPA-HQ-OAR-2022-0829-0594, p. 9]

- Oppose phase-out of off-cycle credits and request the off-cycle credit cap be maintained at 15 g/mi [EPA-HQ-OAR-2022-0829-0594, p. 9]

- Support coordination and harmonization between EPA, NHTSA, and CARB. One fleet should meet all programs with a common goal. [EPA-HQ-OAR-2022-0829-0594, p. 9]

Organization: Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC)

We also support EPA's air conditioning credit programs and its proposal to sunset the off-cycle credits program for both LDVs and MDVs and suggest EPA consider whether shorter timeframes are appropriate. [EPA-HQ-OAR-2022-0829-0584, p. 9]

Organization: Porsche Cars North America (PCNA)

2. Porsche supports continued availability of flexibilities for electrified vehicles.

Porsche supports the continued allowance for electric vehicles to participate in the off-cycle and air conditioning related GHG flexibilities. Porsche does not support the proposal from EPA to remove both for electric vehicles beginning in model year 2027. Off-cycle technology and air conditioning credits have been a pragmatic and supportive pillar within the suite of flexibilities in EPA's GHG regulation for many years and Porsche believes that these flexibilities can continue to provide value within the overall construct of the GHG fleet regulation, even for fully electrified vehicles. [EPA-HQ-OAR-2022-0829-0637, pp. 19-20]

Electric vehicles operate as a supportive element within a manufacturers GHG fleet and should provide a compliance incentivize intended to increase production of EVs. Electric vehicles like any other vehicle should have the opportunity to leverage additional off-cycle or air conditioning technologies that further contribute to CO2 reduction goals and for those credits to be equally available for use within a manufacturers fleet. These types of credits act as an internal flexibility for the manufacturer to manage their overall annual compliance. [EPA-HQ-OAR-2022-0829-0637, p. 20]

Porsche recognizes that the current menu-based credit system may not be appropriate for electric vehicles. As such, Porsche thinks it would be reasonable for manufacturers to continue to be able to leverage the application type pathway to seek off-cycle credits for EVs on a case-by-case basis. Efforts could be made to establish a revised menu-based credit system in the future, like what was envisioned in the California Framework Agreement. [EPA-HQ-OAR-2022-0829-0637, pp. 20-21]

The GHG program leverages other broad assumptions that are equally applied to all vehicles that are also not representative of real-world usage. For example, many Porsche vehicles have very low annual vehicle miles traveled. As such, the assumed lifetime miles used within the GHG regulation to determine debits or credits (i.e., 195k for LDV and 225k for LDT) are nowhere near reflective of the miles that an average Porsche will likely ever see in its lifetime. A Porsche model type that underperforms relative to gram/mile CO2 footprint target would have to purchase credits in megatons that are likely far in excess of the actual potential overage of megatons emitted by the vehicle over its lifetime. [EPA-HQ-OAR-2022-0829-0637, pp. 20-21]

Nevertheless, these common accounting methods are embedded within the regulation to give consistent calculations for all OEMs. [EPA-HQ-OAR-2022-0829-0637, pp. 20-21]

Organization: Rivian Automotive, LLC

Phase Out the Off-Cycle Program Expeditiously

Rivian welcomes the proposal to phase out the off-cycle program but encourages EPA to end off-cycle crediting for all vehicles in MY27—both ICEs and BEVs. [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

We have submitted comments to previous rulemaking dockets expressing fundamental concerns with off- cycle credits and their effect on the environmental integrity of the GHG regulations. As ICCT has noted, one of the "most disconcerting findings" of its examination of off-cycle crediting is that the credited technologies "are still largely without validated real-world benefits."25 In fact, evidence suggests that not only are the real-world benefits of many off-cycle technologies less significant than claimed since the inception of the off-cycle program, but the provision has failed to ensure additionality, often creating windfalls by awarding credits to automakers for technologies that were already installed.26 Moreover, the off-cycle provisions do not account for technologies that could increase emissions in a manner not captured by test procedures, creating in essence an off-cycle debit. Consider remote-start technology that turns on a car engine before a driver arrives at the vehicle, often for the purpose of heating or cooling the cabin. The resulting emissions offset the benefits of an off-cycle technology like stop-start. For all these reasons, and with rapidly increasing electrification of the fleet largely obviating the need for an off-cycle program in the first place, Rivian believes that evidence supports an end to off-cycle crediting for all vehicles in MY27. We call on the agency to pursue and maintain parity between BEVs and ICEs in the elimination of all off-cycle credits. [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

25 Nic Lutsey and Aaron Isenstadt, The International Council on Clean Transportation, How Will Off-Cycle Credits Impact U.S. 2025 Efficiency Standards? (2018), available at https://theicct.org/sites/default/files/publications/Off- Cycle-Credits_ICCT-White-Paper_vF_20180327.pdf.

26 Dave Cooke, Union of Concerned Scientists, "EPA Can't Let 'Off-Cycle' Credits Become an Off-Ramp for Automakers," July 28, 2021, available at www.blog.ucsusa.org/dave-cooke/epa-cant-let-off-cycle-credits-become-an-off-ramp-for-automakers/.

However, if the agency elects to finalize a bifurcated approach and maintain the off-cycle provisions for ICEs only, at a minimum we urge EPA to accelerate the proposed phaseout by reducing the menu cap as suggested below. [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

MY: 2026; EPA's Proposed Menu Cap(g/mi): 10; EPA's Proposed Cap as Share of Overall GHG Standard: 5.4%; Rivian's Proposed Menu Cap (g/mi): 10; Rivian's Proposed Cap as Share of Overall GHG Standard: 5.4% [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

MY: 2027; EPA's Proposed Menu Cap(g/mi): 10; EPA's Proposed Cap as Share of Overall GHG Standard: 6.6%; Rivian's Proposed Menu Cap (g/mi): 8; Rivian's Proposed Cap as Share of Overall GHG Standard: 5.3% [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

MY: 2028; EPA's Proposed Menu Cap(g/mi): 8; EPA's Proposed Cap as Share of Overall GHG Standard: 6.1%; Rivian's Proposed Menu Cap (g/mi): 6; Rivian's Proposed Cap as Share of Overall GHG Standard: 4.6% [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

MY: 2029; EPA's Proposed Menu Cap(g/mi): 6; EPA's Proposed Cap as Share of Overall GHG Standard: 5.4%; Rivian's Proposed Menu Cap (g/mi): 3; Rivian's Proposed Cap as Share of Overall GHG Standard: 2.7% [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

MY: 2030; EPA's Proposed Menu Cap(g/mi): 3; EPA's Proposed Cap as Share of Overall GHG Standard: 2.9%; Rivian's Proposed Menu Cap (g/mi): 0; Rivian's Proposed Cap as Share of Overall GHG Standard: 0.0% [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

MY: 2031; EPA's Proposed Menu Cap(g/mi): 0; EPA's Proposed Cap as Share of Overall GHG Standard: 0.0%; Rivian's Proposed Menu Cap (g/mi): 0; Rivian's Proposed Cap as Share of Overall GHG Standard: 0.0% [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

Table 1. At a minimum, Rivian proposes decreasing the menu cap beginning in MY27 as opposed to MY28. [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

Under Rivian's alternative proposal, which begins decreasing the menu cap in MY27 as opposed to MY28, off-cycle credits—if claimed up to the menu cap—represent a declining share of total compliance toward the overall standard. In contrast, under EPA's proposal off-cycle credits would increase in their contribution to overall compliance, from 5.4 percent in MY26 to 6.6 percent in MY27. We believe that Rivian's proposal delivers more effectively on the intent of the agency to phase out off-cycle credits. [EPA-HQ-OAR-2022-0829-0653, pp. 8-9]

Organization: Southern Environmental Law Center (SELC)

EPA is proposing several modifications to other credit systems that are part of the tailpipe emissions standards in order to ensure these systems actually result in emissions reductions. We support EPA's proposal to eliminate the air conditioning (AC) system credits for AC refrigerant leakage control. Since the phase out of high global warming potential (GWP) refrigerants is required under other laws and regulations, manufacturers should not be rewarded under the tailpipe emissions standards for actions they are already required to take. Vehicles, however, will continue to use low GWP refrigerants, and EPA should implement a leakage design standard to protect against potential system leaks. We also support EPA's proposal to phase out off-cycle credits. It is often difficult to verify that off-cycle technologies provide the emissions reductions claimed, and this becomes more of a concern as vehicles become less polluting overall. [EPA-HQ-OAR-2022-0829-0591, p. 10]

EPA is also proposing to close loopholes that allow for emissions reductions provided by ZEVs to be claimed more than once. We support EPA's modification to the AC efficiency credit so that it applies only to internal combustion engine vehicles starting in model year 2027. This makes sense because AC efficiency credits are earned solely by improving internal combustion engine vehicles. Under the current tailpipe emissions standards, however, some manufacturers were reporting ZEV emissions of less than zero when implementing AC efficiency technology in those vehicles. For similar reasons, we also support EPA's proposal to modify the off-cycle credit system to only include eligible vehicles (i.e., internal combustion engine vehicles) in calculating the cap used for these types of credits until they are phased out. [EPA-HQ-OAR-2022-0829-0591, p. 10]

Organization: Stellantis

EPA's Discounting of Technology Benefits Increases Implicit GHG Stringency [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

EPA has proposed AC, off-cycle and PHEV technology actions that would increase the implicit GHG stringency, making it even more difficult to achieve the explicit aggressive GHG targets. These EPA proposed actions are summarized below: [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

- Remove the Direct AC refrigerant and leak credit in a single model year (2027MY) [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

- Impose an artificial phase down of off-cycle credits, disregarding the real-world benefits of GHG saving technology [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

- Exclude PHEV technology from modeling and discount highly capable PHEV technology that would provide a bridge to a fully electrified future [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

These long-standing flexibilities have incentivized significant investment in GHG saving technology that now proliferates across the light-duty fleet. The Direct AC credit incentive has been a very successful program that industry has moved to implement at a very high rate. The investment and piece costs incurred to develop and introduce the lower Global Warming Potential (GWP) refrigerants and their systems are partially offset by the GHG credits received. In addition, the lower leak technologies and materials, now deployed across the ICE fleet, continue to achieve real-world GHG savings. This GHG benefit of low AC leak rates does not go away as we transition the fleet to higher rates of electrified product. [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

Similarly, the ongoing and already incurred investment and costs of GHG saving off-cycle technologies in the fleet have led to real world benefits. These benefits also do not go away as the fleet adds more EVs and PHEVs. While there may be less available menu credits for EVs versus ICE products, this naturally achieves what the EPA is now proposing in this rule via a forced phase-down of the allowed credit cap. That is, the menu of available technologies will naturally decrease as fleet mix shifts to EVs. EPA's effort to drastically reduce the cap will immediately call into question the ongoing development and deployment of these GHG saving technologies. [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

These combined actions significantly increase the stringency of the proposed rule by making the extremely aggressive fleet targets more difficult to achieve while at the same time incentivizing OEMs to remove this GHG saving technology from products. ICE vehicles and EVs both benefit from many of these technologies and therefore their GHG compliance and real-world benefits should not be removed. [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

- The Direct AC credit and off-cycle credit programs need to be retained for continued GHG benefits on both ICE and EV products. [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

- The implicit stringency impact in the early years of this rulemaking is drastically increased by the additional burden experienced if the proposed flexibilities are removed. [EPA-HQ-OAR-2022-0829-0678, pp. 11-12]

Third, EPA should retain credit for off-cycle GHG technologies that will continue to reduce real-world GHG emissions on ICE and EV product without artificially ramping down credit prematurely. Similarly, EPA should retain today's PHEV Utility Factor to motivate sales of even more capable PHEVs. These technologies remain important in reducing the GHG emissions of a combined ICE/EV fleet, and the overall influence of the credit mechanisms in place to incentivize technology proliferation will scale down naturally as BEV technology proliferates. [EPA-HQ-OAR-2022-0829-0678, pp. 14-15]

In addition to these three pieces, and as a separate matter to setting feasible standards, EPA should consider implementing transparent and objective mechanisms that monitor key market enablers (infrastructure, battery costs, and raw material availability) and create adjustments if these essential enablers fall short of projections. These mechanisms are not a substitute for appropriately set targets, but rather a compliment to address uncertainties that are beyond the control of both industry and EPA. [EPA-HQ-OAR-2022-0829-0678, pp. 14-15]

Stellantis recommends that EPA should:

-Retain GHG saving technology flexibilities recognizing the GHG benefit that continues to be present on electric vehicles and that will naturally decrease as EV penetration increases [EPA-HQ-OAR-2022-0829-0678, p. 24]

Organization: Tesla, Inc.

Tesla supports the proposed Alternative 1 with added stringency so that the final performance standards achieves a fleet BEV penetration rate greater than 69% in MY 2032.2 Alternative 1 is estimated to provide greater CO2 emissions reduction of -51% from no action by 2050 compared to -46% under EPA's proposal, and the additional stringency will result in even greater emission reductions.3 Accordingly, Tesla asserts the EPA should amend its proposal with a more stringent version of Alternative 1 and take, inter alia, the following additional steps to increase the performance and overall stringency of the proposed standards: [EPA-HQ-OAR-2022-0829-0792, p. 2]

2 See, 88 Fed. Reg. 29332-33, Table 96.

3 Id., at 29348 (comparing Tables 135 and 136).

- Eliminate off-cycle crediting for all types of vehicles; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Revisit the plug-in hybrid electric vehicle (PHEV) utility factor to accurately reflect real world emissions; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Amend the proposal to create parity in promoting motor vehicle air conditioning (MVAC) efficiency adoption; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Maintain the existing zero emissions upstream approach for BEVs; [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Eliminate credit multipliers for all vehicles; and [EPA-HQ-OAR-2022-0829-0792, p. 2]

- Ensure BEVs continue to be accounted for, and participate in, the NMOG + NOx reduction standard. [EPA-HQ-OAR-2022-0829-0792, p. 2]

Accordingly, to meet strictures and pathway established under section 202, in addition to adopting Alternative 1 with increased stringency, Tesla also asserts that the following amendments to the proposal will result in a more "forward-looking" performance standard providing greater protection to the public health and welfare. [EPA-HQ-OAR-2022-0829-0792, p. 24]

A. EPA Should Fully Eliminate Off-Cycle Credits Staring in Model Year 2027

In the proposal, EPA takes steps to phasedown the amount of allowed off-cycle credits with a declining cap on such credits from MY 2027 through MY 2030, reducing the menu of eligible credits, eliminating the five-cycle pathway, and allowing only ICE vehicles to generate off-cycle credits.148 While sunsetting off-cycle credits is directionally positive, the agency should instead eliminate all off-cycle credit generation starting in MY 2027. [EPA-HQ-OAR-2022-0829-0792, p. 24]

148 Id., at 29248-929252.

While reduced, continuing off-cycle crediting creates asymmetry in the regulation favoring ICE vehicles, diverts research and development investment away from the best emissions reduction technology of electrification, and unnecessarily weakens the stringency of the standard. [EPA-HQ-OAR-2022-0829-0792, p. 24]

Ongoing utilization of off-cycle credit in only ICE and PHEV vehicles creates a disparity in the type of vehicles that are rewarded for deploying efficiency technology. Originally created in 2010, the off-cycle menu credits consisted almost entirely of technologies (i.e., Active Engine Warmup, Active Transmission Warmup, Engine Stop Start) applicable only for use on ICE vehicles. Subsequently, in its 2012 rules, EPA moved forward the timeline for generating these credits from a proposed MY 2017 to MY 2014. As a result, the off-cycle program has its origins in technologies now over thirteen years old. Despite being an antiquated part of the standard, EPA now proposes extending crediting rewards to manufacturers for deploying these technologies for what amounts to another eight model years. This means ongoing off-cycle credits will reduce the stringency of the proposed standard by rewarding many now commonly deployed efficiency technologies that provide, at best, negligible real-world emissions, or technology advancement benefits. [EPA-HQ-OAR-2022-0829-0792, p. 24]

Moreover, previous analysis has shown that manufacturers reliance on off-cycle credits diverts investment and deployment away from the most efficient vehicle technologies. Continuing these credit rewards old technology and, to the extent new technologies are deployed to generate off-cycle credits, focuses critical research and development budgets on tweaking legacy ICE and PHEV platforms rather than directing these budgets to full electrification and greater emissions reductions. In extending the off-cycle program and limiting it to ICE and PHEV vehicles, EPA's proposal half-heartedly confronts this built-in bias toward legacy technology. Especially at a time when manufacturers should be further developing next generation BEV technology and eliminating legacy technology, the agency should not maintain such perverse incentives and should eliminate all off-cycle crediting starting in MY 2027.149 [EPA-HQ-OAR-2022-0829-0792, p. 24]

Organization: Toyota Motor North America, Inc.

7 Off-Cycle Technology Credits

From the start of the GHG program effective with 2012 model year vehicles, off-cycles credits35 have collectively motivated the introduction of technologies that would not been launched otherwise because they often provide no perceivable benefit for customers. However, these technologies net immediate real-world emissions reductions and should be viewed no differently than emissions reductions achieved over the Federal Test Procedure. Off-cycle credits encourage the continued use of these technologies with commensurate benefits to consumers, the environment and further innovation. [EPA-HQ-OAR-2022-0829-0620, pp. 45-46]

35 Which includes A/C refrigerant leakage credits and A/C efficiency credits for these comments.

Toyota has invested billions of dollars in off-cycle technologies which have saved over approximately 100 million tons of CO2 emissions from our products and avoided high GWP refrigerants from entering the environment. Off-cycle credits have become pivotal in Toyota's compliance planning and longer-term technology strategy affecting future products over the next several years that could potentially include PEVs. [EPA-HQ-OAR-2022-0829-0620, pp. 45-46]

The proposal:

- Eliminates AC refrigerant credits as well as the 5-cycle and alternative credit methods [EPA-HQ-OAR-2022-0829-0620, pp. 45-46]

- Phases out the off-cycle credit menu, and [EPA-HQ-OAR-2022-0829-0620, pp. 45-46]

- Excludes BEV and the electric operation of PHEVs from the remaining available credits. [EPA-HQ-OAR-2022-0829-0620, pp. 45-46]

Toyota has invested in and will deploy technologies that have been approved under the 5-cycle and Alternative test methods. We request all previously approved credits be added to the off-cycle credit menu and the cap increased by the amount of those added credits. [EPA-HQ-OAR-2022-0829-0620, pp. 45-46]

Toyota also requests BEVs and PHEVs be fully eligible for the remainder of the off-cycle credit program. The efficiency of PEVs can be improved with off-cycle technologies. For example, solar panels and solar thermal control technologies conserve battery energy improving PEV driving range and reducing electricity consumption. Improved PEV HVAC system efficiency can produce similar benefits. In a March 2022 meeting with AAI that explored potential approaches for 2027 model year and later GHG standards, EPA mentioned the possibility of incentivizing increased PEV efficiency and range. Market factors alone will motivate improved efficiency and range over time, but off-cycle credits could help accelerate advancements as PEV technologies continue to evolve and mature. EPA and the auto industry could collaborate on appropriate credit values and how to avoid negative fleet emissions if PEV penetration eventually were to reach such a threshold market share. [EPA-HQ-OAR-2022-0829-0620, pp. 45-46]

Organization: Valero Energy Corporation

C. EPA should retain the off-cycle credits program for ICEV and should modify the program to recognize vehicle fuel-based carbon intensity reduction measures such as low-carbon fuels and fuel sequestration.

EPA requests comment on its proposal to phase out the off-cycle credits program that currently allows auto manufacturers to realize credit for CO2 reduction technologies for which the emission reduction benefits are not adequately reflected in the Federal Test Procedure and/or the Highway Fuel Economy Test.349 EPA acknowledges in the preamble that this program has been successful in encouraging a variety of technologies that otherwise would not have been implemented, such as engine start-stop, active aerodynamics, high efficiency alternators, and others. Nevertheless, and notwithstanding EPA's claims regarding the urgent need for GHG reduction measures, EPA now proposes to eliminate this option based on a self-fulfilling prophecy: Now that EPA is forcing manufacturers to abandon ICE technology, "EPA believes it is not likely that manufacturers would invest resources on off-cycle technology in the future for their ICE vehicle fleet that is likely to become a smaller part of their overall vehicle mix over the next several years… manufacturers would be recouping any investment in off-cycle technologies, with relatively small emission reductions, over a decreasing number of vehicles as ICE vehicle production declines."350 [EPA-HQ-OAR-2022-0829-0707, pp. 64-65]

349 40 CFR 86.1869-12.

350 Proposed Rule at 29250.

It is true that manufacturers will not use this option to reduce GHG emissions from ICE vehicles if EPA takes it away. This statement belies EPA's disclaimers in the introductory passages of the preamble denying that EPA seeks to force transition of the domestic fleet to EVs. If EPA is correct that OEMs will not invest in further innovation to improve GHG emission performance of ICE vehicles, then what harm is there in leaving this option available? The rationale that "off-cycle applications take time for us to review" is both weak and nonsensical – if OEMs in fact do not apply for off-cycle credits, then no EPA resources will be needed to review their applications. EPA's proposal to eliminate this option for EVs on the basis that the program was intended to encourage reductions in CO2 emissions for ICE that have tailpipe emissions makes sense. But the only logical reason for removing this option from the rule for the ICE vehicles for which it was intended – and for which it has been successful – is because EPA is afraid that OEMs will use this option to reduce their ICE vehicles' GHG emissions instead of discontinuing them in favor of EVs. [EPA-HQ-OAR-2022-0829-0707, pp. 64-65]

Therefore, to the extent the purpose of the proposed rules is to reduce GHG emissions from the transportation fleet, EPA should retain the off-cycle credits program, at least for the ICE vehicles for which this was intended. Moreover, EPA should consider expanding the program to provide for recognition of lifecycle emissions reductions based on use of fuel-related measures such as low-carbon renewable fuels and carbon sequestration. In much the same manner as EPA has suggested EV manufacturers could generate “e-RINS” on the basis of entering contractual agreements with biogas suppliers, EPA should consider expanding the off-cycle credit calculation methodology to allow OEMs to realize credits for GHG reductions on the basis of agreements with fuel producers to reduce the carbon intensity of fuels. Such a measure would be consistent with EPA’s GHG reduction goals as well as with Congressional mandates under the Renewable Fuel Standard and with Congressional support for carbon sequestration under the Bipartisan Infrastructure Law. [EPA-HQ-OAR-2022-0829-0707, pp. 64-65]

Organization: Volkswagen Group of America, Inc.

Off-Cycle Credit Program

EPA is proposing to sunset the off-cycle credit program fully by MY 2031. [EPA-HQ-OAR-2022-0829-0669, p. 5]

Volkswagen has invested in off-cycle technologies. The EPA had recognized the value of off-cycle technologies recently by increasing the cap from 10 g/mi to 15 g/mi. This NPRM now abruptly reverses this previous indication of the importance of developing innovative energy saving technologies. Volkswagen advocates for keeping the off- cycle credit program and its cap of 15 g/mi. If the EPA’s intent is to simplify the methodologies to approve new technologies, EPA should consider adding previously proven technologies to the off-cycle credit menu and adjusting the caps as appropriate for the additional technologies. [EPA-HQ-OAR-2022-0829-0669, p. 5]

Organization: Volvo Car Corporation (VCC)

VCC believes it is important to continue flexibilities (air conditioning credits for ZEVs and off- cycle credits for ICE vehicles) because low AC emissions and AC efficiency are environmental improvements. EPA should continue these programs and develop a new process so that pure ZEV companies receive these credits without resulting in an overall negative C02 result. [EPA-HQ-OAR-2022-0829-0624, p. 4]

Organization: Zero Emission Transportation Association (ZETA)

The following comments relate to the proposed changes to credit generation:

- ZETA supports the phaseout of off cycle credit generation by MY 2031. While a useful policy tool to promote marginal technological improvements to vehicle efficiency, the urgency in needing to reduce emissions from LMDVs warrants removing such programs that enable more tailpipe emissions. We believe the urgent need to reduce GHG emissions and prevent the worst effects of climate change warrants EPA accelerating the timeline to end offcycle credit generation by MY 2027. [EPA-HQ-OAR-2022-0829-0638, p. 29]

EPA Summary and Response

Off-cycle menu credits - general:

Summary:

The following organizations and companies recommend retaining existing off-cycle credits through at least MY 2030 or MY 2032, with some suggesting a phase-out starting in MY 2031 or MY 2033.

Alliance for Automotive Innovation (AAI), American Honda Motor Co., Inc (Honda), Dana Incorporated, DENSO Corporation, Ford Motor Company, Hyundai America Technical Center, Inc. (HATCI), Hyundai Motor America (HMA), International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW), Kia Corporation, MECA Clean Mobility, MEMA (The Vehicle Suppliers Associated), MEMA (The Vehicle Suppliers Associated), Mitsubishi Motors North America, Inc. (MMNA), Mitsubishi Motors North America, Inc. (MMNA), National Automobile Dealers Association (NADA), Nissan North America, Inc, Stellantis, Toyota Motor North America, Inc., Valero Energy Corporation, Volkswagen Group of America, Inc., and Volvo Car Corporation (VCC)

- **AAI**: AAI recommends that EPA maintain menu-based off-cycle credits and continue off-cycle credits for both ICE vehicles and BEVs. AAI suggested that off-cycle credits should not phaseout before MY 2032, at which time they project that at least 30% ICEVs will continue to be sold in the fleet.
- **BMW** proposes that rather than phase-out the off-cycle menu cap from 10 g/mile in MY 2027 to 0 g/mile in 2031, EPA should maintain a 10 g/mile cap which applies only to the ICE vehicle portion of the fleet (including PHEVs).
- **Dana** supports continuing an off-cycle technology credit program based on the success of this program in encouraging the adoption of new technologies.
- **DENSO** supports the continuation of the off-cycle technology credit program at its full value through at least MY 2032.
- **Ford**: Ford encourages EPA to consider continuing targeted off-cycle credits for both ICE and EV technologies. If EPA discontinues certain off-cycle credits, the agency should phase them out over time, much like the phase-out proposal for the menu- based credits.
- **HATCI:** recommends that the off-cycle cap should remain at its current level (15 g/mile) or should be phased out at a slower rate.

  HMA: HMA agrees that a phase- out will eventually be appropriate but urges the EPA to retain existing off-cycle credits through at least MY 2030. They would support a phasedown of off-cycle credits for both ICE and PEVs beginning at 80% in MY 2031 and 60% in MY 2032.
- **Honda**: Honda requests that the agency continue the existing off-cycle program at least throughout MY 2032 and additionally requests EPA provide sufficient transparency that its inclusion is not offset by a corresponding stringency increase.

- **UAW**: Any adjustments to the regulatory credit system should prioritize promoting advanced technology production domestically and recognizing the economic, social, and environmental benefits of a resilient domestic supply chain.
- **Kia**: Kia opposes EPA's proposal to phase out and eventually eliminate off-cycle technology credits by MY 2031. While Kia agrees that a phase-out of off-cycle credits will eventually be appropriate, they urge the EPA to retain existing off-cycle menu-based credits through at least 2032. Kia made investments in these technologies and would appreciate the opportunity to earn a return on investment (ROI). EPA's proposed immediate phase down in MY2027 will hurt their ROI, stranding investments and potentially foregoing potential emissions benefits. Kia recommends off-cycle credits be continued and any eventual phasedown should be much slower than proposed.
- **MECA**: Off-cycle credits provide real-world emission benefits and should continue to be offered.
- **MEMA**: MEMA recommends EPA maintain off-cycle credits at full value through 2032 for all vehicle types, including ZEV, and consider additional ways emerging technologies that reduce ZEV energy consumption can be rewarded.
- **MMNA**: Maintain the existing GHG program flexibilities, such as Off-Cycle technologies credits (including the alternative method to apply off-cycle credits) and allow previously approved technologies to continue receiving credits.
- **NADA**: NADA opposes EPA's proposals to sunset the off-cycle credits program
- **Nissan**: Nissan opposes phase-out of off-cycle credits and requests the off-cycle credit cap be maintained at 15 g/mile.
- **Stellantis**: Stellantis recommends that EPA retain the credit for off-cycle GHG technologies that will continue to reduce real-world GHG emissions on ICE and EV product without artificially ramping down credit prematurely. The ongoing and already incurred investment and costs of GHG saving off-cycle technologies in the fleet have led to real world benefits.
- **Toyota**: Off-cycle credits encourage the continued use of these technologies with commensurate benefits to consumers, the environment and further innovation. Toyota has invested billions of dollars in off-cycle technologies which have saved over approximately 100 million tons of CO_2 emissions from our products.
- **Valero**: Valero recommends that EPA retain the off-cycle credits program, at least for the ICE vehicles for which this was intended. Moreover, EPA should consider expanding the program to provide for recognition of lifecycle emissions reductions based on use of fuel-related measures such as low-carbon renewable fuels and carbon sequestration.
- **Volkswagen:** Volkswagen has invested in off-cycle technologies, and advocates for keeping the off- cycle credit program and its cap of 15 g/mile. If the EPA's intent is to simplify the methodologies to approve new technologies, EPA should consider adding previously proven technologies to the off-cycle credit menu and adjusting the caps as appropriate for the additional technologies.

- **VCC:** VCC believes it is important to continue flexibilities (air conditioning credits for ZEVs and off- cycle credits for ICE vehicles) because low AC emissions and AC efficiency are environmental improvements.

The following organizations and companies support removing off-cycle credits on an accelerated timeline ending with 0 g/mile prior to MY 2031, with some organizations and companies recommending an earlier phase-out of off-cycle credits.

California Air Resources Board (CARB), California Attorney General's Office, et al., Environmental. and Public Health Organizations, International Council on Clean Transportation (ICCT), Lucid Group, Inc., Minnesota Pollution Control Agency (MPCA), National Association of Clean Air Agencies (NACAA), Northeast States for Coordinated Air Use Management (NESCAUM) and the Ozone Transport Commission (OTC), Rivian Automotive, LLC, Southern Environmental Law Center (SELC), Tesla, Inc., and Zero Emission Transportation Association (ZETA)

- **CARB** supports U.S. EPA's proposal to phase out the off-cycle program. New vehicles have lower GHG emissions and have incorporated technologies that target similar areas of emission reductions thereby reducing the opportunities for some of the off-cycle technologies, and therefore credit levels are becoming increasingly less representative of the actual emission reductions provided by the off-cycle technologies.

  CARB additionally submitted evidence the credit levels are less representative of the emission reductions provided by off-cycle technologies. Specifically, CARB assessed vehicles equipped with idle start-stop, finding that the total percentage of idle time with the engine off was 9.38 percent, which was significantly lower than the value used under the original assumptions of the TSD (87.75 percent).

- **California Attorney General's Office, et al.**: The States and Cities support EPA's Proposal to phase out off-cycle credits.

- **Environmental. and Public Health Organizations** strongly urge EPA not to renew any part of the off-cycle credit program after MY 2026. They state that the program will cause significant fleet emissions increases even though it no longer achieves any of its purposes. There is no reasonable basis for carrying any part of the program forward beyond 2026, and doing so would be arbitrary and capricious.

- **ICCT**: ICCT strongly supports EPA's proposal to phase out off-cycle credits given to automakers for technologies that are not captured in the test cycle and that previously were considered novel but now are fully commercialized. In particular, ICCT supports EPA's proposal to phaseout off-cycle credits by MY 2031. Evidence suggests that the menu credit values of these technologies (such as solar and thermal load control) overestimate the real-world impact of these technologies.

- **Lucid** urges the agency to eliminate the off-cycle program as proposed, or on an accelerated timeline ending with 0g/mile prior to MY 2031, and to eliminate the 5-cycle and public process pathways starting in MY 2027.

- **MPCA:** The MPCA agrees with EPA's proposal to phase out off-cycle credits. While useful to encourage manufacturers to invest in improved technology in earlier phases of

EPA's greenhouse gas vehicle emissions standards, they no longer provide substantive benefit, and it is appropriate to sunset these programs.

- **NACAA:** NACAA supports the agency's proposal to phase out, between 2027 and 2030, the off-cycle credit program for LDVs and MDVs.
- **NESCAUM:** supports EPA's proposal to sunset the off-cycle credits program for both LDVs and MDVs and suggest EPA consider whether shorter timeframes are appropriate.
- **Rivian** welcomes the proposal to phase out the off-cycle program but encourages EPA to end off-cycle crediting for all vehicles in MY 2027—both ICEs and BEVs. Rivian believes that evidence supports an end to off-cycle crediting for all vehicles in MY 2027. Further, Rivian encourages the agency to pursue and maintain parity between BEVs and ICEs in the elimination of all off-cycle credits.
- **SELC**: supports EPA's proposal to phase out off-cycle credits. It is often difficult to verify that off-cycle technologies provide the emissions reductions claimed, and this becomes more of a concern as vehicles become less polluting overall.
- **Tesla**: Tesla recommends eliminating off-cycle crediting for all types of vehicles starting in Model Year 2027.
- **ZETA**: ZETA supports the phaseout of off cycle credit generation by MY 2031. While a useful policy tool to promote marginal technological improvements to vehicle efficiency, the urgency in needing to reduce emissions from LMDVs warrants removing such programs that enable more tailpipe emissions.

Response:

EPA has considered the wide range of comments on off-cycle credits. After further considering the off-cycle credits program in the context of our final light-duty GHG standards, EPA agrees with the auto industry commenters who raised the concern that the proposed phase-down of the off-cycle credits would contribute to a challenging transition in meeting the standards especially in the early years of the program. We also understand the auto manufacturers points that they have invested in off-cycle technologies and these credits represent an additional option to reduce CO2 emissions under the standards for the early years of the program.

At the same time, EPA also agrees with commenters who raised concerns that the off-cycle credit values may be too generous, especially for vehicles in the MY 2032 and later time frame when the standards are the lowest CO_2 grams per mile level. In recognition of both of these concerns, EPA is finalizing an extension of the phase-out of the off-cycle credits menu cap, as follows (and further described in preamble Section III.C.6). EPA is finalizing a phase-out of menu credits over the MY 2030-2033 timeframe as a reasonable way to bring the program to an end. After considering the public comments, EPA is extending the phase-out of off-cycle menu credits, compared to our proposal, to provide a longer transition period. EPA believes the slower phase-out schedule will provide additional pathways for reducing CO_2 emissions for manufacturers who have made substantial use off cycle credits in their product planning. The extended phase-out schedule also will address lead time in the early years of the program. We believe this phase-out schedule is an appropriate way to address concerns that the off-cycle credits may not be reflective of the real-world emissions impact of the off-cycle technologies, by scaling back the menu cap in MYs 2031-2032, and eliminating off-cycle credits altogether in MY 2033 and beyond. Specifically, instead of the proposed menu cap phase-out of 10/8/6/3/0 g/mile in MYs 2027-2031, EPA is finalizing provisions that retain the 10 g/mile menu cap through MY 2030, with a phase-out of 8/6/0 g/mile in MYs 2031-2033. The final phase-out of the menu cap is shown in the following Table:

Off-cycle menu credit cap phase down, final program, expressed in CO_2 g/mile

MY	Off-cycle Menu Credit Cap
2027	10.0
2028	10.0
2029	10.0
2030	10.0
2031	8.0
2032	6.0
2033 and later	0.0

5-cycle and public process pathway off-cycle credits:

<u>Summary:</u>

The following organizations and companies recommend retaining the existing 5-cycle and public process pathway methodologies:

Alliance for Automotive Innovation (AAI), BMW of North America, LLC (BMW NA), DENSO, Hyundai America Technical Center, Inc. (HATCI), Hyundai Motor America (HMG), Kia, MECA Clean Mobility, Mitsubishi Motors North America, Inc. (MMNA), and Toyota.

- **AAI**: AAI recommends that EPA retain the 5-cycle method for the same period of time as the menu-based credits. For vehicles that have 5-cycle and alternative method off-cycle credits approved prior to MY 2027 that remain in production in MY 2027 and later, Auto Innovators recommends that off-cycle credit continue to be granted (i.e., carry-over). If this is EPA's intent (or final decision), clarifying text should be added to the regulation. Alternatively, EPA should consider adding previously approved technologies to the off-cycle credit menu and adjusting the caps as appropriate for the additional technologies. Furthermore, AAI recommends that EPA should follow through under the current regulation and complete action on all submitted applications for alternative method credits.

- **BMW** suggests that EPA continue to allow credits for those vehicles with alternative pathway credits approved prior to MY 2027.

- **DENSO** urges EPA to follow through to complete action on all submitted applications for 5-cycle and alternative pathway applications. Denso also suggests that EPA consider adding previously approved technologies to the off- cycle credit menu and adjusting the caps as appropriate for the additional technologies.

- **HATCI**: HATCI opposes the proposal to eliminate the 5-cycle and the alternative credit pathways by MY 2027 and believes the non-menu pathways offer valuable GHG reductions. Without the credit incentives for innovative GHG technologies, manufacturers may be less inclined to develop and invest in off-cycle credits (OCC) technologies, leading to increased ICE emissions, particularly in the early stages of consumer ZEV adoption when ICE vehicles are still dominant.

If EPA decides to eliminate the 5-cycle and alternative credit pathways, HATCI suggests all credits approved through these pathways prior to the start of the new rule be transferred to the menu from MY 2027 and the menu cap be adjusted accordingly. Furthermore, EPA should review and approve/reject all pending alternative pathway applications by June 1, 2025, and from MY 2027 move those technologies and the corresponding credit values to the menu.

- **Kia**: Kia recommends that EPA keep the 5-cycle and alternative method process off-cycle pathways through MY 2032. If EPA does eliminate the 5-cycle and alternative method process off-cycle pathways starting in MY 2027, they further recommend that EPA (a) follow through under the current regulation and complete action on all submitted applications, no later than June 1, 2025, (b) add technologies approved through the 5-cycle and alternative off-cycle pathways to the off-cycle credit menu, and (c) if an automaker has off-cycle credits approved through the alternative or 5-cycle method prior to MY 2027 and that vehicle remains in production after MY 2027, the credit continues to be granted.

- **MECA**: MECA understands EPA's rationale in its decision to simplify and eliminate the off-cycle credit process by removing the 5-cycle pathway and phasing out the credits, but requests that the agency retain the five-cycle pathway.

- **MMNA**: Maintain the existing GHG program flexibilities, such as Off-Cycle technologies credits (including the alternative method to apply off-cycle credits).

- **Toyota**: Toyota recommends that all previously approved 5-cycle and alternative method credits be added to the menu, and that the cap be increased.

The following organizations and companies recommend eliminating the existing 5-cycle and public process pathways starting in MY 2027.:

California Air Resources Board (CARB) and Environmental. and Public Health Organizations.

- **CARB**: CARB supports U.S. EPA's proposal to eliminate the 5-cycle and public process pathways for OEMs to obtain off-cycle credits starting in the 2027 MY.

- **Environmental. and Public Health Organizations**: EPA points out that since 2021, the 5-cycle process has led to no new credits, and only one manufacturer has used it since 2012. As to the notice-and-comment pathway, EPA states that it has resulted in the award of only a few small credits since 2021. We agree that these programs should not be renewed.

Response

EPA disagrees with commenters who suggested that we should retain the additional two pathways to generate off-cycle credits (i.e., the 5-cycle and public process pathways). In EPA's experience in implementing the off-cycle credits program, there have been few 5-cycle credit demonstrations, and the public process pathway has been challenging due to the complexity of demonstrating real-world emissions reductions for technologies not listed on the menu. The public process pathway was used successfully by several manufacturers for high efficiency alternators, resulting in EPA adding this technology to the off-cycle menu in a prior rulemaking, beginning in MY 2021. The public process pathway program has resulted in a number of concepts for potential off-cycle technologies over the years, but few have been implemented, at least partly due to the difficulty in demonstrating the quantifiable real-world emissions reductions associated with using the technology. Many credits sought by manufacturers have been relatively small (less than 1 g/mile). Manufacturers have commented that the process takes too long, but the length of time is often associated with the need for additional data and information or issues regarding whether a technology is eligible for credits. Therefore, EPA is finalizing its proposal to eliminate the 5-cycle and the public process pathways for off-cycle credits beginning in MY 2027.

With regard to comments that EPA should add to the off-cycle credits menu all previously approved 5-cycle and public process pathway credits with an associated increase in the cap, EPA disagrees. Likewise, EPA disagrees that further action on other submitted applications is warranted. The few credits that have been approved under the 5-cycle and public process pathways have been specific to individual vehicle models and EPA does not have sufficient data on the real-world emissions impact of these technologies across a wide range of vehicle segments which would be necessary to assess an appropriate menu credit for these technologies. Further, EPA notes that commenters did not provide such data.

Applicability to BEV and PHEVs:

Summary:

The following companies and organizations recommend the full availability of off-cycle credits be retained for BEVs and/or PHEVs:

Alliance for Automotive Innovation (AAI), Betsy Cooper, Dana Incorporated, DENSO, Ford, Hyundai America Technical Center, Inc. (HATCI), MEMA (The Vehicle Suppliers Associated), Porsche Cars North America (PCNA), Stellantis, and Toyota.

- **AAI**: Auto Innovators opposes EPA’s proposal to limit off-cycle credits to only ICE-equipped vehicles and believes that off-cycle credits should not be adjusted for PHEVs to address electric vs. ICE operation. For BEVs, AAI further recommends that negative emissions of individual BEV electric vehicle should be handled at the fleet average level rather than the individual model. For PHEVs, AAI questions whether making adjustments in emissions using the vehicle’s utility factor is worth the complexity added for regulated stakeholders, EPA compliance staff, and EPA staff preparing public reports to describe the use of such provisions.

  AAI also notes that the proposed regulatory text does not properly describe the procedure for applying the adjustment for PHEVs.

- **Betsy Cooper**: The EPA should give full off-cycle credit to PHEVs with adequate range, particularly to incentivize car manufacturers to develop longer range PHEVs.

- **Dana** recommends EPA continue to offer off-cycle credits for BEVS, PHEVS, FEVs, and other ZEVs. Such off-cycle technologies could help reduce battery use and therefore lower the amount of electricity used to power ZEVs.

- **DENSO** requests EPA to reconsider its proposal to eliminate off- cycle credits for electrified vehicles. Off-cycle credits for technologies applied across all powertrain types encourage their continued use with commensurate benefits to consumers and the environment.

- **Ford**: Ford encourages EPA to consider continuing targeted off- cycle credits for both ICE and EV technologies.

- **HATCI:** HATCI recommends that ZEVs remain a part of the OCC program. Although ZEVs have no tailpipe emissions, if an off cycle technology improves electrical energy efficiency of the EV, that technology is providing a reduction in overall emissions.

- **HMA**: Retaining existing off-cycle credits for BEVs through MY 2030 allows time for industry to make gains in BEV technology, such as efficiency and price. In this way, off-cycle credit opportunities will serve as a bridge to support compliance during this time.

- **MEMA**: MEMA recommends EPA maintain off-cycle credits at full value through 2032 for all vehicle types, including ZEV, and consider additional ways emerging technologies that reduce ZEV energy consumption can be rewarded.

- **PCNA**: Porsche supports the continued allowance for electric vehicles to participate in the off-cycle program and does not support the proposal from EPA to remove electric vehicles beginning in model year 2027. Porsche recognizes that the current menu-based credit system may not be appropriate for electric vehicles. As such, Porsche thinks it would be reasonable for manufacturers to continue to be able to leverage the application type pathway to seek off-cycle credits for EVs on a case-by-case basis.

- **Stellantis**: EPA should retain credit for off-cycle GHG technologies that will continue to reduce real-world GHG emissions on both ICE and EV products.

- **Toyota**: Toyota recommends that BEVs and PHEVs be eligible for the off-cycle program, as the efficiency of these vehicles can be improved through off-cycle technologies (e.g. solar panels and solar thermal control technologies that improve efficiency and range).

The following companies and organizations recommend eliminating off-cycle credits for BEVs and/or and PHEVs:

California Air Resources Board (CARB), Consumer Reports (CR), International Council on Clean Transportation (ICCT), Rivian, Southern Environmental Law Center (SELC), and Tesla.

- **CARB**: CARB believes scaling the off-cycle credit cap for PHEVs by the vehicle’s assigned utility factor is an appropriate approach.

- **CR** supports EPA eliminating credits for EVs that could allow vehicles to achieve compliance values below 0 g/mile, as they are not appropriate.

- **Environmental. and Public Health Organizations** concur with EPA’s determination that off-cycle credits are inappropriate for BEVs for each of the reasons EPA states. They also concur with EPA that providing off-cycle credits for PHEVs exceeding their utility factor is inappropriate.

- **ICCT:** ICCT supports EPA's proposal to limit off-cycle credits to ICE vehicles. Off-cycle credits are based on reduced tailpipe emissions from ICE vehicles, they are not applicable to BEVs. Relatedly, ICCT supports the proposal to scale PHEV OC credits by the (newly proposed) utility factor.
- **Rivian** recommends EPA maintain parity between BEVs and ICEs in the elimination of all off-cycle credits.
- **Southern Environmental Law Center (SELC)**: SELC supports EPA's proposal to modify the off-cycle credit system to only include eligible vehicles (i.e., internal combustion engine vehicles) in calculating the cap used for these types of credits until they are phased out.
- **Tesla**: Eliminate off-cycle crediting for all types of vehicles starting in MY 2027.

Response

EPA agrees with commenters who suggested that off-cycle credits should not apply to BEVs. EPA is finalizing its proposal to limit eligibility of off-cycle credits to vehicles equipped with an IC engine beginning in MY 2027; thus, BEVs will no longer be eligible for off-cycle credits beginning in MY 2027. In response to automaker and automotive supplier comments that off-cycle credits should continue to apply to BEVs, EPA disagrees. The off-cycle menu credits were established based on potential emissions reductions from ICE vehicles and are not representative of emissions reductions from BEVs. Further, EPA notes that it is concluding in this rule that it is appropriate and consistent with the CAA to determine compliance with emissions standards adopted under section 202 by reference to emissions from vehicles and engines. For these reasons, we are also finalizing our proposal that manufacturers use a zero g/mile tailpipe emissions compliance value for BEVs, as discussed in preamble Section III.C.7 and Section 3.1.5 of this RTC. Since off-cycle credits for BEVs do not reflect reductions in emissions from the vehicles, we believe it is appropriate to end off-cycle credits for BEVs beginning in MYs 2027.

With regard to comments regarding the application of off-cycle credits to PHEVs, EPA is, for similar reasons, finalizing its proposal to restrict the applicability of off-cycle credits for PHEVs to the portion of vehicle operation when the engine is running, based on the vehicle's utility factor. This calculation adjustment is appropriate to associate off-cycle credits only with ICE operation beginning in MY 2027. See preamble Section III.C.6. The final rule includes a corrected approach for applying the adjustment for PHEVs. Rather than applying the adjustment to the maximum credit value that applies for a manufacturer's fleet, the final rule includes a per-vehicle adjustment to reduce off-cycle credit quantities based on a PHEV's utility factor.

In addition, one commenter (Betsy Cooper) suggested that PHEVs should have a 50+ mile PHEV range to qualify for full off-cycle credit. In response, EPA does not specify a PHEV range requirement to qualify for any applicable off-cycle credits. Off-cycle credits for PHEVs would be calculated as described in the paragraph above. However, we note that our finalized PHEV utility factor curve (Section III.C.8 of the preamble) provides a natural incentive for more capable PHEVs, with continuously higher utility factor values for vehicles with greater range, which reflects that such vehicles can be expected to be driven greater distances in charge depleting mode.

Comments on regulatory text:

Summary:

Alliance for Automotive Innovation (AAI) made the following comments:

We oppose EPA's proposal to exclude ZEVs from off-cycle credits. However, if EPA decides to finalize that proposal, we note that EPA has not proposed regulatory text that would exclude zero-emission vehicles in MYs 2027 and later from the assessment of whether a credit cap has been exceeded as described in the preamble.

Also, the proposed paragraphs (b)(2)(iii) and (b)(2)(iv) discuss comparing a calculated value from (b)(2)(ii) to a given value in (b)(2)(v). However, the value derived in (b)(2)(ii) is in megagrams, and the values in (b)(2)(v) are in grams per mile. We would agree that a conversion can be calculated, but the text should be modified such that any comparison is made in consistent units without the need to rely on otherwise undefined calculations.

Response

In response to the comment that EPA did not propose regulatory text to exclude zero emission vehicles in MY 2027 and later, EPA notes that the proposed rule at 40 CFR 86.1869-12 included the following statement in the introductory text: "Manufacturers may no longer generate credits under this section starting in model year 2027 for vehicles deemed to have zero tailpipe emissions and in model year 2031 for all other vehicles." For the final rule, we are delaying the final implementation date from 2031 to 2033, and thus have updated this regulatory text, but we are finalizing as proposed the phase-out of off-cycle credits for electric vehicles in MY 2027.

In response to AAI's comment on the regulatory text, 40 CFR 86.1869-12(b)(2)(iii) and (iv) give an instruction to compare g/mile values between paragraphs (b)(2)(i) and (v), without reference to the megagram value in (b)(2)(ii). The instruction further explains that the megagram cap in (b)(2)(ii) applies if the calculated g/mile fleet value exceeds the maximum allowable credit value in g/mile. There is no conversion.

3.1.5 - 0 g/mi tailpipe emissions for ZEVs

Comments by Organizations

Organization: Alliance for Automotive Innovation

F. Treatment of PEVs and FCEVs in the GHG Fleet Average

1. ZEV Emissions

The Proposed Rule continues EPA's practice of assigning a compliance value of zero grams per mile of carbon-related exhaust emissions for BEVs and fuel cell electric vehicles, as well for the electric portion of PHEVs, and makes this approach—which was originally scheduled to expire in MY 2026—permanent.224 Auto Innovators reaffirms its support for basing compliance only on tailpipe emissions, rather than considering upstream emissions. [EPA-HQ-OAR-2022-0829-0701, pp. 123-124]

224 See NPRM at 29252.

This approach is required by statute. Section 202(a) authorizes EPA to regulate the "emission of any air pollutant from any class or classes of new motor vehicles."225 By definition, "upstream emissions" from electricity-generating units do not originate "from" a class of vehicles. Such upstream air pollutants thus cannot be included in emission standards. Nor does section 202 permit EPA to impose any regulations on upstream emissions. [EPA-HQ-OAR-2022-0829-0701, pp. 123-124]

225 42 U.S.C. §7521(a).

The recognition of zero tailpipe emissions from operation on electricity is also consistent with the treatment of vehicle operation on all other fuels—emissions are measured at the tailpipe no mater what fuel the vehicle is operating on, and upstream emissions are addressed at their upstream sources. EPA has been regulating motor-vehicle emissions under section 202(a) since 1975, and in that time, has never included in its compliance standards any emissions occurring during the production or transport of liquid fuels. Electricity should be treated no differently than gasoline, ethanol, natural gas, or other fuels used in motor vehicles. We continue to support EPA's approach in this regard. [EPA-HQ-OAR-2022-0829-0701, pp. 123-124]

To be clear, the fact that EPA cannot—and should not—include upstream emissions in its vehicle compliance calculations does not mean that the Agency cannot or should not consider upstream emissions when evaluating the costs and benefits of the Proposed Rule more generally. Indeed, consideration of upstream emissions and power generation effects is a crucial part of determining whether the Proposed Rule is technologically feasible, reasonable, and supported by the record evidence. As an "important aspect[s] of the problem,"226 EPA must consider these issues to ensure that any final rule does not run afoul of the reasoned decision- making standard. And indeed, EPA itself recognizes that it is appropriate to consider upstream emissions impacts as a general mater.227 It is also common practice as a general mater for EPA to consider the effects of a regulatory action even for topics that EPA cannot regulate via the proposed action.228 The situation is no different here. [EPA-HQ-OAR-2022-0829-0701, pp. 123-124]

226 Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983).

227 See, e.g., NPRM at 29252, 29298, 29303-07, 29353-58, 29379-82.

228 As just one example, EPA regularly considers air quality-related impacts of its Steam Electric Power Generating Effluent Guidelines issued under the Clean Water Act, even though EPA cannot directly regulate air quality under that program. See, e.g., Supplemental Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category, 88 Fed. Reg. 18824, 18874-76 (Mar. 29, 2023).

Organization: Alliance for Vehicle Efficiency (AVE)

AVE requests that EPA account for upstream emissions for all technologies. [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

AVE urges EPA to include upstream emissions in ZEV calculations. The decision to omit this from compliance calculations contradicts earlier assertions by the Agency and undermines efforts by the automotive sector to plan appropriately. [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

In 2010, EPA saw the need to limit the zero grams/mile accounting for BEVs. The Agency not only foresaw the need to limit doing so in the future, but also capped the number of vehicles for which each manufacturer could obtain a 0/grams/mile credit.11 EPA also noted that although regulatory programs existed to account for upstream emissions with the production and distribution of fuels, [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

11 Federal Register / Vol. 75, No. 88 / Friday, May 7, 2010 / at 25341

"[a]t this time, however, there is no such comprehensive program addressing upstream emissions of GHGs, and the upstream GHG emissions associated with production and distribution of electricity are higher than the corresponding upstream GHG emissions of gasoline or other petroleum based fuels."12 [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

12 Ibid.

EPA went on to promise that "EPA will reassess the issue of how to address EVs, PHEVs, and fuel cell electric vehicles (FCVs) in rulemakings for model years 2017 and beyond, based on the status of advanced vehicle technology commercialization, the status of upstream GHG control programs, and other relevant factors."13 [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

13 Ibid.

In 2012, EPA reasserted a compliance value of 0 g/mile designation for EVs, FCVs, PHEVs and extended the sales caps on manufacturers. Similarly, in 2010, EPA again saw the need to address upstream emissions in the future for all these vehicles, but only for the sales that exceeded the maximum sales caps. [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

"Starting with MY 2022, the compliance value for EVs, FCVs, and the electric portion of PHEVs in excess of individual automaker cumulative production caps must be based on net upstream accounting.14 [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

14 Federal Register / Vol. 77, No. 199 / Monday, October 15, 2012 / at 62651

Despite acknowledging the need to account for the upstream emissions, EPA has never incorporated upstream emissions from electricity generation as a compliance factor for these vehicles. Now, with little explanation, EPA is proposing to ignore upstream emissions for BEVs in perpetuity. [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

"EPA is also proposing that the requirement for upstream emissions accounting for BEVs and PHEVs as part of a manufacturer's compliance calculation, which under the current regulations would begin in MY 2027, would be removed under the proposed program; thus, BEVs would continue to be counted as zero grams/mile in a manufacturer's compliance calculation as has been the case since the beginning of the light-duty GHG program in MY 2012."15 [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

15 Federal Register / Vol. 88, No. 87 / Friday, May 5, 2023 / at 29197

Congress has repeatedly seen the need to employ lifecycle assessments for future compliance standards and has asked EPA to look beyond a vehicle's tailpipe when analyzing GHG emissions. [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

"Vehicle Emissions Lifecycle Analysis. -- The Committee encourages the Agency to build upon its efforts to develop standardized modeling to evaluate the full lifecycle of all vehicle technologies and transportation fuels by integrating full lifecycle analysis accounting into new vehicle standards aimed at reducing greenhouse gas emissions. The Agency is also encouraged to coordinate with other federal agencies that are conducting similar lifecycle models for vehicles to best understand the full impact of standards seeking to reduce greenhouse gas emissions." 16 [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

16 H. Rept. 117-400 - Department Of The Interior, Environment, & Related Agencies Appropriations Bill, 2023 at P.86

Continuing to focus solely on tailpipe emissions for future standards also disregards President Biden's January 25, 2021, Executive Order, in which he stressed the need for environmental standards to account for all GHG. [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

"Sec. 5. Accounting for the Benefits of Reducing Climate Pollution. (a) It is essential that agencies capture the full costs of greenhouse gas emissions as accurately as possible, including by taking global damages into account. Doing so facilitates sound decision- making, recognizes the breadth of climate impacts, and supports the international leadership of the United States on climate issues." 17 [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

17 7040 Federal Register / Vol. 86, No. 14 / Monday, January 25, 2021 / Presidential Documents

Accounting for upstream emissions is consistent with our environmental goals, technology neutrality, and global carbon neutrality goals. More importantly, by including upstream emissions for compliance purposes, EPA will avoid unintentionally promoting inefficiencies with ZEVs. Counting upstream emissions will promote cleaner and more efficient components for all vehicle technologies. [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

ZEVs will continue to require efficiency improvements away from the tailpipe that reduce CO2 production and energy intensity. If BEVs do indeed become the predominant vehicle technology on U.S. roads, even small efficiency gains could have a large impact. [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

We support a transition from a tailpipe-based standard to a more complete life-cycle assessment. This approach is consistent with technology neutrality and will allow the U.S. to truly reach its environmental goals by promoting cleaner and more efficient technologies. [EPA-HQ-OAR-2022-0829-0631, pp. 4-6]

AVE requests that EPA finalize a rule that is genuinely technology neutral. [EPA-HQ-OAR-2022-0829-0631, p. 6]

The Proposal sets out to incentivize specific technologies, including BEVs and FCVs. AVE supports the development of these important technologies and all relevant technologies to address the urgent need to decarbonize the transportation sector. An incentive for one technology can disincentivize other technologies and stifle innovation. [EPA-HQ-OAR-2022-0829-0631, p. 6]

An example of the unintended consequences of earlier incentives is that they led to the upsizing of the U.S. fleet and saw the manufacturing of vehicles with larger footprints. Prior to 2010, passenger car sales were above or close to 50% of all vehicle sales. Today, passenger cars are less than 25% of all new sales. Clearly, this was not the intent of EPA and NHTSA when they set standards in 2012. [EPA-HQ-OAR-2022-0829-0631, p. 6]

The environmental group American Council for an Energy-Efficient Economy recently echoed this obvious concern: [EPA-HQ-OAR-2022-0829-0631, p. 6]

The Environmental Protection Agency should explore ways to factor EV efficiency into fuel-efficiency and greenhouse gas standards, starting with accounting for EVs' upstream emissions. At the moment, regulators calculate the emissions from gasoline vehicles and set requirements for automakers, but EVs are counted as causing no CO2 emissions. This means the sale of an EV Hummer can offset the sale of a highly polluting gasoline vehicle and increase emissions overall. Accounting for upstream emissions would mean that the sale of a more efficient EV would be more advantageous for automakers to meet their regulatory requirements. All EVs do not have the same impact on the environment, and our vehicle regulations should reflect that.18 [EPA-HQ-OAR-2022-0829-0631, p. 6]

18 https://www.aceee.org/blog-post/2022/06/9000-pound-electric-hummer-shows-we-cant-ignore-efficiency-evs

Instead of crediting specific technologies, EPA should create a credit program that promotes cleaner and more efficient vehicles and the development of components that can reduce CO2 emissions in all vehicles. Such a strategy will encourage technology investments in ALL vehicle platforms that significantly reduce CO2. [EPA-HQ-OAR-2022-0829-0631, p. 6]

Suppliers have invested heavily in developing technologies that will significantly improve efficiency and lower the emissions of LD and MD vehicles; gasoline direct injection, cylinder deactivation, and advanced turbo charging are just a few of the technologies that can greatly reduce the emissions footprint of the U.S. fleet. [EPA-HQ-OAR-2022-0829-0631, p. 6]

These options, along with other technologies like mild hybrid systems, advanced aftertreatment, and emission control systems, could bring further significant improvements to internal combustion engines (ICE) vehicles if GHG regulations were more results driven. Without support for engine improvements, manufacturers are less likely to deploy these technologies in future ICE offerings. As a result, we will miss the opportunity to make sizable CO2 and criteria pollutant reductions today. [EPA-HQ-OAR-2022-0829-0631, p. 6]

Compliance pathways that incentivize increased use of renewable fuels, advanced emission control technologies, and new internal combustion platforms will lead to greater adoption of cost-effective technologies that are available today, not eight to ten-years from now. [EPA-HQ-OAR-2022-0829-0631, p. 6]

Organization: American Coalition for Ethanol (ACE)

What's more, EPA lacks the authority to ignore upstream emissions for BEVs. The Agency has authority under 42 U.S.C. § 7521(a)(1) to prescribe "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in its judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” If BEVs are not “vehicles” “which cause, or contribute to, air pollution,” then EPA may not set standards for them. If BEVs are “vehicles” “which cause, or contribute to, air pollution,” then EPA must account for those emissions, which in the case of BEVs come from upstream electricity generating units. [EPA-HQ-OAR-2022-0829-0613, p. 3]

Organization: American Council for an Energy-Efficient Economy (ACEEE)

EPA should implement upstream accounting to encourage BEV Efficiency

EPA proposes to continue, and make permanent, the treatment of electric vehicles as entirely zero emission vehicles (ZEVs)(FR 29252). While it is true that BEVs generate no emissions at the tailpipe, charging these vehicles does create emissions upstream. The major flaw with ignoring refueling emissions is that EPA loses the opportunity to influence the efficiency of a growing component of the vehicle market. EPA is both empowered and required to regulate the emissions from on-road light duty vehicles. Given that BEVs are expected to reach the majority of new sales within this decade,13 it is imperative we address their emissions. Using the rule to improve BEV efficiency will accomplish this. Upstream accounting in compliance is a simple and effective way to promote efficiency. It recognizes that different BEVs, by virtue of their wide range of efficiencies, are responsible for different levels of emissions from our still fossil fuel-based electricity grid. EPA’s GHG standards for LDVs have historically led to innovations in emissions reduction technology and design for ICEVs and the same should be true in an all-electric future. [EPA-HQ-OAR-2022-0829-0642, pp. 4-6]

13 https://www.whitehouse.gov/briefing-room/statements-releases/2021/08/05/fact-sheet-president-biden-announces-steps-to-drive-american-leadership-forward-on-clean-cars-and-trucks/

Our own analysis shows that even among BEVs of the same vehicle type and weight there can be considerable differences in efficiency and, therefore, upstream emissions, as shown in Figure 1.14 Not all BEVs are created equal and there is still plenty of room for innovation and emissions improvements in the BEV market. The fact that BEVs with curb weights of 5,000 pounds can have efficiencies varying from under 2.5 mi/kWh to over 4 mi/kWh demonstrates how important it is that these standards continue their historical role in advancing automotive innovation as we electrify. [EPA-HQ-OAR-2022-0829-0642, pp. 4-6]

14 https://www.aceee.org/blog-post/2023/04/boosting-ev-efficiency-would-cut-emissions-and-reduce-strain-grid

[See original for graph titled “Figure 1. Efficiency versus weight in model year 2023 BEVs”] [EPA-HQ-OAR-2022-0829-0642, pp. 4-6]

By our calculations, if upstream accounting, or another mechanism, led to a 3% annual growth in BEV efficiency over the life of the standards, lifetime emissions from MY 2027- 2032 vehicles would be reduced by over 170 million metric tons under both the proposed standards and Alternative 1. This does not include the benefits from vehicles sold from model year 2033 onwards that would take advantage of advancements in efficiency technologies and designs potentially spurred by this standard. [EPA-HQ-OAR-2022-0829-0642, pp. 4-6]

Greater BEV efficiency has a number of benefits beyond just reducing upstream emissions. Greater BEV efficiency can allow a vehicle to go the same distance with a smaller battery, effectively reducing the use of high-demand minerals and the emissions generated from vehicle production (the calculations discussed above do not account for these emissions reductions impacts from improved BEV efficiency). While BEVs are certainly still better from an emissions perspective than their equivalent ICEV when looking at the entire life-cycle, it is still important to reduce their environmental impact. Mineral supply and battery manufacturing capacity also have the potential to be limiting factors for rapid electrification, so reducing battery needs per vehicle by increasing efficiency can facilitate achievement of the MY 2027-2032 standards. [EPA-HQ-OAR-2022-0829-0642, pp. 4-6]

Greater BEV efficiency also means a smaller impact on our electricity grid and drivers' wallets, as less electricity is needed to drive the same distance.15 If all LDVs on the road were electric and had an average efficiency equivalent to the highest-efficiency vehicle on the market today, we could save enough electricity annually to power 21 million homes. Full on- road fleetwide electrification is not expected for decades so this improvement in BEV efficiency is feasible and could even be surpassed if incentivized by the standards.16 [EPA-HQ-OAR-2022-0829-0642, pp. 4-6]

15 https://www.aceee.org/blog-post/2022/09/evs-surge-utilities-need-transparent-equitable-comprehensive-plans-support-them

Organization: American Free Enterprise Chamber of Commerce (AmFree) et al.

EPA exacerbates that arbitrarily selective approach in the proposed rule's method for measuring compliance. EPA proposes to determine whether manufacturers' fleets meet the new standards based solely on their tailpipe emissions—disregarding the other downstream and all upstream emissions caused by producing and operating vehicles. EPA's proposal thus would skew producers' and purchasers' incentives toward electric vehicles even though they may increase emissions overall. [EPA-HQ-OAR-2022-0829-0683, p. 5]

Given those serious problems, EPA would not be justified in adopting the proposed rule even if it would substantially benefit the environment. But EPA has not even shown that the new standards would achieve that goal. In evaluating the proposed rule's impact on net emissions, EPA understates emissions from producing and powering electric vehicles ("upstream" emissions). It counts only emissions from producing electricity or fuel—failing to consider the substantially greater emissions incurred producing electric vehicles and their components compared to conventional vehicles—and improperly discounts the emissions it does consider. [EPA-HQ-OAR-2022-0829-0683, p. 5]

EPA's Analysis Of Net Emissions Is Flawed

EPA estimates that the proposed rule will result in a net reduction of GHG, criteria air pollutant, and air toxic emissions in 2055. See 88 Fed. Reg. at 29,198. That estimate is dubious. In numerous ways, EPA has underestimated the up- stream emissions—i.e., those that do not come from the vehicle itself but can still be attributed to its manufacture and operation—that will result from a widespread shift to electric vehicles. [EPA-HQ-OAR-2022-0829-0683, pp. 55-56]

First, EPA improperly cabins its upstream analysis to only those emissions caused by electricity generating units ("EGUs") and refineries. See 88 Fed. Reg. at 29,198, 29,347, 29,353, 29,355; Draft RIA at 9-32–33. But the emissions associated with powering a vehicle—whether by electricity from an EGU or fuel from a refinery—are far from the only ones reasonably attributed to its operation. Depending on the vehicle, there are also emissions associated with producing, recycling, and disposing of batteries; operating charging infrastructure; and extracting, refining, transporting, and storing petroleum fuels. These emissions can be substantial and, when considered together, may undermine EPA's assumption that swapping internal-combustion-engine vehicles for electric ones will necessarily result in an environmental good. [EPA-HQ-OAR-2022-0829-0683, pp. 55-56]

The International Energy Agency's discussion of emissions from mining illustrates this point. According to the IEA, "the production and processing of energy transition minerals are energy-intensive" and involve "relatively high emission[s]." Role of Critical Minerals at 15, 130; see also Charging Infrastructure Challenges for the U.S. Electric Vehicle Fleet, Am. Transp. Rsch. Inst., https://tinyurl.com/3ktjd85v ("Mining and processing produce considerable CO2 and pollution issues."). For this reason, producing an electric vehicle is a more carbon-intensive process than producing a conventional one. Role of Critical Minerals at 194. [EPA-HQ-OAR-2022-0829-0683, pp. 55-56]

EPA never explains why emissions from EGUs and refineries are the only ones relevant to the analysis. Instead, it acknowledges that "[t]he upstream emissions inventory does not account for all upstream sources related to vehicles, fuels, and electricity generation, such as charging infrastructure, storage of petroleum fuels, battery manufacture, etc." Draft RIA at 8-14. But EPA makes no attempt to justify that selective, incomplete approach. [EPA-HQ-OAR-2022-0829-0683, pp. 55-56]

Moreover, EPA's current position marks a change from settled agency practice. In earlier GHG and criteria-pollutant rulemakings, the agency did consider additional upstream sources in assessing net emissions. See SAFE Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks, 85 Fed. Reg. 24,174, 24,872 (Apr. 30, 2020) (noting that emissions "model accounts for upstream emissions" from "extraction, transportation, refining, and distribution of . . . fuel"); Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles, 76 Fed. Reg. 57,106, 57,301 (Sept. 15, 2011) ("To project these impacts, EPA estimated the impact of reduced petroleum volumes on the extraction and transportation of crude oil as well as the production and distribution of finished gasoline and diesel."); Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2, 81 Fed. Reg. 73,478, 73,852 (Oct. 25, 2016) ("To project these impacts, Method B estimated the impact of reduced petroleum volumes on the extraction and transportation of crude oil as well as the production and distribution of finished gasoline and diesel."). The agency has not acknowledged its change in position here, let alone explained "why the new approach" of ignoring these upstream emissions "better comports with . . . the provisions that Congress enacted." Am. Fed'n of Gov't Emps. v. FLRA, 25 F.4th 1, 12 (D.C. Cir. 2022). That is reason enough to conclude that "the [agency] has not, in fact, engaged in reasoned decision-making." Id. (internal quotation marks and brackets omitted). Nor could EPA offer a valid explanation for its change. Upstream emissions are more important in the current rulemaking than they were in previous regulations given that EPA, for the first time, intends to effectively mandate widespread adoption of electric vehicles, which (as explained above) produce emissions primarily through upstream sources. [EPA-HQ-OAR-2022-0829-0683, p. 56]

The Method For Measuring Compliance Is Irrational

Under existing rules, beginning in model year 2027, manufacturers are required to account for upstream emissions as part of their compliance calculation. See 88 Fed. Reg. at 29,197. But under the proposed rule, EPA has explicitly changed course and would "remove[]" that requirement—meaning that electric vehicles, rather than fairly reflecting their actual total emissions, would "be counted as zero grams/mile in a manufacturer's compliance calculation." Id. In other words, EPA proposes that vehicle compliance with the new standards be measured solely by the grams of pollutants emitted from the tailpipe. Id. To survive arbitrary-and-capricious review, EPA must provide a reasoned explanation for this change and show that there are "good reasons" for its new policy. Encino Motorcars, LLC v. Navarro, 579 U.S. 211, 221 (2016) (internal quotation marks omitted). The proposed rule does not do so. [EPA-HQ-OAR-2022-0829-0683, p. 59]

First, EPA attempts to justify its change in position by explaining that it does not include upstream emissions when calculating the compliance of internal-combustion-engine vehicles, contending that the principle of equal treatment requires that it take the same approach for electric vehicles. See 88 Fed. Reg. at 29,252. But that compares apples to oranges. These vehicle technologies emit air pollutants in different ways. Internal-combustion-engine vehicles cause emissions mostly from the tailpipe, whereas electric vehicles cause emissions mostly by other means. The timing and manner of their respective emissions is thus fundamentally different. Granularly focusing on tailpipe emissions would mean that almost none of the emissions from electric vehicles are counted, while almost all of the emissions from vehicles with internal-combustion vehicles are. If equal treatment is the goal, EPA must account for both types of emissions when calculating compliance, rather than myopically focusing on tailpipe emissions, which prejudges any analysis in favor of electric vehicles. [EPA-HQ-OAR-2022-0829-0683, p. 59]

Second, EPA states that it originally proposed including upstream emissions in compliance calculations at a time when there was "little if any regulation" of those upstream sources for GHGs, noting that this approach was "a departure from its usual practice of relying on stationary source programs to address pollution risks from stationary sources." 88 Fed. Reg. at 29,252. Now that power-generation emissions are declining, EPA asserts that "manufacturers should not account for upstream utility emissions" any longer. Id. That circular explanation assumes that the only or principal reason to consider upstream emissions is to indirectly regulate the power-generation industry itself—to make each unit of power generated by that industry cleaner. But as EPA acknowledges elsewhere in the proposed rule, it designs vehicle-emissions standards to force vehicle manufacturers to adopt technology that reduces the harmful emissions it is charged with regulating. See, e.g., id. at 29,233. Thus, if a vehicle has no tailpipe emissions but massive upstream emissions—e.g., from producing vehicles and their components, and from generating increased amounts of electricity to operate them—incentivizing manufacturers to incorporate that vehicle into their fleets would be contrary to the agency's stated goal. The increased regulation of stationary sources will not solve this problem. Increased reliance on electric vehicles will increase demand for the electricity that the power-generation industry produces, and improvements in emissions per unit of power generated would not address the total increase in emissions. Moreover, regulation of stationery sources will not capture many of the upstream emissions associated with electric vehicles. As discussed above, operating charging infrastructure and producing, recycling, and disposing of batteries all result in emissions. If upstream emissions are not included in the compliance calculation, these emissions may not be accounted for at all. [EPA-HQ-OAR-2022-0829-0683, pp. 59-60]

EPA itself correctly recognized elsewhere in the proposed rule that upstream emissions are relevant to its overall effort to address the "well-documented buildup of GHGs due to human activities." 88 Fed. Reg. at 29,207. For instance, when estimating the proposed rule's impact on overall emissions, as well as the costs and benefits that it generates, EPA took into account at least some (though far from all) relevant upstream emissions. In doing so, EPA acknowledged that it would be irrational to adopt a rule that decreases downstream emissions but has the effect of increasing overall emissions. The same principle applies here: It would be irrational to find a manufacturer's fleet compliant if the vehicles within the fleet have lower tailpipe emissions but cause emission of harmful pollutants in other ways that exceeds the levels permitted for tailpipe emissions. EPA offers no explanation for this inconsistent approach to upstream emissions. [EPA-HQ-OAR-2022-0829-0683, pp. 59-60]

Moreover, factoring a broader set of emissions into the compliance calculation will not be difficult or unduly burden EPA. The agency has already developed a method for attributing some of these emissions to manufacturers. In its proposed rule, EPA explained that it initially planned to take emissions from electricity generation into account by "attributing a pro rata share of national CO2 emissions from electricity generation to each mile driven under electric power minus a pro rata share of upstream emissions associated with . . . gasoline production." 88 Fed. Reg. at 29,252. That method remains available now. And EPA could develop similarly simple and administrable techniques to account for other key sources of upstream emissions like battery production. [EPA-HQ-OAR-2022-0829-0683, pp. 60-61]

For all of these reasons, EPA's proposed method of calculating compliance is irrational. Any final rule must comprehensively account for the emissions generated by electric vehicles to ensure that EPA's solution (a widespread shift to electric vehicles) bears a rational connection to its regulatory goal of reducing harmful emissions. Cf. Am. Fed'n of Gov't Emps., 25 F.4th at 9 (faulting agency for failing to explain why the standard it adopted will address "the principal problem the new standard is designed to fix"). [EPA-HQ-OAR-2022-0829-0683, pp. 60-61]

Organization: American Fuel & Petrochemical Manufacturers

EPA both describes ZEVs as having "zero emissions"82 for purposes of compliance with its standards and is "proposing to make the 0 g/mile treatment of ZEV operation a permanent part of the program."83 If so, then EPA's proposed standards that apply to ZEVs do not apply "to the emission of any air pollutant from any class or classes vehicles … that cause, or contribute to, air pollution."84 In other words, EPA cannot have it both ways. It cannot claim to be regulating emissions from ZEVs while at the same time considering such vehicles to have no emissions. [EPA-HQ-OAR-2022-0829-0733, p. 22]

82 "As the term 'zero-emission vehicle' suggests, these cars and trucks have zero GHG and criteria pollutant emissions from their tailpipes." 88 Fed. Reg. at 29,187.

83 Id. at 29,251,

84 42 U.S.C. § 7521(a)(1).

C. In the Alternative, EPA Should Set Separate Emissions Standards for Each Vehicle Class.

The Clean Air Act authorizes EPA to establish and revise standards for the emissions of air pollutants from "any class or classes of new motor vehicles or new motor vehicle engines….that endanger public health or welfare"111 Assuming for sake of argument EPA has authority to set emissions standards for EVs, which we posit it does not,112 EPA should promulgate distinct emissions standards for each vehicle class on the basis of the vehicle's powertrain (e.g., diesel, gasoline, natural gas, electricity). At a minimum, this would obligate EPA to abandon its position that ZEVs are emission-less and account for upstream and other lifecycle emissions as the agency envisioned in its 2012 rule.113 This approach would ensure that EPA is regulating relevant pollutants from specific vehicle classes and would promote a level playing field for different vehicle technologies.114 [EPA-HQ-OAR-2022-0829-0733, p. 26]

111 42 U.S.C.§ 7521(a)(1).

112 As discussed in Section III.A., supra, the CAA sec. 202 does not authorize EPA to regulate ZEV emissions because EPA characterizes them as having "zero" emissions.

113 75 Fed. Reg. 25,324, 25,341 (May 7, 2010).

114 42 U.S.C. § 7521(a)(3)(A)(ii) ("In establishing classes or categories of vehicles or engines for purposes of regulations under this paragraph, the Administrator may base such classes or categories on gross vehicle weight, horsepower, type of fuel used, or other appropriate factors."). Although this section of CAA Section 202 references "heavy-duty" vehicles, this applies to light-duty vehicles that weigh more than 6,000 lbs gross vehicle weight rating, such as light-duty heavy trucks, and if EPA has authority to set emissions standards for EVs, the Clean Air Act does not otherwise limit EPA's discretion to expand its classification of vehicles by fuel type.

ZEVs are entirely distinct from other classes of vehicles. Their powertrain design frontloads emissions, meaning the air pollutants associated with these vehicles are emitted before operation (i.e., during vehicle production and recharging). During operation, a ZEV experiences no direct drivetrain emissions. In contrast, most emissions from ICEVs generally occur during operation, not production and refueling. Such different emissions points require different regulatory standards. [EPA-HQ-OAR-2022-0829-0733, p. 26]

As discussed above, because EPA may only prescribe standards applicable to vehicles that "cause or contribute" to air pollution, its standards cannot account for ZEVs with no tailpipe emissions. However, if EPA is authorized to promulgate such standards, those standards must account for any upstream emissions from upstream electric generating units, the mining of battery materials, and the production of the vehicle.197 Without consideration of upstream and full life- cycle impacts (e.g., frequent battery replacements), EPA has failed to inform the public of the comparative costs of emission reductions, whether from ZEVs, ICEVs, energy efficiency, or other sectors. EPA's continued failure to address this "major aspect of the problem" is another example of EPA moving toward its predetermined outcome—the forced electrification of U.S. transportation.198 AFPM has continually put EPA on notice of the need to include a LCA to avoid an arbitrary comparison—the agency continues to ignore this issue of central relevance to EPA's benefit analysis. [EPA-HQ-OAR-2022-0829-0733, pp. 42-44]

197 Proposed Rule at 29,353–55.

198 See, e.g., Comments of the American Fuel & Petrochemical Manufacturers on EPA's Reconsideration of a Previous Withdrawal of a Waiver of Preemption 10 (July 6, 2021),

https://www.regulations.gov/comment/EPA-HQ-OAR-2021-0257-0139, Comments of the American Fuel & Petrochemical Manufacturers on EPA's/NHTSA's Proposed The Safe Affordable Fuel-Efficient Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks 68-73 (Aug. 24, 2018), https://www.regulations.gov/comment/EPA-HQ-OAR-2018-0283-5698; Comments of the American Fuel & Petrochemical Manufacturers on EPA's California State Motor Vehicle Pollution Control Standards; Advanced Clean Trucks; Zero Emission Airport Shuttle; Zero Emission Power Train Certification; Request for Waiver of Preemption 7-12 (Aug. 2, 2022), https://www.regulations.gov/comment/EPA-HQ-OAR-2022- 0331-0088.

For instance, the fuel source of a PEV, like a ZEV—a battery composed of carbon intensive minerals and the electricity generated to power the battery—produces emissions. The fact that emissions occur 100 percent upstream of the vehicle's operation and therefore fall outside of the tailpipe emissions calculation does not make these emissions any less significant. There is no logical basis for this omission because, as EPA is aware, concerns about GHG emissions relate to their longer-term global concentrations. Consequently, air pollutant emissions are an important consideration regardless of where such emissions occur. Without comparing lifecycle ZEV emissions to lifecycle emissions from ICEVs, EPA cannot know if or how much its standards are decreasing total emissions. Thus, while EPA is not required to solve all emissions problems in one rulemaking, EPA cannot claim to be solving part of the problem here without addressing upstream and downstream emissions. EPA's approach of mandating ZEVs cannot possibly be reasonable if it is merely shifting emissions from one source to another at the cost of hundreds of billions of dollars—trillions when costs to upgrade EV infrastructure are factored in— or could do so more cost-effectively by choosing a different approach.199 [EPA-HQ-OAR-2022-0829-0733, pp. 42-44]

199 5 U.S.C. § 706(2)(A); cf. Antonin Scalia, "Regulatory Review and Management," Regulation Magazine 19 (Jan./Feb. 1982) ("Is it conceivable that a rule would not be arbitrary or capricious if it concluded with a statement to the effect that 'we are taking the foregoing action despite the fact that it probably does more harm than good, and even though there are other less onerous means of achieving precisely the same desirable results'?").

The flaw in EPA's approach is illustrated by the fact that emissions standards easily become meaningless by changing the engine's location. The proposed rule would treat a ZEV charged by a diesel-powered generator as if it had zero tailpipe emissions, notwithstanding the fact that it remains "powered" by a diesel engine located outside the vehicle. A LDV directly powered by a diesel engine inside the vehicle, however, is credited with the emissions produced by that engine. EPA's inconsistent approach begs the question of how nascent technologies such as a vehicle propelled by compressed air would be evaluated. Thus, the energy source of the "fuel" matters and EPA arbitrarily ignores lifecycle emissions from ZEVs and also proposes to remove requirements for upstream emissions calculations.200 EPA admits "the program has now been in place for a decade, since MY 2012, with no upstream accounting and has functioned as intended, encouraging the continued development and introduction of electric vehicle technology."201 EPA's mandate is to establish feasible standards rooted in the statute, not to ignore real-world emissions to "encourage" the development of its favored technology. EPA requested comment on whether it should account for upstream emissions for all fuel and vehicles. If technologies are being treated equally, as they must, the answer is an unequivocal yes. [EPA-HQ-OAR-2022-0829-0733, pp. 42-44]

200 88 Fed. Reg. at 29,197.

201 Id. at 29,253.

EPA compounds this flaw by making unsupported assumptions regarding the total emissions impacts of its Proposal. While it claims that the overall analysis for combined downstream and upstream emissions “likely underestimates the net emissions reductions that may result” from the Proposed Rule, EPA fails to offer a data-based substantiation. The Proposed Rule failed to assess emissions from battery manufacturing or electricity production. EPA acknowledges that its standards will increase the demand for electricity and that demand will simultaneously increase emissions from the electric generating sector, but by making the unsupported assumption that low carbon electricity will be readily available, it makes no real attempt to quantify those emissions or compare them to alternative options for reducing emissions from this sector. EPA must provide a more comprehensive analysis to comply with its directive under the Clean Air Act and better assess the resulting impact of the Proposed Rule. [EPA-HQ-OAR-2022-0829-0733, pp. 42-44]

Organization: American Honda Motor Co., Inc.

G. Additional items

The agency solicited public comment on a wide array of topics included in the proposed rule. Below, Honda shares brief feedback on a few of these items. [EPA-HQ-OAR-2022-0829-0652, p. 29]

Upstream Emissions Accounting

In the proposed rule, the agency proposes to indefinitely exclude upstream emissions from BEV compliance calculations: [EPA-HQ-OAR-2022-0829-0652, p. 29]

EPA is also proposing that the requirement for upstream emissions accounting for BEVs and PHEVs as part of a manufacturer's compliance calculation, which under the current regulations would begin in MY 2027, would be removed under the proposed program; thus, BEVs would continue to be counted as zero grams/mile in a manufacturer's compliance calculation as has been the case since the beginning of the light-duty GHG program in MY 2012.48 [EPA-HQ-OAR-2022-0829-0652, p. 29]

48 88 Fed. Reg. 29197 (May 5, 2023)

Honda strongly concurs with this position. Although full lifecycle accounting is necessary to quantify emissions inventories, it is inappropriate to hold the auto industry accountable for emissions that are beyond its control. As such, Honda supports a clear division of regulatory responsibility between the auto and utility industries. Applying 0 g/mi upstream emissions accounting for BEVs, FCEVs and the electric-operation portion of PHEVs is not only logically appropriate but will encourage the transition toward greater levels of vehicle electrification. [EPA-HQ-OAR-2022-0829-0652, p. 29]

Recommendation: Honda strongly urges the agency to indefinitely apply 0 g/mi upstream emissions accounting for BEVs, FCEVs and the electric-operation portion of PHEVs. [EPA-HQ-OAR-2022-0829-0652, p. 29]

Organization: American Petroleum Institute (API)

ii. Zero emission vehicles also have emissions impacts.

As with ICEVs, ZEVs7 have carbon emissions impact associated both with their production and throughout their lifetime which EPA should incorporate in its analysis. While ZEVs can be an important part of a diverse transportation future to reduce emissions, they do produce GHG emissions. For instance, BEV production, use, and the disposal of BEV batteries, are not zero-emission activities. Further, all fuels – whether conventional fuels or electricity – have associated carbon emissions regardless of their source. A study conducted by Ricardo, which is included in a report by the Transportation Energy Institute,8 concludes that BEVs "have higher embedded GHG emissions" and therefore carbon intensity of the electricity mix also plays a vital role in defining the magnitude of carbon emissions in this phase. While meaningful reductions have historically been accomplished by focusing on tailpipe emissions from the vehicle, the growing market share of diffierent technologies that include significant upstream emissions warrant inclusion of those emissions in the standard. [EPA-HQ-OAR-2022-0829-0641, pp. 5-6]

7 In these comments, "ZEV" refers broadly to PHEVs, FCEVs and BEV refers specifically to battery electric vehicles.

8 Ricardo, Inc. "Life Cycle Analysis Comparison: Electric and Internal Combustion Engine Vehicles", study prepared for the Transportation Energy Institute (formerly known as the Fuels Institute). January 2022. https://www.transportationenergy.org/research/reports/life-cycle-analysis-comparison-electric-and-internlife- cycle-analysis-comparison-electric-and-intern.

We encourage the agency to not only acknowledge and address the emissions of ZEVs, but to also continue to study the impacts. Failure to do both would be arbitrary and capricious. As noted below in these comments, and in our comments on the Heavy-Duty GHG Phase 3 proposed rule,9 we strongly recommend that EPA include both a readiness assessment prior to program implementation as well as a program review once implementation begins. There will be CO2 emissions associated with the production and use of BEVs,10 and it is important to address these emissions to provide a full picture of the emissions impacts and mitigation needs. [EPA-HQ-OAR-2022-0829-0641, pp. 5-6]

Organization: Arconic Corporation (ARCO)

In general, Arconic urges EPA to consider a few key points as it moves to finalize this proposed rulemaking. [EPA-HQ-OAR-2022-0829-0741, p. 2]

Arconic recommends including the upstream power generation emissions for BEV vehicles. With that change, Arconic supports more stringent EPA standards in coordination with DOT CAFE standards beyond the 2027-2032 range covered in this proposed rule. [EPA-HQ-OAR-2022-0829-0741, p. 4]

EPA should include a fixed electric generation emission value per kWh in the standard for calculation of vehicle emissions for battery electric vehicles (BEVs) based upon their energy efficiency. This would provide an incentive for improved vehicle efficiency, and it would also allow the EPA rules to easily equate to the DOT CAFE standards. [EPA-HQ-OAR-2022-0829-0741, p. 2]

Emissions standards should correlate with passenger and pedestrian safety imperatives. If all BEVs are counted as zero emission, irrespective of their size and weight, there is no incentive for vehicle manufacturers to continue seeking weight reductions that clearly improve safety. [EPA-HQ-OAR-2022-0829-0741, p. 2]

Similarly, adding incentives for weight reduction for BEVs will correlate to reductions in electricity use, reduced embedded emissions and reduced use of critical minerals that can be difficult to produce in an environmentally friendly manner or recycle. [EPA-HQ-OAR-2022-0829-0741, p. 2]

Specifically, Arconic provides the following comments and recommendations:

1. In Section 7, EPA requests comments on the proposed treatment of electrified vehicles in manufacturers compliance calculations. The proposed rule states that CO2 emissions for a battery electric vehicle (BEV) are zero. Emissions from power generation are not included in BEV emissions. [EPA-HQ-OAR-2022-0829-0741, pp. 2-3]

This is quite different from the current DOT CAFE rule, which uses Miles Per Gallon equivalent (MPGe) to compare BEV efficiency with Internal Combustion Engine (ICE) and hybrid vehicle efficiency. When it comes to environmental impact, the size, weight and efficiency of the vehicle do matter: the most efficient BEV (Lucid Air) uses one third the energy per mile as compared to a Hummer EV according to the CAFE MPGe ratings. [EPA-HQ-OAR-2022-0829-0741, pp. 2-3]

EPA should include a fixed electric generation emission value per kWh for MY 2027- 2032 in the standard for calculation of vehicle emissions for BEV vehicles, based upon their efficiency. The emissions associated with generating 33.7 kWh of electricity (or 23.16 kWh/gal if 10 CFR Part 474 (EERE-2021-VT-0033) is enacted) could be used along with the MPGe values from vehicle testing to get the g/mile CO2 emissions for any BEV. This would provide an incentive for improved vehicle efficiency. It would also allow the EPA rules to easily equate to the DOT CAFE standards. [EPA-HQ-OAR-2022-0829-0741, pp. 2-3]

As currently formulated, the proposed policy would not encourage more energy efficient BEV vehicles. Larger, heavier, less aerodynamic vehicles require higher capacity batteries which consume more critical minerals, more electricity and its associated emissions. [EPA-HQ-OAR-2022-0829-0741, pp. 2-3]

We understand the argument that current ICE based standards do not include emissions for gasoline production. However, the bulk of the emissions for an ICE vehicle come from burning gasoline while the bulk of the emissions for an EV come from electricity generation - both of which are captured effectively in the MPG/MPGe rating. Therefore, utilizing MPG/MPGe ratings would provide a meaningful measure of efficiency that customers and manufacturers can act upon and would result in reduced emissions overall. [EPA-HQ-OAR-2022-0829-0741, pp. 2-3]

Arconic suggests revising the definition of emissions for BEVs to include the upstream power generation emissions. Revising this definition would likely require some modification to the yearly emissions targets. With targets modified in this manner, Arconic does not have a position on the trajectory (i.e., the levels of year-over-year stringency rates) in this rule making. [EPA-HQ-OAR-2022-0829-0741, pp. 3-4]

Organization: BorgWarner Inc.

BorgWarner urges EPA to consider new emission metrics for zero emission vehicles (ZEVs) that benefit and develop new efficiency improvements. [EPA-HQ-OAR-2022-0829-0640, pp. 6-7]

Defining vehicle emissions exclusively at the tailpipe creates a de facto technology mandate and excludes technologies that could make a timely real-world difference in CO2 emissions. [EPA-HQ-OAR-2022-0829-0640, pp. 6-7]

BorgWarner supports EPA moving beyond analyzing vehicle emissions only at the tailpipe and proposes that EPA incorporate accounting of upstream emissions for compliance purposes. [EPA-HQ-OAR-2022-0829-0640, pp. 6-7]

EPA should not ignore upstream emissions as it would be inconsistent with previous assertions that future compliance standards would look beyond a vehicle's tailpipe.6 As we invest in advanced technologies, it is critical to look at their overall environmental impact to determine broad pathways to achieve our emission reduction goals. This approach is consistent with technology neutrality, global carbon neutrality goals, and a holistic environmental impact assessment. [EPA-HQ-OAR-2022-0829-0640, pp. 6-7]

6 Federal Register: Volume 77, No. 199 - October 15, 2012, Page 62651

More importantly, by including upstream emissions for compliance purposes, EPA will address a vehicle's total embedded CO2 instead of unintentionally promoting inefficiencies. Counting upstream emissions promotes cleaner and more efficient components for all vehicle technologies. It is important to set metrics for all vehicles, including BEV, that continue to require efficiency improvements that reduce CO2 production and energy intensity – while small efficiency gains in electric vehicle operation seem to make no difference if measuring at the tailpipe, they would have an impact on the burden to the electricity grid when we have a future BEV vehicle parc in the tens of millions. [EPA-HQ-OAR-2022-0829-0640, pp. 6-7]

Organization: Clean Fuels Development Coalition et al.

D. EPA lacks the statutory authority to ignore upstream emissions for electric vehicles.

EPA has statutory authority to prescribe "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines, which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." 42 U.S.C. § 7521(a)(1). This presents an interpretive dilemma. On the one hand, if electric vehicles are not "vehicles" "which cause[ ] or contribute to" a given type of air pollution, then EPA may not set standards for them. Id. On the other, if electric vehicles are "vehicles" "which cause, or contribute to" a given type of air pollution, then EPA must set "standards applicable to the[ir] emissions." Id. [EPA-HQ-OAR-2022-0829-0712, p. 11]

The proposal tries to solve this problem by splitting the baby.8 EPA reasons that electric vehicles are vehicles that "cause or contribute to air pollution," but EPA just chooses to set their contribution to zero. This cannot be right. Cf. C.S. Lewis, That Hideous Strength 291 (Samizdat ed., 2015) ("Just imagine a man who was too dainty to eat with his fingers and yet wouldn't use forks!"). If electric vehicles truly emit no emissions, then they are not the sort of vehicle EPA can regulate. [EPA-HQ-OAR-2022-0829-0712, p. 11]

8 Of course, the point of the story about Solomon is that the baby wasn't split. See 1 Kings 3:16– 28 ("Give the living child to the first woman, and by no means put him to death; she is his mother.").

Of course, EPA freely admits that electric vehicles do produce upstream emissions, and that these upstream emissions matter. This is true and very important. And the proposal does consider upstream emissions when determining the rule's impact on total emissions. EPA's position is that this inconsistent approach to electric vehicles' upstream emissions is reasonable because it treats upstream emissions of all vehicles, electrified or not, the same way for compliance purposes. 88 Fed. Reg. 29,252 ("EPA proposes to include only emissions measured directly from the vehicle in the vehicle GHG program for MYs 2027 and later (or until EPA changes the regulations through future rulemaking) consistent with the treatment of all other vehicles. Electric vehicle operation would therefore continue to be counted as 0 g/mile, based on tailpipe emissions only.") [EPA-HQ-OAR-2022-0829-0712, pp. 11-12]

But this "consisten[cy]" is precisely what makes the rule unreasonable. Electric vehicles are not like "all other vehicles." EPA has previously recognized that "that for each EV that is sold, in reality the total emissions off-set relative to the typical gasoline or diesel powered vehicle is not zero, as there is a corresponding increase in up-stream CO2 emissions due to an increase in the requirements for electric utility generation." 74 Fed. Reg. 49,454, 49,533 (Sept. 28, 2009). EPA only chose the initial "zero grams/mile compliance value [a]s an incentive," Response to Comments, EPA-420-R- 10-012a at 5-237 (Apr. 2010),), and explained that in future standards it "would attribute a pro rata share of national CO2 emissions from electricity generation to each mile driven under electric power minus a pro rata share of upstream emissions associated with from gasoline production," 88 Fed. Reg. 29,252. [EPA-HQ-OAR-2022-0829-0712, pp. 11-12]

EPA never had authority to incentivize electric vehicles in this way. Section 202(a) requires the agency to "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles." Because it acknowledged that these emissions are "not zero," it is arbitrary to treat them as such. Indeed, as EPA previously acknowledged, treating upstream emissions of all vehicles, electrified or not, the same way puts a thumb on the scale against conventional vehicles in favor of electric vehicles. An agency's bare preference for one technology cannot satisfy the requirement that it "reasonably consider[] the relevant issues and reasonably explain[] the decision." FCC v. Prometheus Radio Project, 141 S. Ct. 1150, 1158 (2021). [EPA-HQ-OAR-2022-0829-0712, pp. 12-13]

At the very least, the agency is not permitted to change its position on the future inclusion of upstream emissions in compliance calculations without explanation. When an agency makes a decision, it must articulate a "satisfactory explanation for its action including a 'rational connection between the facts found and the choice made.'" Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983). If the agency fails to "cogently explain why it has exercised its discretion in a given manner," its action will be held invalid. Id. at 48. In addition, the agency must "provide a more detailed justification than what would suffice for a new policy created on a blank slate . . . when, for example, its new policy rests upon factual findings that contradict those which underlay its prior policy." FCC v. Fox Television Stations, Inc., 556 U.S. 502, 515 (2009); see also Perez v. Mortg. Bankers Ass'n, 135 S. Ct. 1199, 1209 (2015). EPA previously thought that the zero grams-per-mile compliance value was only viable as a temporary incentive because "in reality" the total emissions were not zero. Failure to consider and adequately explain departure from this finding would render the entire rulemaking arbitrary and capricious. Fox Television Stations, 556 U.S. at 515. [EPA-HQ-OAR-2022-0829-0712, pp. 12-13]

F. EPA lacks authority to Misleads Consumers by Using the Term "Zero-emissions Vehicle."

While it is true that all-electric vehicles have no tailpipe emissions, it is completely false to claim that they are "zero-emissions vehicles." As already noted, EPA acknowledges that what it calls "ZEVs" have significant upstream emissions. 88 Fed. Reg. 29,303. Despite this, the proposal repeatedly describes these vehicles as having no emissions. This is per se unreasonable, and it enables illegal marketing by auto- manufacturers. Seizing on EPA's label, dozens of auto-manufacturers have described their electric vehicles as "zero-emissions." Making false claims in the marketing of products is prohibited by the Federal Trade Commission Act, which prohibits "unfair or deceptive acts or practices in or affecting commerce" 15 U.S.C. § 45. The agency lacks authority to facilitate these deceptive acts or to promote innumerable other false "zero emission" statements. [EPA-HQ-OAR-2022-0829-0712, pp. 14-15]

Organization: Coalition for Safe Autonomous Vehicles and Electrification (SAVE)

Introduction of this technology will yield substantial safety, environmental, accessibility, and equity benefits to the motoring public, as well as help keep the United States in a global technology leadership position. AV-EVs promote safer streets by reducing collisions caused by human error. They promote sustainability through shared zero-emission fleets that will reduce congestion and pollution in our cities. And AV-Evs hold the promise to increase equity and accessibility in transportation by providing affordable and accessible mobility options for those who are unable to drive. [EPA-HQ-OAR-2022-0829-0608, pp. 1-2]

The SAVE Coalition appreciates EPA's commitment to improving air quality, reducing emissions from the transportation sector, and encouraging further adoption of electric vehicles (EVs). We want to start by commending EPA's decision to treat EVs the same as non-EVs as it relates to tailpipe emissions, i.e., by not including upstream emissions in the calculation of tailpipe emissions. We agree that it is therefore reasonable and appropriate to assign EVs 0 grams of CO2 per mile for tailpipe emissions. [EPA-HQ-OAR-2022-0829-0608, pp. 1-2]

Organization: Delek US Holdings, Inc.

The flaw in EPA's approach is illustrated by the fact that emissions standards easily become meaningless by changing the engine's location. A BEV charged by the owner through the use of a diesel-powered generator has zero emissions, notwithstanding the fact that it remains "powered" by a diesel engine located outside the vehicle. A LDV or MDV directly powered by a diesel engine inside the vehicle, however, is credited with the emissions produced by that engine.

Thus, the source of the “fuel” matters. EPA’s myopic approach fails to account for such impacts. [EPA-HQ-OAR-2022-0829-0527, p. 5]

Finally, instead of sufficiently analyzing and quantifying upstream emissions, including those from battery manufacturing or electricity production, EPA proposes to instead extend ZEV manufacturers’ “free pass” and allow them to calculate upstream emissions of a BEV as 0 g/mi CO2.22 This compliance flexibility should have expired with MY27 and instead, as EPA concedes, manufacturers producing an all-BEV flight to comply with the new proposed standards will be able to claim their fleet “emit[s] 0 g/mi, regardless of their respective footprints.23 If EPA considers these upstream emissions in BEV compliance calculations, the proposed standards are likely unachievable so it appears EPA has instead cherry-picked data and calculation parameters to ensure a ZEV transition rather than comprehensively analyze a technology-neutral approach to the posited concerns. EPA should provide a more comprehensive analysis to comply with its directive under the Clean Air Act and better assess the resulting impact of the Proposed Rule. [EPA-HQ-OAR-2022-0829-0527, p. 5]

22 Proposed Rule at 29,235, 29,251.

23 Id.

EPA’s reference to electric vehicles as “zero emission vehicles” is misleading. The fuel source of a BEV—a battery composed of carbon intensive minerals and the electricity generated to power the battery—produces emissions. The fact such emissions occur 100% upstream of the vehicle’s operation and therefore fall outside of the tailpipe emissions calculation stacks the deck in favor of this technology. There is no logical basis for this omission because, as EPA is aware, GHG and other criteria pollutant emissions such as PM2.5 have a global impact. Consequently, controlling air pollutant emissions should be important regardless of where such emissions occur. [EPA-HQ-OAR-2022-0829-0527, p. 5]

Organization: Doug Peterson

The Environmental Protection Agency Should Include the Upstream Carbon Dioxide Emissions of Battery Electric Vehicles When Calculating Fleet Performance and Determining Compliance [EPA-HQ-OAR-2022-0829-0500, p. 1]

The EPA has solicited comments regarding its proposal to continue granting all light duty battery electric vehicles (BEVs) a carbon dioxide emissions value of zero grams per mile when averaging an automaker’s fleet performance. There are many strong arguments for maintaining the current approach, and it is important to acknowledge them before making the much stronger case for reforming the upstream emissions policy. [EPA-HQ-OAR-2022-0829-0500, p. 2]

Upstream carbon dioxide emissions have never been considered when determining fleet compliance, in accordance with statutory language directing the agency to regulate emissions that come “from” regulated vehicles. There are other life cycle emissions that are also set aside, and vehicles powered by gasoline have their own significant upstream emissions related to the production and distribution of gasoline that are not incorporated into the mathematical formulas that govern compliance. The overwhelming share of carbon dioxide emissions from light duty vehicles are generated by the combustion of gasoline and enter the troposphere through tailpipes. The primary objective of the regulatory framework is to curtail these emissions. [EPA-HQ-OAR-2022-0829-0500, p. 2]

The rules governing compliance have evolved through many rulemaking cycles, and the ongoing focus on tailpipe emissions is, in part, a manifestation of pragmatism. The agency's 2009 endangerment finding regarding carbon dioxide created an obligation to regulate this major tailpipe greenhouse gas, and it was no small task to determine how to go about it. The regulatory framework that was agreed to under President Obama was a remarkable achievement that has served the nation well. Fleet averaging, targets based on vehicles footprints, and the establishment of a cap-and-trade CO2 credit market were effective methodologies that continue to provide valuable flexibility to automakers and are reasonably fair. The framework was crafted when BEV market penetration was very low and there was little need to consider upstream emissions. The 2012 framework envisioned net upstream emissions accounting that would commence in 2022, but that approach was abandoned in 2020. [EPA-HQ-OAR-2022-0829-0500, pp. 2-3]

The mathematical formulas used to determine individual fleet standards and performance values are extremely complex, surpassing the mathematical reasoning skills of most people, but they work. Adding adjustments for upstream emissions would add another layer of complexity. It would be difficult to estimate upstream emissions accurately, but not impossible. Tailpipe carbon dioxide emissions are directly related to gasoline fuel economy, and the agency has reason to trust the CO2 values it assigns to the gas-powered vehicles it regulates. A high level of accuracy in the quantification of tailpipe emissions is a valuable attribute of the framework that enhances its effectiveness. [EPA-HQ-OAR-2022-0829-0500, pp. 2-3]

Quantifying upstream emissions would require the application of subjective assumptions, and broadening the scope of compliance determination beyond tailpipe emissions would likely increase differences of opinion among stakeholders. It might even lead to more litigation, though that hardly seems possible. Automakers need to design their vehicles years in advance and depend on a stable regulatory framework. They have invested billions of dollars in electrification and seem satisfied with the existing upstream emissions policy. Keeping things simple and consistent yields important benefits. [EPA-HQ-OAR-2022-0829-0500, pp. 3-4]

Most importantly, the current approach appears to accelerate the electrification of the national fleet. BEVs are currently our best hope for fully decarbonizing light duty transportation. Ending the use of gasoline will take decades, and the worthwhile effort must proceed with a sense of urgency. The EPA's current policy on upstream emissions leverages the extraordinary potential of BEVs, which are increasingly recognized as a feasible, scalable alternative to conventional vehicles. There are many challenges that come with widespread BEV adoption, and the EPA's obligation to reduce anthropogenic carbon dioxide is well served when it accelerates the electrification of ground transportation. The EPA is addressing upstream emissions by regulating the utilities that produce them and believes that this strategy is adequate and appropriate. The upstream emissions generated by BEVs will fall to zero when our grids are fully decarbonized, and they do not currently represent a large percentage of light duty emissions. [EPA-HQ-OAR-2022-0829-0500, pp. 3-4]

The EPA is to be commended for soliciting comments on its treatment of upstream emissions, which would remain the same under its proposal. BEVs that produce zero tailpipe emissions will proliferate dramatically between now and 2032, and this inevitable change in the future composition of the national fleet has important implications that the agency must acknowledge as it considers reforming its policy on upstream emissions. My arguments focus exclusively on the EPA's proposed upstream emissions policy for light duty vehicles, which I oppose. Accelerating electrification has always been and continues to be a very worthy goal, but the time has come for BEVs to be held accountable for their upstream emissions. [EPA-HQ-OAR-2022-0829-0500, pp. 4-5]

As the agency primarily responsible for the abatement of anthropogenic carbon dioxide, the EPA is obligated to enact policies that will maximize the fuel economy of the emerging electric fleet. The existing policy on upstream emissions fails to do this. When BEV technology was in its infancy, there was a sensible consensus that the regulatory framework should incentivize its growth. This was the rationale for multipliers, and the same reasonable rationale was applied to hydrogen fuel cell technology. Explaining its proposed decision on upstream emissions, the EPA argues that the current approach has incentivized electrification effectively for over a decade and should therefore continue. Given the considerable momentum that is now driving electrification forward, that argument is somewhat questionable. The decisions made today will have a major impact on the fuel economy of future BEVs, and this impact is arguably more consequential for the environment than the pace of the ongoing transition. It is time for the agency to begin fostering improvements in electric fuel economy, and it should do so by reforming its policy on upstream emissions [EPA-HQ-OAR-2022-0829-0500, pp. 4-5]

When all life cycle emissions are considered, BEVs generate far fewer carbon dioxide emissions than other powertrains, but there is currently wide efficiency variation among different BEV models. Fueleconomy.gov currently shows the Lordstown Endurance earning a combined MPGe rating of just 48. The 2023 Hyundai Ioniq 6 Long range RWD has a much higher combined MPGe rating of 140. The most efficient BEV is currently three times as frugal as the least efficient. When, for compliance purposes, the regulatory framework treats both vehicles as generating zero emissions, it systematically ignores this large disparity in fuel economy. Until our grids are fully decarbonized, the upstream emissions of the two vehicles will be proportional to their disparate MPGe ratings. Those upstream emissions need to be curtailed., and it is imperative that we moderate additional electricity demand while we struggle to produce it cleanly. There are also new challenges associated with the widespread distribution of electric auto fuel that are made more difficult by inefficient BEVs. The most straightforward way to optimize the fuel economy of BEVs is to hold them accountable for their upstream emissions when averaging fleet performance. [EPA-HQ-OAR-2022-0829-0500, p. 5]

The continuation of the existing policy through 2032 would have significant implications for the fuel economy of the emerging electric fleet. Assessing these implications requires a clear-headed view of the "favoritism" that is currently embedded in the regulatory framework. Misleading criticism of BEV favoritism is rooted in the erroneous view that electric fuel produces upstream emissions, but gasoline does not. Both fuels produce upstream emissions that represent a significant portion of their powertrain's life cycle emissions, and neither powertrain is currently held accountable for them. [EPA-HQ-OAR-2022-0829-0500, pp. 5-6]

A more compelling articulation of BEV favoritism argues that the existing regulatory framework forces automakers to improve the fuel economy of gas-powered vehicles but allows BEVs to squander as much electricity as they please. Conventional vehicles do produce upstream emissions that are not tallied for compliance purposes, but those emissions are subject to the considerable restraint that the framework imposes on gasoline fuel economy. The EPA's treatment of BEVs is fundamentally different, and it can only be seen as favorable treatment, ignoring electric fuel economy altogether. The framework does nothing to curtail the upstream emissions associated with the production of electric auto fuel. It also does nothing to conserve the electrical energy that powers our growing electric fleet. Energy is conserved when BEVs displace conventional vehicles, but more is conserved when those BEVs use their fuel efficiently. [EPA-HQ-OAR-2022-0829-0500, pp. 5-6]

Energy conservation is a fundamental goal of environmental stewardship, and this is especially true as we struggle to generate an adequate supply of clean electricity. Light duty vehicles are not the only machines running on fossil fuels that need to be electrified. A day will come when our grids are fully decarbonized, clean electricity is plentiful, and BEV fuel economy makes no difference, but that day is far off. Until then, the EPA is obligated to reduce upstream emissions and conserve energy by optimizing the fuel economy of BEVs. It shares this obligation with the National Highway Traffic Safety Administration, and the two agencies should harmonize their approaches to electric fuel economy, consistent with their overlapping statutory goals. The cleanest electricity on Earth is electricity that never has to be generated to begin with. [EPA-HQ-OAR-2022-0829-0500, pp. 6-7]

The upstream emissions generated by BEVs are proportional to their fuel economy, and the agency cannot skirt its obligation to minimize them by arguing that it will control these emissions by regulating the power plants that produce them. The synergistic benefits of regulating power plants and BEVs simultaneously are obvious. Improving the fuel economy of BEVs reduces overall demand for electricity and the quantity of upstream emissions. The regulation of power plants reduces the carbon intensity of electric auto fuel. Both regulatory efforts reinforce one another as they work to reduce carbon dioxide accumulating in the troposphere. It makes little sense to regulate one but not the other, carelessly wasting electric auto fuel while investing billions to produce it cleanly. [EPA-HQ-OAR-2022-0829-0500, pp. 6-7]

The EPA appears to take the view that displacing the copious emissions associated with gasoline combustion justifies an incentivize now, economize later approach to the electric fleet. Before arguing further, I will pause to admit, with an appropriate level of humility, that assessing the efficacy of the current approach is a very tough judgement to make. Reasonable people will disagree, and the sophisticated computer models that the agency uses to project outcomes informs its view beyond my level of expertise. When this rulemaking process is completed, I believe that the EPA will make a sound decision regarding its treatment of upstream emissions. I intend to exercise my right to comment, at length, laying out the very strong case for upstream emissions accountability. [EPA-HQ-OAR-2022-0829-0500, p. 7]

The EPA's current policy on upstream emissions frees automakers from any legal obligation to optimize electric fuel economy. The framework regulates the fuel economy of conventional vehicles, but it does not regulate the fuel economy of BEVs. When averaging fleet performance, each BEV model is arbitrarily assumed to have perfect fuel economy that produces zero emissions. Its MPGe rating is immaterial. Absent any regulatory limits on electric fuel consumption, consumer desire for additional vehicle size, horsepower, and range will decrease the fuel economy of the emerging electric fleet. (It is worth noting here that the federal tax incentive provided by the Inflation Reduction Act also does nothing to optimize electric fuel economy. Plug-in hybrids with very poor fuel economy will qualify for the same $7,500 tax break as the most efficient BEVs.) If BEVs are going to begin replacing conventional vehicles in large numbers, they need to be as efficient as possible. [EPA-HQ-OAR-2022-0829-0500, pp. 7-8]

The increasingly stringent standards will force automakers to continue moderating the desirable attributes of their conventional vehicles, but the corresponding attributes of BEVs will not be subject to similar restraint. This will give BEVs a significant marketing advantage in the 2027-2032 time frame as automakers strive to sell enough electric vehicles to achieve compliance. Ample size and horsepower will help offset convenience drawbacks that discourage consumers from purchasing BEVs. Conventional muscle cars, jumbo SUVs, and overpowered pickups have difficulty meeting their footprint targets, and extremely inefficient BEVs are already being designed to compete against them. As important as it is to displace the dirtiest gas burners, the EPA should not give its blessing to the unbridled exploitation of inefficient BEV attributes. [EPA-HQ-OAR-2022-0829-0500, pp. 7-8]

BEVs will also square off against each other, with size and horsepower increasing in an inflationary cycle of one-upmanship. The observable attributes of the 2023 BEV fleet demonstrate that automakers intend to weaponize the marketing advantages that the EPA's generous upstream emissions policy confers. The ability of these advantages to accelerate BEV adoption does not justify the additional inefficiency that will be embedded in the emerging electric fleet to satisfy consumer demands. [EPA-HQ-OAR-2022-0829-0500, pp. 8-9]

There is already evidence that automakers are upsizing their BEV offerings, and there appears to be a very strong reluctance to market small models that might deliver outstanding fuel economy. Volkswagen decided not to sell its small id.3 in the United States, replacing the electric Golf with the id.4. General Motors recently announced that it will discontinue production of the efficient Chevy Bolt. There is a lot of competition emerging to capture market share in electrified pickup trucks and luxury SUVs, and nobody appears overly concerned about their abysmal MPGe ratings. An unrestrained upsizing trend will thwart efforts to reduce the average price of BEVs, strengthening the public perception that BEVs are toys that only rich people play with. The notable absence of BEVs in the more affordable compact and subcompact segments does not bode well for widespread BEV adoption, and the regulatory framework does little to encourage their availability. [EPA-HQ-OAR-2022-0829-0500, pp. 8-9]

In fact, the existing policy on upstream emissions has an unintentional mathematical quirk with great potential to upsize the emerging electric fleet. Compliance is ultimately achieved by maintaining an adequate supply of credits, and the number of credits that an efficient model generates is determined by its production volume and the degree to which it outperforms its footprint target. All BEVs generate copious credits because the rules allow them to beat their footprint targets by 100 percent. A BEV with a larger footprint generates more credits than a smaller BEV because there is a greater disparity between its larger footprint target and its arbitrary zero emissions value. The entire rationale for the footprint model is nonsensical when applied to BEVs, and the credits they generate exceed the emission reductions they deliver in the real world. It is extremely troubling that these disingenuous windfall credits are used to offset the shortcomings of the worst gas guzzlers. Holding BEVs accountable for their upstream emissions would allow them to compete against their footprint targets in a conventional way. The credits BEVs generate would more accurately reflect their actual environmental benefits, and the unintended incentive to upsize BEVs would be neutralized. [EPA-HQ-OAR-2022-0829-0500, pp. 9-10]

Efficiency losses associated with upsizing will be compounded by increasingly excessive BEV horsepower. Consumer thirst for horsepower appears to be unquenchable, and BEVs are well suited for serving it up. Many BEV models have high performance variants that earn lower MPGe ratings than their standard counterparts. Many models offer a variety of driving modes that allow the motorist to boost performance by sacrificing fuel economy. Automakers know that additional horsepower will win market share far more than fuel economy. Consumers have shown that they will tolerate a considerable increase in the cost of gasoline to obtain a vehicle that delivers brisk acceleration or outstanding towing capacity, and it is unlikely that a different fuel will alter their priorities. The inherent athleticism of BEVs will be optimized to outperform conventional vehicles that are forced to take fuel economy into account, and BEVs in all segments will compete against each other for market share by prioritizing acceleration. We are already seeing the emergence of an overpowered electric fleet that is far less efficient than it could be. If the regulatory framework is not modified, electric fuel economy will continue to be a low priority for automakers. [EPA-HQ-OAR-2022-0829-0500, pp. 9-10]

Consumer desire for additional range may also put downward pressure on fuel economy. Conventional vehicles have the upper hand with this critical vehicle attribute. Gasoline tanks are sized to provide adequate range. Inadequate range is currently a major convenience drawback for BEVs, and they will not sell in large numbers until range figures increase substantially. Poor range also compounds the convenience drawback of slow refueling because it increases the frequency of charging station visits when travelling far from home. When battery packs are enlarged to provide additional range, fuel economy often suffers. [EPA-HQ-OAR-2022-0829-0500, pp. 10-11]

The relationship between range and electric fuel economy is complex. Higher fuel economy increases range, but automakers can achieve the same result by increasing the size of the battery pack. This approach adds considerable weight to the vehicle and tends to reduce fuel economy. The tradeoff between range and efficiency will shift as engineers improve the gravimetric energy density of battery cells, and impressive breakthroughs appear to be just around the corner. It is also worth noting that some automakers are producing BEV models that deliver impressive range along with outstanding fuel economy. Still, the EPA should be very concerned that its failure to regulate BEV fuel economy will result in the unrestrained upsizing of battery packs. The trend will increase demand for limited supplies of resources like lithium which will also be needed for batteries that store intermittent renewable energy. In the near term, the inability to secure an adequate supply of battery materials will slow BEV proliferation. [EPA-HQ-OAR-2022-0829-0500, pp. 10-11]

Incorporating upstream emissions accountability into the regulatory framework would be consistent with the phasing out of multipliers that have been used to incentivize the early growth of BEVs. The EPA is to be commended for agreeing to end the generous incentive in the latter half of the 2023-2026 time frame. As BEVs began to sell in larger numbers, the multipliers had growing potential to undermine the integrity of the cap-and-trade credit market, which resulted in the EPA capping the benefit, then eliminating it altogether. The rationale for multipliers was rooted in their power to catalyze BEV manufacturing, and the fact that they were finally phased out reflects the agency's wise judgement that they had accomplished their mission and were no longer necessary. Introducing upstream emissions accountability in the 2027-2032 time frame would be consistent with this same judgement, adjusting the framework in response to projected increases in BEV proliferation. If BEVs are going to make up 67% of car sales in 2032, we should not wait until then to begin optimizing electric fuel economy. The EPA's rationale for continuing the current upstream emissions policy echoes the original rationale for multipliers. That obsolete rationale becomes less and less compelling as BEVs reach higher levels of market penetration all around the globe. [EPA-HQ-OAR-2022-0829-0500, pp. 13-14]

The 2027 model year appears to be a very appropriate time to begin regulating the efficiency of the emerging electric fleet, but automakers would likely prefer more lead time to adjust to such a major change. Fortunately, the agency has the ingenuity to craft regulations that phase in upstream emission accountability, just as it phased out multipliers. It also has the necessary expertise to adjust the overall stringency and slope of the footprint curves to compensate for an evolving upstream emissions policy. If upstream emissions accountability were to be phased in between 2028 and 2032, automakers would have five years to prepare. If accountability were to commence in 2029, they would have six. The impact of the change could also be softened by making a generous calculation of upstream BEV emissions that averages the projected carbon intensity of the national grid across the expected operational life of the BEV. [EPA-HQ-OAR-2022-0829-0500, pp. 13-14]

The upstream emissions associated with gasoline production could be phased in during the same time frame, with similar adjustments to keep the overall stringency of the framework reasonable. This might be seen by some as negating the new policy regarding the upstream emissions of electric fuel. Such an argument would fail to persuade. Gasoline and electricity both come with significant upstream emissions that can be estimated with reasonable accuracy, and an effective, equitable framework would treat them roughly the same way. (There are currently not enough fuel cell vehicles in operation to worry about the upstream emissions of hydrogen fuel.) If both gasoline and electricity were held accountable for their upstream emissions and stringency was adjusted accordingly, the obligation to improve the fuel economy of gasoline powered vehicles would remain about the same, and there would now be an appropriate regulatory incentive to optimize the fuel economy of BEVs. [EPA-HQ-OAR-2022-0829-0500, pp. 14-15]

The agency should not refrain from implementing such a change based on the legal argument that it is only authorized to regulate tailpipe emissions that come "from" the vehicles themselves. The statute does not confine the agency to emissions that come "directly from" vehicle tailpipes, and a broader interpretation of the word "from" is well within the agency's discretion. In 2012, net upstream emissions accountability was scheduled to commence in 2022. The EPA is responsible for multiple approaches to carbon dioxide abatement, and it is entirely appropriate for the agency to recognize the synergistic benefits of increasing the fuel economy of the emerging electric fleet while decreasing the carbon intensity of the grid. The fact that upstream emissions have not been regulated in the past is also a poor excuse to maintain the current approach. BEVs are going to proliferate on a much larger scale, and the old policy needs to give way to this new reality. Compromising the agency's longstanding commitment to energy conservation is a much larger break from precedent than a reinterpretation of the word "from". [EPA-HQ-OAR-2022-0829-0500, pp. 14-15]

The EPA must ultimately strike a balance between two fundamental goals that contribute to carbon dioxide abatement. First, it must accelerate the adoption of BEVs, displacing conventional vehicles that are creating the lion's share of light duty vehicle emissions. Second, it must conserve energy by maximizing the efficiency of the emerging electric fleet, reducing aggregate demand for electric auto fuel. The current upstream emission policy fails to strike this balance because it places far too much weight on accomplishing the first goal. Both goals are very important, and they do not undermine one another nearly as much as it may appear. In many ways mentioned above, increasing electric fuel economy supports rapid BEV adoption. I urge the agency to initiate efforts to achieve the second goal by phasing in upstream emissions accountability. The battle against climate change will only be won if we make the very best use of our most promising mitigation strategies. If BEVs are to deliver the full measure of their enormous potential, they can no longer be allowed to squander electricity. Thank you for soliciting comments on this very important issue. [EPA-HQ-OAR-2022-0829-0500, p. 15]

Organization: East Kansas Agri-Energy (EKAE)

EKAE appreciates the Biden administration's goals of increasing vehicle efficiency and reducing carbon emissions. However, we firmly oppose regulatory approaches that arbitrarily favor certain technologies over others, which regrettably seems to be the case with this proposed rule. EPA's proposal would force automakers to produce more battery electric vehicles and discourage them from pursuing other technologies that could achieve the same, or even better, environmental performance at a lower cost to American consumers. [EPA-HQ-OAR-2022-0829-0734, p. 1]

The Agency's decision to assign a Zero grams/mile compliance value to EVs unfairly favors electric vehicle manufacture, while falsely assuming EVs have no carbon impact whatsoever. In this case the Agency is only following the science when it's convenient and nowhere near being consistent with fact. [EPA-HQ-OAR-2022-0829-0734, p. 1]

Organization: Environmental. and Public Health Organizations

C. EPA should not foreclose the possibility of including upstream emissions in compliance accounting.

The Agency’s 2012 rule included net compliance accounting for PEVs’ upstream emissions from electricity generation beginning with MYs 2022-2025. 88 Fed. Reg. at 29252; 77 Fed. Reg. at 62816. Under that rule, net upstream emissions were to be determined by “attribut[ing] a pro rata share of national CO2 emissions from electricity generation to each mile driven under electric power minus a pro rata share of upstream emissions” from gasoline production. 88 Fed. Reg. at 29252. EPA justified leaving these emissions unaccounted for through MY 2023 as a then-necessary incentive for EV technology adoption. However, EPA’s 2020 rule, effective before MY 2023, removed net upstream accounting requirements through MY 2026. 85 Fed. Reg. at 25208. EPA now proposes to eliminate upstream emissions accounting permanently, reasoning that upstream CO2 accounting has consistently been absent from the vehicle program since its inception; that Section 202 regulates only tailpipe emissions; and that power plant emissions, regulated under separate statutory programs, are on the decline. EPA also notes that it does account for upstream emissions in its separate analysis of overall estimated vehicle emissions impacts and the projected benefits of its rules, and that any EV upstream accounting for compliance purposes, were it to take place, would have to be accompanied by a calculation of upstream emission impacts of combustion vehicles from refineries. 88 Fed. Reg. at 29252.168[EPA-HQ-OAR-2022-0829-0759, pp. 62-63]

168 On a "lifecycle" basis, ZEVs offer superior emissions reductions compared to combustion vehicles. See generally Adrian O'Connell et al., Int'l Council on Clean Transp. (ICCT), A Comparison of the Life-Cycle Greenhouse Gas Emissions of European Heavy-Duty Vehicles and Fuels (2023), https://theicct.org/wp-content/uploads/2023/02/lca-ghg-emissions-hdv-fuels-europe-feb23.pdf; Lu Xu, Life Cycle Greenhouse Gas Emissions of Conventional and Alternative Heavy-duty Trucks: Literature Review and Harmonization (Thesis), at chs. 3-4 (2021), https://hdl.handle.net/1807/108920; Dora Burul & David Algesten, Scania, Life cycle assessment of distribution vehicles: Battery electric vs diesel driven (undated), https://www.scania.com/content/dam/group/press-and-media/press-releases/documents/Scania-Life-cycle-assessmen t-of-distribution-vehicles.pdf; Georg Bieker, ICCT, A Global Comparison of the Life-cycle Greenhouse Gas Emissions of Combustion Engine and Electric Passenger Cars (2021), https://theicct.org/wp-content/uploads/2021/07/Global-Vehicle-LCA-White-Paper-A4-revised-v2.pdf; Jarod C. Kelly et al., Argonne National Laboratory, Cradle-to-Grave Lifecycle Analysis of U.S. Light-Duty Vehicle-Fuel Pathways: A Greenhouse Gas Emissions and Economic Assessment of Current (2020) and Future (2030-2035) Technologies, at ch. 8 & app. B, (2022), https://publications.anl.gov/anlpubs/2022/07/176270.pdf; Fuels Institute, Life Cycle Analysis Comparison, (2022), https://www.transportationenergy.org/wp-content/uploads/2022/10/FI_Report_Lifecycle_FINAL.pdf; Maxwell Woody et al., Corrigendum: The role of pickup truck electrification in the decarbonization of light-duty vehicles, Env't Rsch. Letters, July 15, 2022, https://iopscience.iop.org/article/10.1088/1748-9326/ac7cfc/pdf; David Reichmuth et al., Union of Concerned Scientists, Driving Cleaner: Electric Cars and Pickups Beat Gasoline on Lifetime Global Warming Emissions (2022), https://www.ucsusa.org/sites/default/files/2022-09/driving-cleaner-report.pdf; Florian Knobloch et al., Net emission reductions from electric cars and heat pumps in 59 world regions over time (Dec. 1, 2020), https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7308170/pdf/EMS85812.pdf (author manuscript; published in final edited form at 3 Natural Sustainability 437 (2020)).

If EPA proceeds as proposed, it must undertake a full and comprehensive upstream emissions analysis for all vehicles as part of its cost-benefit analysis. However, as noted above, EPA itself previously (and reasonably) interpreted the statute as granting it discretion to include upstream emissions and has set standards that do so. 88 Fed. Reg. at 29252; 77 Fed. Reg. at 62816. We believe the better option is to include upstream emissions of all vehicles in compliance accounting, particularly as EVs are becoming a larger part of the new vehicle fleet and the proliferation of ever larger and heavier EVs increases their upstream emissions. In either case, as EPA states, any accounting of upstream emissions—whether for compliance purposes or cost-benefit analysis—must be consistent for all vehicles. If the Agency proceeds as proposed, we strongly urge it not to characterize its decision as "permanent." Both the vehicle and power generation industries are currently undergoing rapid changes. Though power generation emissions have been declining, the need for electricity is increasing, and the reduction of EV energy use will become more important as the fleet becomes more electrified. Any decision now to permanently omit fleet upstream emissions compliance accounting would be premature. [EPA-HQ-OAR-2022-0829-0759, pp. 63-64]

Organization: Exxon Mobil Corporation

EPA should also consider complementary GHG emission standards for new vehicles based on a well-to-wheels (WTW) lifecycle emissions accounting methodology. Such standards would encourage lower CO2e emissions per mile driven (gCO2e/mile) complementing the above-mentioned carbon-intensity based standards for the energy used by the vehicles. Current vehicle GHG standards account only for fuel combustion or tank- to-wheels emissions. A WTW approach, which accounts for lifecycle GHG emissions, allows for a more transparent comparison between the lifecycle emissions associated with vehicle types. In the case of BEVs or plug-in hybrid electric vehicles, such a standard would allow consumers to see the emissions associated with the electricity used to power these vehicles. Moreover, it enables consistent GHG accounting, and thus provides a more holistic approach toward encouraging advancement in vehicle technologies that can reduce GHG emissions. [EPA-HQ-OAR-2022-0829-0632, pp. 3-4]

Organization: Ford Motor Company

Upstream emissions

Ford fully supports EPA's proposal to continue to exclude upstream emission accounting from manufacturer's compliance calculations for PHEVs and EVs, and we encourage CARB and NHTSA to align with EPA's approach when developing future standards. [EPA-HQ-OAR-2022-0829-0605, p. 9]

Organization: General Motors, LLC (GM)

We support continued treatment of EVs as zero gram per mile in the GHG and Tier 4 regulations. This is appropriate due to EVs emitting zero emissions, and due to EV upstream emissions being outside the control of regulated auto companies [EPA-HQ-OAR-2022-0829-0700, p. 5]

Organization: Growth Energy

Yet the Proposed Rule almost entirely ignores the GHG-reduction and other benefits of ethanol and other biofuels. Most significantly, it fails even to consider the upstream carbon sink that results from growing crops used in biofuels while simultaneously dismissing the upstream carbon emissions of building and powering EVs. EPA assesses the emissions lifecycles of two complex vehicle systems—EVs and internal combustion engine ("ICE") vehicles—in a way that heavily puts the thumb on the scale in favor in EVs. First, although both EVs and ICE vehicles generate "upstream" emissions from vehicle and engine production and power generation, EPA dismisses this reality. Second, although ICE vehicles can run on a diverse range of fuels with vastly different GHG emissions profiles, EPA fails to consider this diversity when assessing "downstream" emissions from petroleum-based and biofuels-based vehicle systems. The result is a proposal that inaccurately treats EVs as if they generate zero grams per mile of carbon and just as inaccurately treats emissions from the use of biofuels the same as emissions from combusting petroleum fuels. [EPA-HQ-OAR-2022-0829-0580, p. 3]

The Proposed Rule is different in kind than EPA's prior tailpipe rules. For one, it makes permanent EPA's disregard of the upstream emissions of EVs, which prior rules promised would be temporary. [EPA-HQ-OAR-2022-0829-0580, p. 4]

The zero grams/mile compliance value for EVs … does not reflect the increase in upstream GHG emissions associated with the electricity used by EVs compared to the upstream GHG emissions associated with the gasoline or diesel fuel used by conventional vehicles. For example, based on GHG emissions from today's national average electricity generation (including GHG emissions associated with feedstock extraction, processing, and transportation) and other key assumptions related to vehicle electricity consumption, vehicle charging losses, and grid transmission losses, a midsize EV might have an upstream GHG emissions of about 180 grams/mile, compared to the upstream GHG emissions of a typical midsize gasoline car of about 60 grams/mile. Thus, the EV would cause a net upstream GHG emissions increase of about 120 grams/mile (in general, the net upstream GHG increase would be less for a smaller EV and more for a larger EV). [EPA-HQ-OAR-2022-0829-0580, pp. 6-7]

75 Fed. Reg. 25,324.

And that estimate of 120 grams/mile for EVs' upstream emissions does not even account for emissions associated with production of batteries. Recent research has increasingly revealed that there are significant GHG emissions associated with the mining of materials for production of batteries used in EVs.6 For example, mining nickel alone requires both significant fossil energy expenditures and GHG emissions associated with land use, including the clear-cutting of rainforest in Indonesia.7 When compared to production of an ICE vehicle on a cradle-to-grave basis, those emissions represent another source of emissions from EVs that are not addressed in EPA's assumption that EVs produce zero grams per mile of GHGs. [EPA-HQ-OAR-2022-0829-0580, pp. 6-7]

6 See, e.g., Catherine Early, The new 'gold rush' for green lithium, BBC News (Nov. 24, 2020) https://www.bbc.com/future/article/20201124-how-geothermal-lithium-could-revolutionise-green-energy.

7 Jon Emont, EV Makers Confront the 'Nickel Pickle', Wall Street Journal, June 4, 2023.

Indeed, a recent National Academy of Sciences ("NAS") assessment explained that an approach like EPA's fails to "fully capture" emissions from "the total light-duty vehicle system."8 NAS noted that one issue of that type of non-system-based analysis is that it would lead to inaccurate comparisons between vehicles using different fuels.9 And NAS further opined that: [EPA-HQ-OAR-2022-0829-0580, pp. 6-7]

8 National Academy of Sciences (NAS), Assessment of Technologies for Improving Light-Duty Vehicle Fuel Economy—2025-2035 at 13-416 (2021).

9 Id.

[I]f deep GHG emissions reduction is a goal, then there will need to be consideration of not only onboard vehicle emissions, but also the emissions from related sectors, like electricity (for vehicle charging), and manufacturing (of vehicles and their materials and components). This motivates the need for life cycle thinking.10 [EPA-HQ-OAR-2022-0829-0580, pp. 6-7]

10 Id.

Moreover, EPA has not acknowledged the inaccuracy of failing to account for the carbon absorbed by biofuel feedstocks when they are grown. Because all of the carbon emitted from a tailpipe is sequestered by crops while they grow, EPA's emissions values assigned to ICE vehicles using biofuels misses dramatically in the other direction. [EPA-HQ-OAR-2022-0829-0580, pp. 7-8]

The fundamental scientific reality that emissions from combusting biofuels is offset by crops' absorption of carbon is reflected in other EPA programs like the Renewable Fuel Standard program. There, emissions from combustion of biofuels in a vehicle are excluded in lifecycle analyses because "[o]ver the full lifecycle of the fuel, the CO2 emitted from biomass-based fuels combustion does not increase atmospheric CO2 concentrations, assuming the biogenic carbon emitted is offset by the uptake of CO2 resulting from the growth of new biomass." 74 Fed. Reg. 24,904, 25040 (May 26, 2009). Similarly, the IPCC excludes emissions from combustion of fuels from biogenic sources when assessing national or sectoral carbon emissions. See 2006 IPCC

Guidelines for National Greenhouse Gas Inventories Vol. 2 at 2.3.3.4. [EPA-HQ-OAR-2022-0829-0580, pp. 7-8]

EPA's failure to recognize biofuels' upstream carbon benefits leads to absurd results in the context of the Proposed Rule. For example, a 2019 MIT study found that, when accounting for emissions from all aspects of a vehicle's manufacturing, fueling, and use, EVs emitted about 200 grams/mile over their lifetimes, compared to about 350 grams per mile for gasoline powered cars, for an emissions reduction of about 43 percent.11 That emissions reduction is very similar to the 46 percent reduction of 100 percent ethanol compared to petroleum.12 Yet, the Proposed Rule would treat an EV as emitting zero GHGs while treating an ICE vehicle running on 100 percent ethanol as having the same lifecycle GHG emissions as petroleum. [EPA-HQ-OAR-2022-0829-0580, pp. 7-8]

11 Massachusetts Institute of Technology, Insights into Future Mobility (2019), available at https://energy.mit.edu/wp-content/uploads/2019/11/Insights-into-Future-Mobility.pdf.

12 Scully, et. al., Carbon intensity of corn ethanol in the United States: state of the science 16 Environ. Res. Lett. 043001 (2021).

Indeed, EPA has already created a methodology for accounting for upstream emissions from EVs; prior light-duty vehicle rules committed to begin accounting for upstream emissions above a certain cap in future years. See, e.g., 77 Fed. Reg. 62624. [EPA-HQ-OAR-2022-0829-0580, p. 10]

EPA provided the following example of how that emissions accounting would work for a Nissan Leaf: [EPA-HQ-OAR-2022-0829-0580, p. 10]

-A measured 2-cycle vehicle electricity consumption of 238 watt-hours/mile over the EPA city and highway tests [EPA-HQ-OAR-2022-0829-0580, p. 10]

-Adjusting this watt-hours/mile value upward to account for electricity losses during electricity transmission (dividing 238 watt-hours/mile by 0.935 to account for grid/transmission losses yields a value of 255 watt-hours/mile) [EPA-HQ-OAR-2022-0829-0580, p. 10]

-Multiplying the adjusted watt-hours/mile value by a 2030 EV/PHEV electricity upstream GHG emissions rate of 0.534 grams/watt-hour at the power plant (255 watt-hours/mile multiplied by 0.534 grams GHG/watt-hour yields 136 grams/mile) [EPA-HQ-OAR-2022-0829-0580, p. 10]

-Subtracting the upstream GHG emissions of a comparable midsize gasoline vehicle of 41 grams/mile to reflect a full net increase in upstream GHG emissions (136 grams/mile for the EV minus 41 grams/mile for the gasoline vehicle yields a net increase and EV compliance value of 95 grams/mile). [EPA-HQ-OAR-2022-0829-0580, p. 10]

Id. at 82,822. While that methodology is a simplification of the upstream emissions to a certain extent, it is an easily workable estimate for the upstream emissions from EVs. EPA could and should, at a minimum, use that approach or a similar one to account for EV emissions for 2027 and later years in this rule. [EPA-HQ-OAR-2022-0829-0580, p. 10]

Yet, EPA backed away from its promise to account for upstream emissions in the 2020 rule, and it has now proposed to make the continued lack of any such accounting "permanent." 88 Fed. Reg. at 29,252. EPA articulated two purported reasons for doing so: (1) that its regulations have “functioned as intended” without any upstream accounting by “encouraging the continued development and introduction of electric vehicle technology,” and (2) that upstream emissions are “addressed by separate stationary source programs.” Id. [EPA-HQ-OAR-2022-0829-0580, p. 10]

Neither of those justifications is a rational reason to continue deliberately underestimating the emissions from EVs. To begin with, while it is true that systematic underestimates of emissions incentivize EV development, this ignores the fact that they disincentivize development in other promising GHG-reduction technologies like biofuels. By incentivizing one technology to the exclusion of others, EPA is reducing an opportunity to develop different technologies that will be appropriate for more applications across the country. [EPA-HQ-OAR-2022-0829-0580, p. 10]

And the fact that upstream emissions are addressed by stationary source permitting programs is no justification at all. Those programs help reduce emissions but do not eliminate them—EPA’s rule still fails to estimate the true lifecycle emissions from EVs even when considering that power plants must get Title V, PSD, and NSPS permits. [EPA-HQ-OAR-2022-0829-0580, p. 10]

EPA also points out that, if it estimated upstream emissions from EVs, “it would appear appropriate to do so for all vehicles, including gasoline-fueled vehicles.” 88 Fed. Reg. at 29,252. [EPA-HQ-OAR-2022-0829-0580, p. 10]

That’s right—EPA should compare apples to apples. But that additional burden of estimating another set of upstream emissions is no reason not to do it. By comparing the lifecycle emissions of EVs and the lifecycle emissions of ICE vehicles, EPA could much better align the incentives provided by its tailpipe rules with the real world. [EPA-HQ-OAR-2022-0829-0580, p. 10]

EPA should ensure that its tailpipe rule maximizes emissions reductions and minimize costs. Appropriately accounting for the lifecycle GHG emissions of vehicles would eliminate unintended consequences like incentivizing fossil hydrogen over low-carbon biofuels. And it would align the incentives provided by EPA’s tailpipe rule with an accurate calculation of lifecycle GHG emissions so that the market can achieve the greatest emissions reductions in the most efficient way. For some vehicle needs and local markets, that may be investing in EVs, but in others it may be investing in vehicles with efficient ICE engines that can and do use higher biofuel blends. [EPA-HQ-OAR-2022-0829-0580, pp. 11-12]

V. The Proposed Rule’s Permanence and Stringency Make its Disparate Treatment of Biofuels and EVs More Problematic.

A. The Impacts of the Proposed Rule are Much More Dramatic than in Previous Tailpipe Rules.

While previous tailpipe rules have made similar mistakes in failing to properly estimate emissions from biofuels and EVs, the impacts of the Proposed Rule are much greater, for two reasons. [EPA-HQ-OAR-2022-0829-0580, pp. 13-14]

First, EPA’s decisions in prior rules not to account for the upstream emissions of EVs were characterized as temporary. In 2012, EPA committed to accounting for upstream emissions above a certain cap for each automaker starting in model years 2022 through 2025. 77 Fed. Reg. at 62,822. EPA later extended the time period of not accounting for upstream emissions through

2026, but it still indicated that such treatment would be temporary. See 86 Fed. Reg. at 74,446. In contrast, the proposed rule is clear that EVs would be considered to emit zero grams per mile permanently. 88 Fed. Reg. at 29,252. Permanence changes the nature of and basis for that decision. [EPA-HQ-OAR-2022-0829-0580, pp. 13-14]

There may have been some justification for previously treating EVs as emitting zero grams per mile on a temporary basis. When EVs were in their relative infancy and needed some assistance to become better established, EPA could credibly assert that it was rational to give EVs an additional boost relative to other vehicles by conducting a skewed assessment of their emissions. Similarly, it would have been understandable if EPA had needed some time after EVs were introduced into commerce on a wider scale to best determine how to calculate their upstream emissions. But both of those excuses are now gone. EPA has already had over a decade since it promised in 2012 to account for upstream emissions of EVs in the future, and manufacturers have had that same amount of time with a thumb on the scale in their favor to ramp up their production. [EPA-HQ-OAR-2022-0829-0580, pp. 13-14]

Second, the proposed rule's stringency makes the impact of EPA's failure to consider both the upstream carbon sinks of biofuels and the upstream carbon emissions of EVs much greater. To date, EPA's tailpipe rules have incentivized EVs at the expense of other technologies, but they have done so in a manner that left room for other vehicles and fuels to play an important part in meeting the country's transportation needs. Today, EPA is putting all of its eggs in the EV basket. The only compliance scenario EPA discusses in the proposal would require more than two-thirds of all new vehicles to be EVs by 2032 (and, if it continues on its current trajectory, the percentage will presumably climb from there). That dramatic shift to EVs is fundamentally different than in prior rules. It disincentivizes biofuel use, even where biofuels could help reduce GHG emissions and be more suited to certain applications, like providing a low-carbon option in areas without sufficient charging infrastructure or with a carbon-intensive electric grid. [EPA-HQ-OAR-2022-0829-0580, p. 14]

Organization: HF Sinclair Corporation

By mandating the rapid electrification of the U.S. LD and MD passenger fleet, EPA's Proposed Rule exceeds its statutory and Congressional authority and severely constrains consumer choice. In so doing, EPA fails to fully account for the total carbon footprint of PEVs. [EPA-HQ-OAR-2022-0829-0579, p. 2]

Notably, EPA's assumption that PEVs produce zero GHGs – coupled with its failure to account for the overall carbon intensity associated with not only powering PEVs but also the emissions tied to mining, processing, and manufacturing of critical minerals necessary for PEV batteries – impedes the agency's ability to conduct a complete comparison of the GHG emissions resulting from different vehicle technologies. [EPA-HQ-OAR-2022-0829-0579, p. 2]

III. The Proposed Rule is Arbitrary and Capricious

a. EPA Fails to Properly Account for All GHG Emissions from PEVs

In an attempt to hinder consumer choice and penalize specific forms of technology, EPA's proposed rule fails fully account for the lifecycle GHG emissions that come from PEVs, creating a disparity between how ICE and PEV vehicle emissions are treated. While EPA purports to have considered the GHG emissions attributed to upstream emissions impacts from fuel production at refineries and electricity generating units,27 EPA assumes – without any factual basis – that the power sector will become cleaner over time through the increased use of wind and solar generation and electricity storage (i.e., more batteries). This in turn will purportedly mitigate EPA's recognized concern that, as a result of the proposed rule, "increases in emissions from [Electric Generating Units] . . . would lead to changes in exposure for people living in communities near these facilities."28 But, EPA glosses over this analysis, and instead only focuses on tailpipe emissions. And even if EPA's assumptions on a cleaner electric grid are correct, EPA fails to account for the increased GHG emissions that will come from an increasing effort to mine, process, and manufacture the critical minerals that will be required to both deliver batteries to power an all- electric future fleet as well as deliver "zero-emission" power to the grid. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

27 Proposed Rule at 29,252.

28 Proposed Rule at 29,327.

Moreover, EPA's proposal to remove upstream emissions from vehicle compliance determinations will incentivize vehicle manufacturers to produce PEVs without having to account for any of the associated emissions impact while ignoring labor and environmental standards of other nations. Preferentially accounting for certain air pollutant emissions over others within the same regulated vehicle class flies in the face of both EPA's statutory authority to prescribe "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles…"29 and its purported regulatory objective to reduce GHG emissions. If PEVs are vehicles which cause or contribute to air pollution, then all associated pollution must be accounted for. If not, EPA may not include PEVs in the regulated "class" of motor vehicles along with comparable ICE vehicles. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

29 42 U.S.C. § 7521(a)(1).

For instance, the power source of a PEV—a battery composed of carbon intensive minerals and the electricity generated to power the battery—produces emissions. The fact such emissions occur 100% upstream of the vehicle's operation and therefore fall outside of the tailpipe emissions calculation stacks the deck in favor of this technology. In fact, according to the International Energy Association, PEVs require six times the raw materials as a traditional ICE vehicle.30 There is no logical basis for this omission because, as EPA is aware, concerns about GHG emissions relate to their longer term global concentrations. Consequently, air pollutant emissions should be an important consideration regardless of where such emissions occur and, by myopically prioritizing PEVs, EPA fails to look at all technologically feasible options that may provide commensurate GHG reductions in a more cost-efficient manner. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

30 IEA, "In the transition to clean energy, critical minerals bring new challenges to energy security," (June 2023), available at https://www.iea.org/reports/the-role-of-critical-minerals-in-clean-energy-transitions/executive- summary.

The flaw in EPA's approach is illustrated by the fact that emissions standards easily become meaningless by changing the engine's location. The proposed rule would treat a PEV charged by a diesel-powered generator as if it had zero tailpipe emissions, notwithstanding the fact that it remains "powered" by a diesel engine located outside the vehicle. A light-duty vehicle directly powered by a diesel engine inside the vehicle, however, is credited with the emissions produced by that engine. Thus, the source of the "fuel" matters. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

For instance, the power source of a PEV—a battery composed of carbon intensive minerals and the electricity generated to power the battery—produces emissions. The fact such emissions occur 100% upstream of the vehicle's operation and therefore fall outside of the tailpipe emissions calculation stacks the deck in favor of this technology. In fact, according to the International Energy Association, PEVs require six times the raw materials as a traditional ICE vehicle.30 There is no logical basis for this omission because, as EPA is aware, concerns about GHG emissions relate to their longer term global concentrations. Consequently, air pollutant emissions should be an important consideration regardless of where such emissions occur and, by myopically prioritizing PEVs, EPA fails to look at all technologically feasible options that may provide commensurate GHG reductions in a more cost-efficient manner. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

30 IEA, "In the transition to clean energy, critical minerals bring new challenges to energy security," (June 2023), available at https://www.iea.org/reports/the-role-of-critical-minerals-in-clean-energy-transitions/executive- summary.

Finally, EPA has not considered the foreseeable, indirect impacts the Proposed Rule will have on ambient air quality. First, with the high purchase price of new PEVs, consumers will likely hold on to their older, higher-emitting ICE vehicles to avoid the increased purchase price of a PEV. Second, PEVs are heavier, and will increase particulate matter emissions through increased brake, tire, and road wear. Ultimately, EPA arbitrarily ignores the full scope of emissions that will come from PEVs, and a full lifecycle analysis of all potential vehicle technologies must be conducted to fully understand the environmental impacts of the Proposed Rule. [EPA-HQ-OAR-2022-0829-0579, pp. 7-9]

Organization: Jaguar Land Rover NA, LLC (JLR)

0 g/mile of ZEVs

JLR supports the EPA's proposal to only include direct vehicle tailpipe emissions for a vehicle, thereby maintaining the 0 g/mile accounting of ZEV in the regulation. In the case of battery electric vehicles (BEVs), it is entirely true that they emit zero tailpipe CO_2 emissions, so they should be treated in the regulation as such. To expand or change this definition would be a fundamental change to the regulation. JLR opposes such a drastic change, especially while the technology is still scaling up. [EPA-HQ-OAR-2022-0829-0744, p. 4]

Organization: John Graham

The Preamble states on page 29342:

"At the same time, we note that the proposed standards are performance-based and do not mandate any specific technology for any manufacturer or any vehicle. Moreover, the overall industry does not necessarily need to reach this level of BEVs in order to comply—the projection in our analysis is one of many possible compliance pathways that manufacturers could choose to take under the performance-based standards. For example, manufacturers that choose to increase their sales of HEV and PHEV technologies or apply more advanced technology to non-hybrid

ICE vehicles would require a smaller number of BEVs than we have projected in our assessment to comply with the proposed standards. [EPA-HQ-OAR-2022-0829-0585, p. 37]

While EPA is correct that specific technologies are not actually mandated and manufacturers can choose to increase their sales of HEV and PHEV technologies, EPA is NOT correct that the "proposed standards are performance-based". As illustrated in Table 1, EPA has put its thumb on the scale and given BEVs approximately a $4,500 ($3,000 DMC) advantage – in addition to the temporary advantages that Congress gave BEVs in the Inflation Reduction Act of 2022. Given that the incremental cost (DMC) of a HEV is only about $2,000, this is a huge artificial disadvantage to HEVs. Had EPA used a lifecycle metric in the CO2 performance standards (rather than the tailpipe metric), the deployment rates of BEVs and hybrids would be more evenly distributed and the overall impact of the standards on total CO2 emissions and total costs would have been more favorable. The agency should run the OMEGA modeling using our suggested assumptions in the final rule. [EPA-HQ-OAR-2022-0829-0585, p. 37]

When EPA first decided, in the 2012 rulemaking (for 2017-2025 models), to use the 0 gram/mile tailpipe assumption for BEVs, it was defended as a temporary provision to spur additional BEV offerings at a time when few BEVs were available for consumers. The circumstances are totally different today. The number of new BEV offerings has proliferated, as ably documented in the NPRM, and Congress has provided a special set of subsidies (in the Inflation Reduction Act) to spur BEV deployment. EPA has no basis for using its discretionary authority to weaken environmental protection by giving a special compliance advantage for BEVs relative to HEVs. [EPA-HQ-OAR-2022-0829-0585, p. 38]

Organization: KALA Engineering Consultants

Comments

1. If I was not an engineer deeply steeped in the subtleties of transportation emission issues and I read your Federal Register (FedReg) text or news reports written by reporters unfamiliar with the actual science basis for your proposed rulemaking for Docket EPA–HQ–OAR– 2022–0829 Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, I might come away from certain descriptions of vehicles discussed in such text as describing transportation vehicles that have absolutely no emissions coming from them or attributable to them at all. Repeated use by the EPA of the terms Zero Emission and Zero Emission Vehicle (ZEV) could lead some to believe there actually is such a thing, when all of EPA's emission scientists and engineers know this is not the case. We hesitate to charge EPA with putting out deliberately misleading characterizations of Battery Electric Vehicles (BEV) as true ZERO emission vehicles, but it seems that way. Examples from the FedReg text below: [EPA-HQ-OAR-2022-0829-0617, pp. 3-4]

From Section I. A. 2, i: "These industry advancements in the production and sales of zero- and near-zero emission vehicles are already occurring both domestically and globally,… [EPA-HQ-OAR-2022-0829-0617, pp. 3-4]

As the term ''zero-emission vehicle'' suggests, these cars and trucks have zero GHG and criteria pollutant emissions from their tailpipes, which can represent significant reductions over current emissions (particularly for GHG). [EPA-HQ-OAR-2022-0829-0617, pp. 3-4]

[I]t is important to recognize that, despite this anticipated growth in zero-emission vehicles, many internal combustion engine (ICE) vehicles will continue to be sold during the time frame of the rule and will remain on the road for many years afterward." [EPA-HQ-OAR-2022-0829-0617, pp. 3-4]

KALA strenuously objects to what seems to be un-scientific and cavalier use of the "zero emission" terminology when referring to all-electric rechargeable vehicles when all of you know that there may well be fossil-fueled electric generating units (EGU), emitting lots of GHG, supplying the electric power to recharge those vehicle batteries. We implore the EPA to be more scientifically precise in its terminology for BEVs as Zero Operating Emission vehicles and use acronyms of (ZOE and ZOEV). Such proper terminology gives the uninformed reader the idea that there may be no emissions from operation of BEVs, but there might be emissions associated with the electrical refueling, ie, recharging, of those vehicles. Yes, we know that the ZEV terminology used by EPA fits into what we believe is misguided regulatory consideration of ONLY the operating emissions or lack thereof from ZOEVs while entirely ignoring the "Upstream" GHG emissions associated with battery recharge. EPA cannot have this situation represent realistic GHG considerations if you cling to that artifice. We could give you several dandy analogies, but we won't waste your time. [EPA-HQ-OAR-2022-0829-0617, pp. 3-4]

EPA waxes poetic about all the upcoming public and private BEV recharging facilities that have been and are being installed or planned to be installed. It seems odd to us that the GHG emissions associated with all those charging facilities are simply being ignored in any calculations of attributable GHG emissions that could arguably be linked to BEV expansion in the US fleet. [EPA-HQ-OAR-2022-0829-0617, pp. 3-4]

Charging facilities are NOT zero emission when all of the associated GHG emissions are considered. These recharging facilities would not be being installed if there were no BEVs. Therefore, all of these recharging stations and facilities are new to the status quo situation and therefore have GHG emissions directly relatable to the presence of BEVs. All of the copper used in these facilities has GHG emissions associated with mining, haulage, transport, smelting, wire drawing and reeling. The plastic used in these facilities and as wire insulation almost certainly comes from petroleum stocks with GHG emissions associated with the creation of the plastics. Concrete and reinforcing steel used to support the facilities and provide driveways and parking areas have GHG emissions directly associated with the construction of these facilities, plus the fossil fuels used by construction machinery and vehicles doing that construction. We could go on, but it seems that EPA staff is conveniently ignoring the GHG emissions associated with what will become the millions of recharging facilities and stations needed to support the advancement of electric vehicles promulgated under these proposed regulatory rules. Such willful dismissal or ignoring of these types of issues when it comes to GHG emissions associated with rule making that essentially requires vehicle manufacturers to move to BEV adoption as virtually their sole option for compliance smacks of the work of zealots – in this case electrification zealots within the EPA. [EPA-HQ-OAR-2022-0829-0617, pp. 3-4]

Comment

3. The EPA appears to be using a very "special" consideration of emissions that are to be counted as regulated emission from Battery Electric Vehicles (BEV). In unbelievable statements of contorted logic, the EPA has set forth what we describe as a complete artifice designed to promote and "force" a major change to vehicle propulsion starting in model year 2027. While it

is true that during operation BEVs produce no criteria pollutants and emit no GHG gasses, the same cannot be said for the probable sources of the electric power used to recharge the batteries of BEVs. We wish this were not so, but we must deal factually with emissions associated with BEV recharging. If the EPA is serious about GHG reductions, they MUST include and consider the GHG emissions of grid-connected Electric Generating Units (EGU). Much like the water that comes from our faucets, several water sources could be being used to provide that water. So it is with electricity. No one can distinguish or filter out clean electrons coming from wind and solar sources and “dirty” electrons coming from GHG-intensive electric generation. [EPA-HQ-OAR-2022-0829-0617, pp. 8-10]

Power that comes into homes and businesses may well be a mix of so-called clean energy and emission-laden dirty energy produced by burning fossil fuels. In fact, the mix of electricity generation varies greatly by state or region, depending on what the “serving utility” chooses to use for generation. Some regions rely almost entirely on fossil fuel and nuclear generation methods, while others have added or switched to renewable energy production methods, such as wind and solar as part of their generation mix. There are few if any regions of the United States that are completely powered by renewable or GHG-free energy. There are GHG implications for most of the so-called renewable generation methods. Solar panels are often produced with high Global Warming Potential (GWP) chemicals being released and there are GHG emissions associated with the steel, carbon fibers, plastics and copper conductors used in wind turbines. All this is to say there are GHG emissions associated with virtually all forms of electric generation that cannot be ignored when considering whether or not the introduction of a new form of vehicle propulsion that relies on recharging batteries will have associated GHG emissions. The latest figures from the Energy Information Agency for 2022, show the mix of energy production for the US: [EPA-HQ-OAR-2022-0829-0617, pp. 8-10]

[See original attachment for U.S. utility-scale electricity generation by source, amount, and share of total in 20221 Data as of February 2023] [EPA-HQ-OAR-2022-0829-0617, pp. 8-10]

As you can see, 60.2% of overall US electricity generation was still produced by burning fossil fuels with their associated GHG and other pollutant emissions. When we aggregate how much GHG emissions might be attributable to recharging Battery Electric Vehicles we normally do so on a nation-wide scale using the latest available information. Since regional electric power generation is so varied, we cannot say a BEV in Southern California will have lower associated GHG emissions than one recharging in St. Paul, Minnesota. [EPA-HQ-OAR-2022-0829-0617, pp. 8-10]

Therefore, as of 2022, we can say in aggregate, there is a 60% chance that the electrons used to recharge BEVs over the next few years will be from fossil CO2 emitting fossil fuel generating plants. That is why, any scientific calculations made for the GHG contributions that a BEV makes must consider how the recharging power delivered to the BEV was generated. A BEV may have zero operating emissions but they do NOT have zero GHG emissions associated with their use. It is our considered engineering opinion that much of the so-called “low-hanging fruit” for renewable generation in the US has already been implemented and is now on-line or soon will be. [EPA-HQ-OAR-2022-0829-0617, pp. 8-10]

Think about an Electric Utility company that has literally made billions of dollars of investments in coal and/or natural gas fired power plants. In their board room minds, they are doing just fine making electricity in the same old way as they did 50 years ago and feel no compunction at all about charging their customers more for electricity when the cost of the fossil fuels they burn go up. Why would such a business feel compelled to create “stranded assets” of their fossil-fired generating facilities long before their estimated useful life expires and switch over to renewable forms of electricity generation? Might it be because the board of directors and the management suddenly “feel” like it is the “right” thing to do for the planet. Really?? Seriously, businesses have built-in inertia when they have made large investments in what brings in revenue for the business and for their stock holders. They might agree that new generating capacity should be renewable, but there is great impetus to expand their existing fossil fuel-fired facilities with a new generator unit. [EPA-HQ-OAR-2022-0829-0617, pp. 8-10]

So, the 60% fossil fuel number may stubbornly stay close to that figure for some time. The EPA attempted to control both pollutant and GHG emissions from power plants when the “Clean Power Plan” was part of policy thrusts, but they were less than successful in courts and countering the Utility and Fossil Fuel lobbies in Congress. [EPA-HQ-OAR-2022-0829-0617, pp. 8-10]

https://www.nationofchange.org/2022/07/05/the-supreme-court-has-curtailed-epas-power-to-regulate- carbon-pollution-and-sent-a-warning-to-other-regulators/ [EPA-HQ-OAR-2022-0829-0617, pp. 8-10]

Given that background, let us look at how EPA proposes to treat and count emissions from BEV vehicles from excerpts from the Federal Register publication: [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

From Section III. B. 7. “Treatment of PEVs and FCEVs in the Fleet Average: As originally envisioned in the 2012 rule, starting with MY 2022, the compliance value for BEVs, FCEVs, and the electric portion of PHEVs in excess of individual automaker cumulative production caps would be based on net upstream emissions accounting (i.e., EPA would attribute a pro rata share of national CO2 emissions from electricity generation to each mile driven under electric power…). The 2012 rule would have required net upstream emissions accounting for all MY 2022 and later electrified vehicles. However, in the 2020 rule, prior to upstream accounting taking effect, EPA revised its regulations to extend the use of 0 g/mile compliance value through MY 2026 with no production cap, effectively continuing the practice of basing compliance only on tailpipe emissions for all vehicle and fuel types.” [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

Let’s stop here and parse out this set of statements. Prior to the cited text, EPA gave some history on how they were thinking about applying regulations for BOTH criteria pollutants and GHG emissions. Ostensibly because the number of BEVs was so small, auto makers were given credit for emission reductions, particularly GHG reductions, up to a company-wide vehicle production cap (a maximum value over which the company would not receive any emission credits). That is why the “individual automaker cumulative production caps” is part of the cited statements above. EPA states that their original thinking on GHG emissions from BEVs would be “based on net upstream emissions accounting,” which they further explain would be a “pro-rata share of national CO2 emissions from electricity generation to each mile driven under electric power.” As we discussed above, a nation-wide aggregation of the share of recharging GHG emissions attributable to fossil fueled generation would be about 60% as of 2022. [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

However, for some reason the EPA made a decision prior to doing any actual “upstream” CO2 accounting in their 2020 rulemaking that they would NOT do any upstream (meaning emissions attributable to activities that produced either the fuel in a gas tank or electricity to recharge a battery) accounting specifically for GHG emissions AND for criteria pollutants. EPA seems to justify its astonishing position on not accounting for GHG emissions related to battery recharge by saying they are treating all vehicles the same by not trying to account for all upstream emissions for BOTH liquid petroleum fuels and recharge electricity. [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

Let us state for the record that we agree with EPA for regulatory treatment of criteria pollutants from BEVs as zero grams per mile. We don’t see any other way of accounting for both upstream and operations-attributable emissions, even though there were emissions related to the production of the materials used in the BEV, those emissions are virtually the same as those for producing a conventional gasoline vehicle. The only emission exceptions would be for battery production and electric motor components that would have different emission profiles than gas engine parts. We think these are minor differences and the upstream emissions for both the gasoline and BEV vehicles themselves are a wash. [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

However, KALA, in the most strenuous way possible, disagrees that upstream GHG emissions for battery recharge should treated the same way as zero grams per mile. The justification that you are treating each vehicle type the same is simply not tenable in any stretch of the imagination. We think that the EPA may have been incorrectly influenced by electrification zealots within the agency who when discussing how BEV GHG emissions should be handled argued something like this: [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

Hey guys we all know that we want to electrify the fleet as much as possible, after all we know that electrification is the only way to truly get GHG emissions under control in a big way, don’t we? So, hey, let’s figure out a way to justify treating the emissions from BEVs as zero all the way around even though we know there are upstream GHG emissions for battery recharge. Maybe if we say that we will treat emissions the same as “tail pipe’ emissions while operating the vehicles, we can get away with counting BEV emissions as zero and really push the auto makers away from gasoline into making predominantly BEVs. [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

Now, we don’t know how the decision was made to treat BEV GHG emissions as zero without any regard for how different BEVs are. The method used for regulating tail pipe emissions from gasoline vehicles requires fuel to be stored in the gas tank and that fuel is used to power the internal combustion engine, which emits both GHG and other air pollutants. That is no different than filling a battery up with “electric fuel” and then accounting for the emissions that made the BEV go down the road. It just so happens that the emissions to fill up the BEV’s “tank” occur before the stored energy is used, but that is because the mode of propulsion and the way in which energy is stored and “refilled” is so different in a BEV. [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

No matter how the EPA moved from the “correct” way to treat BEV emissions by accounting for net upstream GHG emissions as a pro-rata share of national CO2 emissions from electric generation to the “insane” way of completely ignoring them, the initial way of treating GHG emissions from BEVs was the correct first impulse. [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

Otherwise we have no way of comparing GHG emissions from gasoline and diesel powered vehicles and BEVs. It could be that the EPA attempted to make calculations for that pro-rata share of national electric generation CO2 emissions (as an engineer that is what I would do) and found the results not to their liking. That could well be because of the abysmal final efficiency of converting the energy in fossil fuels into rolling motion of a BEV. We offer an info graphic way of showing that terrible efficiency below: [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

[See original attachment for graphics of electric vehicle issues] [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

The science and engineering behind the GHG emission figures associated with BEVs has principally to do with efficiencies of conversion of fossil fuels (remember we still have 60.2% of all electricity being generated by fossil fuels) to electricity and the losses that are seen in transmission, recharge of batteries and conversion of electric charge stored in batteries to rolling motion of the vehicle. The GHG impact of this horrendously low final efficiency is that far more GHG is produced to propel a BEV one mile than a comparable gasoline-powered vehicle. We believe it is entirely possible that the EPA understood the implications of such poor efficiencies, decided that it was in the national interest of the country to electrify the US fleet anyway regardless of the true GHG emission aspects of BEVs and found a way to drive or "Steer" fleet change over by ignoring upstream GHG emissions associated with BEV battery recharge in the regulatory scheme. We hope that is not the case, but it sure looks and feels that way. [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

EPA further continues to justify the compliance treatment of BEVs in Section III. B. 7. "EPA is proposing to make the current treatment of PEVs and FCEVs through MY 2026 permanent. EPA proposes to include only emissions measured directly from the vehicle in the vehicle GHG program for MYs 2027 and later (or until EPA changes the regulations through future rulemaking) consistent with the treatment of all other vehicles. Electric vehicle operation would therefore continue to be counted as 0 g/ mile, based on tailpipe emissions only…. The program has now been in place for a decade, since MY 2012, with no upstream accounting and has functioned as intended, encouraging the continued development and introduction of electric vehicle technology." [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

What did the EPA just say? They brazenly state that no matter what, GHG emissions from BEVs would continue to be counted as zero grams per mile. The program that counts emissions that way has "functioned as intended" to encourage BEV development and introduction into the vehicle fleet. Did they really just say that? Yes, EPA seems to be saying that it doesn't matter how illogical their counting method is for BEVs for GHGs, they are going to continue to do it that way and their motives to encourage or even force BEV transition and displacement through regulation becomes clear. [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

EPA further tries to justify their zero GHG emissions policy by again stating in Section III. B. 7. the following: "This approach of looking only at tailpipe emissions and letting stationary source GHG emissions be addressed by separate stationary source programs is consistent with how every other light duty vehicle calculates its compliance value. If EPA deviated from this tailpipe emissions approach by including upstream accounting, it would appear appropriate to do so for all vehicles, including gasoline- fueled vehicles." [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

We applaud the EPA for attempting, once again, to reduce stationary source (Electric Generating Units are considered to be stationary emissions sources) emissions. But, we are questioning the motives of the EPA for counting emissions from BEVs. As explained above, the equivalence way of looking at attributable GHG emissions is the "Filled Tank" approach suggested in this comment. How it was filled and whether or not the tank has associated emissions either from burning the stored contents of the tank in the case of liquid fuels or consuming the energy stored in a battery should make no difference in attributing GHG emissions to either situation. The only difference is when the related emissions occurred, before the stored energy was used or after the stored energy was used. This minor temporal difference cannot be ignored unless the EPA has an ulterior motive of forcing the change over of vehicle types in the US fleet through regulation. [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

The excuse in the cited FedReg text above that if EPA somehow deviated from the tail pipe emissions approach by including upstream [emissions] accounting they might have to do so for gasoline-fueled vehicles. Our response to that "terrible burden" on the EPA to account for upstream petroleum emissions is that such an argument is specious at best and just another vacuous justification. So what if the EPA had to account for upstream petroleum emissions. That might give us a higher resolution picture of the entirety of the vehicle GHG problem in a larger context. If the EPA considers the issue of accounting for upstream petroleum emissions too great a burden, the good news is that others have actually done this accounting. The group that we believe had the best methodology for accounting GHG emissions at stages of petroleum production and refining is the Renewable and Appropriate Energy Laboratory (RAEL) at UC Berkeley In a paper by the late Alex Farrell, GHG emissions at production stages provided total upstream emissions leading up to gasoline burned in ICEs. That group had a uniquely legible way to portray those upstream emissions graphically as shown below. [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

[See original attachment for alternative metrics for evaluating ethanol] [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

http://rael.berkeley.edu/old_drupal/sites/default/files/EBAMM/FarrellEthanolScience012706.pdf [EPA-HQ-OAR-2022-0829-0617, pp. 10-15]

Overall Comment #3 Conclusions:

A. Despite EPA's published protestations that their new rulemaking will provide leeway for multiple methods of vehicle propulsion to continue and that they have no wish to direct which propulsion method is the one they prefer, the evidence from statements made in describing the unreasonable "regulatory trick" of counting ONLY BEV tail pipe emissions for GHGs, has and will "Steer" automakers decisions toward BEVs as THE compliance solution. When EPA essentially says: "BEVs would be counted as 0 g/ mile in compliance calculations. The program has now been in place for a decade with no upstream accounting and has functioned as intended, encouraging the continued development and introduction of electric vehicle technology.," there is no doubt left in our minds as to the intentions of the EPA to change out ICE vehicles for BEVs through regulatory fiat. [EPA-HQ-OAR-2022-0829-0617, p. 15]

Organization: Kentucky Office of the Attorney General et al.

A. Treating EVs as zero-emitting vehicles is inaccurate.

EPA's claim that EVs should be counted as emitting zero tailpipe emissions is arbitrary. Electricity fuels battery-powered vehicles, and CO2-emitting sources create most electricity. What is U.S. electricity generation by energy source? U.S. Energy Information Administration (Feb. 2023), https://www.eia.gov/tools/faqs/faq.php?id=427&t=3 (In 2022, "[a]bout 60% of . . . electricity generation was from fossil fuels"). This is important because "[t]ailpipe emissions from an [internal combustion engine] vehicle can be comparable to . . . upstream electricity generation emissions." Vehicle criteria pollutant (PM, NOx, CO, HCs) emissions: how low should we go? NPJ Climate and Atmospheric Science (Nov. 5, 2018), https://www.nature.com/articles/s41612-018-0037-5. Yet EPA ignores these "upstream emissions" when determining compliance with the Proposed Rule. 88 Fed. Reg. at 29,252 ("EPA proposes to include only emissions measured directly from [EVs]   consistent with the treatment of all other vehicles."). [EPA-HQ-OAR-2022-0829-0649, p. 8]

EPA argues that refusing to account for upstream emissions furthers its mission to develop EVs. Id. ("The program has now been in place for a decade, since MY 2012, with no upstream accounting and has functioned as intended, encouraging the continued development and introduction of electric vehicle technology."). Congress has never authorized such a mission. To the contrary, the CAA states that "A primary goal of this chapter is to encourage or otherwise promote reasonable Federal, State, and local governmental actions, consistent with the provisions of this chapter, for pollution prevention." 42 U.S.C. § 7401(c). Thus, EPA's sanctioned mission here is pollution prevention, not EV development. Because the CAA announces no policy for special treatment of EVs, the Proposed Rule is arbitrary and capricious. [EPA-HQ-OAR-2022-0829-0649, p. 8]

Organization: Kia Corporation

Kia Supports Limiting Accounting of Upstream Emissions

Kia supports EPA's proposed treatment of limiting emission scope for vehicle programs to tailpipe only. This policy is consistent with previous rulemakings.16 The agency currently has a separate comment period to reduce thermal power stationary source GHG emissions to address concerns of upstream emissions to generate electricity. EPA's analysis of overall estimated emissions impact and projected benefits includes upstream emissions from fuel production and electricity generation. Accordingly, EPA's use of assumptions to limit emission scope for vehicles is appropriate. [EPA-HQ-OAR-2022-0829-0555, p. 9]

Organization: Letter Campaign, Ethanol Producers (7)

[The following letter was submitted by seven commenters; it is reproduced only once. The other commenters are: Highwater Ethanol, LLC (EPA-HQ-OAR-2022-0829-0552), Heartland Corn Products (EPA-HQ-OAR-2022-0829-0622), Absolute Energy, LLC (EPA-HQ-OAR-2022-0829-0716), Trenton Agri Products LLC (EPA-HQ-OAR-2022-0829-0755), Western New York Energy LLC (EPA-HQ-OAR-2022-0829-0753), Southwest Iowa Renewable Energy LLC (EPA-HQ-OAR-2022-0829-0582)]

The Agency's decision to assign a zero grams/mile compliance value to EVs unfairly favors electric vehicle manufacturers, while falsely assuming EVs have no carbon impacts whatsoever.

This approach fails to acknowledge the carbon impacts associated with electricity generation, as well as the immense emissions involved in battery mineral extraction and vehicle construction. Therefore, we strongly disagree with the EPA's proposal to exclude upstream emissions from greenhouse gas accounting. [EPA-HQ-OAR-2022-0829-0739, p. 1]

Organization: Marathon Petroleum Corporation (MPC)

EPA’s tailpipe-only approach also ignores the potential increase in upstream CO2 emissions that will result from manufacturing and fueling of electric vehicles. [EPA-HQ-OAR-2022-0829-0593, p. 2]

Alignment of EPA’s tailpipe emissions standards with other programs that promote domestic renewable liquid fuels, such as the RFS is needed. Mandating the blending and use of renewable liquid fuels in vehicles in one program while simultaneously ignoring the positive impacts of their use in another results in rules that are at cross purposes. Renewable liquid fuels can be a part of a multifaceted solution for reducing carbon emissions and similar treatment of their benefits from program to program would be a significant step forward for the EPA. This change would lead to significantly more investments in renewable liquid fuels, providing an option for meeting EPA’s goals that is compatible with ICE vehicles and does not require a wholesale shift in vehicle manufacturing and infrastructure, with its concomitant effects on U.S. drivers who would bear the costs. [EPA-HQ-OAR-2022-0829-0593, p. 4]

A continued push from the Agency to further narrow regulations in regard to renewable liquid fuels results in lost opportunities for investments and places additional burden on the transportation and fuels industry, as well as consumers. In addition, these lost opportunities for decarbonization are impactful, as renewable liquid fuels can be deployed quickly, at a large scale, and with significant carbon reductions in the transportation fuel sector. The renewable liquid fuel industry is well-positioned to produce the fuels needed to contribute to the EPA’s goals because renewable liquid fuels are widely accepted throughout the country. [EPA-HQ-OAR-2022-0829-0593, p. 4]

Organization: MECA Clean Mobility

Rather than permanently removing the requirement for BEV certification to account for upstream electricity generation, EPA should require upstream emission accounting for the generation of energy to power electric vehicles. [EPA-HQ-OAR-2022-0829-0564, pp. 30-31]

MECA supports EPA’s continued use of lifecycle analysis to analyze the regulatory impacts of its vehicle regulations. However, to drive future U.S. technology leadership and incentivize efficiency improvements in all vehicles, EPA should recognize the need to include life cycle analysis in the design of standards and compliance. When EPA began regulating GHG emissions from light-duty vehicles starting with MY 2012, the Agency decided to allow electric vehicles and fuel cell vehicles to claim 0 g/mile GHG in order to encourage the initial commercialization of these promising technologies.40,41 However, the Agency also finalized requirements for upstream emissions to be factored into electric and fuel cell vehicle certification levels as penetration of these vehicles increased. The justification given by EPA was that “upstream GHG emission values associated with electric vehicles are generally higher than the upstream GHG emission values associated with gasoline vehicles, and that there is currently no national program in place to reduce GHG emissions from electric powerplants." [EPA-HQ-OAR-2022-0829-0564, pp. 30-31]

40 https://www.epa.gov/regulations-emissions-vehicles-and-engines/final-rule-model-year-2012- 2016-light-duty-vehicle

41 https://www.epa.gov/regulations-emissions-vehicles-and-engines/final-rule-model-year-2017- and-later-light-duty-vehicle

EPA is now proposing to make the 0 g/mile GHG treatment of battery and fuel cell vehicles permanent. The Agency's rationale is that "the program has now been in place for a decade, with no upstream accounting and has encouraged the continued development and introduction of electric vehicle technology." EPA further reasons that "these emission reduction technologies are now coming into the mainstream and can serve as the primary technologies upon which EPA can base more stringent standards" and that "power sector emissions are declining and the trend is projected to continue." Finally, EPA concludes that the "approach of looking only at tailpipe emissions and letting stationary source GHG emissions be addressed by separate stationary source programs is consistent with how every other light duty vehicle calculates its compliance value." [EPA-HQ-OAR-2022-0829-0564, pp. 30-31]

Regarding the first two points, while the program has indeed been in place for a decade, the sales volumes of electric and fuel cell vehicles remain in the minority of new vehicle sales (<10%). As sales increase, there is a potential for erosion of benefits if the pace of grid decarbonization and charging infrastructure build-out do not meet projections. Regarding EPA's final point, the agency previously recognized the inconsistency in treatment of upstream emissions of the power sector versus the oil and gas sectors. The Agency's justification then, and still valid today, is that upstream emissions related to power production to propel battery electric vehicles is higher than the upstream GHG emissions associated with gasoline vehicles, and there remains no final federal regulation to reduce GHG emissions from electric power plants. [EPA-HQ-OAR-2022-0829-0564, pp. 30-31]

For these reasons, MECA suggests that EPA maintain an upstream accounting mechanism for the GHG emissions from electricity generation to charge electric vehicles in its requirements. Rather than removing the upstream accounting provision entirely, MECA suggests that the Agency postpone it to a future year as has been the Agency's practice in previous light-duty GHG regulations. It is important to consider the emissions generated from the energy used for propulsion of all vehicles. Currently, this is well established for ICE vehicles since the emissions from fuel combustion are measured at the tailpipe. However, the electricity used to power electric vehicles comes from a mix of sources that includes combustion of fuel, and those emissions could reasonably estimated and reported during certification. It should be noted that we are not suggesting a full life cycle certification method at this time due to the complexity of such an approach. Our suggestion is to exclude the upstream emissions associated with the fuel production (mining, drilling, refining) and delivery that would affect both the fuels supplied to ICE power plants and the fuels used by ICE vehicles. We believe that a simplified approach could be applied while the Agency works with stakeholders to assess the potential of a full life cycle method that could be implemented in a future regulation. [EPA-HQ-OAR-2022-0829-0564, pp. 30-31]

For a simplified approach, EPA could include in the final rule an annual U.S. average grid carbon intensity based on the one used to determine the upstream GHG emissions impacts of this rule in the Agency's Regulatory Impact Analysis. This lookup table could be used by all manufacturers to certify their electric vehicles with the same grid carbon intensity values such that all manufacturers are treated equally. The manufacturer would then use a test determined electric vehicle efficiency value multiplied by the grid carbon intensity averaged over the useful life of the vehicle to report a gram per mile CO2 value for an electric vehicle at certification. By assigning realistic "non-zero" emission values to electric and fuel cell vehicles, EPA will provide a regulatory incentive to further improve the electric efficiency of components and powertrain technologies that will further reduce vehicle related environmental impacts. [EPA-HQ-OAR-2022-0829-0564, pp. 30-31]

Efficiency incentives and regulations have historically driven vehicle manufacturers and technology suppliers to continue to innovate and develop better materials, components, and vehicle systems to reduce energy demand, operating costs and related emissions of vehicles. Electric vehicle efficiency does not provide large benefits at today's EV sales penetration rates. However, if the goals of this rule are met by 2032, electric vehicle sales will be over 60% and EVs will make up a much larger fraction of the in-use passenger car fleet. Therefore, small improvements in efficiency will result in large reductions in grid demand. MECA suggest that EPA consider a range of both incentives and requirements to advance the efficiency of technologies that reduce the emissions footprint of all mobile sources, regardless of the source of propulsion energy. As noted above, setting non-zero certification values for battery electric and fuel cell vehicles will continue to motivate vehicle manufacturers to work with suppliers to improve vehicle efficiency. [EPA-HQ-OAR-2022-0829-0564, pp. 31-32]

Organization: MEMA, The Vehicle Suppliers Associated

- Technology Neutrality and BEV Emissions. EPA should ensure that battery electric vehicles (BEV) are included in metrics for vehicle-to-vehicle comparison by assigning a metric that captures the pollutant emissions related to BEV operation, aligned with national electricity generation figures. [EPA-HQ-OAR-2022-0829-0644, pp. 2-3]
